Over the course of the MAS program, students review and closely examine professional experiences gained so far. The goal of the program is to develop an understanding and form opinions on the present-day building process. The course directs students to draw independent conclusions and set forecasts for design professionals in the building process, creating a basis, in conjunction with group discussions, for independent study.

Content

The Master of Advanced Studies in «Competency in the Building Process» imparts an integral view of the building process. Ever-changing technical and social demands, complex permit processes and increasing pressure to speed up production and completion times have led to the fragmentation and specialization of services and work performed by building process participants. Maintaining an overview of the project are the architects and engineers, who draw from a broad knowledge base as they direct, coordinate and moderate all disciplines involved in the design and construction process.

The MAS program «Competency in the Building Process» is a part-time study for professionally experienced architects and engineers. It provides graduates of the program with a thorough understanding of the complexities of a project, instilling them with an increased capacity to assess the consequences of their actions and decisions. Upon successful completion of the studies, graduates are qualified to assume the complex duties of an overall project leader in building projects.

The first three semesters of the study are comprised of: «Construction Participants», «Services» and «Strategies Interests». Explored in the first semester is communication as it relates to qualifications, acquisition and the organisation chart of the participating client, architects and design and construction professionals. The second semester then turns to the building process as a sequence of activities, placing its focus on basic principles and the services, i.e., the commission for design services, the service model, relevant economic considerations, the overall project leader, coordination of specialty engineers and the project leader. Over the course of the third semester, correlations are then drawn between the topic areas as they relate to the strategies and interests of building industry players. An in-depth look is also taken at the competencies of design professionals. The masters thesis in the fourth and final semester completes the course of study.

**Abstract**
The program aims at enhancing students' understanding of subject matter and methods in the field of research into architectural theory and at assisting them in the critical investigation of the history and theory of architecture.

**Objective**
The historical and social roots of architecture are an essential aspect of the work of architects. To adapt the past to one's own thinking and knowledge, is a challenge. This will be done in a lively and reflecting process. Anyone faced with this challenge in the practical work will find a quality for his buildings that can't be reached by only considering urbanistic, aesthetic and functional factors.

Based on selected issues, the participants of the MAS-program «Geschichte und Theorie der Architektur» get acquainted with the methods of historic research. Participants will gain a deeper insight into the subjects and methods of architectural historians and will be supported in scientific discourses.

**Content**
The MAS-program «Geschichte und Theorie der Architektur» includes a weekly four-hour seminar in which the techniques of scientific work (methodology, creating a bibliography, researching, textual criticism, editing) and practicing essential aspects of art and architecture are discussed on the basis of texts and buildings before they are written down in textual form.

Historiographical and methodological aspects as well as training in analyzing and describing architectural phenomena are at the forefront. A major concern is also to improve the ability for writing of texts (encyclopedia articles, short essays, project descriptions, academic papers). Writing is a key instrument not only of disciplinary discourse, but also the public exchange of research.

Depending on the topic of the course, there is a single or multi-day trip, during which the participants talk about the buildings that are visited. In addition, each semester, at least two additional courses of the Institute gta have to be visited.

The course concludes with a diploma thesis written on a subject that is chosen by the students. The concept and writing of this work are intended to be a process that evolves continuously while studying. The thesis can be extended into a dissertation, provided the student has a graduate degree that is acknowledged by the ETH.

Autumn Semester 2015

Page 852 of 1432
MAS in Housing

The course offered within the MAS-program "Housing" is classified in four relevant modules:

- Module 1: Social and historical context of housing, housing design and construction.
- Module 2: Housing design, past and present: Typology, building, biography of usage.
- Module 3: Housing as a contribution of urban design and neighborhood development.
- Module 4: Sustainable development - a new goal in housing design and construction.

Also see separate program.

The attendance of the lecture "Housing" of Prof. Eberle in the autumn semester is compulsory.

Individual chosen 3-4 further lectures or seminars in the Autumn or Spring Semester have to be attended (6 CP).

The modules 3 and 4 are offered in the Spring Semester.

Abstract

Relevant issues about the provision, the design and the construction of housing and quality of living are explored based on an interdisciplinary analysis. The MAS thesis is focused on studying, for example, the interdependence of architectural, social, spatial and urban planning considerations, and shifting demand and usage patterns related to housing.

Objective

Against the backdrop of jointly developed theoretical ideas, the students' job-related skills and accomplishments in the fields of drawing up concepts, analysis, interpretation, and conversion as well in oral and written conveying are consolidated and expanded in discussions and in joint work. The course of study does not strive to train generalists. Instead it deals with the formulation of questions and procedures elaborated by the students in a generalistic or interdisciplinary way. This is the decisive factor in the qualitative added value of methods which span over several disciplines.

MAS in Landscape Architecture

The Master of Advanced Studies in Landscape Architecture is a one-year full time postgraduate diploma programme delivered in English. It deals mainly with a scale of landscape that is between that of project design and landscape planning. The focus is on peripheral landscapes and their integration into our cities. In the context of the MAS LA these are discussed and developed in respect to their contemporary functional, ecological and aesthetic potentials. Language: English, contact hours: 600h.

For further information please visit: http://www.girot.arch.ethz.ch/

Courses Offered

The programme is a one-year full time master programme, structured around two main poles: a landscape design studio (laboratory), and a theory seminar (oratory). Emphasis within the programme on Landscape Video will also help provide a strong analytical basis in both theory and design. The studies are held during the semester from Tuesday to Friday. The programme will conclude with an individual thesis work.

Abstract

Within the "Master of Advanced Studies in Landscape Architecture" (MAS LA), the use of the latest modeling and visualization possibilities as well as the actual 3D depiction of landscape architecture make up the core emphasis. Here, the focus lies on the integration of CAD/CAM technologies as a design-supporting medium.

Objective

Through an intensive investigation of the latest software and techniques, the students are capable of the following:
- Represent complex design tasks
- Develop spatial perception at different levels of scales
- Handle current problems efficiently and experimentally
- Develop new visualization and communication techniques using new media
- Communicate design ideas professionally

Content

The MAS LA is a one-year (academic) postgraduate diploma programme delivered in English. It is divided into themed modules and a concluding synthesis module. The chosen CAD programs (i.e. Rhino) are particularly appropriate for the visualization of large-scale landscape designs and offer the possibility for export to computer-steered milling machines. In addition, superior competency enhancement in the area of 3D GIS and the use of photography as a design tool and video as tool for illustration and design round off the goal-oriented program.

# Work Design and Organizational Change

**Introduction to Management**

1 credit

This course is an introduction to the critical management skills involved in planning, structuring, controlling and leading an organization.

The course is designed to convey a profound understanding of marketing’s role in modern firms, its interactions and interfaces with other disciplines, its main instruments and recent trends. Particular attention is given to emerging marketing concepts and instruments, and the role of marketing in technology firms.

- Good work design is crucial for individual and company effectiveness and a core element to be considered in organizational change.
- Meaning of work, organization-technology interaction, and uncertainty management are discussed with respect to work design and sustainable organizational change.
- As course project, students learn and apply a method for analyzing and designing work in business settings.
- Objective: Know effects of work design on competence, motivation, and well-being.
- Understand links between design of individual jobs and work processes.
- Know basic processes involved in systematic organizational change.
- Understand the interaction between organization and technology and its impact on organizational change.
- Understand relevance of work design for company performance and strategy.
- Know and apply methods for analyzing and designing work.

**Content**

- Work design: From Adam Smith to job crafting.
- Effects of work design on performance and well-being.
- Approaches to analyzing and designing work.
- Modes of organizational change and change methods.
- Balancing stability and flexibility in organizations as design criterion.
- The organization-technology interaction and its impact on work design and organizational change.
- Example Flexible working arrangements.
- Strategic choices for work design.

**Literature**

A list of required readings will be provided at the beginning of the course.

**Prerequisites / notice**

The course includes the completion of a course project to be conducted in groups of four students. The project entails applying a particular method for analyzing and designing work processes and is carried out by means of interviews and observations in companies chosen by the students.

**Number** 363-0301-00L

**Title** Work Design and Organizational Change

**Type** W+

**ECTS** 3 credits

**Hours** 2G

**Lecturers** G. Grote

**ECTS** 3 credits

**Hours** 2G

**Lecturers** S. Brusoni, P. Baschera, N. Rosenkranz

**Abstract**

This course is an introduction to the critical management skills involved in planning, structuring, controlling and leading an organization.

We develop a systemic view of organizations.

- We look at organizations as part of an industry context, which is affected by different elements like strategy, structure, culture, tasks, people, and outputs.
- We consider how managerial decisions are made in any one of these domains affect decisions in each of the others.

**Abstract**

The course is designed to convey a profound understanding of marketing’s role in modern firms, its interactions and interfaces with other disciplines, its main instruments and recent trends. Particular attention is given to emerging marketing concepts and instruments, and the role of marketing in technology firms.

After taking the lecture, students should have knowledge on

1) The definition and role of marketing (marketing basics)
2) Creating marketing insights - understanding customer behavior
   - Theoretical concepts in customer behavior (customer behavior)
   - Analytical means to extend knowledge on customer behavior (marketing research)
   - Strategic tools to quantify customer behavior (CLV, CE)
3) Strategic marketing - translating marketing insights into actionable marketing strategies
   - Segmentation, Targeting, and Positioning
   - Attracting customers (marketing mix, 4Ps)
   - Maintaining profitable customer relations (CRM)

**Content**

The course is designed to convey a profound understanding of marketing’s role in modern firms, its interactions and interfaces with other disciplines, its main instruments and recent trends. Particular attention is given to emerging marketing concepts and instruments, and the role of marketing in technology firms.

The lecture features a short tutorial that is held at irregularly spaced intervals throughout the semester (approximately every third week). The tutorial is embedded within the lecture and consists of short sessions of about 30 minutes. It serves to illustrate theoretical and methodological concepts from the lecture by walking students through the analysis of real-world data from the telecommunications industry. The case data will be provided so that students practice and apply the concepts of the lecture on their own. The tutorial is held jointly by a Teaching Assistant (S.N. Brüggemann) and the professor (Prof. F. v. Wangenheim).

**Literature**

Weekly readings, distributed in class (via Moodle).

**Number** 365-1061-00L

**Title** B2B Marketing

**Type** W+

**ECTS** 1 credit

**Lecturers** M. Zimmer

Exclusively for MAS MTEC students (first semester).
The seminar extends the "Introduction to Marketing" course by taking a look at the characteristics of B2B markets, particularly at the situation of manufacturing firms. Companies operating on B2B markets increasingly face global competition and demanding customers. One way out is to customize the company's core offering and to enhance it with additional products and services. However, these "business solutions" are often not as profitable as expected; the underlying business model needs improvement.

In this seminar, the participants analyze their company’s business model with regard to its suitability for business solutions. The firm does not have to be a solution provider; the seminar also encourages the students to think about new pathways to increase the competitiveness of the companies they are working for.

The seminar is based on the "Business Model Canvas" and the "Value Proposition Canvas" frameworks by Osterwalder at al. The reading of the underlying books (“Business Model Generation” and "Value Proposition Design") is not mandatory but highly recommended. More information about the frameworks can be found here: http://www.businessmodelgeneration.com/canvas/bmc and: http://www.businessmodelgeneration.com/canvas/vpc. Previews for the first 72 pages (BMC) and 100 pages (VPC) are available after registration on this website: https://strategyzer.com/books

The focus of the seminar is on B2B companies. Therefore, the employer of the participants should primarily serve business customers (as opposed to end consumers, e.g. for fast moving consumer goods). Manufacturing and service companies are equally suitable. Students should have a basic understanding of their firm's business model.

### Information Management, Operations Management

<td></td>
</tr>
</tbody>
</table>

**Abstract**

Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

**Objective**

An effective and efficient flow of goods, data, and control in and between companies contributes significantly to the value added for the customer. Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

**Content**

Strategic and tactical concepts in logistics, operations, and supply chain management: Conflicts of objectives and strategies and in the entrepreneurial context; business process analysis and fundamental logistics concepts; the MRP II / ERP concept: business processes and methods; the lean / just-in-time and repetitive manufacturing; concepts for product families and one-of-a-kind production; concepts for the process industry.

**Lecture notes**

The presentation containing the course outline is available in the section "learning material".

**Literature**

The business model part of the seminar is based on the "Business Model Canvas" and the "Value Proposition Canvas" frameworks by Osterwalder at al. The reading of the underlying books ("Business Model Generation" and "Value Proposition Design") is not mandatory but highly recommended. More information about the frameworks can be found here: http://www.businessmodelgeneration.com/canvas/bmc and: http://www.businessmodelgeneration.com/canvas/vpc. Previews for the first 72 pages (BMC) and 100 pages (VPC) are available after registration on this website: https://strategyzer.com/books

Due to the big number of students, about half of the students will play this game, instead of Oct. 1, at Friday afternoon, Oct. 2. Please be available. Thank you for your help in this matter.

**Abstract**

This lecture provides a theory- and practice-based understanding of how today's information technologies enable new digital business models and disrupt existing markets.

**Objective**

A. After the lecture, the student is able to evaluate digital business models from different angles, including theory-based views:

- Definition and classification of business models
- Digital business model patterns
- Theoretical frameworks that explain why and how digital business models function
- Impact of digital business model patterns on P&L and balance sheet

Students know how to measure & evaluate investments into the digital space as

- a decision maker in an established company (should I invest in project A or B?)
- an entrepreneur (should I pursue this venture?)
- an investor (should I invest in start-up xy?)

B. The student knows different tools to design digital business model patterns.
Content
Uber, Airbnb, Nest and Jawbone - A wide range of innovative companies exist, which successfully implemented ICT enabled business models and continue to grow at a rapid pace. Examples, illustrating how digitalization, including the "Internet of Things" currently fosters business model innovation across various industries. This course is designed to help students to understand and critically assess such newly immersing (digital) business models.

For the lecture students will get access to one of the leading online teaching platforms (called edX) also offered by other top universities (incl. MIT, Harvard, Berkeley, etc.). Using the edX platform, will allow students to collaborate in online discussions, solve online exercises and present a short educational video as part of a group project.

Key Topics:
Business model innovation; (digital) business model patterns; business value of IT; the concept of integration; transaction cost perspective; network economics perspective; essentials and impact of web 2.0; internet of things, mobile computing, market places, social analytics and big data; IT governance and portfolio management; entrepreneurship in the digital space, etc.

Implementing solutions: project management, critical path method, quality control feedback loop.

Controlling solutions: Vensim software, feedback cycles, control parameters, instabilities, chaos, oscillations and cycles, supply and demand, production functions, investment and consumption

A successful participant of the course is able to:
- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyse the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics

Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical systems dynamics, nonlinear dynamics and macroeconomic modeling.

The course is structured along three main tasks:
1. Finding solutions
2. Implementing solutions
3. Controlling solutions

PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM.

The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture

Prerequisites / notice
Self-study tasks (discussion exercises, Vensim exercises) are provided as home work. Weekly exercise sessions (45 min) are used to discuss selected solutions. Regular participation in the exercises is an efficient way to understand the concepts relevant for the final exam.

Economics

</table>

This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation. What significance do international economic relations have for Switzerland?

This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to every-day economic problems.

This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? What is the best way to protect the environment? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

The course webpage (to be found at http://www.kof.ethz.ch/en/events/teaching/) contains announcements, course information and lecture slides.

We advise you to also buy access to Aplia. This internet platform will support you in learning for this course. To save money, you should buy the book together with Aplia. This is sold as a bundle (ISBN: 9781473715998).

Besides this textbook, the slides and lecture notes will cover the content of the lecture and the exam questions.
Principles of Microeconomics

**Abstract**
The course introduces basic principles, problems and approaches of microeconomics.

**Objective**
The course includes the following main topics:
- Basic principles of demand and supply, market and state in a modern economy, externalities, cost analysis, consumer behaviour, economies of scale and economies of scope, perfect competition, monopoly, oligopoly, monopolistic competition, mathematical treatment of some basic concepts.

**Lecture notes**
Lecture notes, exercises and reference material can be downloaded from Moodle.

**Literature**
- The book can also be used for the course "Principles of Macroeconomics" (Sturm)

For students taking only the course 'Principles of Microeconomics' there is a shorter version of the same book:

Complementary:

**Abstract**
This course conveys concepts and methods in strategic management, with a focus on competitive strategy. Competitive strategy aims at improving and establishing position of firms within an industry.

**Objective**
The lecture "strategic management" is designed to teach relevant competences in strategic planning and -implementation, for both professional work-life and further scientific development. The course provides an overview of the basics of strategy and the most prevalent concepts and methods in strategic management. The course is given as a combination of lectures about concepts/methods, and case studies where the students asked to solve strategic issues of the case companies. In two sessions, the students will also be addressing real-time strategic issues of firms that are represented by executives.

**Content**
- a. Introduction to strategy
- b. Industry dynamics I: Industry analysis
- c. Industry dynamics II: Analysis of technology and innovation
- d. The resource-based theory of the firm
- e. The knowledge-based theory of the firm

Due to didactic reasons originating from the case based approach, the number of participants is limited to 80. Registration through myStudies (first come, first served). If you are unable to sign up through myStudies, please contact the course assistant.

Registration through myStudies (first come, first served). If you are unable to sign up through myStudies, please contact the course assistant.
This lecture is a special course for MAS students which supplements the Strategic Management course. Participants work on real-life case studies to develop a nuanced understanding of the sustainability challenges facing companies in different sectors and the various strategies companies develop in response. Students will learn how to critique individual corporate sustainability strategies, as well as the more general concepts of corporate sustainability and sustainability leadership.

Content

Corporate sustainability is a complex concept. Although many companies now report on their corporate sustainability actions, few will be able to demonstrate successful integration of sustainability into their business operations. In this course, we will discuss a selection of case studies of companies from different sectors facing a variety of environmental and social challenges. Through interactive discussions, students will learn to critique the concepts of corporate sustainability and sustainability leadership.

Literature

Case study materials including supplementary readings will be provided to participants by email several weeks before the first seminar. The sessions will be interactive, will include small group discussions and will be complementary to the Corporate Sustainability Lecture.

Prerequisites / notice

Successful registration and prior/parallel enrollment in "363-0392-00 G Strategic Management" required (see course catalogue page for details).

365-0387-00L Corporate Sustainability W+ 3 credits 2G V. Hoffmann

Abstract

We introduce the concept of corporate sustainability; discuss its implications focusing on strategy, technology, and financial markets; and offer e-modules to train relevant critical thinking skills. With this input, students explore the practical challenges of corporate sustainability in a group project, focusing on one of the four sustainability challenges of water, energy, mobility, and food.

Objective

Understand the limits and potential of corporate sustainability for sustainable development

Develop critical thinking skills that are useful for corporate sustainability (argumentation, communication, evaluative judgment)

Content

Overview of the grand sustainability challenges of Water, Energy, Mobility, and Food

Business implications of sustainable development, in particular for corporate strategy, marketing & leadership, technology & innovation, and financial markets.

Critical thinking skills for corporate sustainability

In-depth case study of concrete corporate sustainability challenge in the group project phase, such as: How to deal with environmental pressure groups? How to use the strengths of business to solve pressing sustainability problems? How to catalyze radical innovations for sustainability? How to invest money in a sustainable way?

Lecture notes

Presentation slides will be distributed prior to lectures.

Literature

Literature recommendations will be distributed during the lecture

Autumn Semester 2015

For participants of the MAS-MTEC program we offer a complementary course Practicing Strategy in which students will apply the concepts of Strategic Management to their real-life contexts and organizations. Please register simultaneously for both courses if you want to take part in this course.

For more information please see:

http://www.smi.ethz.ch/education/practicing-strategy.html
The task of designing and managing supply chains requires that managers apply strategic, decision making and leadership skills in a holistic approach to business transformation projects by introducing an integrated model dealing with three main design areas: "strategy", "processes" and "information systems" and applying this model to various case studies.

The goal of the lecture is to understand the main challenges of corporate transformation and to demonstrate the application of a holistic project procedure model for corporate transformation projects with special emphasis on the alignment of business and IT.

The student should understand and be able to explain:

- the main reasons for corporate transformation,
- the relevant management processes to manage corporate transformation,
- the interdependencies between strategy, processes and information systems, especially how these three levels interrelate,
- the critical success factors for the successful accomplishment of large scale corporate transformation projects,
- the main instruments of project, quality and change management and the different types of resulting IT projects.

The globalization of the world leads to an increasingly faster pace in business transformation. Enterprises have to adapt faster and even faster to the environmental changes in a global economy to remain competitive and to make sure they stay in business. In today's information age this does not only mean to adapt business strategy and business processes but also to adapt information systems to the new circumstances. The fast adaptation trough large scale corporate transformation projects that change strategy, business processes and information systems is critical to ensure competitiveness for tomorrow. The introduction of new business processes and information systems typically takes years in very complex large scale projects. Many projects fail because of insufficient alignment between decision makers in business and IT. Unclear understanding of the overall project scope, undefined roles and responsibilities, unclear project processes, quality problems and resistance to change are some typical problems found in such projects. The lecture is subdivided into following modules:

- Corporate development introduction and motivation,
- Parallelization of corporate development and complexity reduction,
- Planning process and project portfolio management in corporate development,
- Management of large scale projects integration of strategy, processes and information systems,
- Quality management in large scale projects,
- Project management in large scale projects,
- Change management within projects.

The lecture is accompanied by four case studies that are used to exemplify the contents of the lecture by applying the concepts to real situations in corporate life.

**Abstract**

The lecture treats the main challenges of business transformation and the alignment of corporate development and IT activities. It presents a holistic approach to business transformation projects by introducing an integrated model dealing with three main design areas: "strategy", "processes" and "information systems" and applying this model to various case studies.

**Objective**

The goal of the lecture is to understand the main challenges of corporate transformation and to demonstrate the application of a holistic project procedure model for corporate transformation projects with special emphasis on the alignment of business and IT.

The student should understand and be able to explain:

- the main reasons for corporate transformation,
- the relevant management processes to manage corporate transformation,
- the interdependencies between strategy, processes and information systems, especially how these three levels interrelate,
- the critical success factors for the successful accomplishment of large scale corporate transformation projects,
- the main instruments of project, quality and change management and the different types of resulting IT projects.

**Content**

The globalization of the world leads to an increasingly faster pace in business transformation. Enterprises have to adapt faster and even faster to the environmental changes in a global economy to remain competitive and to make sure they stay in business. In today's information age this does not only mean to adapt business strategy and business processes but also to adapt information systems to the new circumstances. The fast adaptation through large scale corporate transformation projects that change strategy, business processes and information systems is critical to ensure competitiveness for tomorrow. The introduction of new business processes and information systems typically takes years in very complex large scale projects. Many projects fail because of insufficient alignment between decision makers in business and IT. Unclear understanding of the overall project scope, undefined roles and responsibilities, unclear project processes, quality problems and resistance to change are some typical problems found in such projects. The lecture is subdivided into following modules:

- Corporate development introduction and motivation,
- Parallelization of corporate development and complexity reduction,
- Planning process and project portfolio management in corporate development,
- Management of large scale projects integration of strategy, processes and information systems,
- Quality management in large scale projects,
- Project management in large scale projects,
- Change management within projects.

The lecture is accompanied by four case studies that are used to exemplify the contents of the lecture by applying the concepts to real situations in corporate life.

**Course notes:**

Course material will be available for download from the homepage of the Chair of Logistics Management:

http://www.scm.ethz.ch/teaching/courses.html

Login will be provided in the first lecture or can be obtained from the Teaching Assistant Dennis Schuler(dschuler@ethz.ch).

**Literature**

The following textbook is mandatory:

The following textbook is supplementary:

**Prerequisites / notice**

The final course grade will be a weighted average of the following:

- Exam (semester end): 70%
- Case studies (during the semester): 30%

Students (at least in groups of two) must bring a laptop with MS Excel and the Excel Solver installed to class.

### Quantitative and Qualitative Methods

#### Number 363-0305-00L

**Title:** Empirical Methods in Management

**ECTS:** 3 credits

**Lecturer:** A. Scherer

**Abstract**

Evidence-based management requires valid empirical research. In this course, students will learn the basics of research design, fundamentals of data collection and statistical methods to analyze the data acquired in social science research. Students are expected to apply their knowledge in class discussions and out-of-class assignments.

**Objective**

- Ability to formulate research questions and designing an appropriate study
- Ability to collect and analyze data using a variety of methods
- Ability to critically assess the quality of empirical research in management
- Applied knowledge of empirical methods through out-of-class assignments

**Content**

1. Introduction to empirical management research
2. Research designs: exploratory, descriptive, experimental
3. Measurement and scaling
4. Data collection and sampling
5. Data analysis methods
6. Reporting and presenting empirical research

Bi-weekly out-of-class assignments and projects on covered subjects
Prerequisites / notice

Assignments and projects: This course includes out-of-class assignments and projects to give students some hands-on experience in conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Students will have at least one week to work on each assignment. Students are expected to work on these assignments individually. Duplicate answers will receive no credit and will be subject to a disciplinary review. Assignments will be graded and need to be turned in on time. Exemplary answers to the assignments will be posted online after the submission date for students to review. Some assignments will also be discussed in class.

Class participation: Class participation is encouraged and can greatly improve students’ learning in this class. Class participation will not be graded; however, it will be considered favorably if a student is between grades. Note, however, that quality is more important than quantity. In this spirit, students are expected to attend class regularly and come to class prepared.

363-1004-00L Operations Research W+ 3 credits 2G M. Laumanns

Abstract
This course provides an introduction to operations research methods in the fields of management science and economics. Requisite mathematical concepts are introduced with a practical, problem-solving perspective.

Objective
- Introduction to building and using quantitative models in a business/industrial environment
- Introduction to basic optimization techniques (Linear Programming and extensions, network flows, integer programming, dynamic and stochastic optimization)
- Understanding the integration of quantitative models into the managerial decision process

Content
The following topics are covered: Systems and models, linear models and the importance of linear programming, duality theory and shadow prices, integer programming, optimization under uncertainty and applications in inventory management.

Lecture notes
A printed script will be made available.

Literature
Any standard textbook in Operations Research is a useful complement to the course.

Prerequisites / notice
Undergraduate calculus, linear algebra, probability and statistics are a prerequisite.

Abstract
Relationship between economy and environment, market failure, external effects and public goods, contingent valuation, internalisation of externalities; economics of non-renewable resources, economics of renewable resources, cost-benefit analysis, sustainability, and international aspects of resource and environmental economics.

Objective
Understanding the basic issues and methods in resource and environmental economics; ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

Topics are:
- Introduction to resource and environmental economics
- Importance of resource and environmental economics
- Main issues of resource and environmental economics
- Normative basis
- Utilitarianism
- Fairness according to Rawls
- Economic growth and environment
- Externalities in the environmental sphere
- Governmental internalisation of externalities
- Private internalisation of externalities: the Coase theorem
- Free rider problem and public goods
- Types of public policy
- Efficient level of pollution
- Tax vs. permits
- Command and Control Instruments
- Empirical data on non-renewable natural resources
- Optimal price development: the Hotelling-rule
- Effects of exploration and Backstop-technology
- Effects of different types of markets.
- Biological growth function
- Optimal depletion of renewable resources
- Social inefficiency as result of over-use of open-access resources
- Cost-benefit analysis and the environment
- Measuring environmental benefit
- Measuring costs
- Concept of sustainability
- Technological feasibility
- Conflicts sustainability / optimality
- Indicators of sustainability
- Problem of climate change
- Cost and benefit of climate change
- Climate change as international ecological externality
- International climate policy: Kyoto protocol
- Implementation of the Kyoto protocol in Switzerland
- Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

Abstract
I aim to introduce students to the concepts and tools of modern finance and to make them understand the limits of these tools, and the many problems met by the theory in practice. I will put this course in the context of the on-going financial crises in the US, Europe, Japan and China, which provide fantastic opportunities to make the students question the status quo and develop novel solutions.
Objective
The course explains the key concepts and mechanisms of financial economics, their depth and then stresses how and why the theories and models fail and how this is impacting investment strategies and even a global view of citizenship, given the present developing crises in the US since 2007 and in Europe since 2010.

- Development of the concepts and tools to understand these risks and master them.
- Working knowledge of the main concepts and tools in finance (Portfolio theory, asset pricing, options, real options, bonds, interest rates, inflation, exchange rates)
- Strong emphasis on challenging assumptions and developing a systemic understanding of financial markets and their many dimensional risks

Content
1- The Financial Crises: what is really happening? Historical perspective and what can be expected in the next decade(s). Bubbles and crashes. The illusion of the perpetual money machine.
2- Risks in financial markets
   - What is risk?
   - Measuring risks of financial assets
   - Introduction to three different concepts of probability
   - History of financial markets, diversification, market risks
3- Introduction to financial risks and its management.
   - Relationship between risk and return
   - Portoflio theory: the concept of diversification and optimal allocation
   - How to price assets: the Capital Asset Pricing Model
   - How to price assets: the Arbitrage Pricing Theory, the factor models and beyond
4- Financial markets: role and efficiency
   - What is an efficient market?
   - Financial markets as valuation engines: exogeneity versus endogeneity (reflexivity)
   - Deviations from efficiency, puzzles and anomalies in the financial markets
   - Financial bubbles, crashes, systemic instabilities
5- An introduction to Options and derivatives
   - Calls, Puts and Shares and other derivatives
   - Financial alchemy with options (options are building blocks of any possible cash flow)
   - Determination of option value: concept of risk hedging
6- Valuation and using options
   - A first simple option valuation model
   - The Binomial method for valuing options
   - The Black-scholes model and formula
   - Practical examples and implementation
   - Realized prices deviate from these theories: volatility smile and real option trading
   - How to imperfectly hedge with real markets?
7- Real options
   - The value of follow-on investment opportunities
   - The timing option
   - The abandonment option
   - Flexible production
   - Conceptual aspects and extensions
8- Government bonds and their valuation
   - Relationship between bonds and interest rates
   - Real and nominal rates of interest
   - Term structure and yields to maturity
   - Explaining the term structure
   - Different models of the term structure
9- Managing international risks
   - The foreign exchange market
   - Relations between exchanges rates and interest rates, inflation, and other economic variables
   - Hedging currency risks
   - Currency speculation
   - Exchange risk and international investment decisions
Lecture notes
Lecture slides will be available on the site of the lecture

Literature
Corporate finance
Brealey / Myers / Allen
Eight edition

Prerequisites / notice
+ additional paper reading provided during the lectures
This course will cover how to prepare and deliver your future presentations. The following contents will be covered: the most important elements of a professional presentation, their presentations are more professional and interesting than before, they can structure their presentation for easy delivery and understanding, they can tell what their strengths and areas for improvement are, they will know how to speak of the cuff, they deliver constructive feedback. Feedback from your colleagues, the trainer and the video you will be able to identify your strengths and weaknesses.

The syllabus includes the following topics:
- Elements of risk management
  - risk identification and evaluation
  - risk mitigation
  - risk communication
- Psychological and organizational concepts relevant in risk management
  - decision-making under uncertainty
  - risk perception
  - resilient organizational processes for managing uncertainty
- Case studies on different elements of risk management (e.g., rule making, training, managing project risks, automation)
- Group projects related to company case studies

Lecture notes
There is no script, but slides will be made available before the lectures.

Literature
There are texts for each of the course topics made available before the lectures.

Prerequisites
The course is restricted to 40 participants who will work closely with the lecturers on case studies prepared by the lecturers on topics relevant in their own companies (Swiss Re, Skyguide, Swisscom).

Lecture notes

Literature

Prerequisites / notice
The lecture will be supported by the Chair of Entrepreneurial Risks. Please refer to the chair's website for more detailed information regarding the course (www.er.ethz.ch/teaching).

Abstract
Using uncertainty management by organizations and individuals as conceptual framework, risk management and risk implications of new technologies are treated. Three components of risk management (risk identification/evaluation, risk mitigation, risk communication) and underlying psychological and organizational processes are discussed, using company case studies to promote in-depth understanding.

Content
- understand basic components of risk management in organizations
  - know and apply methods for risk identification/evaluation, risk mitigation, risk communication
  - know psychological foundations of risk perception, decision-making under risk, and risk communication
  - know organizational principles for managing uncertainty
  - apply theoretical foundations to applied issues such as safety management, regulatory activities, and technology design and implementation in different domains (e.g. transport systems, IT, insurance)

Objective
- know and apply methods for risk identification/evaluation, risk mitigation, risk communication
- know psychological foundations of risk perception, decision-making under risk, and risk communication
- know organizational principles for managing uncertainty
- apply theoretical foundations to applied issues such as safety management, regulatory activities, and technology design and implementation in different domains (e.g. transport systems, IT, insurance)

Literature

Prerequisites
The course will cover how to prepare and deliver your future presentations. You will be more confident presenting yourself. Thanks to the feedback from your colleagues, the trainer and the video you will be able to identify your strengths and weaknesses.

Objective
The participants know the most important elements of a professional presentation, their presentations are more professional and interesting than before, they can structure their presentation for easy delivery and understanding, they can tell what their strengths and areas for improvement are, they will know how to speak of the cuff, they deliver constructive feedback.

Content
- the alignment process, and evaluating the alignment outcomes.
- applying the tools / frameworks to real cases.

Literature
Skipwith, Thomas; Reto B. Rüegger: To catch fish use the right bait, DESCUBRIS Press, Zurich, May 2014.
This course focuses on the challenges in managing multi-business corporations, and covers topics related to the vertical and horizontal scope of business activities.

70% of the final grade consists of a final closed-book written exam and 30% of the final grade will consist of individual assignments and group debates.

Course Topic and Learning Objectives:
Large- and medium-sized corporations play a central role in the economic activity of most developed and developing countries. Many of these organizations perform multiple business activities in multiple markets. In the face of increasing international competition, globalization, technological development, deregulation, and the emergence of new markets and industries, operating such a portfolio of business activities poses important managerial challenges forcing corporations to continuously re-consider their vertical and horizontal scope and boundaries.

The course Corporate Strategy draws from a wide range of theories and methods to develop an understanding of the conceptual frameworks, debates, and developments concerning decisions associated with the management of multi-business corporations. We will cover the key questions driving a firm’s corporate strategy, including:

- In what markets to compete with which businesses?
- Which activities should be performed by the firm and which should be outsourced (i.e. “make” or “buy” decisions)?
- What are the most appropriate approaches to growth and divestiture?
- How do institutional forces impact corporate strategy?

Specifically, we will examine how organizations manage their portfolio of business activities and markets to achieve competitive advantage through vertical integration, cooperative strategies such as strategic alliances and joint ventures, corporate diversification, mergers and acquisitions, diversification, and globalization/international strategies, and strategic renewal.

Format:
The course is a combination of lectures about concepts/methods, guest lectures, case studies/assignments, and group debates.

Objective
Learning outcomes professional competence
- The students learn and understand the management basics of inter-firm cooperation and organizational networks (business models, incl. risk, communication, etc.)
- Realize the value creation potentials of alliances (added value)
- Understand underlying theoretical models (Transaction cost theory, principal agent, game theory)
- Identify and understand specific forms of collaboration (Strat. All., JV, Networks, M&A, etc.)
- Apply tools hands on in real companies (in coll. with companies)

Learning outcomes methodological competence
- Writing academic papers
- Developing structured documentation of interviews
- Transferring theory directly into application
- Contributing to the learning journey

Potential of Collaborations
Learning outcomes social competence
- Work together with industrial partners
- Improve communication skills as basics for collaboration
- Developing and applying team work skills
- Coping with conflicts resolution in teams

Content
The constantly augmenting complexity of technologies and systems, the increased pressure caused by competition, the need for shortening time-to-market and the thereby implied growing risks force organizations to increasingly focus on core competencies. Collaboration with external partners is a key value creation opportunity for successful ventures. This type of cooperation also has implications on daily management activities. This lecture will provide a better understanding of special requirements needed for management of cooperation issues.

Content:
- Introduction to theory and management of inter-firm collaboration and networks.
- Description of the formation, management and evolution of collaborations and networks.
- Collaborations in marketing, development, manufacturing (e.g. NUMMI).
- Special forms of collaborations: mergers & acquisition (e.g. pre- and post-merger activities, joint venture, strategic alliances (e.g. Doz & Hamel, networks, virtual communities)

Learning journey:
In an introductory lecture we will give an overview of the theoretical framework and explain the concept of the lecture (Sept. 18, 2014). In weeks 2-5 you will work on a first assignment on six different aspects of the underlying framework: strategy and activities, structure and process, culture and people orientation, interaction and roles, risk and trust, knowledge and learning. This first assignment will give you the basics to participate in the second part (Oct. 30-31,2014, 2014) of this seminar. There you will present the results of the first assignment and get additional theoretical input to perform the 2nd assignment. The second assignment will be to analyze real alliance projects in the partner companies. The final lesson will be used as a best practice exchange together with our industrial partners (Dec 18, 2014).

Lecture notes
- Lecture script
- Current course material
- Harvard Case Studies
- Reader with current papers

Literature
A list with recommended publications will be distributed in the lecture.

Additional Books:
HBR Collaborating Effectively ISBN 978-1-4221-6264-4
HBR on Mergers and Acquisitions: ISBN 1-57851-555-6

Prerequisites / notice
The number of students participating in the lecture is limited to 30.

Autumn Semester 2015
Page 864 of 1432
The course introduces the students to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies.

The course includes both lectures and exercises alternately. The goal is to understand the opportunity of user innovation for management and develop strategies to harness the value of user-developed ideas and contributions for firms and other organizations.

The students actively participate in discussions during the lectures and contribute presentations of case studies during the exercises. The combination should allow to compare theory with practical cases from various industries.

The course presents and builds upon recent research and challenges the students to devise innovation strategies that take into account the availability of user expertise, free and public knowledge, and the interaction with communities that span beyond one organization.

Grading is based on the final exam, the class presentations (including the slides) as well as class participation.

This course on user innovation extends courses on knowledge management and innovation as well as marketing. The students are introduced to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies. Theoretical underpinnings taught in the course include models of innovation, the structuration of technology, and an introduction to entrepreneurship.

Goals of technology transfer with focus on spin-off and start-up creation. Start-up ecosystem, business model innovation, intellectual property, early stage financing and negotiation. Visit to Technopark and Hub Zurich. Guest speakers, meetings with start-up founders. Case study group work with real start-ups. Block lecture (3 days) with strong link between theory and practical examples.

- Ability to take successful actions in a technology transfer process either in your own start-up or within a larger organization
- Get familiar with the start-up ecosystem
- Foster entrepreneurial thinking!

Technology Transfer is a powerful tool to foster economic growth. From the macro-economic perspective, funds invested into basic research flow back to the society through the creation of new jobs, the establishment of talent pools and tax substrates. Spin-off companies and start-ups play a major role in implementing technology transfer. The lecture focuses on the significance and goals of technology transfer and the success factors for technology-oriented spin-off and start-up companies. The major challenge is to bridge the gap between technology push and market pull. Hence the innovation value chain and start-up ecosystem will be thoroughly discussed and the key aspects for building successful start-ups will be analyzed. Special topics addressed involve securing intellectual property, business model innovation, early stage financing, as well as negotiation strategies. The course hosts selected speakers from the industry and endorses personal meetings and presentations with start-up founders. This includes a visit to the Hub and Technopark Zurich. The course requirements are active participation and completion of the case study group work, based on real start-ups and presented in class. Strong link between theory and practical examples.

The course is offered in 3 block days.

Blockday 1 - 27.10.15: Introduction and science push
- Introduction to Technology Transfer (Lesley Spiegel)
- Presentation of the case study group work (Balint Dioszegi)
- From science to market (Dr. Marjan Kraak, ETH Transfer, Head Start-ups)
- Securing intellectual property (Dr. Claudius Dietzsch, Medela)

Blockday 2 - 10.11.15: Start-up ecosystem and market pull
- The start-up ecosystem (Lesley Spiegel)
- Innovation in a mature start-up (Dr. Ekkehard Zwicker, CEO Alstom Inspection Robotics)
- Getting started with your venture: ETH Entrepreneur Club (President ETH Entrepreneur Club)
- Negotiation and conflict management (Prof. Dr. Michael Ambühl)
- Early stage financing models (Erika Puyal, Head Start-up Finance, Zurich Kantonbank)

Blockday 3 - 24.11.15: Presentation of student case study group work and visit to the Hub and Technopark Zurich
- Student presentations of case study group work (Lesley Spiegel)
- Success story: South Pole Carbon Asset Management - from spin-off to world leader (Thomas Camerata, Co-Founder)
- Visit of the Hub Zurich and presentation of Hub Start-up
- Visit of the Technopark Zurich and presentation of 3 start-ups

ICT: Rayneer Entertainment (Oliver Flückiger)
Foodtech: Eaterny (Judith Ellens)
Medtech: Ability (Mario Thomman)

Prerequisites / notice

- Case study (group work)
- Maximal number of students: 50
- Course registration open until 19.10.15.
- In case of non-attendance: Mandatory de-registration until 19.10.15!
- Contact: Balint Dioszegi, bdioszegi@ethz.ch (D-MTEC)

363-0877-00L Technology Transfer

Number of participants limited to 50.

363-0884-00L Industrial Engineering and Management Methodology

For Theses in Companies

Abstract

This course is a preparation course for theses in industry: Criteria of scientific work, writing the final report, using research resources at ETH. Using case studies, content of other lectures is discussed with regard to the special challenges during theses: Systems Engineering, Social science methods for empirical data collection and analysis, project management, presentation technique.
Objective
The objective of this course is to provide students with a practical toolset of techniques, procedures and hints for a successful scientific thesis (Bachelor/Master/MAS Thesis) in industry. The course is held by assistants of professorships at D-MTEC.

Content
Methodology: Systems Engineering, problem solving process, situation analysis, SWOT, objectives, solution finding, evaluation.

Social science methods for empirical data collection and analysis: how to develop a good research question: methodological awareness and practical considerations, criteria in social research: reliability and validity.

Research Designs and Strategies: qualitative and quantitative research.

Methods for data collection and analysis: observation, interview, questionnaire, document and literature analysis, and combinations.

Project Management: tasks plan, milestones, roles, communication

Scientific work: research, resources, citation, argumentation

Presentation: techniques, procedure, handouts, significance

Final report: organization, layout, figures, formal requirements, appendix

Lecture notes
Handouts of the presentations / course materials have to be downloaded and printed out before the course (see link above).

Further reading:

Prerequisites / notice
The course is intended for students who want to carry out a thesis in industry, in general these are:

(1) MSc-students MTEC or MAVT with master thesis (MA) during the next term and supervised by MTEC, (corresponds to 3rd or 4th semester Master) and
(2) BSc-students MAVT with bachelor thesis (BA) in industry and supervised by MTEC, as well as with full MTEC focus (corresponds to 5th or 6th semester Bachelor) or
(3) MAS MTEC students in 3rd semester for MA during the next term.

Important note: Credits will only be awarded to students according to (1), (2) or (3). Prerequisites for obtaining the credit or "Testat": being present during the whole course (presence list) and prior study of documents provided on the Internet and of the book Züst, R.: Einstieg ins Systems Engineering. 3. Aufl., Verlag Industrielle Organisation, Zürich 2004.

Other students on request (limited places).

Important: the chair coaching your BA/MA defines whether the course is mandatory. Please contact your chair!

Electronic enrollment until 08.09.2015 required. Without electronic enrollment participation in the course can't be confirmed. The course is held "en bloc" at the beginning of the semester.

Date: Friday 11.09.2015 (13:15-17:00), location: HG E33.1 (ETH main building) and Saturday, 12.09.2015 (09:15-17:00), location: HG E33.1 (ETH main building). Participation at both days required (Friday afternoon and Saturday whole day).

The course is held in English; handouts are available in English.

Besonderes (deutsche Version):
Der Kurs richtet sich an Studierende, welche an einer Professur des D-MTEC eine Arbeit in der Wirtschaft schreiben werden. Im Allgemeinen sind dies:

(1) MSc-Studierende MTEC oder MAVT mit Masterarbeit (MA) im kommenden Semester, die vom MTEC betreut wird, (entspricht 3. oder 4. Semester Master) sowie
(2) BSc-Studierende MAVT mit Bachelorarbeit (BA) in der Wirtschaft, die vom MTEC betreut wird, sowie mit vollem MTEC Fokus (entspricht 5. oder 6. Semester Bachelor) oder
(3) MAS MTEC-Studierende im 3. Semester für MA im kommenden Semester.

Andere Studierende auf Anfrage (beschränkte Anzahl Plätze).

Wichtig: die Professur, welche die jeweilige BA/MA betreut, legt fest, ob der Besuch der Veranstaltung obligatorisch ist. Bitte informieren Sie sich dort!

Elektronische Einschreibung bis zum 08.09.2015 notwendig. Ohne elektronische Einschreibung kann Ihre Teilnahme am Kurs nicht bestätigt werden.

Der Kurs wird als Blockkurs zu Beginn des Semesters gehalten.

Termin: Freitag, den 11.09.2015 (13:15-17:00) im HG E33.1 und Samstag, 12.09.2015 (09:15- ca. 17:00) im HG E33.1 (ETH Hauptgebäude). Anwesenheitspflicht an beiden Tagen (Freitagnachmittag und Samstag ganztags).

Die Veranstaltung wird auf Englisch gehalten; Handouts sind in Englisch verfügbar.
This course teaches students about the basic principles of scientific work in the field of social sciences. The goal is to motivate students to develop an own thesis design and write scientific articles.

**Objective**
This course teaches students about the basic principles of scientific work in the field of social sciences. The goal is to motivate students to develop an own thesis design and write scientific articles.

**Content**
This course teaches students about the basic principles of scientific work in the field of social sciences. The goal is to motivate students to develop an own thesis design and write scientific articles.

**Literature**
Nicoly Sigge (2007) Persuasion with Case Study AMJ Vol. 50, No. 1

**Prerequisites**
The course is mandatory for MSc. students and recommended for MAS students who write their Master Thesis at the Chair of Strategic Management and Innovation - those will be served first.

- The course will be given once every semester by Dr. Zeynep Erden Özkol and the PhD students of the chair.
- The course takes two days, one for lecture, one for student paper presentations. Participation to both sessions are mandatory to receive the credit, there will be no exceptions.
- Students who participate in the lecture and present a paper receive 1 credit point. The course and the presentations will be given in English.
- Students might benefit more if they take this course towards the end of their studies, before writing their master thesis.
With the aim of preparing the students to take on managerial responsibility, this 2x5 days-seminar teaches basic and practical management skills.

**Objective**

To convey management behaviour based on practical examples, own experiences and team discussions complemented by short theory sessions (subsidized from the donation for promotion and training in enterprise sciences at the ETHZ).

**Content**

1 Fundamentals of Communication Psychology  
2 Communication in Business-Life  
3 Fundamentals of Leadership  
4 Self-Management and Life Balance  
5 Leadership Tools  
6 Problem Solving and Decision Making Techniques  
7 Performance Coaching  
8 Conflict Management  
9 Personality  
10 Summary-Day, Domino-Examination

**Lecture notes**

Will be provided as electronic version at www.entrepreneurship.ethz.ch at least one week before the seminar starts

The number of participants is limited. Please send an email to bms@ethz.ch by 03.08.15 for your registration

Week I: 17.08.15 to 21.08.15  
Week II: 07.09.15 to 11.09.15

**Abstract**

Based on several core Human Resource Management processes, this seminar teaches practical skills in HRM and leadership in teams. Using a variety of interactive methods and discussions of real-life situations, it provides a highly practice-oriented approach to dealing with potential HRM- and team-related conflicts at work.

**Objective**

Participants are able to cope with potentially difficult HRM-related situations they may encounter as line managers and team leaders.

**Content**

Based on several core Human Resource Management processes (e.g. recruiting, performance management, reward, training and development), this seminar teaches practical skills in HRM and leadership in teams from a managerial point of view. Using a variety of interactive methods (e.g. role plays) and discussions of real-life situations, it provides a highly practice-oriented approach to dealing with potential HRM- and team-related conflicts at work. The course also includes a guest lecture on diversity and gender issues at work.

**Literature**

Will be announced and published ahead of each session.

**Prerequisites / Notice**

Prior participation in Prof. Grote's lecture 'Human Resource Management: Leading Teams' is highly recommended.

</tbody>
</table>

**Abstract**

This seminar provides the most ambitious and best performing master students at MTEC with the challenging opportunity of a real case on strategy, innovation and leadership in close collaboration with the top management of an outstanding company - in 2015: PwC Switzerland

**Objective**

In your team, you will work on a specific assignment that flows from the current strategic agenda of the board. While gaining substantial insights into the structure, dynamics and challenges of the advisory and assurance industry, you immerse into the business model and strategic landscape of the corporate partner. You visit their headquarters, conduct interviews with members of the management team, experienced consultants as well as internal and external experts before you discuss your ideas with top executives. To secure impact, it is key that you formulate your recommendations from a deep understanding of the authentic leadership culture of the corporate partner.

**Content**

In this endeavour you are coached and supported by: 
- Guido Grote, Chair of Work and Organizational Psychology  
- Stefano Brusoni, Chair of Technology and Innovation Management  
- Claude Siegenthaler, Hsee University / The St.Gallen MBA  
- Georg von Krogh, Chair of Strategic Management and Innovation  
- Pius Baschera, Chair of Entrepreneurship

**Prerequisites / Notice**

Please apply for this course via the official website (www.mtec.ethz.ch) and send your application form together with a CV and transcript of records to andreakurath@ethz.ch. Apply no later than August 25, yet early registrations are welcomed. The number of participants is limited to 18. ECTS: 4 Participants receive a certificate.

Exclusively for MAS MTEC students (first semester).
The online course will be open from 14.09.2015 to 14.02.2016. Within this time, students can proceed through the course at their own convenience. Seat time is about 25 hours.

All MAS MTEC students will receive further information by e-mail on 14.09.2015.

Abstract
This course is a web-based, online, interactive introduction to financial accounting within the context of management requirements. It has been developed by Harvard Business Publishing.

Objective
The online course uses the case study "Global Grocer" to guide the students from company foundation with a simple balance sheet towards more complex balance sheets, income and cash flow statements. This ensures an integrated understanding of company transactions.

Content
1. Introductory Section
   1.1 Terms and Concepts
   1.2 The Balance Sheet
   1.3 Income Statement
   1.4 Accounting Records
   1.5 The Statement of Cash Flows
2. Advanced Section
   2.1 Revenue & Receivables
   2.2 Inventories and Cost of Sales
   2.3 Depreciation and non-current Assets
   2.4 Liabilities and Financing Costs
   2.5 Investment & Investment Income
   2.6 Deferred Taxes and Tax Expense
2.7 Owner's Equity

Lecture notes
The Financial Accounting online-course is an ideal complement to the lectures "Accounting for Managers (363-0711-00)" as well as "Financial Management (363-0560-00)" with the purpose to further deepen the student's knowledge of accounting. Parts of the course content are overlapping, however, it is provided in a different context. Not covered in the online course is managerial accounting which is an important topic in the lecture "Accounting for Managers".

Literature
Needles & Powers (2010), Financial Accounting, 11e, South-Western College Publishing

Prerequisites / notice
The online course will be open from 14.09.2015 to 14.02.2016. Within this time, students can proceed through the course at their own convenience. Seat time is about 25 hours. The online course should be accessed and activated only if students wish to take and complete it.

No lectures are offered for this course. Specific course topics can be discussed with other course participants, and any questions regarding the course content will be answered by an expert on the learning platform Moodle.

363-1044-00L  Applied Negotiation Seminar
                      Due to didactics reasons, the number of participants is limited to 30.
                      Prerequisites: Successful completion of lectures "363-1039-00L Introduction to Negotiation".

Abstract
The block-seminar combines lectures introducing negotiation, negotiation engineering and specific aspects of successful negotiation with the respective application through in-class negotiation case studies and games.

Objective
Students obtain a concentrated insight into key aspects of the field of negotiations, negotiation engineering and specific aspects of successful negotiation. Multiple opportunities to apply that knowledge in different negotiation situations allow for an in-depth learning experience.

365-1035-00L  Quality Management

Exclusively for MAS MTEC students (third semester).

Limited number of participants: a minimum of 10 persons and a maximum of 30 persons.
Please register by 16.09.2015 at the latest via myStudies.

Attendance on the first course day is highly recommended.

Abstract
The design of this course is intended to introduce quality management from an operations and manufacturing viewpoint. Many of the key topics covered throughout the course are located in the Content section below.

Objective
This course will provide students with the underlying principles and techniques surrounding Quality Management with an emphasis on the application in manufacturing and services settings. Students will develop a working knowledge of the best practices in Quality and Process Management. Students will learn to view quality from a variety of functional perspectives and in the process, gain a better understanding of the problems associated with improving quality. The course aims to impart knowledge on the quality management process and key quality management activities. Specifically it aims to: Compare and contrast the various tools used in quality management, comprehend the concepts of customer's value, discuss the emerging tendencies toward global competitiveness, understand different perspectives on quality, explore six-sigma management and its tools, demonstrate how to design quality into product and services, describe the importance of developing a strategic plan for Quality Management, and discuss the importance of 'benchmarking' as a means of identifying the choice of markets.
Content

Major Topics:

Total Quality Management (TQM): Excellence in manufacturing/service, factors of excellence, applications of TQM

Process Management: Quality function development (QFD) and quality assurance systems, factors affecting process management

Benchmarking Procedures

Statistical Process Control (SPC) and failure mode and effect analysis (FMEA) procedures

Demming’s 14 points of Management

Continuous Improvement

Supplier Evaluation: Managing Supplier Quality

Manufacturing capabilities: Quality as a core focus, cost management, competencies

Environmental Factors: Turbulent environments, manufacturing intensity, uncertainty

Quality Systems Certification Policy:

Six Sigma

ISO 9001, 9002, 9003 / ISO 14001 (Environmental quality policies)

363-1049-00L Contemporary Conflict Management W 3 credits 2V M. Ambühl

Abstract

The course provides students with theoretical background and practical insights in conflict management in the 3 areas international, business and interpersonal (legal) relations. Students are introduced into theoretical concepts related to the research field and real world case studies including examples of international conflicts, WWI, old and new regional conflicts, business and mediation.

Objective

Students will gain
- knowledge of history of conflict management;
- comprehension of major ideas in the theory and practice of conflict management, mediation, transformation and resolution;
- application of theoretical concepts to current conflict situations;
- evaluation of conflict situations in international relations and business.

Content

The following topics will be covered:
- history of international and regional conflicts;
- theoretical concepts of conflict management;
- theoretical models of arms races and conflict escalation;
- case studies in international conflicts, as well as in business.

Distinguished guest speakers will be invited.

Literature

365-1067-00L (Un)ethical Decision Making: Alternative and Critical Thinking in Management W 1 credit 1S A. Vaccaro

Exclusively for MAS MTEC students (third semester).

Limited number of participants: a minimum of 10 persons and a maximum of 40 persons.

Abstract

This course is about decision making processes in complex situations involving financial, relational and ethical problems. First, it provides fundamental tools for addressing problematic situations. Second, it discusses how stakeholders' ethical expectations and social responsibility issues can be effectively implemented and integrated in organizational systems and strategic planning processes.

Objective

- Become familiar with tools and procedures to prevent, identify and resolve corporate fraud and crime in organizations
- Understand the mutual relationship between financial, relational and ethical drivers in managerial decision making
- Become familiar with tools and procedures to prevent and resolve corporate crises and scandals
- Understand the opportunities associated with the corporate social responsibility (CSR) movement and how to integrate CSR in organizational and strategic planning
- Create an effective CSR strategic planning process to successfully develop and implement a CSR package
- Understand a variety of strategic CSR planning tools
- Become familiar with creating deep destructive change in pursuit of dual economic and social value

Content

- Fraud and corruption in organizations
- Crisis management
- Personnel problems: Preventing and managing mobbing and sexual harassment
- Global criminal networks

Lecture notes

Most classes are taught through a series of mini-cases and notes that represent real management decisions.

Some classes are complemented with readings from prominent media resources, guest speakers and experimental exercises.
This course is based on mini-cases that will be distributed during the classes.

Moodle of the course: https://moodle-app2.let.ethz.ch/course/view.php?id=1425

Prerequisites / notice
No Pre-course preparation as requirement.
This is an interactive course.

</table>
Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

The lecture covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerators, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

A script will be provided.

402-0674-00L

**Abstract**

Physics in Medical Research: From Atoms to Cells

**Objective**

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be used to study the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue’s anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

The course is dedicated to introduce MAS students from Medical Physics to the field of radiodiagnostics and nuclear medicine. Dedicated practicals will illustrate the theory with an emphasis on the relationship between dose and image quality as well as the security problems related to the work with radiations.

This 1-week theory and practical class offers the possibility to enjoy a variety of research and clinical areas in diagnostic and nuclear medicine. It gives insight into practical concepts and techniques that are discussed thoroughly as the class is performed within actual laboratories with real radiation sources.

The course starts with the physical basis of radiography (from X-ray production to image detectors) and continues with the basic parameters of image quality in radiography (contrast, resolution, noise) and their measurement methods. Specific applications of radiation diagnostic are then considered separately.

The physics of fluoroscopy and mammography is presented with emphasis on the type of detectors. Computer tomography starts from mono- to multi-detector row technology and finishes with the dose indicators and the impacts of acquisition parameters on patient dose. Nuclear medicine is approached through the production and labeling of radiopharmaceuticals before explaining the aspects related to quality control like the stability of the compounds, nuclide- and radionuclide purity as well as apyrogenicity and sterility.

Imaging aspects of nuclear medicine are treated in details for SPECT and PET through the instrumentation, the reconstruction algorithms and the corresponding image quality. Finally, the aspects related to patient dose and radiation protection of the personnel are considered separately for diagnostic radiology and nuclear medicine. The general frameworks of external as well as internal irradiation are presented and practical examples of dose calculations are explained.

529-0004-00L | Computer simulation in chemistry, biology and physics | W | 7 | 4G |
| Objective   | Introduction to computer simulation of (bio)molecular systems, development of skills to carry out and interpret computer simulations of biomolecular systems. |
| Content     | Molecular models, Force fields, Boundary conditions, Electrostatic interactions, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation. |
| Literature  | For more information: www.csms.ethz.ch/education/CSCBP |
| Lecture notes | Available (copies of powerpoint slides distributed before each lecture) |
| Literature  | See: www.csms.ethz.ch/education/CSCBP |
| Prerequisites / notice | Since the exercises on the computer do convey and test essentially different skills as those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam. |

227-0385-10L | Biomedical imaging | W | 6 | 5G |
| Objective   | Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques. |
| Content     | To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts. |
| Lecture notes | Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming |

227-0386-00L | Biomedical engineering | W | 4 | 3G |
| Objective   | Introduction into selected topics of biomedical engineering as well as their relationship with physiology and physics. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined. |
| Prerequisites / notice | Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming |

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultraviolet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

### Objective
The goal of this Advanced Course in Neurobiology is to provide students with a broader knowledge in several important areas of neurobiology. The course consists of four parts: Part I deals with various topics in developmental neurobiology. Part II is devoted to aspects of signal transduction. Part III focuses on synaptic transmission. Part IV gives deeper insights into systems neuroscience.

### Prerequisites / notice
For doctoral students of the Neuroscience Center Zürich (ZNZ).

## Lectures and Seminars

### Number  115-0300-00L
#### Preliminary Course: Introduction to Swiss Spatial Planning
*Only for MAS, DAS and CAS in Spatial Planning*

**Abstract**
Tasks of spatial planning; objectives and principles; instruments of spatial planning; federal planning; cantonal structural planning; constructing outside of building zones; communal planning; land use planning; compensation of benefits released by planning; environmental protection and spatial planning; review of the spatial planning act; case studies and exercises.

**Objective**
The preliminary course introduces students to the fundamentals of formal spatial planning in Switzerland. It gives a first overview over background and context of spatial planning as well as instruments of spatial planning.

**Lecturers**
L. Bühlmann, A. Schneider

### Number  115-0341-00L
#### Lecture Week 01: Introduction to the Programme
*Only for MAS and DAS in Spatial Planning*

**Abstract**
Discussion of the individual basic understanding of spatial planning; Personal preconditions for and expectations of MAS-program; program concept; knowledge portfolio and learning contract; work environments and tools; introduction to study project 1 with excursion; theoretical background for interdisciplinary team work and spatial design.

**Objective**
Aim of the first week is, to give participants a first overview over the programme and the first study project, to clarify the above mentioned topics of the individual positions and expectations towards the course as well as to acquire basic knowledge about teamwork and design.

**Lecturers**
A. Grams Dietziker

### Number  115-0303-00L
#### Lecture Week 02: Spatial Planning: Function and Methods
*Only for MAS, DAS and CAS in Spatial Planning*

**Abstract**
Significant tasks for spatial development in the future involve the internal development of existing areas, the development of integrated solutions in cross-cutting areas of housing, transportation, and landscape as well as addressing transboundary tasks in the context of european and global perspectives; fundamental methods in spatial planning for exploring, clarifying and solving spatial tasks.

**Objective**
Aim of the course unit is the acquaintance and the comprehension of important tasks and principles in spatial planning; important methodical modules like assessment of the situation, concentration on important tasks as well as designing, decision-making and arguing are providing also a base for working on both study projects of the MAS programme.

**Lecturers**
B. Scholl

### Number  115-0315-00L
#### Lecture Week 03: Urban Planning and Urban Design I
*Only for MAS, DAS and CAS in Spatial Planning*

**Abstract**
Modern urban phenomena and their application to urban design as methods and tools. Lectures are accompanied by design exercises. They are used to project desirable futures and at the same time, they are thought experiments that investigate the qualities of the present reality.

**Objective**
Introduction in current problems and methods of urban design; insights in current tasks, discussions, projects and basic definitions of city, urban design and urban planning.

**Lecturers**
K. Christiaanse, S. Kretz

### Number  115-0337-00L
#### Lecture Week 04: Landscape Architecture
*Only for MAS, DAS and CAS in Spatial Planning*

**Abstract**
Information technology and its possibilities for the integration in design; drawing, model and video camera for application in methods for analysis, design and visualisation; recording and visualisation of landscape with geobased data; topology; the regulating power of landscape architecture for the current requirements on the ambient space.

**Objective**
Introduction in theory and methods of landscape architecture; illustration of a landscaping approach in urban planning; critical examination and reflection about landscape and tools as well as the objectives of its designers; providing fundamentals for a reflected understanding of design.

**Lecturers**
C. Girot, P. C. Fricker

### Number  115-0339-00L
#### Lecture Week 05: Landscape and Environmental Planning
*Only for MAS, DAS and CAS in Spatial Planning*

**Abstract**
Discussion of the proposition of sustainability in landscape and environmental planning; comprehending landscape development with a system dynamics approach; planning of landscape development across cantonal and communal boundaries; negotiating various stakeholder interests on the example of watercourse corridors; instruments and approaches for sustainable development of urban landscapes.

**Objective**
Overview of tasks of landscape and environmental planning as well as essential theories; insights in planning approaches and application of new instruments related to current problems for a sustainable landscape development.

**Lecturers**
A. Grit-Regamey

## Projects and Individual Work

### Number  115-0355-00L
#### Study Project 1 (Part 1)
*Only for MAS in Spatial Planning*

**Abstract**
Project 1 takes 2 semesters, continuation in the following spring semester, taking part 2 is obligatory.

Development of strategies for sustainable development in the City of Berne: spatial planning analysis of the situation (goals and problems, potentials and risks, strengths and weaknesses); concept design (goals and measures); program development (objective and temporal priorities); preparation for implementation (instruments and procedures), independent group work.

**Objective**
Detect, assess and classify the main conflicts of spatial developments and detect need for planning action. Concentrate resources and design and evaluate different solutions and demonstrate their feasibility exemplarily. Recognize possibilities and limits of formal and informal planning and applying them practically. Efficient and interdisciplinary work in groups, using individual knowledge and skills of group members optimally.

**Lecturers**

MAS in Sustainable Water Resources

The Master of Advanced Studies in Sustainable Water Resources is a 12 month full time postgraduate diploma programme. The focus of the programme is on issues of sustainability and water resources in Latin America, with special attention given to the impacts of development and climate change on water resources. The programme combines multidisciplinary coursework with high level research. Sample research topics include: water quality, water quantity, water for agriculture, water for the environment, adaptation to climate change, and integrated water resource management.

Language: English. Credit hours: 66 ECTS.

For further information please visit: http://www.ifu.ethz.ch/MAS_SWR

Urban Water Management
This course supports the course in Biological Wastewater Treatment (102-0217-00L). It is therefore advantageous to follow both courses simultaneously.

Abstract

Objective
The goal of this course is to provide the students with an understanding and the tools to develop their own mathematical models, to plan experiments, to evaluate error propagation and to test simple process control strategies in the field of process engineering in urban water management.

Content
The course will provide a broad introduction into the fundamentals of modeling water treatment systems. The topics are:
- Introduction into modeling and simulation
- The material balance equations, transport processes, transformation processes (kinetics, stoichiometry, conservation)
- Ideal reactors
- Hydraulic residence time distribution and modeling of real reactors
- Dynamic behavior of reactor systems
- Systems analytical tools: Sensitivity, parameter identification, error propagation, Monte Carlo simulation
- Introduction to process control (PID controller, fuzzy control)

Lecture notes
Copies of overheads will be made available.

Literature
There will be a required textbook that students need to purchase:

Sustainability Assessment

Objective
The course is seminar-like, interactive.

At the end of the course students should

Know:
- core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

Content
The course is structured as follows:
- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;
- Tradeoffs in selected examples.

Lecture notes
Handouts.

Literature
Selected scientific articles & book chapters

Process Engineering I (Biological Processes)

651-4031-00L Geographic Information Systems

Objective
Knowledge of the basic architecture and spatial data handling capabilities of geographic information systems.

Content
Theoretical introduction to the architecture, modules, spatial data types and spatial data handling functions of geographic information systems (GIS). Application of data modeling principles and geoprocessing capabilities using ArcGIS: Data design and modeling, data acquisition, data integration, spatial analysis of vector and raster data, particular functions for digital terrain modeling and hydrology, map generation and 3D-visualization.

Lecture notes
Introduction to Geographic Information Systems, Tutorial: Introduction to ArcGIS Desktop
Implementation of Environmental and other Sustainability Goals

**Abstract**
How to make sustainability operational - in industry, services and other organizations: You will learn how to put sustainability into practice by integrating environmental, social and economic aspects into organisations' management and processes. The course contains both a management view, as well as a sustainability view - and how to combine them.

**Objective**
To provide understanding of how sustainability can be made operational in an organisation. To do so, students will understand how to integrate sustainability thinking into the typical current organisational environment and processes, such as planning, implementing and controlling.

**Content**
We meet for five 3-hour-lectures, with discussions and case studies during course time. Additionally, small case studies in-between courses will be given at most course days.

Course topics are:
- Sustainable Development and its meaning for Management
- Management Standards for Sustainability (ISO and others)
- Sustainability Opportunities and Innovation
- Organisation and Implementation
- The concept of 'Continuous Improvement'
- Environmental Performance Measurement (Concepts, Standards, Methods)
- Life Cycle Costing, Life Cycle Management
- (Sustainable) Supply Chain Management
- Communication of Sustainability Issues

**Literature**
Course documentation as well as case study descriptions will be provided during the course via the "Ilias" repository.

**Prerequisites / notice**
If you have specific interests or questions, let me know at arthurb@ethz.ch. Maybe I can include your issues - or I can't :-)

**Seminar on Transdisciplinary Research for Sustainable Development**

**Abstract**
The seminar is designed for students and researchers (MA, PhD, PostDoc) who use inter- and transdisciplinary elements in their projects. It addresses the challenges of this research: How to integrate disciplines? How (and in what role) to include societal actors? How to bring results to fruition? We discuss these questions based on case studies and theories and on the participant's projects.

**Objective**
The participants understand the specific challenges of inter- and transdisciplinary research in general and in the context of sustainable development in particular. They know methods and concepts to address these challenges and apply them to their research projects.

**Content**
The seminar covers the following topics:
1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Involving stakeholders
4. Collaborating disciplines
5. Exploration of tools and methods
6. Analysing participants' projects to improve inter- and transdisciplinary elements

**Lecture notes / Literature**
There are two ways to approach the course's issues:

c) We will touch upon the hotel sustainable scheme and label "ibex" see: http://www.e2mc.com/images/stories/e2_bilder/downloads/Umweltfocus_d.pdf (for an english version, pls contact the lecturer at arthurb@ethz.ch).

**Prerequisites / notice**
The seminar is specifically suitable for PhD or PostDoc researchers. It is open to master students (minor "global change and sustainability") and further interested people, who preferably are preparing, or working on, a project/thesis.

**Electives**

**Abstract**

**Objective**
Consolidation of the basic procedures for design and operation of technical networks in water engineering.

**Content**
Demand Side Management versus Supply Side Management
Optimierung von Wasservernetzungen
Druckstösse
Kalkausfällung, Korrosion von Leitungen
Hygiene in Verteilsystemen
Siedlungshydrologie: Niederschlag, Abflussbildung
Instationäre Strömungen in Kanalisationen
Stofftransport in der Kanalisierung
Einleitbedingungen bei Regenwetter
Versickerung von Regenwasser
Generelle Entwässerungsplanung (GEP)

**Lecture notes / Prerequisites / notice**
Written material and copies of the overheads will be available.
Prerequisite: Introduction to Urban Water Management
The course provides the first part an introduction to the statistical software R for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

Objective
The students will be able to use the software R for simple data analysis.

Content
The course provides the first part an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

Lecture notes
An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

Prerequisites / notice
The course resources will be provided via the Moodle web learning platform. Please login (with your ETH (or other University) username+password) at https://moodle-app2.let.ethz.ch/enrol/users.php?id=1145

Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

Quantification and Modeling of the Cryosphere:
Dynamic Processes (University of Zurich)

Overview of the most important earth surface processes and landforms in cold regions (regions with glaciers and intense frost) with emphasis on high-mountain aspects. Discussion of present research challenges.

Knowledge of the most prominent climate-related geomorphological processes and phenomena in high-mountain regions, understanding of primary research challenges.

Erosion and sedimentation by glaciers as a function of topography, englacial temperature, sediment balance, sliding and melt water runoff. Processes and landforms in regions of seasonal and perennial frost (frost weathering, rock falls, debris cones/talus, solifluction, permafrost creep/rock glaciers, debris flows).

Glacial and periglacial geomorphodynamics in high-mountain regions. Ca. 100 pages.

Basic knowledge about geomorphology and glaciers/permafrost from corresponding courses at ETH/UZH or from the related lecture notes

Handouts will be distributed

Will be mentioned in handouts

Analysis of Climate and Weather Data

Observation networks and numerical climate and forecasting models deliver large primary datasets. The use of this data in practice and in research requires specific techniques of statistical data analysis. This lecture introduces a range of frequently used techniques, and enables students to apply them to and to properly interpret their results.

Introduction into the theoretical background and the practical application of methods of data analysis in meteorology and climatology.

Topics: exploratory methods, hypothesis tests, analysis of climate trends, measuring the skill of climate and forecasting models, analysis of extreme events, principal component analysis and maximum covariance analysis.

The lecture also provides an introduction into R, a programming language and graphics tool frequently used for data analysis in meteorology and climatology. During hands-on computer exercises the student will become familiar with the practical application of the methods.

Documentation and supporting material include:
- documented view graphs used during the lecture
- exercise sets and solutions
- R-packages with software and example datasets for exercise sessions

All material is made available via the lecture web-page.
Powerpoint slides will be made available.

During this course you will get an overview of the world’s typical freshwater ecosystems. After this course you will be able to understand:

- habitats of freshwaters.
- ecological and evolutionary patterns, biotic interactions, and conceptual paradigms in freshwater ecosystems. Important aspects regarding ecosystem metabolism and habitat properties of freshwaters. Applied case studies and experiments testing ecological and evolutionary processes in freshwater ecosystems. The lectures are given by Piet Spaak (Eawag), Florian Altermatt (UNI, Eawag), Tom Gonser (Eawag), Katja Räsänen (Eawag) and Chris Robinson (Eawag), specialists from the Aquatic Ecology department of Eawag and University of Zurich.

Practical part:
- The practical part contains 1-day excursions to a lake (Greifensee) and rivers (Sense, Töss) as well as research projects in small groups.
- The practical part includes an assessment of the ecological state of lake Greifensee and the streams Glatt and Chriesbach. On this practical part you will work with survey methods used in research and practice.

Lecture notes:
- Course notes and power point presentations provided during the course.
- This course can only be taken together with "701-1437-01 Bestimmungskurs aquatische Makroinvertebraten" and "701-1437-02 Bestimmungskurs aquatische Mikroinvertebraten und Kryptogamen".

The maximal participating number of students is 8 from D-USYS and 14 from D-BIOL (ETH & UNI). Registration for the course until Thu 10.9.2015, free places will be distributed Fri 11.9.2015. The course includes a mandatory field trip to the Sense River floodplain. It will take place Saturday, September 26.

Suggested literature:
Content

Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional management has frequently resulted in catastrophic failures such as, for example, the collapse of fish stocks and biodiversity loss. These failures have stimulated the development of alternative ecosystem management approaches that emphasise the functionality of human-dominated systems. Inherent to such approaches are system-wide perspectives and a focus on ecological processes and services, multiple spatial and temporal scales, as well as the need to incorporate diverse stakeholder interests in decision making. Thus, ecosystem management is the science and practice of managing natural resources, biodiversity and ecological processes, to meet multiple demands of society. It can be local, regional or global in scope, and addresses critical issues in developed and developing countries relating to economic and environmental security and sustainability.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

701-0727-00L Politics of Environmental Problem Solving in Developing Countries

Abstract

The course focuses on processes and drivers of decision-making on natural resources management issues in developing countries. It gives insights into the relevance of ecological aspects in developing countries. It covers concepts, instruments, processes and actors in environmental politics at the example of specific environmental challenges of global importance.

Objective

After completion of the module, students will be able to:
- Identify and appraise ecological aspects in development cooperation, development policies and developing countries’ realities
- Analyze the forces, components and processes, which influence the destiny, the implementation and the outcome of ecological measures
- Characterize concepts, instruments and drivers of environmental politics and understand, how policies are shaped, both at national level and in multilateral negotiations
- Study changes (improvements) in environmental politics over time as the result of the interaction of processes and actors, including international development organizations

Content

Key issues and basic concepts related to environmental politics are introduced. Then the course predominantly builds on case studies, providing information on the context, specifying problems and potentials, describing processes, illustrating the change management, discussing experiences and outcomes, successes and failures. The analysis of the cases elucidates factors for success and pitfalls in terms of processes, key elements and intervention strategies.

Different cases not only deal with different environmental problems, but also focus on different levels and degrees of formality. This ranges from local interventions with resource user groups as key stakeholders, to country level policies, to multi- and international initiatives and conventions. Linkages and interaction of the different system levels are highlighted. Special emphasis is given to natural resources management.

The cases address the following issues:
- Land use and soil fertility enhancement: From degradation to sustainable use
- Common property resource management (forest and pasture): Collective action and property rights, community-based management
- Ecosystem health (integrated pest management, soil and water conservation)
- Payment for environmental services: Successes in natural resources management
- Climate change and agriculture: Adaptation and mitigation possibilities
- Biodiversity Convention: Implications for conservations and access to genetic resources
- Biodiversity as a means for more secure livelihoods: Agroforestry and intercropping
- The Millennium Development Goals: Interactions between poverty and the environment
- Poverty and natural resources management: Poverty reduction strategies, the view of the poor themselves
- Food security: Policies, causes for insecurity, the role of land grabbing
- Biofuels and food security: Did politics misfire?
- Strategy development at global level: IAASTD and World Development Report 2008

Lecture notes

Information concerning the case studies and specific issues illustrated therein will be provided during the course (uploaded on Moodle)

Literature

Prerequisites / notice

The performance assessment will consist of an individual essay to be written by each student based on at least five references in addition to the sources provided in the course. Students can choose from a list of topics. Criteria for assessment will be communicated at the beginning of the course.

701-0535-00L Environmental Soil Physics/Vadose Zone Hydrology

Abstract

The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

Objective

Students are able to
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media,
- quantify driving forces and resulting fluxes of water, solute, and heat in soils.
- apply modern measurement methods and analytical tools for hydrological data collection
- conduct and interpret a limited number of experimental studies
- explain links between physical processes in the vadose-zone and major societal and environmental challenges.
Weeks 1 to 3: Physical Properties of Soils and Other Porous Media. Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior.

Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity.

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing.

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:
Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.

Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.

Part 2 - Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.
Midterm exam

Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.

Part 3 - Use of Hydrus model for simulation of unsaturated flow.

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients, small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils. Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.

Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:

Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

Biological Processes in the Vadose Zone - An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.

Lecture notes
Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller (available at the beginning of the semester)

102-0617-00L Basics and Principles of Radar Remote Sensing for Environment Applications

W 3 credits 2G I. Hajnsek

Abstract
The course will provide the basics and principles of Radar Remote Sensing (specifically Synthetic Aperture Radar (SAR)) and its imaging techniques for the use of environmental parameter estimation.

Objective
The course should provide an understanding of SAR techniques and the use of the imaging tools for bio/geophysical parameter estimation. At the end of the course the student has the understanding of:
1. SAR basics and principles,
2. SAR polarimetry,
3. SAR interferometry and
4. environmental parameter estimation from multi-parametric SAR data.

Content
The course is giving an introduction into SAR techniques, the interpretation of SAR imaging responses and the use of SAR for different environmental applications. The outline of the course is the following:
1. Introduction into SAR basics and principles
2. Introduction into electromagnetic wave theory
3. Introduction into scattering theory and decomposition techniques
4. Introduction into SAR interferometry
5. Introduction into polarimetric SAR interferometry
6. Introduction into bio/geophysical parameter estimation (classification/segmentation, soil moisture estimation, earth quake and volcano monitoring, forest height inversion, wood biomass estimation etc.)

Lecture notes
Handouts for each topic will be provided

Literature
First readings for the course:
Complete literature listing will be provided during the course.

Prerequisites / notice
This course in combination with 102-0627-00-G: Applied Radar Remote Sensing for Environmental Parameter Estimation is providing a profound basis for independent data analysis. It is recommended to take both courses together.

401-0649-00L Applied Statistical Regression

W 5 credits 2V+1U M. Dettinger

Abstract
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life.

Objective
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.
The course starts with the basics of linear regression modeling, and then proceeds to parameter estimation, tests and confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, categorical input variables, shrinkage and general modeling strategies.

The last third of the course is dedicated to an introduction into generalized linear regression models: this includes logistic regression for binary response variables, Poisson regression for count data, cumulative logit models for ordered, and multinomial regression for categorical response variables.

### Lecture notes
A script will be available.

### Literature
- Faraway (2005): Linear Models with R
- Faraway (2006): Extending the Linear Model with R
- Draper & Smith (1998): Applied Regression Analysis
- Fox (2008): Applied Regression Analysis and GLMs
- Montgomery et al. (2006): Introduction to Linear Regression Analysis

### Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

#### Mountain Forest Hydrology
- **Course Code:** 701-1644-00L
- **Title:** Mountain Forest Hydrology
- **W 5 credits 3G J. W. Kirchner**
- **Abstract:** This course presents a process-based view of the hydrology, biogeochemistry, and geomorphology of mountain streams. Students learn how to integrate process knowledge, data, and models to understand how landscapes regulate the fluxes of water, sediment, nutrients, and pollutants in streams, and to anticipate how streams will respond to changes in land use, atmospheric deposition, and climate.
- **Objective:** Students will have a broad understanding of the hydrological, biogeochemical, and geomorphological functioning of mountain catchments. They will practice using data and models to frame and test hypotheses about connections between streams and landscapes.
- **Content:** Streams are integrated monitors of the health and functioning of their surrounding landscapes. Streams integrate the fluxes of water, solutes, and sediment from their contributing catchment area; thus they reflect the spatially integrated hydrological, ecophysiological, biogeochemical, and geomorphological processes in the surrounding landscape. At a practical level, there is a significant public interest in managing forested upland landscapes to provide a reliable supply of high-quality surface water and to minimize the risk of catastrophic flooding and debris flows, but the scientific background for such management advice is still evolving.

Using a combination of lectures, field exercises, and data analysis, we explore the processes controlling the delivery of water, solutes, and sediment to streams, and how those processes are affected by changes in land cover, land use, and climate. We review the connections between process understanding and predictive modeling in these complex environmental systems. How well can we understand the processes controlling watershed-scale phenomena, and what uncertainties are unavoidable? What are the relative advantages of top-down versus bottom-up approaches? How much can "black box" analyses reveal about what is happening inside the black box? Conversely, can small-scale, micro-mechanistic approaches be successfully "scaled up" to predict whole-watershed behavior? Practical problems to be considered include the effects of land use, atmospheric deposition, and climate on streamflow, water quality, and sediment dynamics, illustrated with data from experimental watersheds in North America, Scandinavia, and Europe.

**Lecture notes:** Handouts will be available as they are developed.

**Literature:** Recommended and required reading will be specified at the first class session (with possible modifications as the semester proceeds).

#### Numerical Modelling in Fluvial Hydraulics and River Engineering
- **Course Code:** 101-0269-00L
- **Title:** Numerical Modelling in Fluvial Hydraulics and River Engineering
- **W 3 credits 2G D. F. Vetsch, A. Siviglia**
- **Abstract:** The basics of numerical modelling of fluvial hydraulics and river engineering problems are presented. The governing equations for flow and sediment transport in open channels and corresponding numerical solution strategies are introduced. The theoretical parts are discussed by examples.
- **Objective:** Get to know possibilities and limitations of numerical modelling in fluvial hydraulics and river engineering.
- **Content:**
  - Governing equations and modelling approaches
  - Initial and boundary conditions
  - Simulation process and grid generation
  - Numerical methods: basics, accuracy and stability
  - Examples of numerical schemes, 1D and 2D models
- **Lecture notes:** Slides of lecture are available for download as PDF. Supplementary material will be provided during lecture.
- **Literature:** Relevant books and citations will be mentioned.
- **Prerequisites / notice:** Exercises are based on the simulation software BASEMENT (www.basement.ethz.ch), the open-source GIS Qgis (www.qgis.org) and code examples written in MATLAB. The applications comprise one- and two-dimensional approaches for the modelling of flow and sediment transport.

**Requirements:** Hydraulics I, Numerical Hydraulics, Hydraulic Engineering I and II, River Engineering (Flood defense management). MATLAB programming skills would be an advantage.

**Abstract:** Students propose relevant research topics from their home countries, or from Latin American research projects, around which individual study programmes are devised, and on which they write their thesis. The Master thesis is supervised by scientific staff at ETH and collaborating institutions, and is based on the student's academic or professional experience.

**Objective:** The Master Thesis research takes place throughout the duration of the MAS Programme (12 months), complemented by Master level coursework and Seminars focusing on Water Resources and Sustainability. Students become familiar with new research techniques, and receive guidance from experts. The topic of the research should address a relevant water resources problem in the student's home country, and is aimed at enhancing collaboration between academics and professionals in Latin America and in Switzerland.

### Abstract

The MAS programme is structured around an investigation of transforming urban conditions as they pertain to global phenomena, and the development of practical tools for operating within such domains.

### Objective

The programme aims at developing a culture of urban research and design that will enable the participant to actively engage in envisioning future urban scenarios. Secondly, a strong emphasis is put on methodology, process design and communication in order to prepare for the interdisciplinary negotiating agenda of the urban designer as future member of professional design offices, academic research teams, public services or communication agencies.

### Content

Each year, the MAS studio will focus on two specific topics of urban research and two existing sites on which to intervene in the form of two design research studios. The sites are preferably territories under development pressure with existing groups of urban actors to engage with.

**Abstract**

Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. The module provides an overview of the principles of management, teaches knowledge about management that is highly complementary to the students' technical knowledge, and provides a basis for advancing the knowledge of the various subjects offered at D-MTEC.

**Objective**

Discovering Management offers an integrated learning system, which combines in an innovative format a set of lectures, an advanced business game simulation and a set of group exercises involving industry speakers (ranging from leading venture capitalists to executives at established corporations). Unlike more traditional courses, the learning model for Discovering Management involves 'learning by doing'. While the 13 different lectures, in-class discussions and assigned readings provide the theoretical and conceptual foundations, the experiential learning outcomes result from the interrelated group activities: 1) the interactive case studies and exercises, 2) the business game simulation.

By covering key aspects of entrepreneurial management, the purpose of the course is to advance students' understanding of factors driving company success, where success is understood as a broad construct including financial return, employee, customer and supplier satisfaction as well as social and ecological responsibility.

Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Entrepreneurial Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich. No prior knowledge of business or economics is required to successfully complete this course.

**Content**

The lectures for Discovering Management are designed to broaden the participant's understanding of the principles of entrepreneurial management, emphasizing the interdependence of various specialties in the development and management of a firm. For this reason, the lectures are structured on the basis of a coherent business model and will be presented by the respective area specialists at D-MTEC. The lectures broaden the view and the understanding of technology by interlinking it with society. Corporate sustainability, for example, introduces economic, ecological and social issues that are relevant to all engineering disciplines. Practical examples stimulate the students to assess these issues and be aware of their responsibilities as engineers. Technology and innovation management, to mention a second example, focuses on the interplay of technical and organizational change, and how these often neglected interactions explain why many new technologies are never used. It fosters the students' ability to see the business and social consequences of their 'technical' decisions. Critical skills will be trained by the case study exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of the decision maker, as they learn more about the specific case and identify the challenge they are faced with. Students will be presented real case scenarios by industry guests from established corporations and will have to critically analyze specific issues. The case study exercise will provide an insight into the context of a managerial problem-solving and enhance the participant's appreciation for the complex tasks companies deal with.

**Prerequisites / notice**

Discovering Management attempts to overcome the limitations of traditional teaching curricula of management in technical universities, which often merely focus on transferring specific skills to students, e.g. planning or forecasting. In response to the new challenges for entrepreneurial decision-making, students will be offered the opportunity to actively engage in an advanced business game simulation; a business game that establishes a link between business management theory and business management in practice. The simulation presents a realistic model of a company and provides participants with the opportunity to quickly gain the lasting effects of practical experience in a risk-free environment. All this provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyze the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities.

Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Business Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich.

No prior knowledge of business or economics is required to successfully complete this course.

**Abstract**

This course is offered complementary to the basis course 351-0778-00L, "Discovering Management". The course offers additional exercises and case studies.

**Objective**

The course is offered to complement the course 351-0778-00L. The course offers additional exercises and case studies.

**Content**

The course offers additional exercises and case studies concerning:

- Strategic Management: Technology and Innovation Management; Operations and Supply Chain Management; Finance and Accounting; Marketing and Sales.
- Critical skills will be trained by the case study exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of the decision maker, as they learn more about the specific case and identify the challenge they are faced with.

**Abstract**

The course introduces the students to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through their own case they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies.

**Objective**

The course includes both lectures and exercises alternately. The goal is to understand the opportunity of user innovation for management and develop strategies to harness the value of user-developed ideas and contributions for firms and other organizations.

The students actively participate in discussions during the lectures and contribute presentations of case studies during the exercises. The combination should allow to compare theory with practical cases from various industries.

The course presents and builds upon recent research and challenges the students to devise innovation strategies that take into account the availability of user expertise, free and public knowledge, and the interaction with communities that span beyond one organization.

Grading is based on the final exam, the class presentations (including the slides) as well as class participation.
This course on user innovation extends courses on knowledge management and innovation as well as marketing. The students are introduced to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies. Theoretical underpinnings taught in the course include models of innovation, the structuration of technology, and an introduction to entrepreneurship.

Abstract
Managerial Economics applies economic theory and methods to business and economic decision-making. Economic ideas related to optimization, the theory of consumer demand, the theory of the firm, industrial organization and decision making under uncertainty are studied using methods of numerical analysis, statistical estimation, game theory and constrained optimization.

Objective
The objective of the course is to provide undergraduate and graduate students in MAVT with an understanding of the use of economic concepts for firm-level management decisions. The course covers a number of models and methods of analysis which are commonly employed in business decisions. The course covers the economic theory of choice, models of oligopoly and industrial organization, applications of game theory to contract design and agency theory, and the theory of decision making under uncertainty focusing specifically on long-term investment decisions. The course will include three lectures by Professor Volker Hoffman focusing on related case-studies in management.

Literature
Mikroökonomie (Pearson Studium - Economic VWL) Gebundene Ausgabe, August 2013, Robert S. Pindyck, Dr. Daniel L. Rubinfeld.

Prerequisites / notice
The course acquaints students who have previous not studied economics to economic concepts and quantitative methods which can be used to solve management decision problems.

<td></td>
<td></td>
<td>This course is an introduction to the critical management skills involved in planning, structuring, controlling and leading an organization. We develop a 'systemic' view of organizations. We look at organizations as part of an industry context, which is affected by different elements like strategy, structure, culture, tasks, people and outputs. We consider how managerial decisions are made in any one of these domains affect decisions in each of the others.</td>

| 363-0387-00L   | Corporate Sustainability            | W+   | 3    | 2G    | V. Hoffmann                 |
|                | **Abstract**                        |      |      |       | We introduce the concept of corporate sustainability; discuss its implications focusing on strategy, technology, and financial markets; and offer e-modules to train relevant critical thinking skills. With this input, students explore the practical challenges of corporate sustainability in a group project, focusing on one of the four sustainability challenges of water, energy, mobility, and food. |
|                | **Objective**                       |      |      |       | Understand the limits and the potential of corporate sustainability for sustainable development |
|                | **Content**                         |      |      |       | Develop critical thinking skills that are useful for corporate sustainability (argumentation, communication, evaluative judgment) |
|                | **Lecture notes**                   |      |      |       | Be able to recognize and realize opportunities for corporate sustainability in a business environment |
|                | **Literature**                      |      |      |       | Overview of the grand sustainability challenges of Water, Energy, Mobility, and Food |
|                | **Literature**                      |      |      |       | Business implications of sustainable development, in particular for corporate strategy, marketing & leadership, technology & innovation, and financial markets. |
|                | **Literature**                      |      |      |       | Critical thinking skills for corporate sustainability |
|                | **Literature**                      |      |      |       | In-depth case study of concrete corporate sustainability challenge in the group project phase, such as: How to deal with environmental pressure groups? How to use the strengths of business to solve pressing sustainability problems? How to catalyze radical innovations for sustainability? How to invest money in a sustainable way? |
|                | **Lecture notes**                   |      |      |       | Presentation slides will be distributed prior to lectures. Literature recommendations will be distributed during the lecture |

| 363-0392-00L   | Strategic Management                | W+   | 3    | 2G    | G. von Krogh                |
|                | **Abstract**                        |      |      |       | Due to didactic reasons originating from the case based approach, the number of participants is limited to 80. Registration through myStudies (first come, first served). If you are unable to sign up through myStudies, please contact the course assistant. |
|                | **Objective**                       |      |      |       | This courses conveys concepts and methods in strategic management, with a focus on competitive strategy. Competitive strategy aims at improving and establishing position of firms within an industry. |
|                | **Content**                         |      |      |       | The lecture "strategic management" is designed to teach relevant competences in strategic planning and -implementation, for both professional work-life and further scientific development. The course provides an overview of the basics of strategy and the most prevalent concepts and methods in strategic management. The course is given as a combination of lectures about concepts/methods, and case studies where the students asked to solve strategic issues of the case companies. In two sessions, the students will also be addressing real-time strategic issues of firms that are represented by executives. |
|                | **Prerequisites / notice**           |      |      |       | Contents: a. Introduction to strategy b. Industry dynamics I: Industry analysis c. Industry dynamics II: Analysis of technology and innovation d. The resource-based theory of the firm e. The knowledge-based theory of the firm |
|                | **Prerequisites / notice**           |      |      |       | Session #0: (September 29) Organizational Issues & How to Solve a Case Session #1: (October 6) Introduction Session #2: (October 13) Industry Dynamics I Session #3: (October 27) Guest Lecture Session #4: (November 3) Industry Dynamics II Session #5: (November 10) Resource-Based Theory Session #6: (November 24) Knowledge-Based Theory Session #7: (December 1) Guest Lecture |
|                | **Prerequisites / notice**           |      |      |       | For participants of the MAS-MTEC program we offer a comlimentary course Practicing Strategy in which students will apply the concepts of Strategic Management to their real-life contexts and organizations. Please register simultaneously for both courses if you want to take part in this course. For more information please see: http://www.smi.ethz.ch/education/practicing-strategy.html |

**363-0403-00L** Introduction to Marketing  
W+ 3 credits 2G  
F. von Wangenheim
The course is designed to convey a profound understanding of marketing's role in modern firms, its interactions and interfaces with other disciplines, its main instruments and recent trends. Particular attention is given to emerging marketing concepts and instruments, and the role of marketing in technology firms.

The lecture features a short tutorial that is held at irregularly spaced intervals throughout the semester (approximately every third week). The tutorial is embedded within the lecture and consists of short sessions of about 30 minutes. It serves to illustrate theoretical and methodological concepts from the lecture by walking students through the analysis of real-world data from the telecommunications industry. The case data will be provided so that students practice and apply the concepts of the lecture on their own. The tutorial is held jointly by a Teaching Assistant (S.N. Brüggemann) and the professor (Prof. F. v. Wangenheim).

For the lecture students will get access to one of the leading online teaching platforms (called edX) also offered by other top universities (incl. MIT, Harvard, Berkeley, etc.). Using the edX platform, will allow students to collaborate in online discussions, solve online exercises and present a short educational video as part of a group project.

Key Topics:
- Business model innovation; (digital) business model patterns; business value of IT; the concept of integration; transaction cost perspective;
- network economics perspective; essentials and impact of web 2.0, internet of things, mobile computing, market places, social analytics and big data; IT governance and portfolio management; entrepreneurship in the digital space, etc.

### Literature

Weekly readings, distributed in class (via Moodle)

### 363-0421-00L

**Management Information Systems**

<table>
<thead>
<tr>
<th>W+</th>
<th>3 credits</th>
<th>2G</th>
<th>E. Fleisch</th>
</tr>
</thead>
</table>

**Abstract**

This lecture provides a theory- and practice-based understanding of how today's information technologies enable new digital business models and disrupt existing markets.

**Objective**

A. After the lecture, the student is able to evaluate digital business models from different angels, including theory-based views:

- Definition and classification of business models
- Digital business model patterns
- Theoretical frameworks that explain why and how digital business models function
- Impact of digital business model patterns on P&L and balance sheet

Students know how to measure & evaluate investments into the digital space as

- a decision maker in an established company (should I invest in project A or B?)
- an entrepreneur (should I pursue this venture?)
- an investor (should I invest in start-up xy?)

B. The student knows different tools to design digital business model patterns.

Ubber, Airbnb, Nest and Jawbone - A wide range of innovative companies exist, which successfully implemented ICT enabled business models and continue to grow at a rapid pace. Examples, illustrating how digitalization, including the “Internet of Things” currently fosters business model innovation across various industries. This course is designed to help students to understand and critically assess such newly emerging (digital) business models.

For the lecture students will get access to one of the leading online teaching platforms (called edX) also offered by other top universities (incl. MIT, Harvard, Berkeley, etc.). Using the edX platform, will allow students to collaborate in online discussions, solve online exercises and present a short educational video as part of a group project.

Key Topics:
- Business model innovation; (digital) business model patterns; business value of IT; the concept of integration; transaction cost perspective;
- network economics perspective; essentials and impact of web 2.0, internet of things, mobile computing, market places, social analytics and big data; IT governance and portfolio management; entrepreneurship in the digital space, etc.

**Logistics, Operations and Supply Chain Management I**

<table>
<thead>
<tr>
<th>W+</th>
<th>3 credits</th>
<th>2G</th>
<th>P. Schönsleben, E. Scherer Gasanova</th>
</tr>
</thead>
</table>

**Abstract**

Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

**Objective**

An effective and efficient flow of goods, data, and control in and between companies contributes significantly to the value added for the customer. Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

**Content**

Strategic and tactical concepts in logistics, operations, and supply chain management: Conflicts of objectives and strategies and in the entrepreneurial context; business process analysis and fundamental logistics concepts; the MRP II / ERP concept: business processes and methods; the lean / just-in-time and repetitive manufacturing; concepts for product families and one-of-a-kind production; concepts for the process industry.

**Lecture notes**

This book also serves as textbook for LOS II (spring term) as well as ERP and SCM software systems (autumn term). In addition powerpoint-handouts and documents for case studies.

Sales at 17.9.15, from 12:45, before and during brakes of the first lecture.

**Literature**

As for the lecture of the 3rd week (BEMAD, a much-liked Business Engineering and Management Ability Development game), this lecture (of Oct. 1) will follow a specific schedule in specific rooms. The schedule will be presented at Sept. 17 during the 1st lecture.

Due to the big number of students, about half of the students will play this game, instead of Oct. 1, at Friday afternoon, Oct. 2. Please be available. Thank you for your help in this matter.

### 363-0453-00L

**Strategic Supply Chain Management**

<table>
<thead>
<tr>
<th>W+</th>
<th>3 credits</th>
<th>2G</th>
<th>S. Wagner</th>
</tr>
</thead>
</table>

**Abstract**

The course offers an introduction to the theory and practice of supply chain management. Students will learn how to develop supply chain strategies and supply chain networks based on firms competitive strategies and marketing priorities.

**Objective**

The task of designing and managing supply chains requires that managers apply strategic, decision making and leadership skills in a supply chain context. The goal of this course is to develop and practice these skills.
The course provides an introduction to operations research methods in the fields of management science and economics. Requisite

Finding solutions: what is complexity, problem solving cycle.

Implementing solutions: project management, critical path method, quality control feedback loop.

Controlling solutions: Vensim software, feedback cycles, control parameters, instabilities, chaos, oscillations and cycles, supply and demand, production functions, investment and consumption

A successful participant of the course is able to:
- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyse the stability of non-linear dynamical systems and apply this to macroeconomic dynamics

The course includes the following main topics:

PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Students (at least in groups of two) must bring a laptop with MS Excel and the Excel Solver installed to class.
Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and international aspects of resource and environmental economics.

Complementary:

363-0537-00L Resource and Environmental Economics W+ 3 credits 2G

Abstract
Relationship between economy and environment, market failure, external effects and public goods, contingent valuation, internalisation of externalities; economics of non-renewable resources, economics of renewable resources, cost-benefit analysis, sustainability, and international aspects of resource and environmental economics.

Objective
Understanding of the basic issues and methods in resource and environmental economics; ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

Topics are:
Introduction to resource and environmental economics
Importance of resource and environmental economics
Main issues of resource and environment economics
Normative basis
Utilitarianism
Fairness according to Rawls
Economic growth and environment
Externalities in the environmental sphere
Governmental internalisation of externalities
Private internalisation of externalities: the Coase theorem
Free rider problem and public goods
Types of public policy
Efficient level of pollution
Tax vs. permits
Command and Control Instruments
Empirical data on non-renewable natural resources
Optimal price development: the Hotelling-rule
Effects of exploration and Backstop-technology
Effects of different types of markets.
Biological growth function
Optimal depletion of renewable resources
Social inefficiency as result of over-use of open-access resources
Cost-benefit analysis and the environment
Measuring environmental benefit
Measuring costs
Concept of sustainability
Technological feasibility
Conflicts sustainability / optimality
Indicators of sustainability
Problem of climate change
Cost and benefit of climate change
Climate change as international ecological externality
International climate policy: Kyoto protocol
Implementation of the Kyoto protocol in Switzerland

Content
Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

Literature

For students taking only the course 'Principles of Microeconomics' there is a shorter version of the same book:

363-0565-00L Principles of Macroeconomics W+ 3 credits 2V

Abstract
This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation. What significance do international economic relations have for Switzerland?

Objective
This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to everyday economic problems.

Content
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer. Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society’s resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? What is the best way to protect the environment? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers,

Literature

We advise you to also buy access to Aplia. This internet platform will support you in learning for this course. To save money, you should buy the book together with Aplia. This is sold as a bundle (ISBN: 9781473715998).

Besides this textbook, the slides and lecture notes will cover the content of the lecture and the exam questions.

1. Introduction to empirical management research

This course focuses on the analysis of innovation as a pervasive process that cuts across organizational and functional boundaries. It looks at technology and innovation management as a process. Organizations are faced with a fundamental question: how do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, guest speakers, simulations, and group work.

- Understand the different procedures involved in the accounting system
- Record change in financial position
- Prepare final accounts
- Understand the principles of cost accounting
- Calculate the different product costs
- Make decisions about the acceptance or rejection of a particular product

Content

Financial Accounting: Balance sheet, income statement, double-entry accounting, journal and ledger, accounting for merchandising activities, value-added tax, adjustments before final accounts, provisions, depreciation, valuation, and full and variable costing system.

Managerial Accounting: Full costing, variable costing, cost-volume-profit, break-even analysis, activity-based costing

Abstract

Overview of financial and managerial accounting
- Accounting for current and fixed assets
- Liabilities and owners equity
- Recording change in balance sheet
- Measuring financial performance
- Managing financial reporting
- Using accounting information for decision making purposes

Objective

Understand the different procedures involved in the accounting system
- Record change in financial position
- Prepare final accounts
- Understand the principles of cost accounting
- Calculate the different product costs
- Make decisions about the acceptance or rejection of a particular product

Prerequisites / notice

This course is a prerequisite for the course Financial Management.

3. Semester, Core Courses

</tr>
</tbody>
</table>

Abstract

Evidence-based management requires valid empirical research. In this course, students will learn the basics of research design, fundamentals of data collection and statistical methods to analyze the data acquired in social science research. Students are expected to apply their knowledge in class discussions and out-of-class assignments.

Objective

- Ability to formulate research questions and designing an appropriate study
- Ability to collect and analyze data using a variety of methods
- Ability to critically assess the quality of empirical research in management
- Applied knowledge of empirical methods through out-of-class assignments

Content

1) Introduction to empirical management research
2) Research designs: exploratory, descriptive, experimental
3) Measurement and scaling
4) Data collection and sampling
5) Data analysis methods
6) Reporting and presenting empirical research

Assignments and projects: This course includes out-of-class assignments and projects to give students some hands-on experience in conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Students will have at least one week to work on each assignment. Students are expected to work on these assignments individually. Duplicate answers will receive no credit and will be subject to a disciplinary review. Assignments will be graded and need to be turned in on time. Exemplary answers to the assignments will be posted online after the submission date for students to review. Some assignments will also be discussed in class.

Class participation: Class participation is encouraged and can greatly improve students’ learning in this class. Class participation will not be graded; however, it will be considered favorably if a student is between grades. Note, however, that quality is more important than quantity.

In this spirit, students are expected to attend class regularly and come to class prepared.

Prerequisites / notice

No specific background in economics or management is required.

363-0389-00L | Technology and Innovation Management | W+   | 3    | 2G    | S. Brusoni |

Abstract

This course focuses on the analysis of innovation as a pervasive process that cut across organizational and functional boundaries. It looks at the sources of innovation, at the tools and techniques that organizations deploy to routinely innovate, and the strategic implications of technical change.

Objective

This course intends to enable all students to:
- Understand the core concepts necessary to analyze how innovation happens
- Master the most common methods and tools organizations deploy to innovate
- Develop the ability to critically evaluate the innovation process, and act upon the main obstacles to innovation

Content

This course looks at technology and innovation management as a process. Continuously, organizations are faced with a fundamental decision: they have to allocate resources between well-known tasks that reliably generate positive results; or explore new ways of doing things, new technologies, products and services. The latter is a high risk choice. Its rewards can be high, but the chances of success is small.

How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, guest speakers, simulations, and group work.

Lecture notes

Slides will be available on the TIMGROUP website.

Literature

Readings will be available on the TIMGROUP website.

363-0561-00L | Financial Market Risks | W+   | 3    | 2G    | D. Sornette |

Abstract

I aim to introduce students to the concepts and tools of modern finance and to make them understand the limits of these tools, and the many problems met by the theory in practice. I will put this course in the context of the on-going financial crises in the US, Europe, Japan and China, which provide fantastic opportunities to make the students question the status quo and develop novel solutions.
Objective

The course explains the key concepts and mechanisms of financial economics, their depth and then stresses how and why the theories and models fail and how this is impacting investment strategies and even a global view of citizenship, given the present developing crises in the US since 2007 and in Europe since 2010.

- Development of the concepts and tools to understand these risks and master them.
- Working knowledge of the main concepts and tools in finance (Portfolio theory, asset pricing, options, real options, bonds, interest rates, inflation, exchange rates)
- Strong emphasis on challenging assumptions and developing a systemic understanding of financial markets and their many dimensional risks

Content

1- The Financial Crises: what is really happening? Historical perspective and what can be expected in the next decade(s). Bubbles and crashes. The illusion of the perpetual money machine.

2- Risks in financial markets
- What is risk?
- Measuring risks of financial assets
- Introduction to three different concepts of probability
- History of financial markets, diversification, market risks

3- Introduction to financial risks and its management.
- Relationship between risk and return
- Portfolio theory: the concept of diversification and optimal allocation
- How to price assets: the Capital Asset Pricing Model
- How to price assets: the Arbitrage Pricing Theory, the factor models and beyond

4- Financial markets: role and efficiency
- What is an efficient market?
- Financial markets as valuation engines: exogeneity versus endogeneity (reflectivity)
- Deviations from efficiency, puzzles and anomalies in the financial markets
- Financial bubbles, crashes, systemic instabilities

5- An introduction to Options and derivatives
- Calls, Puts and Shares and other derivatives
- Financial alchemy with options (options are building blocks of any possible cash flow)
- Determination of option value; concept of risk hedging

6- Valuation and using options
- A first simple option valuation model
- The Binomial method for valuing options
- The Black-scholes model and formula
- Practical examples and implementation
- Realized prices deviate from these theories; volatility smile and real option trading
- How to imperfectly hedge with real markets?

7- Real options
- The value of follow-on investment opportunities
- The timing option
- The abandonment option
- Flexible production
- Conceptual aspects and extensions

8- Government bonds and their valuation
- Relationship between bonds and interest rates
- Real and nominal rates of interest
- Term structure and Yields to maturity
- Explaining the term structure
- Different models of the term structure

9- Managing international risks
- The foreign exchange market
- Relations between exchanges rates and interest rates, inflation, and other economic variables
- Hedging currency risks
- Currency speculation
- Exchange risk and international investment decisions

Good work design is crucial for individual and company effectiveness and a core element to be considered in organizational change. Meaning of work, organization-technology interaction, and uncertainty management are discussed with respect to work design and sustainable organizational change. As course project, students learn and apply a method for analyzing and designing work in business settings.
Objective
- Know effects of work design on competence, motivation, and well-being
- Understand links between design of individual jobs and work processes
- Know basic processes involved in systematic organizational change
- Understand the interaction between organization and technology and its impact on organizational change
- Understand relevance of work design for company performance and strategy
- Know and apply methods for analyzing and designing work

Content
- Work design: From Adam Smith to job crafting
- Effects of work design on performance and well-being
- Approaches to analyzing and designing work
- Modes of organizational change and change methods
- Balancing stability and flexibility in organizations as design criterion
- The organization-technology interaction and its impact on work design and organizational change
- Example Flexible working arrangements
- Strategic choices for work design

Literature
A list of required readings will be provided at the beginning of the course.

Prerequisites / notice
The course includes the completion of a course project to be conducted in groups of four students. The project entails applying a particular method for analyzing and designing work processes and is carried out by means of interviews and observations in companies chosen by the students.

363-0311-00L Psychological Aspects of Risk Management and Technology
Objective
- Understand basic components of risk management in organizations
- Know and apply methods for risk identification/evaluation, risk mitigation, risk communication
- Know psychological and organizational processes for managing uncertainty
- Apply theoretical foundations to applied issues such as safety management, regulatory activities, and technology design and implementation in different domains (e.g., transport systems, IT, insurance)

Content
The syllabus includes the following topics:

- Elements of risk management
  - Risk identification and evaluation
  - Risk mitigation
  - Risk communication
- Psychological and organizational concepts relevant in risk management
  - Decision-making under uncertainty
  - Risk perception
  - Resilient organizational processes for managing uncertainty
- Case studies on different elements of risk management (e.g., rule making, training, managing project risks, automation)
- Group projects related to company case studies

Lecture notes
There is no script, but slides will be made available before the lectures.

Literature
There are texts for each of the course topics made available before the lectures.

Prerequisites / notice
The course is restricted to 40 participants who will work closely with the lecturers on case studies prepared by the lecturers on topics relevant in their own companies (Swiss Re, Skyguide, Swisscom).

363-0393-00L Corporate Strategy
Objective
Course Topic and Learning Objectives:
Large- and medium-sized corporations play a central role in the economic activity of most developed and developing countries. Many of these organizations perform multiple business activities in multiple markets. In the face of increasing international competition, globalization, technological development, deregulation, and the emergence of new markets and industries, operating such a portfolio of business activities poses important managerial challenges forcing corporations to continuously reconsider their vertical and horizontal scope and boundaries.

The course Corporate Strategy draws from a wide range of theories and methods to develop an understanding of the conceptual frameworks, debates, and developments concerning decisions associated with the management of multi-business corporations. We will cover the key questions driving a firm's corporate strategy, including:

- In what markets to compete with which businesses?
- Which activities should be performed by the firm and which should be outsourced (i.e. "make" or "buy" decisions)?
- What are the most appropriate approaches to growth and divestiture?
- How do institutional forces impact corporate strategy?

Specifically, we will examine how organizations manage their portfolio of business activities and markets to achieve competitive advantage through vertical integration, cooperative strategies such as strategic alliances and joint ventures, corporate diversification, mergers and acquisitions, divestitures, and globalization/international strategies, and strategic renewal.

Format:
The course is a combination of lectures about concepts/methods, guest lectures, case studies/assignments, and group debates.

Prerequisites / notice
The course homepage can be found at: http://www.smi.ethz.ch/education/courses/corporatestrategy
Having participated in the course Strategic Management by Prof. Georg von Krogh/Dr. Zeynep Erden is an advantage but not a requirement.

363-0425-00L Transformation: Corporate Development and IT
Objective
- Know and apply methods for risk identification/evaluation, risk mitigation, risk communication
- Know psychological and organizational processes for managing uncertainty
- Apply theoretical foundations to applied issues such as safety management, regulatory activities, and technology design and implementation in different domains (e.g., transport systems, IT, insurance)

Content
The syllabus includes the following topics:

- Elements of risk management
  - Risk identification and evaluation
  - Risk mitigation
  - Risk communication
- Psychological and organizational concepts relevant in risk management
  - Decision-making under uncertainty
  - Risk perception
  - Resilient organizational processes for managing uncertainty
- Case studies on different elements of risk management (e.g., rule making, training, managing project risks, automation)
- Group projects related to company case studies

Lecture notes
There is no script, but slides will be made available before the lectures.

Literature
There are texts for each of the course topics made available before the lectures.

Prerequisites / notice
The course is restricted to 40 participants who will work closely with the lecturers on case studies prepared by the lecturers on topics relevant in their own companies (Swiss Re, Skyguide, Swisscom).
The lecture treats the main challenges of business transformation and the alignment of corporate development and IT activities. It presents a holistic approach to business transformation projects by introducing an integrated model dealing with three main design areas “strategy”, "processes" and “information systems” and applying this model to various case studies.

The goal of the lecture is to understand the main challenges of corporate transformation and to demonstrate the application of a holistic project procedure model for corporate transformation projects with special emphasis on the alignment of business and IT.

The student should understand and be able to explain the main reasons for corporate transformation, the relevant management processes to manage corporate transformation, the interdependencies between strategy, processes and information systems, especially how this three levels interrelate, the critical success factors for the successful accomplishment of large scale corporate transformation projects, the main instruments of project, quality and even change management and the different types of resulting IT projects.

The globalization of the world leads to an increasingly faster pace in business transformation. Enterprises have to adapt faster and even faster to the environmental changes in a global economy to remain competitive and to make sure they stay in business. In todays information age this does not only mean to adapt business strategy and business processes but also to adapt information systems to the new circumstances. The fast adaptation through large scale corporate transformation projects that change strategy, business processes and information systems is critical to ensure competitiveness for tomorrow. The introduction of new business processes and information systems typically takes years in very complex large scale projects. Many projects fail because of insufficient alignment between decision makers in business and IT. Unclear understanding of the overall project scope, undefined roles and responsibilities, unclear project processes, quality problems and resistance to change are some typical problems found in such projects. The lecture is subdivided into following modules:

Corporate development introduction and motivation,
Parallelization of corporate development and complexity reduction,
Planning process and project portfolio management in corporate development,
Management of large scale projects integration of strategy, processes and information systems,
Quality management in large scale projects,
Project management in large scale projects,
Change management within projects.

The lecture is accompanied by four case studies that are used to exemplify the contents of the lecture by applying the concepts to real situations in corporate life.

### 363-0427-00L Business-IT Alignment

**Abstract**

Attending the lectures is imperative to complete the assignments.

**Objective**

What, how, and outcomes of Business-IT Alignment. This course will introduce tools for strategically aligning business and IT, managing the alignment process, and evaluating the alignment outcomes.

**Content**

Students will not only learn about the tools and frameworks to align business and IT, but also learn how to apply the tools / frameworks to real cases.

Lecture 1: IT potential and IT Strategy, business process change, IT portfolio and IT HR management (with case examples)

Lecture 2: Evaluating IT investment and alignment maturity assessment, Digital Strategy

Lecture 3: Case Presentations

Check the course website: http://www.mis.ethz.ch/teaching/HS13/BsnsIT2013

### 363-0562-01L Economics of Innovation and Growth

**Abstract**

Overview how the world has developed. Understanding the role of innovation for economic growth. Design of policies to foster innovation and growth.

**Objective**

The three goals of the lecture. First, understanding how the world has developed over the last centuries and the proximate and fundamental causes of economic growth. Second, understanding and application of the basic models of economic growth. Third, design of policies to foster innovation and growth to reduce the large wealth differences in the world.

**Content**

1. Introduction
2. Neoclassical Growth Theory
3. Innovations and Growth (New Growth Theory)
4. Growth Policy
5. Institutions and Growth

**Lecture notes**

The transparencies used in the lectures will be distributed to the participants.

**Literature**

**Additional literature**

851-0609-05L The Economics of Climate Change

Abstract
Climate change is one of the most pressing issues that governments and the global community have to face. This course outlines the problem of climate change and discusses the economic solutions (both domestic and international) to this problem.

Objective
This course has a number of objectives: (i) To outline the problem of climate change (ii) to discuss and compare the theoretical economic solutions to combating climate change (iii) to present existing climate change mitigation actions in an economic context and (iv) to outline possible future climate policy issues.

Content
Economics of pollution, Optimal level of greenhouse gases, International Environmental Agreements, Tradable pollution permit markets, Carbon Taxes, Technological innovation and R&D, The optimal approach to control Climate change, The future of Climate change policy

Literature
Required reading: Pernan et al. (2003), Natural Resource and Environmental Economics, Pearson Addison Wesley.
Also, Journal articles will be cited

Prerequisites / notice
Prerequisites: The course relies heavily on the concepts and techniques used in basic game theory. Therefore prior knowledge is recommended

363-0585-00L Intermediate Econometrics

Abstract
The idea of this course is to familiarize students with instrumental variables estimation of linear regression models and the estimation of models with limited dependent variables as well as of nonlinear regression models. While most of the material covered will pertain to cross-sectional data, we will also work on selected issues with panel data.

Objective
I will provide STATA programs and show the execution thereof. After having participated in this course, students will be able to carry out simple research projects and understand the basics of intermediate econometrics. In particular, they will be able to write simple programs in STATA and to qualify their own and others’ regression output relating to problems covered.

Literature

363-0723-00L Corporate Finance

Abstract
Corporate Finance, Investment management, business valuation, value based management & compensation, financial reporting today & in future, financial reporting value chain, reporting on non-financial measures, such as corporate sustainability reporting, mergers & acquisitions, legal aspects, taxes, corporate governance - risk management - internal controls & mgmt. information systems, turnaround.

Objective
Introduction in theory and practical application of Corporate Finance, with a particular focus on financing of operations and transactions, analysed from multiple aspects, including legal and tax.

Content
Corporate Finance, investment management, business valuation, value based management and compensation, financial reporting today and in future, financial reporting value chain, reporting on non-financial measures, such as corporate sustainability reporting, mergers and acquisitions, legal aspects, taxes, corporate governance - risk management - internal controls and management information systems, turnaround.

Prerequisites / notice
The lecture will be supported by the Chair of Entrepreneurial Risks. Please refer to the chair’s website for more detailed information regarding the course (www.er.ethz.ch/teaching).

363-0777-00L Technology Transfer

Abstract
Number of participants limited to 50.
Goals of technology transfer with focus on spin-off and start-up creation. Start-up ecosystem, business model innovation, intellectual property, early stage financing and negotiation. Visit to Technopark and Hub Zurich. Guest speakers, meetings with start-up founders. Case study group work with real start-ups. Block lecture (3 days) with strong link between theory and practical examples.

Objective
-Ability to take successful actions in a technology transfer process either in your own start-up or within a larger organization
-Gets familiar with the start-up ecosystem
-Foster entrepreneurial thinking

Content
Technology Transfer is a powerful tool to foster economic growth. From the macro-economic perspective, funds invested into basic research flow back to the society through the creation of new jobs, the establishment of talent pools and tax substrates. Spin-off companies and start-ups play a major role in implementing technology transfer. The lecture focuses on the significance and goals of technology transfer and the success factors for technology-oriented spin-off and start-up companies. The major challenge is to bridge the gap between technology push and market pull. Hence the innovation value chain and start-up ecosystem will be thoroughly discussed and the key aspects for building successful start-ups will be analyzed. Special aspects addresses for building successful start-ups will be presented in class.

The course is offered in 3 block days.
Blockday 1 - 27.10.15: Introduction and science push
-Introduction to Technology Transfer (Lesley Spiegel)
-Presentation of the case study group work (Bailint Dioszegi)
-From science to market (Dr. Marian Kraak, ETH Transfer, Head Start-ups)
-Securing intellectual property (Dr. Claudiautz Dietzsch, Medela)

Blockday 2 - 10.11.15: Start-up ecosystem and market pull
-The startup ecosystem (Lesley Spiegel)
-Innovation in a mature start-up (Dr. Eckehard Zwicker, CEO Alstom Inspection Robotics)
-Getting started with your ventures: ETH Entrepreneur Club (President ETH Entrepreneur Club)
-Negotiation and conflict management (Prof. Dr. Michael Ambühl)
-Early stage financing models (Erika Puyal, Head Start-up Finance, Zurich Kantonalbank)

Blockday 3 - 24.11.15: Presentation of student case study group work and visit to the Hub and Technopark Zurich
-Student presentations of case study group work (Lesley Spiegel)
-Success story: South Pole Carbon Asset Management - from spin-off to world leader (Thomas Camerata, Co-Founder)
-Visit of the Hub Zurich and presentation of Hub Start-ups
-Visit of the Technopark Zurich and presentation of 3 start-ups

ICT: Rayneer Entertainlorman (Oliver Flückiger)
Foodtech: Eaternity (Judith Ellens)
Medtech: Ability (Mario Thomann)
The following topics will be covered:

Contemporary Conflict Management, F. Liberini

Students obtain a concentrated insight into key aspects of the field of negotiations, negotiation engineering and specific aspects of negotiation. Multiple opportunities to apply that knowledge in different negotiation situations allow for an in-depth learning experience.

363-0887-00L Management Research (Basics of Scientific Work)  ■ W 1 credit 1S Z. Erden Özkol

The course is mandatory for MSc. students and recommended for MAS students who write their Master Thesis at the Chair of Strategic Management and Innovation.

Participation to both sessions are mandatory to receive the credit. If a student can't take part in one of the sessions, the course has to be taken the following semester.

Abstract
This course teaches students about the basic principles of scientific work in the field of social sciences. The goal is to motivate students to develop an own thesis design and write scientific articles.

Objective
This course teaches students about the basic principles of scientific work in the field of social sciences. The goal is to motivate students to develop an own thesis design and write scientific articles.

Content
This course teaches students about the basic principles of scientific work in the field of social sciences. It is an introduction into the fascinating field of research. The course shows the power of theory and literature, helps formulating intriguing research questions, provides an overview of scientific methods and data analysis, and gives hints on how to derive insightful conclusions out of results. The goal is to motivate students to find and read research papers relevant to their field, develop an own thesis design and write scientific articles.

Literature

Prerequisites / notice
The course is mandatory for MSc. students and recommended for MAS students who write their Master Thesis at the Chair of Strategic Management and Innovation - those will be served first.
- The course will be given once every semester by Dr. Zeynep Erden Özkol and the PhD students at the chair.
- The course takes two days, one for lecture, one for student paper presentations. Participation to both sessions are mandatory to receive the credit, there will be no exceptions.
- Students who participate in the lecture and present a paper receive 1 credit point. The course and the presentations will be given in English.
- Students might benefit more if they take this course towards the end of their studies, before writing their master thesis.

363-1037-00L Fiscal Competition and Multinational Firms W 3 credits 2V M. Köthlenbürger, F. Liberini

The course enables students to understand how multinational firms respond to differential tax regimes in a global economy and how countries strategically use the tax system to host multinationals. In particular, the course covers transfer pricing issues, internal financing decisions and agency problems and their relation to tax policy.

Objective
Understanding how taxes influence decisions of multinational firms

Using theoretical models and empirical analysis to uncover regularities in how multinational firms respond to taxes

363-1044-00L Applied Negotiation Seminar ■ W 3 credits 2S M. Ambühl

Due to didactics reasons, the number of participants is limited to 30.

Prerequisites: Successful completion of lectures "363-1039-00L Introduction to Negotiation".

Abstract
The block-seminar combines lectures introducing negotiation, negotiation engineering and specific aspects of successful negotiation with the respective application through in-class negotiation case studies and games.

Objective
Students gain:
- knowledge of history of conflict management;
- comprehension of major ideas in the theory and practice of conflict management, mediation, transformation and resolution;
- application of theoretical concepts to current conflict situations;
- evaluation of conflict situations in international relations and business.

Content
The following topics will be covered:
- history of international and regional conflicts;
- theoretical concepts of conflict management;
- theoretical models of arms races and conflict escalation;
- case studies in international conflicts, as well as in business.

Distinguished guest speakers will be invited.
Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by management skills.

Will be provided as electronic version at www.entrepreneurship.ethz.ch at least one week before the seminar starts.

This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures.

Ziel der Veranstaltung ist es einen Einblick in die praktischen Herausforderungen von Einkaufs- und Beschaffungsmmanagern zu erlangen, den Einkauf als wichtige Unternehmensfunktion kennen-zulernen und seine Bedeutung für den Unternehmenserfolg zu erkennen.

Die diesjährigen Veranstaltung trägt den Titel "Wertbeitrag der Beschaffung - bewährte und neue Ansätze".

| Abstract   | The development of new business models coping with the constantly augmenting complexity of technologies and systems as well as the ever increasing global competition force organizations to focus on close collaboration with key partners. These alliances are key value creation opportunities and constitute the core part of this lecture. |

The number of participants is limited. Please send an email to bms@ethz.ch by 03.08.15 for your registration

Week I: 17.08.15 to 21.08.15
Week II: 07.09.15 to 11.09.15

### Literature
- Peter Wallenstein (2012): Understanding Conflict Resolution. SAGE, London, UK
Learning outcomes professional competence
- The students learn and understand the management basics of inter-firm cooperation and organizational networks (business models, incl. risk, communication, etc.)
- Realize the value creation potentials of alliances (added value)
- Understand underlying theoretical models (Transaction cost theory, principal agent, game theory)
- Identify and understand specific forms of collaboration (Strat. All., JV, Networks, M&A, etc.)
- Apply tools hands on in real companies (in coll. with companies)

Learning outcomes methodological competence
- Writing academic papers
- Developing structured documentation of interviews
- Transferring theory directly into application
- Contributing to the learning journey

Learning outcomes social competence
- Work together with industrial partners
- Improving communication skills as basics for collaboration
- Developing and applying team work skills
- Coping with conflicts resolution in teams

Content
The constantly augmenting complexity of technologies and systems, the increased pressure caused by competition, the need for shortening time-to-market and the thereby implied growing risks force organizations to increasingly focus on core competencies. Collaboration with external partners is a key value creation opportunity for successful ventures. This type of cooperation also has implications on daily management activities. This lecture will provide a better understanding of special requirements needed for management of cooperation issues. Content:
- Introduction to theory and management of inter-firm collaboration and networks.
- Description of the formation, management and evolution of collaborations and networks.
- Collaborations in marketing, development, manufacturing (e.g. NUMMI).
- Special forms of collaborations: mergers & acquisition (e.g. pre- and post-merger activities, joint venture, strategic alliances (e.g. Doz & Hamel, networks, virtual communities)

Learning journey:
In an introductory lecture we will give an overview of the theoretical framework and explain the concept of the lecture (Sept. 18, 2014). In weeks 2-5 you will work on a first assignment on six different aspects of the underlying framework: strategy and activities, structure and process, culture and people orientation, interaction and roles, risk and trust, knowledge and learning. This first assignment will give you the basics to participate in the second part (Oct.30-31.2014, 2014) of this seminar. There you will present the results of the first assignment and get additional theoretical input to perform the 2nd assignment. The second assignment will be to analyze real alliance projects in the partner companies. The final lesson will be used as a best practice exchange together with our industrial partners (Dec.18, 2014).

Lecture notes
- Lecture script
- Current course material
- Harvard Case Studies
- Reader with current papers

Additional Books:
HBR Collaborating Effectively ISBN 978-1-4221-6264 4
HBR on Mergers and Acquisitions: ISBN 1-57851-555-6

Prerequisites / notice
The number of students participating in the lecture is limited to 30.
Further reading:

Verlag, Zürich 2012.

Netherlands 2006.

The course is intended for students who want to carry out a thesis in industry, in general these are:

1. MSc-students MTEC or MAVT with master thesis (MA) during the next term and supervised by MTEC, (corresponds to 3rd or 4th
semester Master) and
2. BSc-students MAVT with bachelor thesis (BA) in industry and supervised by MTEC, as well as with full MTEC focus (corresponds to 5th
or 6th semester Bachelor) or
3. MAS MTEC students in 3rd semester for MA during the next term.

Important note: Credits will only be awarded to students according to (1), (2) or (3). Prerequisites for obtaining the credit or "Testat": being
present during the whole course (presence list) and prior study of documents provided on the Internet and of the book Züst, R.: Einstieg ins

Other students on request (limited places).

Important: the chair coaching your BA/MA defines whether the course is mandatory. Please contact your chair!

Electronic enrollment until 08.09.2015 required. Without electronic enrollment participation in the course can’t be confirmed. The course is
held "en bloc" at the beginning of the semester.

Date: Friday 11.09.2015 (13:15-17:00), location: HG E33.1 (ETH main building) and Saturday, 12.09.2015 (09:15-17:00), location: HG
E33.1 (ETH main building). Participation at both days required (Friday afternoon and Saturday whole day).

The course is held in English; handouts are available in English.

Besonderes (deutsche Version):

Der Kurs richtet sich an Studierende, welche an einer Professor des D-MTEC eine Arbeit in der Wirtschaft schreiben werden. Im
Allgemeinen sind dies:

1. MSc-Studierende MTEC oder MAVT mit Masterarbeit (MA) im kommenden Semester, die vom MTEC betreut wird, (entspricht 3. oder
oder 4. Semester Master) sowie
2. BSc-Studierende MAVT mit Bachelorarbeit (BA) in der Wirtschaft, die vom MTEC betreut wird, sowie mit vollem MTEC Fokus
(entspricht 5. oder 6. Semester Bachelor) oder

Achtung: Kreditpunkte erhalten nur Studierende gemäss (1), (2) und (3). Testat-Kreditbedingung: Anwesenheit während des ganzen
Kurses (Präsenzkontrole), vorgängiges Studium der auf dem Internet zur Verfügung gestellten Unterlagen und des Buches Züst, R.: Einstieg ins
Systems Engineering. 3. Aufl., Verlag Industrielle Organisation, Zürich 2004

Andere Studierende auf Anfrage (beschränkte Anzahl Plätze).

Wichtig: die Professor, welche die jeweilige BA/MA betreut, legt fest, ob der Besuch der Veranstaltung obligatorisch ist. Bitte informieren
Sie sich dort!

Elektronische Einschreibung bis zum 08.09.2015 notwendig. Ohne elektronische Einschreibung kann Ihre Teilnahme am Kurs nicht
bestätigt werden.

Der Kurs wird als Blockkurs zu Beginn des Semesters gehalten.

Termin: Freitag, den 11.09.2015 (13:15-17:00) im HG E33.1 und Samstag, 12.09.2015 (09:15- ca. 17:00) im HG E33.1 (ETH
Hauptgebäude). Anwesenheitspflicht an beiden Tagen (Freitag Nachmittag und Samstag ganztags).

Die Veranstaltung wird auf Englisch gehalten; Handouts sind in Englisch verfügbar.

Abstract
The semester project (90 hours) is designed to train the students in the solution of specific engineering problems. This makes use of the
technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and
define the roadmap together with their students, as well as monitor the overall execution.

Abstract
The main aim of this course is to analyse the goals of monetary policy and to review the instruments available to central banks in order
to pursue these goals. It will focus on the transmission mechanisms of monetary policy and the differences between monetary policy rules
and discretionary policy. It will also make connections between theoretical economic concepts and current real world issues.
Economics of Regulation

This course introduces the economic theories and practices of governmental market regulation. We review related theories in microeconomics and apply them to various industries such as energy, telecoms and finance. We discuss different types of market failure in these markets, the ideal interventions, the real life practices and their evolutions. And we also learn about how to evaluate the policies.

Objectives
- To deliver the understanding about why and when regulations are needed; to make students familiar with common regulatory policies; and to let students know about some very famous cases;
- To make a systematic review of the microeconomic theories that are related to regulation, specifically including game theory, industrial organization, environmental economics, and contract theory. Furthermore, by applying these theories to the regulatory problems, we want to show how one can use microeconomic theories to explain and solve real-life issues.
- By the end of the course, students are expected to have enhanced their understandings of the related microeconomic theories, and have strengthened the abilities to explain, to analyze, and to solve regulatory problems.

Content
Topics include:
- Introduction (market efficiency and failure);
- Classical regulatory tools (Price regulations and more);
- Monopoly power and dominance;
- Regulating the utilities (Electricity and energy, Telecommunications, Environmental regulation, Financial regulation);
- Cost-benefit analysis;
- The asymmetric information problem in regulation.

Literature
Lodge, M., M. Cave and R. Baldwin (eds.), The Oxford Handbook of Regulation, Oxford University Press, 2010. (accessible online via the school network)

Prerequisites:
Students are expected to have taken at least one basic microeconomics course. Knowledge about game theory, industrial organization and public economics will be useful. Knowledge about contract theory is a plus.

Introduction to Health Economics and Policy

Health expenditures constitute about 10% of GDP in OECD countries. Extensive government intervention is a typical feature in health markets. Risk factors to health have been changing with growing importance of lifestyle factors such as smoking, obesity and lack of physical activity. This course gives an introduction to the economic concepts and empirical findings in health economics.

Objective
Introduce students without prior economics background to the main concepts of health economics and policy to enhance students understanding of how health care institutions and markets function.

Content
The course gives an introduction to the economic concepts and empirical findings in health economics to enhance students understanding of how health care institutions and markets function. First, the three important decisions made by individuals will be analyzed: What determines the health behaviors, like the intensity of preventive measures like sport, that an individual undertakes? What types and amount of personal health care services does an individual demand? How much health insurance coverage will be purchased?

In a second part, the major participants on the supply side of health care markets - physicians, hospitals, nurses and pharmaceutical manufacturers - will be discussed. E.g., how important are financial incentives in the choice of medicine as a career, specialty choice and practice location? What does it mean and imply that a physician is an agent for a patient? How do pharmaceutical firms decide on investments in new products and how can public policy encourage pharmaceutical innovation?

The choices made by societies about how health care services are financed and about the types of organizations that supply health care will be addressed in a third part. One important choice is whether a country will rely on public financing of personal health care services or encourage private health insurance markets. How could and should a public health insurance system be designed? What health care services should be included or excluded from a public system? Another important choice is whether a society relies on government provision of health care services, private provision by not-for-profit or for-profit organizations or some combination. The advantages and disadvantages of the alternatives will be discussed to provide a framework for analyzing specific types of health care systems.

Literature

Empirical Innovation Economics

The course focuses on important factors that drive the innovation performance of firms, like innovation capabilities, science-industry relationships, environmental policy and it shows how innovation activities relate to firm performance and to the technological dynamic of industries. Hence, the course provides an understanding of the relationship between technical change and industrial dynamics.

Objective
The course provides students with the basic skills to understand and assess empirically the technological activities of firms and the technological dynamics of industries.

Content
The course consists of two parts. Part I provides an introduction into important topics in the field of the economics of innovation. Part II consists of empirical exercises based on the KOF Innovation Data. In part I we will learn about: ...a market conditions that encourage firms to invest in R&D (Research and Development) and develop new products. ...b) the role of universities for the technological activities of a firm (technology transfer). ...c) how technologies diffuse among firms. ...d) how the R&D activities of firms are affected by economic crises and how firms finance their R&D activities. ...e) how we can measure the returns to R&D activities. ...f) how (environmental) policies affect the technological activities of a firm. In part II we will use the KOF Innovation Survey Data in order to assess empirically the technological activities of firms referring to the topics introduced in part I.

Literature

Prerequisites:
Cases will be announced during the course.

Strategic Career Development

The offer Strategic Career Development has the goal to support students in the development and alignment of their personal & professional goals. Orientation, Goal setting, action plan development, motivation letter, CV, interview training

We will include high level external guest speakers
Objective

We will discuss and develop answers to the following questions:

What do I want to achieve in my life?
Why is it to important to define goals?
What decision criteria can I use as a guide?
How do potential career paths look like? What are the possibilities?
How does the life cycle of a career look like? What are the alternatives?
How do I increase my chances of success/reaching my goals?
How did others do it? What kind of advice can experienced captains of industry give?
Why is a periodic check of my goals and my progress necessary?

Content

INTRODUCTION (7.10.2015)
Awareness building / Overview on the career life cycle / Examples from praxis / Exchange of experiences / Approach for goalsetting / Introduction to the success secrets of a career

ORIENTATION AND GOAL SETTING (14.10.2015)
Class discussion of the success secrets of a career / Orientation on career options / Discussion of possible decision criteria / Initial formulation of concrete goals

External guest speaker: Inspiring Start-up Entrepreneur

CAREER DEVELOPMENT PLANS (21.10.2015)
Exchange w/representatives of industries / Personal Values & Norms vs Corporate Identity / Work-Life Balance Gender / Diversity / Summary of discussions / Best practice / Modification/Sharpening of goals

External guest speaker: Dr. Alexandre Grêt, CEO, HaslerRail AG

DETAILING OF INDIVIDUAL CAREER PLANS (28.10.2015)
Development of detailed individual career plans / Next steps / action plan / Tips & Tricks for careers in organizations and entrepreneurship

External guest speaker: Dr. Alexandre Grêt, CEO, HaslerRail AG

REVIEW & APPLICATION COUNSELING (04.11.2015)
Review/check of goals and career plans / Motivation letter / CV / Preparation for interviews

INTERVIEW TRAINING (11.11.2015)

External guest speaker: Thomas Vellacott, CEO, WWF Switzerland

Lecture notes

In today’s world of everything is possible it becomes an every increasing challenge to find orientation, to define a goal for which it is worth to work for with focus and energy. But this is exactly what is so important in today’s work environment. Only with a definite goal one can decide if the taken path is right, one can develop enough motivation to go beyond the comfort zone. With a definite goal, one increases the chances of success of one`s education and career. The earlier one has defined what he/she wants to achieve, the bigger the effect.

Prerequisites / notice

Motivation. Strategic long-term view.

363-1047-00L Economics of Urban Transportation W 3 credits 2G A. Russo

Abstract

The first part of the course will present some basic principles of transportation economics, applied to the main issues in urban transport policy (e.g. road pricing, public transport tariffs, investment in infrastructure etc.). The second part of the course will consider some case studies where we will apply the tools acquired in the first part to actual policy issues.

Objective

The main objective of this course is to provide students with some basic tools to analyze transport policy decisions from an economic perspective. Can economics help us reduce road congestion problems? Should drivers be asked to pay for using urban roads? Should public transport tariffs depend on how roads are priced? How should the investment in transport infrastructure be financed? These are some of the questions that students should be able to tackle after completing the course.

Content

COURSE OUTLINE (preliminary):

1. Introduction
2. Travel demand :
   a. travel cost and value of time
   b. mode choice
3. Road congestion and first-best pricing
   a. Static congestion model
   b. Dynamic congestion models
   c. Examples: London Congestion Charge, Stockholm Congestion Charge
4. Second-best pricing
   a. Pricing roads with unpriced alternatives. Examples: tolled and toll-free highways
   b. Public transport: pricing with road congestion and with (or without) road tolls
5. Investment in infrastructure: public transport and roads
   a. Roads: Investment with and without pricing
   b. induced demand
   c. Economies of scale/density in public transport
6. Topics:
   a. Political economy of road pricing: why do we see road pricing in so few cities (London, Stockholm...) and not in many other cities (NYC, Manchester, Paris...)?
   b. What are the alternatives to road pricing to reduce congestion? Parking tariffs, traffic regulation (speed bumps, low emission zones), road space reduction. Examples: Zurich, San Francisco (SFPark), Paris.
   c. Transport and land use: value of housing and transport services. Road congestion, transport subsidies and urban sprawl.

Lecture notes

Course slides will be made available to students prior to each class.

SYLLABUS (preliminary):

course slides will be made available to students.

Additional material:

Part 1 to 5: textbook: Small and Verhoef (The economics of urban transportation, 2007).

Part 6: Topics to be covered on research papers/case studies.

363-1048-00L Sustainable Supply Chain Management W 3 credits 2G C. Busse
Abstract
The course focuses on the establishment of sustainability in firm’s supply chains (that is, in their internal operations, in their logistics processes, and in their upstream supply chains). We will consider how supply chains can become more sustainable, as well as the extent to which firms are interested in such a development.

Objective
This course aims to equip students with an in-depth knowledge of the sustainability-related challenges and problems within supply chain management, and suggests some tools for managing these challenges. Equally importantly, the course seeks to capacitate students for understanding and analyzing the tradeoffs and conflicts of target within sustainable supply chain management.

The content of the course is closely linked to the latest research in the field, meaning that the absence of simple solutions will be the rule, rather than the exception. Moreover, the course will be highly interactive, and there will be intensive coursework during the course.

Content
The preliminary course outline is as follows:

Module 1: Motivation for SusSCM
-Sustainable development, sustainability, and corporate social responsibility
-Importance of SusSCM
-Motivation for firms to engage in SusSCM
-Specificity of SusSCM

Module 2: Supply chain sustainability topics and issues in an overview
-Types of issues
-Juxtaposing the three dimensions of the triple-bottom line
-Issue reporting
-Dilemmas for firms

Module 3: Sustainable operations management
-Lean and green
-CO2 avoidance
-Recycling
-Closed-loop SCM

Module 4: Sustainable logistics
-Forward vs. reverse logistics
-Sustainable transportation
-Sustainable warehousing
-Sustainable packaging
-Design of sustainable logistics networks

Module 5: Sustainable purchasing and supply management
-Management of the entire supply base in global sourcing contexts
-Sustainable supplier management processes
-Information processing prerequisites to sustainable supplier management processes
-Sustainability-oriented supply chain risk management

Module 6: Emerging topics in sustainable supply chain management

Wrap-up

Lecture notes
The course material will be available for download from the homepage of the Chair of Logistics Management:
http://www.scm.ethz.ch/teaching/Courses. The login will be announced in the first lecture. In addition, we will employ scientific publications and case studies as readings which are provided throughout the course. Supplementary textbooks are listed below in the literature section.

Literature
Supplementary textbooks:

Prerequisites / notice
There are no formal prerequisites. However, to profit most from the course, it would be desirable if students attended the MTEC courses on Strategic Supply Chain Management (MTEC MSc course no. 363-0453-00L), on Purchasing and Supply Management (MTEC MSc course no. 363-0452-00L) and on Corporate Sustainability (MTEC MSc course no. 363-0387-00L) beforehand. Moreover, the course builds on and details lectures on Sustainable Supply Chain Management within the course LOS II: Manufacturing Strategies - From Supply Chain Design to Factory Planning II (MTEC MSc course no. 363-0448-00L).

851-0735-09L Workshop & Lecture Series on the Law & Economics of Innovation W 2 credits 2S S. Bechtold, H. Gersbach, A. Heinemann, G. Hertig

Abstract
This series is a joint project by ETH Zurich and the University of Zurich. It provides an overview of interdisciplinary research on intellectual property, innovation, antitrust and technology policy. Scholars from law, economics, management and related fields give a lecture and/or present their current research. All speakers are internationally well-known experts from Europe, the U.S. and beyond.

Objective
After the workshop and lecture series, participants should be acquainted with interdisciplinary approaches towards intellectual property, innovation, antitrust and technology policy research. They should also have an overview of current topics of international research in these areas.

Content
The workshop and lecture series will present a mix of speakers who represent the wide range of current social science research methods applied to intellectual property, innovation, antitrust policy and technology policy issues. In particular, theoretical models, empirical and experimental research as well as legal research methods will be represented.

Lecture notes
Papers discussed in the workshop and lecture series are posted in advance on the course web page.
363-1028-00L  Entrepreneurial Leadership  
W  4 credits  3S  C. P. Siegenthaler, P. Baschera, S. Brusoni, G. Grote, V. Hoffmann, G. von Krogh

Abstract
This seminar provides the most ambitious and best performing master students at MTEC with the challenging opportunity of a real case on strategy, innovation and leadership in close collaboration with the top management of an outstanding company - in 2015: PwC Switzerland.

Objective
In your team, you will work on a specific assignment that flows from the current strategic agenda of the board. While gaining substantial insights into the structure, dynamics and challenges of the advisory and assurance business, you immerse into the business model and strategic landscape of the corporate partner. Your visit their headquarter, conduct interviews with members of the management team, experienced consultants as well as internal and external experts before you discuss your ideas with top executives. To secure impact, it is key that you formulate your recommendations from a deep understanding of the authentic leadership culture of the corporate partner.

Content
In this endeavour you are coached and supported by:- Gudela Grote, Chair of Work and Organizational Psychology
- Stefano Brusoni, Chair of Technology and Innovation Management
- Claude Siegenthaler, Hosi University / The St.Gallen MBA
- Georg von Krogh, Chair of Strategic Management and Innovation
- Plus Baschera, Chair of Entrepreneurship

Prerequisites / notice
Please apply for this course via the official website (www.mtec.ethz.ch) and send your application form together with a CV and transcript of records to andreakurath@ethz.ch. Apply no later than August 25, yet early registrations are welcomed.

The number of participants is limited to 18.

ECTS: 4
Participants receive a certificate.

363-1051-00L  Cases in Technology Marketing  
W  3 credits  1G  F. von Wangenheim, C. Grieder

Abstract
The aim of this module is to introduce students to some key concepts in technology marketing and to familiarize them subsequently with current and past managerial problems and will be enabled to compare their solutions with what has actually been done.

Objective
This module should enable students to deal with the uncertainty related to challenges in technology marketing by introducing them to some key concepts and letting them apply those concepts to real life cases. The competences acquired in this module are meant to go beyond the mere understanding of the study material by improving students' analytical skills and capacity for team work. Furthermore, students will be exposed to decision-making styles and procedures in companies.

Prerequisites / notice
Students have to apply for this course by sending a CV and a one-page motivation letter until 14.09.2015 to mgrohmann@ethz.ch.

Limited number of participants. Students apply with motivation letter, CV and a transcript of records no later than 25.8.2015. Earlier applications welcome. Send application to andreakurath@ethz.ch.

Once your application is confirmed, a registration in myStudies is possible.

363-1055-00L  Marketing Practice  
W  3 credits  3S  F. von Wangenheim

Abstract
The course enables students to apply their knowledge from marketing and other disciplines to real life cases under the supervision of internationally operating partner companies.

Objective
First, students have to assess and analyse real life problems in order to generate creative solutions.

Secondly, students have to demonstrate that they are both - able to apply their knowledge from marketing theory to practice, as well as to communicate their ideas to other students and leading marketing executives.

Content
The Circle of Excellence is a one-year talent program for outstanding students together with the universities of Münster, Cologne and Berlin. It aims at preparing the participants for interesting management tasks within various workshops in collaboration with our internationally operating partner companies, e.g. PanGas, L'Oreal, Henkel, McKinsey, EDEKA,...

Prerequisites / notice
Your profile:
- Strong interest in Marketing topics
- Very good academic performance
- Interesting and convincing personality

Students have to organize the remaining phase of their studies in a way that they are able to participate in the workshops.
### Design Thinking: Human-Centred Solutions to Real World Challenges

**Due to didactic reasons, the number of participants is limited to 30.**

All interested students are invited to apply for this course by sending a one-page motivation letter until 07.09.2015 to Florian Rittiner (frittiner@ethz.ch).

Additionally please enroll via mystudies. Places will be assigned after the first lecture on the basis of your motivation letter and commitment for the class.

**Abstract**
The purpose of this course is to engage students in a multidisciplinary collaboration to tackle real world problems. Following a design thinking approach, students will work in multidisciplinary teams to solve a set of design challenges that are organized as a one-week, a three-week, and a six-week project. The final project will be in collaboration with an external project partner.

**Objective**
During the course, students will learn about different design thinking methods and tools. This will enable them to:
- Generate deep insights through the systematic observation and interaction of key stakeholders.
- Engage in collaborative ideation with a multidisciplinary (student) team.
- Rapidly prototype and iteratively test ideas and concepts by using various materials and techniques.

---

### Human Factors I

**Abstract**
Every day humans interact with various systems. Strategies of interaction, individual needs, physical & mental abilities, and system properties are important factors in controlling the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction & overall performance.

**Objective**
The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

**Content**
- Physiological, physical, and cognitive factors in sensation and perception
- Body spaces and functional anthropometry
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

**Literature**

---

### Conference of Disarmament: Simulation of Negotiations

The Global Studies Institute (University of Geneva) is organizing a simulation seminar on nuclear disarmament in collaboration with the Chair of Negotiation and Conflict Management (ETH), experts from the United Nations Institute for Disarmament Research and the Geneva Center for Security Policy.

**Objective**
The simulation is conducted in collaboration with experts and students during a two days seminar at the University of Geneva. Students will have the possibility to participate in simulated diplomatic negotiations and to analyse and assess the negotiation logic behind the situations. They should gain insight in the basic information on disarmament issues and on the functioning of the Conference on Disarmament as well as on negotiation techniques in general.
The simulation project is intended for Master's or Doctoral students of the Global Studies Institute (GSI) of the University of Geneva, of the ETH and for interested students of the Geneva Centre for Security Policy (GCSP). The simulation will be in French and English and is conducted by Prof. Calmy-Rey, former President of Switzerland.

In the lectures, students will be provided with basic information on disarmament issues and on the functioning of the Conference on Disarmament as well as on negotiation techniques in general. Students will take the role of negotiators in the simulation (including the heads of the delegations), of keeper of the minutes or of observers and analysts. Students will co-develop their mandates for the negotiation and be assisted by experts that are specialized in international negotiations as well as in the topic of disarmament. The negotiation tables will be chaired by former diplomats. Representatives of diplomatic missions in Geneva will play the role of the "Capitals" to which the heads of delegations will have to give account of the ongoing negotiations.

More details on the program, timetable, reading lists and performance assessment will be published here: https://chamilo.unige.ch/home/courses/M165/?id_session=0

The simulation will take place on the 26 and 27 November 2015 at the University of Geneva.

Languages: English and French

Dates/Time/Location (GE = University of Geneva)

22 Sept. | ETH HG D 22 | 10:15-12:00 | Introduction
29 Sept. | GE Uni Mail Salle 1170 | 10:15-12:00 | Introduction to Negotiation Techniques (Dr. Vitalijus Butenko and Dr. Sibylle Zürcher, ETH)
6 Oct. | ETH HG D 16.2 | 10:15-12:00 | Distribution of the roles, composition of the negotiation tables, preparation of mandates for the HA (humanitarian approach)
13 Oct. | ETH HG D 22 | 10:15-12:00 | Preparation of the mandates for the FMCT (Fissile Material Cut-off Treaty)
20 Oct. | GE Uni Mail Salle 1170 | 10:15-12:00 | No session; Students deepen and summarize their mandates on one page (A4)
27 Oct. | GE Uni Mail Salle 1170 | 10:15-12:00 | Discussion of the Mandates I (FMCT)
10 Nov. | GE Uni Mail Salle 1170 | 10:15-12:00 | Discussion of the Mandates II (HA)
17 Nov. | GE Uni Mail Salle 1170 | 10:15-12:00 | Preparation Meeting
26 & 27 Nov. | GE Salles 407 et 408 | 10:00-18:00 | Simulation at Uni Dufour
1 Dec. | GE Uni Mail Salle 1170 | 10:15-12:00 | Discussion of the results

Note:
The participation in the simulation on 26. and 27. November in Geneva is necessary.
The two hours lectures on the 22. September, 6. and 13. October have to be attended in Zürich via conference call (ETH HG D 16.2). The other lectures during the semester can be attended via Skype.

To get the 3 ECTS, students have to participate at the 2 days simulation In Geneva, attend the 3 mandatory lecture parts via conference call an Zürich and write a report of 5 pages at the end of the course.

(Technical note for registration: At this stage all registered students are on the waiting list)

► Supplementary Courses

The students have to deepen their knowledge in the area(s) of engineering/natural sciences in consultation with the responsible professor (tutor). Core courses and electives of D-MTEC can not be used as supplementary courses.

Abstract
Only students who fulfill the following criteria are allowed to begin with their master thesis:
a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme;
c. internship fulfilled

Objective
In the Master thesis students prove their ability to independent, structured and scientific working. The Master thesis is supervised by the tutor and normally deals with a subject contained in the major fields. The research will be performed normally within a private company or at the ETH Zurich.

Abstract
This course for MTEC master's students will focus on developing and refining students' English writing skills and their understanding of the requirements and conventions of academic writing.
Objective

The aim of this course is to improve the academic writing skills needed to complete an MSc thesis successfully. The course provides theoretical input, practical writing exercises, and detailed individual feedback organised into one group lecture and four workshops in smaller tutorial groups.

Initially, the lecture provides an overview of the range of demands on academic essay and MSc thesis writers and outlines the academic expectations that students must meet. Our goal is to provide a basis for informed decisions when selecting a thesis topic and supervisor. Guidance is then provided in the workshops on planning the writing process effectively, and individual feedback is provided to enhance writing ability.

The course develops a range of practical and transferrable writing skills. Students can use these skills to improve the overall quality of their MSc theses and to produce their thesis more rapidly and efficiently. The writing skills developed here can be used beyond the MSc, whether students go on to complete a PhD or to produce reports and other documents in industry.

Content

Group lecture:
- an introduction to writing an MSc thesis in D-MTEC
- selecting topic and supervisor
- academic expectations
- avoiding plagiarism

Workshop 1:
- the writing process
- reading, note taking and planning
- overview of the thesis structure
- building academic vocabulary

Workshop 2:
- writing methods sections
- embedding figures and tables
- structuring sentences and paragraphs
- noun phrases and articles

Workshop 3:
- introductions; results and discussion sections
- analysis v description
- writing critically
- relative clauses

Workshop 4:
- abstracts and conclusions
- editing your own text
- punctuation, spelling, and grammar

Lecture notes

Notes will be available after registration.

ECTS

European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
### Engineering Materials and Production I

**ECTS**: 4G

**Title**: Linear Algebra I

**Abstract**: Systems of linear equations, Gaussian elimination, solution space, matrices, normed vector spaces, inner products, method of least squares, QR decomposition, introduction to MATLAB, applications.

**Objective**: Upon completion of this course, students will be able to recognize linear structures, and to solve corresponding problems in theory and in practice.

**Content**: Linear algebra is an indispensable tool of engineering mathematics. The course offers an introduction into the theory with many applications. The new notions are practised in the accompanying exercise classes. The course will be continued as Linear algebra II.

**Literature**: *K. Nipp / D. Stoffer, Lineare Algebra, vdf Hochschulverlag, 5. Auflage 2002*  
*K. Meyberg / P. Vachenauer, Höhere Mathematik 1, Springer 2003*

**Prerequisites / notice**: It is expected, that students submit 3/4 of all exercises for control.

**Lecturers**: U. Lang

**Lecture notes**: Active participation in the exercises is part of this course.

### Kinematics and Statics

**ECTS**: 3 credits

**Title**: Kinematics and Statics

**Abstract**: Basics: Position of a material point, velocity, kinematics of rigid bodies, forces, reaction principle, mechanical power

**Objective**: The understanding of the fundamentals of statics for engineers and their application in simple settings.

**Content**: Statics: Groups of forces, moments, equilibrium of rigid bodies, reactions at supports, parallel forces, center of gravity, statics of systems, principle of virtual power, trusses, frames, forces in beams and cables, friction

**Lecture notes**: Übungsbilanz

**Literature**: Sayir, M.B., Dual J., Kaufmann S., Ingenieurmechanik 1: Grundlagen und Statik, Teubner

**Prerequisites / notice**: Written session examination in "Kinematics and Statics" and "Mechanics of Materials" for D-MAVT Students, Students in Human Movement Sciences and Sport and all other Students, who take "Kinematics and Statics" and "Mechanics of Materials".

**Lecturers**: E. Mazza

### Engineering Materials and Production I

**ECTS**: 4G

**Title**: Engineering Materials and Production I

**Abstract**: The lecture covers the structure and the properties of metallic materials. In the focus are the branches: microscopic structure; thermally activated processes; solidification, plastic deformation, creep. Generally the lecture also refers to manufacturing, to the processing, and application of the concerning materials.

**Objective**: Understanding the basics of metallic materials for engineers who are confronted with material decisions in design and production.

**Content**: The lecture covers the structure and the properties of metallic materials. In the focus are the branches: microscopic structure as ideal and real structure, alloying, thermally activated processes e.g. diffusion, recovery, recrystallisation, solidification, elastic and plastic deformation and creep. Generally the lecture also refers to manufacturing, to the processing, and application of the concerning materials.

**Lecture notes**: yes

**Prerequisites**: yes

**Lecturers**: K. Wegener

### Machine Elements

**ECTS**: 2 credits

**Title**: Machine Elements

**Abstract**: Introduction to machine elements and mechanical systems as basics of product development. Case studies of their application in products and systems.

**Objective**: The students get an overview of the main mechanical components (machine elements) which are used in mechanical engineering. Selected examples will demonstrate how these can be assembled into functional parts and complete systems such as machinery, tools or actuators. At the same time, also the problem of production (production-oriented design) is discussed.

In concurrent lectures / exercises "technical drawing and CAD" the design implementation will be practiced.
Content
- Innovation Process: A Quick Overview
- Stages of the planning and design process
- Requirements for a design and technical implementation
- Choice of materials - Basic principles of a material-specific design
- Manufacturing process - fundamentals of a production-oriented design
- Connections, fuses, seals
- Machine-standard elements
- Storage & guides
- Transmission and its components
- Drives

The idea of machine elements is complemented by case studies and illustrated.

Lecture notes
The lecture slides will be published beforehand on the website of the pd|z.

Prerequisites / notice
For Bachelor studies in Mechanical and Process Engineering, the lecture "Maschinenelemente" (HS) is examined together with "Innovationsprozess" (FS) in the exam "Basisprüfung Maschinenelemente und Innovationsprozess".

529-0010-00L Chemistry O 3 credits 2V+1U A. de Mello, K. Elvira
Abstract
This is a general chemistry course aimed at first year undergraduate students in the Department of Mechanical and Process Engineering (D-MAVT).

Objective
The aims of the course are as follows:
1) To provide a thorough understanding of the basic principles of chemistry and its application.
2) To develop an understanding of the atomic and molecular nature of matter and of the chemical reactions that describe their transformations.
3) To emphasize areas considered most relevant in an engineering context.

Content
Electronic structure of atoms, chemical bonding, molecular shape and bonding theory, gases, thermodynamics, chemical thermodynamics, chemical kinetics, equilibria, solutions and intermolecular forces, redox and electrochemistry.

Literature
The course is based on "Chemistry the Central Science" by Brown, LeMay, Bursten, Murphy and Woodward. Pearson, 12th Edition (international edition).

</tbody>
</table>
Abstract

Objective
The lecture and exercises teach the fundamentals of technical drawing and CAD. After taking the course students will be able to create accurate technical drawings of parts and assemblies as well as read them. Students will also be able to create models of parts and assemblies in a 3D, feature-based CAD system. They will understand the links with simulation, product data management (PDM) and additive manufacturing.

Content
Introduction to Engineering Design
Sketching in Engineering Design
- Technical Drawing:
  - projections and views
  - cuts
  - notations
  - primitives
  - ISO norm elements
  - dimensioning
  - tolerances
  - assemblies
  - documentation
- CAD:
  - CAD basics
  - CAD modeling methods
  - sketch modeling
  - modeling operations
  - feature-based modeling
  - assemblies
  - creating 2D drawings from 3D parts
  - links to simulation, e.g. kinematics
  - links to model variants and Product Data Management (PDM)
  - links to additive manufacturing (3D printing)

Lecture notes
Lecture slides and exercise handouts are available on the course Moodle website: https://moodle-app2.let.ethz.ch/course/index.php?categoryid=56

Literature
In addition to the lecture material the following books are recommended (only in German):
TZ
Technisches Zeichnen: selbstständig lernen und effektiv üben
Susanna Labisch and Christian Weber
2008 Vieweg
eBook (accessible from the ETH domain): https://link.springer.com/book/10.1007/978-3-8348-9451-9/page/1

VSM Normen-Auszugs 2010
(kann in den Übungen bestellt und gekauft werden)

CAD
Marcel Schmid
CAD mit NX: NX 8
J.Schlembach Fachverlag
ISBN: 978-3-935340-72-4
Prerequisites / notice
This course is given as a lecture (1h/week) and an exercise (3h/week). Students are split into working groups for the exercises with a maximum of 20 students per group.

Semester Fee
A fee is charged for printed copies of the course handouts.

➡️ First Year Optional Colloquia

Abstract
Basics: Position of a material point, velocity, kinematics of rigid bodies, forces, reaction principle, mechanical power
Statics: Groups of forces, moments, equilibrium of rigid bodies, reactions at supports, parallel forces, center of gravity, statics of systems, principle of virtual power, trusses, frames, forces in beams and cables, friction

Objective
The understanding of the fundamentals of Statics for engineers and their application in simple settings.

Content
Statics: equivalence and reduction of groups of forces; rest and equilibrium; basic theorem of statics; kinematic and static boundary conditions, applications to supports and clamps of rods and beams; procedures for determination of forces at supports and clamps; parallel forces and centre of gravity; statics of systems, solution using basic theorem and using the principle of virtual power, statically indeterminate systems; statically determinate truss structures, ideal truss structures, nodal point equilibrium, methods for truss force determination; friction, static friction, sliding friction, friction at joints and supports, rolling resistance; forces in cables; beam loading, force and moment vector.

Abstract
Introduction to partial differential equations. Differential equations which are important in applications are classified and solved. Elliptic, parabolic and hyperbolic differential equations are treated. The following mathematical tools are introduced: Laplace transforms, Fourier series, separation of variables, methods of characteristics.

Objective
Mathematical treatment of problems in science and engineering. To understand the properties of the different types of partial differential equations.

Content
Laplace Transforms:
- Laplace Transform, Inverse Laplace Transform, Linearity, s-Shifting
- Transforms of Derivatives and Integrals, ODEs
- Unit Step Function, t-Shifting
- Short Impulses, Dirac's Delta Function, Partial Fractions
- Convolution, Integral Equations
- Differentiation and Integration of Transforms

Fourier Series, Integrals and Transforms:
- Fourier Series
- Functions of Any Period p=2L
- Even and Odd Functions, Half-Range Expansions
- Forced Oscillations
- Approximation by Trigonometric Polynomials
- Fourier Integral
- Fourier Cosine and Sine Transform

Partial Differential Equations:
- Basic Concepts
- Modeling: Vibrating String, Wave Equation
- Solution by separation of variables; use of Fourier series
- D'Alembert Solution of Wave Equation, Characteristics
- Heat Equation: Solution by Fourier Series
- Heat Equation: Solutions by Fourier Integrals and Transforms
- Modeling Membrane: Two Dimensional Wave Equation
- Laplacian in Polar Coordinates: Circular Membrane, Fourier-Bessel Series
- Solution of PDEs by Laplace Transform

Abstract
Kinematics, dynamics and oscillations: Motion of a single particle - Motion of systems of particles - 2D and 3D motion of rigid bodies Vibrations

Data: 06.12.2017 12:57  Autumn Semester 2015  Page 914 of 1432
Objective

This course provides Bachelor students of mechanical engineering with fundamental knowledge of kinematics and dynamics of mechanical systems. By studying motion of a single particle, systems of particles and rigid bodies, we introduce essential concepts such as work and energy, equations of motion, and forces and torques. Further topics include stability of equilibria and vibrations. Examples presented in the lectures and weekly exercise lessons help students learn basic techniques that are necessary for advanced courses and work on engineering applications.

Content

Lecture notes

Typed course notes from the previous year

Literature

Hand-written slides will be downloadable after each lecture.

Prerequisites / notice

Please log in to moodle (https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php), search for "Dynamics", and join the course there. All exercises sheets, lecture materials etc. will be uploaded there.

151-0303-00L

Dimensioning I

Objective

Content

- Theoretical basics of engineering design
- Description of ductile and brittle material behavior
- Design of machine elements at static loading conditions
- Notch effects
- Axes and shafts
- Fatigue design
- Surface pressure
- Rotationally symmetric bodies, pressure vessels and cylindrical interference
- Dimensioning of permanent and separable joints

Lecture notes

The lecture bases on the books specified under "LITERATUR". The books 1) to 5) can be downloaded as pdf's. Additional documentation and handouts are available as PDFs on our website.

Literature

151-0551-00L

Thermodynamics I

Objective

Introduction to the fundamentals of technical thermodynamics.

Content

1. Konzepte und Definitionen
2. Der erste Hauptsatz, der Begriff der Energie und Anwendungen für geschlossene Systeme
3. Eigenschaften reiner kompressibler Substanzen, quasi-statische Zustandsänderungen
4. Elemente der kinetischen Gastheorie
5. Der erste Hauptsatz in offenen Systemen - Energieanalyse in einem Kontrollvolumen
6. Der zweite Hauptsatz - Der Begriff der Entropie
7. Nutzbarkeit der Energie - Exergie
8. Thermodynamische Beziehungen für einfache, kompressible Substanzen.

Lecture notes

The lecture bases on the books specified under "LITERATUR". The books 1) to 5) can be downloaded as pdf's. Additional documentation and handouts are available as PDFs on our website.

Literature

151-0591-00L

Control Systems I

Objective

Analysis and synthesis of linear systems with one input and one output signal (SISO); transition matrix; stability; controllability; observability; Laplace transform; transfer functions; transient and steady state responses. PID control; dynamic compensators; Nyquist theorem.

Content

Introduction to main ideas of linear systems analysis and synthesis. Transient and steady-state behavior, system engineering (input/output, static/dynamic behavior, feedforward and feedback loops, etc.), introduction of most important tools (solution of linear ODE, Laplace transformation, Nyquist theorem, etc.). Elementary controller synthesis techniques.

Lecture notes

Prerequisites / notice

Basic knowledge of (complex) analysis and linear algebra

This is a two-semester course introducing students into the foundations of Modern Physics. Topics include electricity and magnetism, light, waves, quantum physics, solid state physics, and semiconductors. Selected topics with important applications in industry will also be considered.
Objective
The lecture is intended to promote critical, scientific thinking. Key concepts of Physics will be acquired, with a focus on technically relevant applications. At the end of the two semesters, students will have a good overview over the topics of classical and modern Physics.

Content
Electric and magnetic fields, current, magnetism, Maxwell’s equations, concept of light, classical optics, waves.

Lecture notes
Notes from lectures will be available (in German).

Abstract
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

Objective
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.
Content
Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Reynolds- and Chilton-Colburn analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogenous and heterogenous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogenous reaction. Applications.

Literature

Prerequisites / notice
Three tests are offered for practicing the course material. Participation is voluntary.

401-0603-00L
Stochastics (Probability and Statistics) (W 4 credits 2V+1U J. Teichmann)

Abstract
This class covers the following concepts: random variables, probability, discrete and continuous distributions, joint and conditional probabilities and distributions, the law of large numbers, the central limit theorem, descriptive statistics, statistical inference, inference for normally distributed data, point estimation, and two-sample tests.

Objective
Knowledge of the basic principles of probability and statistics.

Content
Introduction to probability theory, some basic principles from mathematical statistics and basic methods for applied statistics.

Lecture notes
Lecture notes

Literature

151-0573-00L
System Modeling (4 credits 2V+2U G. Ducard, C. Onder)

Abstract

Objective
Introduction to system modeling for control. Analysis and optimization of linear and nonlinear systems. Parameter identification. Case studies.

Content
Introduction to generic system modeling approaches for control-oriented models based on first principles and on experimental data. Examples: mechatronic, energy, and process engineering systems. Model scaling, linearization, order reduction, and balancing. Planning of experiments, estimation techniques for "gray-box" models (linear and nonlinear least-squares methods). The exercises are solved in teams. One larger case study is to be solved.

Lecture notes
The handouts in English will be sold in the first lecture.

Literature
A list of references is included in the handouts.

151-0973-00L
Fundamentals in Process Engineering (W 4 credits 2V+2U P. Rudolf von Rohr, C. Müller)

Abstract
Overview of process engineering, reactions, balances and residence time analysis; overview of the thermal separation processes; equilibria for multiphase systems; introduction into mechanical process engineering and particle technology

Objective
To expand fundamentals in process engineering

Content
Overview of process engineering, reactions, balances and residence time analysis; overview of the thermal separation processes; equilibria for multiphase systems; introduction into mechanical process engineering and particle technology

Lecture notes
The handouts in English will be sold in the first lecture.

151-0575-01L
Signals and Systems (W 4 credits 4G R. D’Andrea)

Abstract
Signals arise in most engineering applications. They contain information about the behavior of physical systems. Systems respond to signals and produce other signals. In this course, we explore how signals can be represented and manipulated, and their effects on systems. We further explore how we can discover basic system properties by exciting a system with various types of signals.

Objective
Master the basics of signals and systems. Apply this knowledge to problems in the homework assignments and programming exercises.

Content

Lecture notes
Lecture notes available on course website.

363-0511-00L
Managerial Economics (W 4 credits 3V S. Rausch, V. Hoffmann)

Abstract
Managerial Economics applies economic theory and methods to business and economic decision-making. Economic ideas related to optimization, the theory of consumer behavior and demand, the theory of the firm, industrial organization and decision making under uncertainty are studied using methods of numerical analysis, statistical estimation, game theory and constrained optimization.

Objective
The objective of the course is to provide undergraduate and graduate students in MAVT with an understanding of the use of economic concepts for firm-level management decisions. The course covers a number of models and methods of analysis which are commonly employed in business decisions. The course covers the economic theory of choice, models of oligopoly and industrial organization, applications of game theory to contract design and agency theory, and the theory of decision making under uncertainty focusing specifically on long-term investment decisions. The course will include three lectures by Professor Volker Hoffmann focusing on related case-studies in management.

Prerequisites / notice
Not for MSc students belonging to D-MTEC!

Literature
Mikroökonomie (Pearson Studium - Economic VWL) Gebundene Ausgabe, August 2013, Robert S. Pindyck, Dr. Daniel L. Rubinfeld.

227-0076-00L
Electrical Engineering II (W 4 credits 2V+2U J. Biela)

Abstract
Signals and systems in the time and frequency domain, principle of operation and design of basic analog and digital circuits, analog-digital conversion. Basic power electronic circuits, design of magnetic components, electromechanical energy conversion, principle of operation and characteristics of transistors and selected rotating electrical machines.

Objective
see above

Content

401-0435-00L
Computational Methods for Engineering Applications II (W 4 credits 2V+2U S. Mishra)

Abstract
The course gives an introduction to the numerical methods for the solution of ordinary and partial differential equations that play a central role in engineering applications. Both basic theoretical concepts and implementation techniques necessary to understand and master the methods will be addressed.

Objective
At the end of the course the students should be able to:
- implement numerical methods for the solution of ODEs (= ordinary differential equations);
- identify features of a PDE (= partial differential equation) based model that are relevant for the selection and performance of a numerical algorithm;
- implement the finite difference, finite element and finite volume method for the solution of simple PDEs using C++;
- read engineering research papers on numerical methods for ODEs or PDEs.

Data: 06.12.2017 12:57 Autumn Semester 2015 Page 917 of 1432
Content
Initial value problems for ODE: review of basic theory for ODEs, Forward and Backward Euler methods, Taylor series methods, Runge-Kutta methods, multi-step methods, predictor-corrector methods, basic stability and consistency analysis, numerical solution of stiff ODEs.
Two-point boundary value problems: Green's function representation of solutions, Maximum principle, finite difference schemes, stability analysis.
Elliptic equations: Laplace's equation in one and two space dimensions, finite element methods, implementation of finite elements, error analysis.
Hyperbolic equations: Linear advection equation, method of characteristics, upwind schemes and their stability. Burgers equation, scalar conservation laws, shocks and rarefactions, Riemann problems, Godunov type schemes, TVD property.

Lecture notes
Script will be provided.

Literature
Chapters of the following book provide supplementary reading and are not meant as course material:

Prerequisites / notice
(Suggested) Prerequisites:
Analysis I-III (for D-MAVT), Linear Algebra, CMEA I, basic familiarity with programming in C++.

151-3207-00L Lightweight W 4 credits 4G P. Ermanni
Abstract The lecture embraces lightweight materials, construction techniques, design principles and calculation methods for the analysis of the load bearing and failure behavior of lightweight structures.
Objective The course aims to impart basic principles for the understanding and for the design and dimensioning of modern lightweight constructions in mechanical, automotive and aerospace engineering.
Content Light metals and fiber reinforced plastics, technologies and construction techniques, frames and truss structures, bending, shear and torsion of open and closed, thin-walled constructions, statically indetermined systems, stability of thin-walled systems.
Lecture notes Handouts

Focus Project

Focus Projects in Mechatronics

151-0073-30L Submersible Robot for Underwater Scanning This course is part of a one-year course. The 14 credit points will be issued at the end of FS2016 with new enrolling for the same Focus-Project in FS2016.
For MAVT BSc and ITET BSc only.

Prerequisites for the focus projects:
a. Basis examination successfully passed
b. Block 1 and 2 successfully passed

Abstract Students develop and build a product from A-Z! They work in teams and independently, learn to structure problems, to identify solutions, system analysis and simulations, as well as presentation and documentation techniques. They build the product with access to a machine shop and state of the art engineering tools (Matlab, Simulink, etc).
Objective The various objectives of the Focus Project are:
- Synthesizing and deepening the theoretical knowledge from the basic courses of the 1. - 4. semester
- Team organization, work in teams, increase of interpersonal skills
- Independence, initiative, independent learning of new topic contents
- Problem structuring, solution identification in indistinct problem definitions, searches of information
- System description and simulation
- Presentation methods, writing of a document
- Ability to make decisions, implementation skills
- Workshop and industrial contacts
- Learning and recession of special knowledge
- Control of most modern engineering tools (Matlab, Simulink, CAD, CAE, PDM)
- Convert and experience technical solutions

Prerequisites / notice
This Focus-Project is supervised by the following lecturers:
Siegwart, R., ASL
Haas, R., ASL
Beardsley P., Disney Research Zurich

151-0073-10L Remote Controlled Walking Excavator This course is part of a one-year course. The 14 credit points will be issued at the end of FS2016 with new enrolling for the same Focus-Project in FS2016.
For MAVT BSc and ITET BSc only.

Prerequisites for the focus projects:
a. Basis examination successfully passed
b. Block 1 and 2 successfully passed

Abstract
Students develop and build a product from A-Z! They work in teams and independently, learn to structure problems, to identify solutions, system analysis and simulations, as well as presentation and documentation techniques. They build the product with access to a machine shop and state of the art engineering tools (Matlab, Simulink, etc).

Objective
The various objectives of the Focus Project are:
- Synthesizing and deepening the theoretical knowledge from the basic courses of the 1. - 4. semester
- Team organization, work in teams, increase of interpersonal skills
- Independence, initiative, independent learning of new topic contents
- Problem structuring, solution identification in indistinct problem definitions, searches of information
- System description and simulation
- Presentation methods, writing of a document
- Ability to make decisions, implementation skills
- Workshop and industrial contacts
- Learning and recess of special knowledge
- Control of most modern engineering tools (Matlab, Simulink, CAD, CAE, PDM)
- Convert and experience technical solutions

151-0075-20L | Formula Student Electric - Chassis and Suspension | W | 0 credits | 15A | P. Hora |

For MAVT BSc and ITET BSc only.
Prerequisites for the focus projects:
a. Basis examination successfully passed
b. Block 1 and 2 successfully passed

**Objective**

**Abstract**

Students develop and build a product from A-Z! They work in teams and independently, learn to structure problems, to identify solutions, system analysis and simulations, as well as presentation and documentation techniques. They build the product with access to a machine shop and state of the art engineering tools (Matlab, Simulink, etc).

**Content**

Several teams of 4-8 students of the ETH as well as students from other universities realize a product during two semesters. On the basis of a vision and provocative problem definition, all processes of product development are beat down close-to-reality: conception, design, engineering, simulation, draft and production. The teams are coached by experienced staff who gives them the possibility of a unique learning experience.

Innovative ideas of the research labs of the ETH, of industrial partners or students are selected and realized by the teams.

**Prerequisites / notice**

This Focus-Project is supervised by the following lecturers:
Hora, P.
Heingärtner, J.

Course: Practice Course to Focus Projects on CAD and CAE

**Title:** Practice Course to Focus Projects on CAD and CAE Based on Siemens NX

**ECTS:** 3 credits

**Weeks:** W

**Number of participants:** limited to 30.

**Primary target group:** Only students for focus projects. 2 up to 3 students per focus project.

**Abstract:** This course provides comprehensive input to ongoing focus project teams in the areas of CAD and CAE with Siemens NX. Other topics can be chosen on top. Participants will receive tips, hints and background information from experienced tutors applicable to current projects. The course presents an overview of measurement tasks in engineering environments. Different concepts for the acquisition and processing of typical measurement quantities are introduced. Following an initial in-class introduction, laboratory exercises from different application areas (especially in thermofluidics and process engineering) are attended by students in small groups.

**Objective:**
- Getting aware of all project related aspects (problem understanding, user identification, generation of solution ideas)
- Learning about different approaches in Product Development (iteration, prototyping, testing, project management)
- Developing soft skills (presenting, giving and getting feedback, team composition and roles)
- Getting ready to start (motivation, vision, critical thinking, project plan)

**Content:**
- CAD with Siemens NX
  - 1 day of intensive training (1x8L)
- CAE with Siemens NX
  - 2 separate days of intensive training (2x8L)
- Further Topics, free choice (each 1x4L)
  - FreeForm-Modelling, CAE Integration in TeamCenter PDM, Design methodology

**Lecture notes:** Lecture notes and documentation will be electronically available.

**Prerequisites / notice:**
- only for students participating in a Focus Project in the same semester
- not more than 30 students

**Number of participants:** limited to 30

**Primary target group:** Only students for focus projects. 2 up to 3 students per focus project.

**Abstract:** This course provides comprehensive input to ongoing Focus Projects teams in the areas of project management, dealing with the media, and business and interpersonal skills. The course focuses on the following areas:
- Getting ready to start (motivation, vision, critical thinking, project plan)
- Developing soft skills (presenting, giving and getting feedback, team composition and roles)
- Learning about different approaches in Product Development (iterations, prototyping, testing, project management)
- Getting ready to start (motivation, vision, critical thinking, project plan)

**Objective:**
- Getting aware of all project related aspects (problem understanding, user identification, generation of solution ideas)
- Developing soft skills (presenting, giving and getting feedback, team composition and roles)
- Getting ready to start (motivation, vision, critical thinking, project plan)

**Content:**
- Project planning and controlling
- Problem solving cycle and decision taking transparent for others
- Communication
  - Public Relations in a Nutshell
  - How to acquire and manage suppliers and sponsors
- Technical reports
- Creativity and Solution Finding
  - Creativity methodology
  - Design methodology and product validation
- Issues regarding patents

**Lecture notes:** Lecture notes and documentation will be electronically available.

**Prerequisites / notice:**
- only for students participating in a Focus Project in the same semester
- not more than 30 students
Focused Study: Selected Topics in Research and Application in Energy, Flows and Processes

Abstract
Independent studies on a defined field in energy, flows, and processes.

Objective

</table>
| Objective | Overview of Mechatronics topics and study subjects. Identification of minimum 10 pertinent refereed articles or works in the literature in consultation with supervisor or instructor. After 4 weeks, submission of a 2-page proposal outlining the value, state-of-the-art and study plan based on these articles. After feedback on the substance and technical writing by the instructor, project commences.
| Content | The students are familiar with the challenges of the fascinating and interdisciplinary field of Mechatronics and Mikrosystems. They are introduced in the basics of independent non-experimental scientific research and are able to summarize and to present the results efficiently.
| Lecture notes | Will be available |
| Literature | 376-1504-00L | Physical Human Robot Interaction (pHRI) | 4 credits | 2V+2U | R. Gassert, O. Lamercy, R. Riener |
| Objective | The objective of this course is to give an introduction to the fundamentals of physical human-robot interaction. After an overview of human haptic, visual, auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits. Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (http://eduhaptics.org/index.php/HapticDevices/HapticPaddles), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.
| Content | The students work independently on a study of selected topics in the field of Mechatronics or Microsystems. They start with a selection of scientific papers to continue literature research. The results (e.g. state-of-the-art, methods) are evaluated with respect to predefined criteria. Then the results are presented in an oral presentation and summarized in a report, which takes the discussion of the presentation into account.
| Lecture notes | Will be available on course website. |
Fields of application of power electronic systems. Principle of operation of basic pulse-width modulated and line-commutated power

Lecture notes and associated exercises including correct answers, simulation program for interactive self-learning including visualization/animation features.

Prerequisites: Basic knowledge of electric circuit analysis and signal theory.

Prerequisites / notice
The registration is limited to 26 students. There are 4 credit points for this lecture. The lecture will be held in English. The students are expected to have basic control knowledge from previous classes.

Notice:
Devices and Scenarios, pages 157-162.

The students are expected to have basic control knowledge from previous classes.

Abstract
Students are introduced to the basics of micromachining and silicon process technology and will learn about the fabrication of microsystems and -devices by a sequence of defined processing steps (process flow).

Objective
Students are introduced to the basics of micromachining and silicon process technology and will understand the fabrication of microsystem devices by the combination of unit process steps (+ process flow).

Content
- Introduction to microsystems technology (MST) and micro electro mechanical systems (MEMS)
- Basic silicon technologies: Thermally grown oxide, phosphosilicate glass, and silicon germanium
- Specific microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical and thermal properties, piezoelectric and piezoresistive materials
- Selected microsystems: Mechanical sensors and actuators, microresonators, thermal sensors and actuators, system simulation and encapsulation.

Lecture notes
Handouts (available online)

J. W. Kolar

Abstract
Fields of application of power electronic systems. Principle of operation of basic pulse-width modulated and line-commutated power electronic converters, analysis of the operating behavior and of the control oriented behavior, converter design. Reduction of effects of line-commutated rectifiers on the mains, electromagnetic compatibility.

Objective
Fields of application of power electronic systems. Principle of operation of basic pulse-width modulated and line-commutated power electronic converters, analysis of the operating behavior and of the control oriented behavior, converter design. Reduction of effects of line-commutated rectifiers on the mains, electromagnetic compatibility.

Content

Lecture notes
Lecture notes and associated exercises including correct answers, simulation program for interactive self-learning including visualization/animation features.

Prerequisites / notice
Prerequisites: Basic knowledge of electric circuit analysis and signal theory.
Abstract
In the course "Drive System II" the power semiconductors are repeated. The creation of converters based on the combination of switches/cells and based topologies is explained. Another main focus is on the 3-level inverter with its switching and transfer functions. Further topics are the control of the synchronous machine, of line-side converters and issues with converter-fed machines.

Objective
The students establish a deeper understanding in regards of the design of the main components of an electrical drive system. They establish knowledge on the most important interaction with the grid and the machine and their related high dynamic control.

Content
Converter topologies (switch or cell based), multi-pulse diode rectifiers, system aspects of transformer and electrical machines, 3-level inverter with its switching and transfer functions, grid side harmonics, modeling and control of synchronous machines (including permanent magnet machines), control of line-side converters, reflection effects with power cables, winding induction and bearing stress. Field trip to ABB Semiconductors.

Lecture notes
Skript is sold at the beginning of the lectures or can be downloaded from Ilias.

Literature
Skript of lecture; References in skript to related technical publications and books.

Prerequisites / notice
Prerequisites: Electrical Drive Systems I (recommended), Basics in electrical engineering, power electronics, automation and mechatronics.

Abstract
Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course students are expected to submit assignments. The course concludes with an end-of-semester examination.

Objective
The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, the technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content
Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes
The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

Prerequisites / notice
The lecture will be taught in English.

Abstract
The class gives an overview of fundamental concepts in nanoscale engineering. Mobility of small objects, interacting forces, surface tensions and wetting phenomena are some of the physical phenomena investigated. These will be applied to the description of formation and growth of nanoparticles and thin films as well as nanofabrication technologies.

Objective
The goal of the lecture is to familiarize the students with the basic phenomena occurring on the nanometer scale, thereby illustrating the links to physics, chemistry, materials science, and biology. A further objective is to demonstrate the development of technologies and processes based on or including nanoscale phenomena.

Content
- Nanoparticle building blocks for device fabrication
- Particle size distributions and size selection
- Nanoparticle formation
- Forces between small objects
- Control of nanoparticle properties in the gas-phase
- The electric double layer
- Characterization of nanomaterials
- Microscopes and tools for nanoscale objects
- Thin film formation
- Nanofabrication
- Small “hands-on” research project including project presentations and reporting

Abstract
The students get familiarized with the challenges of the fascinating and interdisciplinary field of Micro- and Nanosystems. They are introduced to the basics of independent non-experimental scientific research and are able to summarize and to present the results efficiently.
Objective

The students get familiarized with the challenges of the fascinating and interdisciplinary field of Micro- and Nanosystems. They are introduced to the basics of independent non-experimental scientific research and are able to summarize and to present the results efficiently.

Content

Students work independently on a study of selected topics in the field of Micro- and Nanosystems. They start with a selection of scientific papers, and continue with an independent literature research. The results (e.g. state-of-the-art, methods) are evaluated with respect to predefined criteria. Then the results are presented in an oral presentation and summarized in a report, which takes the discussion of the presentation into account.

<tr>
<td>Objective</td>
<td>Electromagnetic oscillations known as surface plasmon polaritons have many unique properties that are useful across a broad set of applications in biology, chemistry, physics, and optics. The field of plasmonics has arisen to understand the behavior of surface plasmon polaritons and to develop applications in areas such as catalysis, imaging, photovoltaics, and sensing. In particular, metallic nanoparticles and patterned metallic interfaces have been developed to utilize plasmonic resonances. The aim of this course is to provide the basic knowledge to understand and apply the principles of plasmonics. The course will strive to be approachable to students from a diverse set of science and engineering backgrounds.</td>

The course "Machine tool metrolgy" deals with the principal design of machine tools, their spindles and linear axes, as well as process monitoring.

Deeper insight in the machining processes and their optimisation, chip removal by undefined cutting edge, such as grinding, honing and lapping, machining processes without cutting edges, such as EDM, extrusion, plugging, open die forging, drop forging, milling; active principle; elementary methods to estimate stress and strain; fundamentals of process design; manufacturing limits and machining accuracy; tools and operation; machinery and machine usage.

Deeper discussion on the machining processes and their optimisation. Outlook for additional areas such as NC-Technique, dynamics of processes and machines, chatter as well as process monitoring.

Overview of the most important forming processes and its field of applications. This includes, together with the acquirements of the most important forming processes, the characterization of plastic material behavior and manufacturing limits.

Overview of the most important processes of metal-forming technology and its industrial applications. This includes, together with the acquirements of the most important forming processes, the manufacturing process in metal-working industries. Typical applications of forming technology range from the manufacturing of sheet metal components in auto bodies to applications in food and pharma packaging, fabrication of implants in medical technologies and to the fabrication of leads in microelectronic components. This course introduces the fundamentals which are essential to evaluate metal-forming processes and its industrial applications. Objective: The student learns the right use of (Who? When? How?) of the event-driven and computer-based simulation in the illustration of the operating procedures and the production facilities. Operating simulation in the productions, logistic and scheduling will be shown by means of practical examples. The student should make his first experiences in the use of computer-based simulation.

Content:
- Application and application areas of the event-driven simulation
- Exemplary application of a software tool (Technomatrix-Simulation-Software)
- Internal organisation and functionality of simulation tools
- Procedure for application: optimizing, experimental design planning, analysis, data preparation
- Controlling philosophies, emergency concepts, production in sequence, line production, rescheduling
- Application on the facilities projecting

Lecture notes: The knowledge is enhanced by practice-oriented exercises and an excursion. A guest speaker will present a practical example.

Prerequisites / notice: Recommended for all Bachelor Students in the 5th semester and Master Students in the 7th semester.

---

**151-0833-00L**

**Principles of Nonlinear Finite-Element-Methods**

| W | 5 credits | 2V+2U | N. Manopulo, B. Berisha |

Objective: The goal of the lecture is to provide the students with the fundamentals of the non linear Finite Element Method (FEM). The lecture focuses on the principles of the non linear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Methods are simulations of:

- Crash
- Collapse of structures
- Materials in Biomechanics (soft materials)
- General forming processes

Content:
- Fundamentals of continuum mechanics to characterize large plastic deformations
- Elastic-plastic material models
- Updated-Lagrange (UL), Euler and combined Euler-Lagrange (ALE) approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- Modeling of crack propagation
- Introduction of advanced FE-Methods

Lecture notes: yes

Prerequisites / notice: If we will have a large number of students, two dates for the exercises will be offered.

---

**227-0113-00L**

**Power Electronics**

| W | 6 credits | 4G | J. W. Kolar |

Abstract: Fields of application of power electronic systems. Principle of operation of basic pulse-width modulated and line-commutated power electronic converters, analysis of the operating behavior and of the control oriented behavior, converter design. Reduction of effects of line-commutated rectifiers on the mains, electromagnetic compatibility.

Objective: Fields of application of power electronic systems. Principle of operation of basic pulse-width modulated and line-commutated power electronic converters, analysis of the operating behavior and of the control oriented behavior, converter design. Reduction of effects of line-commutated rectifiers on the mains, electromagnetic compatibility.

Content:

Lecture notes: Lecture notes and associated exercises including correct answers, simulation program for interactive self-learning including visualization/animation features.

Prerequisites / notice: Prerequisites: Basic knowledge of electric circuit analysis and signal theory.

---

**151-0573-00L**

**System Modeling**

| W | 4 credits | 2V+2U | G. Ducard, C. Onder |

Content:
- Introduction to generic system modeling approaches for control-oriented models based on first principles and on experimental data. Examples: mechatronic, energy, and process engineering systems. Model scaling, linearization, order reduction, and balancing. Planning of experiments, estimation techniques for "gray-box" models (linear and nonlinear least-squares methods). The exercises are solved in teams. One larger case study is to be solved.

Lecture notes: The handouts in English will be sold in the first lecture.

Literature: A list of references is included in the handouts.

---

**151-0141-00L**

**Focused Study: Selected Topics in Research and Application in Manufacturing Science A**

| W | 1 credit | 2A | K. Wegener |

Abstract: Specialization "Manufacturing Science". Please discuss

Exclusive for D-MAVT Bachelor-students of Focus
Biomedical Engineering

**Introduction to Biomedical Engineering I**

- **Number**: 376-0021-00L
- **Type**: W
- **ECTS**: 4
- **Hours**: 3G
- **Lecturers**: R. Müller, P. Christen, J. G. Snedeker, M. Zenobi-Wong

**Objective**
Understanding of physical and technical principles in biomechanics, biomaterials, tissue engineering, medical imaging as well as the history of biomedical engineering.

**Content**
- Tissue and Cellular Biomechanics
- Molecular Biomechanics
- Biopolymers
- Computational Biomechanics
- Tissue Engineering
- Radiation and Radiographic Imaging
- Diagnostic Ultrasound Imaging
- Magnetic Resonance Imaging
- Biomedical Optics and Lasers

**Lecture notes**
Slides of the lectures, relevant journal papers and users manuals will be provided.

**Literature**

**Introduction to Nanoscale Engineering**

- **Number**: 151-0619-00L
- **Type**: W
- **ECTS**: 5
- **Hours**: 2V+3P
- **Lecturers**: S. E. Pratsinis, D. J. Norris, A. R. Moryson, D. Mohr

**Objective**
The goal of the lecture is to familiarize the students with the basic phenomena occurring on the nanometer scale, thereby illustrating the links to physics, chemistry, materials science, and biology. A further objective is to demonstrate the development of technologies and processes based on or including nanoscale phenomena.

**Content**
- Nanoparticle building blocks for device fabrication
- Particle size distributions and size selection
- Nanoparticle formation
- Forces between small objects
- Control of nanoparticle properties in the gas-phase
- Thin film formation
- Nanofabrication
- Small “hands-on” research project including project presentations and reporting

**Energy Conversion and Transport in Biosystems**

- **Number**: 151-0255-00L
- **Type**: W
- **ECTS**: 4
- **Hours**: 2V+1U
- **Lecturers**: D. Poulikakos, A. Ferrar

**Objective**
Theory and application of thermodynamics and energy conversion in biological systems and biomedicine at the macro scale and the cellular level.

**Lecture notes**
Lecture notes are handed out during the individual lessons (CHF 20.-).

**Prerequisites**
Course in continuum mechanics (mandatory), finite element method (recommended)
### Course Description

**Objective**
Theory and application of energy conversion at the macro scale and the cellular level. Understanding of the basic features governing fluid transport in the principal systems of the human cell. Connection of characteristics and patterns from other fields of engineering to biofluidics. Heat and mass transport processes within the human body and relation to biomedical technologies.

**Content**
Mass transfer models for the transport of chemical species in the human cell. Organization and function of the cell membrane and of the cell cytoskeleton. The role of molecular motors in cellular force generation and their function in cell migration. Description of the functionality of these systems and of analytical experimental and computational techniques for understanding of their operation. Introduction to bioengineering approaches for the treatment of common pathogenic conditions of these systems. Introduction to cell metabolism, cellular energy transport and cellular thermodynamics.

**Lecture notes**
Script as well as additional material in the form of hand-outs will be distributed.

**Literature**
Lecture notes and references therein.

**Objective**

- **Microrobotics**
  - The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

- **Microsystems Technology**
  - Students are introduced to the basics of micromachining and silicon process technology and will learn about the fabrication of microsystems and -devices by a sequence of defined processing steps (process flow).

- **Physical Human Robot Interaction (pHRI)**
  - The objective of this course is to give an introduction to the fundamentals of physical human-robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

**Content**

- **Microrobotics**
  - Main topics of the course include:
    - Scaling laws at micro/nano scales
    - Electrostatics
    - Electromagnetism
    - Low Reynolds number flows
    - Observation tools
    - Materials and fabrication methods
    - Applications of biomedical microrobots

- **Microsystems Technology**
  - Students are introduced to the basics of micromachining and silicon process technology and will understand the fabrication of microsystems devices by the combination of unit process steps (= process flow).

- **Physical Human Robot Interaction (pHRI)**
  - This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.

**Prerequisites / notice**

- **Microrobotics**
  - The lecture will be taught in English.

- **Microsystems Technology**
  - The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

- **Physical Human Robot Interaction (pHRI)**
  - The lecture notes will be distributed through the document repository before the lectures.

**Literature**

Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the

S. Kozerke

Basic theories for solving continuum mechanics problems of engineering applications, with particular attention to material models.

6 credits

The class consists of three parts:

1. Introduction into molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials introduced.

2. The concept of biocompatibility.

3. Introduction into methodology used in biomaterials research and application.

Objective

227-0385-10L Biomedical Imaging

New course. Not to be confused with 227-0385-00L of fall 2014.

W 6 credits 5G S. Kazerke, U. Moser, K. P. Prüssmann, M. Rudin

Abstract

Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.
Movement and Sport Biomechanics

Objective
Students are able to describe the human body as a mechanical system. They analyse and describe human movement according to the laws of mechanics.

Content
Movement and sport biomechanics deals with the attributes of the human body and their link to mechanics. The course includes topics such as functional anatomy, biomechanics of daily activities (gait, running etc.) and looks at movement in sport from a mechanical point of view. Furthermore, simple reflections on the loading analysis of joints in various situations are discussed. Additionally, questions covering the statics and dynamics of rigid bodies, and inverse dynamics, relevant to biomechanics are investigated.

Abstract
In this lecture the basics as well as practical aspects (from modelling to design and fabrication) are described from a solid and fluid mechanics perspective with applications to microsystems and lab on a chip devices.

Literature

Prerequisites / Notice
Prerequisites / Notice
Solid and fluid continuum mechanics. Notice: The exercise part is a mixture of presentation, lab session and hand in homework.

Systems Dynamics and Complexity

Objective
A successful participant of the course is able to:
- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyse the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics

Content
Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical systems dynamics, nonlinear dynamics and macroeconomic modeling.

The course is structured along three main tasks:
1. Finding solutions
2. Implementing solutions
3. Controlling solutions

PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Abstract
Finding solutions: what is complexity, problem solving cycle.

Implementing solutions: project management, critical path method, quality control feedback loop.

Controlling solutions: Vensim software, feedback cycles, control parameters, instabilities, chaos, oscillations and cycles, supply and demand, production functions, investment and consumption

Logistics, Operations and Supply Chain Management I

Objective
To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

Content
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

Literature
Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011

Prerequisites / Notice
Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming
Abstract
Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Objective
An effective and efficient flow of goods, data, and control in and between companies contributes significantly to the value added for the customer. Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Content
Strategic and tactical concepts in logistics, operations, and supply chain management: Conflicts of objectives and strategies and in the entrepreneurial context; business process analysis and fundamental logistics concepts; the lean / just-in-time and repetitive manufacturing; concepts for product families and one-of-a-kind production; concepts for the process industry.

Lecture notes

This book also serves as textbook for LOS II (spring term) as well as ERP and SCM software systems (autumn term). In addition powerpoint-handouts and documents for case studies.

Sales at 17.9.15, from 12:45, before and during breaks of the first lecture.

see "script"

Prerequisites / notice
As for the lecture of the 3rd week (BEMAD, a much-liked Business Engineering and Management Ability Development game), this lecture (of Oct. 1) will follow a specific schedule in specific rooms. The schedule will be presented at Sept. 17 during the 1st lecture.

Due to the big number of students, about half of the students will play this game, instead of Oct. 1, at Friday afternoon, Oct. 2. Please be available. Thank you for your help in this matter.

363-0503-00L
Principles of Microeconomics
W 3 credits 2G M. Filippini

The course introduces basic principles, problems and approaches of microeconomics.

The course includes the following main topics:

Basic principles of demand and supply, market and state in a modern economy, externalities, cost analysis, consumer behaviour, economies of scale and economies of scope, perfect competition, monopoly, oligopoly, monopolistic competition, mathematical treatment of some basic concepts.

Lecture notes
Lecture notes, exercises and reference material can be downloaded from Moodle.

The book can also be used for the course 'Principles of Macroeconomics' (Sturm)

For students taking only the course 'Principles of Microeconomics' there is a shorter version of the same book:

Complementary:

363-0565-00L
Principles of Macroeconomics
W 3 credits 2V J.E. Sturm

This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation. What significance do international economic relations have for Switzerland?

This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? What is the best way to protect the environment? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

Lecture notes
The course webpage (to be found at http://www.kof.ethz.ch/en/events/teaching/) contains announcements, course information and lecture slides.

Literature

We advise you to also buy access to Aplia. This internet platform will support you in learning for this course. To save money, you should buy the book together with Aplia. This is sold as a bundle (ISBN: 9781473715998).

Besides this textbook, the slides and lecture notes will cover the content of the lecture and the exam questions.

351-0778-00L
Discovering Management

Entry level course in management for BSc, MSc and PHD students at all levels not belonging to D-MTEC. This course can be complemented with Discovering Management (Exercises) 351-0778-01.

Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. The module provides an overview of the principles of management, teaches knowledge about management that is highly complementary to the students' technical knowledge, and provides a basis for advancing the knowledge of the various subjects offered at D-MTEC.

Abstract
### Objective
Discovering Management offers an integrated learning system, which combines in an innovate format a set of lectures, an advanced business game simulation and a set of group exercises involving industry speakers (ranging from leading venture capitalists to executives at established corporations). Unlike more traditional courses, the learning model for Discovering Management involves 'learning by doing'. While the 13 different lectures, in-class discussions and assigned readings provide the theoretical and conceptual foundations, the experiential learning outcomes result from the interrelated group activities: 1) the interactive case studies and exercises, and 2) the business game simulation.

By discovering the key aspects of entrepreneurial management, the purpose of the course is to advance students' understanding of factors driving company success, where success is understood as a broad construct including financial return, employee, customer and supplier satisfaction as well as social and ecological responsibility.

Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Entrepreneurial Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich. No prior knowledge of business or economics is required to successfully complete this course.

### Content
The lectures for Discovering Management are designed to broaden the participant's understanding of the principles of entrepreneurial management, emphasizing the interdependence of various specialties in the development and management of a firm. For this reason, the lectures are structured on the basis of a coherent business model and will be presented by the respective area specialists at D-MTEC.

The lectures broaden the view and the understanding of technology by interlinking it with society. Corporate sustainability, for example, introduces economic, ecological and social issues that are relevant to all engineering disciplines. Practical examples stimulate the students to assess these issues and be aware of their responsibilities as engineers. Technology and innovation management, to mention a second example, focuses on the interplay of technical and organizational change, and how these often neglected interactions explain why many new technologies are never used. It fosters the students' ability to see the business and social consequences of their 'technical' decisions.

Critical skills will be trained by the case study exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of the decision maker, as they learn more about the specific case and identify the challenge they are faced with. Students will be presented real case scenarios by industry guests from established corporations and will have to critically analyze specific issues. The case study exercise will provide an insight into the context of a managerial problem-solving and enhance the participant's appreciation for the complex tasks companies deal with.

Discovering Management attempts to overcome the limitations of traditional teaching curricula of management in technical universities, which often merely focus on transferring specific skills to students, e.g. planning or forecasting. In response to the new challenges for entrepreneurial decision-making, students will be offered the opportunity to actively engage in an advanced business game simulation; a business game that establishes a link between business management theory and business management in practice. The simulation presents a realistic model of a company and provides participants with the opportunity to quickly gain the lasting effects of practical experience in a risk-free environment. All this provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyze the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities.

Discovering Management attempts to overcome the limitations of traditional teaching curricula of management in technical universities, which often merely focus on transferring specific skills to students, e.g. planning or forecasting. In response to the new challenges for entrepreneurial decision-making, students will be offered the opportunity to actively engage in an advanced business game simulation; a business game that establishes a link between business management theory and business management in practice. The simulation presents a realistic model of a company and provides participants with the opportunity to quickly gain the lasting effects of practical experience in a risk-free environment. All this provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyze the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities.

Critical skills will be trained by the case study exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of the decision maker, as they learn more about the specific case and identify the challenge they are faced with. Students will be presented real case scenarios by industry guests from established corporations and will have to critically analyze specific issues. The case study exercise will provide an insight into the context of a managerial problem-solving and enhance the participant's appreciation for the complex tasks companies deal with.

Overview of the grand sustainability challenges of Water, Energy, Mobility, and Food

This course intends to enable all students to:

C. Sustainability

This course focuses on the analysis of innovation as a pervasive process that cut across organizational and functional boundaries. It looks at the sources of innovation, at the tools and techniques that organizations deploy to routinely innovate, and the strategic implications of technical change.

Objective

- Understand the limits and the potential of corporate sustainability for sustainable development
- Be able to recognize and realize opportunities for corporate sustainability in a business environment

Content

Overview of the grand sustainability challenges of Water, Energy, Mobility, and Food

Critical thinking skills for corporate sustainability

Literature

Presentation slides will be distributed prior to lectures.

Lecture notes

Will be provided

Prerequisites / notice

No specific background in economics or management is required.

Autumn Semester 2015
The aim of the course is to introduce students to the engineering design research and practice in a multitude of Mechanical Engineering disciplines and convey knowledge from both academia and industry about state of the art methods, tools and processes.

Each talk is introduced and moderated by the students. The project work is supported by selected teaching units.

The project is structured as described below:
- Concept development
- design of the component including FEM simulation and stability checks
- manufacturing and structural testing of a prototype
- manufacturing and structural testing of an improved component
- Report

The project work is supported by selected teaching units.

The lecture teaches on the basic knowledge of major processes in sheet metal, tube and bulk metal forming technologies. In particular it focuses on fundamental computation methods, which allow a fast assessment of process behaviour and a rough layout. Process-specific states of stress and deformation are analysed and process limits are identified.

The study of metal working processes: sheet metal forming, folding die cutting, cold bulk metal forming, ro extrusion, plunging, open die forging, drop forging, milling; active principle; elementary methods to estimate stress and strain; fundamentals of process design; manufacturing limits and machining accuracy; tools and operation; machinery and machine usage.

The task of each team (typically 2-4 students) is the realization of a load-carrying structure with selected materials. The teams are free to develop the skills to identify and solve typical problems of the structure mechanics on a real application. Other important aspects are to foster team work and team spirit, to link theoretical knowledge and practice, to gather practical experiences in various fields related to lightweight structures such as design, different CAE-methods and structural testing.

The project work is supported by selected teaching units.

The fundamentals of forming technology are represented to Mechanical, Production and Material Engineers. The content of the lecture is: Overview of manufacturing with forming techniques, deformation specific description of material properties and their experimental measurement, material laws, residual stresses, heat balance, tribological aspects of forming processes, workpiece and tool failure.

Overview of the most important processes of metal-forming technology and its field of applications, characterization of the plastic metal-forming behavior, basic principles of plasto-mechanical calculations, metal-forming residual stresses, thermo-mechanical coupling of metal-forming processes, influence of tribology. Work piece failure through cracking and folding, tool failure through rupture and mechanical wear, metal-forming tools, sheet forming and massive forming processes, handling systems, metal-forming machinery.
The students are exposed to a variety of topics in the field of Engineering Design. Topics are bundled in three main grand challenges and include an introductory lecture held by one of the responsible Professors and 2-3 invited talks of 45 min. each, addressing specific issues. The success of the course is largely dependant on active involvement of the students. Accordingly, a small group of students (1-3) is asked to introduce and moderate each external talk. The group will therefore gather adequate information about the speaker and topic, read and synthesize relevant documents and scientific papers, prepare questions to motivate the interaction with the audience and summarize, at the end of the lecture, the discussed points and outcome.

Abstract
Introduction of integrated CAD applications CAM (Computer Aided Manufacturing), Motion Simulation (Kinematics)

Objective
The participants learn the possibilities of integrated CAD applications. The goal is to understand the procedures and the most important functions of these applications.

Content
CAM: Introduction to CAM, practical examples for a 3-axle milling machine
Motion simulation (kinematic): Introduction to the possibilities of the movement simulator. Practical examples.

Prerequisites / notice
Voraussetzungen:
- CAD-Grundkenntnisse in NX (CAD 1. Sem.)
- Eigene Laptop mit installierter, lauffähiger Software NX für die Durchführung der Übungen (Siemens NX kann über Stud-IDES kostenlos bestellt werden).

151-0027-10L Engineering Tool IV/V: Programming with LabView
All Engineering Tool courses are for MAVT-Bachelor students only.

Number of participants limited to 16.

Abstract
An introduction is given to the LabView programming environment. The basic concepts of “virtual instruments” and data flow programming are presented. Computer-based exercises are solved during class. A simple electronic data acquisition module is used to demonstrate basic concepts of interface management and data acquisition.

Objective
Introduction to the LabView programming environment.
Understanding of fundamental concepts: virtual instruments, data flow programming, control structures, data types etc.
Development of basic programming skills using in-class exercises on computers.

Lecture notes
Wird abgegeben

Prerequisites / notice
Prerequisite is knowledge of Matlab.

151-0030-10L Engineering Tool IV/V: Modelling and Servo Axis Control of Machine Tool Manipulators
All Engineering Tool courses are for MAVT-Bachelor students only.

Number of participants limited to 30.

Abstract
This course covers model building and the applied stimulation of (power-assisted axles on production machinery using MATLAB/Simulink and provides a practical example of how drive parameters may be set up, how through simulation an optimal axis design can be developed and which characteristics of a production machine can be reliably estimated in advance.

Objective
The students are able to model servo axes considering all relevant components and process influences to simulate the achievable productivity.

Content
1. Introduction, complexity levels in model building for production machines.
2. Complexity level 1: Power-assisted axles, transmission systems, general structural model.
3. Complexity level 2: Robotic models, kinematics and dynamics
4. Complexity level 3: Multi-body models and finite element models
5. Regulation of power-assisted axes, cascade regulator and state regulator extensions.
7. Master slave and gantry operations with dispersed servo drive.
8. Simulation examples in MATLAB/Simulink (Swivel axle, 5-axle milling machine, parallel kinematic milling machine, industrial robots).

151-0032-10L Engineering Tool IV: Introduction to the Methods of Six Sigma Quality Control and Lean Production
All Engineering Tool courses are for MAVT-Bachelor students only.

Number of participants limited to 36.

Abstract
The course introduces to Six Sigma quality management and quality improvement, which aims to reduce process variation and to sustain process capability. It introduces also to the Lean production principles, aiming to reduce waste within the processes as well as aiming to a customer taked pull-production.

Objective
The participant gets an overview to the Operational Excellence philosophy and the working methods of these two approches. He learns the most important tools and the interaction of these two approches.
1. Understanding the changing environment
- Globalization, customer requirements, production systems
- Six Sigma quality philosophy
- Lean Manufacturing and TPS (Toyota Production System)

2. Quality management with Six Sigma
- What is Six Sigma
- DMAIC problem solving cycle
- Use of different control charts
- Evaluate process capability, DPMO, Cp, Cpk, Taguchi
- Cause-effect diagram
- Control plan and sustainability, PDCA

3. Introduction to the Lean approach
- Lean goals and principles
- A3 project management
- The 9 types of waste
- Value add and non value add activities
- The 8 Lean-Tools, whereof 4
- 5S workplace organization
- Value stream mapping (exercise), Little’s law
- Continuous flow vs batch
- Pull Principles, Kanban, DBR
- Cell design
- Linear Programming

4. Lean and Six Sigma in practice
- How fits Lean and Six Sigma together
- Continuous Improvement/Kaizen organization
- Change-Management, risks
- Inspire deployment approach

Lecture notes
Notes will be distributed.

151-0044-10L  Engineering Tool IV/V: Computational Fluid Dynamics with OpenFoam (CFD) with OpenFoam
All Engineering Tool courses are for MAVT-Bachelor students only.

Number of participants limited to 40.

Abstract
Participants will learn to use the open source simulation software OpenFOAM on a user level (i.e. to conduct classical CFD studies). We will also introduce the students into programming with OpenFOAM so they will be able to implement additional equations into existing solvers.

Objective
Participants will learn to use the open source simulation software OpenFOAM on a user level (i.e. to conduct classical CFD studies). We will also introduce the students into programming with OpenFOAM so they will be able to implement additional equations into existing solvers.

Content
OpenFOAM is a very professional open-source simulation package which is freely (CHF 0.-) available under the GNU General Public License (GPL). It consists of a vast C++ library, many different applications and additional tools. Although most of the existing applications are flow solvers, OpenFOAM can be used in many different areas, as varied as solid dynamics, electromagnetics or pricing of financial options.

Most users make only use of the included applications. One particular strength of OpenFOAM, however, is that new applications and even extensions of the library can be developed in a rather compact and elegant way.

Literature

Prerequisites / notice
Knowing C++ or at least having some experience in another programming language will be of an advantage but is not strictly required to follow this course.

151-0057-10L  Engineering Tool IV/V: Systems Engineering for Project Work
All Engineering Tool courses are for MAVT-Bachelor students only.

Number of participants limited to 60.

Abstract
The course is about a methodical basis of systematic project work, with a focus on demanding interdisciplinary problems. The participants will be shown how to use it appropriately and correctly in their projects. This short course is based on the "Systems Engineering" (SE) method, which was developed at the ETH.

Objective
The goals of this compact course are:
- Goal-oriented identification and perception of relevant problem areas and project goal setting.
- Deduction and development of procedures for a promising project, including systematic planning of the project content.
- Development of work packages including efficient methodology
- Simple embedding of the projects in the organization, including relationships with buyers, users and securing project participation.
1. Nachmittag:
- Einstieg ins Systems Engineering; Entstehung, Inhalt und Werdegang; Voraussetzungen (anspruchsvolle Fragestellungen, institutionelle Einbettung, Systemdenken und heuristische Prinzipien);
- Grundstruktur und Inhalt Lebensphasenmodell; Grundstruktur in Inhalt Problemlöszungszyklus;
- Zusammenspiel von Lebensphasenmodell & Problemlöszungszyklus in Projekten

2. Nachmittag:
- Situationsanalyse: Systemanalyse (Systemabgrenzung (gestaltbarer Bereich, relevante Bereiche des Umsystems)), Methoden der Analyse und Modellierung, Umgang mit Vernetzung, Dynamik und Unsicherheit; wichtigste Methoden der IST-Zustands- und Zukunftsanalyse);
- Zielformulierung (wichtigste Methoden der Zielformulieren),
- Konzeptsynthese und Konzepte Analyse (u.a. Kreativität; wichtigste Methoden der Synthese und Analyse),
- Simulationsanalyse: Analyse des Methodeneinsatzes, Entwickeln alternativer Vorgehensschritte und Auswahl des zweckmäßigsten Vorgehens

3. Nachmittag:
- Beurteilung (u.a. Methoden für mehrdimensionale Kriterienvergleich, z.B. Kosten-Wirksamkeits-Analyse); Diskussion von Planungsbeispielen
- Diskussion von Planungsbeispielen: Analyse des Methodeneinsatzes, Entwickeln alternativer Vorgehensschritte und Auswahl des zweckmäßigsten Vorgehens

Content
- Engineering Tool IV: CAD-Methodology and PDM-Technology in the Focus Project
  All Engineering Tool courses are for MAVT-Bachelor students only.

Objective
- The participants will deepen their existing CAD knowledge and learn new PDM knowledge, so that these may be directly applied and used in the focus project.
  - CAD refresh (Modelling, Assembling, Drafting, etc.) and CAD mythology for construction (Top-Down modelling)
  - Introduction to the Team Center (Siemens PDM System)
  - TeamCenter data flow, in particular the process of creating and managing new Items and Parts, the approval procedure and creating different versions of Parts
  - To refresh already existing knowledge of CAD functionality.
  - i. Sketch and features as well as manipulation and optimizing models.
  - ii. Assembling
  - iii. Drafting
  - Top down modelling CAD
  - i. Introduction to top down modelling and concept modelling
  - ii. Case study of top down modelling
  - 2. Afternoon: Introduction to TC (Team Center)
    - Introduction: Short introduction to PLM (What is the idea of PLM? PLM is more than the pure management of drawings!).
    - Lesson 1 - Team Center Rich Client Interface
    - Lesson 2 - TC data types
    - Lesson 3 - Construction from data in TC
    - Lesson 4 - Searching for and examining data.
  - 3. Afternoon: TC application
    - Lesson 5 - Unit lists (PSE)
    - Lesson 6 - Cross-referencing
    - Lesson 7 - Data release
    - Lesson 8 - Product data examination

Prerequisites / notice
- only one course can be chosen per semester.
- at least two students of a Focus-Team should sign in for this course, if the use of Siemens TeamCenter PLM is given for the Team.
- not more than 25 students

Abstract
- The following topics will be dealt with in depth in the lectures supporting the focus project (Praxiskurs): CAD-Methodology, FE calculations, motion simulation and construction methodology.
- The participants will learn and experiment with procedures by working on concrete examples so that they will subsequently be able to begin with independent product construction.
- The participants will deepen their existing CAD knowledge and learn new PDM knowledge, so that these may be directly applied and used in the focus project.
- To refresh already existing knowledge of CAD functionality.
- Sketch and features as well as manipulation and optimizing models.
- Assembling
- Drafting
- Organisation. working methods, conventions.
- Top down modelling CAD
- Introduction to top down modelling and concept modelling
- Case study of top down modelling

151-0059-10L Engineering Tool IV: CAD-Methodology and PDM-Technology in the Focus Project W 0.4 credits 1K M. Schütz, K. Shea

Number of participants limited to 25.

151-0061-10L Engineering Tool IV/V: Scientific Writing with LaTeX W and Vector Graphics W 0.4 credits 1K R. Gassert

All Engineering Tool courses are for MAVT-Bachelor students only.

Number of participants limited to 40.

Abstract
- This course provides insights into the structure and compilation of scientific papers and publications using LaTeX as well as open source software for image editing and the creation of vector graphics. LaTeX is a typesetting tool that separates text format and layout. It is widely used for reports and publications in the scientific domain.

Objective
- By looking at specific examples during class you will obtain an overview on composing scientific papers (e.g. bachelor theses, semester theses, master theses) using LaTeX and acquire the most important commands to typeset complex formulas, tables and graphics.
Content
-- layout of scientific reports
-- writing with LaTeX (structure, formatting, formulas, tables, graphics, references, table of contents, hyperlinks, packages) based on a template for bachelor/semester/master theses.
-- graphic design and illustration using open source software and Matlab
-- including PDF files in the report (project description, data sheets)
-- managing bibliography databases

Literature
http://www.relab.ethz.ch/education/courses/engineering-tools-latex.html

Prerequisites / notice
Particular: The exercises will be done on your personal laptop (at least one laptop per two students). The entire LaTeX package, Inkscape and Gimp should be installed in advance.

151-0067-10L Engineering Tool IV: Sketching and Visualization of Technical Concepts
All Engineering Tool courses are for MAVT-Bachelor students only.

Number of participants limited to 20.

Abstract
This course is offered by the Design and Technology Lab Zurich. Effective visualizations of ideas are essential to communicate technical concepts. The course focuses on the basics of a coherent draft design through forms of sketches using various simple techniques.

Objective
Mastering various simple techniques for the visualization of technical ideas.

Content
Basics in: Perspective, line drawing, proportions, implementation of the plan views of perspective will be distributed

Literature
It requires no further books

Prerequisites / notice
Max 20 participants

Material: Paper and pens

151-0069-10L Engineering Tool IV: Design Optimization and CAD
All Engineering Tool courses are for MAVT-Bachelor students only.

Number of participants limited to 20.

Abstract
Participants will learn about the Computer-Aided Engineering fundamentals and methods that are necessary for successful design of modern technical products. The focus will be placed on the simulation-driven design in the context of product development process as well as on the fundamentals of the design optimization.

Objective
Basic Computer-Aided Engineering (CAE) knowledge and skills will be acquired to enable students to recognize both the advantages and the limitations of current CAE tools. Examples of how to build feature-based and parametric models for simulation-driven design automation will be given along with common pitfalls. The CAE environment will be the Siemens NX 8.5 which couples the simulation modeling (e.g. structural, thermal, flow, motion, and multiphysics) with design optimization and Feature-Based Design (FBD). After taking the course students should be able to independently create effective feature-based and parametric models to suit the requirements of simulation-driven design.

Content
1. Computer-Aided Engineering (CAE) methods and tools in context of design process (2 afternoons):
   * CAE in the context of the design process
   * Simulation-driven design
   * Introduction to design optimization
   * Features, parameterization and synchronous modeling technology
   * Basic design optimization examples
   * Introduction to Finite-Element Method (FEM) with basic examples

2. Simulation-Driven Design with application to structural design (1 afternoon):
   * Coupling simulation with structural design optimization and feature-based-design
   * Simulation driven design examples (single parts and assemblies)

Lecture notes
Handouts in the lecture

Literature
1. CAD NX:
2. CAE NX:

Prerequisites / notice
Max. 25 participants

151-0091-10L Engineering Tool IV: Scientific Writing
All Engineering Tool courses are for MAVT-Bachelor students only.

Number of participants limited to 50.

Abstract
Participants acquire scientific writing basics as a core competency to communicate with different audiences. They apply important methods and tools to refine a scientific question, research and evaluate the necessary information, quote and paraphrase, and to plan the structure of their own text.

Objective
Students are able to
- derive and structure ideas for a text starting from a scientific question using simple techniques
- find literature sources, check their relevance and completeness, organize them with a suitable tool and cite correctly
- apply a reading technique for summarizing a text
- distinguish plagiarism, quotation and paraphrase in texts using the presented criteria and correctly cite or paraphrase external content
- use and cite information from the Internet correctly
- plan and structure specialized texts that refer to different target groups

Data: 06.12.2017 12:57  Autumn Semester 2015  Page 943 of 1432
KURSPROGRAMM

1. Halbtag: Recherchieren und Lesen
   (1) Auf Vorhandenem aufbauen
   (2) Ideen generieren
   (3) Recherchieren
   (4) Quellen beurteilen

   2. Halbtag: Paraphrasieren nicht Plagiarisieren (1 Nachmittag, 3 Stunden, 15 min Pause)
   (1) Verantwortlich sein: der Wert des eigenständigen Denkens
   (2) Regeln und Anweisungen: was ist ein Plagiat, wie wird es an der ETHZ gehandhabt, Eigenständigkeitserklärung, Prüfwerkzeuge
   (3) Zitieren und Paraphrasieren - so geht's
   (4) Paraphrasieren oder Zitieren?
   (5) Lesen und verstehen
   (6) Vom Umgang mit Quellen und Material aus dem Internet

3. Halbtag: Einen Text strukturieren und generieren
   (1) Verwendung einer Standard-Textstruktur als Vorlage für ein Outline
   (2) Ein Grundgerüst mit Abschnitten erstellen
   (3) Eine Textabschnitt schreiben

LEHRFORMEN
- Inputs: Kurzvorträge
- Übungen: während des Nachmittags selbständig in Moodle anhand von Fallstudien
- Feedback und Diskussion: Lösungen der Studierenden via Moodle an Dozentenbeamer und Besprechen durch die Dozierenden

Zu allen Inhaltssteilen gibt es Übungsteile in Moodle, für die ein Laptop mit funktionierendem Internetanschluss benötigt wird.

151-0062-10L  Engineering Tool V: Computer-Aided Design Methods  W  0.4 credits  1K  T. Stankovic, K. Shea

Number of participants limited to 25.

Only one course can be chosen per semester. All Engineering Tool courses are for MAVT-Bachelor students only.

Abstract
Participants will learn about the Computer-Aided Design fundamentals and methods that are necessary to model complex technical products. The focus will be placed on feature-based and parametric modelling that is common to all modern CAD tools used in mechanical engineering design.

Objective
CAD knowledge and skills will be further developed to enable students to recognize both the advantages and the limitations of current Computer-Aided Design tools. Examples of how to build feature-based and parametric models including design automation will be given along with common pitfalls. After taking the course students should be able to independently create effective feature-based and parametric models of mechanical parts.

Content
1. CAD Methods and Feature-Based Design (2 afternoons):
   * CAD in the context of the design process
   * Feature types and their relation to mechanical design
   * Strategies for building feature-based assemblies
   * Integration of digital part libraries
   * Common issues and difficulties with feature interaction

2. CAD and Parametric Modeling (1 afternoon):
   * Designing and building parametric models
   * Design automation to create design variants
   * Common issues and difficulties with parametric modelling

Abstract
Students are required to conduct a workshop training outside ETH Zurich for a minimum duration of five weeks. The students learn how to operate workshop equipment, and acquire first experience in the realization of an engineering project. They summarize the workshop practice in a work and project description.

Objective
The students learn how to operate workshop equipment, and acquire first experience in the realization of an engineering project.

Prerequisites / notice
The minimum duration of the workshop practice is five weeks. The practice may be done prior to the start of the study.

► Laboratory Practice

Students attend at least 10 Laboratory Practices during the 4th and 5th semester. 4 of these must be Physics laboratories. All laboratory work is graded "pass" or "fail". After completion of 10 laboratory training units, 2 credit points will be issued.

Please register online at https://www.mavt.ethz.ch/praktika/index.

Abstract
Selected laboratory experiments in physics, mechanical and process engineering. With the Laboratory Training held during the fourth and fifth semester, the students learn how to handle and apply measurement methods and devices. Students are offered a diversified choice of laboratory experiments at least ten of which must be completed. Four of the chosen experiments must be in physics.

Objective
With the Laboratory Training held during the fourth and fifth semester, the students learn how to handle and apply measurement methods and devices.

Potential supervisors for the Bachelor's Thesis:
- All D-MAVT professors (https://www.mavt.ethz.ch/the-department/people/professors.html)
- Professors in other departments who are accredited at D-MAVT (https://www.mavt.ethz.ch/the-department/people/accredited-professors.html)
- D-MAVT titula professors (https://www.mavt.ethz.ch/the-department/people/titular-professors.html). For enrollment, please contact the D-MAVT Student Administration.

Abstract: The bachelor's thesis is the culmination of the program. The students develop, enhance, and demonstrate their methodological abilities to independently tackle and solve a given research problem. The thesis furnishes the students with their first major research experience and is a further development of the work done in the basis courses, and usually, the focused study.

Objective: The students develop, enhance and demonstrate their methodological abilities to independently tackle and solve a given research problem.

Content: The topics for the bachelor's thesis are published by the professorship or they can be set in consultation between the professors and the students. Thesis projects in cooperation with the industry are also possible.

Prerequisites / notice: Supervisors should normally be part of the D-MAVT professorship or may be professors accredited by D-MAVT. The bachelor's thesis must be completed within 14 weeks, which is an equivalent half-time workload during a semester.

<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The primary objective of this course is that the student deepens an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The course consists of three parts: First, we will refresh and deepen the student's knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is on modeling fixed wing aircraft, along with related control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in robotics. The last part finally covers different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.</td>

<tr>
<td>Content</td>
<td>The analysis of realistic reactive flow systems necessitates the use of detailed computer models that can be constructed starting from first principles i.e. thermodynamics, fluid mechanics, chemical kinetics, and heat and mass transport. In this course, the focus will be on combustion theory and modeling. The reacting flow governing equations and the combustion chemistry are firstly reviewed, setting the ground for the analysis of homogeneous-gas-phase mixtures, laminar diffusion and premixed flames. Heterogeneous (catalytic) combustion, an area of increased importance in the last years, will be dealt in detail along with its coupling with homogeneous combustion. Finally, approaches for the modeling of turbulent combustion will be presented. Available numerical codes will be used to compute the above described phenomena. Familiarity with numerical methods for the solution of partial differential equations is expected.</td>

The course provides an introduction to digital image analysis in modern flow diagnostics. Different techniques which are discussed include image velocimetry, laser induced fluorescence, liquid crystal thermography and interferometry. The physical foundations and measurement configurations are explained. Image analysis algorithms are presented in detail and programmed during the exercises.

### Objective

Introduction to modern imaging techniques and post processing algorithms with special emphasis on flow analysis and visualization.

Understanding of hardware and software requirements and solutions.

Development of basic programming skills for (generic) imaging applications.

### Content

- Fundamentals of optics, flow visualization and electronic image acquisition.
- Frequently used mage processing techniques (filtering, correlation processing, FFTs, color space transforms).
- Image velocimetry (tracking, pattern matching, Doppler imaging).
- Surface pressure and temperature measurements (fluorescent paints, liquid crystal imaging, infrared thermography).
- Laser induced fluorescence.
- (Digital) Schlieren techniques, phase contrast imaging, interferometry, phase unwrapping.
- Wall shear and heat transfer measurements.
- Pattern recognition and feature extraction, proper orthogonal decomposition.

### Lecture notes

Available

### Prerequisites / notice

Requirements: successful attendance at lectures "Fluidodynamik I und II", "Thermodynamik I und II"

### 151-0113-00L

**Applied Fluid Dynamics**

**Abstract**

The methods of fluid dynamics play an important role in the description of a chain of events, involving the release, spreading and dilution of dangerous fluids in the environment.

Tunnel ventilation systems and strategies are studied, which must meet severe requirements during normal operation and in emergency situations (tunnel fires etc.).

**Objective**

Generally applicable methods in fluid dynamics and gas dynamics are illustrated and practiced using selected current examples.

**Content**

Often experts fall back on the methodology of fluid dynamics when involved in the construction of environmentally friendly processing and incineration facilities, as well as when choosing safe transport and storage options for dangerous materials. As a result of accidents, but also in normal operations, dangerous gases and liquids may escape and be transported further by wind or flowing water.

There are many possible forms that the resulting damage may take, including fire and explosion when flammable substances are mixed. The topics covered include: Emissions of liquids and gases from containers and pipelines, evaporation from pools and vaporization of gases kept under pressure, the spread and dilution of waste gas plumes in the wind, deflagration and detonation of inflammable gases, fireballs in gases held under pressure, pollution and exhaust gases in tunnels (tunnel fires etc.)

**Prerequisites / notice**

1. English literature covering the content of the course:

2. Einführung in die Fahrzeugaerodynamik (Introduction in car aerodynamics, script in german language)

3. Grundlagen der Flugtechnik (Basics of flight science, script in german language)

**Introduction to Aircraft and Car Aerodynamics**

**Abstract**

Aircraft aerodynamics: Atmosphere; aerodynamic forces (lift, drag); thrust.

**Objective**

An introduction to the basic principles and interrelationships of aircraft and automotive aerodynamics.

To understand the basic relations of the origin of aerodynamic forces (ie lift, drag). To quantify the aerodynamic forces for basic configurations of aerofoil and car components.

Illustration of the intrinsic problems and results using examples.

Using experimental and theoretical methods to illustrate possibilities and limits.

**Content**

Aircraft aerodynamics: atmosphere, aerodynamic forces (ascending force: profile, wings. Resistance, residual resistance, induced resistance); thrust (overview of the propulsion system, aerodynamics of the propellers), introduction to static longitudinal stability.

**Lecture notes**

1.) Grundlagen der Flugtechnik (Basics of flight science, script in german language)

2.) Einführung in die Fahrzeugaerodynamik (Introduction in car aerodynamics, script in german language)

**Literature**

### 151-0235-00L

**Thermodynamics of Novel Energy Conversion Technologies**

**Abstract**

In the framework of this course we will look at a broad spectrum of novel energy conversion processes which are not based on the heat-power-conversion. Especially the production of electrical energy without using mechanical work will be covered.

**Objective**

This course deals with novel energy conversion and storage systems such as fuel cells and micro-fuel cells, batteries, hydrogen production and storage, plasmonics and photovoltaics. The focus of the course is on the physics and basic understanding of those systems as well as their real-world applications.

**Content**

Part 1: Fundamentals:
- Thermodynamic overview and exergy analysis;
- Thermodynamics of multi-component-systems (mixtures) and phase equilibrium;
- Electrochemistry;
- Part 2: Novel energy conversion and storage systems:
  - batteries and accumulators;
  - fuel cells and micro fuel cells (fundamentals, fabrication, modelling, and applications);
  - hydrogen production and storage, Fuel reforming;
  - Plasmonics and photovoltaics.

The course will be given in English:

1. Weekly exercises, each includes 1 or 2 questions which should be solved and returned at the specified due dates. Exercises count as 15% of the final grade.
2. One programming mini-project which should be finished at the specified due date. It counts as 5% of the final grade.
3. Final exam: Written exam during the regular examination session. It counts as 80% of the final grade.

**Lecture notes**

Available (ca. 200 pages in English)

**Prerequisites / notice**

### 151-0109-00L

**Turbulent Flows**

**Abstract**

- Laminar and turbulent flows, instability and origin of turbulence - Statistical description: averaging, turbulent energy, dissipation, closure problem - Scalings; Homogeneous isotropic turbulence, correlations, Fourier representation, energy spectrum - Free turbulence: wake, jet, mixing layer - Wall turbulence: Channel and boundary-layer - Computation and modelling of turbulent flows

**Contents**

- Laminar and turbulent flows, instability and origin of turbulence - Statistical description: averaging, turbulent energy, dissipation, closure problem - Scalings; Homogeneous isotropic turbulence, correlations, Fourier representation, energy spectrum - Free turbulence: wake, jet, mixing layer - Wall turbulence: Channel and boundary-layer - Computation and modelling of turbulent flows

**Objective**

Introduction to modern imaging techniques and post processing algorithms with special emphasis on flow analysis and visualization.

Understanding of hardware and software requirements and solutions.

Development of basic programming skills for (generic) imaging applications.

**Content**

- Fundamentals of optics, flow visualization and electronic image acquisition.

- Image velocimetry (tracking, pattern matching, Doppler imaging).
- Surface pressure and temperature measurements (fluorescent paints, liquid crystal imaging, infrared thermography).
- Laser induced fluorescence.
- (Digital) Schlieren techniques, phase contrast imaging, interferometry, phase unwrapping.
- Wall shear and heat transfer measurements.
- Pattern recognition and feature extraction, proper orthogonal decomposition.

**Lecture notes**

Available

**Prerequisites / notice**

Prerequisites: Fluidodynamics I, Numerical Mathematics, programming skills.

Language: German on request.
Objective
Basic physical phenomena of turbulent flows, quantitative and statistical description, basic and averaged equations, principles of turbulent flow computation and elements of turbulence modelling

Content
- Properties of laminar, transitional and turbulent flows.
- Origin and control of turbulence. Instability and transition.
- Statistical description, averaging, equations for mean and fluctuating quantities, closure problem.
- scalings, homogeneous isotropic turbulence, energy spectrum.
- Turbulent free shear flows. Jet, wake, mixing layer.
- Wall-bounded turbulent flows.
- Turbulent flow computation and modeling.

Lecture notes are available

Literature

151-0163-00L Nuclear Energy Conversion
W 4 credits 2V+1U H.M. Prasser

Abstract
Physical fundamentals of the fission reaction and the sustainable chain reaction, thermal design, construction, function and operation of nuclear reactors and power plants, light water reactors and other reactor types, conversion and breeding

Objective
Students get an overview on energy conversion in nuclear power plants, on construction and function of the most important types of nuclear reactors with special emphasis to light water reactors. They obtain the mathematical/physical basis for quantitative assessments concerning most relevant aspects of design, dynamic behaviour as well as material and energy flows.

Content
Nuclear physics of fission and chain reaction. Thermodynamics of nuclear reactors. Design of the reactor core. Introduction into the dynamic behaviour of nuclear reactors. Overview on types of nuclear reactors, difference between thermal reactors and fast breeders. Construction and operation of nuclear power plants with pressurized and boiling water reactors, role and function of the most important safety systems, special features of the energy conversion. Development tendencies of reactor technology.

Lecture notes
Hand-outs will be distributed. Additional literature and information on the website of the lab: https://www.ethz.ch/content/specialinterest/mart/energy-technology/lab-of-nuclear-energy-systems/en/studium/teaching-materials/151-0163-00l-nuclear-energy-conversion.html

Dieter Smidt: Reaktortechnik, Band 1 und Band 2, G. Braun Karlsruhe, 1971

151-0951-00L Process Design and Safety
W 4 credits 2V+1U P. Rudolf von Rohr

Abstract
Process design and safety deals with the fundamentals of process apparatus, plant design and safety.

Objective
The goal of the lecture is to expound design characteristics of systems for process engineering applications.

Content
Fundamentals of plant and apparatus design; materials in the process industries, mechanical design and design rules of main components; pumps and fans; piping and armatures, safety in process industry

Lecture notes
Script is available, english slides will be distributed

Literature

151-0927-00L Rate-Controlled Separations in Fine Chemistry
W 4 credits 3G M. Mazzotti

Abstract
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Objective
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Content
The class covers separation techniques that are central in the purification and downstream processing of chemicals and bio-pharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Liquid-liquid extraction; 2) Adsorption and chromatography; 3) Membrane processes; 4) Crystallization and precipitation.

Lecture notes
Handouts during the class

Literature
Recommendations for text books will be covered in the class

Prerequisites / notice
Requirements: Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

151-0933-00L Synthetic Biology II
W 4 credits 4A S. Panke, Y. Benenson, J. Stelling

Abstract
7 months biological design project, during which the students are required to give presentations on advanced topics in synthetic biology (specifically genetic circuit design) and then select their own biological system to design. The system is subsequently modeled, analyzed, and experimentally implemented. Results are presented at an international student competition at the MIT (Cambridge).

Objective
The students are supposed to acquire a deep understanding of the process of biological design including model representation of a biological system, its thorough analysis, and the subsequent experimental implementation of the system and the related problems.

Content
Presentations on advanced synthetic biology topics (eg genetic circuit design, adaptation of systems dynamics, analytical concepts, large scale de novo DNA synthesis), project selection, modeling of selected biological system, design space exploration, sensitivity analysis, conversion into DNA sequence, (DNA synthesis external,) implementation and analysis of design, summary of results in form of scientific presentation and poster, presentation of results at the iGEM international student competition (www.igem.org).

Lecture notes
Handouts during course

Prerequisites / notice
The final presentation of the project is typically at the MIT (Cambridge, US). Other competing schools include regularly Imperial College, Cambridge University, Harvard University, UC Berkeley, Princeton University, CalTech, etc. This project takes place between end of Spring Semester and beginning of Autumn Semester. Registration in April.

Please note that the number of ECTS credits and the actual work load are disconnected.

Data: 06.12.2017 12:57  Autumn Semester 2015  Page 948 of 1432
Lecture notes will be distributed during the course.

Objective
Research seminar for master's students and doctoral students

529-0193-00L Renewable Energy Technologies I
The lectures Renewable Energy Technologies I (529-0193-00L) and Renewable Energy Technologies II (529-0191-01L) can be taken independently from one another.

Abstract
Scenarios for world energy demand and CO2 emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry), Wind and ocean energy, heat pumps, geothermal energy, energy from waste, CO2 sequestration.

Objective
Scenarios for the development of world primary energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO2 emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

Content

Literature

Prerequisites / notice
Fundamentals of chemistry and physics are a prerequisite for this course.

Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.

Acoustics
Z 0 credits 0.5K K. Heutsch

New Enterprises for Engineers
W 4 credits 3G R. S. Abhari, A. Gawlikowska

Transforming Needs to opportunities for new technology enterprises.
- Links between entrepreneurship and product development/engineering.
- Sales, marketing, financing, and growth. Detailed Plans and execution.
- Survival through cash flow management.
- Human issues in new enterprise
- Alignment of interests.
- Transition of enterprises along growth path
- http://www.NEFE.ethz.ch

Transforming Needs to Business Enterprises

Goals of the course:
- Propose the role of Needs-Driven Opportunities for new technology enterprises
- Explore links between entrepreneurship and engineering; such as problem solving, planning, system analysis, can-do attitude!
- Making it happen- through sales, marketing, planning, staffing, implementation, financing, and growth. Detailed Plans and execution
- Survival (and success) through cash flow management
- Explore the human issues in any new enterprise
- Alignment of interests between providers of value (founders and staff, VCs) and the providers of capital (Angels, VCs, Corporation)
- Transformations of enterprises along growth path

Content
Approach:
Weekly lectures including discussions of international case studies
Exercises to develop and present modules of new plans
Extensive class interactions capped with presentation by each (group) student of new enterprise plan

Please see http://www.NEFE.ethz.ch

Lecture notes
Course material will be communicated to the students prior to the start of each class for download.

This course is primarily for engineering and natural science students at all levels who are interested in participating in the initiation or growth of a new enterprise. The new enterprise could be stand-alone start up or a new business unit for an existing enterprise.

The class is practical in nature but emphasizes the basic understanding of the parameters that significantly contribute to the success of a new enterprise. It will be highly interactive with special selected guests from Selected guests from: companies founder, venture capital and business angel, and large corporation executive. Class attendance and active participation is required.

Mass Transfer
W 4 credits 2+V+U R. Büchel, S. E. Pratsinis

This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

Objective
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

Content
Fick’s laws; application and significance of mass transfer; comparison of Fick’s laws with Newton’s and Fourier’s laws; derivation of Fick’s 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Reynolds- and Chilton-Colburn analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogeneous and heterogeneous irreversible and reversible reactions; diffusion-controlled reactions; mass transfer and first order heterogenous reaction. Applications.

Literature

Stochastic Methods for Engineers and Natural Scientists, 1 edn.
W 4 credits 3G D. W. Meyer-Massetti

Abstract
The course provides an introduction into stochastic methods that are applicable for example for the description and modeling of turbulent and subsurface flows. Moreover, mathematical techniques are presented that are used to quantify uncertainty in various engineering applications.
Objective
By the end of the course you should be able to mathematically describe random quantities and their effect on physical systems. Moreover, you should be able to develop basic stochastic models of such systems.

Content
- Probability theory, single and multiple random variables, mappings of random variables
- Stochastic differential equations, Ito calculus, PDF evolution equations
- Polynomial chaos and other expansion methods
All topics are illustrated with application examples from engineering.

Lecture notes
Detailed lecture notes will be provided.

Literature
Some textbooks related to the material covered in the course:

151-0911-00L
Introduction to Plasmonics
W 4 credits 2V+1U D. J. Norris

Abstract
This course provides fundamental knowledge of surface plasmon polaritons and discusses their applications in plasmonics.

Objective
Electromagnetic oscillations known as surface plasmon polaritons have many unique properties that are useful across a broad set of applications in biology, chemistry, physics, and optics. The field of plasmonics has arisen to understand the behavior of surface plasmon polaritons and to develop applications in areas such as catalysis, imaging, photovoltaics, and sensing. In particular, metallic nanoparticles and patterned metallic interfaces have been developed to utilize plasmonic resonances. The aim of this course is to provide the basic knowledge to understand and apply the principles of plasmonics. The course will strive to be approachable to students from a diverse set of science and engineering backgrounds.

Content
Fundamentals of Plasmonics
- Basic electromagnetic theory
- Optical properties of metals
- Surface plasmon polariton propagations on surfaces
- Surface plasmon polariton propagation
- Localized surface plasmons

Applications of Plasmonics
- Waveguides
- Extraordinary optical transmission
- Enhanced spectroscopy
- Sensing
- Metamaterials

Fluid Dynamics with the Lattice Boltzmann Method
W 4 credits 3G I. Karlin

Abstract
The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations.

Objective
Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations.

During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on.

Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course).

The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microflows among others.

Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.
The course builds upon three parts:
I Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.
II Theoretical basis of statistical mechanics and kinetic equations.
III Lattice Boltzmann method for real-world applications.

The content of the course includes:

1. Background: Elements of statistical mechanics and kinetic theory:
   Particle's distribution function, Liouville equation, entropy, ensembles; Kinetic theory: Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions; Vlasov equation; Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

2. Basics of the Lattice Boltzmann Method and Simulations:
   Minimal kinetic models: lattice Boltzmann method for single-component fluid, discretization of velocity space, time-space discretization, boundary conditions, forcing, thermal models, mixtures.

3. Hands on:
   Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. Practical issues of LBM for fluid dynamics simulations:
   Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.

5. Microflow:
   Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. Advanced lattice Boltzmann methods:
   Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

7. Introduction to LB models beyond hydrodynamics:
   Relativistic fluid dynamics; flows with phase transitions.

Lecture notes
Lecture notes on the theoretical parts of the course will be made available.
Selected original and review papers are provided for some of the lectures on advanced topics.
Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided.

Prerequisites / notice
The course addresses mainly graduate students (MSc/Ph D) but BSc students can also attend.

151-0107-20L High Performance Computing for Science and Engineering (HPCSE) I
Abstract
This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering.
Objective
Introduction to HPC for scientists and engineers
Fundamental of:
1. Parallel Computing Architectures
2. MultiCores
3. ManyCores
Content
Programming models and languages:
1. C++ threading (2 weeks)
2. OpenMP (4 weeks)
3. MPI (5 weeks)
Computers and methods:
1. Hardware and architectures
2. Libraries
3. Particles: N-body solvers
4. Fields: PDEs
5. Stochastics: Monte Carlo

Class notes, handouts

151-0182-00L Fundamentals of CFD Methods
Abstract
This course is focused on providing students with the knowledge and understanding required to develop simple computational fluid dynamic (CFD) codes to solve the incompressible Navier-Stokes equations and to critically assess the results produced by CFD codes. As part of the course, students will write their own codes and verify and validate them systematically.
Objective
1. Students know and understand basic numerical methods used in CFD in terms of accuracy and stability.
2. Students have a basic understanding of a typical simple CFD code.
3. Students understand how to assess the numerical and physical accuracy of CFD results.
Content
1. Governing and model equations. Brief review of equations and properties
2. Overview of basic concepts: Overview of discretization process and its consequences
3. Overview of numerical methods: Finite-difference and finite-volume methods
4. Analysis of spatially discrete equations: Consistency, accuracy, stability, convergence of semi-discrete methods
5. Time-integration methods: LMS and RK methods, consistency, accuracy, stability, convergence
6. Analysis of fully discrete equations: Consistency, accuracy, stability, convergence of fully discrete methods
7. Solution of one-dimensional advection equation: Motivation for and consequences of upwinding, Godunov's theorem, TVD methods, DRP methods
8. Solution of two-dimensional advection equation: Dimension-by-dimension methods, dimensional splitting, multidimensional methods
9. Solution of one- and two-dimensional diffusion equations: Implicit methods, ADI methods
10. Solution of one-dimensional advection-diffusion equation: Numerical vs physical viscosity, boundary layers, non-uniform grids
11. Solution of incompressible Navier-Stokes equations: Incompressibility constraint and consequences, fractional-step and pressure-correction methods
12. Solution of incompressible Navier-Stokes equations on unstructured grids
Lecture notes
The course is based mostly on notes developed by the instructor.
Objective
The objective of this course is to introduce the students to the fundamentals, technologies, modern day application, and economics of wind energy. These subjects are introduced through a discussion of the basic principles of wind energy generation and conversion, and a detailed description of the broad range of relevant technical, economic and environmental topics.

Content
This mechanical engineering course focuses on the technical aspects of wind turbines; non-technical issues are not within the scope of this technically oriented course. On completion of this course, the student shall be able to conduct the preliminary aerodynamic and structural design of the wind turbine blades. The student shall also be more aware of the broad context of drivetrains, dynamics and control, electrical systems, and meteorology, relevant to all types of wind turbines.

151-0368-00L

Aeroelasticity

Abstract
Introduction to the basics and methods of Aeroelasticity. An overview of the main static and dynamic phenomena arising from the interaction between structural and aerodynamic loads.

Objective
The course will give you a physical basic overview of current-structure phenomena. Furthermore you will get to know the most important phenomena in the statistical and dynamical aerelastic as well as an introduction to the methods for mathematical descriptions and for the wording of quantitative forecasts.

Literature

151-0104-00L

Uncertainty Quantification for Engineering & Life Sciences

Abstract
Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective
The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content
Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Lecture notes
The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Literature
1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes
3. Class Notes

Prerequisites / notice
Fundamentals of Probability, Fundamentals of Computational Modeling

151-0215-00L

Introduction to Acoustics, Aeroacoustics and Thermoacoustics

Abstract
This course provides an introduction to Acoustics. The focus will be on phenomena that are relevant for industrial and transport applications in the contexts of noise pollution and mechanical fatigue due to acoustic-structure interactions.

Objective
This course is proposed for Master and PhD students interested in getting knowledge in acoustics. Students will be able to predict sound generation, absorption and propagation using various modeling approaches (analytical, numerical) in configurations that are relevant for practical industrial applications (for example in aeronautics, automotive industry or power plants).

Content
First, orders of magnitudes characterizing sound propagation are reviewed and the constitutive equations for acoustics are derived. Then the different types of sources (monopole/dipole/quadrupole, point, non-compact) are introduced and linked to the noise generated by turbulent flows, coherent vortical structures or fluctuating heat release. The scattering of sound by rigid bodies is given in basic configurations. Analytical, experimental and numerical methods used to analyze sound in ducts and rooms are presented (Green functions, Galerkin expansions, Helmholtz solvers, acoustic field reconstruction, state-space formulation). Modeling strategies to predict self-sustained acoustic oscillations driven by reacting and non-reacting flows are given (system stability, describing function analysis). Finally, guidelines to design active and passive control systems are presented.

Lecture notes
Handouts will be distributed during the class

Literature
Books will be recommended for each chapter

Prerequisites / notice
The use of Matlab and Simulink is required in several lessons which will be announced in advance. The students are expected to bring their own laptop with Matlab installed at these dates.

101-0187-00L

Structural Reliability and Risk Analysis

Abstract
Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.

Objective
The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. After this course the students will have refreshed their knowledge of probability theory and statistics to model uncertainties in view of engineering applications. They will be able to analyze the reliability of a structure and to use risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.

Data: 06.12.2017 12:57
Autumn Semester 2015

Page 952 of 1432
Content

Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. When designing new structures and systems, the design codes such as SIA or Euro-codes provide a framework that guarantees safety and reliability. However, the level of safety is not quantified explicitly, which does not allow the analyst to properly choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FOSM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and pre-post risk assessment methods are presented. Bayesian networks are introduced as a generic numerical tool for solving such problems. The course also includes a tutorial using a software dedicated to real world structural reliability analysis.

Abstract

Virtual Reality can not only be used for the visualization of 3D objects, but also offers a wide application field for small and medium enterprises (SME). This could be for instance an enabling technology for net-based collaboration, the transmission of images and other data, the interaction of the human user with the digital environment, or the use of augmented reality systems. The goal of the lecture is to provide a deeper knowledge of today's VR environments that are used in business processes. The technical background, the algorithms, and the applied methods are explained more in detail. Finally, future tasks of VR will be discussed and an outlook on ongoing international research is given.

Content

Introduction into Virtual Reality; basics of augmented reality; interaction with digital data, tangible user interfaces (TUI); basics of simulation; compression procedures of image-, audio-, and video signals; new materials for force feedback devices; introduction into data security; cryptography; definition of free-form surfaces; digital factory; new research fields of virtual reality

Lecture notes

The handout is available in German and English.

Prerequisites / notice

"Visualization, Simulation and Interaction - Virtual Reality I" is recommended.

<td>Fatigue Strength of Materials, Components and Structures</td>
<td>W</td>
<td>4 credits</td>
<td>3G</td>
<td>M. Guillaume, R. E. Koller</td>
</tr>
</tbody>
</table>

Abstract

Fatigue of materials is playing a key role in light weight structures. All applications are affected that are exposed to oscillating loads. The lecture will present the most important methods for analyzing the fatigue strength under service load conditions. This starts with the conventional assessment of a components endurance limit and ends with the application of the damage tolerance philosophy.

Objective

An introduction to the most important terms and phenomena related to fatigue damages of metallic components will be given and explained by practical examples. Methods for assessment of endurance strength, finite life fatigue strength, crack initiation and crack growth will be discussed. The lecture shall demonstrate how to solve fatigue problems in practice. Examples like the ICE disaster at Eschede or structural problems of the Combino tram demonstrate the significance of this subject. The fatigue behavior of lightweight structures for vehicles and aircrafts has to be considered during the component design process. Designing the static strength of a component alone is not sufficient since fatigue damages of such components may cause extremely high costs. Structural components of modern aircraft like Airbus A380 or A400M are designed with respect to crack growth using the damage tolerance philosophy. Understanding fatigue strength and its phenomena requires broad knowledge of material behavior, services loads, manufacturing effects as well as of analysis and test methods. Fatigue strength is a highly interdisciplinary area of work. For this the most important tools and methods shall be presented.
1. INTRODUCTION, OVERVIEW, MOTIVATION

1.1 Preface (General introduction and history survey) (Schijve; Chapter 1)
1.2 Standards and Guidelines
1.3 Examples of damage events
   - Comet-Accident (Pressure cycles, stress concentration)
   - Aloha-Incident at Hawaii (Multiple site damage)
   - Accident of an aerial passenger tramway (Fretting corrosion on axle)
   - ICE-Accident (Wheel failure)

1.4 Presentations
   - DVD "MTW Materialermüdung (1995, 21')"
   - DVD "F/A-18 Full Scale Fatigue Test (2004, 12')"
   - DVD "Sicherheit von Seilbahnen (1996, 7')" with discussion

2. LOADING

2.1 Fatigue strength overview
2.2 Significance of operational loading
2.3 Types of load histories (Schijve; Chapter 9)
2.4 Terms and definitions (Schijve; Chapter 9)
2.5 Measurement of operational loadings (Schijve; Chapter 9)
2.6 Counting algorithms (Schijve; Chapter 9)
2.7 Frequency distributions or spectra (Schijve; Chapter 9)
2.8 Impact of spectrum shape
2.9 Design Spectra (Schijve; Chapter 13)

3. MATERIAL

3.1 Fatigue strength overview
3.2 Evaluation of material properties for cyclic loading (Schijve; Chapter 13)
3.3 Fatigue properties (Schijve; Chapter 6)
3.4 Wöhler-Diagram (Schijve; Chapter 6, 7)
3.5 Scatter of fatigue properties (Schijve; Chapter 12)
3.6 Mean stress effect (Schijve; Chapter 6)
3.7 Damage mechanisms & material selection (Schijve; Chapter 2)
3.8 Environmental effects (Schijve; Chapter 16, 17)
3.9 Specific fatigue properties (Schijve; Chapter 6)

4. STRUCTURAL COMPONENT

4.1 Fatigue strength overview
4.2 Notches (Schijve; Chapter 3, 7)
4.3 Residual stresses (Schijve; Chapter 4)
4.4 Size effect
4.5 Surface condition and surface layers (Schijve; Chapter 7, 14)
4.6 Fretting corrosion (Schijve; Chapter 15)
4.7 Summary of fatigue strength improving methods (Schijve; Chapter 14)

5. SAFETY FACTORS (Schijve; Chapter 19)

6. FATIGUE STRENGTH ASSESSMENT

6.1 Fatigue strength overview
6.2 Assessment concepts for fatigue lifetime prediction
6.3 Assessment of the endurance strength
6.4 Finite life fatigue strength assessment using the nominal stress concept (Schijve; Chapter 10)
6.5 Local stress-strain concept (Schijve; Chapter 10)
6.6 Fracture mechanics concept (Schijve; Chapter 5, 8, 11)
6.7 Accuracy of concepts for fatigue lifetime assessment

7. STRUCTURAL INTEGRITY CONCEPTS

7.1 Safe life design (Mirage III, Pressure Vessel)
7.2 Fail safe design (modern aircraft construction)
7.3 Damage tolerance (approach according to US Air Force)
7.4 F/A-18 design philosophy
7.5 Summary

8. EXPERIMENTAL FATIGUE STRENGTH

8.1 In case of interesting current tests laboratory visitation at Empa

Lecture notes
All lecture chapters are on Powerpoint presentations. The chapters will be available as presentation handouts at the first day for a fee of CHF 20.-

Literature
Recommended books as supplement to the lecture:
- Schijve, Jaap
  Fatigue of Structures and Materials
- Broek, David
  The Practical Use of Fracture Mechanics

Prerequisites / notice
Depending on actual fatigue tests a Laboratory visitation at Empa in Dübendorf may be organized.

151-0353-00L Mechanics of Composite Materials W 4 credits 2V+1U G. Kress

Abstract
The course Mechanics of Composite Materials is dedicated to modeling problems following from the complex mechanical behavior of these anisotropic material structures. and modeling of continuous fibre reinforced composites. Participants will be able to design parts for the mechanical, automotive and aerospace industry.

Objective
Understanding of the mechanical properties of fiber reinforced composites with regard to analysis and design of lightweight structures for mechanical, transportation and aerospace applications.
Content
1. Introduction and Elastic Anisotropy
2. Laminate Theory
3. Thick-Walled Laminates and Interlaminar Stresses
4. Edge Effects at Multidirectional Laminates
5. Micromechanics
6. Failure Hypotheses and Damage Prediction
7. Fatigue Response
8. Joining and Bonding Techniques
9. Sandwich Designs

Lecture notes
Manuscript and handouts in printed form and as PDF-files:
http://www.structures.ethz.ch/education/master/intro/compulsory/mechanics

Literature

151-0357-00L
Ropeway Technology

Ropeways represent a public transport system where steel wired ropes play a central role. Such systems come to a favorite transport solution when the costs for conventional systems become out of scale due to difficult and impossible terrestrial surface (alpine terrain). Additionally, ropeways are environment friendly, very energy efficient and offer a very high safety level.

Objective
Cable cars make use of extensive mechanical systems, which because of their operational location, are exposed to difficult meteorological and topographical conditions. In order to guarantee the requisite safety and reliability of the equipment, the components and their interaction in the system must fulfill stringent functional requirements. This is particularly the case because of the significant distance (2-4km) between the individual structures. The lectures with related exercises offer an excellent opportunity to apply the learned theoretical basic principles of mechanics and engineering in plant construction. Not only the function and resistance of individual components will be studied, but also complex interactions, which are imperative for the safe and smooth running of the equipment. It also includes the teaching of the basics of project planning and design, as well as the evaluation of systems in a distinctly interdisciplinary manner. For the manufacturer of a cable car installation the integration of sub-assemblies making use of very different technologies always poses a particular challenge. For this reason, the methodology for the handling of these typical engineering assignments is important and makes up a significant part of the lecture content.

Content
Cable cars and cable cranes: Construction methods and areas of application. The use of mechanical principles in system engineering, Swiss building and business regulations, planning and equipment with special consideration for business and the environment: steel cables (construction, evaluation, damage, inspection), drive mechanisms, brakes, vehicles, construction over an extended area. Calculation of the supporting cable with weight strain and with fixed mountings on both sides. Excursions.

Lecture notes
SEILBAHNEN I

151-0360-00L
Procedures for the Analysis of Structures

Basic theories for structure integrity calculations are presented with focus on strength, stability, fatigue and elasto-plastic structural analysis. Theories and models for one dimensional and planar structures are presented based on energy theorems.

Objective
Basic principles applied in structural mechanics. Introduction to the theories of planar structures. Development of an understanding of the relationship between material properties, structural theories and design criteria.

Abstract
Basic principles of continuum mechanics and energy principles: structural theories, homogenization theories; finite elements; fracture mechanics.

Content
1. Basic problem of continuum mechanics and energy principles: structural theories, homogenization theories; finite elements; fracture mechanics.
3. Strength of material theories and material properties: ductile behaviour, plasticity, von Mises, Tresca, principal stress criterion; brittle behaviour; viscoplastic behaviour, creep resistance.
4. Structural design: fatigue and dynamic structural analysis.

151-0524-00L
Continuum Mechanics 1

The lecture deals with constitutive models that are relevant for design and calculation of structures. These include anisotropic linear elasticity, linear viscoelasticity, plasticity, viscoplasticity. Homogenization theories and laminate theory are presented. Theoretical models are complemented by examples of engineering applications and experiments.

Objective
Basic theories for solving continuum mechanics problems of engineering applications, with particular attention to material models.

Content

151-0525-00L
Wave Propagation in Solids

The course will cover the basic principles of wave propagation in periodic media. It will discuss the fundamental principles used to describe linear and nonlinear wave propagation in continuum and discrete media. Selected recent scientific advancements in the dynamics of periodic media will also be discussed.

Objective
Students learn the basic principles governing the propagation of waves in discrete and continuum solid media. These methods can be used to engineer materials with predefined properties and to design dynamical systems for a variety of engineering applications (e.g., vibration mitigation, impact absorption and sound insulation).

Content
Wave propagation in solids including applications. Phenomenology of wave propagation (plane waves, harmonic waves, dispersion, attenuation, group and phase velocity), transmission and reflection, impact problems, waves in linear elastic media, discrete media, experimental and numerical methods.

Literature
Various books will be recommended pertaining to the topics covered.

376-1219-00L
Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions

Rehab. Engineering is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.
Content

Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

Introductionary Books:

Selected Journal Articles and Web Links:

Prerequisites / notice

Target Group:
Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich
Students of other departments, faculties, courses are also welcome

Literature

Optical Methods in Experimental Mechanics
4 credits
E. Hack, R. Brönnimann
Abstract

The lecture introduces a variety of optical methods to assess the mechanical behaviour of a structure, to determine material parameters, or to validate results from FE analysis. Focus is on camera-based techniques for deformation, strain and stress analysis. Applications and limitations will be thoroughly discussed. The lecture includes two afternoons of hands-on experience at Empa (Dübendorf).

Objective

The students are able to describe simple optical set-ups and image formation by using a camera system. They understand the working principle of various camera-based techniques for shape, deformation and strain measurement. Most notably they can explain how the measurement is transformed into an interference signal, a change of polarization or temperature, or a different signal modulation. They know the main application fields of the individual techniques. They are able to choose the most appropriate technique for solving a measurement task and to estimate its expected resolution. Through the hands-on experience the students gain a deeper and sustained understanding of the theoretical content by applying the theoretical foundations to dedicated measurement tasks.

Content

After an introduction into optics and image acquisition the lecture explains how to transform mechanical quantities such as strain, stress or deformation into an image content. Imaging optical measurement techniques for deformation and strain analysis make use of a variety of optical principles:

- Triangulation (Digital Image Correlation, Fringe Projection),
- Interference (Speckle Pattern Interferometry, Shearography),
- Diffraction (Moiré-Interferometry, Fiber Bragg Gratings),
- Birefringence (Photelasticity),
- Infrared radiation (Thermal Stress Analysis)

In addition, dynamic measurements and vibration analysis are explained in the context of modal analysis or transient events. The calibration of imaging optical methods and their application to the validation of numerical simulations are described.

The content is structured as follows:
1. Imaging methods: an introduction
2. Digital Image Correlation
3. White light moiré methods
4. Interferometry
5. Deformation analysis: Speckle pattern interferometry
6. Strain analysis: Shearography
7. Modal analysis
8. Measurement of transient deformations
9. Stress analysis; Photelasticity
10. Stress analysis: Thermoelasticity
11. Validation of FEA results and calibration of optical full-field methods
12. Fibre based methods

The lecture includes two afternoons of laboratory experience at Empa, where the student will take the first steps with optical methods.

Hands-on experience includes e.g. Digital Image Correlation, Speckle pattern interferometry, Thermal Stress Analysis, Fibre optic sensors, Fringe projection, depending on availability of the equipment and the interest of the students.

Lecture notes

Copies of the slides will be made available on-line through ILIAS. A private blog will stimulate the discussion on lecture and exercises.

Literature

A good overview on the optical methods is presented in the following text books:

Prerequisites / notice

Basic knowledge of optics and interferometry as taught in basic physics courses are advantageous but not compulsory.

Every week exercises will be made available. Solving is warmly recommended but voluntary.

The two afternoons with hands-on experience, however, are central elements of the lecture.

151-0573-00L System Modeling W 4 credits 2V+2U G. Ducard, C. Onder

Abstract

Objective

Introduction to system modeling for control. Analysis and optimization of linear and nonlinear systems. Parameter identification. Case studies.

Content

Introduction to generic system modelling approaches for control-oriented models based on first principles and on experimental data. Examples: mechatronic, energy, and process engineering systems. Model scaling, linearization, order reduction, and balancing. Planning of experiments, estimation techniques for "gray-box" modells (linear and nonlinear least-squares methods). The exercises are solved in teams. One larger case study is to be solved.

Lecture notes

The handouts in English will be sold in the first lecture.

Literature

A list of references is included in the handouts.

151-0703-00L Operational Simulation of Production Lines W 4 credits 2V+1U P. Acél

Abstract

The student learns the application of the event-driven and computer-based simulation for layout and operational improvement of production facilities by means of practical examples.

Objective

The student learns the right use of (Who? When? How?) of the event-driven and computer-based simulation in the illustration of the operating procedures and the production facilities. Operating simulation in the productions, logistic and scheduling will be shown by means of practical examples.

The student should make his first experiences in the use of computer-based simulation.

Content

- Application and application areas of the event-driven simulation
- EXEMPLARY application of a software tool (Technomatrix-Simulation-Software)
- Internal organisation and functionality of simulation tools
- Procedure for application: optimizing, experimental design planning, analysis, data preparation
- Controlling philosophies, emergency concepts, production in sequence, line production, rescheduling
- Application on the facilities projecting

The knowledge is enhanced by practice-oriented exercises and an excursion. A guest speaker will present a practical example.

Lecture notes

will be distributed simultaneously during lecture (+ PDF)

<td></td>
<td>Overview of manufacturing with forming techniques, deformation specific description of material properties and their experimental measurement, material laws, residual stresses, heat balance, tribological aspects of forming processes, workpiece and tool failure. Forming technology represents with its 70% global share in manufactured metal volume with respect to yield and cost, the most important manufacturing process in metal-working industries. Typical applications of forming technology range from the manufacturing of sheet metal components in auto bodies to applications in food and pharma packaging, fabrication of implants in medical technologies and to the fabrication of leads in microelectronic components. This course introduces the fundamentals which are essential to evaluate metal-forming processes and its industrial applications. This includes, together with the acquirements of the most important forming processes, the characterization of plastic behavior and manufacturing.</td>

</table>
The lecture teaches on the basic knowledge of major processes in sheet metal, tube and bulk metal forming technologies. In particular it focuses on fundamental computation methods, which allow a fast assessment of process behaviour and a rough layout. Process-specific states of stress and deformation are analysed and process limits are identified.

Objective
Acquaintance with forming processes. Determination of forming processes. Interpretation of forming manufacturing

Content
The study of metal working processes: sheet metal forming, folding die cutting, cold bulk metal forming, ro extrusion, plunging, open die forging, drop forging, milling; active principle; elementary methods to estimate stress and strain; fundamentals of process design; manufacturing limits and machining accuracy; tools and operation; machinery and machine usage.

<tr>
<td><strong>Objective</strong></td>
<td>Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.</td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.</td>

<td><strong>Abstract</strong></td>
<td>Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.</td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.</td>
</tr>
</tbody>
</table>
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:
- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

Lecture notes: No lecture notes, but slides will be made available on the course webpage.

Literature:

Prerequisites notice: Solid basic knowledge in analysis, statistics and numerical methods for CSE. Experience in programming for solving the project tasks.
Crack-flaws cannot be neglected in engineering analysis. Even microscopic crack flaws can grow over time, ultimately resulting in fractured components. Structures that may have been blindly deemed “safe” could fail disastrously, causing injuries to its users, or the loss of life. Fracture mechanics can be used to:

* Determine how large a crack can be in a structure before it leads to catastrophic failure
* Predict the rate at which a crack can approach a critical size due to fatigue loads or aggressive environmental conditions

The topics covered are

* Introduction to Linear Elastic Fracture Mechanics (LEFM): crack tip stress, strain and displacement fields in linear elastic materials (Modes I, II and III); the stress-intensity factor, K; the fracture toughness $K_{IC}$ and their determination; fracture criterion
* Estimates of crack plastic zones in ductile materials
* The compliance method: experimental determination of compliance
* Introduction to fracture mechanics of nonlinear materials: the J-integral; the Jlc fracture criterion; Jlc testing
* Application of fracture mechanics concepts in the analysis of subcritical crack growth (fatigue, stress corrosion cracking, creep and their combinations)
* Lifetime determination and prediction; failure analysis.

| 363-0445-00L | Logistics, Operations and Supply Chain Management I W | 3 credits | 2G | P. Schönleben, E. Scherer Casanova |
| Content | Logistics, Operations and Supply Chain Management I W | 3 credits | 2G | P. Schönleben, E. Scherer Casanova |
| Abstract | Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment. | 3 credits | 2G | P. Schönleben, E. Scherer Casanova |
| Objective | An effective and efficient flow of goods, data, and control in and between companies contributes significantly to the value added for the customer. Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment. | 3 credits | 2G | P. Schönleben, E. Scherer Casanova |
| Content | Strategic and tactical concepts in logistics, operations, and supply chain management: Conflicts of objectives and strategies and in the entrepreneurial context; business process analysis and fundamental logistics concepts; the MRP II / ERP concept: business processes and methods; the lean / just-in-time and repetitive manufacturing; concepts for product families and one-of-a-kind production; concepts for the process industry. | 3 credits | 2G | P. Schönleben, E. Scherer Casanova |
| Literature | This book also serves as textbook for LOS II (spring term) as well as ERP and SCM software systems (autumn term). In addition powerpoint-handouts and documents for case studies. | 3 credits | 2G | P. Schönleben, E. Scherer Casanova |
| Prerequisites / notice | Sales at 17.9.15, from 12:45, before and during brakes of the first lecture. | 3 credits | 2G | P. Schönleben, E. Scherer Casanova |
| Literature | As for the lecture of the 3rd week (BEMAD, a much-liked Business Engineering and Management Ability Development game), this lecture (of Oct. 1) will follow a specific schedule in specific rooms. The schedule will be presented at Sept. 17 during the 1st lecture. | 3 credits | 2G | P. Schönleben, E. Scherer Casanova |
| Due to the big number of students, about half of the students will play this game, instead of Oct. 1, at Friday afternoon, Oct. 2. Please be available. Thank you for your help in this matter. | 3 credits | 2G | P. Schönleben, E. Scherer Casanova |
| 363-0541-00L | Systems Dynamics and Complexity | W | 3 credits | 3G | F. Schweitzer, P. Mavrodiev |
| Abstract | Finding solutions: what is complexity, problem solving cycle. | 3 credits | 3G | F. Schweitzer, P. Mavrodiev |
| Objective | Implementing solutions: project management, critical path method, quality control feedback loop. | 3 credits | 3G | F. Schweitzer, P. Mavrodiev |
| Content | Controlling solutions: Vensim software, feedback cycles, control parameters, instabilities, chaos, oscillations and cycles, supply and demand, production functions, investment and consumption. | 3 credits | 3G | F. Schweitzer, P. Mavrodiev |
| | A successful participant of the course is able to:
| | - understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
| | - apply the problem solving cycle as a systematic approach to identify problems and their solutions
| | - calculate project schedules according to the critical path method
| | - setup and run systems dynamics models by means of the Vensim software
| | - identify feedback cycles and reasons for unintended systems behavior
| | - analyse the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics
| | Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical systems dynamics, nonlinear dynamics and macroeconomic modeling.
| | The course is structured along three main tasks:
| | 1. Finding solutions
| | 2. Implementing solutions
| | 3. Controlling solutions
| | PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.
| | PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.
| | PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.
| Literature | The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture. | 3 credits | 3G | F. Schweitzer, P. Mavrodiev |
There will be about 5 talks on how statistical methods are applied in practice.

**Zurich Colloquium in Applied and Computational Mathematics**

*3 credits, 2V+1U*

Financial Accounting: Balance sheet, income statement, double-entry accounting, journal and ledger, accounting for merchandising

Topics covered in this course include:
- See how statistical methods are applied in practice.
- Make decisions about the acceptance or rejection of a particular product.
- Understand the different procedures involved in the accounting system.
- Understand the principles of cost accounting.
- Calculate the different product costs.
- Using accounting information for decision making purposes.
- Record change in financial position.
- Prepare final accounts.
- Manage financial reporting.
- Full and variable costing system.
- Managerial Accounting: Full costing, variable costing, cost-volume-profit, break-even analysis, activity-based costing.

**Prerequisites**

- This course is a prerequisite for the course Financial Management.

**Lecture notes**

The slides of the lectures are made available and updated continuously through the SMI website:

- Relevant literature for the exam includes the slides and the reading assignments. The corresponding papers are either available from the author online or distributed during class.

**Literature**

Reading assignments: please consult the SMI website:
### Course: Transport Phenomena

**Objective**
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

**Content**
- Fick’s laws; application and significance of mass transfer; comparison of Fick’s laws with Newton’s and Fourier’s laws; derivation of Fick’s 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Reynolds- and Chilton-Colburn analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogenous and heterogenous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogenous reaction. Applications.

**Literature**

**Prerequisites / notice**
Three tests are offered for practicing the course material. Participation is voluntary.

**Abstract**
The lecture follows the value added process sequence of electric and electronic components. It contains: Development of electric and electronic circuits, design of electronic circuits on printed circuit boards as well as in hybrid technology, integrated test technology, planning of production lines, production of highly integrated electronic on a wafer as well as recycling.

**Objective**
Knowledge about the value added process sequence for electronics manufacturing, planning of electric and electronic product as well as their production, planning of production lines, value added process sequence for photovoltaics.

**Content**
Nothing works without electronics! Typical products in mechanical engineering such as machine tools, as well as any kind of vehicle contain a significant amount of electric or electronic components of more than 60%. Thus, it is important to master the value added process sequence for electric and electronic components.

The lecture starts with a brief introduction of electronic components and the planning of integrated circuits. Next, an overview will be provided about electronic functional units assembled from these electronic components, on printed circuit boards as well as in hybrid technology. Value added process steps are shown as well as their quality check and their combination for planning a complete manufacturing line. The lecture further describes the manufacturing of integrated circuits, starting from the wafer via the structuring and bonding to the packaging. As an example, the manufacturing of micro-electromechanic and electro-optical systems and actuators is described. Due to similar processes in the electronic production, the value added process sequence for photovoltaics will be described too.

The lecture concludes with an excursion to a large manufacturing company. Here, students can see the application and realization of the manufacturing of electric and electronic devices.

**Lecture notes**
Lecture notes are handed out during the individual lessons (CHF 20.-).

**Prerequisites / notice**
Help for English speaking students on request.

The lecture is partly given by experts from industry. It is supplemented by an excursion to one of the industry partners.

**Abstract**
Adaptive materials offer appealing ways to extend the design space of structures by introducing time-variable properties into them. In this course, the physical working principles of selected adaptive materials are analyzed and simple models for describing their behavior are presented. Some applications are illustrated, also with laboratory experiments where possible.

**Objective**
The study of adaptive materials covers topics that range from chemistry to theoretical mechanics.

**Content**
The aim of this course is to convey knowledge about adaptive materials, their properties and the physical mechanisms that govern their function, so as to develop the skills to deal with this interdisciplinary subject.

The course will provide the students with an insight into the properties and physical phenomena which lead to the features of adaptive materials. Starting from chemomechanical (skeletal muscles), the physical behavior of a wide range of adaptive materials, thermo- and photo-mechanical, electro-mechanical, magneto-mechanical and meta-materials will be thoroughly discussed and analyzed. Up-to-date results on their performance and their implementation in mechanical structures will be detailed and studied in laboratory sessions. Analytical tools and energy based considerations will provide the students with effective instruments for understanding adaptive materials and assess their performance when integrated in structures or when arranged in particular fashions.

Basic concepts: Power conjugated variables, dissipative effects, geometry- and materials-based energy conversion

Thermo-mechanical coupling: Shape memory alloys / polymers

Electromechanical coupling(1): DEA, EBL, electrorheological fluids

Shape control / morphing: Use, requirements, challenges

Morphing applications of variable stiffness structures: Lab work

Electromechanical coupling (2): Piezoelectric, electrostrictive effect

Vibration Reduction: Measurement, passive, semi-active (active) damping methods

Vibration reduction applications of piezoelectric materials: Lab work

Metamaterials: Definition of metamaterials - electromagnetic, acoustical and other metamaterials

Magneto-mechanical coupling: Magnetostrictive effect, mSMA, magnetorheological fluids, ferrofluids

Energy harvesting and sensing: Energy harvesting with EAP and piezoelectric materials, transducers as sensors: Piezo, resistive,...
Engineering (HPCSE) I

Abstract
This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering.

Objective
Introduction to HPC for scientists and engineers

Fundamentals of:
1. Parallel Computing Architectures
2. MultiCores
3. ManyCores

Content
Programming models and languages:
1. C++ threading (2 weeks)
2. OpenMP (4 weeks)
3. MPI (5 weeks)

Computers and methods:
1. Hardware and architectures
2. Libraries
3. Particles: N-body solvers
4. Fields: PDEs
5. Stochastics: Monte Carlo

Class notes, handouts

Skills for Creativity and Innovation W 4 credits 3G I. Goller, C. Kobe, M. Meboldt

Abstract
This lecture aims to enhance the knowledge and competency of students regarding their innovation capability. An overview on prerequisites of and different skills for creativity and innovation in individual & team settings is given. The focus of this lecture is clearly on building competencies - not just acquiring knowledge.

Objective
- Basic knowledge about creativity and skills
- Knowledge about individual prerequisites for creativity
- Development of individual skills for creativity
- Knowledge about teams
- Development of team-oriented skills for creativity
- Knowledge and know-how about transfer to idea generation teams

Content
Basic knowledge about creativity and skills:
- Introduction into creativity & innovation: definitions and models

Knowledge about individual prerequisites for creativity:
- Personality, motivation, intelligence

Development of individual skills for creativity:
- Focus on creativity as problem analysis & solving
- Individual skills in theoretical models
- Individual competencies: exercises and reflection

Knowledge about teams:
- Definitions and models
- Roles in innovation processes

Development of team-oriented skills for creativity:
- Idea generation and development in teams
- Cooperation & communication in innovation teams

Knowledge and know-how about transfer to idea generation teams:
- Self-reflection & development planning
- Methods of knowledge transfer

Lecture notes
Slides, script and other documents will be distributed via moodle.ethz.ch
(access only for students registered to this course)

Literature
Please refer to lecture script.

Colloquium on Manufacturing Technology W 4 credits 3K K. Wegener, F. Kuster

Abstract
Future training on selected current topics of the manufacturing technology. Per afternoon a selected topic is presented in several lectures, by the majority by experts from the industry. The students prepare a summary of the lectures given and prepare themselves on the basis of these lectures and own information search.

Objective
Continuous further training to current topics of the manufacturing technique. Exchange of experience and knowledge with the industry and other universities.

Content
Selected actual topics on manufacturing methods and tools, machine tools, NC-control and drives, components and measuring methods and devices. Topics are changing every year.

Lecture notes
no Script

Prerequisites / notice
- Students must have participated and passed the courses Manufacturing, Production Machines I and Forming Technology III - Forming Processes.
- Further training with specialized lectures and large participation from the industry.

Language: Help for English speaking students on request.

Aeroelasticity W 4 credits 2V+1U F. Campanile

Abstract
Introduction to the basics and methods of Aeroelasticity. An overview of the main static and dynamic phenomena arising from the interaction between structural and aerodynamic loads.

Objective
The course will give you a physical basic overview of current-structure phenomena. Furthermore you will get to know the most important phenomena in the statistical and dynamical aeroelastic as well as an introduction to the methods for mathematical descriptions and for the wording of quantitative forecasts.
## Human Factors I

<table>
<thead>
<tr>
<th>Code</th>
<th>Title</th>
<th>W</th>
<th>Credits</th>
<th>V</th>
<th>U</th>
<th>Authors</th>
</tr>
</thead>
</table>

### Objective

Every day humans interact with various systems. Strategies of interaction, individual needs, physical & mental abilities, and system properties are important factors in controlling the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction & overall performance.

### Content

- Physiological, physical, and cognitive factors in sensation and perception
- Body spaces and functional anthropometry
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

### Literature

Relevant articles and reading materials will be provided. Various books will be recommended pertaining to the topics covered.

### Prerequisites / notice

Mechanics I, II, III

## Mechanics of Nano- and Micro-Materials

</tbody>
</table>

### Objective

The course provides an introduction to the mechanics of nano- and micro-materials and devices, in the quasistatic and dynamic domains. It reviews scale effects in materials, surveys available characterization techniques and describes the effects of surfaces and microscale contacts. Recent applications of nano- and micro-materials in engineering systems will be discussed.

### Content

- Learn the fundamental mechanical properties of nano- and micro-system. Understand the effects of scales on the response of materials.
- Explore applications and devices exploiting the response of materials at small scales.

### Lecture notes

Slides and notes from the course will be provided.

### Literature

Relevant articles and reading materials will be provided. Various books will be recommended pertaining to the topics covered.

### Prerequisites / notice

Mechanics I, II, III

</tr>
</tbody>
</table>

### Objective

The course is structured in three main blocks, each of them addressing a specific grand challenge in engineering design. Each block is composed of an introductory lecture and two to three invited talks, considering a good mix between speakers coming from academia and industry. Each talk is introduced and moderated by the students.

### Content

The aim of the course is to introduce students to the engineering design research and practice in a multitude of Mechanical Engineering disciplines and convey knowledge from both academia and industry about state of the art methods, tools and processes.

### Prerequisites / notice

Offered in English and German

## Leading and Coaching Focus Project Teams (Basic Course)

### Objective

The course "Leading and Coaching Focus Project Teams (Basic Course)" for Autumn Semester is examined together with the course "Leading and Coaching Focus Project Teams (Advanced Course)" for Spring Semester with 4 ECTS.

### Abstract

The course is the first part of a two-semester course.

### Prerequisites / notice

Basic knowledge about role and mindset of a coach;
Knowledge and reflection of the classical problems in coaching of a focus project;
Development of personal coaching skills;
Knowledge and know-how about coaching methods;
Reflection and exchange of experiences about personal coaching situations;
Inspiration and learning from good cases regarding organizational and team management aspects.

### Literature

**Data:** 06.12.2017 12:57 **Autumn Semester 2015** **Page 965 of 1432**
The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature. The purpose of the lecture is to acquaint the students with a consistent generalization of classical mechanics towards systems with uncertainty quantification and propagation (UQ&P) for computational models of systems in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology. The lecture provides the students an introduction to modern methods for inequality problems in dynamics. The contents of the lecture are fitted to frictional contact problems in mechanics, but can be transferred to a large class of inequality problems in technical sciences. The purpose of the lecture is to acquaint the students with a consistent generalization of classical mechanics towards systems with discontinuities, and to make them familiar with inequalities treated as set-valued constitutive laws.

**151-0104-00L Uncertainty Quantification for Engineering & Life Sciences**
- **Number of participants limited to 60.**
- **Abstract:** Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.
- **Objective:** The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.
- **Content:** Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.
- **Lecture notes:** The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.
- **Literature:**
  1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
  2. Probability Theory: The Logic of Science by E. T. Jaynes
  3. Class Notes
- **Prerequisites / notice:** The course "Leading and Coaching Focus Project Teams (Basic Course)" (HS) is examined together with "Leading and Coaching Focus Project Teams (Advanced Course)" (FS) in FS with 4 ECTS.

**151-0536-00L Dynamics of Structure-Variant Systems**
- **Abstract:** Contents: inequality problems in dynamics, in particular friction and impact problems: discontinuities in velocity and acceleration, accumulation points, combinatorial problems, set-valued constitutive laws, unilateral contacts, spray clutches, friction, pre-stressed springs, impact equations and impact laws, linear complementarity, quadratic optimization.
- **Objective:** The lecture provides the students an introduction to modern methods for inequality problems in dynamics. The contents of the lecture are fitted to frictional contact problems in mechanics, but can be transferred to a large class of inequality problems in technical sciences. The purpose of the lecture is to acquaint the students with a consistent generalization of classical mechanics towards systems with discontinuities, and to make them familiar with inequalities treated as set-valued constitutive laws.
- **Content:**
  2. Einfache generalisierte Kraftgesetze: Generalisierte Kraft und Kraftrichtung, einfache Kraftgesetze, Zerlegung mengenwertiger Kraftgesetze in Upr- und Sgn-Grundelemente, Parallel- und Reihenschaltung von Grundelementen, geometrische und kinematische Stufenbindung und einseitige Bindung, einseitiger Kontakt, Freilauf, Reibung, vorgespannte Federn
  4. Stoßfreie Bewegung: Kraftgesetze auf Lage- und Geschwindigkeits- und Beschleunigungsebene, lineares Komplementaritätsproblem und quadratisches Programm zur Bestimmung der Richtungsbeschleunigungen
  5. Stoßfreie Bewegung bei Coulombreibung: Kontaktmodell, Anwendung der stoßfreien Bewegung auf Coulombreibung, Sätze zur Eindeutigkeit und Existenz, Systeme mit gleichzeitigen Kontakten, Minimalkoordinaten und Gleitreibung
- **Lecture notes:** Es gibt kein Vorlesungsskript. Den Studenten wird empfohlen, eine eigene Mitschrift der Vorlesung anzulegen. Ein Katalog mit relevanten Algorithmen in multicore Architekturen ist verfügbar.
- **Prerequisites / notice:** Participants (Students, PhD Students, Postdocs) should be part of the coaching team of focus project teams.

**Number of participants limited to 60.**

**Prerequisites:** Fundamentals of Probability, Fundamentals of Computational Modeling

**Credit:** 4 credits

**Lecture notes**
- Slides, script and other documents will be distributed via electronically (access only for participants registered to this course).

**Prerequisites / notice**
- Participants (Students, PhD Students, Postdocs) should be part of the coaching team of focus project teams.
- The course "Leading and Coaching Focus Project Teams (Basic Course)" (HS) is examined together with "Leading and Coaching Focus Project Teams (Advanced Course)" (FS) in FS with 4 ECTS.

**Literature**

### Railway Vehicle Dynamics

**Abstract**
After an introduction in to the railway vehicle design, the modelling of the contact between wheel and rail, the building of a simulation model and the fundamentals of the track guiding will be explained. The applications of simulations in the development of railway vehicles will be presented and illustrated on examples.

**Objective**
Development of the theoretical basics regarding the track guiding and the vehicle running dynamics. Understanding the background of multi-body dynamics simulation tools and their application in the development of railway vehicles.

**Content**
- Introduction in to railway vehicle technology: Vehicle concepts, bogies, suspension systems, brakes, drives.
- Use of multi-body simulations in the railway vehicle industry. Simulation programmes.
- Vehicle model: Model building, modelling of coil springs, rubber to metal springs, air springs and suspension components with friction.
- Wheel/rail contact: Contact geometry, contact area, normal forces, tangential forces.
- Track models. Modelling of track irregularities.
- Linearization of the contact geometry wheelset-track.
- Fundamentals of track guiding.
- Eigenbehaviour, calculation of eigenvalues.
- Linearised and nonlinear calculation of running stability: Methods and assessment criteria. Influence of vehicle design on the running stability.
- Ride comfort assessment.
- Testing and simulations for the acceptance of running characteristics of railway vehicles. Validation of simulation models for the application in context of vehicle acceptance.

**Lecture notes**
Script will be provided.

**Prerequisites / notice**
Fundamentals of mechanics and physics.

### Railway Systems I

**Abstract**
Basic characteristics of railway vehicles and their interfaces with the railway infrastructure:
- Transportation tasks and vehicle types
- Running dynamics
- Mechanical part of rail vehicles
- Brakes
- Traction chain and auxiliary supply
- Railway power supply
- Signalling systems
- Traffic control and maintenance

**Objective**
- Overview of the technical characteristics of railway systems
- Know-how about the design and construction principles of rail vehicles
- Interrelationship between different fields of engineering sciences (mechanics, electro and information technology, transport systems)
- Understanding tasks and opportunities of engineers working in an environment which has strong economical and political boundaries
- Insight into the activities of the railway vehicle industry and railway operators in Switzerland
- Motivation of young engineers to start a career in the railway industry or with railway operators

**Content**
EST I (Frühjahrsemester) - Begriffen, Grundlagen, Merkmale

1. Einführung:
   1.1 Geschichte und Struktur des Bahnsystems
   1.2 Fahrdynamik

2. Vollbahnfahrzeuge:
   2.1 Mechanik: Kasten, Drehgestelle, Lauftechnik, Adhäsion
   2.2 Bremsen
   2.3 Traktionsantriebsysteme
   2.4 Hilfsbetriebe und Komfortanlagen
   2.5 Steuerung und Regelung

3. Infrastruktur:
   3.1 Fahrweg
   3.2 Bahnstromversorgung
   3.3 Sicherungsanlagen

4. Betrieb:
   4.1 Interoperabilität, Normen und Zulassung
   4.2 RAMS, LCC
   4.3 Anwendungsbeispiele

Voraussichtlich ein oder zwei Gastreferate

Geplante Exkursionen:
- Betriebszentrale SBB, Zürich Flughafen
- Reparatur und Unterhalt, SBB Zürich Altstetten
- Fahrzeugübergabe, Stadler Bussnang

**Lecture notes**
Abgabe der Unterlagen (gegen eine Schutzgebühr) zu Beginn des Semesters. Rechtzeitig eingeschriebene Teilnehmer können die Unterlagen auf Wunsch und gegen eine Zusatzgebühr auch in Farbe beziehen.

**Prerequisites / notice**
Dozent:
Dr. Markus Meyer, Emkamatik GmbH

Voraussichtlich ein oder zwei Gastvorträge von anderen Referenten.

EST I (Herbstsemester) kann als in sich geschlossene einsemestrige Vorlesung besucht werden. EST II (Frühjahrssemester) dient der weiteren Vertiefung der Fahrzeugtechnik und der Integration in die Bahnninfrastruktur.

### Microscale Acoustofluidics

**Abstract**
In this lecture the basics as well as practical aspects (from modelling to design and fabrication) are described from a solid and fluid mechanics perspective with applications to microsystems and lab on a chip devices.

**Objective**
Understanding acoustophoresis, the design of devices and potential applications

**Content**
- Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microrobotics to surface acoustic wave devices

Prerequisites / notice: Solid and fluid continuum mechanics. Notice: The exercise part is a mixture of presentation, lab session and hand in homework.

**Dynamic Programming and Optimal Control (W 4 credits 2V+2U D. Mohr)**

Lectures and computer labs concerned with the modeling of the deformation response and failure of engineering materials (metals, polymers and composites) subject to extreme loadings during manufacturing, crash, impact and blast events.

**Objective**: Students will learn to apply, understand and develop computational models of a large spectrum of engineering materials to predict their dynamic deformation response and failure in finite element simulations. Students will become familiar with important dynamic testing techniques to identify material model parameters from experiments. The ultimate goal is to provide the students with the knowledge and skills required to engineer modern multi-material solutions for high performance structures in automotive, aerospace and nautical engineering.

**Content**: Topics include viscoelasticity, temperature and rate dependent plasticity, dynamic brittle and ductile fracture; impulse transfer, impact and wave propagation in solids; computational aspects of material model implementation into hydrocodes; simulation of dynamic failure of structures.

**Lecture notes**: Slides of the lectures, relevant journal papers and users manuals will be provided.

**Literature**: Various books will be recommended covering the topics discussed in class.

**Prerequisites / notice**: Course in continuum mechanics (mandatory), finite element method (recommended)

---

**Robots, Systems and Control**

- **Virtual Reality in Medicine**: Virtual Reality has the potential to support medical training and therapy. This lecture will derive the technical principles of multi-modal (audiovisual, haptic, tactile etc.) input devices, displays and rendering techniques. Examples are presented in the fields of surgical training, intra-operative augmentation, and rehabilitation. The lecture is accompanied by practical courses and excursions.
  - **Objective**: Provide theoretical and practical knowledge of new principles and applications of multi-modal simulation and interface technologies in medical education, therapy, and rehabilitation.
  - **Content**: Virtual Reality has the potential to provide descriptive and practical information for medical training and therapy while relieving the patient and/or the physician. Multi-modal interactions between the user and the virtual environment facilitate the generation of high-fidelity sensory impressions, by using not only visual and auditory modalities, but also kinesthetic, tactile, and even olfactory feedback. On the basis of the existing physiological constraints, this lecture will derive the technical requirements and principles of multi-modal input devices, displays, and rendering techniques. Several examples are presented that are currently being developed or already applied for surgical training, intra-operative augmentation, and rehabilitation. The lecture will be accompanied by several practical courses on graphical and haptic display devices as well as excursions to facilities equipped with large-scale VR equipment.
  - **Prerequisites / notice**: The course language is English. Basic experience in Information Technology and Computer Science will be of advantage.

---

---

**Engine Systems**: Introduction to current and future engine systems and their control systems. Introduction to methods of control and optimization of dynamic systems. Application to real engines. Understand the structure and behavior of drive train systems and their quantitative descriptions.

---

**Vehicle Propulsion Systems**: Introduction to current and future propulsion systems and the electronic control of their longitudinal behavior. Introduction to methods of system optimization and controller design for vehicles. Understanding the structure and working principles of conventional and new propulsion systems. Quantitative descriptions of propulsion systems

---

**Data**: 06.12.2017 12:57

**Autumn Semester 2015**

**Page**: 968 of 1432
An embedded system is a microprocessor used as a component in another piece of technology, such as cell phones or automobiles. In this course, students will be introduced to system modeling for control oriented systems based on first principles and on experimental data. A list of references is included in the handouts.

### 151-0573-00L System Modeling

**Abstract**
Generic modeling approaches for control-oriented models based on first principles, Lagrangian formalism and experimental data. Model parameterization, planning of experiments, linear and nonlinear estimation techniques for “gray-box” models. Analysis of linear systems, model scaling, linearization, order reduction, and balancing. Analysis of nonlinear models.

**Objective**
Introduction to system modeling for control. Analysis and optimization of linear and nonlinear systems. Parameter identification. Case studies.

**Content**
Introduction to generic system modeling approaches for control-oriented models based on first principles and on experimental data. Examples: mechatronic, energy, and process engineering systems. Model scaling, linearization, order reduction, and balancing. Planning of experiments, estimation techniques for “gray-box” models (linear and nonlinear least-squares methods). The exercises are solved in teams. One larger case study is to be solved.

**Literature**
The handouts in English will be sold in the first lecture. A list of references is included in the handouts.

**Prerequisites / notice**
Lectures of Dr. Ch. Onder are also possible to be held in German.

### 151-0593-00L Embedded Control Systems

**Abstract**
This course provides a comprehensive overview of embedded control systems. The concepts introduced are implemented and verified on a microprocessor-controlled haptic device.

**Objective**
Familiarize students with main architectural principles and concepts of embedded control systems.

**Content**
An embedded system is a microprocessor used as a component in another piece of technology, such as cell phones or automobiles. In this intensive two-week block course the students are presented the principles of embedded digital control systems using a haptic device as an example for a mechatronic system. A haptic interface allows for a human to interact with a computer through the sense of touch.

Subjects covered in lectures and practical lab exercises include:
- The application of C-programming on a microprocessor
- Digital I/O and serial communication
- Quadrature decoding for wheel position sensing
- Queued analog-to-digital conversion to interface with the analog world
- Pulse width modulation
- Timer interrupts to create sampling time intervals
- System dynamics and virtual worlds with haptic feedback
- Introduction to rapid prototyping

**Lecture notes**
Lecture notes, lab instructions, supplemental material

**Prerequisites / notice**
Prerequisite courses are Control Systems I and Informatics I.

This course is restricted to 33 students due to limited lab infrastructure. Interested students please contact Marianne Schmid (E-Mail: schmid@idsc.mavt.ethz.ch)

After your reservation has been confirmed please register online at www.mystudies.ethz.ch.

Detailed information can be found on the course website http://www.idsc.ethz.ch/education/lectures/embedded-control-systems.html

### 151-0601-00L Theory of Robotics and Mechatronics

**Abstract**
This course provides an introduction and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. It's a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

**Objective**
Robotics is often viewed from three perspectives: perception (sensing), manipulation (affecting changes in the world), and cognition (intelligence). Robotic systems integrate aspects of all three of these areas. This course provides an introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. This course is a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

**Content**

- The application of C-programming on a microprocessor
- Digital I/O and serial communication
- Quadrature decoding for wheel position sensing
- Queued analog-to-digital conversion to interface with the analog world
- Pulse width modulation
- Timer interrupts to create sampling time intervals
- System dynamics and virtual worlds with haptic feedback
- Introduction to rapid prototyping

**Lecture notes**
available.

**Prerequisites / notice**
The course will be taught in English.

### 376-1219-00L Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions

**Abstract**
Rehab. Engineering is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

**Objective**
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.
Content

Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

Literature

Introductory Books:

Selected Journal Articles and Web Links:
- VideoTact, ForeThought Development, LLC. http://my.execpc.com/?dwysocki/videotac.html

Prerequisites / notice

Target Group:
- Students of higher semesters and PhD students of
  - D-MAVT, D-ITET, D-INFK, D-HEST
  - Biomedical Engineering, Robotics, Systems and Control
  - Medical Faculty, University of Zurich
- Students of other departments, faculties are also welcome

151-0851-00L Robot Dynamics W 4 credits 2V+1U R. Siegwart, M. Hutter, K. Rudin, T. Staastny

Data: 06.12.2017 12:57 Autumn Semester 2015 Page 970 of 1432
The primary objective of this course is that the student deepens an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.

The course consists of three parts: First, we will refresh and deepen the student’s knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on its application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related design and control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in robotics. The last part finally covers different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.

The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

Prerequisites / notice
The contents of the following ETH Bachelor lectures or equivalent are assumed to be known: Mechanics and Dynamics, Control, Basics in Fluid Dynamics.

Abstract
We will provide an overview on how to kinematically and dynamically model typical robotic systems such as robot arms, legged robots, rotary wing systems, or fixed wing.

Objective
The class is intended to provide a comprehensive overview of the theory of linear dynamical systems, their use in control, filtering, and estimation and their applications to areas ranging from avionics to systems biology.

Content
- Rings, fields and linear spaces, normed linear spaces and inner product spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete time, time varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Controllability and observability, canonical forms, Kalman decomposition. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.
- Realization theory.

Lecture notes

Prerequisites / notice
Prerequisites: Control systems (227-0216-00 or equivalent) and sufficient mathematical maturity.

Abstract
By the end of the class students should be comfortable with the fundamental results in linear system theory and the mathematical tools used to derive them.

Objective
Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course students are expected to submit assignments. The course concludes with an end-of-semester examination.

Content
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes
The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

Prerequisites / notice
The lecture will be taught in English.

Abstract
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

Objective
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

Content
Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Reynolds- and Chilton-Colburn analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogenous and heterogeneous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogeneous reaction. Applications.

Literature

Prerequisites / notice
Three tests are offered for practicing the course material. Participation is voluntary.

Abstract
This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.
The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and de-sign safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the defined design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical-human-robot interaction, laboratory sessions and lab visits.

Students will attend theoretical sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (http://edu.haptics.org/index.php/HapticDevices/HapticPaddles), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, signal quantization, Automation, etc.) during rendering of different mechanical properties.

Will be distributed through the document repository before the lectures.

http://www.relab.ethz.ch/education/courses/phRI.html

Notice:
The registration is limited to 26 students
There are 4 credit points for this lecture.
The lecture will be held in English.
The students are expected to have basic control knowledge from previous classes.

System Identification

W 4 credits

2V+1U

R. Smith

227-0689-00L

Theory and techniques for the identification of dynamic models from experimentally obtained system input-output data.

To provide a series of practical techniques for the development of dynamical models from experimental data, with the emphasis being on the development of models suitable for feedback control design purposes. To provide sufficient theory to enable the practitioner to understand the trade-offs between model accuracy, data quality and data quantity.
Introduction to modeling: Black-box and grey-box models; Parametric and non-parametric models; ARX, ARMAX (etc.) models.

Predictive, open-loop, black-box identification methods. Time and frequency domain methods. Subspace identification methods.

Optimal experimental design, Cramer-Rao bounds, input signal design.

Parametric identification methods. On-line and batch approaches.

Closed-loop identification strategies. Trade-off between controller performance and information available for identification.

Control systems (227-0216-00L) or equivalent.

Electrical Drive Systems II

In the course "Drive System II" the power semiconductors are repeated. The creation of converters based on the combination of switches/cells and based topologies is explained. Another main focus is on the 3-level inverter with its switching and transfer functions. Further topics are the control of the synchronous machine, of line-side converters and issues with converter-fed machines.

The students establish a deeper understanding in regards of the design of the main components of an electrical drive system. They establish knowledge on the most important interaction with the grid and the machine and their related high dynamic control.

Converter topologies (switch or cell based), multi-pulse diode rectifiers, system aspects of transformer and electrical machines, 3-level inverter with its switching and transfer functions, grid side harmonics, modeling and control of synchronous machines (including permanent magnet machines), control of line-side converters, reflection effects with power cables, winding isolation and bearing stress. Field trip to ABB Semiconductors.

Prerequisites: Electrical Drive Systems I (recommended), Basics in electrical engineering, power electronics, automation and mechatronics

High Performance Computing for Science and Engineering (HPCSE)

This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering.

Introduction to HPC for scientists and engineers

Fundamental of:
1. Parallel Computing Architectures
2. MultiCores
3. ManyCores

Programming models and languages:
1. C++ threading (2 weeks)
2. OpenMP (4 weeks)
3. MPI (5 weeks)

Computers and methods:
1. Hardware and architectures
2. Libraries
3. Particles: N-body solvers
4. Fields: PDEs
5. Stochastics: Monte Carlo

Claas notes, handouts

Skills for Creativity and Innovation

This lecture aims to enhance the knowledge and competency of students regarding their innovation capability. An overview on prerequisites of and different skills for creativity and innovation in individual & team settings is given. The focus of this lecture is clearly on building competencies - not just acquiring knowledge.

Basic knowledge about creativity and skills:
- Introduction into creativity & innovation: definitions and models

Knowledge about individual prerequisites for creativity:
- Personality, motivation, intelligence

Development of individual skills for creativity:
- Focus on creativity as problem analysis & solving
- Individual skills in theoretical models
- Individual competencies: exercises and reflection

Knowledge about teams:
- Definitions and models
- Roles in innovation processes

Development of team-oriented skills for creativity:
- Idea generation and development in teams
- Cooperation & communication in innovation teams

Knowledge and know-how about transfer to idea generation teams:
- Self-reflection & development planning
- Methods of knowledge transfer
151-0727-00L Colloquium on Manufacturing Technology

Abstract
Future training on selected current topics of the manufacturing technology. Per afternoon a selected topic is presented in several lectures, by the majority by experts from the industry. The students prepare a summary of the lectures given and prepare themselves on the basis of these lectures and own information search.

Objective
Continuous further training to current topics of the manufacturing technique. Exchange of experience and knowledge with the industry and other universities.

Content
Selected actual topics on manufacturing methods and tools, machine tools, NC-control and drives, components and measuring methods and devices. Topics are changing every year.

Lecture notes
No script

Prerequisites / notice
- Students must have participated and passed the courses Manufacturing, Production Machines I and Forming Technology III - Forming Processes.
- Further training with specialized lectures and large participation from the industry.

Language: Help for English speaking students on request.

151-0104-00L Uncertainty Quantification for Engineering & Life Sciences

Abstract
Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective
The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content
Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Lecture notes
The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Literature
1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes
3. Class Notes

Prerequisites / notice
Fundamentals of Probability, Fundamentals of Computational Modeling

 במצבים שונים של录入技術 למקונים במעבדה והיו במעבדה逻辑學, ב-3G במעבדה מנהלת zeigt מהלה נייקства במעבדה ל QDateTime 12.2017 12:57 1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia

151-0620-00L Embedded MEMS Lab

Abstract
Practical course: Students are introduced to the process steps required for the fabrication of MEMS (Micro Electro Mechanical System) and carry out the fabrication and testing steps in the clean rooms by themselves. Additionally, they learn the requirements for working in clean rooms. Processing and characterization will be documented and analyzed in a final report. Limited access

Objective
Students learn the individual process steps that are required to make a MEMS (Micro Electro Mechanical System). Students carry out the process steps themselves in laboratories and clean rooms. Furthermore, participants become familiar with the special requirements (cleanliness, safety, operation of equipment and handling hazardous chemicals) of working in the clean rooms and laboratories. The entire production, processing, and characterization of the MEMS is documented and evaluated in a final report.

Content
With guidance from a tutor, the individual silicon microsystem process steps that are required for the fabrication of an accelerometer are carried out:
- Photolithography, dry etching, wet etching, sacrificial layer etching, critical point drying, various cleaning procedures
- Packaging and electrical connection of a MEMS device
- Testing and characterization of the MEMS device
- Written documentation and evaluation of the entire production, processing and characterization

Lecture notes
A document containing theory, background and practical course content is distributed at the first meeting of the course.

Literature
The document provides sufficient information for the participants to successfully participate in the course.

Prerequisites / notice
Participating students are required to attend all scheduled lectures and meetings of the course.

Participating students are required to provide proof that they have personal accident insurance prior to the start of the laboratory portion of the course.

This master's level course is limited to 15 students per semester for safety and efficiency reasons. If there are more than 15 students registered, we regret to restrict access to this course by the following rules:

Priority 1: master students of the master's program in "Micro and Nanosystems"
Priority 2: master students of the master's program in "Mechanical Engineering" with a specialization in Microsystems and Nanoscale Engineering (MAVT-tutors Profs Darai, Dual, Hierold, Koumoutsakos, Nelson, Norris, Park, Poulikakos, Pratsinis, Stemmer), who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.
Priority 3: master students, who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.
Priority 4: all other students (PhD, bachelor, master) with a background in silicon or microsystems process technology.

If there are more students in one of these priority groups than places available, we will decide by drawing lots.

Students will be notified at the first lecture of the course (introductory lecture) as to whether they are able to participate.

The course is offered in autumn and spring semester.
Familiarize students with basic science and engineering principles governing the nano domain. The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics that are traditionally taught separately.

Topics are treated in 2 blocks:

(I) From Quantum to Continuum
From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale
Intermolecular forces, their macroscopic manifestations, and ways to control such interactions. Self-assembly and directed assembly of 2D and 3D structures.

Prerequisites / notice
Lectures and Mini-Review presentations: Thursday 10-13, ML F 36

Homework: Mini-Reviews
Students select a paper (list distributed in class) and expand the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper.

| 151-0255-00L | **Energy Conversion and Transport in Biosystems**                       | W    | 4    | 2V+1U | D. Poulikakos, A. Ferrari |
| **Abstract** | Theory and application of thermodynamics and energy conversion in biological systems and biomedicine at the macro scale and the cellular level. |      |      |       |                            |
| **Objective** | Theory and application of energy conversion at the macro scale and the cellular level. Understanding of the basic features governing fluid transport in the principal systems of the human cell. Connection of characteristics and patterns from other fields of engineering to biofluidics. Heat and mass transport processes within the human body and relation to biomedical technologies. |      |      |       |                            |
| **Content** | Mass transfer models for the transport of chemical species in the human cell. Organization and function of the cell membrane and of the cell cytoskeleton. The role of molecular motors in cellular force generation and their function in cell migration. Description of the functionality of these systems and of analytical experimental and computational techniques for understanding of their operation. Introduction to bioengineering approaches for the treatment of common pathogenic conditions of these systems. Introduction to cell metabolism, cellular energy transport and cellular thermodynamics. |      |      |       |                            |
| **Lecture notes** | Script as well as additional material in the form of hand-outs will be distributed. |      |      |       |                            |
| **Literature** | Lecture notes and references therein. |      |      |       |                            |

| 151-0317-00L | **Visualization, Simulation and Interaction - Virtual Reality II** | W    | 4    | 3G    | A. Kunz                    |
| **Abstract** | This lecture provides deeper knowledge on the possible applications of virtual reality, its basic technology, and future research fields. The goal is to provide a strong knowledge on Virtual Reality for a possible future use in business processes. |      |      |       |                            |
| **Objective** | Virtual Reality can not only be used for the visualization of 3D objects, but also offers a wide application field for small and medium enterprises (SME). This could be for instance an enabling technology for net-based collaboration, the transmission of images and other data, the interaction of the human user with the digital environment, or the use of augmented reality systems. The goal of the lecture is to provide a deeper knowledge of today's VR environments that are used in business processes. The technical background, the algorithms, and the applied methods are explained more in detail. Finally, future tasks of VR will be discussed and an outlook on ongoing international research is given. |      |      |       |                            |
| **Content** | Introduction into Virtual Reality; basics of augmented reality; interaction with digital data, tangible user interfaces (TUI); basics of simulation; compression procedures of image-, audio-, and video signals; new materials for force feedback devices; introduction into data security; cryptography; definition of free-form surfaces; digital factory; new research fields of virtual reality |      |      |       |                            |
| **Lecture notes** | The handout is available in German and English. |      |      |       |                            |
| **Prerequisites / notice** | Prerequisites: "Visualization, Simulation and Interaction - Virtual Reality I" is recommended. |      |      |       |                            |
| **Didactical concept:** | The course consists of lectures and exercises. |      |      |       |                            |

| 151-0917-00L | **Mass Transfer**                                                       | W    | 4    | 2V+2U | R. Büchel, S. E. Pratsinis |
| **Abstract** | This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated. |      |      |       |                            |
| **Objective** | This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated. |      |      |       |                            |
| **Content** | Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Reynolds- and Chilton-Colburn analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogeneous and heterogenous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogeneous reaction. Applications. |      |      |       |                            |
| **Prerequisites / notice** | Three tests are offered for practicing the course material. Participation is voluntary. |      |      |       |                            |

| 227-0385-10L | **Biomedical Imaging**                                                  | W    | 6    | 5G    | S. Kozerke, U. Moser, K. P. Prüssmann, M. Rudin |
| **Abstract** | New course. Not to be confused with 227-0385-00L of fall 2014. |      |      |       |                            |

**Data:** 06.12.2017 12:57 | **Autumn Semester 2015** | **Page 977 of 1432**
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011

Prerequisites / notice

227-0386-00L Biomedical Engineering W 4 credits 3G J. Vörös, S. J. Ferguson, S. Kozerke, U. Moser, M. Rudin, M. P. Wolf, M. Zenobi-Wong

Abstract

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Objective

Content

Lecture notes

Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

Objective

Content

Lecture notes

Prerequisites:

Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.

227-0945-00L Cell and Molecular Biology for Engineers I W 3 credits 3G C. Frei

Abstract

This course is part I of a two-semester course.

Objective

Content

Lecture notes

Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

227-0965-00L Micro and Nano-Tomography of Biological Tissues W 4 credits 3G M. Stampanoni, K. S. Mader

Abstract

The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective

Content

In addition, three journal clubs will be held, where one/two publictions will be discussed. For each journal club, students (alone or in groups of up to three students) have to write a summary and discuss the publication. These written documents will be graded, and count as 25% for the final grade.

Lecture notes

Prerequisites:

Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C. The course language is English.

227-0945-00L Cell and Molecular Biology for Engineers I W 3 credits 3G C. Frei

Abstract

This course is part I of a two-semester course.

Objective

Content

Lecture notes

Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions
W 3 credits 2V
R. Riener, R. Gassert, L. Marchal Crespo

Abstract
Rehab. Engineering is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

Content
Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces
Virtual Reality has the potential to provide descriptive and practical information for medical training and therapy while relieving the patient. This lecture will derive the technical principles of multi-modal input devices, displays, and rendering techniques. Examples are presented in the fields of surgical training, medical education, therapy, and rehabilitation. The lecture is accompanied by practical courses and excursions.

Selected Journal Articles and Web Links:

- VideoTact, ForeThought Development, LLC. http://my.execpc.com/?dwysocki/videotac.html

Prerequisites / notice

Target Group:

- Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich

Students of other departments, faculties, courses are also welcome

376-1279-00L Virtual Reality in Medicine ■ W 3 credits 2V R. Riener, M. Harders

Abstract

Virtual Reality has the potential to support medical training and therapy. This lecture will derive the technical principles of multi-modal (audiovisual, haptic, tactile etc.) input devices, displays and rendering techniques. Examples are presented in the fields of surgical training, intra-operative augmentation, and rehabilitation. The lecture is accompanied by practical courses and excursions.

Objective

Provide theoretical and practical knowledge of new principles and applications of multi-modal simulation and interface technologies in medical education, therapy, and rehabilitation.

Content

Virtual Reality has the potential to provide descriptive and practical information for medical training and therapy while relieving the patient and/or the physician. Multi-modal interactions between the user and the virtual environment facilitate the generation of high-fidelity sensory impressions, by using not only visual and auditory modalities, but also kinesthetic, tactile, and even olfactory feedback. On the basis of the existing physiological constraints, this lecture will derive the technical requirements and principles of multi-modal input devices, displays, and rendering techniques. Several examples are presented that are currently being developed or already applied for surgical training, intra-operative augmentation, and rehabilitation. The lecture will be accompanied by several practical courses on graphical and haptic display devices as well as excursions to facilities equipped with large-scale VR equipment.

Target Group:

- Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich

Students of other departments, faculties, courses are also welcome!

Literature

Number of participants limited to 26.

Abstract

This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.

Objective

The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and design safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the defined design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

Content

This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (http://eduhapsics.org/index.php/HapticDevices/HapticPaddles), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.

Lecture notes

Will be distributed through the document repository before the lectures.

http://www.relab.ethz.ch/education/courses/phri.html

Literature

Number of participants limited to 26.

Notice

The registration is limited to 26 students

There are 4 credit points for this lecture.

The lecture will be held in English.

The students are expected to have basic control knowledge from previous classes.

http://www.relab.ethz.ch/education/courses/phri.html

Biocompatible Materials  ■  W  4 credits  3G  K. Manirua, J. Möller, M. Zenobi-
Abstract
Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Objective
The class consists of three parts:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

Content
Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed. In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

Lecture notes
Handouts can be accessed online.

</tr>
<tr>
<td><strong>Content</strong></td>
<td>The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.</td>

<td><strong>Abstract</strong></td>
<td>Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division &amp; growth, and cell migration.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>The full-year course (551-0319-00 &amp; 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.</td>
<td></td>

Data: 06.12.2017 12:57 Autumn Semester 2015 Page 982 of 1432
Cross-disciplinary collaboration between engineers and medical doctors is indispensable for innovation in health care. This course will bring together engineering students from ETH Zurich and medical students from the University of Zurich to experience the rewards and challenges of such interdisciplinary work in a project-based learning environment.

The main goal of this course is to demonstrate the differences in communication between the fields of medicine and engineering. Since such differences become the most evident during actual collaborative work, the course is based on a current project in physiology research that combines medicine and engineering. For the engineering students, the specific aims of the course are to:

- Acquire a working understanding of the anatomy and physiology of the investigated system;
- Identify the engineering challenges in the project and communicate them to the medical students;
- Develop and implement, together with the medical students, solution strategies for the identified challenges;
- Present the found solutions to a cross-disciplinary audience.

After a general introduction to interdisciplinary communication and detailed background on the collaborative project, the engineering students will receive tailored lectures on the anatomy and physiology of the relevant system. They will then team up with medical students who have received a basic introduction to engineering methodology to collaborate on said project. In the process, they will be coached both by lecturers from ETH Zurich and the University of Zurich, receiving lectures customized to the project. The course will end with each team presenting their solution to a cross-disciplinary audience.

Handouts and relevant literature will be provided.

Measurement and modeling of the human movement during daily activities and in a clinical environment.

The students are able to analyse the human movement from a technical point of view, to process the data and perform modeling with a focus towards clinical application.

This course includes ethical considerations, measurement techniques, clinical testing, accessing movement data and analysis as well as modeling with regards to human movement.

376-1177-00L | Uncertainty Quantification for Engineering & Life Sciences | W | 4 | J. Beck, P. Koumoutsakos |

Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Topics that will be covered include: Uncertainty quantification under parametric and non-parametric moulding uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Every day humans interact with various systems. Strategies of interaction, individual needs, physical & mental abilities, and system properties are important factors in controlling the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction & overall performance.

The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

Handout at the start of the course.

You will learn how to apply the scientific discipline of ergonomics for system analysis and product development "in order to optimise human well-being and overall system performance" (www.iea.cc). The course offers the framework of models, concepts, methods and tools of applied ergonomics. Teaching is combined with learning-by-doing and research-based learning.

Knowledge of:

- Principles and rules of applied ergonomic system and product design.
- Methods and tools of ergonomic analysis and evaluation.
- Practical experiences and hands-on skills in:
  - Conducting a study in system and task analysis.
  - Analysing human-product interactions.
  - Applying ergonomic knowledge for product and system improvements.

- Definition and role of applied ergonomics in engineering and design.
- Framework of ergonomic analysis and design.
- Design principles and rules.
- Methods and tools for system and task analysis.
- Hands-on experience in team work:
  - Experimental study of human-product interaction and usability through eye-tracking
  - Field study of system and task analysis, including on-site visits of complex work stations (Hospital OR/ICU or Air traffic/Railway Control Rooms).

Lecture notes Handout at the start of the course.

Literature

Max. number of participants is 15.

Experiments and field studies in teams of 2-3 students are obligatory.

*All interested students are invited to apply for this course by sending a one-page motivation letter until 07.09.2015 to Florian Rittiner (rittiner@ethz.ch).*

*Additionally please enroll via mystudies. Places will be assigned after the first lecture on the basis of your motivation letter and commitment for the class.*

### Abstract

The purpose of this course is to engage students in a multidisciplinary collaboration to tackle real world problems. Following a design thinking approach, students will work in multidisciplinary teams to solve a set of design challenges that are organized as a one-week, a three-week, and a six-week project. The final project will be in collaboration with an external project partner.

### Objective

During the course, students will learn about different design thinking methods and tools. This will enable them to:

- Generate deep insights through the systematic observation and interaction of key stakeholders.
- Engage in collaborative ideation with a multidisciplinary (student) team.
- Rapidly prototype and iteratively test ideas and concepts by using various materials and techniques.

### Literature

### Prerequisites

Max. number of participants is 15.

Experiments and field studies in teams of 2-3 students are obligatory.

3. Class Notes

### Prerequisites

Fundamentals of Probability, Fundamentals of Computational Modeling

### 151-3209-00L Engineering Design Optimization

*Number of participants limited to 25.*

### Abstract

The course covers fundamentals of computational optimization methods in the context of engineering design. It develops skills to formally state and model engineering design tasks as optimization problems and select appropriate methods to solve them.
The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and computational models of engineering materials to predict their dynamic deformation response and failure in finite element simulations. Students will become familiar with important dynamic testing techniques to identify material model parameters from experiments. The ultimate goal is to provide the students with the knowledge and skills required to engineer modern multi-material solutions for high performance structures in automotive, aerospace and naval engineering.

### Multidisciplinary Courses

*The students are free to choose individually from the entire course offer of ETH Zurich, ETH Lausanne and the Universities of Zurich and St. Gallen.*

Abstract
Linear algebra is an indispensable tool of engineering mathematics. The course is an introduction to basic methods and fundamental concepts of linear algebra and its applications to engineering sciences.

Objective
After completion of this course, students are able to recognize linear structures and to apply adequate tools from linear algebra in order to solve corresponding problems from theory and applications. In addition, students have a basic knowledge of the software package Matlab.

Content

Linear maps, kernel and image, coordinates and matrices, coordinate transformations, norm of a matrix, orthogonal matrices, eigenvalues and eigenvectors, algebraic and geometric multiplicity, eigenbasis, diagonalizable matrices, symmetric matrices, orthonormal basis, condition number, linear differential equations, Jordan decomposition, singular value decomposition, examples in MATLAB, applications.

Reading:
Gilbert Strang "Introduction to linear algebra", Wellesley-Cambridge Press: Chapters 1-6, 7.1-7.3, 8.1, 8.2, 8.6

Abstract
Introduction to partial differential equations. Differential equations which are important in applications are classified and solved. Elliptic, parabolic and hyperbolic differential equations are treated. The following mathematical tools are introduced: Laplace transforms, Fourier series, separation of variables, methods of characteristics.

Objective
Mathematical treatment of problems in science and engineering. To understand the properties of the different types of partial differential equations.

Content
Laplace Transforms:
- Laplace Transform, Inverse Laplace Transform, Linearity, s-Shifting
- Transforms of Derivatives and Integrals, ODEs
- Unit Step Function, t-Shifting
- Short Impulses, Dirac's Delta Function, Partial Fractions
- Convolution, Integral Equations
- Differentiation and Integration of Transforms

Fourier Series, Integrals and Transforms:
- Fourier Series
- Functions of Any Period p=2L
- Even and Odd Functions, Half-Range Expansions
- Forced Oscillations
- Approximation by Trigonometric Polynomials
- Fourier Integral
- Fourier Cosine and Sine Transform

Partial Differential Equations:
- Basic Concepts
- Modeling: Vibrating String, Wave Equation
- Solution by separation of variables; use of Fourier series
- D'Alembert Solution of Wave Equation, Characteristics
- Heat Equation: Solution by Fourier Series
- Heat Equation: Solutions by Fourier Integrals and Transforms
- Modeling Membrane: Two Dimensional Wave Equation
- Laplacian in Polar Coordinates: Circular Membrane, Fourier-Bessel Series
- Solution of PDEs by Laplace Transform

Data: 06.12.2017 12:57 Autumn Semester 2015 Page 988 of 1432
Number of participants limited to 20.

The successful participation in EW1 ("Human Learning") and EW2 ("Designing Learning Environments for School") is recommended, but not a mandatory prerequisite.

Abstract
In this class, students will learn concepts and skills for coping with psychosocial demands of teaching

Objective
Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

(1) They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).
(2) They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions).

The teaching internship can just be visited if all other courses of TC are completed.
Repetition of the teaching internship is excluded even if the examination lessons are to be repeated.

Abstract
Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons

Objective
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content

Lecture notes
Dokument: schriftliche Vorbereitung für Prüfungslektionen.

Literature
Wird von der Praktikumslehrperson bestimmt.

Prerequisites / notice
Dieses Unterrichtspraktikum ist für Studierende, die sich ab dem HS 2011 ins DZ eingeschrieben haben. Alle anderen Lehrveranstaltungen des DZ sind erfolgreich abgeschlossen.
Findet verbindlich am Schluss der Ausbildung, vor Ablegung der Prüfungslektion statt!

Subject Didactics I for D-MAVT and D-ITET

Number of participants limited to 20.

Abstract
Didactical methods in mechanical and electrical engineering

Objective
- The students can plan, conduct and critically reflect single lessons.
- They orient themselves towards the academic goals and take into account existing knowledge, the professional environment and the ambitions of the students.
- They can apply the basic teaching principles meaningfully in their subject and suitably structure the learning phases.
- They can reduce and present complex technical content such that it is in a form suitable for the students to learn.
- They have considered examples of the common conceptual errors encountered by students

Content
- Didactic analysis
- Competencies and goals
- Preparation and wrap-up of lessons
- Process and structure of a typical lesson
- Teaching techniques (interactive introduction to lessons, Advance Organizer, learning assignments, frontal teaching, questions, assignments, feedback)
- Assignments and short tests
- Media and language competence
- Conceptual change, misconceptions,
- Integration of the subcomponents of a lesson.

Literature

| 327-0104-00L| Crystallography          | O    | 3    | 2V+1U   | M. Fiebig         |
| Abstract     | Introduction into the fundamental relationships between chemical composition, crystal structure, symmetry and physical properties of solids. Emphasis: group-theoretical introduction into symmetry, discussion of the factors governing the formation of crystal structures, structural dependence of physical properties, fundamentals of experimental techniques probing the crystal structure. |
| Objective    | Introduction into the fundamental relationships between chemical composition, crystal structure, symmetry and physical properties of solids. |

Data: 06.12.2017 12:57  Autumn Semester 2015  Page 991 of 1432
Symmetry and order: lattices, point groups, space groups.

Crystal chemistry: geometrical, physical and chemical factors governing the formation of crystal structures; close sphere packings; typical basic crystal structures; lattice energy; magnetic crystals; quasicrystals.

Structure/property relationships: Example quartz (piezoelectricity); perowskite and derivative structures (ferroelectrics and high-temperature superconductors); magnetic materials.

Materials characterization: diffraction techniques, optical techniques.

Lecture notes:
A script of the lecture until 2014 is available. New script: to be decided.

Literature:

Prerequisites / notice:
Organisation: Two hours of lectures per week accompanied by one hour of exercises.

Abstract

The goal of this course is to give the students a basic understanding of the molecules that build a cell and make it function, and the basic principles of metabolism and molecular genetics.

Objective

Die folgenden Kapitelnummern beziehen sich auf die Vorlesung zugrundeliegende Lehrbuch "Biology" (Campbell & Rees, 7th edition, 2005)

Content

Kapitel 1-4 des Lehrbuchs werden als Grundwissen vorausgesetzt

1. Aufbau der Zelle

Kapitel 5: Struktur und Funktion biologischer Makromoleküle
Kapitel 6: Eine Tour durch die Zelle
Kapitel 7: Membranstruktur und Funktion
Kapitel 8: Der Stoffwechsel
Kapitel 9: Zelluläre Atmung und Speicherung chemischer Energie
Kapitel 10: Photosynthese
Kapitel 12: Der Zellzyklus
Kapitel 17: Vom Gen zum Protein

2. Allgemeine Genetik

Kapitel 13: Meiose und Reproduktionszyklen
Kapitel 14: Mendelsche Genetik
Kapitel 15: Die chromosomale Basis der Vererbung
Kapitel 16: Die molekulare Grundlage der Vererbung
Kapitel 18: Genetik von Bakterien und Viren
Kapitel 46: Tierische Reproduktion

Grundlagen des Stoffwechsels und eines Überblicks über molekulare Genetik

Lecture notes

Der Vorlesungstitel ist sehr nahe am Lehrbuch gehalten, Skripten werden ggf. durch die Dozenten zur Verfügung gestellt.
Das folgende Lehrbuch ist Grundlage für die Vorlesungen Biologie I und II:

Abstract
Introduction into the most important spectroscoical methods and their applications to gain structural information.

Objective
Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications

Content
Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods

Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.

NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.

IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy

UV/VIS spectroscopy: Basics, interpretation of electron spectra. Circular dichroism (CD) und optical rotation dispersion (ORD).

Data: 06.12.2017 12:57 Autumn Semester 2015 Page 995 of 1432
Partial Differential Equations:
- Fourier Cosine and Sine Transform

Abstract
To impart basic knowledge and experimental competence using selected examples from chemistry and physics.

Objective
To impart basic knowledge and experimental competence using selected examples from chemistry and physics.

Content
Chemistry III: Synthesis of PMMA via Transesterification; manufacture of poly(methylmethacrylat) via radical polymerization of methlymethacrylat; 3D-printing.
Physics I: Powder dacriffactometry, single crystal radiography, capillary rheometry, viscoelasticity of the polymer melt (or an equivalent exp.), 2 physics Experiment at the EMPA: e.g. X-ray floourescence analysis, impendence measurements of batteries, cathode manufacturing for a Li-ion battery or texture measurement; and two further phyisc experiments at D-Phys (e.g. about "elastic constants" or "infrence and diffraction").

Lecture notes
Notes with information for each experiment (aim of the experiment, theory, experimental procedure, data analysis) can be downloaded from the web (https://praktikum.mat.ethz.ch or http://www.mat.ethz.ch/education/bachelor_degree/lab_courses).

Abstract
This course introduces classical and quantum mechanical concepts for the understanding of material properties from a microscopic point of view. The lectures focus on the static and dynamic properties of crystals, the formation of chemical bonds and electronic bands in molecules, insulators, metals, and semiconductors, and on the thermal and electrical properties that emerge from this analysis.

Objective
Providing physical concepts for the understanding of material properties:

Understanding the electronic properties of solids is at the heart of modern society and technology. The aim of this course is to provide fundamental concepts that allow the student to relate the microscopic structure of matter and the quantum mechanical behavior of electrons to the macroscopic properties of materials. Beyond fundamental curiosity, such level of understanding is required in order to develop and appropriately describe new classes of materials for future technology applications. By the end of the course the student should have developed a semi-quantitative understanding of basic concepts in solid state physics and be able to appreciate the pertinence of different models to the description of specific material properties.
The crystal lattice, Bravais lattices, primitive cells and unit cells, Wigner-Seitz cell, primitive lattice vectors, lattice with a basis, examples of 3D and 2D lattices.

Fourier transforms and reciprocal space, reciprocal lattice vectors, Brillouin zones

PART II: Dynamics of atoms in crystals

Lattice vibrations and phonons in 1D, phonons in 1D chains with monatomic basis, phonon in 1D chains with a diatomic basis, optical and acoustic modes, phase and group velocities, phonon dispersion and eigenvectors. Phonons in 2D and 3D.

Quantum mechanical description of lattice waves in solids, the harmonic oscillator, the concept of phonon, phonon statistics, Bose-Einstein distribution, phonon density of states, Debye and Einstein models, thermal energy, heat capacity of solids.

PART III: Electron states and energy bands in molecules and solids

Electronic properties of materials, classical concepts: electrical conductivity, Hall effect, thermoelectric effects. Drude model. Transition to quantum models and review of quantum mechanical concepts.

Introduction to molecular orbital theory and linear combination of atomic orbitals (LCAO). The H2+ molecule, homonuclear and heteronuclear molecules, benzene, sigma and pi bonds, sp3 and sp2 hybridization. From molecules to periodic crystal structures.

The free electron gas: Fermi statistics, Fermi energy and Fermi surface, density of states in k-space and as a function of energy. Inadequacy of the free electron model.

PART IV: Electrical and heat conduction

Dynamics of electrons in energy bands, phase and group velocity, crystal momentum, the effective mass concept, scattering phenomena. The equilibrium and non-equilibrium distribution function for electrons. The Boltzmann equation in the presence of external fields in the relaxation time approximation.

Electrical and thermal conductivities revisited. Electron transport due to electric fields (drift) and concentration gradients (diffusion). Einstein's relations. Transport of heat by electrons, Seebeck effect and thermopower, Peltier effect, thermoelectric cooling, thermoelectric energy conversion.

PART V: Semiconductors: concepts and devices

Introduction to molecular orbital theory and linear combination of atomic orbitals (LCAO). The H2+ molecule, homonuclear and heteronuclear molecules, benzene, sigma and pi bonds, sp3 and sp2 hybridization. From molecules to periodic crystal structures.

The free electron gas: Fermi statistics, Fermi energy and Fermi surface, density of states in k-space and as a function of energy. Inadequacy of the free electron model.

PART IV: Electrical and heat conduction

Dynamics of electrons in energy bands, phase and group velocity, crystal momentum, the effective mass concept, scattering phenomena. The equilibrium and non-equilibrium distribution function for electrons. The Boltzmann equation in the presence of external fields in the relaxation time approximation.

Electrical and thermal conductivities revisited. Electron transport due to electric fields (drift) and concentration gradients (diffusion). Einstein's relations. Transport of heat by electrons, Seebeck effect and thermopower, Peltier effect, thermoelectric cooling, thermoelectric energy conversion.

PART V: Semiconductors: concepts and devices

Content
This course is structured in 3 blocks:
Block (I): Fundamentals of engineering in biological materials
- Biological engineering principles
- Basic building blocks found in biological materials

Block (II): Replicating biological design principles in synthetic materials
- Biological and bio-inspired materials: polymer-reinforced and ceramic-toughened composites
- Lightweight biological and bio-inspired materials
- Functional biological and bio-inspired materials: surfaces, self-healing and adaptive materials

Block (III): Bio-inspired design and systems
- Bio-inspiration in the building environment
- Future developments in bio-inspired materials

Lecture notes
Copies of the slides will be made available for download before each lecture.

Literature
The course is mainly based on the books listed below. Additional references will be provided during the lectures.

Phenomenological approach to "Transport Phenomena" based on balance equations supplemented by thermodynamic considerations to

Introduction to Surface Science

H. C. Öttinger

Transport Phenomena I

After being introduced to the physical/chemical principles and importance of surfaces and interfaces, the student is introduced to the most

important techniques that can be used to characterize surfaces. Later, liquid interfaces are treated, followed by an introduction to the fields of

tribology (friction, lubrication, and wear) and corrosion.

To gain an understanding of the physical and chemical principles, as well as the tools and applications of surface science, and to be able to

choose appropriate surface-analytical approaches for solving problems.

Introduction to Surface Science

Physics:

General undergraduate physics

including basic theory of diffraction and basic knowledge of crystal structures

Transport Phenomena I

Phenomenological approach to "Transport Phenomena" based on balance equations supplemented by thermodynamic considerations to

formulate the undetermined fluxes in the local species mass, momentum, and energy balance equations; fundamentals, applications, and

simulations

The teaching goals of this course are on five different levels:

(1) Deep understanding of fundamentals: local balance equations, constitutive equations for fluxes, entropy balance, interfaces, idea of
dimensionless numbers, ...

(2) Ability to use the fundamental concepts in applications

(3) Insight into the role of boundary conditions

(4) Knowledge of a number of applications

(5) Flavor of numerical techniques: finite elements, finite differences, lattice Boltzmann, Brownian dynamics, ...

Approach to Transport Phenomena

Diffusion Equation

Brownian Dynamics

Refreshing Topics in Equilibrium Thermodynamics

Balance Equations

Forces and Fluxes

Measuring Transport Coefficients

Pressure-Driven Flows

Heat Exchangers

Complex Fluids

A detailed manuscript is provided; this manuscript will be developed into a book entitled "A Modern Course in Transport Phenomena" by

David C. Venerus and Hans Christian Öttinger

Complex numbers, Vector analysis (integrability; Gauss' divergence theorem), Laplace and Fourier transforms. Ordinary differential

equations (basic ideas). Linear algebra (matrices; functions of matrices; eigenvectors and eigenvalues; eigendfunctions). Probability theory

(Gaussian distributions; Poisson distributions; averages; moments; variances; random variables). Numerical mathematics (integration).

Equilibrium thermodynamics (Gibbs' fundamental equation; thermodynamic potentials; Legendre transforms). Maxwell equations,

Programming and simulation techniques (Matlab, Monte Carlo simulations).

Solid State Physics and Chemistry of Materials I

In this course we study how the properties of solids are determined from the chemistry and arrangement of the constituent atoms, with a

focus on materials that are not well described by conventional band theories because their behavior is governed by strong quantum-

mechanical interactions.

Electronic properties and band theory description of conventional solids

Electron-lattice coupling and its consequences in functional materials

Electron-spin/orbit coupling and its consequences in functional materials

Structure/property relationships in strongly-correlated materials

In this course we study how the properties of solids are determined from the chemistry and arrangement of the constituent atoms, with a

focus on materials that are not well described by conventional band theories because their behavior is governed by strong quantum-

mechanical interactions. We begin with a review of the successes of band theory in describing many properties of metals, semiconductors

and insulators, and we practise building up band structures from atoms and describing the resulting properties. Then we explore classes of

systems in which the coupling between the electrons and the lattice is so strong that it drives structural distortions such as Peierls

instabilities, John-Teller distortions, and ferroelectric transitions. Next, we move on to strong couplings between electronic charge and spin-

and/or orbital- angular momentum, yielding materials with novel magnetic properties. We end with examples of the complete breakdown of

single-particle band theory in so-called strongly correlated materials, which comprise for example heavy-fermion materials, frustrated

magnets, materials with unusual metal-insulator transitions and the high-temperature superconductors.

Hand-outs with additional reading will be made available during the course.
Teaching goals:
The aim is a) to learn how to design and create objects as building blocks with a particular shape and a defined recognition pattern, b) to understand the chemistry that allows for the creation of such hard and soft objects within a certain size range, and c) to master the concepts to assemble these objects into hierarchically structured materials.

The course is divided into two parts: I) synthesis of 0-, 1-, 2-, and 3-dimensional building blocks with a length scale from nm to μm, and II) assembly of these building blocks into 1-, 2-, and 3-dimensional structures over several length scales up to cm.

In part I, various methodologies for the synthesis of the building blocks will be discussed, including Turkevich and Brust-Schiffrin-method for gold nanoparticles, hot-injection for semiconducting quantum dots, aqueous and nonaqueous sol-gel chemistry for metal oxides, or gas- and liquid-phase routes to carbon nanostructures.

Part II is focused on self- and directed assembly methods that can be used to create higher order architectures from those building blocks connecting the microscopic with the macroscopic world. Examples include photonic crystals, nanocrystal solids, colloidal molecules, mesocrystals or particle-based foams and aerogels.

References to original articles and reviews for further reading will be provided on the lecture notes.

The course will comprise a balance of lectures, tutorials, student presentations and laboratory classes. In addition, case study site visits will be made for certain topics to illustrate the industrial application of particular technologies.

More and more, the interest in functional fibre composites is increasing. In beginning, the main focus will be on the production of functional fibres, e.g., for fibre-based sensor and actuator composites with polymers, metals and ceramics. Optical, piezoelectric, shape memory and other fibres for advanced composite applications will be treated in detail. There will be a discussion on fibre classification, fibre production (ceramic and others), adaptive and smart materials, types of sensors and actuators (e.g. made from electro-active poly-mers), and sensor networks with piezoelectric composites (e.g., Active or Macro Fibre Composites) for adaptive material systems or structural health monitoring (SHM) of advanced composite structures.

Emphasis will be put on the underlying science of a particular process or effect rather than a detailed description of the technique or equipment.

Manufacturing of actuators driven by electro-active polymers (EAP) and sensors applications of Active Fibre Composites (AFC) will be studied in laboratory classes.

Case studies and examples drawn from structural and functional applications of advanced composite and adaptive material systems will be demonstrated.

Abstracts and Objectives
- **Practical work on a TEM and on SEM, treatment of typical problems, data analysis, writing of a report**

Objective
Application of basic electron microscopic techniques to materials science problems

Prerequisites
Prerequisite: the lecture Electron Microscopy (327-0703-00L) has to be attended with success, maximum number of participants 15, work in groups of 3 people.

Abstract
A comprehensive understanding of the interaction of electrons with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

Objective
A comprehensive understanding of the interaction of electrons with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

Content
This course provides a general introduction into electron microscopy of organic and inorganic materials. In the first part, the basics of transmission- and scanning electron microscopy are presented. The second part includes the most important aspects of specimen preparation, imaging and image processing. In the third part, recent applications in materials science, solid state physics, structural biology, structural geology and structural chemistry will be reported.

Lecture notes
English

Literature
Erni: Aberration-corrected imaging in transmission electron microscopy, Imperial College Press (2010, and 2nd ed. 2015)

Abstract
Preparation, characterization and applications of polymeric aggregates formed from amphiphilic block copolymers.

Objective
To become acquainted with the principles of the self-assembly of amphiphilic block copolymers into micelles and vesicles and to become acquainted with some of the properties and applications of these aggregates.

Content
With selected recent examples on the self-assembly of amphiphilic block copolymers several basic aspects and possible applications will be discussed. The focus will mainly be on micelles and vesicles.

Lecture notes
no script

Abstract
From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

Objective
Familiarize students with basic science and engineering principles governing the nano domain.

Content
The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics that are traditionally taught separately.

Topics are treated in 2 blocks:

(I) From Quantum to Continuum
From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale
Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.

Self-assembly and directed assembly of 2D and 3D structures.

**Prerequisites / notice**

Course format:
Lectures and Mini-Review presentations: Thursday 10-13, ML F 36

Homework: Mini-Reviews
Students select a paper (list distributed in class) and expand the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper.

---

### 402-0313-00L Materials Research Using Synchrotron Radiation

**Abstract**
The course gives an introduction to the use of synchrotron radiation in materials science. It treats the generation of intense x-ray beams at synchrotron radiation sources and their use for the characterisation of materials properties at different length scales. As part of the course, experiments will be carried out at the Swiss Light Source, Paul Scherrer Institut.

**Objective**
A comprehensive understanding of the interaction of x-rays with condensed matter and their use in materials analysis; acquiring hands-on experience with the use of synchrotron radiation.

**Content**
- Interaction of x-rays with matter:
  - Elastic scattering from bound electron, atom and assemblies of atoms; Compton scattering; principles of diffraction from crystals and scattering from disordered systems; thermal diffuse scattering, small-angle scattering from nanometre-sized objects; X-ray absorption spectroscopy; microscopy; comparison with neutron scattering, where appropriate.

- The generation of high-brilliance x-ray beams at synchrotron radiation sources:
  - Undulators, wigglers and bending magnets; comparison with conventional lab sources; the future x-ray free electron laser.

**Instrumentation**
- Monochromator; diffractometer; detector.

**Determination of materials properties**
- Crystal structure; defects and strain fields; structure of surfaces and interfaces; chemical bonding properties.

**New methods**
- Coherent x-ray scattering and diffractive imaging.

**Lecture notes**
A reader and a guide through the experiments at the Swiss Light Source will be made available on the web.

**Literature**

**Prerequisites / notice**
Part of the course is in the form of practical work at the Swiss Light Source. During two days (dates to be agreed), the following experiments will be performed: (1) elastic and Compton scattering, (2) liquid scattering and powder diffraction, and (4) X-ray absorption spectroscopy.

---

### 402-0890-00L Introduction to Computational Physics

**Abstract**
This course offers an introduction to computer simulation methods for physics problems and their implementation on PCs and super computers: classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell's equation), Monte Carlo simulations, percolation, phase transitions

**Content**

**Prerequisites / notice**
Lecture and exercise lessons in english, exams in German or in English

---

### 529-0947-00L Basic Polymer Synthesis

**Abstract**
Chain-growth polymerizations (anionic, cationic, Ziegler/Natta, ROMP, radical, NMP, ATRP, RAFT), mechanistic details including how to render a polymerization "living", recent developments, and important examples.

**Objective**
The students should gain an overview of important polymerization procedures, learn how to deal with chemical structures and reactivities, and be able to suggest reasonable synthetic pathways to a given polymer structure. Aspects like achievable molar masses in dependence of the method used and structure perfection play a role throughout.
An introduction to polarization optics is given before optical properties following from crystal symmetry are discussed. Particular emphasis will be put on magneto-optical properties of crystals. Lasers as prototypical intense light sources will be introduced before advanced topics such as the determination of magnetic structures and interactions by nonlinear magneto-optics are discussed.

Connections to the courses "Complex materials II" and "Quantum-enabled materials". Some knowledge in quantum theory, preferably (but not necessarily) including basic perturbation theory.
Abstract
This course will provide an up-to-date, comprehensive review of the industrial perspective at the interface of biomaterials and drugs. This covers regulatory, clinical, pre-clinical and manufacturing concepts. The presentations are provided in an effort to maximize the interaction of student and lecturer.

Objective
- The student will be able to categorize a drug-biomaterial as a "drug" or a "material" from a regulatory perspective and can summarize general regulatory pathways for material/drug development.
- The student will be able to summarize the current concepts and challenges for the industry at the material-drug interface.

Content
This course will provide an up-to-date comprehensive review of the industrial perspective at the interface of biomaterials and drugs. General concepts related to regulatory affairs or such as cost-conscious planning of manufacturing processes will be covered by interactive case-studies and in close interaction between students and lecturers. The course covers the future at the biomaterial - implant interface - as it is seen by the industry today - and will be reviewed by experienced and long-standing faculty from industry with the aim to provide a balanced, insightful perspective. From that, clinical development concepts, regulatory pathways and real-life case studies will be discussed with the students. Finally the students - working in small groups of 4-5 - will outline a development pathway for an industrial project and present it to the course and in presence of all faculty to receive maximum feedback to their approaches.

The student will become familiar with the major elements required for a successful development and which challenges have to be taken into account to translate an idea into a successful product.

### 327-0406-AAL: Basic Principles of Materials Physics A

**Objective**

The course provides a solid working knowledge in thermodynamics (as the appropriate language for treating a variety of problems in materials science) and in statistical mechanics (as a systematic tool to find thermodynamic potentials for specific problems).

**Content**

Thermodynamics, Statistical Mechanics

1. Introduction
2. Foundations of Thermodynamics
3. Applications of Thermodynamics
4. Foundations of Classical Statistical Mechanics
5. Applications of Classical Statistical Mechanics
6. Elementary Theory of Transport Phenomena

**Literature**

3. L. E. Reichl, A Modern Course in Statistical Physics (University of Texas Press, Austin, 1980)

**Lecture notes**

Ein Leitfaden und ein zusammenfassender Artikel werden auf der oben angegebenen Website zur Lehrveranstaltung zur Verfügung gestellt.

---

### 327-0407-AAL: Basic Principles of Materials Physics B

**Objective**

Understanding the electronic properties of solids is at the heart of modern society and technology. The aim of this course is to provide fundamental concepts that allow the student to relate the microscopic structure of matter and the quantum mechanical behavior of electrons to the macroscopic properties of materials. Beyond fundamental curiosity, such level of understanding is required in order to develop and appropriately describe new classes of materials for future technology applications. By the end of the course the student should have developed a semi-quantitative understanding of basic concepts in solid state physics and be able to appreciate the pertinence of different models to the description of specific material properties.

**Content**

PART I: Structure of solid matter, real and reciprocal space

The crystal lattice, Bravais lattices, primitive cells and unit cells, Wigner-Seitz cell, primitive lattice vectors, lattice with a basis, examples of 3D and 2D lattices. Fourier transforms and reciprocal space, reciprocal lattice vectors, Brillouin zones

PART II: Dynamics of atoms in crystals

Lattice vibrations and phonons in 1D, phonons in 1D chains with monoatomic basis, phonon in 1D chains with a diatomic basis, optical and acoustic modes, phase and group velocities, phonon dispersion and eigenvectors. Phonons in 2D and 3D.

Quantum mechanical description of lattice waves in solids, the harmonic oscillator, the concept of phonon, phonon statistics, Bose-Einstein distribution, phonon density of states, Debye and Einstein models, thermal energy, heat capacity of solids.

PART III: Electron states and energy bands in molecules and solids

Electronic properties of materials, classical concepts: electrical conductivity, Hall effect, thermoelectric effects. Drude model. Transition to quantum models and review of quantum mechanical concepts.

Introduction to molecular orbital theory and linear combination of atomic orbitals (LCAO). The H2+ molecule, homonuclear and heteronuclear molecules, benzene, sigma and pi bonds, sp3 and sp2 hybridization. From molecules to periodic crystal structures. The free electron gas: Fermi statistics, Fermi energy and Fermi surface, density of states in k-space and as a function of energy. Inadequacy of the free electron model.

PART IV: Electrical and heat conduction

Dynamics of electrons in energy bands, phase and group velocity, crystal momentum, the effective mass concept, scattering phenomena. The equilibrium and non-equilibrium distribution function for electrons. The Boltzmann equation in the presence of external fields in the relaxation time approximation.

Electrical and thermal conductivities revisited. Electron transport due to electric fields (drift) and concentration gradients (diffusion).

Einstein's relations. Transport of heat by electrons, Seebeck effect and thermopower, Peltier effect, thermoelectric cooling, thermoelectric energy conversion.

PART V: Semiconductors: concepts and devices

**Literature**

3. L. E. Reichl, A Modern Course in Statistical Physics (University of Texas Press, Austin, 1980)
327-0506-AAL Materials Physics
Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
Extended concepts of material physics and analytical description of material-physical problems.

Objective
Building on the lectures 'Introduction to Materials Science' and 'Materials Science I + II' this lecture aims to give a deepened physical understanding of Materials Science.

Content
1. Thermal vacancies and diffusion
2. Nucleation and growth; diffusion-controlled and diffusion-less phase transitions
3. Spinodal decomposition and anharmonic effects
4. Dislocation energy/stacking faults; recovery; recrystallization; solidification

Lecture notes

- C. Kittel, Introduction to Solid State Physics (Wiley, 2005), also available in German.

Prerequisites / notice
The lecture will be given in English. The script will be available in English.

327-0503-AAL Ceramics I
Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
The aim is the understanding of the basic principles of ceramic processing.

Objective
The aim is the understanding of the basic principles of ceramic processing.

Content
Basic chemical processes for powder production.
Liquid-phase synthesis methods.
Sol-Gel processes.
Classical crystallization theory.
Gas phase reactions.
Basics of the colloidal chemistry for suspension preparation and control.
Characterization techniques for powders and colloids.
Shaping techniques for bulk components and thin films.
Sintering processes and microstructural control.

Lecture notes
See: http://www.multimat.mat.ethz.ch/education/courses/ceramics1

Literature

Literature

327-0502-AAL Polymers I
Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
Physical foundations of single polymer molecules and interacting chains.

Objective
The course offers a modern approach to the understanding of universal static and dynamic properties of polymers.

Content
Polymer Physics:
1. Introduction to Polymer Physics, Random Walks
2. Excluded Volume
3. Structure Factor from Scattering Experiments
4. Persistence
5. Solvent and Temperature Effects
6. Flory Theory
7. Self-consistent field theory
8. Interacting Chains, Phase Separation and Critical Phenomena
9. Rheology
10. Numerical methods in polymer physics, computer experiments

Lecture notes

Abstract
Principles of polymer technology

Objective
To obtain an understanding of the engineering aspects of structure and properties of solid polymers. Influence of polymer processing on properties of solid polymers.

Content
1. Crystallization of semi-crystalline polymers
2. Glass transition of amorphous polymers
3. Mechanical properties of solid polymers
4. Examples of polymer processing
5. Laboratory exercises

Lecture notes

327-0501-AAL Metals I E- 3 credits 6R R. Spolenak

Abstract
Repetition and advancement of dislocation theory. Mechanical properties of metals: hardening mechanisms, high temperature plasticity, alloying effects. Case studies in alloying to illustrate the mechanisms.

Objective
Repetition and advancement of dislocation theory. Mechanical properties of metals: hardening mechanisms, high temperature plasticity, alloying effects. Case studies in alloying to illustrate the mechanisms.

Content
Dislocation theory:
- Properties of dislocations, motion and kinetics of dislocations, dislocation-dislocation and dislocation-boundary interactions, consequences of partial dislocations, sessile dislocations
- Hardening theory:
  - a. solid solution hardening: case studies in copper-nickel and iron-carbon alloys
  - b. particle hardening: case studies on aluminium-copper alloys
  - High temperature plasticity:
    - thermally activated glide
    - power-law creep
    - diffusional creep: Coble, Nabarro-Herring
  - deformation mechanism maps
  - Case studies in turbine blades
  - superplasticity
  - alloying effects

Abstract
Introduction to materials selection. Basic knowledge of major metallic materials: aluminium, magnesium, titanium, copper, iron and steel. Selected topics in high temperature materials: nickel and iron-base superalloys, intermetallics and refractory metals.

Objective
Introduction to materials selection. Basic knowledge of major metallic materials: aluminium, magnesium, titanium, copper, iron and steel. Selected topics in high temperature materials: nickel and iron-base superalloys, intermetallics and refractory metals.

Content
This course is divided into five parts:

A. Materials selection
- Principles of materials properties maps
- Introduction to the 'Materials selector' software package
- Case studies

B. Light metals and alloys
- Aluminium, magnesium, titanium
- Properties and hardening mechanisms
- Case studies in technological applications

C. Copper and its alloys

D. Iron and steel
- The seven pros for steel
- Fine grained steels, heat resistant steels
- Steel and corrosion phenomena
- Selection and application

E. High temperature alloys
- Superalloys: iron, nickel, cobalt
- Intermetallics: properties and application

327-0610-AAL Advanced Composites E- 3 credits 6R F. J. Clemens, A. Winistörfer

Abstract
Enrolment only for MSc students who need this course as additional admission requirement.

Objective
To obtain an understanding of the engineering aspects of structure and properties of solid polymers. Influence of polymer processing on properties of solid polymers.

Content
1. Crystallization of semi-crystalline polymers
2. Glass transition of amorphous polymers
3. Mechanical properties of solid polymers
4. Examples of polymer processing
5. Laboratory exercises

Lecture notes
http://www.polytech.mat.ethz.ch/education/courses/PolymereII

Literature
W. Kaiser, Kunststoffchemie für Ingenieure (Hanser, München, 2005)
Abstract
Introduction of basic concepts for composites with polymer- metal- and ceramic matrix composites; production and properties of composites reinforced with particles, whiskers, short and long fibres; selection criteria, case histories of applications, recycling, future perspectives, and basic concepts for adaptive and functional composites

Objective
Gain an insight into the diversity of opportunities to change the properties of composites, learn about the most important applications and processing techniques

Content
1. Introduction
   1.1 What are advanced composites?
   1.2 What are materials by combination?
   1.3 Are composites an idea of today?
   1.4 Delphi foresight
   1.5 Why composites?
   1.6 References for chapter 1

2. Basic modules
   2.1 Particles
   2.2 Short fibres including whiskers
   2.3 Long fibres
   2.4 Matrix materials
   2.4.1 Polymers
   2.4.2 Metals
   2.4.3 Ceramics and glasses
   2.5 References for chapter 2

3. PMC: Polymer Matrix Composites
   3.1 Historical background
   3.2 Types of PMC-laminates
   3.3 Production, processing and machining operation
   3.4 Mechanics of reinforcement, microstructure, interfaces
   3.5 Failure criteria
   3.6 Fatigue behaviour of a multiply composite
   3.7 Adaptive materials systems
   3.8 References for chapter 3

4. MMC: Metal matrix composites
   4.1 Introduction: Definitions, selection criteria und "design"
   4.2 Types von MMCs - examples und typical properties
   4.3 Mechanical and physical properties of MMCs - basics of design, influencing variables and damage mechanisms
   4.4 Production processes
   4.5 Micro structure / interfaces
   4.6 machining operations for MMC
   4.7 Applications
   4.8 References for chapter 4

5. CMC: Ceramic Matrix Composites
   5.1 Introduction and historical background
   5.2 Modes of reinforcement
   5.3 Production processes
   5.4 Mechanisms of reinforcement
   5.5 Micro structure / interfaces
   5.6 Properties
   5.7 Applications
   5.8 Materials testing and quality assurance
   5.9 References for chapter 5

Lecture notes
The script will be delivered at the begin of the semester

Literature
The script is including a comprehensive list of references

Prerequisites / notice
Before each class, students will get a handout. Students will get the power point presentation of each class by e-mail.

The exercises take place in small groups. It is their goal to deepen knowledge gained in the classes

written end of semester examination

Abstract

Overview of financial and managerial accounting
Accounting for current and fixed assets
Liabilities and owners equity
Recording change in balance sheet
Measuring financial performance
Managing financial reporting
Full and variable costing system
Using accounting information for decision making purposes
Record change in financial position
Measure business income
Prepare final accounts
Understand the principles of cost accounting
Calculate the different product costs
Make decisions about the acceptance or rejection of a particular product
Managerial Accounting: Full costing, variable costing, cost-volume profit, break-even analysis, activity-based costing

Objective

Students learn the theoretical foundations of the selected methods, as well as practical skills to apply these methods and to interpret their outcomes.

Content

Financial Accounting: Balance sheet, income statement, double-entry accounting, journal and ledger, accounting for merchandising activities, value-added tax, adjustments before final accounts, provisions, depreciation, valuation,

Prerequisites / notice

This course is a prerequisite for the course Financial Management.

401-3611-00L Advanced Topics in Computational Statistics

Abstract

This lecture covers selected advanced topics in computational statistics, including various classification methods, the EM algorithm, clustering, handling missing data, and graphical modelling.

Objective

Students learn the theoretical foundations of the selected methods, as well as practical skills to apply these methods and to interpret their outcomes.

Content

The course is roughly divided in three parts: (1) Supervised learning via (variations of) nearest neighbor methods, (2) the EM algorithm and clustering, (3) handling missing data and graphical models.

Lecture notes

Lecture notes.

Prerequisites / notice

Lecture notes.

Literature

401-3627-00L High-Dimensional Statistics

Abstract

“High-Dimensional Statistics” deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed.

Objective

Knowledge of methods and basic theory for high-dimensional statistical inference

Content

Lasso and Group Lasso for high-dimensional linear and generalized linear models; Additive models and many smooth univariate functions; Non-convex loss functions and l1-regularization; Stability selection, multiple testing and construction of p-values; Undirected graphical modeling

Literature

Prerequisites / notice

Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

Abstract

Students who have attended or will attend the lecture "Introduction to Law for Civil Engineering and Architecture" or "Introduction to Law" (851-0708-00) cannot register for this course unit.

Particularly suitable for students of D-MAVT, D-MATL

Objective

This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered.

Students are able to identify basic structures of the legal system. They understand selected topics of public and private law and are able to apply the fundamentals in more advanced law classes.
Content
Basic concepts of law, sources of law.
Private law: Contract law (particularly contract for work and services), tort law, property law.
Public law: Human rights, administrative law, procurement law, procedural law.
Insights into the law of the EU and into criminal law.

O. Forster: Analysis I. Vieweg Verlag
J. Appell: Analysis in Beispielen und Gegenbeispielen. Springer Verlag

401-1151-00L | Linear Algebra I | O | 7 credits | 4V+2U | E. Kowalski

**Abstract**
Introduction to the theory of vector spaces for mathematicians and physicists including solutions of linear equations, linear transformations, determinants, eigenvalues and eigenvectors, bilinear forms, canonical forms for matrices, and selected applications, part I.

**Objective**
Mastering basic concepts of Linear Algebra

402-1701-00L | Physics I | O | 7 credits | 4V+2U | G. Dissertori

**Abstract**
This course gives a first introduction to Physics. The emphasis is on classical mechanics, together with an introduction to thermodynamics.

**Objective**
Acquire knowledge of the basic principles regarding the physics of classical mechanics and thermodynamics. Skills in solving physics problems.

252-0847-00L | Computer Science | O | 5 credits | 2V+2U | B. Gärtner

**Abstract**
This lecture is an introduction to programming based on the language C++. We cover fundamental types, control statements, functions, arrays, and classes. The concepts will be motivated and illustrated through algorithms and applications.

**Objective**
The goal of this lecture is an algorithmically oriented introduction to programming.

**Content**
This lecture is an introduction to programming based on the language C++. We cover fundamental types, control statements, functions, arrays, and classes. The concepts will be motivated and illustrated through algorithms and applications.

**Lecture notes**
Lecture notes in English and Handouts in German will be distributed electronically along with the course.

**Literature**

Compulsory Courses

Examination Block I

In Examination Block I either the course unit 402-2883-00L Physics III or the course unit 402-2203-01L Classical Mechanics must be chosen and registered for an examination. (Students may also enrol for the other of the two course units; within the ETH Bachelor Programme Mathematics, this other course unit cannot be registered for an examination. Knowledge of classical mechanics is presupposed in the spring semester core course 402-0224-00L Theoretical Physics.)

**Number** | **Title** | **Type** | **ECTS** | **Hours** | **Lecturers**
--- | --- | --- | --- | --- | ---
401-2303-00L | Complex Analysis | O | 6 credits | 3V+2U | R. Pandharipande

**Abstract**
Complex functions of one variable, Cauchy-Riemann equations, Cauchy theorem and integral formula, singularities, residue theorem, index of closed curves, analytic continuation, special functions, conformal mappings, Riemann mapping theorem.

**Objective**
Working Knowledge with functions of one complex variables; in particular applications of the residue theorem

**Literature**

The course presents some aspects of probabilistic number theory, including distribution properties of the number of prime divisors of integers, probabilistic properties of the zeta function and statistical distribution of exponential sums.

Further reading:

More exercises and examples in:

6. A. A. Asteroh, Ch. Baier: Theoretische Informatik

The goal of the course is to present some results of probabilistic number theory in a unified manner. The main concepts will be presented in parallel with the proof of three main theorems: (1) the Erdős-Kac theorem and its variants concerning the number of prime divisors of integers in various sequences; (2) the distribution of values of the Riemann zeta function, including Selberg's central limit theorem for the Riemann zeta function on the critical line; (3) functional limit theorems for the paths of partial sums of families of exponential sums such as Kloosterman sums.

The course presents some aspects of probabilistic number theory, including distribution properties of the number of prime divisors of integers, probabilistic properties of the zeta function and statistical distribution of exponential sums.

The lecture notes will be prepared.

Prerequisites / notice

During the semester, two non-obligatory test exams will be offered.

Prerequisites / notice

The course Combinatorics I and II is an introduction into the field of enumerative combinatorics. A. Buryak

The course presents some aspects of probabilistic number theory, including distribution properties of the number of prime divisors of integers, probabilistic properties of the zeta function and statistical distribution of exponential sums.

Prerequisites: Complex analysis, measure and integral; some probability theory is useful but the main concepts needed will be recalled. Some knowledge of number theory is useful but the main results will be summarized.

Number Title Type ECTS Hours Lecturers

401-3059-00L Combinatorics II W 4 credits 2G N. Hungerbühler

401-3035-00L Forcing: An Introduction to Independence Proofs W 8 credits 3V+1U L. Halbeisen

401-3109-65L Probabilistic Number Theory W 6 credits 2V+1U E. Kowalski

401-3202-09L Representation Theory of Finite Groups, and in particular Symmetric Groups W 4 credits 2V A. Buryak

Objective

The course Combinatorics I and II will be an introduction into the field of enumerative combinatorics.

Content

Contents of the lectures Combinatorics I and II: congruence transformation of the plane, symmetry groups of geometric figures, Euler's function, Cayley graphs, formal power series, permutation groups, cycles, Bunsdie's lemma, cycle index, Polya's theorems, applications to graph theory and isomers.

Lecture notes

Ich werde mich weitgehend an mein Buch "Combinatorial Set Theory" halten, aus dem einige Kapitel aus Part II & III behandelt werden.

More exercises and examples in:

Voraussetzung ist die Vorlesung "Axiomatische Mengenlehre" (Fruehlingssemester 2015) bzw. die entsprechenden Kapitel aus meinem Buch.

The lecture notes will be prepared.

Prerequisites / notice

Prerequisites: Complex analysis, measure and integral; some probability theory is useful but the main concepts needed will be recalled. Some knowledge of number theory is useful but the main results will be summarized.

The first part of the course will be devoted to the general theory of linear representations of finite groups. In the second part we will discuss in details the representation theory of the symmetric groups and some of its applications.

It will be assumed that the listeners know the material from a basic linear algebra course and also basic facts about groups and rings.

The first part of the course will be devoted to the general theory of linear representations of finite groups. In the second part we will discuss in details the representation theory of the symmetric groups and some of its applications.

The course presents some aspects of probabilistic number theory, including distribution properties of the number of prime divisors of integers, probabilistic properties of the zeta function and statistical distribution of exponential sums.

The goal of the course is to present some results of probabilistic number theory in a unified manner. The main concepts will be presented in parallel with the proof of three main theorems: (1) the Erdős-Kac theorem and its variants concerning the number of prime divisors of integers in various sequences; (2) the distribution of values of the Riemann zeta function, including Selberg's central limit theorem for the Riemann zeta function on the critical line; (3) functional limit theorems for the paths of partial sums of families of exponential sums such as Kloosterman sums.

Equidecomposability of Polytopes

Abstract
A polygon in the plane can be decomposed into finitely many (convex) pieces and reassembled to form another polygon if and only if they have the same area. Hilbert's third problem asks if the analogous is also true for two polyhedra in space. Whether or not it is possible to define volume without the use of approximation arguments depends on the answer to this question.

Objective
The course will cover classical results on equidecomposability including the Dehn-Sydler theorem, i.e. the solution to Hilbert's third problem. We will then describe the connection between equidecomposability and valuation theory. Finally, we will discuss some recent classification results of valuations that are invariant under certain groups of motions.

Prerequisites / notice
Office hours: Thursday 11:00 - 12:00

Finite Geometries II

Abstract
Finite geometries I, II: Finite geometries combine aspects of geometry, discrete mathematics and the algebra of finite fields. In particular, we will construct models of axioms of incidence and investigate closing theorems. Applications include test design in statistics, block design, and the construction of orthogonal Latin squares.

Objective
Finite geometries I, II: Students will be able to construct and analyse models of finite geometries. They are familiar with closing theorems of the axioms of incidence and are able to design statistical tests by using the theory of finite geometries. They are able to construct orthogonal Latin squares and know the basic elements of the theory of block design.

Content
Finite geometries I, II: finite fields, rings of polynomials, finite affine planes, axioms of incidence, Euler's thirty-six officers problem, design of statistical tests, orthogonal Latin squares, transformation of finite planes, closing theorems of Desargues and Pappus-Pascal, hierarchy of closing theorems, finite coordinate planes, division rings, finite projective planes, duality principle, finite Möbius planes, error correcting codes, block design

Introduction to Random Graphs

Abstract
This is an introductory course on random graphs, covering Erdos-Renyi graphs, inhomogeneous graphs, phase transition phenomena, connectivity, and random walks on random graphs.

Objective
A basic undergraduate course on probability.

Literature

Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

Time Series Analysis

Abstract
Statistical analysis and modeling of observations in temporal order, which exhibit dependence. Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. Implementations in the software R.

Objective
Understanding of the basic models and techniques used in time series analysis and their implementation in the statistical software R.

Content
This course deals with modeling and analysis of variables which change randomly in time. Their essential feature is the dependence between successive observations. Applications occur in geophysics, engineering, economics and finance. Topics covered: Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. The models and techniques are illustrated using the statistical software R.

Literature
Not available

A list of references will be distributed during the course.

Basic knowledge in probability and statistics

Advanced Topics in Computational Statistics

Abstract
This lecture covers selected advanced topics in computational statistics, including various classification methods, the EM algorithm, clustering, handling missing data, and graphical modelling.

Objective
Students learn the theoretical foundations of the selected methods, as well as practical skills to apply these methods and to interpret their outcomes.

Content
The course is roughly divided in three parts: (1) Supervised learning via (variations of) nearest neighbor methods, (2) the EM algorithm and clustering, (3) handling missing data and graphical models.

Literature
Lecture notes

We assume a solid background in mathematics, an introductory lecture in probability and statistics, and at least one more advanced course in statistics.

Applied Statistical Regression

Abstract
This course is designed to provide students with a solid background in mathematical statistics, an introductory lecture in probability and statistics, and at least one more advanced course in statistics.
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life.

**Objective**
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

**Content**
The course starts with the basics of linear regression modeling, and then proceeds to parameter estimation, tests and confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, categorical input variables, shrinkage and general modeling strategies.

The last third of the course is dedicated to an introduction into generalized linear regression models: this includes logistic regression for binary response variables, Poisson regression for count data, cumulative logit models for ordered, and multinomial regression for categorical response variables.

**Lecture notes**
A script will be available.

**Literature**
Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

**Prerequisites / notice**
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

</tbody>
</table>

**Abstract**
We introduce and discuss the most important models for interest rate markets. Emphasis will be placed both on theoretical foundations and on numerical implementation and calibration.

**Objective**
- Gain overview of interest rate markets and the corresponding financial products.
- Understand the various modeling approaches used (short-rate models, Heath-Jarrow-Morton models, LIBOR market models).
- Get a firm grasp of the underlying theory, and practice numerical implementation of concrete examples.
- Learn about extensions that have recently become increasingly important: default risk, multiple yield curves, etc.
- Gain overview of interest rate markets and the corresponding financial products.
- Understand the various modeling approaches used (short-rate models, Heath-Jarrow-Morton models, LIBOR market models).
- Get a firm grasp of the underlying theory, and practice numerical implementation of concrete examples.
- Learn about extensions that have recently become increasingly important: default risk, multiple yield curves, etc.

**Literature**

**Prerequisites / notice**
- Itô calculus.
- Option pricing and hedging for equity markets as covered, e.g., in "Mathematical Foundations for Finance".

**Abstract**
This course gives an introduction to stochastic interest rate modeling in discrete time. Starting from cash flow valuation with state price deflators, we derive the equivalent martingale measures for pricing financial instruments and derivatives of primary assets. The lecture is supplemented by several examples such as the Vasicek model where we also study model calibration.

**Objective**
The students are familiar with the basic terminology of stochastic interest rate modeling and he is able to transfer his (financial) mathematical knowledge to real world pricing of cash flows and financial instruments.

**Content**
The following topics are covered:
1) stochastic discounting with state price deflators
2) equivalent martingale measures
3) pricing of cash flows and primary assets
4) pricing of derivatives, e.g. European put options
5) (multi-factor) Vasicek state price deflator model
6) Heath-Jarrow-Morton interest rate modeling framework
One might have, more provocatively, entitled the course: How does time end (in, Einstein's general relativity)? In a word, badly. Not in a

Lecturers

There will be lecture notes.

For further reading:

Prerequisites / notice

The exams ONLY take place during the official ETH examination period.

Prerequisites: knowledge of probability theory and stochastic processes.

401-3925-00L

Non-Life Insurance: Mathematics and Statistics

W 6 credits 4G M. V. Wüthrich

Abstract

The lecture aims at providing a basis in non-life insurance mathematics which forms a core subject of actuarial sciences. It discusses collective risk model, individual claim size modeling, approximations for compound distributions, ruin theory, premium calculation principles, tariffication with generalized linear models, credibility theory, claims reserving and solvency.

Objective

The student is familiar with the basics in non-life insurance mathematics and statistics. This includes the basic mathematical models for insurance liability modeling, pricing concepts, stochastic claims reserving models and ruin and solvency considerations.

Content

The following topics are treated:
- Collective Risk Modeling
- Individual Claim Size Modeling
- Approximations for Compound Distributions
- Ruin Theory in Discrete Time
- Premium Calculation Principles
- Tariffication and Generalized Linear Models
- Bayesian Models and Credibility Theory
- Claims Reserving
- Solvency Considerations

Lecture notes

M. V. Wüthrich, Non-Life Insurance: Mathematics & Statistics

Prerequisites / notice

The exams ONLY take place during the official ETH examination period.

This course will be held in English and counts towards the diploma of "Aktuar SAV". For the latter, see details under www.actuaries.ch.

Prerequisites: knowledge of probability theory, statistics and applied stochastic processes.

401-3922-00L

Life Insurance Mathematics

W 4 credits 2V M. Koller

Abstract

The classical life insurance model is presented together with the important insurance types (insurance on one and two lives, term and endowment insurance and disability). Besides that the most important items such as mathematical reserves are introduced and calculated. The profit and loss account and the balance sheet of a life insurance company is explained and illustrated.

Content

The following topics are treated:
- Collective Risk Modeling
- Individual Claim Size Modeling
- Approximations for Compound Distributions
- Ruin Theory in Discrete Time
- Premium Calculation Principles
- Tariffication and Generalized Linear Models
- Bayesian Models and Credibility Theory
- Claims Reserving
- Solvency Considerations

Chaotically Singular Spacetimes

W 6 credits 3V E. Trubowitz

Abstract

One might have, more provocatively, entitled the course: How does time end (in, Einstein's general relativity)? In a word, badly. Not in a whimper, nor in a crunch, but in something much more exotic.

Content

One might have, more provocatively, entitled the course: How does time end (in, Einstein's general relativity)? In a word, badly. Not in a whimper, nor in a crunch, but in something much more exotic.

More, technically, what does a generic singular point, restricting time, in solutions to the Einstein gravitational field equations look like?

Special cosmological solutions, such as Friedman's, do have singularities.

In 1963, Lifshitz and Khalatnikov 'constructed a class' of singular solutions and concluded that '... the presence of a singularity in time is NOT a necessary property of cosmological models of the general theory of relativity, and that the general case of an arbitrary distribution of matter and gravitational field does not lead to the appearance of a singularity.'

In 1965 Penrose and Hawking formulated and proved 'incompleteness' theorems that convinced even Lifshitz and Khalatnikov that singularities in time ARE a necessary property of cosmological models of the general theory of relativity. Penrose and Hawking proved, that under very general, physically reasonable conditions, a spacetime (that is, a solution to the Einstein equations) has a light ray (null geodesic) that suddenly ends ('incompleteness') sufficiently far in the past. They adroitly sidestep the problem of defining what a singularity actually is, by saying it is the 'place' where their light rays end. The proofs of incompleteness theorems are not hard. That's good. Unfortunately, they are by their very nature completely non constructive and provide no quantitative information at all about what a 'singularity' really looks like.

In 1970, Belinski, Khalatnikov and Lifshitz revisited the work of 1963 and found that Khalatnikov and Lifshitz had missed something and that'... we shall show that there exists a general solution which exhibits a physical singularity with respect to time.' In 1982 they revised the 1970 proposal. Their work culminates in a series of fascinating, but very, very heuristic, statements about the possible existence of a class of singular solutions to the field equations. These heuristic statements are referred to as the 'BKL Conjectures'.

Next semester, we will rigorously formulate and prove the 'BKL Conjectures' for homogeneous spacetimes. That is, we will construct a set of initial data with positive measure which evolve into homogeneous, chaotically singular spacetimes that exhibit all of the BKL phenomenology. Most importantly, there are chaotic oscillations, growing in magnitude, whose distribution is governed by the continued fraction expansion of a parameter appearing in the initial data.

The lectures will be completely self contained. One doesn't need to know anything about general relativity; the Einstein field equations will be introduced from scratch. We will classify real, three dimensional Lie algebras, introduce tensor analysis and discuss the geometry of homogeneous spacetimes. We will also derive the basic properties of continued fractions and the Gauss map $\phi = \frac{1}{\sqrt{x^2+1}}$ for $x\geq 0$. The map $\phi$ maps $\mathbb{R}^+$ to itself.

Lecture notes

There will be lecture notes.

#### Selection: Math. Optimization, Discrete Mathematics, Computer Science

**252-1425-00L**

**Title:** Geometry: Combinatorics and Algorithms

**Abstract:** Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them algorithmically. The lecture addresses theoretical foundations concerning geometric structures. Central objects of interest are triangulations. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?)

**Objective:** The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area and in various application domains.

**Content:** Planar and geometric graphs, embeddings and their representation (Whitney’s Theorem, canonical orderings, DCEL), Delaunay triangulations and the art gallery theorem, convexity in R^n, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chan’s Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction), Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, hem-sandwich cuts), 3-SUM hardness, counting planar triangulations.

**Prerequisites / notice**
Prerequisites: The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH.

**Outlook:** In the following spring semester there is a seminar "Geometry: Combinatorics and Algorithms" that builds on this course. There are ample possibilities for Semester-, Bachelor- and Master Thesis projects in the area.

**252-1407-00L**

**Title:** Algorithmic Game Theory

**Abstract:** Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory.

**Objective:** Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.

**Content:** The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don’t care about others, and the same is true for computational load or download rates. Game theory provides a particularly well-suited model for the behaviour and interaction of such selfish users and programs. Classical game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

**Outline:**
- Introduction to classical game theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- The cost difference between an optimum under central control and an equilibrium under selfish agents, known as the "price of anarchy".
- Auction-like mechanisms and algorithms that "direct" the actions of selfish agents into a certain desired equilibrium situation.
- Selected current research topics of Algorithmic Game Theory, such as Web-Search Based Keyword Auctions, or Information Cascading in Social Networks

**Prerequisites / notice**
Prerequisites: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.

**252-0417-00L**

**Title:** Randomized Algorithms and Probabilistic Methods

**Abstract:** Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks

**Objective:** After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.

**Content:** Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas.

**Prerequisites / notice**
Prerequisites: The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH. Several copies of both books are available in the Computer Science library.

**Outlook:** Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.

**Requirements:** You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.
### Complexity Theory

**Abstract**
Complexity Theory classifies problems according to the resources required in order to solve them. In this course, we give an introduction to modern complexity theory. We introduce basic complexity classes (such as L, P, BPP, PH, NP, AM, PH, PSPACE, IP, EXP), and study circuit complexity.

**Objective**
The student learns the fundamentals of Complexity Theory, as well as some of the more recent techniques. He not only understands the basic results and techniques used to prove them, but also has insight in some of the technically more advanced theorems.

**Content**
Complexity Theory classifies problems according to the difficulty of solving them. In this course, we give an introduction to modern complexity theory. We introduce basic complexity classes (such as L, P, BPP, PH, PSPACE, IP, EXP), and study the known relationship to uniform complexity. We study circuit complexity, and its relationship to uniform complexity. We also will study some circuit lower bounds for constant depth circuits, as well as results which explain why it is difficult to improve these results.

**Block course**
Starts on October 8 and ends on November 26, 2015
Thursdays 10-12 and 13-16

**Abstract**
Usually Fourier Analysis and Systems Theory emphasize the analogy between the different settings (continuous, discrete, periodic, non-period.). The author proposes a simple approach to generalized functions, based on a Banach space of test functions. The course provides the foundations to Banach Gelfand triples, but also concrete applications in signal processing (time-variant systems, sampling).

**Objective**
Deeper mathematical understanding of the foundations of signal processing and system theory. The setting of Banach Gelfand Triples allows to provide a framework that allows among others to discuss the relations between different settings (e.g. the generalized Fourier transform of functions on the Euclidean space and corresponding FFT-based routines).

**Abstract**

The Linear Complementarity Problem (LCP) was introduced in mid 1960's (1965-67) by Lemke and Cottle-Dantzig (also called rigged Hilbert space), its use for signal processing and systems theory applications. In addition to classical questions we will also discuss the fundamental results of time-frequency analysis (Short-time Fourier transform, Gabor frames, Gabor multipliers, best approximation of operators by Gabor multipliers, identification of slowly varying channels using pilot tones, etc.).

**Content**

In principle a good understanding of concepts from linear algebra is sufficient. Of course, basic knowledge about functional analysis (Banach and Hilbert spaces, linear operators and linear functionals) is helpful. We will, however, explain all these concepts as we go along. We will not need background on Lebesgue integration or topological vector spaces (as usually required for the treatment of distributions).

**Literature**

- Robin Hartshorne: "Geometry: Euclid and beyond", Springer Verlag
- Der Neue Kosmos. A. Unsöld, B. Baschek, Springer

**Lecture notes**

- The seminar schedule and a list of articles: [http://www.inf.ethz.ch/personal/fukudak/lect/lcsemi/lcseminar2015_ref.pdf](http://www.inf.ethz.ch/personal/fukudak/lect/lcsemi/lcseminar2015_ref.pdf)

**Notice**

- Early enrolments for seminars in myStudies are encouraged, so that we will recognize need for additional seminars in a timely manner. Some seminars have waiting lists. Nevertheless, register for at most two mathematics seminars. In this case, you express a stronger preference for the seminar for which you register earlier.

**Prerequisites / notice**

- The seminar is for more advanced students. Registration is officially closed, but if Prof. Doran agrees, further registrations (via the Study Administration) might be possible.
Scientific Works in Mathematics

2S
A list of papers for presentations will be distributed at the beginning of the seminar.

Geometry: Combinatorics and Algorithms

Introduction to scientific writing for students with focus on publication standards and ethical issues, especially in the case of citations

Types of mathematical works

- Directives
- Publication standards in pure and applied mathematics
- Data handling
- Ethical issues
- Citation guidelines

Goal of this seminar is to study and present, in continuation of the course "Boolean Satisfiability-Combinatorics and Algorithms", research papers from the literature.

Study and presentation of research papers from the literature on "Boolean Satisfiability-Combinatorics and Algorithms".

We study Monstrous Moonshine, the surprising connection between modular forms and the Monster group.

To understand the equation 196884 = 196883 + 1.

Volume of participants limited to 16.

Numerical Analysis Seminar: Mathematics for Nanophotonics

Limited number of participants.

Abstract

The aim of the seminar is to review new and fundamental mathematical tools, computational approaches, and inversion and optimal design methods to address challenging problems in nanophotonics. An emphasis will be put on analyzing plasmon resonant nanoparticles.

Algebra I and II. Some familiarity with modular forms and Lie algebras is helpful, but not crucial: all necessary concepts will be introduced in the early talks.

Number of participants limited to 16.

Abstract

The seminar builds heavily on the material covered in the course "Boolean Satisfiability-Combinatorics and Algorithms." Successful completion of that course is a prerequisite for participation in the seminar. The seminar is suited for Bachelor and Master students. Some knowledge in linear functional analysis and algebra is required.

Seminar SAT

Study and presentation of research papers from the literature on "Boolean Satisfiability-Combinatorics and Algorithms".

Goal of this seminar is to study and present, in continuation of the course "Boolean Satisfiability-Combinatorics and Algorithms", research papers from the literature.

A list of papers for presentations will be distributed at the beginning of the seminar.

Each student is expected to read, understand, and elaborate on a selected research paper. To this end, (s)he should give a 45-min. presentation about the paper. The process includes

1. getting an overview of the related literature;
2. understanding and working out the background/motivation: why and where are the questions addressed relevant?
3. understanding the contents of the paper in all details;
4. selecting parts suitable for the presentation;
5. presenting the selected parts in such a way that an audience can appreciate your presentation;
6. getting an overview of the related literature;
7. understanding and working out the background/motivation: why and where are the questions addressed relevant?
8. understanding the contents of the paper in all details;
9. selecting parts suitable for the presentation;
10. presenting the selected parts in such a way that an audience can appreciate your presentation;
11. getting an overview of the related literature;
12. understanding and working out the background/motivation: why and where are the questions addressed relevant?
13. understanding the contents of the paper in all details;
14. selecting parts suitable for the presentation;
15. presenting the selected parts in such a way that an audience can appreciate your presentation;
16. getting an overview of the related literature;
17. understanding and working out the background/motivation: why and where are the questions addressed relevant?
18. understanding the contents of the paper in all details;
19. selecting parts suitable for the presentation;
20. presenting the selected parts in such a way that an audience can appreciate your presentation;
21. getting an overview of the related literature;
22. understanding and working out the background/motivation: why and where are the questions addressed relevant?
23. understanding the contents of the paper in all details;
24. selecting parts suitable for the presentation;
25. presenting the selected parts in such a way that an audience can appreciate your presentation;
26. getting an overview of the related literature;
27. understanding and working out the background/motivation: why and where are the questions addressed relevant?
28. understanding the contents of the paper in all details;
29. selecting parts suitable for the presentation;
30. presenting the selected parts in such a way that an audience can appreciate your presentation;
31. getting an overview of the related literature;
32. understanding and working out the background/motivation: why and where are the questions addressed relevant?
33. understanding the contents of the paper in all details;
34. selecting parts suitable for the presentation;
35. presenting the selected parts in such a way that an audience can appreciate your presentation;
36. getting an overview of the related literature;
37. understanding and working out the background/motivation: why and where are the questions addressed relevant?
38. understanding the contents of the paper in all details;
39. selecting parts suitable for the presentation;
40. presenting the selected parts in such a way that an audience can appreciate your presentation;

Bachelor Thesis

Seminars (Mathematics Master)

Bachelor Thesis

401-2000-00L

Scientific Works in Mathematics

Target audience:
Third year Bachelor students;
Master students who cannot document to have received an adequate training in working scientifically.

Mandatory for all Bachelor and Master students with matriculation in the autumn semester 2014 or later. Optional for Bachelor and Master students with matriculation until or before the spring semester 2014.

Example: You matriculated in the autumn semester 2013 into the first semester of the Bachelor programme, are now in the third year and plan to matriculate in the autumn semester 2016 into the first semester of the Master programme. In this case, you don't need "Scientific Works in Mathematics" in order to complete the Bachelor degree, but for the Master degree you will need it. In this case, we recommend that you register for "Scientific Works in Mathematics" in the autumn semester 2015 or spring semester 2016.

Directive

Abstract

Introduction to scientific writing for students with focus on publication standards and ethical issues, especially in the case of citations (references to works of others.)

Objective

Learn the basic standards of scientific works in mathematics.

Content

- Types of mathematical works
- Publication standards in pure and applied mathematics
- Data handling

This course is completed by the optional course "Recherchieren in der Mathematik" (held in German) by the Mathematics Library. For more details see: http://www.math.ethz.ch/library/services/schulungen

**Prerequisites / notice**

No direct enrolment to this course unit in myStudies. Please fill in the online application form. Requirements and application form under www.math.ethz.ch/intranet/students/study-administration/theses.html ( Afterwards the enrolment will be done by the Study Administration.)

**Abstract**

The purpose of the BSc thesis is to deepen knowledge in a certain subject chosen by the student. In their BSc thesis, students should demonstrate their ability to carry out independent work in mathematics and to organize results in a written report.

**Compulsory Electives in Humanities, Social and Political Sciences**

- Recommended GESS compulsory elective courses (Type B) for D-MATH.
- see GESS Compulsory Electives: Type A: Enhancement of Reflection Capability

</tr>
</tbody>
</table>
Upon completion of the course, students are able to classify combinatorial problems and to apply adequate techniques to solve them.

Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird Vertiefung und Ausbau des Stoffes Mathematik I/II für die Anwendung in der Systemanalyse.

Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.

Wird von der Praktikumslehrperson bestimmt.

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Themenische Schwerpunkte
Die Gegenstände der mentorierten Arbeit in Fachdidaktik stammen in der Regel aus dem gymnasialen Unterricht.

Lernformen

Eine kurze Anleitung zur mentorierten Arbeit in Fachdidaktik wird zur Verfügung gestellt.

Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

**Objective**
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

### Abstract

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

### Objective

- The aim is for the students to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
- To independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readers.
- To try out different options for specialist further training in their profession.

This course unit can only be enrolled after successful participation in, or during enrollment in the course “Human Learning (EW 1)”.

Abstract

This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

Objective

- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice

Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

Number of participants limited to 30.

This course unit can only be enrolled after successful participation in, or during enrollment in the course “Human Learning (EW 1)”.

Abstract

The focus will be on the book “Intelligenz: Grosse Unterschiede und ihre Folgen” by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objective

- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

Prerequisites / notice

Research Methods in Educational Science

Number of participants limited to 30.

This course unit can only be enrolled after successful participation in, or during enrollment in the course “Human Learning (EW 1)”.

Abstract

Literature from the learning sciences is critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and two further meetings will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

Objective

- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

Number of participants limited to 20.

Abstract

In teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturers in this course. Basic conceptual and methodological issues are the topic of a series of plenary meetings; however, the major part of the work is done in small-group meetings with the advising researcher, and in self-directed research projects.

Objective

The course is targeted at advanced students who have taken an interest in gathering practical research experience in the field of Learning & Instruction. In teams of two, students conduct their own research projects (planning, conducting, analyzing, interpreting, and presenting research); thus, the course requires a high amount of self-directed working. Students are personally advised, and supported in their research project, by one of the researchers serving as lecturers in this course. During the first half the semester, relevant methodological knowledge and skills are practiced during plenary meetings and in students’ independent reading (e.g. generating and testing research questions, designing experiments, and analyzing data in the field of Learning and Instruction)

Learning goals include:
- Participants can illustrate and explain basic methods and concepts for research in the fields of Learning and Instruction, e.g. with the help of practical examples.
- Participants can generate testable research questions for a topic relevant in the fields of Learning and Instruction.
- Participants can design and conduct a study that is relevant for answering their research question.
- Participants can summarize and evaluate the main results from a study in the field of learning and Instruction, with regard to the research question being asked.
Subject Didactics in Mathematics

Abstract: Students learn about and learn to use findings from empirical research into mathematical didactics and best practice, as well as theoretical approaches to teaching various topics in mathematics. Methodological suggestions are compared and draft tuition concepts discussed.

Objective: On the basis of their understanding of mathematics, of the knowledge acquired from research into teaching/learning and subject teaching, and also of best practice, students who have completed this course will be in a position to draft motivating learning arrangements, with cognitive appeal, which trigger and maintain learning processes. The aim here is to implement a corresponding teaching plan, so that the mathematics tuition that is given has a general-education value, on the one hand, and ensures that pupils acquire the fundamental knowledge necessary for studying at university, on the other hand.

401-9983-00L | Mentored Work Subject Didactics Mathematics A | O | 2 credits | 4A | M. Akveld, K. Barro, L. Halbeisen, M. Huber, N. Hungerbühler |

Abstract: In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

Objective: The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Content: Thematics Schwerpunkte

The Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

Abstract: During the introductory teaching practice, the students sit in on five lessons given by the teacher responsible for their teaching practice, and teach five lessons themselves. The students are given observation and reflection assignments by the teacher responsible for their teaching practice.
Objective
Right at the start of their training, students acquire initial experience with the observation of teaching, the establishment of concepts for teaching and the implementation of teaching. This early confrontation with the complexity of everything that teaching involves helps students decide whether they wish to and, indeed, ought to, continue with the training. It forms a basis for the subsequent pedagogical and subject-didactics training.

Content
The teaching practice takes in 50 lessons: 30 are taught by the students, and the students sit in on 20 lessons. The teaching practice lasts 4-6 weeks. It gives students the opportunity to implement the contents of their specialist-subject, educational science and subject-didactics training in the classroom. Students also conduct work assignments in parallel to their teaching practice.

Objective
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They acquire the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content

- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Objective
Simultaneous enrolment in “Examination Lesson II Mathematics” (401-9991-02L) is compulsory.

Objective
On the basis of a specified topic, the candidate shows that they are in a position
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Content

The gehaltene Lektion wird kriterienbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/ der Kandidatin über die gehaltene Lektion im Rahmen eines kurzen Kolloquiums.

*Teaching Internship Mathematics* for *Teaching Diploma* in Mathematics Didactics course and not after the second three weeks in an educational institution, during which time they observe 10 lessons and teach 30 lessons independently. The Teaching Internship is complemented by 10 further observed lessons, which are integrated into the Mentored Work in Subject Didactics.

Abstract | The course Combinatorics I and II is an introduction into the field of enumerative combinatorics. |
Objective | Upon completion of the course, students are able to classify combinatorial problems and to apply adequate techniques to solve them. |
### Content

Contents of the lectures Combinatorics I and II: congruence transformation of the plane, symmetry groups of geometric figures, Euler's function, Cayley graphs, formal power series, permutation groups, cycles, Bunsdie's lemma, cycle index, Polya's theorems, applications to graph theory and isomers.

#### 401-3057-00L Finite Geometries II

**Abstract**

Finite geometries I, II: Finite geometries combine aspects of geometry, discrete mathematics and the algebra of finite fields. In particular, we will construct models of axioms of incidence and investigate closing theorems. Applications include test design in statistics, block design, and the construction of orthogonal Latin squares.

**Objective**

Finite geometries I, II: Students will be able to construct and analyse models of finite geometries. They are familiar with closing theorems of the axioms of incidence and are able to design statistical tests by using the theory of finite geometries. They are able to construct orthogonal Latin squares and know the basic elements of the theory of block design.

**Content**

Finite geometries I, II: finite fields, rings of polynomials, finite affine planes, axioms of incidence, Euler's thirty-six officers problem, design of statistical tests, orthogonal Latin squares, transformation of finite planes, closing theorems of Desargues and Pappus-Pascal, hierarchy of closing theorems, finite coordinate planes, division rings, finite projective planes, duality principle, finite Moebius planes, error correcting codes, block design

#### 401-9951-58L Didactics of Mathematics at the College Level I

**University of Zurich**

**Abstract**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: 090MaDgU

Enrolment only possible with matriculation in Teaching Diploma or TC at ETH or in Teaching Diploma at UZH.

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

**Objective**

Students are familiarised with the subjects taught at high-school level I (the first three years of the full-length high school, or the first year of the reduced-length high school). The central contents of geometry, arithmetic and algebra, and also written mathematical problems are explained.

**Content**

Beispiele von Schülerarbeiten geben in diesem Seminar einen Einblick in die mathematische Denkwelt der Schülerinnen und Schüler. Vielfältige Aufgaben zum Einsatz im Unterricht werden vorgestellt, selber gelöst und diskutiert.

- Arithmetik und Algebra: Zahlbereiche, Form und Inhalt in der Algebra.
- Geometrie: Konstruieren-Berechnen-Beweisen, dynamische Geometrie (Geogebra).
- Sachrechnen: Funktionsbegriff, mathematische Modellierung.
- Aktuelle mathematikdidaktische Aspekte wie Lernprozesse, Grundvorstellungen, Kompetenzen, offene Aufgaben.

**Lecture notes**

Zahlreiche begleitende Unterlagen werden abgegeben.

**Prerequisites / notice**

Seminar mit Übungen

#### 401-9931-00L Foundations of Mathematics

**Abstract**

Das Ziel dieser Vorlesung ist die Vermittlung der grundlegenden Konzepte und Begriffe der Mathematik. Dazu gehören die Sprache der Mathematik (d.h. Aussagenlogik und Prädikatenlogik), Modelle von Axiomsystemen (inkl. Gödel'scher Vollständigkeitssatz), Beweismethoden, der Aufbau der Zahlen von den natürlichen Zahlen bis zu den reellen Zahlen, sowie die Axiome der Mengenlehre.

**Objective**

Das Ziel dieser Vorlesung ist die Vermittlung der grundlegenden Konzepte und Begriffe der Mathematik. Dazu gehören die Sprache der Mathematik (d.h. Aussagenlogik und Prädikatenlogik), Modelle von Axiomsystemen (inkl. Gödel'scher Vollständigkeitssatz), Beweismethoden, der Aufbau der Zahlen von den natürlichen Zahlen bis zu den reellen Zahlen, sowie die Axiome der Mengenlehre (auf denen die gesamte Mathematik aufgebaut ist). Die Vorlesung ist mit Übungen. Über das Semester verteilt finden 8 Übungsstunden statt.

**Literature**

Als ergänzende Literatur zur Vorlesung kann ich folgende beiden Bücher empfehlen:

#### 252-0855-00L Computer Science in Secondary School Mathematics

**Abstract**

The unit "Computer Science in Secondary School Mathematics" addresses key contributions of computer science to general education, the tight relations between the algorithmic and the mathematical way of thinking, and the thoughtful choice of computer science topics for high school mathematics classes.
### Mathematics as Second Subject

**Abstract**

Students learn about and learn to use findings from empirical research into mathematical didactics and best practice, as well as theoretical approaches to teaching various topics in mathematics. Methodological suggestions are compared and draft tuition concepts discussed.

**Objective**

On the basis of their understanding of mathematics, of the knowledge acquired from research into teaching/learning and subject teaching, students learn about and learn to use findings from empirical research into mathematical didactics and best practice, as well as theoretical approaches to teaching various topics in mathematics. Methodological suggestions are compared and draft tuition concepts discussed. The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners. Besides holding classes, the students do care about the individual pupil support.

They encourage the autonomy of the learners, manage to work with diverse target groups and to establish a positive learning environment.

They are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.

The students are able to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

**Content**

- The main topics of the course unit "Computer Science in Secondary School Mathematics" represent a scientific and didactic added value for mathematics classes.
- The course covers the didactics of logic, of cryptography, of finite state automata, of computability and of the introduction to programming.
- The students develop the understanding of fundamental scientific concepts such as algorithm, program, complexity, determinism, computation, automata, verification, testing, security of a cryptosystem and secure communication. They reflect on ways to embed them into a scientifically sound and didactically sustainable mathematics course.

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

**Literature**

*see Compulsory Elective Courses Teaching Diploma*
Abstract
In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

Objective
The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Content
Thematische Schwerpunkte
Die Gegenstände der mentorierten Arbeit in Fachdidaktik stammen in der Regel aus dem gymnasialen Unterricht.

Lernformen

Lecture notes
Eine kurze Anleitung zur mentorierten Arbeit in Fachdidaktik wird zur Verfügung gestellt.

Literature
Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

Prerequisites / notice
Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

Abstract
Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Objective
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate own performance.

Mathematical Optimization

401-3901-00L Mathematical Optimization  W  11 credits  4V+2U  R. Weismantel

Abstract
Mathematical treatment of diverse optimization techniques.

Objective
Advanced optimization theory and algorithms.

Content
1. Linear optimization: The geometry of linear programming, the simplex method for solving linear programming problems. Farkas’ Lemma and infeasibility certificates, duality theory of linear programming.

3. Integer optimization: Ties between linear and integer optimization, total unimodularity, complexity theory, cutting plane theory.

4. Combinatorial optimization: Network flow problems, structural results and algorithms for matroids, matchings and, more generally, independence systems.

**Also Bachelor**

Core Courses: Pure Mathematics

401-3531-00L Differential Geometry I can only be recognised for the Master Programme if 401-3532-00L Differential Geometry II has not been recognised for the Bachelor Programme.

Analogously for:

401-3461-00L Functional Analysis I - 401-3462-00L Functional Analysis II
401-3001-61L Algebraic Topology I - 401-3002-12L Algebraic Topology II
401-3132-00L Commutative Algebra - 401-3146-12L Algebraic Geometry
401-3371-00L Dynamical Systems I - 401-3372-00L Dynamical Systems II

Abstract
This course is an introduction to differential and Riemannian geometry.

Objective
The aim is to lead students from a reasonable knowledge of advanced calculus, basic knowledge of general topology and solid knowledge of linear algebra to fundamental knowledge of differentiable manifolds and their basic tools. Riemannian geometry, some basic Lie theory, and de Rham cohomology will be developed as applications.

Literature
W.Boothby “An introduction to differentiable manifolds and Riemannian geometry”

J.M.Lee “Introduction to smooth manifolds”

M.P. Do Carmo "Riemannian Geometry"

401-3461-00L Functional Analysis I

Abstract
Baire category; Banach and Hilbert spaces, bounded linear operators; Three Fundamental Principles: Uniform Boundedness, Open Mapping/Closed Graph, Hahn-Banach; Convexity; Dual Spaces: weak and weak* topologies, Banach-Alaoglu, reflexive spaces; Ergodic Theorem; compact operators and Fredholm theory, Closed Image Theorem; Spectral theory, self-adjoint operators.

Lecture notes
Lecture Notes on "Functional Analysis" by D.A. Salamon

401-3001-61L Algebraic Topology I

Abstract
This is an introductory course in algebraic topology. The course will cover the following main topics: introduction to homotopy theory, homology and cohomology of spaces.

Literature

Book can be downloaded for free at: http://www.math.cornell.edu/~hatcher/AT/ATpage.html

See also:
http://www.math.cornell.edu/~hatcher/#anchor1772800

3) E. Spanier, "Algebraic topology", Springer-Verlag

General topology, linear algebra.

Prerequisites / notice
Some knowledge of differential geometry and differential topology is useful but not absolutely necessary.

401-3132-00L Commutative Algebra

Abstract
This course is meant to provide an introduction to commutative algebra that equips the student to start studying the basics of algebraic geometry.

Objective
About the course: We shall closely follow the text "Introduction to Commutative Algebra" by M. F. Atiyah and I. G. Macdonald. Wherever possible, there will be extra focus on exercises that lead towards the basics of Algebraic Geometry. Topics include * Basics about rings, ideals and modules * Localization * Primary decomposition * Integral dependence and valuations * Noetherian rings * Completions * Basic dimension theory

Literature
References:

Prerequisites / notice
Prerequisites: Algebra I (or a similar introduction to the basic concepts of ring theory).

401-3371-00L Dynamical Systems I

Abstract
This course is a Part I of a broad introduction to dynamical systems. Topic covered include topological dynamics, symbolic dynamics, ergodic theory, hyperbolic dynamics. In Part II (FS 2016), we will cover low-dimensional dynamics, complex dynamics, measure-theoretic entropy and Hamiltonian dynamics.

Objective
Mastery of the basic methods and principal themes of dynamical systems.
The course introduces the principal themes of modern dynamical systems. Topics covered include:

1. Topological dynamics
   (transitivity, attractors, chaos, structural stability)

2. Symbolic dynamics
   (Perron-Frobenius theorem, zeta functions)

3. Ergodic theory
   (Poincare recurrence theorem, Birkhoff ergodic theorem, existence of invariant measures)

4. Hyperbolic dynamics
   (Grobman-Hartman theorem, Shadowing lemma, Closing lemma and applications)

The most relevant textbook for this course is

"Combinatorial Set Theory: with a gentle introduction to forcing" (Springer-Verlag 2012)

Die Forcing-Technik kennenlernen und verschiedene Unabhängigkeitbeweise führen können.

W. V. D. G. 3V+1U
ECTS 4V+1U

Mit Hilfe der Forcing-Technik werden verschiedene Unabhängigkeitsbeweise geführt. Insbesondere wird gezeigt, dass die Kontinuumshypothese von den Axiomen der Mengenlehre unabhängig ist.

W. V. D. 3V+1U
ECTS 4V+1U

Lecturers

Prerequisites / notice

Introduction to Dynamical Systems, Brin and Stuck, CUP, 2002.

Another excellent book (which will be relevant also for Dynamical Systems II) is

Lectures on Dynamical Systems, Zehnder, EMS 2010.

A more advanced textbook which covers everything in both Dynamical Systems I and II (and much more!) is

The material of the basic courses of the first two years of the program at ETH is assumed. Some basic differential geometry and functional analysis would be useful but not essential.

#### (also Bachelor) Core Courses: Applied Mathematics

**401-3601-00L** Probability Theory can only be recognised for the Master Programme if neither 401-3642-00L Brownian Motion and Stochastic Calculus nor 401-3602-00L Applied Stochastic Processes has been recognised for the Bachelor Programme.

For the category assignment take contact with the Study Administration Office (www.math.ethz.ch/studiensekretariat) after having received the credits.

Abstract

The course presents some aspects of probabilistic number theory, including distribution properties of the number of prime divisors of integers, probabilistic properties of the zeta function and statistical distribution of exponential sums.
The goal of the course is to present some results of probabilistic number theory in a unified manner. The main concepts will be presented in parallel with the proof of three main theorems: (1) the Erdős-Kac theorem and its variants concerning the number of prime divisors of integers in various sequences; (2) the distribution of values of the Riemann zeta function, including Selberg's central limit theorem for the Riemann zeta function on the critical line; (3) functional limit theorems for the paths of partial sums of families of exponential sums such as Kloosterman sums.

Prerequisites / notice

Prerequisites: Complex analysis, measure and integral; some probability theory is useful but the main concepts needed will be recalled. Some knowledge of number theory is useful but the main results will be summarized.

**401-3149-65L**  Equation Decomposability of Polytopes  W  4 credits  2V  E. Viada

**Abstract**

We will study the properties of equidecomposability of polytopes from different points of view: as varieties, as equations, as quotients. We will then study some properties of algebraic points on an elliptic curve. We will finally describe special subset of the rational points of curves that are embedded in products of elliptic curves.

**Objective**

The aim of this course is to get used to geometric objects and algebraic tools, such as elliptic curves, curves, heights and degree.

**Content**

We will first study the properties of equidecomposability. We will then describe some aspects of algebraic points of bounded height and degree. Finally, we will study some properties of algebraic points on curves embedded in products of elliptic curves.

**Literature**

J. Silverman "The arithmetic of Elliptic Curves"

J. Silverman " Advanced Topics in the arithmetic of Elliptic Curves"

E. Bombieri & W. Gubler " Heights in Diophantine Geometry"

**Prerequisites / notice**

Algebra and Linear Algebra, Topology, Geometry, some basic Algebraic Geometry.

**401-3059-00L**  Combinatorics II  W  4 credits  2G  N. Hungerbühler

**Abstract**

The course Combinatorics I and II is an introduction into the field of enumerative combinatorics. Upon completion of the course, students are able to classify combinatorial problems and apply adequate techniques to solve them.

**Objective**

Contents of the lectures Combinatorics I and II: congruence transformation of the plane, symmetry groups of geometric figures, Euler's function, Cayley graphs, formal power series, permutation groups, cycles, Bunsdie's lemma, cycle index, Polya's theorems, applications to graph theory and isomers.

**Literature**

J.-P. Serre. Linear Representations of Finite Groups.

**Prerequisites / notice**

Algebra and Linear Algebra, Topology, Geometry, some basic Algebraic Geometry.

**401-3202-09L**  Representation Theory of Finite Groups, and in Particular Symmetric Groups  W  4 credits  2V  A. Buryak

**Abstract**

The first part of the course will be devoted to the general theory of linear representations of finite groups. In the second part we will discuss in details the representation theory of the symmetric groups and some of its applications.

**Literature**

J.-P. Serre, Linear Representations of Finite Groups.

**Prerequisites / notice**

It will be assumed that the listeners know the material from a basic linear algebra course and also basic facts about groups and rings.

**401-4149-65L**  Reading Course: Geometric Invariant Theory  W  2 credits  4A  J. Fresán, P. S. Jossen

**Abstract**

Geometric Invariant Theory (GIT) is concerned with the problem of defining quotients of algebraic varieties by group actions, a crucial step in the construction of moduli spaces. Although some of the ideas go back to Hilbert, it was developed in its present form by Mumford in the 60s.

**Objective**

The goal of this reading course is to give an introduction to GIT, with emphasis on examples rather than the most general statements.

**Content**

After a couple of introductory sessions, participants will contribute with talks.

We will cover topics as: existence of affine and projective quotients -the Hilbert-Mumford criterion -construction of the moduli space of elliptic curves -toric varieties as GIT quotients -semistable vector bundles on curves

**Literature**

**Prerequisites / notice**

Basic knowledge of algebraic geometry will be assumed.

</tr>
<tr>
<td>Abstract</td>
<td>A polygon in the plane can be decomposed into finitely many (convex) pieces and reassembled to form another polygon if and only if they have the same area. Hilbert's third problem asks if the analogous is also true for two polyhedra in space. Whether or not it is possible to define volume without the use of approximation arguments depends on the answer to this question. The course will cover classical results on equidecomposability including the Dehn-Sydler theorem, i.e. the solution to Hilbert's third problem. We will then describe the connection between equidecomposability and valuation theory. Finally, we will discuss some recent classification results of valuative that are invariant under certain groups of motions.</td>

| 401-4573-65L | Surfaces and 3-Manifolds | W | 4 credits | 2V | A. Sisto |
| Abstract | This course is an introduction and invitation to the theory of manifolds of dimension 2 and 3, with focus on the connections between the two dimensions. |

Data: 06.12.2017 12:57  Autumn Semester 2015  Page 1046 of 1432
In this course we will present the classical theory as well as more recent developments of the calculus of variation of surfaces. The main topics to two dimensional Lagrangians. The starting point will be the statement of the geometrisation theorem in dimension 2 and the goal the statement of the geometrisation theorem in dimension 3.

The choice of topics to discuss, especially in the second part of the course, can vary depending on the interests of the audience.

The prerequisite is essentially just knowing the definition of manifold. It could help but it's not strictly necessary to know basic covering theory and Riemannian geometry. The exam will consist in presenting a result from the course whose proof has been skipped during the course.

---

**Objective**

The goal is to give an overview of hyperbolic surfaces, Mapping Class Groups, construction of 3-manifolds, and the geometrisation theorem. The starting point will be the statement of the geometrisation theorem in dimension 2 and the goal the statement of the geometrisation theorem in dimension 3.

**Prerequisites / notice**

Finite geometries, I, II: Finite geometries combine aspects of geometry, discrete mathematics and the algebra of finite fields. In particular, we will construct models of axioms of incidence and investigate closing theorems. Applications include test design in statistics, block design, and the construction of orthogonal Latin squares.

**Prerequisites / notice**

Finite geometries I, II: Students will be able to construct and analyse models of finite geometries. They are familiar with closing theorems of the axioms of incidence and are able to design statistical tests by using the theory of finite geometries. They are able to construct orthogonal Latin squares and know the basic elements of the theory of block design.

**Content**

Finite geometries I, II: finite fields, rings of polynomials, finite affine planes, axioms of incidence, Euler's thirty-six officers problem, design of statistical tests, orthogonal Latin squares, transformation of finite planes, closing theorems of Desargues and Pappus-Pascal, hierarchy of closing theorems, finite coordinate planes, division rings, finite projective planes, duality principle, finite Mobius planes, error correcting codes, block design

**Prerequisites / notice**

- Dembowski: Finite Geometries.

**Abstract**

Partial Differential Equations

The course covers elliptic partial differential equations in connection to differential geometry and geometric elliptic variational problems. The main topics are the uniformization theorem for 2-dim Riemannian manifolds, harmonic maps from the unit disc to a n-dim Riemannian manifold, and the theory of parametric minimal surfaces in n-dim Euclidean space.

**Prerequisites / notice**

- Real Analysis and Differential Geometry

**Abstract**

In this course we will present the classical theory as well as more recent developments of the calculus of variation of surfaces. We will expose method mixing functional analysis and differential geometry in order to produce and describe global and local minimizers or saddle points to two dimensional Lagrangians.

**Prerequisites / notice**

- Requirements:
  - Fundamental knowledge in functional analysis, Fourier analysis and differential geometry (FAI and DGI)

**Abstract**

For this Reading Course proactive students make an individual agreement with a lecturer to acquire knowledge through independent literature study.

### Electives: Applied Mathematics and Further Application-Oriented Fields

#### 401-4655-64L Numerical Analysis of High-Dimensional Problems for Uncertainty Quantification

**Abstract**

In many applications of mathematics, efficient numerical methods for PDEs on high dimensional state and/or parameter spaces is required. This course provides succinct surveys of recently developed numerical methods, their computer implementation for model problems, and elements of their mathematical analysis for the efficient approximation of high- and infinite-dimensional PDE problems.

| 401-4607-59L | Percolation Theory | W    | 4 credits | 2V | P. Nolin |
| Abstract | An introduction to the percolation theory. |
| Objective | The objective is to gain familiarity with the methods of the percolation theory and to learn some of its important results. |
| Content | Definition of percolation, FKG and BK inequalities, Harris-Kesten Theorem, Menshikov's Theorem, uniqueness of the infinite cluster and possibly Smirnov's Theorem on the conformal invariance of the critical percolation. |
### 401-3627-00L High-Dimensional Statistics

**Abstract**

"High-Dimensional Statistics" deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed.

**Objective**

Knowledge of methods and basic theory for high-dimensional statistical inference

**Content**

Lasso and Group Lasso for high-dimensional linear and generalized linear models; Additive models and many smooth univariate functions; Non-convex loss functions and l1-regularization; Stability selection, multiple testing and construction of p-values; Undirected graphical modeling

**Literature**

**Prerequisites / notice**

Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

---

### 401-4623-00L Time Series Analysis

**Abstract**

Statistical analysis and modeling of observations in temporal order, which exhibit dependence. Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. Implementations in the software R.

**Objective**

Understanding of the basic models and techniques used in time series analysis and their implementation in the statistical software R.

**Content**

This course deals with modeling and analysis of variables which change randomly in time. Their essential feature is the dependence between successive observations. Applications occur in geophysics, engineering, economics and finance. Topics covered: Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. The models and techniques are illustrated using the statistical software R.

**Lecture notes**

Not available

**Literature**

A list of references will be distributed during the course.

**Prerequisites / notice**

Basic knowledge in probability and statistics

---

### 401-3611-00L Advanced Topics in Computational Statistics

**Abstract**

This lecture covers selected advanced topics in computational statistics, including various classification methods, the EM algorithm, clustering, handling missing data, and graphical modelling.

**Objective**

Students learn the theoretical foundations of the selected methods, as well as practical skills to apply these methods and to interpret their outcomes.

**Content**

The course is roughly divided in three parts: (1) Supervised learning via (variations of) nearest neighbor methods, (2) the EM algorithm and clustering, (3) handling missing data and graphical models.

**Lecture notes**

Lecture notes

**Prerequisites / notice**

We assume a solid background in mathematics, an introductory lecture in probability and statistics, and at least one more advanced course in statistics.

---

### 401-0649-00L Applied Statistical Regression

**Abstract**

This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life.

**Objective**

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

**Content**

The course starts with the basics of linear regression modeling, and then proceeds to parameter estimation, tests and confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, categorical input variables, shrinkage and general modeling strategies.

The last third of the course is dedicated to an introduction into generalized linear regression models: this includes logistic regression for binary response variables, Poisson regression for count data, cumulative logit models for ordered, and multinomial regression for categorical response variables.

**Lecture notes**

A script will be available.

**Literature**

Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

**Prerequisites / notice**

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

---

### 401-0625-01L Applied Analysis of Variance and Experimental Design

**Abstract**

Key concepts of experimental design. Planning and analysis of single factor experiments, block designs, full factorial and fractional designs, split-plot and strip-plot designs. Random effects and mixed effects models.

**Objective**

Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.

**Content**

**Lecture notes**

see website
401-4607-65L Schramm-Loewner Evolution and Gaussian Free Field  W  2 credits  2V+1U  W. Werner
Abstract
This block course taking place in January 2016 will be an introduction to the Schramm-Loewner Evolutions, which are random curves arising in a number of random planar systems.
Objective
Topics covered in this class will include:
- Definition of Loewner chains and their properties
- Definition and basic properties of Schramm-Loewner Evolutions
- Relation between SLE(4) and the Gaussian Free Field
- Survey of properties of some other SLE curves.
Prerequisites / notice
Students of the 2015-2016 Swissmap Master class program are welcome to attend.

Selection: Financial and Insurance Mathematics

In the Master's programmes in Mathematics resp. Applied Mathematics 401-3913-01L Mathematical Foundations for Finance is eligible as an elective course, but only if 401-3888-00L Introduction to Mathematical Finance isn't recognised for credits (neither in the Bachelor's nor in the Master's programme). For the category assignment take contact with the Study Administration Office (www.math.ethz.ch/studiensekretariat) after having received the credits.

Introduction to equilibrium models: The classical life insurance model is presented together with the important insurance types (insurance on one and two lives, term and...
Content

One might have, more provocatively, entitled the course: How does time end (in, Einstein's general relativity)? In a word, badly. Not in a whimper, nor in a crunch, but in something much more exotic.

More, technically, what does a generic singular point, restricting time, in solutions to the Einstein gravitational field equations look like?

Special cosmological solutions, such as Freedman's, do have singularities.

In 1963, Lifshitz and Khalatnikov 'constructed a class' of singular solutions and concluded that '... the presence of a singularity in time is NOT a necessary property of cosmological models of the general theory of relativity, and that the general case of an arbitrary distribution of matter and gravitational field does not lead to the appearance of a singularity.'

In 1965 Penrose and Hawking formulated and proved 'incompleteness' theorems that convinced even Lifshitz and Khalatnikov that singularities in time ARE a necessary property of cosmological models of the general theory of relativity. Penrose and Hawking proved, that under very general, physically reasonable conditions, a spacetime (that is, a solution to the Einstein equations) has a light ray (null geodesic) that suddenly ends ('incompleteness') sufficiently far in the past. They adroitly sidestep the problem of defining what a singularity actually is, by saying it is the 'place' where their light rays end. The proofs of incompleteness theorems are not hard. That's good. Unfortunately, they are by their very nature completely non constructive and provide no quantitative information at all about what a 'singularity' really looks like.

In 1970, Belinskii, Khalatnikov and Lifshitz revisited the work of 1963 and found that Khalatnikov and Lifshitz had missed something and that '... we shall show that there exists a general solution which exhibits a physical singularity with respect to time.' In 1982 they revised the 1970 proposal. Their work culminates in a series of fascinating, but very, very heuristic, statements about the possible existence of a class of singular solutions to the field equations. These heuristic statements are referred to as the 'BKL Conjectures'.

Next semester, we will rigorously formulate and prove the 'BKL Conjectures' for homogeneous spacetimes. That is, we will construct a set of initial data with positive measure which evolve into homogeneous, chaotically singular spacetimes that exhibit all of the BKL phenomenology. Most importantly, there are chaotic oscillations, growing in magnitude, whose distribution is governed by the continued fraction expansion of a parameter appearing in the initial data.

The lectures will be completely self contained. One doesn't need to know anything about general relativity; the Einstein field equations will be introduced from scratch. We will classify real, three dimensional Lie algebras, introduce tensor analysis and discuss the geometry of homogeneous spacetimes. We will also derive the basic properties of continued fractions and the Gauss map $\delta \text{displaystyle style x} \text{mapsto } \frac{1}{x - \lfloor \frac{1}{x} \rfloor}$ from $(0,1) \smallsetminus \mathbb{Q}$ to itself.

Lecture notes

There will be lecture notes.

Prerequisites / notice

First year analysis and linear algebra are the only prerequisites.

402-0843-00L Quantum Field Theory I

Abstract

This course discusses the quantisation of fields in order to introduce a coherent formalism for the combination of quantum mechanics and special relativity.

Topics include:
- Relativistic quantum mechanics
- Quantisation of bosonic and fermionic fields
- Interactions in perturbation theory
- Scattering processes and decays
- Radiative corrections

Objective

The goal of this course is to provide a solid introduction to the formalism, the techniques, and important physical applications of quantum field theory. Furthermore it prepares students for the advanced course in quantum field theory (Quantum Field Theory II), and for work on research projects in theoretical physics, particle physics, and condensed-matter physics.

402-0861-00L Statistical Physics

Abstract

This lecture covers the concepts of classical and quantum statistical physics, and some aspects of kinetic gas theory. In a more advanced part Bose-Einstein condensation, general mean field theory and critical phenomena will be addressed. Finally also various aspects of linear response theory will be discussed.

Objective

This lecture gives an introduction in the basic concepts and applications of statistical physics for the general use in physics and, in particular, as a preparation for the theoretical solid state physics education.

Content

- Basics of phenomenological thermodynamics, three laws of thermodynamics.
- Classical statistical physics: microcanonical ensembles, canonical ensembles and grandcanonical ensembles, applications to simple systems.
- Quantum statistical physics: single particle, ideal quantum gases, fermions and bosons.
- Bose-Einstein condensation: Bogolyubov theory, superfluidity.
- Critical phenomena: mean field, series expansions, scaling behavior, universality.
- Renormalization group: fixed points, simple models.
- Linear response theory: general formulation, response in mean field, sum rules, collective modes, fluctuation dissipation theorem.

Lecture notes

No specific book is used for the course. Relevant literature will be cited in the course.

402-0830-00L General Relativity

Abstract

Manifold, Riemannian metric, connection, curvature; Special Relativity; Lorentzian metric; Equivalence principle; Tidal force and spacetime curvature; Energy-momentum tensor, field equations, Newtonian limit; Post-Newtonian approximation; Schwarzschild solution; Mercury's perihelion precession, light deflection.

Objective

Basic understanding of general relativity, its mathematical foundations, and some of the interesting phenomena it predicts.

Literature

- C. Misner, K. Thorne and J. Wheeler: Gravitation
- S. Carroll - Spacetime and Geometry: An Introduction to General Relativity
- R. Wald - General Relativity
- S. Weinberg - Gravitation and Cosmology
- N. Straumann - General Relativity with applications to Astrophysics

402-0873-65L Partial Differential Equations of Quantum Physics

Abstract

In this course we cover several fundamental equations of quantum physics: the Schrödinger equation, which lies at the foundation of Quantum Mechanics, the Gross-Pitaevskii, Landau-Lifshitz and Hartree and Hartree-Fock equations playing an important role in condensed matter physics, the Ginzburg-Landau equations of superconductivity, and the Yang-Mills equations of particle physics.
## 252-1425-00L Randomized Algorithms and Probabilistic Methods

**Abstract**

Randomized algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?) geometrically.

**Objective**

The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area and in various application domains.

**Content**

Planar and geometric graphs, embeddings and their representation (Whitney’s Theorem, canonical orderings, DCEL), polygon triangulations and the art gallery theorem, convexity in R^d, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chan’s Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction), Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.

**Lecture notes**

Yes

**Prerequisites / notice**

Prerequisites: The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH.

**Outlook**

In the following spring semester there is a seminar “Geometry: Combinatorics and Algorithms” that builds on this course. There are ample possibilities for Semester-, Bachelor- and Master Thesis projects in the area.

---

## 252-1407-00L Algorithmic Game Theory

**Abstract**

Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory.

**Objective**

Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.

**Content**

The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a paradigm suitable for the behavior and interaction of such selfish users and programs. Classical game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

**Outline**

- Introduction to classical game theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- The cost difference between an optimum under central control and an equilibrium under selfish agents, known as the "price of anarchy".
- Auction-like mechanisms and algorithms that "direct" the actions of selfish agents into a certain desired equilibrium situation.
- Selected current research topics of Algorithmic Game Theory, such as Web-Search Based Keyword Auctions, or Information Cascading in Social Networks

**Lecture notes**

No lecture notes.

**Prerequisites / notice**

Several copies of both books are available in the Computer Science library.

**Audience**

Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.

**Requirements**

You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.

---

## Literature

## Prerequisites

- *Auction-like mechanisms and algorithms that "direct" the actions of selfish agents into a certain desired equilibrium situation.
- *Selected current research topics of Algorithmic Game Theory, such as Web-Search Based Keyword Auctions, or Information Cascading in Social Networks

|                  | Thursdays 10-12 and 13-16

Abstract
Usually Fourier Analysis and Systems Theory emphasize the analogy between the different settings (continuous, discrete, periodic, and non-periodic). The author proposes a simple approach to generalized functions, based on a Banach space of test functions. The course provides the foundations to Banach Gelfand triples, but also concrete applications in signal processing (time-variant systems, sampling).

Objective
Deeper mathematical understanding of the foundations of signal processing and system theory. The setting of Banach Gelfand Triples allows to provide a framework that allows among others to discuss the relations between different settings (e.g. the generalized Fourier transform of functions on the Euclidean space and corresponding FFT-based routines).

Content
Time-Frequency Analysis and its discretized version, namely Gabor Analysis have required to develop a family of function spaces (the so-called modulation spaces, introduced by Feichtinger in the 80th) which is different from the usual Lebesgue spaces. There is a smallest space (called $S_0$) and a largest space (namely the dual space), which is a suitable reservoir of generalized functions relevant for the rigorous establishment of basic results in signal processing (sampling theorem, Poisson formula, Fourier inversion, etc.). The course will be centered on the basic properties of the Banach Gelfand triple $(S_0,L2,S_0')$ (also called rigged Hilbert space), its use for signal processing and systems theory applications. In addition to classical questions we will also discuss the fundamental results of time-frequency analysis (Short-time Fourier transform, Gabor frames, Gabor multipliers, best approximation of operators by Gabor multipliers, identification of slowly varying channels using pilot tones, etc.).

Lecture notes
There will a script related to the course. In fact, material for a book project on the subject is developed while the course is given.

Prerequisites / notice
In principle a good understanding of concepts from linear algebra is sufficient. Of course, basic knowledge about functional analysis (Banach and Hilbert spaces, linear operators and linear functionals) is helpful. We will, however, explain all these concepts as we go along. We will not need background on Lebesgue integration or topological vector spaces (as usually required for the treatment of distributions).

**Application Area**

Only necessary and eligible for the Master degree in Applied Mathematics.

One of the application areas specified must be selected for the category Application Area for the Master degree in Applied Mathematics. At least 8

</tbody>
</table>

**Abstract**

Key features of the surface climate (e.g., the wind and temperature distribution) can be understood by considering how basic physical balances such as the angular momentum and energy balance constrain global atmospheric circulations. This course gives an overview of the physical balances involved and explores some of their implications for maintaining the surface climate.

**Objective**

Understanding of the basic physical processes involved in maintaining the global circulation of the atmosphere and the surface climate (winds, temperature, precipitation, etc.). Ability to reason how climate may change on long timescales.

**Content**

Introduction to the physical balances and dynamical mechanisms governing global atmospheric circulations and the surface climate: angular momentum balance and its role in controlling winds; energy balance and its role in controlling temperatures; the hydrologic cycle and its role in controlling humidity and aridity; tracer transport and connections to the surface. The relative importance of mean circulations, transient eddies, and stationary eddies in these balances will be discussed, as will be the dynamics of their generation and maintenance.

The course gives an overview of the dominant processes that govern the surface climate, with a focus on phenomenology and order-of-magnitude physics that is applicable to climates generally, including those of Earth's distant past and of other planets.

**Lecture notes**

**Abstract**

The lecture Biology I, together with the lecture Biology II in the following summer semester, is a basic, introductory course into Biology for Students of Materials Sciences and other students with biology as subsidiary subject.

**Objective**

The goal of this course is to give the students a basic understanding of the molecules that build a cell and make it function, and the basic principles of metabolism and molecular genetics.

**Content**

Die folgenden Kapitelnummern beziehen sich auf das der Vorlesung zugrundeliegende Lehrbuch "Biology" (Campbell & Rees, 7th edition, 2005)

Kapitel 1-4 des Lehrbuchs werden als Grundwissen vorausgesetzt

1. Aufbau der Zelle
   - Kapitel 5: Struktur und Funktion biologischer Makromoleküle
   - Kapitel 6: Eine Tour durch die Zelle
   - Kapitel 7: Membranstruktur und-funktion
   - Kapitel 8: Einführung in den Stoffwechsel
   - Kapitel 9: Zelluläre Atmung und Speicherung chemischer Energie
   - Kapitel 10: Photosynthese
   - Kapitel 12: Der Zellzyklus
   - Kapitel 17: Vom Gen zum Protein

2. Allgemeine Genetik
   - Kapitel 13: Meiose und Reproduktionszyklen
   - Kapitel 14: Mendelsche Genetik
   - Kapitel 15: Die chromosomale Basis der Vererbung
   - Kapitel 16: Die molekulare Grundlage der Vererbung
   - Kapitel 18: Genetik von Bakterien und Viren
   - Kapitel 46: Tierische Reproduktion

**Lecture notes**

Der Vorlesungsstoff ist sehr nahe am Lehrbuch gehalten, Skripte werden ggf. durch die Dozenten zur Verfügung gestellt.

**Literature**

Das folgende Lehrbuch ist Grundlage für die Vorlesungen Biologie I und II:

<td>W</td>
<td>4 credits</td>
<td>3G</td>
<td>T. Stadler</td>
</tr>
</tbody>
</table>

**Abstract**

The aim of the course is to provide up-to-date knowledge on how we can obtain an understanding of the evolution and population dynamics of organisms based on their genetic sequencing data, employing key concepts from molecular evolution, phylogenetics and phyloodynamics. Throughout the course, we tie the models and methods closely with applications, mainly in the field of epidemiology and evolution.
Attendees will learn what information is contained in genetic sequencing data and how this information is extracted from the sequencing data. The main concepts introduced are:

- models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics
- stochastic processes

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

The course consists of three parts. We first introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Second, we employ these evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades.

Lecture notes
Slides of the lecture will be available online.

Literature
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics.

Objective
- to describe and apply population biology models (e.g. growth, species interactions)
- to describe and apply epidemiological models
- to substantiate evolutionary concepts (e.g., life history evolution, coevolution, evolution of sex) using population biology arguments and provide examples
- to propose population biology experiments

Content
Population growth, population regulation, predator-prey interactions, host-pathogen interactions, competition, metapopulations, life history evolution, local adaptation, mating systems, sexual selection, coevolution.

Lecture notes
Handouts of lectures

Literature
Recommended:

Objective
- to provide examples
- to substantiate evolutionary concepts (e.g., life history evolution, coevolution, evolution of sex)
- to propose population biology experiments

Content
- Population growth, population regulation, predator-prey interactions, host-pathogen interactions, competition, metapopulations, life history evolution, local adaptation, mating systems, sexual selection, coevolution.
- Typical optimization problems and their difficulties are outlined. Well-known deterministic search strategies, combinatorial minimization, and evolutionary algorithms are presented and compared. In engineering, optimization problems are often very complex. Therefore, new techniques based on the generalization and combination of known methods are discussed. To illustrate the procedure, various problems of practical interest are presented and solved with different optimization codes.

Lecture notes
PDF file see http://alphard.ethz.ch/hafner/Vorles/lect.htm

Prerequisites / notice
Lecture in the first half of the semester, exercises in form of small projects in the second half, presentation of the results in the last week of the semester.

<table>
<thead>
<tr>
<th>Number</th>
<th>Title</th>
<th>Type</th>
<th>ECTS</th>

<td>Physical Modelling and Simulation</td>
<td>W</td>
<td>5</td>
<td>4G</td>
<td>C. Hafner, J. Leuthold, J. Smajic</td>
</tr>
</tbody>
</table>

Objective
- to provide examples
- to substantiate evolutionary concepts (e.g., life history evolution, coevolution, evolution of sex)
- to propose population biology experiments

Content
- First half of the semester: Introduction to the main methods of numerical optimization with focus on stochastic methods such as genetic algorithms, evolutionary strategies, etc.
- Second half of the semester: Each participant implements a selected optimizer and applies it on a problem of practical interest.
- Typical optimization problems and their difficulties are outlined. Well-known deterministic search strategies, combinatorial minimization, and evolutionary algorithms are presented and compared. In engineering, optimization problems are often very complex. Therefore, new techniques based on the generalization and combination of known methods are discussed. To illustrate the procedure, various problems of practical interest are presented and solved with different optimization codes.
- Since the fabrication and characterization of micro- and nanostructures is difficult, expensive, and time-consuming, numerical modelling drastically reduced the design process. Although many commercial software packages are available, it is important to know the drawbacks and difficulties of the numerical methods behind them and to be able to validate the results obtained with such packages.
- First, an introduction to the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics is given. This is important for understanding the problems to be analyzed and for validating results obtained from software packages. After this, the main concepts of numerical methods and of the most widely used codes for physical modelling are outlined and compared, which is essential for the adequate selection of software for solving given problems. After this, prominent commercial software packages are applied to various types of problems, ranging from electromagnetics to multiphysics. For becoming able to select appropriate software and to validate the results obtained, different commercial software packages will be used and compared during the exercises in form of small projects.

Objective
- Dynamic Programming and Optimal Control
- Covers the fundamental concepts of Dynamic Programming & Optimal Control.
- Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.
### Literature

### Prerequisites / notice
Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

**Abstract**
Relationship between economy and environment, market failure, external effects and public goods, contingent valuation, internalisation of externalities; economics of non-renewable resources, economics of renewable resources, cost-benefit analysis, sustainability, and international aspects of resource and environmental economics.

**Objective**
Understanding of the basic issues and methods in resource and environmental economics; ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

Topics are:
- Introduction to resource and environmental economics
- Importance of resource and environmental economics
- Main issues of resource and environmental economics
- Normative basis
- Utilitarianism
- Fairness according to Rawls
- Economic growth and environment
- Externalities in the environmental sphere
- Governmental internalisation of externalities
- Private internalisation of externalities: the Coase theorem
- Free rider problem and public goods
- Types of public policy
- Efficient level of pollution
- Tax vs. permits
- Command and Control Instruments
- Empirical data on non-renewable natural resources
- Optimal price development: the Hotelling-rule
- Effects of exploration and Backstop-technology
- Effects of different types of markets.
- Biological growth function
- Optimal depletion of renewable resources
- Social inefficiency as result of over-use of open-access resources
- Cost-benefit analysis and the environment
- Measuring environmental benefit
- Measuring costs
- Concept of sustainability
- Technological feasibility
- Conflicts sustainability / optimality
- Indicators of sustainability
- Problem of climate change
- Cost and benefit of climate change
- Climate change as international ecological externality
- International climate policy: Kyoto protocol
- Implementation of the Kyoto protocol in Switzerland

**Content**
Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

**Abstract**
The course introduces basic principles, problems and approaches of microeconomics.

**Objective**
The course includes the following main topics:

- Basic principles of demand and supply, market and state in a modern economy, externalities, cost analysis, consumer behaviour, economies of scale and economies of scope, perfect competition, monopoly, oligopoly, monopolistic competition, mathematical treatment of some basic concepts.

**Lecture notes**
Lecture notes, exercises and reference material can be downloaded from Moodle.

**Literature**

The book can also be used for the course 'Principles of Macroeconomics' (Sturm)

For students taking only the course 'Principles of Microeconomics' there is a shorter version of the same book:

**Complementary:**

<table>

</tr>
</tbody>
</table>

**Abstract**
This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation. What significance do international economic relations have for Switzerland?

**Objective**
This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to every-day economic problems.
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? What is the best way to protect the environment? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

We advise you to also buy access to Aplia. This internet platform will support you in learning for this course. To save money, you should buy the book together with Aplia. This is sold as a bundle (ISBN: 9781473715998).

Besides this textbook, the slides and lecture notes will cover the content of the lecture and the exam questions.

Abstract
The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

Objective
Students are able to:
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media.
- quantify driving forces and resulting fluxes of water, solute, and heat in soils.
- apply modern measurement methods and analytical tools for hydrological data collection
- conduct and interpret a limited number of experimental studies
- explain links between physical processes in the vadose-zone and major societal and environmental challenges

Content
Weeks 1 to 3: Physical Properties of Soils and Other Porous Media
- Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior
- Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics)
- The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity
- Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:
Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law; conditions and states of flow; saturated flow; hydraulic conductivity and its measurement
- Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.

Part 2 - Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties
- Midterm exam

Part 3 - Use of Hydrus model for simulation of unsaturated flow
- Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.

Week 10 to 11: Energy Balance and Land Atmosphere Interactions
- Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients; small and large scale influences on hydrological cycle; surface evaporation

Week 12 to 13: Solute Transport in Soils
- Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance
- Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation

Additional topics:
- Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

Biological Processes in the Vadose Zone
- An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.
- Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller (available at the beginning of the semester)
- http://www.step.ethz.ch/education/active-courses/vadose-zone-hydrology

Supplemental textbook (not mandatory) - Environmental Soil Physics, by: D. Hillel
The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
This lecture is intended for students who would like to learn more on equity derivatives modelling and pricing. Examples are valuation, takeovers, the measurement of value created, mergers, capital structure, project finance, and foreign direct investment. These are studied in the context of real cases.

Abstract

Objective

Lecture notes
Lecture notes.

Prerequisites / notice
- local bachelors: course "Discrete-Time and Statistical Signal Processing" (5. Sem.)
- others: solid basics in linear algebra and probability theory
The course introduces some fundamental topics of digital signal processing with a bias towards applications in communications: discrete-time linear filters, equalization, DFT, discrete-time stochastic processes, elements of detection theory and estimation theory, LMMSE estimation and LMMSE filtering, LMS algorithm, Viterbi algorithm.

Objective

The course introduces some fundamental topics of digital signal processing with a bias towards applications in communications. The two main themes are "linearity" and "probability". In the first part of the course, we deepen our understanding of discrete-time linear filters. In the second part of the course, we review the basics of probability theory and discrete-time stochastic processes. We then discuss some basic concepts of detection theory and estimation theory, as well as some practical methods including LMMSE estimation and LMMSE filtering, the LMS algorithm, and the Viterbi algorithm.

Information Theory I

Abstract

This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

Objective

The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

Content

The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity

Abstract

Phenomenological approach to "Transport Phenomena" based on balance equations supplemented by thermodynamic considerations to formulate the undetermined fluxes in the local species mass, momentum, and energy balance equations; fundamentals, applications, and simulations

Objective

The teaching goals of this course are on five different levels:

1. Deep understanding of fundamentals: local balance equations, constitutive equations for fluxes, entropy balance, interfaces, idea of dimensionless numbers, ...
2. Ability to use the fundamental concepts in applications
3. Insight into the role of boundary conditions
4. Knowledge of a number of applications
5. Flavor of numerical techniques: finite elements, finite differences, lattice Boltzmann, Brownian dynamics, ...

Content

Approach to Transport Phenomena

Diffusion Equation

Brownian Dynamics

Refreshing Topics in Equilibrium Thermodynamics

Balance Equations

Forces and Fluxes

Measuring Transport Coefficients

Pressure-Driven Flows

Heat Exchangers

Complex Fluids

Lecture notes

A detailed manuscript is provided; this manuscript will be developed into a book entitled "A Modern Course in Transport Phenomena" by David C. Venerus and Hans Christian Ottinger

Abstract

Advanced, but fundamental topics central to the understanding of theory in chemistry and for solving actual chemical problems with a computer. Examples are:

- Operators derived from principles of relativistic quantum mechanics
- Relativistic effects + methods of relativistic quantum chemistry
- Open-shell molecules + spin-density functional theory
- New electron-correlation theories

Data: 06.12.2017 12:57  Autumn Semester 2015  Page 1061 of 1432
The aim of the course is to provide an in-depth knowledge of theory and method development in theoretical chemistry. It will be shown that this is necessary in order to be able to solve actual chemical problems on a computer with quantum chemical methods.

The relativistic re-derivation of all concepts known from (nonrelativistic) quantum mechanics and quantum-chemistry lectures will finally explain the form of all operators in the molecular Hamiltonian - usually postulated rather than deduced. From this, we derive operators needed for molecular spectroscopy (like those required by magnetic resonance spectroscopy). Implications of other assumptions in standard non-relativistic quantum chemistry shall be analyzed and understood, too. Examples are the Born-Oppenheimer approximation and the expansion of the electronic wave function in a set of pre-defined many-electron basis functions (Slater determinants). Overcoming these concepts, which are so natural to the theory of chemistry, will provide deeper insights into many-particle quantum mechanics. Also revisiting the workhorse of quantum chemistry, namely density functional theory, with an emphasis on open-shell electronic structures (radicals, transition-metal complexes) will contribute to this endeavor. It will be shown how these insights allow us to make more accurate predictions in chemistry in practice - at the frontier of research in theoretical chemistry.

### Content

1. Introductory lecture: basics of quantum mechanics and quantum chemistry
2. Einstein's special theory of relativity and the (classical) electromagnetic interaction of two charged particles
3. Klein-Gordon and Dirac equation; the Dirac hydrogen atom
4. Numerical methods based on the Dirac-Fock-Coulomb Hamiltonian, two-component and scalar relativistic Hamiltonians
5. Response theory and molecular properties, derivation of property operators, Breit-Pauli-Hamiltonian
6. Relativistic effects in chemistry and the emergence of spin
7. Spin in density functional theory
8. New electron-correlation theories: Tensor network and matrix product states, the density matrix renormalization group
9. Quantum chemistry without the Born-Oppenheimer approximation.

**Abstract**
The course addresses the physical principles of modern semiconductor devices and the foundations of their modeling and numerical simulation. Necessary basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided. Computer simulations of the most important devices and of interesting physical effects supplement the lectures.

**Objective**
The course aims at the understanding of the principle physics of modern semiconductor devices, of the foundations in the physical modeling of transport and its numerical simulation. During the course also basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided.

**Content**
The main topics are: transport models for semiconductor devices (quantum transport, Boltzmann equation, drift-diffusion model, hydrodynamic model), physical characterization of silicon (intrinsic properties, scattering processes), mobility of cold and hot carriers, recombination (Shockley-Read-Hall statistics, Auger recombination), impact ionization, metal-semiconductor contact, metal-insulator-semiconductor structure, and heterojunctions.

The exercises are focussed on the theory and the basic understanding of the operation of special devices, as single-electron transistor, resonant tunneling diode, pn-diode, bipolar transistor, MOSFET, and laser. Numerical simulations of such devices are performed with an advanced simulation package (Sentaurus-Synopsys). This enables to understand the physical effects by means of computer experiments.

**Abstract**
Implementing solutions: project management, critical path method, quality control feedback loop.

**Objective**
A successful participant of the course is able to:
- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyze the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics

Data: 06.12.2017 12:57 Autumn Semester 2015 Page 1062 of 1432
Content
Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical systems dynamics, nonlinear dynamics and macroeconomic modeling.
The course is structured along three main tasks:
1. Finding solutions
2. Implementing solutions
3. Controlling solutions

PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Lecture notes
Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM.
The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

Prerequisites / notice
Self-study tasks (discussion exercises, Vensim exercises), are provided as home work. Weekly exercise sessions (45 min) are used to discuss selected solutions. Regular participation in the exercises is an efficient way to understand the concepts relevant for the final exam.

Theoretical Physics
In the Master's programme in Applied Mathematics 402-0205-00L Quantum Mechanics I is eligible as a course unit in the application area Theoretical Physics. But only if 402-0294-00L Theoretical Physics wasn't or isn't recognised for credits (neither in the Bachelor's nor in the Master's programme).
For the category assignment take contact with the Study Administration Office (www.math.ethz.ch/studienkontor) after having received the credits.

Number Title Type ECTS Hours Lecturers

402-0809-00L Introduction to Computational Physics W 8 credits 2V+2U H. Herrmann
This course offers an introduction to computer simulation methods for physics problems and their implementation on PCs and super computers: classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell's equation), Monte Carlo simulations, percolation, phase transitions

402-2203-01L Classical Mechanics W 7 credits 4V+2U C. Anastasiou
A conceptual introduction to theoretical physics: Newtonian mechanics, central force problem, oscillations. Lagrangian mechanics, symmetries and conservation laws, spinning top, relativistic space-time structure, particles in an electromagnetic field, Hamiltonian mechanics, canonical transformations, integrable systems, Hamilton-Jacobi equation.

402-0861-00L Statistical Physics W 10 credits 4V+2U M. Sigrist
This lecture covers the concepts of classical and quantum statistical physics, and some aspects of kinetic gas theory. In a more advanced part Bose-Einstein condensation, general mean field theory and critical phenomena will be addressed. Finally also various aspects of linear response theory will be discussed.

402-0843-00L Quantum Field Theory I W 10 credits 4V+2U G. Isidori
This course discusses the quantisation of fields in order to introduce a coherent formalism for the combination of quantum mechanics and special relativity.

402-0830-00L General Relativity W 10 credits 4V+2U M. Gaberdiel
Manifold, Riemannian metric, connection, curvature; Special Relativity; Lorentzian metric; Equivalence principle; Tidal force and spacetime curvature; Energy-momentum tensor, field equations, Newtonian limit; Post-Newtonian approximation; Schwarzschild solution; Mercury's perihelion precession, light deflection.

Data: 06.12.2017 12:57 Autumn Semester 2015 Page 1063 of 1432
Objective

Basic understanding of general relativity, its mathematical foundations, and some of the interesting phenomena it predicts.

Abstract

The course provides the necessary knowledge to develop models supporting the solution of given planning problems. This is done by dividing the forecasting problem into sub-problems.

The course is composed of a lecture part, providing the theoretical knowledge, and a applied part, in which students develop their own models.

Objective

- Knowledge of methods and algorithms commonly used in transport planning
- Ability to independently develop a transport model able to solve / answer the given problem / questions
- Understanding of algorithms and their implementations commonly used in transport planning

Content

The course provides the necessary knowledge to develop models supporting the solution of given planning problems. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with the forecasting problem it is first divided into sub-problems. Then, these are solved using various algorithms like iterative proportional fitting, shortest path algorithms and the method of successive averages.

The course is composed of a lecture part, providing the theoretical knowledge, and a applied part, in which students create their own models. This part takes place in form of a tutorial and consists in the development of a computer program. The programming part is closely guided and particularly suitable for students with little programming experience.

Lecture notes

The slides of the lecture are provided electronically.

</tr>
</tbody>
</table>

Abstract

We study the combinatorics and the complexity of various subclasses of the linear complementarity problem.

Objective

To understand the importance of linear complementarity as a common generalization of linear programming, bimatrix games and convex quadratic programming.

Content

The Linear Complementarity Problem (LCP) was introduced in mid 1960's (1965-67) by Lemke and Cottle-Dantzig as a common generalization of linear programming, bimatrix game and convex quadratic programming.

The problem is NP-hard in general, but there are many subclasses of LCP that are in P (polynomially solvable) or suspected to be in P. The reason for the possible polynomial solvability is that these studied subclasses (e.g. P-matrix LCPs and positive-definite LCPs) can be formulated as a problem which admits a solution that has a succinct certificate for its correctness. Moreover, there are elegant combinatorial abstractions of these subclasses.

In this seminar, we study the most important papers/books, both old and new, in the theory of LCP, and aim at understanding what is crucial lack of knowledge in proving or disproving existing conjectures.

Literature

To be posted here before the first class on September 15.

The seminar schedule and a list of articles:

Accepted Reports:

http://www.inf.ethz.ch/personal/fukudak/lect/lcsemi/reports

The slides of the overview (Revised on September 22, 2015):

Each student is expected to read, understand, and elaborate on a selected research paper. To this end, (s)he should give a 45-min. presentation about the paper. The process includes:

* getting an overview of the related literature;
* understanding and working out the background/motivation: why and where are the questions addressed relevant?
* understanding the contents of the paper in all details;
* selecting parts suitable for the presentation;
* presenting the selected parts in such a way that an audience with some basic background in geometry and graph theory can easily understand and appreciate it.

**Prerequisites / notice**

To attend the seminar, some basic knowledge in (discrete and computational) geometry and graphs and algorithms is required. Thus, previous participation in some of the courses “Graphs and Algorithms”, “Computational Geometry”, “Geometric Graphs: Combinatorics & Algorithms”, or similar courses is strongly encouraged. It is also possible to take this seminar in parallel to the lecture “Computational Geometry”.

#### Semester Papers

There are several course units “Semester Paper” that are all equivalent. If, during your studies, you write several semester papers, choose among the different numbers in order to be able to obtain credits again.

Target audience:
Third year Bachelor students;
Master students who cannot document to have received an adequate training in working scientifically.

Mandatory for all Bachelor and Master students with matriculation in the autumn semester 2014 or later.
Optional for Bachelor and Master students with matriculation until or before the spring semester 2014.
Example: You matriculated in the autumn semester 2013 into the first semester of the Bachelor programme, are now in the third year and plan to matriculate in the autumn semester 2016 into the first semester of the Master programme. In this case, you don't need "Scientific Works in Mathematics" in order to complete the Bachelor degree, but for the Master degree you will need it. In this case, we recommend that you register for "Scientific Works in Mathematics" in the autumn semester 2015 or spring semester 2016.

Directive

Abstract
Introduction to scientific writing for students with focus on publication standards and ethical issues, especially in the case of citations (references to works of others.)

Objective
Learn the basic standards of scientific works in mathematics.

Content
- Types of mathematical works
- Publication standards in pure and applied mathematics
- Data handling
- Ethical issues
- Citation guidelines

Lecture notes
Moodle of the Mathematics Library: https://moodle-app2.let.ethz.ch/course/view.php?id=519

Prerequisites / notice
This course is completed by the optional course "Recherchieren in der Mathematik" (held in German) by the Mathematics Library. For more details see: http://www.math.ethz.ch/library/services/schulungen

401-4990-00L Master's Thesis
Only students who fulfil the following criteria are allowed to begin with their master's thesis:
- successful completion of the bachelor programme;
- fulfilling of any additional requirements necessary to
gain admission to the master programme.

No direct enrolment to this course unit in myStudies. Please fill in the online application form. Requirements and application form under www.math.ethz.ch/intranet/students/study-administration/theses.html

( Afterwards the enrolment will be done by the Study Administration.)

Abstract

The master's thesis concludes the study programme. Writing up the master's thesis allows students to independently produce a major piece of work on a mathematical topic. It generally involves consulting the literature, solving any ensuing problems, and putting together the results in writing.

Content

Prerequisites / notice

This is no lecture. There is no exam and no credit points will be awarded. The current program can be found on the web: http://stat.ethz.ch/events/zukost

Course language is English or German and may depend on the speaker.

Autumn Semester 2015
401-5960-00L  Colloquium on Mathematics, Computer Science, and Education  E-  0 credits  N. Hungerbühler, M. Akveld, J. Hromkovic, H. Klemenz  
Abstract  Didactics colloquium  

Abstract  Research colloquium  
Prerequisites / notice  Occasionally, talks may be delivered in German.  

Abstract  Research colloquium  
Objective  The Zurich Theoretical Physics Colloquium is jointly organized by the University of Zurich and ETH Zurich. Its mission is to bring both students and faculty with diverse interests in theoretical physics together. Leading experts explain the basic questions in their field of research and communicate the fascination for their work. 

251-0100-00L  Computer Science Colloquium  E-  0 credits  2K  Lecturers  
Abstract  Invited talks, covering the entire scope of computer science. External Listeners are welcome at no charge. A detailed schedule is published at the beginning of each semester.  
Objective  Top international computer scientists take the floor at the distinguished computer science colloquium. Our guest speakers present impacting topics across various areas of the discipline. The colloquium series is held every semester and also includes inaugural and farewell lectures of the department's professors. The colloquium is a noteworthy event for all graduate students. Outside attendance is equally welcome.  
Content  Eingeladene Vorträge aus dem gesamten Bereich der Informatik, zu denen auch Auswärtige kostenlos eingeladen sind. Zu Semesterbeginn erscheint jeweils ein ausführliches Programm.

406-2284-AAL  Measure and Integration
Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
Introduction to the abstract measure theory and integration, including the following topics: Lebesgue measure and Lebesgue integral, Lp-spaces, convergence theorems, differentiation of measures, product measures (Fubini's theorem), abstract measures, Radon-Nikodym theorem, probabilistic language.

Literature
1. Lecture notes by Professor Michael Struwe (http://www.math.ethz.ch/~struwe/Skripten/AnalysisIII-SS2007-18-4-08.pdf)
2. L. Evans and R.F. Gariepy "Measure theory and fine properties of functions"
3. Walter Rudin "Real and complex analysis"
4. R. Bartle The elements of Integration and Lebesgue Measure

http://www.mat.unimaq2.it/~cannarsa/cam_0607.pdf

406-2554-AAL  Topology
Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
Topological spaces, continuous maps, connectedness, compactness, separation axioms, metric spaces, quotient spaces, homotopy, fundamental group and covering spaces, van Kampen Theorem, surfaces and manifolds.

Literature
Klaus Jänich: Topologie (Springer-Verlag)

Prerequisites / notice
The precise content changes with the examiner. Candidates must therefore contact the examiner in person before studying the material.

406-2604-AAL  Probability and Statistics
Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
Introduction to probability and statistics with many examples, based on chapters from the books "Probability and Random Processes" by G. Grimmett and D. Stirzaker and "Mathematical Statistics and Data Analysis" by J. Rice.

Objective
The goal of this course is to provide an introduction to the basic ideas and concepts from probability theory and mathematical statistics. In addition to a mathematically rigorous treatment, also an intuitive understanding and familiarity with the ideas behind the definitions are emphasized. Measure theory is not used systematically, but it should become clear why and where measure theory is needed.

Content
Probability:
Chapters 1-5 (Probabilities and events, Discrete and continuous random variables, Generating functions) and Sections 7.1-7.5 (Convergence of random variables) from the book "Probability and Random Processes". Most of this material is also covered in Chap. 1-5 of "Mathematical Statistics and Data Analysis", on a slightly easier level.

Statistics:
Sections 8.1 - 8.5 (Estimation of parameters), 9.1 - 9.4 (Testing Hypotheses), 11.1 - 11.3 (Comparing two samples) from "Mathematical Statistics and Data Analysis".

</tr>
</tbody>
</table>

**Abstract**
In this course, various topics related to the development, GMP production and application of therapeutic proteins will be discussed. Furthermore, students will expand their training in pharmaceutical immunology and will be introduced to the basic concepts of pharmaceutical product quality management.

**Objective**
- Students know and understand:
  - basic mechanisms and regulation of the immune response
  - the pathogenic mechanisms of the most important immune-mediated disorders
  - the most frequently used expression systems for the production of therapeutic proteins
  - the use of protein engineering tools for modifying different features of therapeutic proteins
  - the mechanism of action of selected therapeutic proteins and their application
  - basic concepts in the GMP production of therapeutic proteins

**Content**
The course consists of two parts:
- In a first part, students will complete their training of pharmaceutical immunology (Chapter 13 - 16 Immunobiology VIII textbook). This part particularly focuses on the pathogenic mechanisms of immune-mediated diseases. Deepened knowledge of immunology will be relevant for understanding the mechanism of action of many therapeutic proteins, as well as for understanding one major concern related to the use of protein-based drugs, namely, immunogenicity.
- The second part focuses on topics related to the development and application of therapeutic proteins, such as protein expression, protein engineering, reducing immunogenicity, and GMP production of therapeutic proteins. Furthermore, selected examples of approved therapeutic proteins will be discussed.

**Lecture notes**
Handouts to the lectures will be available for downloading under [http://www.pharma.ethz.ch/scripts/index](http://www.pharma.ethz.ch/scripts/index)

**Literature**
- Chapters 13-16 of the Immunobiology VIII book (Janeway et al.)
- Lecture Handouts
- Paper References provided in the Scripts
- EMEA Dossier for Humira

**Abstract**
The course advances basic knowledge in pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects of drug therapy in the fields of infectious diseases and cancer. The course also provides an overview of the field of pharmacogenomics, with a special focus on the role of genetic polymorphisms in disease susceptibility, drug response and adverse effects.

**Objective**
The course advances basic knowledge in pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects of drug therapy in the fields of infectious diseases and cancer. The course also provides an overview of the field of pharmacogenomics, with a special focus on the role of genetic polymorphisms in disease susceptibility, drug response and adverse effects.

**Content**
Topics include the pharmacology and pharmacotherapy of infectious diseases and cancer. In the field of pharmacogenomics, the course is focused on genetics, genome-wide association studies, genetic disease predisposition, examples of genetic variability of drug metabolism and drug responses, identification of new drug targets, relevance of pharmacogenomics for clinical drug development, and toxicogenomics.

**Lecture notes**
A script is provided for each lecture course. The script defines important and exam-relevant contents of lectures. Scripts do not replace the lecture.

**Literature**

**Abstract**
Introduction of principles of pharmacoepidemiology and epidemiology in addressing drug related questions in the population and of epidemiologic perspectives for health care management.
In parallel appropriate tools to critique pharmacoepidemiologic studies in medical literature will be given and applied.

**Objective**
Objectives:
- To familiarize participants with the principles of pharmacoepidemiology and epidemiology in addressing drug related questions with concern to the use, effects and risks of medicinal products in a large population.
- To introduce participants to fundamental statistical, economic and epidemiological concepts and methods.
- To provide the appropriate tools to critique pharmacoepidemiologic studies in the literature and to critically read and understand papers in the medical literature which relate to drug benefits, risks, and costs.
- To address controversial topics in drug use and benefit-risk assessment, and to critically appraise the outcome of drug therapy.
- To equip participants with skills to facilitate further studies in these areas.

**Content**
The contribution of epidemiology to the study of drug uses, effects and risks:
- Pharmacoepidemiology study methodologies, concepts and strategies,
- Detection and identification of unintended drug effects (pharmacovigilance),
- Quantifying unintended effects and drug interactions,
- Bias and confounding by indication,
- Drug utilization

Pharmacoepidemiology and outcome assessment of drug therapy.

Meta-analysis in pharmacoepidemiology.

Pharmacoepidemiology and regulatory decision making in drug safety

**Lecture notes**
This course will be a combination of formal lectures, group discussions and self-directed project work. Course material will be taught through seminars, case studies and group projects. Reading material and scripts will be given for each week.
Clinical Chemistry II

Abstract
Detailed knowledge on particular aspects of clinical chemistry and medical laboratory diagnostics concerning quality control, point-of-care analytics, analytics of kidney stones, tumor markers, diagnosis of HIV and hepatitis, pharmacogenetics, thyroid function, bone metabolism and laboratory diagnosis of hypertension.

Objective
Detailed knowledge on the implementation and interpretation of clinical laboratory diagnostic tests. Competence to interpret selected tests.

Content
Internal and external quality control, point-of-care analytics, analytics of kidney stones, use of tumor marker determinations, diagnosis of HIV and hepatitis, pharmacogenetics, thyroid function, bone metabolism and laboratory diagnosis of hypertension.

Literature
- Jürgen Hallbach, Klinische Chemie und Hämatologie für den Einstieg, Thieme Verlag
- Alan H.B. Wu, Tietz, Clinical Guide to Laboratory Tests, Saunders
- William Marshall, Clinical Chemistry, Mosby Ltd.
- Lothar Thomas, Labor und Diagnose, TH Books

Further references will be provided in the course.

Prerequisites / notice
Requirement: basic knowledge in clinical chemistry and laboratory diagnostics

Biotransformation of Drugs and Xenobiotics

Abstract
Knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.

Objective
Goals: knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.

Content
Major reactions of biotransformation. Major enzymes and reaction partners involved in the biotransformation of drugs and xenobiotics. Toxic reactions of metabolites. Factors which affect the biotransformation.

Literature

Patents
Knowledge in the field of intellectual property, especially of patents and trademarks, with particular emphasis on pharmacetics. Introduction into intellectual property; protection of patent applications; patent information; exploitation and enforcement of patents; peculiarities in pharmaceuticals and medicine; social, political and ethical aspects; Trademarks.

Objective
Basic knowledge in the field of industrial property, especially of patents and trademarks, with particular emphasis on the chemical, pharmaceutical and biotech field.
Content
1. Introduction into industrial property (patents, trademarks, industrial designs);
2. Prosecution of patent applications (patentability);
3. Patent information (patent publications, databases, searches);
4. Exploitation and enforcement of patents (possibilities of exploitation, licenses, parallel imports, scope of protection, patent infringement);
5. Peculiarities in pharmacetics and medicine (supplementary protection certificates, experimental use exemption, therapy and diagnosis, medical indication);
6. Social, political and ethical aspects (patents and prices for medicinal products, traditional knowledge and ethnomedicine, bioprospecting and biopiracy, human DNA inventions);
7. Trademarks, types of trademarks, grounds for refusal, peculiarities of pharma- trademarks.

Lecture notes
A script is available in electronic form during the lecture.

</table>

Abstract
Protein-based drugs constitute around 25% of new approvals and most of them are glycoproteins. Using selected examples the course aims at providing insight into our present knowledge on glycosylation-activity relationships and the production and analysis of glycoprotein-based drugs.

Objective
Gaining insight into the glycobiology of therapeutically used glycoproteins. This implies knowing and understanding.
- the major types of protein-linked glycans and their biosynthesis
- the most important expression systems for production of recombinant glycoproteins
- methods used to alter or manipulate glycosylation
- the most prominent clinically used glycoproteins and how glycosylation influences their therapeutic profile.
- Current methods for the qualitative and quantitative characterization of glycoproteins and being able to apply this knowledge in other contexts.

Content
lecture plan:
1. Proteins wearing a "sugar dress"
Glycans in cell-cell communication and molecular recognition in multicellular organisms
2. Tissue plasminogen activator (t-PA), glucocerebrosidase and the biosynthesis of N-glycans
3. PSGL-1 and the biosynthesis of O-glycans;
P-selectin and other lectins
4. The glycoprotein hormones and the production and analysis of therapeutic glycoproteins
5. Monoclonal antibodies and the modification of their therapeutic profile through glycoengineering
6. EPO "the same but different"
7. Current topics: Biosimilars and the currently marketed 'Biopharmaceuticals'

Lecture notes
The slides used for the lectures will be provided online

Literature

Prerequisites / notice
Requirements: Basic knowledge in molecular biology, protein chemistry and analytics. Basic knowledge in pharmacology.

535-0300-00L Molecular Mechanisms of Drug Actions and Targets

Abstract
In the last 10 years, an average of one drug per year was withdrawn from the market. Using selected examples of such drug failures, the course aims at analyzing the present explanations of drug actions as well as the design and predictive power of animal models and clinical trials. In addition, the ethical, societal, and economical expectations in new drugs shall be reflected.

Objective
To develop a critical understanding of the relevance and limitations of the current approaches to explaining and anticipating drug effects.
To critically appraise the ethical, societal, economical and political expectations in the development of new drugs.

Content
In December 2006, Pfizer stopped a large phase III study on the use of Torcetrapib for the prevention of atherosclerosis and cardiovascular disease. 800 million $ in development costs and 21 billion $ in stocks were annihilated overnight. The failure of Torcetrapib has pinpointed the limitations of an extremely reductionist view of atherosclerosis and it's prevention by drug therapy. It has also highlighted what high expectations we have in a safe and wide applicability of drugs and of their economical success.

Lecture notes
Printouts of the slides used for the lectures and literature for reading and discussions will be available online.

Literature

Prerequisites / notice
Requirements: Basic knowledge in Medicinal Chemistry and Pharmacology. Ability to read and understand scientific publications in English.

535-0022-00L Computer-Assisted Drug Design

Abstract
The lecture series provides an introduction to computer applications in medicinal chemistry. A focus is on molecular representations, property predictions, molecular similarity concepts, virtual screening techniques, and de novo drug design. All theoretical concepts and algorithms presented are illustrated by practical applications and case studies.

Objective
The students will learn how computer simulation operates for drug design and development, understand the theoretical principles of property prediction and computer-generated compound generation, and understand possibilities and limitations of computer-assisted drug design in pharmaceutical chemistry. As a result, they are prepared for professional assessment of computer-assisted drug design studies in medicinal chemistry projects.

Literature
Recommended textbooks:
Successful participation in this course is required for a research project ("Forschungspraktikum") in the CADD group.

**Prerequisites / notice**

This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

**Abstract**

The main goal of this course is to enhance the student's ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.

**Objective**

The main goal of this course is to enhance the student's ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.

**Content**

**I. Ethics & the Process of Ethical Inquiry**

- Introduction in Ethics and Research Ethics
  - What is ethics? What ethics is not...;
  - Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
  - The ethics movement in the biological and health sciences;
  - What is research ethics and why is it important?
  - Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
  - Professional codes of conduct: functions and limitations

- Ethical approaches in the conduct of research (Normative Ethics)
  - Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
  - The plurality of ethical theories and its consequences;
  - The concept of dignity

- Moral reasoning I: Arguments
  - Why arguments? What is a good argument? The structure of (moral) arguments;
  - Deductive and inductive arguments; Validity and soundness;
  - Assessing moral arguments

- Moral reasoning II: Decision-making
  - How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
  - Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
  - Is there a right answer?

**II. Research Ethics / Responsible Conduct of Research (RCR)**

- Integrity in Research & Research Misconduct
  - What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
  - Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
  - The confidant of ETH Zurich

- Data Management
  - Data collection and recordkeeping; Analysis and selection of data;
  - Ownership of data; retention and sharing of data;
  - Falsification and fabrication of data

- Research involving animals
  - The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
  - The 3 Rs (replacement, reduction, refinement);
  - Ethical assessment of conflicting issues in animal experimentation;
  - The dignity of animals in the Swiss constitution;

- Research involving human subjects
  - History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
  - Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
  - Clinical trials;
  - Biobanks
  - Ethics Committees / Institutional Review Boards (IRB)

- Authorship & Peer review
  - Criteria for authorship;
  - Plagiarism;
  - Challenges to openness and freedom in scientific publication;
  - Open access
  - Peer review

- Social responsibility
  - What is social responsibility? Social responsibility: whose obligation?
  - Public advocacy by researchers

**Lecture notes**

Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.
Discovering Management offers an integrated learning system, which combines in an innovative format a set of lectures, an advanced business game simulation and a set of group exercises involving industry speakers (ranging from leading venture capitalists to executives at established corporations). Unlike more traditional courses, the learning model for Discovering Management involves 'learning by doing'. While the 13 different lectures, in-class discussions and assigned readings provide the theoretical and conceptual foundations, the experiential learning outcomes result from the interrelated group activities: 1) the interactive case studies and exercises, 2) the business game simulation.

By discovering the key aspects of entrepreneurial management, the purpose of the course is to advance students' understanding of factors driving company success, where success is understood as a broad construct including financial return, employee, customer and supplier satisfaction as well as social and ecological responsibility.

Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Entrepreneurial Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich. No prior knowledge of business or economics is required to successfully complete this course.

The lectures for Discovering Management are designed to broaden the participant's understanding of the principles of entrepreneurial management, emphasizing the interdependence of various specialties in the development and management of a firm. For this reason, the lectures are structured on the basis of a coherent business model and will be presented by the respective area specialists at D-MTEC.

The lectures broaden the view and the understanding of technology by interlinking it with society. Corporate sustainability, for example, introduces economic, ecological and social issues that are relevant to all engineering disciplines. Practical examples stimulate the students to assess these issues and be aware of their responsibilities as engineers. Technology and innovation management, to mention a second example, focuses on the interplay of technical and organizational change, and how these often neglected interactions explain why many new technologies are never used. It fosters the students' ability to see the business and social consequences of their 'technical' decisions. Critical skills will be trained by the case study exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of the decision maker, as they learn more about the specific case and identify the challenge they are faced with. Students will be presented real case scenarios by industry guests from established corporations and will have to critically analyze specific issues. The case study exercise will provide an insight into the context of a managerial problem-solving and enhance the participant's appreciation for the complex tasks companies deal with.

Discovering Management attempts to overcome the limitations of traditional teaching curricula of management in technical universities, which often merely focus on transferring specific skills to students, e.g. planning or forecasting. In response to the new challenges for entrepreneurial decision-making, students will be offered the opportunity to actively engage in an advanced business game simulation; a business game that establishes a link between business management theory and business management in practice. The simulation presents a realistic model of a company and provides participants with the opportunity to quickly gain the lasting effects of practical experience in a risk-free environment. All this provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyze the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities.

Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Business Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich. No prior knowledge of business or economics is required to successfully complete this course.

**Research Project**

Only students who fulfill the following criteria are allowed to begin with their master thesis: a. successful completion of the bachelor programme; b. fulfilling of any additional requirements necessary to gain admission to the master programme.

In the Master thesis students prove their ability to independent, structured and scientific working. The Master thesis is usually carried out in a subject area of Pharmaceutical Sciences as chosen by the student.

**Compulsory Electives in Humanities, Social and Political Sciences**

Recommended GESS compulsory elective courses (Type B) for D-CHAB.

### 535-0222-AAL  Pharmaceutical Analytics  
**Enrolment only for MSc students who need this course as additional admission requirement.**

**Abstract**
Theoretical and practical comprehension of analytical chemistry in order to solve pharmaceutical problems.

**Objective**
- Knowledge in Pharmaceutical Analytics in order to solve fundamental analytical problems.
- Handling of the most important pharmacopeial texts and monographs.

**Content**
Introduction in Pharmaceutical Analytics. Theoretical and practical considerations concerning a lot of methods in different Pharmacopeias.
- Identification, purity testing, stability testing.
- Assays of drugs and drug formulations.

**Lecture notes**
A script can be purchased at the HCI-Shop, HCI-Building, D floor.

**Literature**
- David G. Watson, Pharmaceutical Analysis, Elsevier.

### 535-0241-AAL  Biopharmacy  
**Enrolment only for MSc students who need this course as additional admission requirement.**

**Abstract**
- Introduction to the Basics in Biopharmacy.
- Pharmacokinetic processes (absorption, distribution, metabolism and excretion, ADME), which determine the fate of a drug in the body. Knowledge of the most important pharmacokinetic parameters.
- Interpretation of concentration-time-profiles of drugs. Pharmacokinetic profiling of drugs in view of therapy optimization and analysis of interaction potential.

**Objective**
- Introduction to the Basics in Biopharmacy.
- Pharmacokinetic processes (absorption, distribution, metabolism and excretion, ADME), which determine the fate of a drug in the body. Knowledge of the most important pharmacokinetic parameters.
- Interpretation of concentration-time-profiles of drugs. Pharmacokinetic profiling of drugs in view of therapy optimization and analysis of interaction potential.

**Content**
- Introduction to pharmacokinetics; definition of the most important pharmacokinetic parameters and their calculation from clinical data.
- Enrolment only for MSc students who need this course as additional admission requirement.

**Lecture notes**
- none

**Literature**

### 535-0440-AAL  Quality Management in Pharmaceutical Business  
**Enrolment only for MSc students who need this course as additional admission requirement.**

**Abstract**
The students know the relevance and the role of quality assurance measures to assure quality, efficacy and safety of drugs. The students know the most important Swiss regulations, including the associated European regulations, which are relevant from a quality assurance point of view and they are able to interpret the content of these regulations.

**Objective**
- The students know the relevance and the role of quality assurance measures to assure quality, efficacy and safety of drugs.
- The students know the most important Swiss regulations, including the associated European regulations, which are relevant from a quality assurance point of view.

**Content**
- The students know the relevance and the role of quality assurance measures to assure quality, efficacy and safety of drugs.
- The students know the most important Swiss regulations, including the associated European regulations, which are relevant from a quality assurance point of view.

### 535-0110-AAL  Fundamentals of Biology II: Microbiology  
**Enrolment only for MSc students who need this course as additional admission requirement.**

**Abstract**
- Structure, function, genetics of prokaryotic microorganisms and fungi.

**Objective**
- Basic principles of cell structure, growth physiology, energy metabolism, gene expression.

**Content**
- Basic principles of cell structure, growth physiology, energy metabolism, gene expression.

**Lecture notes**
- none

**Literature**

### 535-0108-AAL  Fundamentals of Biology II: Plant Biology  
**Enrolment only for MSc students who need this course as additional admission requirement.**

**Abstract**
Water balance, assimilation, transport in plants; developmental biology, stress physiology.

**Objective**
- Water balance, assimilation, transport in plants; developmental biology, stress physiology.

**Content**
- Water balance, assimilation, transport in plants; developmental biology, stress physiology.

**Lecture notes**
- none

**Literature**

### 535-1323-AAL  Fundamentals of Biology II: Biochemistry and Molecular Biology  
**Enrolment only for MSc students who need this course as additional admission requirement.**

**Abstract**
The course provides an introduction to Biochemistry / Molecular Biology with some emphasis on chemical and biophysical aspects.

**Objective**
- Topics include the structure-function relationship of proteins / nucleic acids, protein folding, enzymatic catalysis, cellular pathways involved in bioenergetics and the biosynthesis and breakdown of amino acids, glycans, nucleotides, fatty acids and phospholipids, and steroids. There will also be a discussion of DNA replication and repair, transcription, and translation.

**Lecture notes**
- none

227-0166-00L Analog Integrated Circuits W 6 credits 2V+2U Q. Huang

Abstract
This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies.

Objective
Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems. The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

Content
Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc; Amplifiers: differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; Stability; Comparators; Second-order effects in analog circuits such as mismatch, noise and offset; A/D and D/A converters; Introduction to switched capacitor circuits.

Lecture notes
Handouts of presented slides. No script but an accompanying textbook is recommended.

Energy Conversion and Quantum Phenomena

<td>Semiconductor Nanostructures</td>
<td>W+</td>
<td>6 credits</td>
<td>2V+1U</td>
<td>T. Ihn</td>
</tr>
<tr>
<td>Abstract</td>
<td>The course covers the foundations of semiconductor nanostructures, e.g., materials, band structures, bandgap engineering and doping, field-effect transistors. The physics of the quantum Hall effect and of common nanostructures based on two-dimensional electron gases will be discussed, i.e., quantum point contacts, Aharonov-Bohm rings and quantum dots.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>At the end of the lecture the student should understand four key phenomena of electron transport in semiconductor nanostructures: 1. The integer quantum Hall effect 2. Conductance quantization in quantum point contacts 3. the Aharonov-Bohm effect 4. Coulomb blockade in quantum dots</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
In addition to the lecture notes, the following supplementary books can be recommended:

The lecture is suitable for all physics students beyond the bachelor of science degree. Basic knowledge of solid state physics is required. Very ambitious students in the third year may be able to follow. The lecture can be chosen as part of the PhD-program. The course is taught in English.

<tr>
<td><strong>Objective</strong></td>
<td>Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability 1) to select appropriate software, 2) to apply it for solving given problems, 3) to validate the results, 4) to interactively improve the models until sufficiently accurate results are obtained.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>Since the fabrication and characterization of micro- and nanostructures is difficult, expensive, and time-consuming, numerical modelling drastically reduces the design process. Although many commercial software packages are available, it is important to know the drawbacks and difficulties of the numerical methods behind them and to be able to validate the results obtained with such packages. First, an introduction to the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics is given. This is important for understanding the problems to be analyzed and for validating results obtained from software packages. After this, the main concepts of numerical methods and of the most widely used codes for physical modelling are outlined and compared, which is essential for the adequate selection of software for solving given problems. After this, prominent commercial software packages are applied to various types of problems, ranging from electrodynamic to multiphysics. For becoming able to select appropriate software and to validate the results obtained, different commercial software packages will be used and compared during the exercises in form of small projects.</td>

**Abstract**

Practical course: Students are introduced to the process steps required for the fabrication of MEMS (Micro Electro Mechanical System) and carry out the fabrication and testing steps in the clean rooms by themselves. Additionally, they learn the requirements for working in clean rooms. Processing and characterization will be documented and analyzed in a final report. Limited access

**Objective**

Students learn the individual process steps that are required to make a MEMS (Micro Electro Mechanical System). Students carry out the process steps themselves in laboratories and clean rooms. Furthermore, participants become familiar with the special requirements (cleanliness, safety, operation of equipment and handling hazardous chemicals) of working in the clean rooms and laboratories. The entire production, processing, and characterization of the MEMS is documented and evaluated in a final report.

**Content**

With guidance from a tutor, the individual silicon microsystem process steps that are required for the fabrication of an accelerometer are carried out:
- Photolithography, dry etching, wet etching, sacrificial layer etching, critical point drying, various cleaning procedures
- Packaging and electrical connection of a MEMS device
- Testing and characterization of the MEMS device
- Written documentation and evaluation of the entire production, processing and characterization

**Lecture notes**

A document containing theory, background and practical course content is distributed at the first meeting of the course.

**Literature**

The document provides sufficient information for the participants to successfully participate in the course.

**Prerequisites / notice**

Participating students are required to attend all scheduled lectures and meetings of the course.

Participating students are required to provide proof that they have personal accident insurance prior to the start of the laboratory portion of the course.

This master's level course is limited to 15 students per semester for safety and efficiency reasons. If there are more than 15 students registered, we regret to restrict access to this course by the following rules:

**Priority 1:** master students of the master's program in "Micro and Nanosystems"

**Priority 2:** master students of the master's program in "Mechanical Engineering" with a specialization in Microsystems and Nanoscale Engineering (MAVT-tutors Profs Daraio, Dual, Hierold, Koumoutsakos, Nelson, Norris, Park, Poulikakos, Pratsinis, Stember), who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

**Priority 3:** master students, who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

**Priority 4:** all other students (PhD, bachelor, master) with a background in silicon or microsystems process technology.

If there are more students in one of these priority groups than places available, we will decide by drawing lots.

Students will be notified at the first lecture of the course (introductory lecture) as to whether they are able to participate.

The course is offered in autumn and spring semester.

<td>2V+1U</td>
<td>D. Daraio</td>
</tr>
</tbody>
</table>

**Abstract**

The course will cover the basic principles of wave propagation in periodic media. It will discuss the fundamental principles used to describe linear and nonlinear wave propagation in continuum and discrete media. Selected recent scientific advancements in the dynamics of periodic media will also be discussed.

**Objective**

Students learn the basic principles governing the propagation of waves in discrete and continuum solid media. These methods can be used to engineer materials with predefined properties and to design dynamical systems for a variety of engineering applications (e.g., vibration mitigation, impact absorption and sound insulation).

**Content**

Wave propagation in solids including applications. Phenomenology of wave propagation (plane waves, harmonic waves, dispersion, attenuation, group and phase velocity), transmission and reflection, impact problems, waves in linear elastic media, discrete media, experimental and numerical methods.

**Lecture notes**

Handouts

**Literature**

Various books will be recommended pertaining to the topics covered.

**Abstract**

Theory and application of thermodynamics and energy conversion in biological systems and biomedicine at the macro scale and the cellular level.
### Aerosols I: Physical and Chemical Principles

**Objective**
Theory and application of energy conversion at the macro scale and the cellular level. Understanding of the basic features governing fluid transport in the principal systems of the human cell. Connection of characteristics and patterns from other fields of engineering to biofluidics. Heat and mass transport processes within the human body and relation to biomedical technologies.

**Content**
Mass transfer models for the transport of chemical species in the human cell. Organization and function of the cell membrane and of the cell cytoskeleton. The role of molecular motors in cellular force generation and their function in cell migration. Description of the functionality of these systems and of analytical experimental and computational techniques for understanding of their operation. Introduction to bioengineering approaches for the treatment of common pathogenic conditions of these systems. Introduction to cell metabolism, cellular energy transport and cellular thermodynamics.

**Lecture notes and references therein.**
Script as well as additional material in the form of hand-outs will be distributed.

**Abstract**
Aerosols I deals with basic physical and chemical properties of aerosol particles. The importance of aerosols in the atmosphere and in other fields is discussed.

**Objective**
Knowledge of basic physical and chemical properties of aerosol particles and their importance in the atmosphere and in other fields is distributed during the lecture.

**Content**
Physical and chemical properties of aerosols, aerosol dynamics (diffusion, coagulation...), optical properties (light scattering, -absorption, -extinction), aerosol production, physical and chemical characterization.

Lecture notes
No script

Literature

Prerequisites / notice
Prerequisite: Thermodynamic Unit Operations

752-3103-00L Food Rheology I
W 3 credits 2V P. A. Fischer

Abstract
Rheology is the science of flow and deformation of matter such as polymers, suspensions (emulsions, foams, suspensions), and colloidal systems. The fluid dynamical basis, measuring techniques (rheometry), and the flow properties of different fluids (Newtonian, non-Newtonian, viscoelastic) are introduced and discussed.

Objective
The concept of rheological constitutive equations and the application to different material classes. The course provides an introduction on the link between flow and structural properties of flowing material. Rheometrical techniques and appropriate measuring protocols for the characterization of complex fluids will be discussed.

Content
Lectures will be given on general introduction (4h), fluid dynamics (4h), complex flow behavior (4h), influence of temperature (2h), rheometers (4h), rheological tests (6h) and structure and rheology of complex fluids (4h).

Lecture notes
Notes will be handed out during the lectures.

227-0157-00L Semiconductor Devices: Physical Bases and Simulation
W 4 credits 3G A. Schenk

Abstract
The course addresses the physical principles of modern semiconductor devices and the foundations of their modeling and numerical simulation. Necessary basic knowledge on quantum-mechanics, semiconductordynamics and device physics is provided. Computer simulations of the most important devices and of interesting physical effects supplement the lectures.

Objective
The course aims at the understanding of the principle physics of modern semiconductor devices, of the foundations in the physical modeling of transport and its numerical simulation. During the course also basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided.

Content
The main topics are: transport models for semiconductor devices (quantum transport, Boltzmann equation, drift-diffusion model, hydrodynamic model), physical characterization of silicon (intrinsic properties, scattering processes), mobility of cold and hot carriers, recombination (Shockley-Read-Hall statistics, Auger recombination), impact ionization, metal-semiconductor contact, metal-insulator-semiconductor structure, and heterojunctions. The exercises are focussed on the theory and the basic understanding of the operation of special devices, as single-electron transistor, resonant tunneling diode, pn-diode, bipolar transistor, MOSFET, and laser. Numerical simulations of such devices are performed with an advanced simulation package (Sentaurus-Synopsys). This enables to understand the physical effects by means of computer experiments.

Lecture notes

Literature
Provided in the lecture notes.

Prerequisites / notice

227-0225-00L Linear System Theory
W 6 credits 5G J. Lygeros, M. Kamgarpour

Abstract
The class is intended to provide a comprehensive overview of the theory of linear dynamical systems, their use in control, filtering, and estimation and their applications to areas ranging from avionics to systems biology.

Objective
By the end of the class students should be comfortable with the fundamental results in linear system theory and the mathematical tools used to derive them.

Content
- Rings, fields and linear spaces, normed linear spaces and inner product spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete time, time varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Controllability and observability, canonical forms, Kalman decomposition. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.
- Realization theory.

Lecture notes
The script (in book style) is sufficient. Further reading will be recommended in the lecture.

Prerequisites / notice
Prerequisites: Control systems (227-0216-00 or equivalent) and sufficient mathematical maturity.

227-0377-00L Physics of Failure and Failure Analysis of Electronic Devices and Equipment
W 3 credits 2V U. Sennhauser

Abstract
Failures have to be avoided by proper design, material selection and manufacturing. Properties, degradation mechanisms, and expected lifetime of materials are introduced and the basics of failure analysis and analysis equipment are presented. Failures will be demonstrated experimentally and the opportunity is offered to perform a failure analysis with advanced equipment in the laboratory.

Objective
Introduction to the degradation and failure mechanisms and causes of electronic components, devices and systems as well as to methods and tools of reliability testing, characterization and failure analysis.

Content
Summary of reliability and failure analysis terminology; physics of failure: materials properties, physical processes and failure mechanisms; failure analysis of ICs, PCBs, opto-electronics, discrete and other components and devices; basics and properties of materials and components; application in circuit design and reliability analysis

Lecture notes
Comprehensive copy of transparencies

151-0593-00L Embedded Control Systems
W 4 credits 6G J. S. Freudenberg, M. Schmid Daners

Abstract
This course provides a comprehensive overview of embedded control systems. The concepts introduced are implemented and verified on a microprocessor-controlled haptic device.

Objective
Familiarize students with main architectural principles and concepts of embedded control systems.
An embedded system is a microprocessor used as a component in another piece of technology, such as cell phones or automobiles. In this intensive two-week block course the students are presented the principles of embedded digital control systems using a haptic device as an example for a mechatronic system. A haptic interface allows for a human to interact with a computer through the sense of touch.

Subjects covered in lectures and practical lab exercises include:
- The application of C-programming on a microprocessor
- Digital I/O and serial communication
- Quadrature decoding for wheel position sensing
- Queued analog-to-digital conversion to interface with the analog world
- Pulse width modulation
- Timer interrupts to create sampling time intervals
- System dynamics and virtual worlds with haptic feedback
- Introduction to rapid prototyping

This course is restricted to 33 students due to limited lab infrastructure. Interested students please contact Marianne Schmid (E-Mail: schmid@idsd.mavt.ethz.ch)

After your reservation has been confirmed please register online at www.mystudies.ethz.ch.

Detailed information can be found on the course website http://www.idsc.ethz.ch/education/lectures/embedded-control-systems.html

Prerequisites / notice

The course will be given in English:

1- Weekly exercises, each includes 1 or 2 questions which should be solved and returned at the specified due dates. Exercises count as 15% of the final grade.
2- One programming mini-project which should be finished at the specified due date. It counts as 5% of the final grade.
3- Final exam: Written exam during the regular examination session. It counts as 80% of the final grade.

- Undergraduate physics, mathematics, semiconductor devices
- Recommended background:

Microsystems Technology
- Basic system methodology: System design, modeling, simulation, and analysis
- Introduction to microsystem technology (MST) and micro electro mechanical systems (MEMS)
- Basic silicon technologies: Thermal oxidation, photolithography and etching, diffusion and ion implantation, thin film deposition
- Specific microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical and thermal properties, piezoelectric and piezoresistive materials
- Selected microsystems: Mechanical sensors and actuators, microfluidic systems, thermal sensors and actuators, system integration and encapsulation

Solid State Electronics
- "Solid State Electronics" is an introductory condensed matter physics course covering crystal structure, electron models, classification of metals, semiconductors, and insulators, band structure engineering, thermal and electronic transport in solids, magnetoresistance, and optical properties of solids
- Undergraduate physics, mathematics, semiconductor devices

Thermodynamics of Novel Energy Conversion
- Introduction to thermodynamics
- Thermodynamic overview and exergy analysis
- Thermodynamics of multi-component-systems (mixtures) and phase equilibrium
- Electrochemistry
- Part 2: Novel energy conversion and storage systems
- Batteries and accumulators
- Fuel cells and micro fuel cells
- Hydrogen production and storage
- Plasmonics and photovoltaics

Programming Techniques for Scientific Simulations I
- Overview of programming techniques for scientific simulations
- Focus on advances C++ programming techniques and scientific software libraries

Introduction to Plasmonics
- Basic principles of surface plasmon polaritons
- Applications and discussion of plasmonics

Lecture notes

Lecture notes available (ca. 200 pages in English)

Prerequisite courses are Control Systems I and Informatics I

Website:

Prerequisites / notice

Course: 3 credits

Prerequisite courses are Control Systems I and Informatics I

Undergraduate physics, mathematics, semiconductor devices

Recommended background:

- Undergraduate physics, mathematics, semiconductor devices
- Basic system methodology: System design, modeling, simulation, and analysis
- Introduction to microsystem technology (MST) and micro electro mechanical systems (MEMS)
- Basic silicon technologies: Thermal oxidation, photolithography and etching, diffusion and ion implantation, thin film deposition
Objective
Electromagnetic oscillations known as surface plasmon polaritons have many unique properties that are useful across a broad set of applications in biology, chemistry, physics, and optics. The field of plasmonics has arisen to understand the behavior of surface plasmon polaritons and to develop applications in areas such as catalysis, imaging, photovoltaics, and sensing. In particular, metallic nanoparticles and patterned metallic interfaces have been developed to utilize plasmonic resonances. The aim of this course is to provide the basic knowledge to understand and apply the principles of plasmonics. The course will strive to be approachable to students from a diverse set of science and engineering backgrounds.

Content
Fundamentals of Plasmonics
- Basic electromagnetic theory
- Optical properties of metals
- Surface plasmon polaritons on surfaces
- Surface plasmon polariton propagation
- Localized surface plasmons

Applications of Plasmonics
- Waveguides
- Extraordinary optical transmission
- Enhanced spectroscopy
- Sensing
- Metamaterials

Physics I, Physics II

151-0642-00L Seminar on Micro and Nanosystems Z 0 credits 1S C. Hierold
Abstract
Scientific presentations from the field of Micro- and Nanosystems
Objective
In particular, the seminar addresses students, who are interested in scientific work in the field of Micro- and Nanosystem technologies, or who have started already with it. Respectively, current examples in the research will be discussed.
Content
Current themes in the field of Micro- and Nanosystem technologies using the examples of intern and extern research groups, as well as ongoing themes of study-, diploma- and doctoral thesis will be introduced and discussed. The scope of the seminar is broadened by occasional guest speakers.

151-0511-00L Mechanics of Nano- and Micro-Materials W 4 credits 2V+1U C. Darai
Abstract
The course provides an introduction to the mechanics of nano- and micro-materials and devices, in the quasistatic and dynamic domains. It reviews scale effects in materials and devices, and reviews available characterization techniques and describes the effects of surfaces and microscale contacts. Recent applications of nano- and micro-materials in engineering systems will be discussed.
Objective
Learn the fundamental mechanical properties of nano- and micro-system. Understand the effects of scales on the response of materials. Explore applications and devices exploiting the response of materials at small scales.
Content
follows soon

151-0104-00L Uncertainty Quantification for Engineering & Life Sciences W 4 credits 3G J. Beck, P. Koumoutsakos
Abstract
Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.
Objective
The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.
Content
Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modeling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

151-0104-00L Analog Signal Processing and Filtering W 6 credits 2V+2U H. Schmid
Abstract
Suitable for Master Students as well as Doctoral Students.
Objective

Prerequisites / notice
Fundamentals of Probability, Fundamentals of Computational Modeling

151-0104-00L Data Analysis: A Bayesian Tutorial by Devinderjt Sivia
1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes

Physics I, Physics II

Seminar on Micro and Nanosystems

Mechanics of Nano- and Micro-Materials

Nanooptics

Uncertainty Quantification for Engineering & Life Sciences

Analog Signal Processing and Filtering

Fundamentals of Probability, Fundamentals of Computational Modeling

Notice
Number of participants limited to 60.
This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers.

The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.

At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during the whole term to analyze circuits and understand how signals propagate through them. The theory and CMOS implementation of active filters is then discussed in detail using the example of Gm-C filters and active-RC filters. The ideal and nonideal behaviour of opamps, current conveyors, and inductor simulators follows. The link to the practical design of circuits and systems is done with an overview over different quality measures and figures of merit used in scientific literature and data sheets. Finally, an introduction to discrete-time and mixed-domain filters and circuits is given, including sensor read-out amplifiers, correlated double sampling, and chopping, and an introduction to sigma-delta A/D and D/A conversion on a system level.

The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

Details: https://people.ee.ethz.ch/~haschmid/aswiki/

Prerequisites: Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

Course in continuum mechanics (mandatory), finite element method (recommended) and of the main properties of linear systems is necessary.

**Multidisciplinary Courses**

The students are free to choose individually from the entire course offer of ETH Zurich, ETH Lausanne and the Universities of Zurich and St. Gallen.

---

**Compulsory Electives in Humanities, Social and Political Sciences**

Recommended GESS compulsory elective courses (Type B) for D-MAVT.

</table>

The subject of the Semester Project and the choice of the supervisor (ETH-professor) are to be approved in advance by the tutor.

Abstract

The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

Objective

The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's programme.

Abstract

The main objective of the 12-week internship is to expose master's students to the industrial work environment. During this period, students have the opportunity to be involved in on-going projects at the host institution.

Objective

The main objective of the 12-week internship is to expose master's students to the industrial work environment.
Only students who fulfill the following criteria are allowed to begin with their Master Thesis:

a. Successful completion of the Bachelor programme
b. Any additional requirements for admission to the degree programme have been fulfilled
c. Have achieved at least 32 credits in the category “Core Courses”
d. Successful completion of the Semester Project (the corresponding credits have been acquired)

The subject of the Master Thesis and the choice of the supervisor (ETH-professor) are to be approved in advance by the tutor.

To choose an adjunct professor of D-MAVT as a supervisor (http://www.mavt.ethz.ch/people/adjunct/index), please contact the Student Administration Office of D-MAVT.

Abstract
Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

Objective
The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem.

Exchange Students

Courses for Exchange Students

Prepare a study plan
In case the course catalogue of the upcoming semester is not available yet, please expect it to be like the year before.

You can study at ETH Zurich as an exchange student for 1 or 2 semesters, starting in the autumn or in the spring semester. Exchange students may choose courses from different curricula and years, provided that at least two thirds of all courses are taken in the ETH Zurich department they are registered in. Please be sure to coordinate your schedule with your home university.

Exam sessions and End-of-semester examinations
Like all ETH Zurich students, exchange students are obliged to sit their exams during the official examination periods. Students are requested to be present at ETH Zurich during these periods. You are therefore expected to plan your studies, internships, jobs, and financial means accordingly.

by individual arrangement

Admission only if A L L of the following apply:
a) bachelor program successfully completed;
b) acquired (if applicable) all credits from additional requirements for admission to master program;
c) successfully completed both semester projects.

Note: the conditions above are not applicable to incoming exchange students.

Registration in mystudies required!

Abstract
The Master Program finishes with a 6-months Master Thesis which is directed by a Professor of the Department or a Professor of another Department who is associated with the D-ITET. Students gain the ability to conduct independent scientific research on a specific research problem.

Objective
see above

D-MAVT (Exchange Students)

Nuclear Engineering MSc

Master's Thesis Nuclear Engineering
Only students who fulfill the following criteria are allowed to begin with their Master Thesis:
a. Successful completion of the Bachelor programme
b. Any additional requirements for admission to the degree programme have been fulfilled
c. Have achieved a total of at least 72 credits in the categories "Core Subjects" and "Electives"
d. Successful completion of the Semester Project (the corresponding credits have been acquired)

The supervisor of the Master Thesis and the choice of the supervisor (ETH or EPFL professor) are to be approved in advance by the tutor.

Abstract
Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

Objective
The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem.

Mechanical Engineering MSc

Master's Thesis Mechanical Engineering
Only students who fulfill the following criteria are allowed to begin with their Master's Thesis:
a. Successful completion of the Bachelor's programme
b. Any additional requirements for admission to the degree programme have been fulfilled
c. Successful completion of the Semester Project and Industrial Internship (the corresponding credits have been acquired)

The subject of the Master's Thesis and the choice of the supervisor (ETH professor/titular professor) are to be approved by the tutor.

To choose a titular professor of D-MAVT as a supervisor (https://www.mavt.ethz.ch/the-department/people/titular-professors.html), please contact...

Basics of Instrumentation, Measurement, and Analysis (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: IN502.

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract

Experimental data are always as good as the instrumentation and measurement, but never any better. This course provides the very basics of instrumentation relevant to neurophysiology and neuromorphic engineering, it consists of two parts: a common introductory part involving analog signals and their acquisition (Part I), and a more specialized second part (Part II).

Objective

The goal of Part I is to provide a general introduction to the signal acquisition process. Students are familiarized with basic lab equipment such as oscilloscopes, function generators, and data acquisition devices. Different electrical signals are generated, visualized, filtered, digitized, and analyzed using Matlab (Mathworks Inc.) or Labview (National Instruments).

Prerequisites / notice

For each part, students must hand in a written report and present a live demonstration of their measurement setup to the respective supervisor. The supervisor of Part I is the teaching assistant, and the supervisor of Part II is task specific. Admission to Part II is conditional on completion of Part I (report + live demonstration).

Reports must contain detailed descriptions of the measurement goal, the measurement procedure, and the measurement outcome. Either confidence or significance of measurements must be provided. Acquisition and analysis software must be documented.

227-1031-00L

Journal Club

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: IN702.

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract

The Neuroinformatics Journal club is a weekly meeting during which students present current research papers. The presentation last from 30 to 60 Minutes and is followed by a general discussion.

Objective

The Neuroinformatics Journal club aims to train students to present cutting-edge research clearly and efficiently. It leads students to learn about current topics in neurosciences and neuroinformatics, to search the relevant literature and to critically and scholarly appraise published papers. The students learn to present complex concepts and answer critical questions.

Content

Relevant current papers in neurosciences and neuroinformatics are covered.
This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in nervous systems.

Methods & Models for fMRI Data Analysis

- **Objective**: Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

- **Content**: This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in nervous networks.

- **Prerequisites / notice**: None

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

- **ECTS**: 6 credits
- **Lecturers**: K. E. Stephan, T. Delbrück, M. Indiveri, G. I. Liu

Neuromorphic Engineering I

- **Objective**: Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (diode, transistor, current mirror, transconductance amplifier, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina, silicon cochlea) and an introduction to multi-chip systems that communicate events analogously to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

- **Abstract**: Understanding the characteristics of neuromorphic circuit elements.

- **Literature**: "Principles of Neural Science", Kandel, Schwartz, and Jessel

- **Prerequisites / notice**: Particular: The course is highly recommended for those who intend to take the spring semester course 'Neuromorphic Engineering II', that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

</table>
This course provides a general introduction into electron microscopy of organic and inorganic materials. In the first part, the basics of transmission- and scanning electron microscopy are presented. The second part includes the most important aspects of specimen preparation, imaging and image processing. In the third part, recent applications in materials science, solid state physics, structural biology, structural geology and structural chemistry will be reported.

**Lecture notes**
English

**Literature**
Emi: Aberration-corrected imaging in transmission electron microscopy, Imperial College Press (2010, and 2nd ed. 2015)

---

**227-0147-00L**

**Circuits**

**VLSI II: Design of Very Large Scale Integration**

**W 7 credits**

**SG 5G**

**H. Kaeslin, N. Felber**

**Objective**
Know how to design digital VLSI circuits that are safe, testable, durable, and make economic sense.

**Content**
The second course begins with a thorough discussion of various technical aspects at the circuit and layout level before moving on to economic issues of VLSI. Topics include:
- Limitations of functional design verification, design for test.
- Synchronous clocking disciplines compared, clock skew, clock distribution, input/output timing.
- Synchronization and metastability.
- CMOS transistor-level circuits of gates, flip-flops and random access memories.
- Sinks of energy in CMOS circuits.
- Power estimation and low-power design.
- Current research in low-energy computing.
- Layout parasitics, interconnected delay, static timing analysis.
- Switching currents, ground bounce, IR-drop, power distribution.
- Floorplanning, chip assembly, packaging.
- Layout design at the mask level, physical design verification.
- Electromigration, electrostatic discharge, and latch-up.
- Models of industrial cooperation in microelectronics.
- The caveats of virtual components.
- The cost structures of ASIC development and manufacturing.
- Market requirements, decision criteria, and case studies.
- Yield models.
- Avenues to low-volume fabrication.
- Marketing aspects and case studies.
- Management of VLSI projects.

Exercises are concerned with back-end design (floorplanning, placement, routing, clock and power distribution, layout verification). Industrial CAD tools are being used.

**Lecture notes**
All written documents in English.

**Literature**

**Prerequisites / notice**
Highlight:
Students are offered the opportunity to design a circuit of their own which then gets actually fabricated as a microchip! Students who elect to participate in this program register for a term project at the Integrated Systems Laboratory in parallel to attending the VLSI II course.

Prerequisites:
"VLSI I: from Architectures to Very Large Scale Integration Circuits and FPGAs" or equivalent knowledge.

**402-0341-00L**

**Medical Physics I**

**W 6 credits**

**2V+1U**

**P. Manser**

**Abstract**
Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

**Objective**
Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

**Content**
The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

**Lecture notes**
A script will be provided.

**227-1047-00L**

**Consciousness: From Philosophy to Neuroscience**

**W 3 credits**

**2V**

**D. Kiper, A. Gamma**

**Abstract**
This seminar reviews the philosophical and phenomenological as well as the neurobiological aspects of consciousness. The subjective features of consciousness are explored, and modern research into its neural substrate, particularly in the visual domain, is explained. Emphasis is placed on students developing their own thinking through a discussion-centered course structure.

**Objective**
The course's goal is to give an overview of the contemporary state of consciousness research, with emphasis on the contributions brought by modern cognitive neuroscience. We aim to clarify concepts, explain their philosophical and scientific backgrounds, and to present experimental protocols that shed light on a variety of consciousness related issues.

**Content**
The course includes discussions of scientific as well as philosophical articles. We review current schools of thought, models of consciousness, and proposals for the neural correlate of consciousness (NCC).
Abstract

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

Objective

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein adsorption/ activity and monocye behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitations. Scanning probe methods that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

252-0523-00L
Computational Biology
W 6 credits 3V+2U G. H. Gonnet

Abstract
Study of computational techniques, algorithms and data structures used to solve problems in computational biology. Topics: basic biology, string alignment, phylogeny (distance, character, parsimony), molecular evolution, multiple sequence alignment, probabilistic and statistical models, Markov models, microarrays, dynamic programming, maximum likelihood and specialized DNA and protein analysis.

Objective
Familiarize the students with the basic concepts of molecular biology and the models and algorithms used to understand, classify and predict behaviour of living organism. This course is at the most basic level, where the main issues, mostly of molecular sequences, are studied.

Content
This course lies in the intersection between Computer Science and Molecular Biology. The main purpose is to study computational techniques, algorithms and data structures which are usually applied to solve problems in Molecular Biology and Biochemistry. The following topics are likely to be covered: Introduction, mathematical models of evolution, protein and DNA sequence alignment and its meaning, phylogenetic tree construction, multiple sequence alignments, secondary structure prediction, molecular dynamics, threading, role of bioinformatics in drug design, etc. From the computer science point of view we concentrate our attention in practical solutions for the above problems. Biological knowledge is an asset but not a prerequisite.

227-0427-00L
Signal and Information Processing: Modeling, Filtering, Learning
W 6 credits 4G H.A. Loeliger

Abstract
Fundamentals in signal processing, detection/estimation, and machine learning.

Objective
The course is an introduction to some basic topics in signal processing, detection/estimation theory, and machine learning.

Content
Part II - Learning Linear Functions: fundamentals of learning, neural networks, kernel methods.

Lecture notes Lecture notes.
Prerequisites / notice Prerequisites:
- local bachelors: course “Discrete-Time and Statistical Signal Processing” (5. Sem.)
- others: solid basics in linear algebra and probability theory

252-0535-00L
Machine Learning
W 6 credits 3V+2U J. M. Buhmann

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:
- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
Solid basic knowledge in analysis, statistics and numerical methods for CSE. Experience in programming for solving the project tasks.

Compulsory Electives in Humanities, Social and Political Sciences
Recommended GESS compulsory elective courses (Type B) for D-ITET.

Abstract

In this course, one acquires an understanding of the basic neutronics interactions occurring in a nuclear fission reactor and, as such, the conditions for establishing and controlling a nuclear chain reaction.

Objective

By the end of the course, the student must be able to:
- Elaborate on neutron diffusion equation
- Systematize nuclear reaction cross sections
- Formulate approximations to solving the diffusion equation for simple systems

Content

Content:
- Brief review of nuclear physics
- Historical: Constitution of the nucleus and discovery of the neutron - Nuclear reactions and radioactivity - Cross sections - Differences between fusion and fission.
- Nuclear fission
- Characteristics - Nuclear fuel - Introductory elements of neutronics.
- Fissile and fertile materials - Breeding.
- Neutron diffusion and slowing down
- Monoenergetic neutrons - Angular and scalar flux
- Diffusion theory as simplified case of transport theory - Neutron slowing down through elastic scattering.
- Multiplying media (reactors)
- Multiplication factors - Criticality condition in simple cases.
- Reactor kinetics
- Point reactor model: prompt and delayed transients - Practical applications.
- Reactivity variations and control
- Short, medium and long term reactivity changes ? Different means of control.

Literature

Distributed documents, recommended book chapters

Prerequisites / notice

Prerequisite for: Reactor Experiments

151-2013-00L | Reactor Experiments (EPFL) | O | 4 credits | 5U | external organisers |

Abstract

To gain hands-on experience in the conduction of nuclear radiation measurements, as also in the execution and analysis of reactor physics experiments using the CROCUS reactor.

Objective

To gain hands-on experience in the conduction of nuclear radiation measurements, as also in the execution and analysis of reactor physics experiments using the CROCUS reactor.

Content

- Radiation detector systems, alpha and beta particles
- Radiation detector systems, gamma spectroscopy
- Introduction to neutron detectors (He-3, BF3)
- Slowing-down area (Fermi age) of Pu-Be neutrons in H2O
- Approach-to-critical experiments
- Buckling measurements
- Reactor power calibration
- Control rod calibration

Literature

Distributed documents, recommended book chapters

Prerequisites / notice

Prerequisite for: Special Topics in Reactor Physics (2nd sem.)

151-2015-00L | Reactor Technology (EPFL) | O | 4 credits | 3G | H.M. Prasser, external organisers |

Abstract

This course provides an overview of microfabrication processes used to produce micro-scale robots and will cover topics related to microactuators, microsensors, and modeling at these scales. The course will also investigate micromanipulation technologies, incl. the assembly of micron-sized parts, the manipulation of biological cells, and the types of robots used to perform these tasks.

Objective

To comprehend (particularly in the context of light water reactors) the basic heat removal phenomena in a reactor core, identify the technological limits for heat generation from the viewpoints of fuel, cladding and coolant, and be introduced to optimization principles in reactor thermal design.
<table>

**Title**

Hydraulic turbomachines (ME-453)
### Prerequisites / notice
- Prérequis:
  - Mécanique des milieux continus; Introduction aux turbomachines.
  - Préparation pour:
  - Choix des équipements hydrauliques; Projets et travail pratique de Master

### 151-2023-00L Nuclear Fusion and Plasma Physics (EPFL)
- **Objective**: Achieve basic understanding of plasma physics concepts for fusion energy, and of basic principles of fusion reactors.
- **Content**:
  1) Basics of thermonuclear fusion
  2) The plasma state and its collective effects
  3) Charged particle motion and collisional effects
  4) Fluid description of a plasma
  5) Plasma equilibrium and stability
  6) Magnetic confinement: Tokamak and Stellarator
  7) Waves in plasma
  8) Wave-particle interactions
  9) Heating and non inductive current drive by radio frequency waves
  10) Heating and non inductive current drive by neutral particle beams
  11) Material science and technology: Low and high Temperature superconductor - Properties of material under irradiation
  12) Some nuclear aspects of a fusion reactor: Tritium production
  13) Licensing a fusion reactor: safety, nuclear waste
  14) Inertial confinement

### Literature

### Prerequisites / notice
- Required prior knowledge:
  - Basic knowledge of electricity and magnetism, and of simple concepts of fluids

### 151-2025-00L Introduction to Particle Accelerators (EPFL)
- **Abstract**: The course presents basic physics ideas underlying the workings of modern accelerators. We will examine key features and limitations of these machines as used in accelerator driven sciences like high energy physics, materials and life sciences.
- **Objective**: By the end of the course, the student must be able to:
  - Design basic linear and non-linear charged particles optics
  - Elaborate basic ideas of physics of accelerators
  - Use a computer code for optics design
  - Optimize accelerator design for a given application
  - Estimate main beam parameters of a given accelerator
- **Content**:
  - Overview, history and fundamentals
  - Transverse particle dynamics (linear and nonlinear)
  - Longitudinal particle dynamics
  - Linear accelerators
  - Circular accelerators
  - Acceleration and RF-technology
  - Beam diagnostics
  - Accelerator magnets
  - Injection and extraction systems
  - Synchrotron radiation

### Literature
- Recommended during the course
  - Prérequis: Notion de relativité restreinte et d'électrodynamique

### 151-2041-00L Medical Radiation Physics (EPFL)
- **Abstract**: This course covers the physical principles underlying medical imaging using ionizing radiation (radiography, fluoroscopy, CT, SPECT, PET). The focus is not only on risk and close to the patient and staff, but also on an objective description of the image quality.
- **Content**:
  - Physics of radiography: X-ray production, Radiation-patient interaction, Image detection and display
  - Image quality: Wagner's taxonomy, MTF, NPS, contrast, SNR, DQE, NEQ, CNR
  - Dose to the patient: External irradiation, Internal contamination, compartmental models
  - Physics of computer tomography (CT)
  - Risk and radiation: Rational risk and state of our knowledge, Psychological aspects, Ethics and communication
  - Physics of single-photon emission computed tomography (SPECT)
  - Physics of mammography
  - Receiver operating characteristics (ROC) and hypothesis testing: Link between medical diagnostic and statistical hypothesis testing, Sensitivity, specificity, prevalence, predictive values
  - Physics of radioscopy
  - Model observers in medical imaging: Human visual characteristics and their quantification, Bayesian cost and Ideal model observer, Anthropomorphic model observers, Detection experiments (rating, M-AFC, yes-no)
  - Physics of positron emission tomography (PET)
  - Physics of resonance magnetic imaging

### 151-2043-00L Radiation Protection and Radiation Applications (EPFL)
- **Objective**: No enrolment to this course at ETH Zurich. Book the corresponding module directly at EPFL.
- **Content**:
  - Radiation Protection
  - Radiation Health Physics
  - Radiation in the Environment
  - Radiation in Industry
  - Radiation in Medicine
  - Radiation in Research
  - Radiation in Radiation Protection

### Data: 06.12.2017 12:57  Autumn Semester 2015  Page 1100 of 1432
The behaviour of materials in nuclear reactors determines the reliability and safety of nuclear power plants (NPPs). Life extension and the

### 3G Title
Advanced Topics in Nuclear Reactor Materials

#### Abstract
The course will highlight the above needs from different points of view. Experimental methods for the control and analysis of nuclear

#### Objective
- Explain the basic physics principles that underpin radiotherapy, e.g. types of radiation, atomic structure, etc.
- Explain the interaction mechanisms of ionizing radiation at keV and MeV energies with matter.
- Explain the principles of radiation dosimetry.
- Explain the principles of therapeutic radiation physics including X-rays, electron beam physics, radioactive sources, use of unsealed sources and Brachytherapy.
- Describe how to use radiotherapy equipment both for tumour localisation, planning and treatment.
- Define quality assurance and quality control, in the context of radiotherapy and the legal requirements.
- Explain the principles and practice of radiation protection, dose limits, screening and protection mechanisms.
- Explain the use of radiation in industrial and research applications.

#### Content
- Basics: radiation sources and interaction with matter, radioisotope production using reactors and accelerators, radiation protection and shielding.
- Medical applications: diagnostic tools, radiopharmaceuticals, cancer treatment methodologies such as brachytherapy, neutron capture therapy and proton therapy.
- Industrial applications: radiation gauges, radiochemistry, tracer techniques, radioisotope batteries, sterilization, etc.
- Applications in research: dating by nuclear methods, applications in environmental and life sciences, etc.

#### Literature
- 1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.
- 2. Probability Theory: The Logic of Science by E. T. Jaynes
- 3. Class Notes

#### Prerequisites / notice
- Fundamentals of Probability, Fundamentals of Computational Modeling

### 3. Semester

#### 151-0104-00L
**Number**: 151-0104-00L **Title**: Uncertainty Quantification for Engineering & Life Sciences

**Abstract**: Quantity of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

**Objective**: The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

**Content**: Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

**Lecture notes**: The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

**Literature**: 1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes
3. Class Notes

**Prerequisites / notice**: Fundamentals of Probability, Fundamentals of Computational Modeling

#### 151-0150-00L
**Number**: 151-0150-00L **Title**: Advanced Topics in Nuclear Reactor Materials

**Abstract**: The course deals with the important challenges for materials (structural and fuel) for current and advanced nuclear power plants. Experimental techniques and tools used for working with active materials are discussed in detail. Students will be well acquainted with analytical and modeling methodologies for damage assessment and residual life determination and with the behavior of high burnup fuel.

**Objective**: The behaviour of materials in nuclear reactors determines the reliability and safety of nuclear power plants (NPPs). Life extension and the understanding of fuel behavior under high burn-up conditions is of central importance for current-day NPPs. Advanced future systems (fission and fusion) need materials meeting additional challenges such as high temperatures and/or high doses. The course will highlight the above needs from different points of view. Experimental methods for the control and analysis of nuclear components and materials in operating NPPs will be presented. Advanced analytical and modeling tools will be introduced for characterization and understanding of irradiation damage, creep, environment effects, etc. Insights acquired from recent experimental programs into high burnup fuel behavior under hypothetical accident conditions (RIA, LOCA) will be presented. Materials for advanced future nuclear plants will be discussed.

**Content**: Students registered at ETH Zurich have to enroll to this course at ETH, EPFL students can enroll to this course directly at EPFL.

**Literature**: Students registered at ETH Zurich have to enroll to this course at ETH, EPFL students can enroll to this course directly at EPFL.

**Prerequisites / notice**: Advanced Nuclear Reactor Physics and Reactor Engineering

#### 151-2037-00L
**Number**: 151-2037-00L **Title**: Nuclear Computations Lab

**Abstract**: Students registered at ETH Zurich have to enroll to this course at ETH, EPFL students can enroll to this course directly at EPFL.

**Objective**: Students registered at ETH Zurich have to enroll to this course at ETH, EPFL students can enroll to this course directly at EPFL.

**Content**: - Lattice (assembly) calculations
- Thermal-hydraulic analysis
- Reactor core analysis
- Multi-physics core dynamics calculations
- Best-estimate NPP transient analysis

**Literature**: Distributed documents, recommended book chapters

**Prerequisites / notice**: Required prior knowledge: Special Topics in Reactor Physics, Nuclear Safety
Beyond-Design-Basis Safety

Students registered at ETH Zurich have to enroll to this course at ETH. EPFL students can enroll to this course directly at EPFL.

Abstract

Comprehensive knowledge is provided on the phenomena during a Beyond Design Bases Accident (BDBA) in a Nuclear Power Plants (NPP) on their modeling as well as on countermeasures taken against radioactive releases into the environment, both by Severe Accident Management Guidelines (SARG), together with technical backfilling measures in existing plants and an extended design of new NPP.

Objective

Deep understanding of the processes associated with core degradation and fuel melting in case of sustained lack of Core Cooling.

Content

Physical basic understanding of severe accident phenomenology: loss of core cooling, core dryout, fuel heat-up, fuel rod cladding oxidation and hydrogen production, loss of core coolability and, fuel melting, molt relocation and melt accumulation in the lower plenum of the reactor pressure vessel (RPV), accident evolution at high and low reactor coolant system pressure, heat flux from the molten debris in the lower plenum and its distribution to the lower head, RPV failure and melt ejection, direct containment heating, molten corium and concrete interaction, in- and ex-vessel molten fuel coolant interaction (steam explosions), hydrogen distribution in the containment, hydrogen risk (deflagration, transition to detonation), pressure buildup and containment vulnerability, countermeasures mitigating avoiding hydrogen deflagration, formation, transport and deposition of radioactive aerosols, iodine behavior, plant ventilation filtration systems, filtered venting to avoid containment failure and mitigate activity release into the environment, containment bypass scenarios, source term assessment, in-vessel and ex-vessel corium retention, behavior of fuel elements in the spent fuel pool during long-lasting station blackout, cladding oxidation in air, discussion of occurred severe accidents (Harrissburg, Chernobyl, Fukushima), internal and external emergency response. Probabilistic assessment and interfacing with severe accident phenomenology.

Lecture notes

Hand-outs will be distributed.

Prerequisites / notice

Prerequisites: Recommended courses: 151-0156-00L Safety of Nuclear Power Plants plus either 151-0163-00L Nuclear Energy Conversion or 151-2015-00L Reactor Technology

Decommissioning of Nuclear Power Plants

Students registered at ETH Zurich have to enroll to this course at ETH. EPFL students can enroll to this course directly at EPFL.

Abstract

Characterization and survey prior to dismantling. Technologies for segmentation and dismantling. Decontamination and remediation - Materials and waste management - Site characterization and environmental monitoring.

Objective

Students get an overview on the challenges of decommissioning and dismantling of nuclear installations. They are well introduced in the current state-of-the-art dismantling technologies as well as in the regulatory requirements. They know how to protect and minimize the impact to workers, the public and the environment. They recognize the importance of optimization of radioactive waste, of achieving a proper end state and a sustainable re-use.

Content

The use of imaging and remote sampling systems is discussed, as well as novel detection and sample analysis technologies. Experience with robotics, remote systems and innovative cutting technologies are presented. A wide array of subjects including understanding of chemical and physical processes being used for decontamination. Addressing of challenges and technologies and fundamental research to better understand interactions between waste, packaging and disposal environs. Site characterization towards end state, post decommissioning challenges and technologies. Exploring the obstacles that must be overcome bring innovative solutions and technologies to bear on nuclear decommissioning. Reference is made to the challenges of getting new technologies into the field of decommissioning projects. A survey of decommissioning costing and human resources needs of skills and mind-setting is given.

Lecture notes

The script will be handed out.

Electives

Course from the catalogue of Master courses ETH Zurich and EPFL. At least 4 credit points must be collected from the offer of GESS compulsory electives at ETH Zurich or Management of Technology and Entrepreneurship at EPFL.

Industrial Internship

Number Title Type ECTS Hours Lecturers

151-1021-00L Industrial Internship Nuclear Engineering Only for Nuclear Engineering MSc. O 8 credits external organisers

Abstract

The main objective of the 12-week internship is to expose master's students to the industrial work environment within the field of nuclear energy. During this period, students have the opportunity to be involved in on-going projects at the host institution.

Objective

The main objective of the 12-week internship is to expose master's students to the industrial work environment within the field of nuclear energy.

Prerequisites / notice

The internship must be approved by the tutor.

Semester Project

Number Title Type ECTS Hours Lecturers

151-1020-00L Semester Project Nuclear Engineering Only for Nuclear Engineering MSc. O 8 credits 17A Professors

Abstract

The subject of the Semester Project and the choice of the supervisor (ETH or EPFL professor) are to be approved in advance by the tutor.

Objective

The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

Master Thesis

Number Title Type ECTS Hours Lecturers

151-1009-00L Master’s Thesis Nuclear Engineering Only students who fulfill the following criteria are allowed to begin with their Master Thesis:

- Successful completion of the Bachelor programme
- Any additional requirements for admission to the degree programme have been fulfilled

O 30 credits 64D Professors
c. Have achieved a total of at least 72 credits in the categories "Core Subjects" and "Electives"
d. Successful completion of the Semester Project (the corresponding credits have been acquired)

The supervisor of the Master Thesis and the choice of the supervisor (ETH or EPFL professor) are to be approved in advance by the tutor.

Abstract
Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

Objective
The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem.

**Abstract**
First identification with Pharmaceutical Sciences; motivation for profiling in the Natural Sciences, which are focused on within the first two years as a preparation for the specialized studies; sensitization for the duties and the responsibilities of a person with a federal diploma in Pharmacy; information about job opportunities.

**Objective**
First identification with Pharmaceutical Sciences; motivation for profiling in the Natural Sciences as a preparation for the specialized studies; sensitization for the duties and the responsibilities of a person with a federal diploma in Pharmacy; information about job opportunities.

**Content**
Introduction to Pharmaceutical Sciences by selected milestones of research and development. Overview on research activities at the Institute of Pharmaceutical Sciences that is focussed on drug delivery and development (from concepts to prototypes). Sensitization for communication skills and information management. Demonstration of job opportunities in community pharmacies, in the hospital, in industry, and in the public sector by experts in the different fields.

**Lecture notes**
Handouts for individual lectures.

### 401-0291-00L Mathematics I

**Abstract**
Mathematics I/II is an introduction to one- and multidimensional calculus and linear algebra emphasizing on applications.

**Objective**
Students understand mathematics as a language for modeling and as a tool for solving practical problems in natural sciences. Students can analyze models, describe solutions qualitatively or calculate them explicitly if need be. They can solve examples as well as their practical applications manually and using computer algebra systems.

**Content**

#### Eindimensionale diskrete Entwicklungen ##
- linear, exponentiell, begrenzt, logistisch
- Fixpunkte, diskrete Veränderungsrate
- Folgen und Grenzwerte

#### Funktionen in einer Variablen ##
- Reproduktion, Fixpunkte,
- Periodizität,
- Stetigkeit

#### Differentialrechnung (I) ##
- Veränderungsrate/-geschwindigkeit
- Differentialquotient und Ableitungsfunktion
- Anwendungen der Ableitungsfunktion

#### Integralrechnung (I) ##
- Stammfunktion
- Integrationstechniken

#### Gewöhnliche Differentialgleichungen (I) ##
- Qualitative Beschreibung an Beispielen:
  - Beschränkt, Logistisch, Gompertz
  - Stationäre Lösungen
  - Lineare DGL 1. Ordnung
  - Trennung der Variablen

#### Lineare Algebra ##
- Erste Arithmetische Aspekte
- Matrizenrechnung
- Eigenwerte / -vektoren
- Quadratische LGS und Determinante

**Lecture notes**
In Ergänzung zu den Vorlesungskapiteln der Lehrveranstaltungen fassen wir wichtige Sachverhalte, Formeln und weitere Ausführungen jeweils in einem Vademecum zusammen. Die pdfs finden Sie unter Lernmaterial > Dokumente.

Dabei gilt:

- Die Skripte ersetzen nicht die Vorlesung und/oder die Übungen!
- Ohne den Besuch der Lehrveranstaltungen verlieren die Ausführungen ihren Mehrwert.
- Details entwickeln wir in den Vorlesungen und den Übungen, um die hier bestehenden Lücken zu schliessen.
- Prüfungsrelevant ist, was wir in der Vorlesung und in den Übungen behandeln.

### Übungen und Prüfungen ##

+ Die Übungsaufgaben (inkl. Multiple-Choice) sind ein wichtiger Bestandteil
  der Lehrveranstaltung.
+ Es wird erwartet, dass Sie mindestens 75 % der wöchentlichen Serien bearbeiten
  und zur Korrektur einreichen.
+ Der Prüfungsstoff ist eine Auswahl von Themen aus Vorlesung und Übungen. Für
  eine erfolgreiche Prüfung ist die konzentrierte Bearbeitung der Aufgaben
  unerlässlich.

---

### Einschreibung in die Übungen ##

Die Einschreibung in die Übungsgruppen erfolgt online.
Alle unter http://www.mystudies.ethz.ch/ für die Vorlesung Eingeschriebenen
erhalten rechtzeitig per Email einen personalisierten Link zur Einschreibung.
Behalten Sie diesen Link.

### Zugang Übungsserien ##

Erfolgt auch online.
Alle unter http://www.mystudies.ethz.ch/ für die Vorlesung Eingeschriebenen
erhalten rechtzeitig per Email einen 2. personalisierten Link.

### 252-0852-00L Foundations of Computer Science O 4 credits 2V+2U J. Hromkovic, H.J. Böckenhauer, M. Dahinden, L. E. Fässler, D. Komm ###

**Abstract**

Students learn to apply selected concepts and tools from computer science for working on interdisciplinary projects.

**Objective**

The students learn to
- understand the role of computer science in science,
- to control computer and automate processes of problem solving by programming,
- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data.
- know universal methods for algorithm design.

**Content**

1. The role of computer science in science
2. Introduction to Programming with Python
3. Modeling and simulations
4. Introduction to Matrices with Matlab
5. Visualizing multidimensional data
6. Data management with lists and tables
7. Data management with a relational database
8. Universal methods for algorithm design

**Lecture notes**

All materials for the lecture are available at www.gdi.ethz.ch

---

### 529-1001-01L General Chemistry (for Biology/Pharmacy/HST) O 4 credits 4V W. Uhlig ###

**Abstract**

The lecture deals with a number of basic chemistry concepts. These include (amongst others) chemical reactions, energy transfer during
chemical reactions, properties of ionic and covalent bonds, Lewis structures, properties of solutions, kinetics, thermodynamics, acid-base
equilibria, electrochemistry and properties of metal complexes.

**Objective**

The course is designed to provide an understanding of the basic principles and concepts of general and inorganic chemistry.

**Content**

The lecture deals with a number of basic chemistry concepts. These include (amongst others) chemical reactions, energy transfer during
chemical reactions, properties of ionic and covalent bonds, Lewis structures, properties of solutions, kinetics, thermodynamics, acid-base
equilibria, electrochemistry and properties of metal complexes.

### 529-1011-00L Organic Chemistry I (for students of Biology, Pharmaceutical Sci., and Health Sci. & Tech.) O 4 credits 4G C. Thilgen ###

**Abstract**

Fundamentals of Organic Chemistry: molecular structure. Bonding and functional groups; nomenclature; resonance and aromaticity;
stereochemistry; conformation; bond strength; organic acids and bases; basic reaction thermodynamics and kinetics; reactive
intermediates: carbanions, carbenium ions and radicals.

**Objective**

Understanding the basic concepts and definitions of organic chemistry. Knowledge of the functional groups and classes of compounds that
are important in biological systems. Understanding the relationship between structure and reactivity.

Printed lecture notes are available. Exercises, answer keys and other handouts can be downloaded from the Moodle course "Organic Chemistry I" of the current semester (https://moodle-app2.let.ethz.ch).

The course consists of plenary lectures (2 h per week) and problem-solving lessons (2 h per week, groups of ca. 25 people). In addition, online exercises are available in the e-learning environment Moodle (Course OC I).

Communication and Social Competences

Introduction into basic skills of rhetoric, presentation, communication. Introduction into learning and working techniques and writing protocols.

Objective

(1) recognize the importance of effective communication/presentation regarding objectives and audience;
(2) know the basics of rhetoric, communication, presentation, learning and working techniques;
(3) are enabled to prepare presentations (with slides/powerpoint);
(4) know four types of protocols;
(5) are enabled to write protocols;
(6) know possibilities to optimize their learning and working success;
(7) are enabled to scrutinize a scientific text.

Literature

Supplementary textbooks:

Laboratory Course General Chemistry (for Biology and Pharmacy)

Information about the practical course will be given on the first day.
The goal of this course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.
Objective

The goal of this course is to provide students with a wide general understanding cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Content

The focus is animal cells and the development of multicellular organisms with a clear emphasis on the molecular basis of cellular structures and phenomena. The topics include biological membranes, the cytoskeleton, protein sorting, energy metabolism, cell cycle and division, viruses, extracellular matrix, cell signaling, embryonic development and cancer research.

Lecture notes

The lectures are presented in the Powerpoint format. These are available on the WEB for ETH students over the nethz (Moodle). Some lectures are available on the ETH WEB site in a live format (Livestream) at the above WEB site.

Literature

Prerequisites / notice

Some of the lectures are given in the English language. Certain sections of the text-book must be studied by self-instruction.

551-1323-00L Fundamentals of Biology II: Biochemistry and Molecular Biology

Abstract

The course provides an introduction to Biochemistry / Molecular Biology with some emphasis on chemical and biophysical aspects.

Objective

Topics include the structure-function relationship of proteins / nucleic acids, protein folding, enzymatic catalysis, cellular pathways involved in bioenergetics and the biosynthesis and breakdown of amino acids, glycyan, nucleotides, fatty acids and phospholipids, and steroids. There will also be a discussion of DNA replication and repair, transcription, and translation.

Lecture notes

none

Literature

Prerequisites / notice

Some of the lectures are given in the English language.

529-1022-00L Physical Chemistry I (for Biology and Pharmacy)

Abstract

Objective

Understanding the fundamental thermodynamical properties of chemical and biological systems.

Content

Lecture notes

in process, will be distributed at the beginning of the first lecture

Literature

Prerequisites / notice

Prerequisite: mathematics I-II, functions of multiple variables, partial derivatives.
### Literature

### Prerequisites / notice
Requirements: Knowledge of physical and organic chemistry, biochemistry and biology. Attendance of Medicinal Chemistry II in the spring semester.

### Prerequisites / notice
Voraussetzungen: Abschluss Grundstudium
### 535-0333-00L Pharmaceutical Biology

**Abstract**
The structure and biosynthesis of plant constituents and the pharmacological effects and therapeutic applications of biogenic drugs of plant origin (extract-based herbal medicines; isolated natural products) are discussed. Areas of focus are (a) major biosynthetic pathways for plant-derived natural products, (b) pharmacological effects of herbal extracts, and (c) molecular mechanisms of action.

**Objective**
The understanding of the biosynthesis of plant-derived natural products. Acquisition of fundamental knowledge on the medical applications of important herbal medicines and of isolated natural products (general disease areas, molecular constituents of medicinal plants and herbal medicines in general, molecular constituents responsible for pharmacological activity, possible mechanisms of action, available clinical data to support medical use).

**Content**
The lecture is centered around the discussion of medicinal plants and herbal medicines and their common medical applications. The main areas addressed in the lecture are (a) the structure and biosynthesis of plant constituents (i.e. plant-derived natural products) and (b) the pharmacological effects and therapeutic applications of biogenic drugs of plant origin (herbal medicines based on plant extracts as well as isolated natural products). The basic pathways for the biosynthesis of the most important classes of plant-derived natural products are discussed in detail. Likewise, the molecular basis of the pharmacological effects of medicinal plant extracts (and derived herbal medicines) and their individual constituent components (isolated natural products) is broadly addressed. As part of this discussion the availability of clinical data (or lack thereof) to support specific clinical applications of herbal medicines will be repeatedly highlighted. Potential risks associated with the use of herbal medicines are discussed for selected cases.

The lecture is structured according to the major classes of natural products prevalent in medicinal plants and herbal medicines: Carbohydrates, lipids, terpenes, phenolic compounds, alkaloids, essential oils.

**Lecture notes**
Is provided in parts before each lecture (electronically as pdf) and also available on the Ilias platform via My Studies.

**Literature**

Is provided in parts before each lecture (electronically as pdf) and also available on the Ilias platform via My Studies.

**Prerequisites / notice**
Requirements: Lecture courses in basic organic chemistry, biochemistry, and biology

### 535-0810-00L Gene Technology

**Abstract**
The aim of the lecture course is to provide a solid overview of the science and issues in gene technology and genome science.

**Objective**
The course will provide a solid overview of the science and issues in gene technology and genome science.

**Content**
1. Antibody phage technology
   - The antibody molecule
   - V genes, CDRs, basics of antibody engineering
   - Principles of phage display
   - Phagemid and phage vectors
   - Antibody libraries
   - Phage display selection methodologies
   - Other phage libraries (peptides, globular proteins, enzymes)
   - Alternative screening/selection methodologies
   - DNA-encoded chemical libraries

2. Proteins: chemical modification and detection of biomolecular interactions
   - Homo- and hetero-dimerization of proteins
   - Chemical modifications of proteins
   - Radioactive labeling of proteins
   - Kinetic association and dissociation constants
   - Affinity constant: definition and its experimental measurement

3. Genomics: Applications to Human Biology
   - Protein cloning and expression
   - Functional Genomics
   - Sequencing genomes and novel sequencing methods
   - Genetic disorders: discovery and pharmaceutical implications
   - Transcriptomics
   - Proteomics
   - Principles of Cancer
   - Principles of Vaccine Development
   - Principles of Gene Therapy

4. Pharmaceuticals: Focus on Discovery
   - Chemical Libraries
   - Protein Therapeutics
   - Consideration on pharmacokinetics and half-life extension

**Lecture notes**
- Skript "Gene Technology" by Prof. Dario Neri
- Prophages: An Introduction to Genetic Engineering
- Antibody phage technology, protein modification technology, genome projects, genome sequencing, transcriptomics, proteomics and SNP technology. The course is suited for advanced undergraduate and early graduate students in pharmaceutical sciences or related fields.

### 535-0830-00L Pharmaceutical Immunology

**Abstract**
Get Students familiar with basic Immunological concepts of pharmaceutical relevance.

**Objective**
Get Students familiar with basic Immunological concepts of pharmaceutical relevance.

**Content**
- Chapters 1 - 11 of the Janeway's ImmunoBiology, by Kenneth Murphy (8th Edition; Garland).

**Literature**

Paperback: [www.garlandscience.com](http://www.garlandscience.com)

### 535-0210-00L Radiopharmaceutical Chemistry

**Abstract**
Introduction of basic principles of radiation, structure and function of radiopharmaceuticals, examples of radiopharmaceuticals in nuclear medicine practice, discussion of functional radiopharmaceuticals,molecular imaging, targeted radionuclide therapy, radiopharmaceutical synthesis.

**Objective**
Introduction of basic principle of radiation, structure and function of radiopharmaceuticals, examples of radiopharmaceuticals in nuclear medicine practice, discussion of functional radiopharmaceuticals,molecular imaging, targeted radionuclide therapy, radiopharmaceutical synthesis.

**Content**
Introduction radioactivity, radiopharmaceuticals, PET- and SPET- nuclides, radionuclide generators, radiopharmaceuticals for imaging the heart, infection- and lung diagnostics, groups of brain radiopharmaceuticals, PET-kinetik modelling, molecular imaging, application in nuclear medicine, tumor-affine radiopharmaceuticals, targeted radionuclide therapy, radioimmunoconjugates, dosis calculations, nuclearmedicine practice, radiopharmaceutical chemistry.

**Abstract**

Thorough knowledge of major pathogens involved in infectious diseases; principles of laboratory diagnosis of pathogenic bacteria and fungi.

**Objective**

Thorough knowledge of all major pathogens involved in infectious diseases; principles of laboratory diagnosis of pathogenic bacteria and fungi.

**Content**

- Basics and principles of clinical microbiology:
  - host-pathogen interaction
  - symptoms and diagnosis of major bacterial pathogens
  - therapeutic regimens commonly used against bacterial disease
  - major aspects of medical mycology, virology and parasitology
  - epidemiology

</table>
This lecture focusses on basic concepts of ecotoxicology and their application to environmental chemicals and environmental pollution problems. Basic concepts are regarded with respect to their consequences for the environment. Toxicological effects on organisms are analysed at different levels of organisation, from the molecular to the ecosystem level. Case studies are regarded in order to understand chemical's actions and their effects. In addition bioaccumulation and their consequences, the methods in ecotoxicology and environmental effects of various compounds will be regarded. Emphasis will be placed on hormonally active compounds and their effects to aquatic organisms. Furthermore, methods of environmental risk assessment of environmental pollutants will be discussed.

Introduction to Biomedical Engineering I

**Objective**
Introduction to biomechanics, biomaterials, tissue engineering, medical imaging as well as the history of biomedical engineering.

**Abstract**
The course covers the development of the nervous system (NS) with a focus on: sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.

**Content**
The main focus is on the development of the NS: Early development of the NS, cellular processes, nerve fiber growth, building of synapses and neuronal networks.

**Literature**
- Academic Press

**Lecture notes**
- Stored on LIAS.
- Handouts provided during the classes and references therin.

**Prerequisites / notice**
None. Bring something to write and your student ID

**Repetitionsprüfung**
15. Juni 2016, HG E 26.1, 9-10.30h

**551-0313-00L Microbiology (Part I)**

**Objective**
Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

**Abstract**
Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed. In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

**Content**
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

**Literature**

**Handouts**
Handouts provided during the classes and references therin.

**Available online via ETH library**
Content
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Lecture notes
Updated handouts will be provided during the class.

Literature
Current literature references will be provided during the lectures.

Prerequisites / notice
English
The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration. The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

Objective
The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Notes
Updated handouts will be provided during the class.

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Abstract
To familiarize with the structure, properties and reactivity of food constituents. To understand the relationship between the multiple chemical reactions and the quality of food.

Objective
To familiarize with the structure, properties and reactivity of food constituents. To understand the relationship between the multiple chemical reactions and the quality of food.

Content
Descriptive chemistry of food constituents (proteins, lipids, carbohydrates, plant phenolics, flavour compounds). Reactions which affect the colour, flavour, texture, and the nutritional value of food raw materials and food products during processing, storage and preparation in a positive or in a negative way (e.g. lipid oxidation, Maillard reaction, enzymatic browning). Links to food analysis, food processing, and nutrition.

Lecture notes
The lectures Food Chemistry I and Food Chemistry II constitute a unit.

Literature
The lectures are supplemented with handouts.

Abstract
This lecture is the first part of a one-year course. It offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

Objective
The lecture offers insights into the basics, practical consequences and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts, molds and protozoa in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

The focus of this first part of the lecture will be on the organisms, but also on the factors which determine spoilage and foodborne disease.
1. History of Food Microbiology
   1.1. Short synopsis of foodborne microorganisms
   1.2. Spoilage of Foods
   1.3. Foodborne Disease
   1.4. Food Preservation
   1.5. VIP's of Food Microbiology
2. Overview of Microorganisms in Foods
   2.1. Origin of foodborne Microorganisms
   2.2. Bacteria
   2.3. Yeasts
   2.4. Molds
3. Microbial Spoilage of Foods
   3.1. Intrinsic and Extrinsic Parameters
   3.2. Meats, Seafoods, Eggs
   3.3. Milk and Milk Products
   3.4. Vegetable and Fruit Products
   3.5. Miscellaneous (baked goods, nuts, spices, ready-to-eat products)
   3.6. Drinks and Canned Foods
4. Foodborne Disease
   4.1. Significance and Transmission of Foodborne pathogens
   4.2. Staphylococcus aureus
   4.3. Gram-positive Sporeformers (Bacillus & Clostridium)
   4.4. Listeria monocytogenes
   4.5. Salmonella, Shigella, Escherichia coli
   4.6. Vibrio, Yersinia, Campylobacter
   4.7. Brucella, Mycobacterium, Aeromonas, Plesiomonas
   4.8. Parasites
   4.9. Viruses and Bacteriophages
   4.10. Mycotoxins
   4.11. Bioactive Amines
   4.12. Miscellaneous (Antibiotic-resistant Bacteria, Biofilms)
Content
This course will address selected and current topics on new applications of microorganisms with functional properties in food and functional food products and characterization of functionality and safety of food bacteria. Specialists from the Laboratory of Food Biotechnology, as well as invited speakers from the industry will contribute to the selected topics as follows:

- Probiotics and Prebiotics: Probiotics, functional foods and health, towards understanding molecular modes of probiotic action; Challenges for the production and addition of probiotics to foods; Prebiotics and other microbial substrates for gut functionality.
- Bioprotective Cultures and Antimicrobial Metabolites: Antifungal cultures and applications in foods; Antimicrobial peptide-producing cultures (bacteriocins) for enhancing food quality and safety; Development of new protective cultures, the long path from research to industry.
- Legal and Protection Issues Related Functional Foods
- Industrial Biotechnology of Flavor and Taste Development
- Safety of Food Starter Cultures and Probiotics

Students will be required to complete a group project on food products and ingredients with of from functional bacteria. The project will involve information research and analysis followed by an oral presentation and short written report.

Lecture notes
Copy of the power point slides from lectures will be provided.

Literature
A list of references will be given at the beginning of the course for the different topics presented during this course.

752-6101-00L Nutrition and Chronic Disease (HS)
Abstract
To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.
Objective
Students are able to:
- Identify the physiological consequences of chronic diseases
- Explain the role of nutritional factors in the prevention and control of chronic diseases
- Evaluate the nutritional status of a population
- Assess preventive measures addressing individuals and society
Content
The module examines the role of nutrition in the prevention of chronic diseases such as type 2 diabetes, cardiovascular diseases, cancer, obesity etc. is presented.

752-6015-00L Epidemiology and Prevention
Abstract
The module Epidemiology and Prevention gives a brief introduction to epidemiology with the aim to enable students to judge the scientific evidence on dietary habits and health.
Objective
Students are able to:
- Evaluate the scientific evidence on the effects of diet on human health
- Describe the role of nutritional factors in the prevention of chronic diseases
- Assess the nutritional status of a population
- Assess preventive measures addressing individuals and society
Content
The module Epidemiology and Prevention gives a brief introduction to epidemiology with the aim to enable students to judge the scientific evidence on dietary habits and health.

752-5001-00L Food Biotechnology I
Abstract
Basic information for understanding biotechnology applied to food processing will be presented. This will include a presentation of the physiology of important productive microorganisms used in food fermentations, closely related to applications in biotechnology; microbial genetics, and design and operation of bioreactors; and application of modern molecular tools for food biotechnology.
Objective
The main goal for this course is to provide students with basic information for understanding biotechnology applied to food processing. For the students, the aim will be:
- To understand the important role of microbial physiology and molecular tools for food biotechnology;
- To understand basic principles of fermentation biotechnology, with particular emphasis on food applications.
Content
Biotechnology has been defined as any technique that uses living organisms, or substances from those organisms, to make or modify a product, to improve plants or animals, or to develop microorganisms for specific uses. In this course, basic knowledge for understanding biotechnology as applied to food processing will be presented. This course builds on the application of principles learned from other basic courses in the Bachelor program, especially microbiology and microbial metabolism, molecular biology, biochemistry, physics and engineering. Students will learn about the physiology of important productive microorganisms (lactic acid bacteria, bifidobacteria, propionibacteria and fungi) used in food fermentations, closely related to applications in biotechnology. Microbial kinetics, and design and operation of bioreactors used for both research and industrial scale production of traditional foods and modern food ingredients will be presented. This part will be illustrated by examples of food fermentation processes, representative of specific challenges. Finally, the application of modern molecular tools to food biotechnology will be discussed.

</table>
| Objective   | Students know and understand:  
- basic mechanisms and regulation of the immune response  
- the pathogenic mechanisms of the most important immune-mediated disorders  
- the most frequently used expression systems for the production of therapeutic proteins  
- the use of protein engineering tools for modifying different features of therapeutic proteins  
- the mechanism of action of selected therapeutic proteins and their application  
- basic concepts in the GMP production of therapeutic proteins |
| Content     | The course consists of two parts:  
In a first part, students will complete their training of pharmaceutical immunology (Chapter 13 - 16 Immunobiology VIII textbook). This part particularly focuses on the pathogenic mechanisms of immune-mediated diseases. Deepened knowledge of immunology will be relevant for understanding the mechanism of action of many therapeutic proteins, as well as for understanding one major concern related to the use of protein-based drugs, namely, immunogenicity.  
The second part focuses on topics related to the development and application of therapeutic proteins, such as protein expression, protein engineering, reducing immunogenicity, and GMP production of therapeutic proteins. Furthermore, selected examples of approved therapeutic proteins will be discussed. |
| Lecture notes | A script is provided for each lecture course. The scripts define important and exam-relevant contents of lectures. Scripts do not replace the lecture. |

|             | The course is divided into two parts. The first part provides a detailed understanding of drugs and pharmacotherapy of infectious diseases and cancer. The second part gives an overview of the field of pharmacogenomics with a special focus on the role of genetic polymorphisms in disease susceptibility, drug response and adverse effects. |
| Objective   | The course advances basic knowledge in pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects of drug therapy in the fields of infectious diseases and cancer. The course also provides an overview of the field of pharmacogenomics, with a special focus on the role of genetic polymorphisms in disease susceptibility, drug response and adverse effects. |
| Content     | Topics include the pharmacology and pharmacotherapy of infectious diseases and cancer. In the field of pharmacogenomics, the course is focused on genetics, genome-wide association studies, genetic disease predisposition, examples of genetic variability of drug metabolism and drug responses, identification of new drug targets, relevance of pharmacogenomics for clinical drug development, and toxicogenomics. |
| Lecture notes | A script is provided for each lecture course. The scripts define important and exam-relevant contents of lectures. Scripts do not replace the lecture. |

Objective

Objectives:
- To familiarize participants with the principles of pharmacoepidemiology and epidemiology in addressing drug related questions with concern to the use, effects and risks of medicinal products in a large population.
- To introduce participants to fundamental statistical, economic and epidemiological concepts and methods.
- To provide the appropriate tools to critique pharmacoepidemiologic studies in the literature and to critically read and understand papers in the medical literature which relate to drug benefits, risks, and costs.
- To address controversial topics in drug use and benefit-risk assessment, and to critically appraise the outcome of drug therapy.
- To equip participants with skills to facilitate further studies in these areas.

Content

The contribution of epidemiology to the study of drug uses, effects and risks:
- Pharmacoepidemiology study methodologies, concepts and strategies,
- Detection and identification of unintended drug effects (pharmacovigilance),
- Quantifying unintended effects and drug interactions,
- Bias and confounding by indication,
- Drug utilization

Pharmacoepidemiology and outcome assessment of drug therapy.

Meta-analysis in pharmacoepidemiology.

Limited number of participants.

Abstract

The practical course is open for master and graduate students to get an introduction into hands-on computer-assisted drug design. The class includes an introduction to computer-based screening of a virtual compound library, subsequent synthesis of candidate ligands, and biochemically testing for activity on pharmacologically important drug targets.

Objective

Participants become familiar with state-of-the-art methodologies in a real-life computer-aided medicinal chemistry project. Participants work as small teams, perform literature research and discuss recent research findings. A seminar talk is to be given presenting the molecular design strategy chosen and the results obtained during the course.

Content

The course offers the possibility for people with and without computational and or laboratory background to get an introduction into computer-assisted drug design, as well as practical training in a modern chemical laboratory. Using various software suites, the participants will computationally create and screen a virtual compound library for potential active small molecules. The process will involve an introduction to screening a virtual compound library, synthesizing candidate inhibitors, and biophysical testing against a pharmacologically important drug target.

Lecture notes

Detailed information will be handed out during the course.

Literature

Prerequisites / notice

The class is organized as a two-week block course.

The number of participants is limited.

Kick-off meeting and confirmation of registration (Vorbesprechung und Platzvergabe); During the last lecture of the class "Computer-Assisted Drug Design" (535-0022-00).

Ideally, students interested in the course participated and successfully passed the lecture "Computer-Assisted Drug Design" (535-0022-00).

535-0024-00L | Methods in Drug Design | W Dr | 1 credit | 1V | G. Schneider

Complementary to the practical course "Computer-Assisted Drug Design (Practical Course)" 535-0023-00L. Compulsory for the students of the practical course, open for other interested students.

Abstract

The lecture is organized as a two-week block during the practical course "Computer-Assisted Drug Design" (535-0023-00 P), totalling 10 two-hour lectures. It provides an introduction to advanced drug design techniques and approaches emphasizing computer-assisted molecular design.

Objective

Participants will learn about computational algorithms and advanced experimental approaches to drug discovery and design, including selected actual topics and practical applications. The contents of the lecture will allow for a deeper understanding of modern computer-assisted drug design methods and how they are linked to experimental applications. The main focus is on computational medicinal chemistry, so that participants will be able to use relevant computer-based methods in own research projects.

Literature

Prerequisites / notice

The lecture is mandatory for all participants of the course "Computer-Assisted Drug Design" (535-0023-00 P).

**History of Pharmacy**  
*W*  
1 credit  
1V  
M. Fankhauser  
**Abstract**  
The students will receive the basic knowledge of the history of pharmacy. This knowledge will allow them to have a detailed approach to the actual pharmacy and the development of the materia medica.  
**Objective**  
The students will receive the basic knowledge of the history of pharmacy. This knowledge will allow them to have a detailed approach to the actual pharmacy and the development of the materia medica.  
**Content**  
The students will receive the basic knowledge of the history of pharmacy. This knowledge will allow them to have a detailed approach to the actual pharmacy and the development of the materia medica.  
**Lecture notes**  
Handouts will be provided.  
**Literature**  
**Prerequisites / notice**  
Voraussetzungen: Keine. Interesse für die Rolle der Pharmazie und der Medikamente in der Vergangenheit von Vorteil.

535-0344-00L  
**From Ethnopharmacy to Molecular Pharmacognosy**  
*W Dr*  
1 credit  
1V  
B. Frei Haller, J. Gertsch  
**Abstract**  
Basic understanding and awareness of ethnopharmaceutical and ethnopharmacological issues and research. Knowledge of methods used in drug discovery from natural sources. Discussion of the issues around law and international treaties. Importance of ethnopharmaceutical knowledge for world health.  
**Objective**  
Basic understanding and awareness of ethnopharmaceutical and ethnopharmacological issues and research. Knowledge of methods used in drug discovery from natural sources. Discussion of the issues around law and international treaties. Importance of ethnopharmaceutical knowledge for world health.  
**Content**  
Introduction into ethnopharmacy and related disciplines; definitions of terms, working methods, research projects, bioprospecting.  
**Lecture notes**  
Handouts will be provided.  
**Literature**  
**Prerequisites / notice**  
Prerequisites: Basic lectures in biology or biochemistry and pharmaceutical biology have been attended; not suitable for first semester students.

535-0423-00L  
**Drug Delivery and Drug Targeting**  
*W Dr*  
2 credits  
2V  
J.C. Leroux, D. Brambilla  
**Abstract**  
The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.  
**Objective**  
The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.  
**Content**  
The course covers the following topics: drug targeting and delivery principles, radiopharmaceuticals, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, delivery of active agents in tissue engineering, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices and novel trends in transdermal and nasal drug delivery.  
**Lecture notes**  
Selected lecture notes, documents and supporting material will be directly provided or may be downloaded using  
http://www.galenik.ethzf.ch/teaching/drug_del_drug_targ  
The website also displays additional information on peroral delivery systems, transdermal systems and systems for alternative routes (nasal, pulmonary) of delivery. These fields are covered in detail in the course Galenische Pharmazie II (Galeneical Pharmacy II).  
**Literature**  
Further references will be provided in the course.

535-0300-00L  
**Molecular Mechanisms of Drug Actions and Targets**  
*W Dr*  
1 credit  
1V  
V. I. Otto  
**Abstract**  
In the last 10 years, an average of one drug per year was withdrawn from the market. Using selected examples of such drug failures, the course aims at analyzing the present explanations of drug actions as well as the design and predictive power of animal models and clinical trials. In addition, the ethical, societal, and economical expectations in new drugs shall be reflected.  
**Objective**  
To develop a critical understanding of the relevance and limitations of the current approaches to explaining and anticipating drug effects. To critically appraise the ethical, societal, economical and political expectations in the development of new drugs.
In December 2006, Pfizer stopped a large phase III study on the use of Torcetrapib for the prevention of atherosclerosis and cardiovascular disease. $800 million in development costs and $21 billion in stocks were annihilated overnight. The failure of Torcetrapib has pinpointed the limitations of an extremely reductionist view of atherosclerosis and its prevention by drug therapy. It has also highlighted what high expectations we have in a safe and wide applicability of drugs and of their economical success.

Torcetrapib is not a single case. In the last 10 years, on average one drug per year was withdrawn from the market due to lack of efficacy, unexpected side effects or toxicity. This clearly shows that the common investigations and the modern understanding of drug actions are often not sufficient to predict the effects a drug will have in large patient populations. These are the topics of the present course. Using three particularly informative examples of drug failures, the problems encountered and the concepts and informative value of preclinical and clinical studies will be analyzed and discussed. Furthermore, the ethical, societal, economical and political expectations in new drugs shall be reflected.

Lecture notes
Printouts of the slides used for the lectures and literature for reading and discussions will be available online.

Literature
Recommended reading: John Abramson, Overdo$ed America, Harper Perennial, New York 2008

Prerequisites / notice
Requirements: basic knowledge in Medicinal Chemistry and Pharmacology. Ability to read and understand scientific publications in English.

535-0022-00L Computer-Assisted Drug Design

Abstract
The lecture series provides an introduction to computer applications in medicinal chemistry. A focus is on molecular representations, property predictions, molecular similarity concepts, virtual screening techniques, and de novo drug design. All theoretical concepts and algorithms presented are illustrated by practical applications and case studies.

Objective
The students will learn how computer simulation generates ideas for drug design and development, understand the theoretical principles of property prediction and computer-generated compound generation, and understand possibilities and limitations of computer-assisted drug design in pharmaceutical chemistry. As a result, they are prepared for professional assessment of computer-assisted drug design studies in medicinal chemistry projects.

Literature
Recommended textbooks:

Prerequisites / notice
Successful participation in this course is required for a research project ("Forschungspraktikum") in the CADD group.

535-0546-00L Patents

Abstract
Knowledge in the field of intellectual property, especially of patents and trademarks, with particular emphasis on pharmacoeconomics. Introduction into intellectual property; prosecution of patent applications; patent information; exploitation and enforcement of patents; peculiarities in pharmacoeconomics; medicine; social, political and ethical aspects; Trademarks.

Objective
Basic knowledge in the field of industrial property, especially of patents and trademarks, with particular emphasis on the chemical, pharmaceutical and biotech field.

Content
1. Introduction into industrial property (patents, trademarks, industrial designs);
2. Prosecution of patent applications (patentability);
3. Patent information (patent publications, databases, searches);
4. Exploitation and enforcement of patents (possibilities of exploitation, licenses, parallel imports, scope of protection, patent infringement);
5. Peculiarities in pharmacoeconomics and medicine (supplementary protection certificates, experimental use exemption, therapy and diagnosis, medical indication);
6. Social, political and ethical aspects (patents and prices for medicinal products, traditional knowledge and ethnomedicine, bioprospecting and biopiracy, human DNA inventions);
7. Trademarks, types of trademarks, grounds for refusal, peculiarities of pharmacoeconomics.

Lecture notes
A script is available in electronic form during the lecture.

Literature

535-0310-00L Glycobiology in Drug Development

Abstract
Protein-based drugs constitute around 25% of new approvals and most of them are glycoproteins. Using selected examples the course aims at providing insight into our present knowledge on glycosylation-activity relationships and the production and analysis of glycoprotein-based drugs.

Objective
Gaining insight into the glycobiology of therapeutically used glycoproteins. This implies knowing and understanding - the major types of protein-linked glycans and their biosynthesis - the most important expression systems for production of recombinant glycoproteins - methods used to alter or manipulate glycosylation - the most prominent clinically used glycoproteins and how glycosylation influences their therapeutic profile.

Content
lecture plan:
1. Proteins wearing a “sugar dress” - Glycans in cell-cell communication and molecular recognition in multicellular organisms
2. Tissue plasminogen activator (t-PA), glucosaminidase and the biosynthesis of N-glycans
3. PSGL-1 and the biosynthesis of O-glycans; P-selectin and other lectins
4. The glycoprotein hormones and the production and analysis of therapeutic glycoproteins
5. Monoclonal antibodies and the modification of their therapeutic profile through glycoengineering
6. EPO “the same but different”
7. Current topics: Biosimilars and the currently marketed ‘Biopharmaceuticals’

Lecture notes
The slides used for the lectures will be provided online

Literature

Prerequisites / notice
Requirements: Basic knowledge in molecular biology, protein chemistry and analytics. Basic knowledge in pharmacology.
Abstract

Vitamins are essential organic compounds that cannot be synthesized by an organism and hence, they have to be acquired from the diet. This lecture will give an overview about the application of vitamins in health and disease.

Objective

The aim of this lecture is a critical examination of the students with the topic of "Vitamins in Health and Disease". The students will get an overview of vitamins, of their medical applications and the role of the pharmacist with "over-the-counter" products.

Content

Deficiencies of particular vitamins result in specific diseases such as for example scurvy (vitamin C deficiency). Such disease patterns are usually easily recognized and facile to be treated. The clinical utility of supplementation concerns people with severe deficiencies and a risk of complications. Latent vitamin deficiencies might result in variable disorders and risks. As an example neurological disorders in elderly as a consequence of lack of vitamin B12 should be mentioned. Subclinical deficiencies are often difficult to assess. However, these are exactly the cases where advice of a pharmacist is requested.

A large intake of vitamins by over-supplementation or food fortification might be dangerous (hypervitaminosis). This is in particular the case for fat-soluble vitamins or in the case of constant intake of high amounts of water-soluble vitamins over a long time period.

The lecture 'Vitamins in Heath and Disease' will give an overview over the history and applications of vitamins and their functions to preserve good health. The utility of vitamin supplementation during conditions of deficiencies, potential consequences of a latent deficiency as well as risks of over-supplementation will be discussed.

Lecture notes

Hand-outs will be distributed during the lecture (in English).

Pharmaceutical Manufacturing in Small Quantities

Abstract
This course will provide an up-to-date, comprehensive review of the industrial perspective at the interface of biomaterials and drugs. This covers regulatory, clinical, pre-clinical and manufacturing concepts. The presentations are provided in an effort to maximize the interaction of student and lecturer.

Objective
- The student will be able to categorize a drug-biomaterial as a "drug" or a "material" from a regulatory perspective and can summarize general regulatory pathways for material/drug development.
- The student will be able to summarize the current concepts and challenges for the industry at the material-drug interface.
- The student will actively develop innovative, industrial concepts at the drug-biomaterial interface.

Content
This course will provide an up-to-date comprehensive review of the industrial perspective at the interface of biomaterials and drugs. General concepts related to regulatory affairs or such as cost-conscious planning of manufacturing processes will be covered by interactive case-studies and in close interaction between students and lecturers. The course covers the future at the biomaterial - implant interface - as it is seen by the industry today - and will be reviewed by experienced and long-standing faculty from industry with the aim to provide a balanced, insightful perspective. From that, clinical development concepts, regulatory pathways and real-life case studies will be discussed with the students. Finally the students - working in small groups of 4-5 - will outline a development pathway for an industrial project and present it to the course and in presence of all faculty to receive maximum feedback to their approaches.

The student will become familiar with the major elements required for a successful development and which challenges have to be taken into account to translate an idea into a successful product.

Research Project

Number Title Type ECTS Hours Lecturers
535-0565-00L Research Project O 10 credits 20A Lecturers

Abstract
The Research Project accustoms students to scientific work.

Objective
Students are accustomed to scientific work and they get to know one specific research field.

Content
Students work on a current field of research.

Master Thesis

Number Title Type ECTS Hours Lecturers
535-0560-00L Master’s Thesis O 30 credits 40D Lecturers

Abstract
In the Master thesis students prove their ability to independent, structured and scientific working. The Master thesis is usually carried out in a subject area of Pharmaceutical Sciences as chosen by the student.

Compulsory Electives in Humanities, Social and Political Sciences

Recommended GESS compulsory elective courses (Type B) for D-CHAB.

Second Year

Compulsory and Compensatory Block Courses

Compulsory Block Courses

Number Title Type ECTS Hours Lecturers
535-5501-00L Applied Pharmacology O 6 credits 7G P. Wiedemeier, S. Erni, B. Falch, K. Fünschilling

Abstract
Overview of the most important clinical pictures: symptoms, recognition, differentiation, pharmacotherapy for the most important general and special medical indications. Groups of pharmaceutical compounds, active pharmaceutical ingredients, proprietary medicinal products: mechanisms of action, contraindication, therapeutic patterns, side effects, of Reflection Capability

Objective
Students have a thorough knowledge of all clinical pictures and their symptoms regarding outpatient treatment. They know the main groups of indications including active pharmaceutical self-medication and ingredients, mechanisms of action, pharmacokinetics, pharmacodynamics and dosage. They are also able to identify the relevant side effects and interactions.

Content
Pathophysiology of selected clinical pictures and their main symptoms and clinical parameters. Recognition of alarm symptoms and distinction between pharmaceutical self-medication and the need for medical treatment. Detailed coverage of the pharmacotherapy of all fields of indication encountered in outpatient treatment. Outlining of therapeutic strategies and patterns with regard to suitable pharmaceutical compounds, active pharmaceutical ingredients and representative range of proprietary medicinal products. Discussion of the most important mechanisms of action, contraindications, side effects and interactions.

535-5502-00L Pharmaceutical Manufacturing in Small Quantities O 3 credits 3G J. Fröhlich, H. Hartenberg, C. Meier

Abstract
Hands-on course in pharmaceutical manufacturing in the pharmacy according to "GMP regulations for small quantities" defined in the pharmacopoeia: Design and practical approach in compounding of formulas using the most important dosage forms including their risks and quality assurance.

Objective
Students are able to manufacture, to package, to quality-control and document pharmaceutical compounding on their own, "lege artis" and according to GMP regulations, using the appropriate techniques. They know the most important properties of active ingredients and excipients frequently used. They achieve the necessary knowledge including the relevant literature and other sources of information, as well as the legal requirememts regarding pharmaceutical manufacturing in small quantities.

Content
To impart knowledge about the principal techniques and processes in the manufacturing of pharmaceuticals in small quantities (formulas), focusing on the design, manufacturing, quality assurance and risk based self-appraisal including the patient specific dispensing. During the practical training periods: by means of pharmaceutical relevant examples the design, the planning, the manufacturing including the correct use of the equipment, the in-process control, the packaging and the quality assurance are practiced for various dosage forms and recipes. Quality assurance and control are mainly risk adapted considering as well hygiene regulations according to current pharmaceutical practice. The participants will thus improve their general GMP knowledge and skills.

535-5503-00L Institutional Pharmacy O 3 credits 3G P. Wiedemeier, J. Beney,
Abstract

Organisation of institutional environments (emergency hospitals), with special focus on the medication process and institutional pharmaceutical care (continuum of care).

Objective

Students understand the concept of continuum of care and its practical implementation. They know the medication process within an institutional environment. They are able to find the necessary information and deal with problems in connection with pharmaceuticals, to evaluate them and to communicate and document their findings adequately. They know how a hospital is organised (procedures, possible problems), responsibilities of the different members of the staff and, most importantly, what the function of a hospital pharmacy is.

Content

Principals of the organisation of institutional environments (emergency hospitals), with special focus on medication processes and institutional pharmaceutical care (circulation of medication, continuum of care). Hygiene regulations, medical products, applications, drug formulations, patient files, SOAP notes, kardex study. Participation at interdisciplinary visits, internal trainings and doctors’ reports as well as visitation of the emergency room. Drug interaction, generic substitution, quality management and pharmacovigilance.

535-5504-00L  Basics of Practical Pharmacy  ■  O  6 credits  7G  P. Wiedemeyer, S. Erni, B. Falch, K. Fünfschilling

Abstract

Introduction to managed care systems (Pharmaceutical Care und Public Health): problems with regard to therapy and approaches to solutions, service, first aid and medicinal products. Methods of illness prevention and health promotion. Important additional assortments including complementary medicine. Law and economy in everyday pharmacy, structures of the national health care system.

Objective

Students know the most important concepts and methods of pharmaceutical care of patients with regard to OTC and Rx-only drugs as well as the essential concepts and methods of public health, prevention and health care. They master the basic rules concerning the pharmaceutical triage and their implications. For the clinical pictures covered during the course, they are able to make therapeutic plans or accompany and optimize doctor’s orders. Students show an adequate understanding of the rights and duties of pharmacists as medical personnel regarding medical care and service within the framework of the Swiss health care system. They are capable of handling important medical products and instructing patients about their use. Students have the necessary basic skills and applications of first aid and emergency medicine. They know the essence, chances and limits with reference to additional assortments, therapeutic options like phytotherapy, complementary medicine, veterinary pharmacy and non-medical methods of healing. Students have the essential knowledge of legal aspects and regulations concerning pharmacists and know the basics of business administration.

Content

Pharmaceutical Care: possibilities of pharmaceutical care of patients regarding OTC and Rx-only drugs in the officinal pharmacy. Good pharmaceutical triage in practical, introduction to the pharmaceutic validation of prescriptions, recognition of medicinal, patient related, therapeutic problems and the finding of solutions: Choice of therapy (OTC), accompanying and optimizing therapies (Rx), compliance, correct administration of drugs, cooperation with other medical professions in the field of outpatient treatment. Traditional and proactive pharmaceutical service: development of adequate means of documents of intervention and consultation as well as pharmaceutical follow-up care. Public health; role and possibilities of official pharmacies as partners within the Swiss health care system: primary health care, prevention, campaigns, early detection, instruction and mediation, referral to doctors. Needs of customers, patients and employees, and social interaction. Significance of the medical profession (illness, suffering, promotion of health and well-being). Basic training in first aid, emergency medicine and wound care. Medical products: handling of important applications and instruction of patients. Important and additional forms of therapy and assortments: phytotherapy, complementary medicine, veterinary pharmacy, non-medical methods of healing. Economy and law in everyday pharmacy: overview of the Swiss legal system. Relevant legal framework, jurisdiction and regulations and their meaning with regard to quality assurance for practicing pharmacists. Basics of finance and accounting as well as personnel management and insurance matters. Organisation and competencies of the various partners within the Swiss health care system, focusing on the intermediate position and the role of pharmacists as part of the medical community.

Compensatory Block Courses

All Elective Block Courses of the second year in Master studies are eligible as Compensatory Block Courses. Elective Block courses take place in Spring Semester.

Course Units for Additional Admission Requirements

The courses below are only available for MSc students with additional admission requirements.

Abstract

Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

Objective

The objective of this course is to build a solid fundamend in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

Content

From "Statistics for research" (online)

Ch 1: The Role of Statistics
Ch 2: Populations, Samples, and Probability Distributions
Ch 3: Binomial Distributions
Ch 6: Sampling Distribution of Averages
Ch 7: Normal Distributions
Ch 8: Student’s t Distribution
Ch 9: Distributions of Two Variables

Ch 4: Descriptive statistics and tables
Ch 5: One- and two-sample tests
Ch 6: Regression and correlation
The goal of this course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Objective
The focus is animal cells and the development of multicellular organisms with a clear emphasis on the molecular basis of cellular structures and phenomena. The topics include biological membranes, the cytoskeleton, protein sorting, energy metabolism, cell cycle and division, viruses, extracellular matrix, cell signaling, embryonic development and cancer research.

Abstract
The students know the relevance and the role of quality assurance measures to assure quality, efficacy and safety of drugs. The students know the most important Swiss regulations, including the associated European regulations, which are relevant from a quality assurance point of view and they are able to interpret the content of this regulations.

Data: 06.12.2017 12:57  Autumn Semester 2015  Page 1127 of 1432
The course provides an overview of fundamental concepts and physical processes in astrophysics with the dual goals of: i) illustrating physical principles through a variety of astrophysical applications; and ii) providing an overview of research topics in astrophysics.

Quantum mechanics: wavefunctions, operators, Schrödinger's equation, infinite and finite square well potentials, harmonic oscillator, hydrogen atoms, spin.

Atomic structure: Perturbation to basic structure, including Zeeman effect, spin-orbit coupling, many-electron atoms. X-ray spectra, optical selection rules, emission and absorption of radiation, including lasers.

Optics: Fermat's principle, lenses, imaging systems, diffraction, interference, relation between geometrical and wave descriptions, interferometers, spectrometers.

Statistical mechanics: probability distributions, micro and macrostates, Boltzmann distribution, ensembles, equipartition theorem, blackbody spectrum, including Planck distribution.

Evidence for Quantum Mechanics: atoms, photons, photo-electric effect, Rutherford scattering, Compton scattering, de-Broglie waves.

The course provides an introduction to solid state physics, covering several topics that are later discussed in more detail in other more specialized lectures. The central topics are: solids and their lattice structures; interatomic bindings; lattice dynamics, electronic properties of insulators, metals, semiconductors, transport properties, magnetism, superconductivity.

The course provides an introduction to non-relativistic single-particle quantum mechanics. In particular, the basic concepts of quantum mechanics, such as the quantization of classical systems, wave functions and the description of observables as operators on a Hilbert space, and the formulation of symmetries will be discussed. Basic phenomena will be analysed and illustrated by generic examples.

The course provides an overview of fundamental concepts and physical processes in astrophysics with the dual goals of: i) illustrating physical principles through a variety of astrophysical applications; and ii) providing an overview of research topics in astrophysics.

Type

Proseminar Theoretical Physics: Particle Physics at

Lecturers

Professors

Students should learn how to perform a bit more complex experiments, analyze the data and interpret the results.

Prerequisites / notice

To organise a semester project take contact with one of the instructors.

Not all lecturers are directly eligible in myStudies if "Professors" is the required type of lecturers. In such cases please take contact with the Study Administration Office (http://www.phys.ethz.ch/phys/education/studiensekretariat/?lang=en).

Proseminars, Experimental and Theoretical Semester Papers

To organise a semester project take contact with one of the instructors.

Die Leistungskontrolle erfolgt aufgrund eines oder mehrerer schriftlicher Berichte bzw. einer schriftlichen Arbeit. Vorträge können ein zusätzlicher Bestandteil der Leistungskontrolle sein.

The aim of the project is to give the student experience in working in a research environment, carrying out physics experiments, analysing and interpreting the resulting data.

The Leistungskontrolle erfolgt aufgrund eines oder mehrerer schriftlicher Berichte bzw. einer schriftlichen Arbeit.

**Abstract**
This lecture provides an overview of programming techniques for scientific simulations. The focus is on advanced C++ programming techniques and scientific software libraries. Based on an overview of the hardware components of PCs and supercomputer, optimization methods for scientific simulation codes are explained.

**402-0713-00L** | Astro-Particle Physics I | W | 6 credits | 2V+1U | A. Biland |

**Abstract**
This lecture gives an overview of the present research in the field of Astro-Particle Physics, including the different experimental techniques. In the first semester, main topics are the charged cosmic rays including the antimatter problem. The second semester focuses on the neutral components of the cosmic rays as well as on some aspects of Dark Matter.

**Objective**
Successful students know:
- experimental methods to measure cosmic ray particles over full energy range
- current knowledge about the composition of cosmic ray
- possible cosmic acceleration mechanisms
- correlation between astronomical object classes and cosmic accelerators
- information about our galaxy and cosmology gained from observations of cosmic ray

**Content**
First semester (Astro-Particle Physics I):
- definition of 'Astro-Particle Physics'
- important historical experiments
- chemical composition of the cosmic rays
- direct observations of cosmic rays
- indirect observations of cosmic rays
- 'extended air showers' and 'cosmic muons'
- 'knee' and 'ankle' in the energy spectrum
- the 'anti-matter problem' and the Big Bang
- 'cosmic accelerators'

**Lecture notes**
See lecture home page: [http://ihp-lx2.ethz.ch/AstroTeilchen/](http://ihp-lx2.ethz.ch/AstroTeilchen/)

**Literature**

| 402-0737-00L | Energy and Environment in the 21st Century (Part I) | W | 6 credits | 2V+1U | M. Dittmar |

**Abstract**
The energy and related environmental problems, the physics principles of using energy and the various real and hypothetical options are discussed from a physicist point of view. The lecture is intended for students of all ages with an interest in a rational approach to the energy problem of the 21st century.

**Objective**
Scientists and espially physicists are often confronted with questions related to the problems of energy and the environment. The lecture tries to address the physical principles of todays and tomorrow energy use and the resulting global consequences for the world climate.

The lecture is for students which are interested participate in a rational and responsible debate about the energy problem of the 21. century.

**Content**
Introduction: energy types, energy carriers, energy density and energy usage. How much energy does a human needs/uses?

Energy conservation and the first and second law of thermodynamics

Fossil fuels (our stored energy resources) and their use.

Burning fossil fuels and the physics of the greenhouse effect.

physics basics of nuclear fission and fusion energy

controlled nuclear fission energy today, the different types of nuclear power plants, uranium requirements and resources, natural and artificial radioactivity and the related waste problems from the nuclear fuel cycle.

Nuclear reactor accidents and the consequences, a comparison with risks from other energy using methods.

The problems with nuclear fusion and the ITER project.

Nuclear fusion and fission: "exotic" ideas.

Hydrogen as an energy carrier: ideas and limits of a hydrogen economy.

new clean renewable energy sources and their physical limits (wind, solar, geothermal etc)

Energy perspectives for the next 100 years and some final remarks

**Lecture notes**

**Abstract**

- The course gives an insight into the notion of information and its relevance to physics and, in particular, quantum mechanics. Further topics include applications such as quantum cryptography and quantum computing.
- The course provides an introduction to the functional properties of neurons. Particularly, the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.
- The goal of this course is to introduce the foundations of quantum information theory. It starts with a brief introduction to the mathematical theory of information and then discusses the basic information-theoretic aspects of quantum mechanics. Further topics include applications such as quantum cryptography and quantum computing.

**Objective**

- The course gives an insight into the notion of information and its relevance to physics and, in particular, quantum mechanics. It also serves as a preparation for further courses in the area of quantum information sciences.
- The course introduces the most important aspects of superconductivity, covering both experimental as well as theoretical aspects. The following subtopics are discussed: occurrence of superconductivity, basic phenomena, thermodynamics, electrodynamics, London equation, Pippard theory, Ginzburg-Landau theory and -equations, flux quantization, magnetic properties of type I and II superconductors, BCS theory, tunnel effects with superconductors, Josephson effects, superconducting quantum interference devices (SQUID), introduction to high-Tc superconductivity.
- The lecture course provides an introduction to superconductivity, covering both experimental as well as theoretical aspects. The following subtopics are discussed: occurrence of superconductivity, basic phenomena, thermodynamics, electrodynamics, London equation, Pippard theory, Ginzburg-Landau theory, Ginzburg-Landau equations, flux quantization, magnetic properties of type I and II superconductors, BCS theory, tunnel effects with superconductors, Josephson effects, superconducting quantum interference devices (SQUID), short introduction to high-Tc superconductivity.
- The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.
- The preceding attendance of the scheduled lecture courses Introduction to Solid State Physics and Quantum Mechanics I are expected.
- Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.
- As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.
- The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.
- High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.
- Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization vitals are optimal for the preparation of medical implants and the determination of tissue's anisotropies within the human body.
- Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.
- 3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

**Notice**

- Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.
Content
This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

401-3531-00L Differential Geometry I

Abstract
This course is an introduction to differential and riemannian geometry.

Objective
The aim is to lead students from a reasonable knowledge of advanced calculus, basic knowledge of general topology and solid knowledge of linear algebra to fundamental knowledge of differentiable manifolds and their basic tools. Riemannian geometry, some basic Lie theory, and de Rham cohomology will be developed as applications.

Literature
W. Boothby “An introduction to differentiable manifolds and Riemannian geometry”

401-3461-00L Functional Analysis I

Abstract
Baire category; Banach and Hilbert spaces, bounded linear operators; Three Fundamental Principles: Uniform Boundedness, Open Mapping/Closed Graph, Hahn-Banach; Convexity; Dual Spaces: weak and weak* topologies, Banach-Alaoglu, reflexive spaces; Ergodic Theorem; compact operators and Fredholm theory, Closed Image Theorem; Spectral theory, self-adjoint operators.

Lecture notes
Lecture Notes on “Functional Analysis” by D. A. Salamon

401-3601-00L Probability Theory

Abstract
Basics of probability theory and the theory of stochastic processes in discrete time

Objective
This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:
Basics in measure theory, random series, law of large numbers, weak convergence, characteristic functions, central limit theorem, conditional expectation, martingales, convergence theorems for martingales, Galton Watson chain, transition probability, Theorem of Ionescu Tulcea, Markov chains.

Content
This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:
Basics in measure theory, random series, law of large numbers, weak convergence, characteristic functions, central limit theorem, conditional expectation, martingales, convergence theorems for martingales, Galton Watson chain, transition probability, Theorem of Ionescu Tulcea, Markov chains.

Lecture notes
available, will be sold in the course

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

The topics of the mentored work are mostly chosen from the high school curriculum.

Methods
With the help of the mentor the students individually work on a topic and write a thesis about it.

### Specialized Courses in Respective Subject with Educational Focus

**Abstract**
Scientists and especially physicists are often confronted with questions related to the problems of energy and the environment. The lecture tries to address the physical principles of todays and tomorrow energy use and the resulting global consequences for the world climate.

The lecture is for students which are interested participate in a rational and responsible debate about the energyproblem of the 21st century.
Content
Introduction: energy types, energy carriers, energy density and energy usage. How much energy does a human needs/uses?
Energy conservation and the first and second law of thermodynamics
Fossile fuels (our stored energy resources) and their use.
Burning fossile fuels and the physics of the greenhouse effect.
Physics basics of nuclear fission and fusion energy
controlled nuclear fission energy today, the different types of nuclear power plants, uranium requirements and resources, natural and artificial radioactivity and the related waste problems from the nuclear fuel cycle.
Nuclear reactor accidents and the consequences, a comparison with risks from other energy using methods.
The problems with nuclear fusion and the ITER project.
Nuclear fusion and fission: "exotic" ideas.
Hydrogen as an energy carrier: ideas and limits of a hydrogen economy.
new clean renewable energy sources and their physical limits (wind, solar, geothermal etc)
Energy perspectives for the next 100 years and some final remarks

Lecture notes
many more details (in english and german) here:

Literature
Environmental Physics: Boeker and Egbert New York Wiley 1999

Prerequisites / notice
Science promised us truth, or at least a knowledge of such relations as our intelligence can seize:
it never promised us peace or happiness
Gustave Le Bon

Physicists learned to realize that whether they like a theory or they don't like a theory is not the essential question.
Rather, it's whether or not the theory gives predictions that agree with experiment.
Richard Feynman, 1985

402-0922-00L Mentored Work Specialised Courses in Physics with an Educational Focus A
Mentored Work Specialised Courses in the Respective Subject with an Educational Focus in Physics for TC and Teaching Diploma.

Abstract
In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

Objective
Practice in the explanation of complex topics in physics as the core competence of the teaching profession

Content
Improvement of the physics education by providing attractive recent topics with regard to future curricular decisions and the public view of physics
Choice of topic by individual arrangement

402-0944-00L Science in School (Current Topics for the Classroom)
Enrolment in Physics Didactics I (402-0910-00L) and Physics Didactics II (402-0910-00L) is mandatory.

Content
Kennenlernen und erarbeiten (Übungen) von Unterrichtsssequenzen zu modernen Themen der Physik.
Unterlagen werden verteilt.

Literature
Wird angegeben.

The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objectives:
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

Course offerings in the category Educational Science are listed under "Programme: Educational Science for Teaching Diploma and TC".

|            | This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)". |
| Abstract   | Literature from the learning sciences is critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and two further meetings will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work. |
| Objective  | - Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences |
| 851-0242-09L | Student Research Projects: Practical Research on Learning and Instruction ■ Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport). |
|            | Number of participants limited to 30.                                  |
|            | The successful completion of both course no. 851-0240-00L "Menschliches Lernen (EW 1)" and course no. 851-0238-01L "Unterstützung und Diagnose von Wissenserwerbsprozessen (EW 3)" is a necessary prerequisite for this course. |
| Abstract   | In teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturers in this course. Basic conceptual and methodological issues are the topic of a series of plenary meetings; however, the major part of the work is done in small-group meetings with the advising researcher, and in self-directed research projects. |
| Objective  | The course is targeted at advanced students who have taken an interest in gathering practical research experience in the field of Learning & Instruction. In teams of two, students conduct their own research projects (planning, conducting, analyzing, interpreting, and presenting research); thus, the course requires a high amount of self-directed working. Students are personally advised, and supported in their research project, by one of the researchers serving as lecturers in this course. During the first half the semester, relevant methodological knowledge and skills are practiced during plenary meetings and in students’ independent reading (e.g. generating and testing research questions, designing experiments, and analyzing data in the field of Learning and Instruction) |
| Learning goals include: |
- Participants can illustrate and explain basic methods and concepts for research in the fields of Learning and Instruction, e.g. with the help of practical examples.
- Participants can generate testable research questions for a topic relevant in the fields of Learning and Instruction.
- Participants can design and conduct a study that is relevant for answering their research question.
- Participants can summarize and evaluate the main results from a study in the field of learning and Instruction, with regard to the research question being asked.

Objective
- The objective is for the students:
  - to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle.
  - to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Content
- The topics of the mentored work are mostly chosen from the high school curriculum.

Methods
- With the help of the mentor the students individually work on a topic and write a thesis about it.

Abstract
During the introductory teaching practice, the students sit in on five lessons given by the teacher responsible for their teaching practice, and teach five lessons themselves. The students are given observation and reflection assignments by the teacher responsible for their teaching practice.
On the basis of a specified topic, the candidate shows that they are in a position

Examination Lesson I Physics

Teaching Internship Physics

Physics as Major Subject

Abstract

The teaching practice takes in 50 lessons: 30 are taught by the students, and the students sit in on 20 lessons. The teaching practice lasts 4-6 weeks. It gives students the opportunity to implement the contents of their specialist-subject, educational science and subject-didactics training in the classroom. Students also conduct work assignments in parallel to their teaching practice.

Objective

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They acquire the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Teaching Internship Physics I

Teaching Internship for Teaching Diploma

Physics as Major Subject

Abstract

Die Studierenden können die Bedeutung von Unterrichtsthemen in ihrem Fach unter verschiedenen Blickwinkeln einschätzen. Sie kennen und beherrschen das Unterrichtshandwerk. Sie können ein gegebenes Unterrichtsthema für eine Gruppe von Lernenden fachlich und didaktisch korrekt strukturieren und in eine adäquate Lernumgebung umsetzen. Es gelingt ihnen, die Balance zwischen Anleitung und Offenheit zu finden, sodass die Lernenden sowohl über den nötigen Freiraum als auch durch Orientierung verfügen, um aktiv und effektiv flexibel nutzbare (Fach-)Wissen zu erwerben.

**Abstract**

In the final phase of their training, students have to apply and test the insights, abilities and skills they have acquired. They spend 3-5 weeks in an educational institution, during which time they observe 10 lessons and teach 30 lessons independently. The Teaching Internship is complemented by 10 further observed lessons, which are integrated into the Mentored Work in Subject Didactics.

**Objective**

Die Studierenden können die Bedeutung von Unterrichtsthemen unter verschiedenen Blickwinkeln einschätzen. Sie kennen und beherrschen das unterrichtliche Handwerk. Sie können ein gegebenes Unterrichtsthema für eine Gruppe von Lernenden fachlich und didaktisch korrekt strukturieren und in eine adäquate Lernumgebung umsetzen. Es gelingt ihnen, die Balance zwischen Anleitung und Offenheit zu finden, sodass die Lernenden sowohl über den nötigen Freiraum wie über ausreichend Orientierung verfügen, um aktiv und effektiv flexibel nutzbaren (Fach-)Wissen zu erwerben.

**Abstract**

The energy and related environmental problems, the physics principles of using energy and the various real and hypothetical options are derived from a physicist’s point of view. The lecture is intended for students of all ages with an interest in a rational approach to the energy problem of the 21st century.

**Objective**

Scientists and espially physicists are often confronted with questions related to the problems of energy and the environment. The lecture tries to address the physical principles of todays and tomorrow energy use and the resulting global consequences for the world climate.

The lecture is for students which are interested participate in a rational and responsible debate about the energy problem of the 21. century.

**Content**

Introduction: energy types, energy carriers, energy density and energy usage. How much energy does a human needs/uses?

Energy conservation and the first and second law of thermodynamics

Fossil fuels (our stored energy resources) and their use.

 Burning fossil fuels and the physics of the greenhouse effect.

physics basics of nuclear fission and fusion energy

controlled nuclear fission energy today, the different types of nuclear power plants, uranium requirements and resources, natural and artificial radioactivity and the related waste problems from the nuclear fuel cycle.

Nuclear reactor accidents and the consequences, a comparison with risks from other energy using methods.

The problems with nuclear fusion and the ITER project.

Nuclear fusion and fission: “exotic” ideas.

Hydrogen as an energy carrier: ideas and limits of a hydrogen economy.

new clean renewable energy sources and their physical limits (wind, solar, geothermal etc)

Energy perspectives for the next 100 years and some final remarks

402-0922-00L Mentored Work Specialised Courses in Physics with an Educational Focus A W 2 credits 4A G. Schiltz, A. Vaterlaus, C. Wagner

Mentored Work Specialised Courses in the Respective Subject with an Educational Focus in Physics for TC and Teaching Diploma.

Abstract
In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

Objective
Practice in the explanation of complex topics in physics as the core competence of the teaching profession

Content
Choice of topic by individual arrangement

Compulsory Elective Courses

Further course offerings from the category Educational Science are listed under “Programme: Educational Science for Teaching Diploma and TC”. Teaching Diploma in 2 Subjects in One-Step Procedure:
a) the course 402-0904-00L “Professional Exercises: Experiments in physics teaching” (takes place in Spring Semester only) must be completed within the category Compulsory Elective Courses;
b) courses from the category Compulsory Elective Courses of the Minor Subject may also be selected;
c) courses from the category Specialized Courses in the Respective Subject, either of the Major or the Minor Subject, may also be selected.

Science promised us truth, or at least a knowledge of such relations as our intelligence can seize: it never promised us peace or happiness

Gustave Le Bon

Physicists learned to realize that whether they like a theory or they don’t like a theory is not the essential question. Rather, it’s whether or not the theory gives predictions that agree with experiment.

Richard Feynman, 1985
The main topics of the course unit "Computer Science in Secondary School Mathematics" represent a scientific and didactic added value for mathematics classes.

The course covers the didactics of logic, of cryptography, of finite state automata, of computability and of the introduction to programming. The students develop the understanding of fundamental scientific concepts such as algorithm, program, complexity, determinism, computation, automata, verification, testing, security of a cryptosystem and secure communication. They reflect on ways to embed them into a scientifically sound and didactically sustainable mathematics course.

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

Simultaneous enrolment in Introductory Internship Physics
- course 402-0920-00L - is compulsory for Teaching Diploma Physic

Objective

Die Studierenden verfügen über fachdidaktisches Grundwissen für den Physikunterricht an einer Mittelschule. Sie können eigene Lektionen unter Berücksichtigung der vielfältigen Rahmenbedingungen planen, durchführen und evaluieren. Sie reflektieren ihren Unterricht und sind bestrebt, ihn didaktisch und pädagogisch weiter zu entwickeln.

Die Studierenden kennen die Einsatzmöglichkeiten, Chancen und Schwierigkeiten verschiedener Unterrichtsmethoden und Hilfsmittel. Sie können die Eignung von Unterrichtsformen im Hinblick auf eine Lernsituation beurteilen. Sie bemühen sich in ihrem Unterricht, geeignete Methoden und Medien angepasst an die Klasse und das Thema einzusetzen.

Content

Thematische Schwerpunkte
Fachspezifisches; Sachstrukturen der gängigen Unterrichtsthemen, Alltagsbeziehungen, Fehlvorstellungen, Demonstrations- und Schülerexperimente, Arbeitsmittel zu physikalischen Themen des Grundlagen- und Schwerpunktkunterrichts
Einsatz verschiedener Unterrichtsmaterialien: Experimente, Computer, Taschenrechner, Video, Simulation Unterrichtsformen: Lernaufgabe, Werkstatt, Puzzle, Projekt, Gruppenarbeit, Praktikum
Lernformen
Interaktive Lehr-Lernveranstaltung mit Vorträgen und Demonstrationen des Dozenten, studentischer Einzel- und Kleingruppenarbeit, kurzen Präsentationen der Studierenden, Verblendung der Inhalte durch Bearbeitung von Aufträgen in der Freizeit

Lecturer notes

Limited number of participants.
Further information is available from the lecturer via email: momohr@ethz.ch

Literature

Simultaneous enrolment in Introductory Internship Physics
- course 402-0920-00L - is compulsory for Teaching Diploma Physic

Objective

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

Objective

The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Content

Thematic Focus
The topics of the mentored work are mostly chosen from the high school curriculum.

Methods
With the help of the mentor the students individually work on a topic and write a thesis about it.

- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Content

Thematic Focus
The topics of the mentored work are mostly chosen from the high school curriculum.

Methods
With the help of the mentor the students individually work on a topic and write a thesis about it.
Teaching Internship Including Examination Lessons

Physics

Teaching Internship Physics for TC and Teaching Diploma Physics as Minor Subject.
Repetition of the Teaching Internship is excluded even if Examination Lessons are to be repeated.

Abstract
Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Objective
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Abstract
This lecture covers the concepts of classical and quantum statistical physics, and some aspects of kinetic gas theory. In a more advanced part Bose-Einstein condensation, general mean field theory and critical phenomena will be addressed. Finally also various aspects of linear response theory will be discussed.

Objective
This lecture gives an introduction in the basic concepts and applications of statistical physics for the general use in physics and, in particular, as a preparation for the theoretical solid state physics education.

Content
Basics of phenomenological thermodynamics, three laws of thermodynamics.
Classical statistical physics: microcanonical ensembles, canonical ensembles and grandcanonical ensembles, applications to simple systems.
Quantum statistical physics: single particle, ideal quantum gases, fermions and bosons.
Bose-Einstein condensation: Bogolyubov theory, superfluidity.
Critical phenomena: mean field, series expansions, scaling behavior, universality.
Renormalization group: fixed points, simple models.
Linear response theory: general formulation, response in mean field, sum rules, collective modes, fluctuation dissipation theorem.

Lecture notes
Lecture notes will be provided.

Literature
No specific book is used for the course. Relevant literature will be cited in the course.

Abstract
This course discusses the quantisation of fields in order to introduce a coherent formalism for the combination of quantum mechanics and special relativity.
Topics include:
- Relativistic quantum mechanics
- Quantisation of bosonic and fermionic fields
- Interactions in perturbation theory
- Scattering processes and decays
- Radiative corrections

Objective
The goal of this course is to provide a solid introduction to the formalism, the techniques, and important physical applications of quantum field theory. Furthermore it prepares students for the advanced course in quantum field theory (Quantum Field Theory II), and for work on research projects in theoretical physics, particle physics, and condensed-matter physics.

Abstract
This course is an extension of the introductory course on solid state physics.

The purpose of this course is to learn to navigate the complex collective quantum phases, excitations and phase transitions that are the dominant theme in modern solid state physics. The emphasis is on the main concepts and on specific experimental examples, both classic ones and those from recent research.

Objective
The goal is to study how novel phenomena emerge in the solid state.
Content = Today's challenges and opportunities in Solid State Physics
= Phase transitions and critical phenomena
   . Main concepts: coherence length, symmetry, order parameter, correlation functions, generalized susceptibility
   . Bragg-Williams mean field theory
   . Landau theory of phase transitions
   . Fluctuations in Landau theory
   . Critical exponents: significance, measurement, inequalities, equalities
   . Scaling and hyperscaling
   . Universality
   . Critical dynamics
   . Quantum phase transitions and quantum criticality
= Fermi surface instabilities
   . The concept of the Landau Fermi liquid in metals
   . Kohn anomalies
   . Charge density waves
   . Metallic ferromagnets and half-metals
   . Spin density waves
= Magnetism of insulators
   . Magnetic interactions in solids and the spin Hamiltonian
   . Magnetic structures and phase transitions
   . Spin waves
   . Quantum magnetism
= Electron correlations in solids
   . Mott insulating state
   . Phases of the Hubbard model
   . Layered cuprates (non-superconducting properties)

Lecture notes
The printed material for this course involves: (1) a self-contained script, distributed electronically at semester start. (2) experimental examples (Power Point slide-style) selected from original publications, distributed at the start of every lecture.

Literature
A list of books will be distributed. Numerous references to useful published scientific papers will be provided.

Prerequisites / notice
This course is for students who like to be engaged in active learning. The "exercise classes" are organized in a non-traditional way: following the idea of "less is more", we will work on only about half a dozen topics, and this gives students a chance to take a look at original literature (provided), and to get the grasp of a topic from a broader perspective.

Students report back that this mode of "exercise class" is more satisfying than traditional modes, even if it does not mean less effort.

402-0442-00L Quantum Optics W 10 credits 3V+2U T. Esslinger

Abstract
This course gives an introduction to the fundamental concepts of Quantum Optics and will highlight state-of-the-art developments in this rapidly evolving discipline. The topics covered include:

- coherence properties of light
- quantum nature of light: statistics and non-classical states of light
- light matter interaction: density matrix formalism and Bloch equations
- quantum description of light matter interaction: the Jaynes-Cummings model, photon blockade
- laser manipulation of atoms and ions: laser cooling and trapping, atom interferometry,
- further topics: Rydberg atoms, optomechanics, quantum computing, complex quantum systems.

Objective
The course aims to provide the knowledge necessary for pursuing research in the field of Quantum Optics. Fundamental concepts and techniques of Quantum Optics will be linked to modern experimental research. During the course the students should acquire the capability to understand currently published research in the field.

Content
This course gives an introduction to the fundamental concepts of Quantum Optics and will highlight state-of-the-art developments in this rapidly evolving discipline. The topics that are covered include:

Lecture notes
Selected book chapters will be distributed.

Literature
Text-books:

Data: 06.12.2017 12:57  Autumn Semester 2015  Page 1150 of 1432
This course gives an introduction into the fundamentals of semiconductor materials. The main focus is on state-of-the-art fabrication and

1. Introduction and overview
2. Semiconductor crystals: Fabrication and band structures
3. k.p-theory, effective mass
4. Envelope functions and effective mass approximation, heterostructures and band engineering
5. Fabrication of semiconductor nanostructures
6. Electrostatics and quantum mechanics of semiconductor nanostructures
7. Heterostructures and two-dimensional electron gases
8. Drude Transport
9. Electron transport in quantum point contacts; Landauer-Büttiker description
10. Ballistic transport experiments
11. Interference effects in Aharonov-Bohm rings
12. Electron in a magnetic field, Shubnikov-de Haas effect
13. Integer quantum Hall effect
14. Coulomb blockade and quantum dots

Lecture notes

Literature
In addition to the lecture notes, the following supplementary books can be recommended:

Prerequisites / notice
The course is taught in English.

402-0313-00L Materials Research Using Synchrotron Radiation

Objective
A comprehensive understanding of the interaction of x-rays with condensed matter and their use in materials analysis; acquiring hands-on experience with the use of synchrotron radiation.

Content
Interaction of x-rays with matter:
Elastic scattering from bound electron, atom and assemblies of atoms; Compton scattering; principles of diffraction from crystals and scattering from disordered systems; thermal diffuse scattering, small-angle scattering from nanometre-sized objects; X-ray absorption spectroscopy; microscopy; comparison with neutron scattering, where appropriate.

The generation of high-brilliance x-ray beams at synchrotron radiation sources:
Undulators, wiggler and bending magnets; comparison with conventional lab sources; the future x-ray free electron laser.

Instrumentation:
Monochromator; diffractometer; detector.

Determination of materials properties:
Crystal structure; defects and strain fields; structure of surfaces and interfaces; chemical bonding properties.

New methods:
Coherent x-ray scattering and diffractive imaging.

Lecture notes
A reader and a guide through the experiments at the Swiss Light Source will be made available on the web.

Prerequisites / notice
The lab course has been designed by J. Als-Nielsen in collaboration with staff from the SLS.

Part of the course is in the form of practical work at the Swiss Light Source. During two days (dates to be agreed), the following experiments will be performed: (1) elastic and Compton scattering, (2) liquid scattering and powder diffraction, and (4) X-ray absorption spectroscopy.

The course is taught in English.

14. Coulomb blockade and quantum dots
13. Integer quantum Hall effect
12. Electron in a magnetic field, Shubnikov-de Haas effect
11. Interference effects in Aharonov-Bohm rings
10. Ballistic transport experiments
9. Electron transport in quantum point contacts; Landauer-Büttiker description
8. Drude Transport
7. Heterostructures and two-dimensional electron gases
6. Fabrication of semiconductor nanostructures
5. Electrostatics and quantum mechanics of semiconductor nanostructures
4. Envelope functions and effective mass approximation, heterostructures and band engineering
3. k.p-theory, effective mass
2. Semiconductor crystals: Fabrication and band structures
1. Introduction and overview

6 credits

402-0317-00L Semiconductor Materials: Fundamentals and Fabrication

Abstract
This course gives an introduction into the fundamentals of semiconductor materials. The main focus is on state-of-the-art fabrication and characterization methods. The course will be continued in the spring term with a focus on applications.

Objective
Basic knowledge of semiconductor physics and technology. Application of this knowledge for state-of-the-art semiconductor device processing.

Content
Fundamentals of Solid State Physics: Semiconductor materials, band structures, carrier statistics in intrinsic and doped semiconductors, p-n junctions, low-dimensional structures;
Bulk Material growth of Semiconductors: Czochralski method, floating zone method, high pressure synthesis;
Semiconductor Epitaxy: Fundamentals, MBE, MOCVD, LPE;
In situ characterization: RHEED, LEED, AES, XPS, process control (temperature, thickness)

402-0543-00L Neutron Scattering in Solid State Physics

Abstract
Introduction to neutron scattering: quantum-mechanical description in terms of correlation functions. Principles of neutron instrumentation. Applications to basic problems of solid state physics: diffraction from crystals, lattice dynamics, scattering by liquids, magnetic structures and magnetic excitations.

Objective
Derivation and comprehension of neutron scattering cross sections, principles of neutron instrumentation, and applications (lecture and exercises) to basic problems of solid state physics: static and dynamics of condensed matter, magnetic structures as well as magnetic excitations.
Students recognize and appreciate the enormous impact "physics" has on today's high tech world. Abstract concepts, old and recent, we explore how traditional and new physics concepts and achievements make their way into today's ubiquitous high-tech gadget: the smartphone.

The rich physics of the optical properties of semiconductors, as well as the advanced processing available on these materials, enabled numerous applications (lasers, LEDs and solar cells) as well as the realization of new physical concepts. Systems that will be covered include quantum dots, exciton-polaritons, quantum Hall fluids and graphene-like materials.

**Optical Properties of Semiconductors**

**Number** 402-0404-00L
**Type** W
**ECTS** 6
**Hours** 2V+2U

**Abstract** This course presents a comprehensive discussion of optical processes in semiconductors.

**Objective** The rich physics of the optical properties of semiconductors, as well as the advanced processing available on these materials, enabled numerous applications (lasers, LEDs and solar cells) as well as the realization of new physical concepts. Systems that will be covered include quantum dots, exciton-polaronitons, quantum Hall fluids and graphene-like materials.

**Content** Electronic states in III-V materials and quantum structures, optical transitions, excitons and polaritons, novel two dimensional semiconductors, spin-orbit interaction and magneto-optics.

**Prerequisites / notice** Prerequisites: Quantum Mechanics I, Introduction to Solid State Physics

---

**Ultrafast Laser Physics**

**Number** 402-0402-00L
**Type** W
**ECTS** 6
**Hours** 2V+1U

**Abstract** This lecture will introduce students to active ongoing research topics and provide their fundamental background.

**Objective** This course gives a survey of current research topics using accelerator-based probes (photons, neutrons, muons) to study problems in condensed matter physics, solid state dynamics in superconductors and low dimensional systems, quantum phase transitions, as well as structural biology.

**Content** The course will discuss several current examples of research using accelerator facilities highlighting different technologies and their applications. Specific attention will be given to x-ray spectroscopy and scattering experiments conducted at synchrotrons and x-ray Free Electron Lasers, as well as neutron scattering experiments at spallation sources and muon spin rotation.

**Prerequisites / notice** Former course title "Neutron Scattering in Condensed Matter Physics I"

---

**Selection: Quantum Electronics**

**Number** 402-0464-00L

<td>2V+1U</td>
<td>S. Johnson</td>
</tr>
</tbody>
</table>

**Abstract:**
This course gives a practical overview of the THz frequency electromagnetic radiation and over the applications of this radiation in a variety of fields, both scientific and industrial.

**Objective:**
Terahertz frequency electromagnetic radiation lies at the border between electronics and optics, and as such has many unique properties that make it well-suited to study the electronic, magnetic and structural properties of many materials. This course objective is to give students the ability to identify problems that can be addressed using terahertz frequency radiation and to design (on a conceptual level) a way to implement solutions to these problems. These "problems" include both scientific (in physics, chemistry and biology) and industrial (medicine, pharmaceuticals, security) areas.

On the scientific side the applications of THz relate to understanding the electronic, structural and magnetic properties of materials by studying the optical response at low frequencies without the need for physical contact with the sample. The industrial applications tend to be more related imaging (e.g. THz-based airport scanners), but also some spectroscopy is done to identify materials.

**Content:**
Topics to be discussed in the class include:
1. Overview of THz & interactions with matter
2. THz generation methods
3. THz optics and electronics
4. THz detection methods
5. THz applications
   - a) Spectroscopy
   - b) Imaging

**Literature:**
- Principles of Terahertz Science and Technology, Yun-Shick Lee (Springer, 2008). More of a focus on basic principles, many of the readings will come from this book.
- Introduction to THz Wave Photonics, Xi-Cheng Zhang and Jingzhou Xu (Springer, 2010). Fairly good overview, also good description of applications.
- Quantum electronics.

### Selection: Particle Physics, Nuclear Physics

</tr>
</tbody>
</table>

**Abstract:**

**Objective:**
Acquire an in-depth understanding and overview of the essential elements of experimental methods in particle physics, including accelerators and experiments.

**Content:**
1. Examples of modern experiments
2. Basics: Bethe-Bloch, radiation length, nucl. interaction length, fixed-target vs. collider, principles of measurements: energy- and momentum-conservation, etc
3. Physics and layout of accelerators
4. Charged particle tracking and vertexing
5. Calorimetry
6. Particle identification
7. Analysis methods: invariant and missing mass, jet algorithms, b-tagging
8. Special detectors: extended airshowers, emulsions, cryogenic detectors for dark matter detection
9. MC simulations (GEANT), trigger, readout, electronics

<td>402-0713-00L</td>
<td>Astro-Particle Physics I</td>
<td>W</td>
<td>6</td>
<td>2V+1U</td>
<td>A. Biland</td>
</tr>
</tbody>
</table>

**Abstract:**
This lecture gives an overview of the present research in the field of Astro-Particle Physics, including the different experimental techniques. In the first semester, main topics are the charged cosmic rays including the antimatter problem. The second semester focuses on the neutral components of the cosmic rays as well as on some aspects of Dark Matter.

**Objective:**
Successful students know:
- experimental methods to measure cosmic ray particles over full energy range
- current knowledge about the composition of cosmic ray
- possible cosmic acceleration mechanisms
- correlation between astronomical object classes and cosmic accelerators
- information about our galaxy and cosmology gained from observations of cosmic ray

**Prerequisites:**
- 402-0415-62L Terahertz Technology and Applications
- 402-0725-00L Experimental Methods and Instruments of Particle Physics
First semester (Astro-Particle Physics I):
- definition of 'Astro-Particle Physics'
- important historical experiments
- chemical composition of the cosmic rays
- direct observations of cosmic rays
- indirect observations of cosmic rays
- 'extended air showers' and 'cosmic muons'
- 'knee' and 'ankle' in the energy spectrum
- the 'anti-matter problem' and the Big Bang
- 'cosmic accelerators'

The course aims to provide an introduction to selected advanced topics in low energy particle physics with neutrons and muons. Besides the sensitivity to effects related with new physics (e.g. lepton flavor violation, symmetry violations, CPT tests, search for electric dipole moments, new low mass exchange bosons etc.), low energy physics provides the best test of QED (electron g-2), the best tests of bound-state QED (atomic physics and exotic atoms), precise determinations of fundamental constants, information about the CKM matrix, precise information on the weak and strong force even in the non-perturbative regime etc.

In this lecture, we will concentrate on selected experiments, using mainly neutrons and muons, which have significantly improved our understanding of particle physics today. Starting from a general introduction on high intensity/high precision particle physics and the main characteristics of neutrons and neutrinos and their production, we will then focus on the discussion of fundamental problems and ground-breaking experiments:

- Production and characteristics of muon and neutron beams
- Ultracold neutron production
- Measurement of the neutron lifetime and electric dipole moment
- The neutron in the gravitational field and its electric charge
- Muon and neutron decay correlations
- Lepton flavour violations with muons to search for new physics
- What atomic physics can do for particle physics and vice versa
- Laser experiments at accelerators
- From myonic hydrogen to the proton structure and bound-state QED
- From pionic hydrogen to the strong interaction and effective field theories
- etc.

The course will be complemented by exercises that aim to provide you with hands-on experience with the tools and techniques discussed in the lecture. In some of the exercises you will be confronted with next generation machines. We will develop a Python simulation tool (AcceLEGrator) that reflects the theory from the lecture.

Abstract

An introduction to the theoretical aspects and experimental tests of QCD, with emphasis on perturbative QCD and related experiments at colliders.

Objective

Knowledge acquired on basics of perturbative QCD, both of theoretical and experimental nature. Ability to perform simple calculations of perturbative QCD, as well as to understand modern publications on theoretical and experimental aspects of perturbative QCD.

Content

- QCD Lagrangian and Feynman Rules
- QCD running coupling
- Parton model
- Altarelli-Parisi equations
- Basic processes
- Experimental tests at lepton and hadron colliders
- Measurements of the strong coupling constant

Literature

2. R. K. Ellis, W. J. Stirling, B. R. Webber: "QCD and Collider Physics" (Cambridge Monographs on Particle Physics, Nuclear Physics & Cosmology)

Prerequisites / notice

This lecture is also suited for PhD. students.

---

Abstract

The energy and related environmental problems, the physics principles of using energy and the various real and hypothetical options are discussed from a physicist point of view. The lecture is intended for students of all ages with an interest in a rational approach to the energy problem of the 21st century.

Objective

Scientists and especially physicists are often confronted with questions related to the problems of energy and the environment. The lecture tries to address the physical principles of today's and tomorrow energy use and the resulting global consequences for the world climate. The lecture is for students which are interested participate in a rational and responsible debate about the energy problem of the 21st century.

Content

- Introduction: energy types, energy carriers, energy density and energy usage. How much energy does a human need/use?
- Energy conservation and the first and second law of thermodynamics
- Fossil fuels (our stored energy resources) and their use.
- Burning fossil fuels and the physics of the greenhouse effect.
- Physics basics of nuclear fission and fusion energy
- Controlled nuclear fusion energy today, the different types of nuclear power plants, uranium requirements and resources, natural and artificial radioactivity and the related waste problems from the nuclear fuel cycle.
- Nuclear reactor accidents and the consequences, a comparison with risks from other energy using methods.
- The problems with nuclear fusion and the ITER project.
- Nuclear fusion and fission: "exotic" ideas.
- Hydrogen as an energy carrier: ideas and limits of a hydrogen economy.
- New clean renewable energy sources and their physical limits (wind, solar, geothermal etc)
- Energy perspectives for the next 100 years and some final remarks

Lecture notes

Literature

- Environmental Physics: Boeker and Egbert New York Wiley 1999

Prerequisites / notice

Science promised us truth, or at least a knowledge of such relations as our intelligence can seize: it never promised us peace or happiness

Gustave Le Bon

Physicists learned to realize that whether they like a theory or they don't like a theory is not the essential question. Rather, it's whether or not the theory gives predictions that agree with experiment.

Richard Feynman, 1985

---

Selection: Theoretical Physics
### Abstract

The course gives an introduction to symmetry groups in physics. It will explain the relevant mathematical background (finite groups, Lie groups and algebras as well as their representations), and illustrate their important role in modern physics.

**Objective**

The aim of the course is to give a self-contained introduction into finite group theory as well as Lie theory from a physicists point of view. Abstract mathematical constructions will be illustrated with examples from physics.

### Prerequisites / notice

The former title of this course unit was "The Physics Beyond the Standard Model". If you already got credits for "The Physics Beyond the Standard Model" (402-0898-00L), you cannot get credits for "The Physics of Electroweak Symmetry Breaking" (402-0898-00L).

### Lecturers

N. Beisert

### Content

**Theory part:**
- the Standard Model and the mass problem: WW scattering and the no-lose theorem
- the Higgs mechanism and its implementation in the Standard Model
- radiative corrections and the screening theorem
- theoretical constraints on the Higgs mass; the hierarchy problem
- Higgs production in e+e- collisions
- Higgs production at hadron colliders
- Higgs decays to fermions and vector bosons
- Higgs differential distributions, rapidity distribution, pt spectrum and jet vetoes
- Higgs properties and beyond the Standard Model perspective
- Outlook: The Higgs sector in weakly coupled and strongly coupled new physics scenarios.

**Experimental part:**
- Introductory material:
  - reminders of detectors/accelerators
  - reminders of statistics: likelihoods, hypothesis testing
  - reminders of multivariate techniques: Neural Networks, Decision Trees
- Main topics:
  - pre-history (pre-LEP)
  - LEP1: measurements at the Z-pole
  - LEP2: towards the limit mH<114 GeV
  - TeVatron searches
  - LHC:
    -- main channel overview
    -- dissect on analysis
    -- combine information from all channels
    -- differential measurements
    -- off-shell measurements
  - Future:
    -- pseudo-observables / EFT
    -- Beyond Standard Model

### Literature

### Prerequisites / notice

- Prerequisites: Quantum Field Theory I, Phenomenology of Particle Physics I

---

### Introduction to Lattice QCD

### Abstract

This course offers an introduction to quantum field theories, in particular QCD, formulated on a space-time lattice. The lattice provides a non-perturbative, gauge-invariant regularization scheme for the Euclidean path integral. The course introduces both the theoretical background and the computational tools, like Monte Carlo simulations, used for the quantitative study of quarks and gluons.

### Objective

To gain familiarity with the formalism of lattice field theories and their numerical simulation methods.

### Quantum Information Theory

### Abstract

The goal of this course is to introduce the foundations of quantum information theory. It starts with a brief introduction to the mathematical theory of information and then discusses the basic information-theoretic aspects of quantum mechanics. Further topics include applications such as quantum cryptography and quantum computing.

### Objective

The course gives an insight into the notion of information and its relevance to physics and, in particular, quantum mechanics. It also serves as a preparation for further courses in the area of quantum information sciences.

### Topological Aspects of Condensed Matter Physics

### Abstract

Elasticity, Dislocation mediated melting of 2d crystals, Roughnening transition, Liquid crystals (classification, elasticity, defects...), Polymers (single chain, Flory scaling, dynamics...), Membranes...

### Content

- Elasticity, Dislocation mediated melting of 2d crystals, Roughnening transition, Liquid crystals (classification, elasticity, defects...), Polymers (single chain, Flory scaling, dynamics...), Membranes...

### Lecturers

G. M. Graf

### Notes

Data: 06.12.2017 12:57
Autumn Semester 2015
Page 1156 of 1432
Statistical methods play a vital role in modern cosmology and astrophysics studies. This course will give an overview of the statistical methods used in these fields. The focus is on advancing C++ programming techniques and software libraries. Based on an overview over the hardware components of PCs and computer, optimization methods for statistical simulation codes are explained.

**402-0873-65L**
**Partial Differential Equations of Quantum Physics**

This course offers an introduction to quantum physics, covering both experimental and theoretical aspects. The following subtopics are discussed: occurrence of superconductivity, basic phenomena, thermodynamics, electrodynamics, London equation, Pippard theory, Ginzburg-Landau theory and -equations, flux quantization, magnetic properties of type I and II superconductors, BCS theory, tunnel effects with superconductors, Josephson effects, superconducting quantum interference devices (SQUID), introduction to high-Tc superconductivity.

**Objective**
Introduction to the most important aspects of superconductivity.

**Content**
This lecture course provides an introduction to superconductivity, covering both experimental and as well as theoretical aspects. The following subtopics are discussed: occurrence of superconductivity, basic phenomena, thermodynamics, electrodynamics, London equation, Pippard theory, Ginzburg-Landau theory, Ginzburg-Landau equations, flux quantization, magnetic properties of type I and II superconductors, BCS theory, tunnel effects with superconductors, Josephson effects, superconducting quantum interference devices (SQUID), introduction to high-Tc superconductivity.

**Literature**
M. Tinkham "Introduction to Superconductivity"  
P. G. de Gennes "Superconductivity Of Metals And Alloys"  
A. A. Abrikosov "Fundamentals of the Theory of Metals"

**Prerequisites / notice**
The preceding attendance of the scheduled lecture courses Introduction to Solid State Physics and Quantum Mechanics I are expected.

**402-0867-00L**
**Programming Techniques for Scientific Simulations I**

This course covers advanced general C++ programming techniques relevant for scientific simulations. The course will cover, in particular:

- generic algorithm and library design  
- exception safety  
- smart pointers and safe memory handling  
- polymorphism at compile time, at run time and hybrid designs  
- mixed language programs, in particular C++, C, Fortran and Python, and the Boost Python library  
- template meta programming and relevant libraries  
- C++ libraries for parallel programming on distributed and shared memory machines  
- Useful C++ libraries from Boost and other sources

**402-0580-00L**
**Superconductivity**

Topics: occurrence of superconductivity, basic phenomena, thermodynamics, electrodynamics, London equation, Pippard theory, Ginzburg-Landau theory and -equations, flux quantization, magnetic properties of type I and II superconductors, BCS theory, tunnel effects with superconductors, Josephson effects, superconducting quantum interference devices (SQUID), introduction to high-Tc superconductivity.

**Objective**
Develop an understanding of basic probability and statistical theory. Gain practical knowledge of statistical methods commonly used in cosmology and astrophysics.

**Content**
Credit or current enrollment in Astrophysics I is recommended but not required.
Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocrystals of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchainments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

Content
- Understanding computation by neurons and neuronal circuits is one of the great challenges of science.
- Many different disciplines can contribute to solving mysteries of neural computation.
- The goal of this introductory course is to introduce the monocrystals of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchainments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

Objective
- This course considers the structure and function of biological neural networks at different levels.
- The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

Literature
- Lecture notes; Plasma Physics for Astrophysics (R. Kulcursd); Plasma Astrophysics (S. Benz); Basic Principles of Plasma Physics (S. Ichimaru); Kinetic Physics (Landau and Lifshitz, Course of Theoretical Physics 10)

Prerequisites / notice
- Astrophysics I is required and Astrophysics II is recommended. Some programming skills in Python or similar languages are necessary.
Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxide and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

Aerosols I deals with basic physical and chemical properties of aerosol particles. The importance of aerosols in the atmosphere and in other fields is discussed.

Knowledge of basic physical and chemical properties of aerosol particles and their importance in the atmosphere and in other fields is presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.
This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are covered:

- **Probability Theory**
  - Basics of probability theory and the theory of stochastic processes in discrete time.
  - Key topics: Measure theory, random series, law of large numbers, weak convergence, characteristic functions, central limit theorems, conditional expectation, martingales, convergence theorems for martingales, Galton Watson chain, transition probability, Theorem of Ionescu Tulcea, Markov chains.

- **Differential Geometry I**
  - This is an introductory course to differential and Riemannian geometry.
  - Key topics: Basics of measure theory, random series, law of large numbers, weak convergence, characteristic functions, central limit theorems, conditional expectation, martingales, convergence theorems for martingales, Galton Watson chain, transition probability, Theorems of Ionescu Tulcea, Markov chains.

- **Partial Differential Equations**
  - The course covers elliptic partial differential equations in connection to differential geometry and geometric elliptic variational problems.

- **Riemannian Geometry**
  - Focuses on uniformization theorem for 2-dim Riemannian manifolds, harmonic maps from the unit disc to a n-dim Riemannian manifold, and the theory of parametric minimal surfaces in n-dim Euclidean space.

- **Introduction to Random Graphs**
  - A basic undergraduate course on probability.

**Selection: Mathematics**

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Objective
Acquire knowledge of main methodologies for computer-based models of astrophysical systems, the physical equations behind them, and train such knowledge with simple examples of computer programmes

Content
1. Integration of ODE, Hamiltonians and Symplectic integration techniques, time adaptivity, time reversibility
2. Large-N gravity calculation, collisionless N-body systems and their simulation
3. Fast Fourier Transform and spectral methods in general
4. Eulerian Hydrodynamics: Upwinding, Riemann solvers, Limiters
5. Lagrangian Hydrodynamics; The SPH method
6. Resolution and instabilities in Hydrodynamics
7. Initial Conditions: Cosmological Simulations and Astrophysical Disks
8. Physical Approximations and Methods for Radiative Transfer in Astrophysics

Literature
Galactic Dynamics (Binney & Tremaine, Princeton University Press),
Computer Simulation using Particles (Hockney & Eastwood CRC press),
Targeted journal reviews on computational methods for astrophysical fluids (SPH, AMR, moving mesh)

Prerequisites / notice
Some knowledge of UNIX, scripting languages (see www.physik.uzh.ch/lectures/informatik/python/ as an example), some prior experience programming, knowledge of C, C++ beneficial

General Electives
Students may choose General Electives from the entire course programme of ETH Zurich - with the following restrictions: courses that belong to the first or second year of a Bachelor curriculum at ETH Zurich as well as courses from the Compulsory Electives in Humanities, Social and Political Sciences are not eligible here.

The following courses are explicitly recommended to physics students by their lecturers. (Courses in this list may be assigned to the category “General Electives” directly in myStudies. For the category assignment of other eligible courses keep the choice “no category” and take contact with the Study Administration Office (www.phys.ethz.ch/phys/education/studiensekretariat/?lang=en) after having received the credits.)

Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations.

During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on.

Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course).

The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, micflows among others.

Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.

The course builds upon three parts:
I Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.
II Theoretical basis of statistical mechanics and kinetic equations.
III Lattice Boltzmann method for real-world applications.

The content of the course includes:

1. Background: Elements of statistical mechanics and kinetic theory:
   - Particle's distribution function, Liouville equation, entropy, ensembles; Kinetic theory; Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation;
   - Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

2. Basics of the Lattice Boltzmann Method and Simulations:
   - Minimal kinetic models: lattice Boltzmann method for single-component fluid, discretization of velocity space, time-space discretization, boundary conditions, forcing, thermal models, mixtures.

3. Hands on:
   - Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. Practical issues of LBM for fluid dynamics simulations:
   - Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.

5. Microflow:
   - Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. Advanced lattice Boltzmann methods:
   - Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

7. Introduction to LB models beyond hydrodynamics:
   - Relativistic fluid dynamics; flows with phase transitions.

Lecture notes
Lecture notes on the theoretical parts of the course will be made available.
Selected original and review papers are provided for some of the lectures on advanced topics.
Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided.

Prerequisites / notice
The course addresses mainly graduate students (MSc/Ph D) but BSc students can also attend.

Abstract
The course provides an introduction to digital image analysis in modern flow diagnostics. Different techniques which are discussed include image velocimetry, laser induced fluorescence, liquid crystal thermography and interferometry. The physical foundations and measurement configurations are explained. Image analysis algorithms are presented in detail and programmed during the exercises.

Objective
Introduction to modern imaging techniques and post processing algorithms with special emphasis on fluid analysis and visualization. Understanding of hardware and software requirements and solutions. Development of basic programming skills for (generic) imaging applications.

Content
Fundamentals of optics, flow visualisation and electronic image acquisition. Frequently used mage processing techniques (filtering, correlation processing, FFTs, color space transforms). Image Velocimetry (tracking, pattern matching, Doppler imaging). Surface pressure and temperature measurements (fluorescent paints, liquid crystal imaging, infrared thermography). Laser induced fluorescence. (Digital) Schlieren techniques, phase contrast imaging, interferometry, phase unwrapping. Wall shear and heat transfer measurements. Pattern recognition and feature extraction, proper orthogonal decomposition.

Lecture notes available
Prerequisites: Fluidodynamics I, Numerical Mathematics, programming skills.
Language: German on request.

Abstract
This course provides fundamental knowledge of surface plasmon polaritons and discusses their applications in plasmonics.

Objective
Electromagnetic oscillations known as surface plasmon polaritons have many unique properties that are useful across a broad set of applications in biology, chemistry, physics, and optics. The field of plasmonics has arisen to understand the behavior of surface plasmon polaritons and to develop applications in areas such as catalysis, imaging, photovoltaics, and sensing. In particular, metallic nanoparticles and patterned metallic interfaces have been developed to utilize plasmonic resonances. The aim of this course is to provide the basic knowledge to understand and apply the principles of plasmonics. The course will strive to be approachable to students from a diverse set of science and engineering backgrounds.
Content
- Fundamentals of Plasmonics
  - Basic electromagnetic theory
  - Optical properties of metals
  - Surface plasmon polaritons on surfaces
  - Surface plasmon polariton propagation
  - Localized surface plasmons
- Applications of Plasmonics
  - Waveguides
  - Extraordinary optical transmission
  - Enhanced spectroscopy
  - Sensing
  - Metamaterials

Physics I, Physics II

151-0107-20L High Performance Computing for Science and Engineering (HPCSE) I

Abstract
This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering.

Objective
Introduction to HPC for scientists and engineers
Fundamental of:
1. Parallel Computing Architectures
2. MultiCores
3. ManyCores

Content
Programming models and languages:
1. C++ threading (2 weeks)
2. OpenMP (4 weeks)
3. MPI (5 weeks)

Computers and methods:
1. Hardware and architectures
2. Libraries
3. Particles: N-body solvers
4. Fields: PDEs
5. Stochastics: Monte Carlo

227-1047-00L Consciousness: From Philosophy to Neuroscience

Abstract
This seminar reviews the philosophical and phenomenological as well as the neurobiological aspects of consciousness. The subjective features of consciousness are explored, and modern research into its neural substrate, particularly in the visual domain, is explained. Emphasis is placed on students developing their own thinking through a discussion-centered course structure.

Objective
The course's goal is to give an overview of the contemporary state of consciousness research, with emphasis on the contributions brought by modern cognitive neuroscience. We aim to clarify concepts, explain their philosophical and scientific backgrounds, and to present experimental protocols that shed light on a variety of consciousness related issues.

Content
The course includes discussions of scientific as well as philosophical articles. We review current schools of thought, models of consciousness, and proposals for the neural correlate of consciousness (NCC).

Lecture notes
None

Literature
We display articles pertaining to the issues we cover in the class on the course's webpage.

Prerequisites / notice
Since we are all experts on consciousness, we expect active participation and discussions!

151-0621-00L Microsystems Technology

Abstract
Students are introduced to the basics of micromachining and silicon process technology and will learn about the fabrication of microsystems and -devices by a sequence of defined processing steps (process flow).

Objective
Students are introduced to the basics of micromachining and silicon process technology and will understand the fabrication of microsystem devices by the combination of unit process steps (= process flow).

Content
- Introduction to microsystems technology (MST) and micro electro mechanical systems (MEMS)
- Basic silicon technologies: Thermal oxidation, photolithography and etching, diffusion and ion implantation, thin film deposition.
- Specific microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical and thermal properties, piezoelectric and piezoresitive materials.

227-0385-10L Biomedical Imaging

New course. Not to be confounded with 227-0385-00L of fall 2014.

Abstract
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

Objective
To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

Data: 06.12.2017 12:57 Autumn Semester 2015 Page 1163 of 1432
Biomedical Engineering

Objective
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

https://ww1.ethz.ch/lbb/Education/BME

Micro and Nano-Tomography of Biological Tissues

Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications

Content
Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

Lecture notes
Available online

Semiconductor Devices: Physical Bases and Simulation

Objective
The course aims at the understanding of the principle physics of modern semiconductor devices, of the foundations in the physical aspects and management issues of VLSI projects are also addressed.

Content
This second course in our VLSI series is concerned with how to turn digital netlists into safe, testable and manufacturable mask layout, taking into account various parasitic effects (clock skew, metastability, ground bounce, IR-drop, electromigration, ESD, latchup). Economic aspects and management issues of VLSI projects are also addressed.

Abstract
This second course in our VLSI series is concerned with how to turn digital netlists into safe, testable and manufacturable mask layout, taking into account various parasitic effects (clock skew, metastability, ground bounce, IR-drop, electromigration, ESD, latchup). Economic aspects and management issues of VLSI projects are also addressed.

Objective
Know how to design digital VLSI circuits that are safe, testable, durable, and make economic sense.
Starting with an angular spectrum representation of optical fields, the role of inhomogeneous evanescent fields is discussed. Among the important nonlinear optical phenomena, the effects can be described mathematically by means of the susceptibility. Mathematical descriptions of second harmonic generation, four-wave mixing or soliton propagation and others. As an example, we will cover fundamental phenomena such as the refractive index, the electro-optic effect, and high-resolution imaging and spectroscopy. Further topics are: optical interactions between nanoparticles, atomic decay rates in inhomogeneous environments, single molecule spectroscopy, light forces and optical trapping, photonic bandgap materials, and theoretical methods in nano-optics.

Industrial CAD tools are being used.

Lecture notes
- English lecture notes.
- All written documents in English.

Literature

Prerequisites / notice
- Students are offered the opportunity to design a circuit of their own which then gets actually fabricated as a microchip! Students who elect to participate in this program register for a term project at the Integrated Systems Laboratory in parallel to attending the VLSI II course.
- "VLSI I: from Architectures to Very Large Scale Integration Circuits and FPGAs" or equivalent knowledge.

</tr>
</tbody>
</table>
A script which covers the topics will be distributed in the lecture and will be accessible through the web page. Notice that a comprehensive understanding of the interaction of electrons with condensed matter and details on the instrumentation and methods of electron microscopy is documented and evaluated in a final report. With guidance from a tutor, the individual silicon microsystem process steps that are required for the fabrication of an accelerometer are carried out: photolithography, dry etching, wet etching, sacrificial layer etching, critical point drying, various cleaning procedures, and experiments will be discussed, e.g., magic-angle spinning, cross-polarization, decoupling, and recoupling experiments. Such basic building blocks allow a tailoring of the effective Hamiltonian to the needs of the experiment. These basic building blocks can then be combined in different ways to obtain spectra that contain the desired information. From a mathematical description of spin dynamics, important building blocks for multi-dimensional experiments are discussed to allow students a better understanding of modern solid-state NMR experiments.

Participating students are required to attend all scheduled lectures and meetings of the course. Participating students are required to provide proof that they have personal accident insurance prior to the start of the laboratory portion of the course. If there are more than 15 students registered, we regret to restrict access to this course by the following rules: Priority 1: master students of the master's program in "Micro and Nanosystems". Priority 2: master students of the master's program in "Mechanical Engineering" with a specialization in Microsystems and Nanoscale Engineering (MAVT-tutors Profs Daraio, Dual, Hierold, Koumoutsakos, Nelson, Norris, Park, Poulikakos, Pratsinis, Stemmer), who attended the bachelor course "151-0621-00L Microsystems Technology" successfully. Priority 3: master students, who attended the bachelor course "151-0621-00L Microsystems Technology" successfully. Priority 4: all other students (PhD, bachelor, master) with a background in silicon or Microsystems process technology. If there are more students in one of these priority groups than places available, we will decide by drawing lots. Students will be notified at the first lecture of the course (introductory lecture) as to whether they are able to participate.

The course is offered in autumn and spring semester.

**529-0443-00L**

**Advanced Magnetic Resonance**

Abstract: The course is for advanced students and covers selected topics from magnetic resonance spectroscopy. This year, the lecture will introduce and discuss the theoretical foundation of high-resolution solid-state NMR under magic-angle spinning.

Objective: The aim of the course is to familiarize the students with the basic concepts of high-resolution solid-state NMR. Starting from the mathematical description of spin dynamics, important building blocks for multi-dimensional experiments are discussed to allow students a better understanding of modern solid-state NMR experiments.

Content: The basic principles of NMR in solids will be introduced. After the discussion of basic tools to describe NMR experiments, basic methods and experiments will be discussed, e.g., magic-angle spinning, cross-polarization, decoupling, and recoupling experiments. Such basic building blocks allow a tailoring of the effective Hamiltonian to the needs of the experiment. These basic building blocks can then be combined in different ways to obtain spectra that contain the desired information.

Lecture notes: A script which covers the topics will be distributed in the lecture and will be accessible through the web page http://www.ssnmr.ethz.ch/education/

**327-0703-00L**

**Electron Microscopy in Material Science**

Abstract: A comprehensive understanding of the interaction of electrons with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

Objective: A comprehensive understanding of the interaction of electrons with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

Content: This course provides a general introduction into electron microscopy of organic and inorganic materials. In the first part, the basics of transmission- and scanning electron microscopy are presented. The second part includes the most important aspects of specimen preparation, imaging and image processing. In the third part, recent applications in materials science, solid state physics, structural biology, structural geology and structural chemistry will be reported.

Lecture notes: English
This course unit is an alternative if no suitable “Proseminar Theoretical Physics” is available or if the proseminar is already overbooked. Williams, Finding solutions: what is complexity, problem solving cycle.

Type 4P The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found in the lecture Electron Microscopy (327-0703-00L) see lecture Electron Microscopy (327-0703-00L) has to be attended with success, maximum number of participants 15, work in groups of 3 people.

363-0541-00L Systems Dynamics and Complexity W 3 credits 3G F. Schweitzer, P. Mavrodiev

Abstract Implementing solutions: project management, critical path method, quality control feedback loop.

Objective Controling solutions: Vensim software, feedback cycles, control parameters, instabilities, chaos, oscillations and cycles, supply and demand, production functions, investment and consumption.

Content A successful participant of the course is able to:
- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyse the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics

Content Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical systems dynamics, nonlinear dynamics and macroeconomic modeling.

Lecture notes The course is structured along three main tasks:
1. Finding solutions
2. Implementing solutions
3. Controlling solutions

PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM. The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

Prerequisite: the lecture Electron Microscopy (327-0703-00L) has to be attended with success, maximum number of participants 15, work in groups of 3 people.

Proseminars and Semester Papers

To organise a semester project take contact with one of the instructors. Not all lecturers are directly eligible in myStudies if "Professors" is the required type of lecturers. In such cases please take contact with the Study Administration Office (http://www.phys.ethz.ch/phys/education/studienk雪terat?lang=en).

Arbeiten in einer Forschungsgruppe sind besonders gut geeignet, die Studierenden mit aktuellen Forschungsthemen und mit moderner Instrumentierung bekannt zu machen.

402-0400-MSL Advanced Quantum Electronics Experiments  ■  W  9 credits  18P  Professors

Abstract
Implementation of experiments in quantum electronics. Planning, design, realisation, evaluation, and interpretation of the experiments.

Content

402-0719-MSL Particle Physics at PSI (Paul Scherrer Institute)  ■  W  9 credits  18P  C. Grab

Abstract
During the semester break participating students stay for 3 weeks at PSI and participate in a hands-on course on experimental particle physics. A small real experiment is performed in common, including apparatus design, construction, running and data analysis. The course includes some lectures, but the focus lies on the practical aspects of experimenting.

Objective
Students learn all the different steps it takes to perform a complete particle physics experiment in a small team. They acquire skills to do this themselves in the team, including design, construction, data taking and data analysis.

402-0340-MSL Medical Physics  ■  W  9 credits  18P  A. Lomax, R. Müller, K. P. Prüssmann, M. Rudin

Abstract
In agreement with the lecturers a semester paper in the context of the topics discussed in the lectures can be written.

Abstract
Research colloquium

The Zurich Theoretical Physics Colloquium is jointly organized by the University of Zurich and ETH Zurich. Its mission is to bring both students and faculty with diverse interests in theoretical physics together. Leading experts explain the basic questions in their field of research and communicate the fascination for their work.

Objective

The Zurich Theoretical Physics Colloquium is jointly organized by the University of Zurich and ETH Zurich. Its mission is to bring both students and faculty with diverse interests in theoretical physics together. Leading experts explain the basic questions in their field of research and communicate the fascination for their work.

Abstract

Seminars of the Platform for Advanced Scientific Computing (PASC)

Seminars by invited speakers in the area of advanced scientific computing.

Objective

Discussion of state of the art techniques and methodologies in scientific computing.

Content

This course consists in a series of seminars by invited speakers on subjects of interest for the "Platform for Advanced Scientific Computing".

Lecture notes

There is no script.

Literature

Literature will be provided by the speakers in their respective presentations.

Prerequisites / notice

Participants should have experience on advanced scientific computing.

Abstract

Talks in Mathematical Physics

Objective

Stay informed about current research results in elementary particle physics.

Prerequisites / notice

Occasionally, talks may be delivered in German.

Abstract

Research colloquium

Seminars by invited speakers in the area of advanced scientific computing.

Research colloquium

In Seminarvorträgen werden aktuelle Fragestellungen aus der Teilchenphysik vom theoretischen und experimentellen Standpunkt aus diskutiert. Besonders wichtig erscheint uns der Bezug zu den eigenen Forschungsmöglichkeiten am PSI, CERN und DESY.
Abstract

The seminar is aimed at all students who, during their studies, are confronted with age determination methods based on long-living radionuclides found in nature. Basic methodology, the latest developments, and special examples from a wide range of applications will be discussed.

227-0980-00L Seminar on Biomedical Magnetic Resonance

Objective

Actual developments and problems of magnetic resonance imaging (MRI)

Abstract

Getting insight to advanced topics in Magnetic Resonance Imaging

227-1043-00L Neuroinformatics - Colloquia

Abstract

The colloquium in Neuroinformatics is a series of lectures given by invited experts. The lecture topics reflect the current themes in neurobiology and neuromorphic engineering that are relevant for our Institute.

Objective

The goal of these talks is to provide insight into recent research results. The talks are not meant for the general public, but really aimed at specialists in the field.

Content

The topics depend heavily on the invited speakers, and thus change from week to week. All topics concern neural computation and their implementation in biological or artificial systems.

227-1044-00L Auditory Informatics

Abstract

Invited talks on current research from the following areas: Auditory information processing, auditory sensors (biological and electrical), coding of information, perception, scene-segmentation.

Objective

Exchange with researchers in the domain of auditory informatics. Preparing and giving a presentation on a suitable topic in front of a scientific audience.

Content

The semester program is available under:
http://stoop.ini.uzh.ch/teaching/seminar-on-auditory-informatics

Prerequisites / notice

On request the "Lehrsprache" may be changed to German.

651-1581-00L Seminar in Glaciology

Abstract

Studium aktueller und klassischer Arbeiten der glaziologischen Forschung

Objective

Content

Studium aktueller und klassischer Arbeiten der glaziologischen Forschung

**Abstract**
First introduction to main modelling ideas and mathematical tools from mathematical finance

**Objective**
This course gives a first introduction to the main modelling ideas and mathematical tools from mathematical finance. It aims at a double audience: mathematicians who want to learn the modelling ideas and concepts for finance, and non-mathematicians who need an introduction to the main tools from stochastics used in mathematical finance. The main emphasis will be on ideas, but important results will be given with (sometimes partial) proofs.

**Content**
Topics to be covered include:
- financial market models in finite discrete time
- absence of arbitrage and martingale measures
- valuation and hedging in complete markets
- basics about Brownian motion
- stochastic integration
- stochastic calculus: Itô’s formula, Girsanov transformation, Itô’s representation theorem
- Black-Scholes formula

**Lecture notes**
Lecture notes will be sold at the beginning of the course.

**Literature**
Lecture notes will be sold at the beginning of the course. Additional (background) references are given there.

**Prerequisites / notice**
Prerequisites: Results and facts from probability theory as in the book "Probability Essentials" by J. Jacod and P. Protter will be used freely. Especially participants without a direct mathematics background are strongly advised to familiarise themselves with those tools before (or very quickly during) the course. (A possible alternative to the above English textbook are the (German) lecture notes for the standard course "Wahrscheinlichkeitstheorie").

For those who are not sure about their background, we suggest to look at the exercises in Chapters 8, 9, 22-25, 28 of the Jacod/Protter book. If these pose problems, you will have a hard time during the course. So be prepared.

#### Data Analytics in Organisations and Business

<table>

<td>Data Analytics in Organisations and Business</td>
<td>W</td>
<td>5 credits</td>
<td>2V+1U</td>
<td>I. Flückiger</td>
</tr>
</tbody>
</table>

**Abstract**
On the end-to-end process of data analytics in organisations & business and how to transform data into insights for fact based decisions. Presentation of the process from the beginning with framing the business problem to presenting the results and making decisions by the use of data analytics. For each topic case studies from the financial service, healthcare and retail sectors will be presented.

**Objective**
The goal of this course is to give the students the understanding of the data analytics process in the business world, with special focus on the skills and techniques used besides the technical skills. The student will become familiar with the "business language", current problems and thinking in organisations and businesses and tools used.

**Content**
Framing the Business Problem  
Framing the Analytics Problem  
Data Methodology  
Model Building  
Deployment  
Model Lifecycle  
Soft Skills for the Statistical/Mathematical Professional

**Lecture notes**
Lecture Notes will be available.

**Prerequisites / notice**
Prerequisites: Basic statistics and probability theory and regression

#### Interest Rate Modeling in Discrete Time

<table>
<thead>

<th>Lecturers</th>
</tr>
</thead>
<tbody>
<tr>
<td>401-3953-00L</td>
<td>Interest Rate Modeling in Discrete Time</td>
<td>W</td>
<td>4 credits</td>
<td>2V</td>
<td>M. V. Wüthrich</td>
</tr>
</tbody>
</table>

**Abstract**
This course gives an introduction to stochastic interest rate modeling in discrete time. Starting from cash flow valuation with state price deflators, we derive the equivalent martingale measures for pricing financial instruments and derivatives of primary assets. The lecture is supplemented by several examples such as the Vasicek model where we also study model calibration.

**Objective**
The students are familiar with the basic terminology of stochastic interest rate modeling and he is able to transfer his (financial) mathematical knowledge to real world pricing of cash flows and financial instruments.

**Content**
The following topics are covered:
1) stochastic discounting with state price deflators  
2) equivalent martingale measures  
3) pricing of cash flows and primary assets  
4) pricing of derivatives, e.g. European put options  
5) (multi-factor) Vasicek state price deflator model  
6) Heath-Jarrow-Morton interest rate modeling framework

**Lecture notes**
We present an introduction into stochastic portfolio theory following the recent work of Bob Fernholz and Ioannis Karatzas. Stochastic

Prerequisites / 

Lecture notes

Prerequisites: knowledge of probability theory and applied stochastic processes.

Non-Life Insurance: Mathematics and Statistics

Abstract

The lecture aims at providing a basis in non-life insurance mathematics which forms a core subject of actuarial sciences. It discusses collective risk modeling, individual claim size modeling, approximations for compound distributions, ruin theory, premium calculation principles, tariffication with generalized linear models, credibility theory, claims reserving and solvency.

Objective

The student is familiar with the basics in non-life insurance mathematics and statistics. This includes the basic mathematical models for insurance liability modeling, pricing concepts, stochastic claims reserving models and ruin and solvency considerations.

Content

The following topics are treated:

Collective Risk Modeling
Individual Claim Size Modeling
Approximations for Compound Distributions
Ruin Theory in Discrete Time
Premium Calculation Principles
Tariffication and Generalized Linear Models
Bayesian Models and Credibility Theory
Claims Reserving
Solvency Considerations

New Trends in Stochastic Portfolio Theory

Abstract

We present an introduction into stochastic portfolio theory following the recent work of Bob Fernholz and Ioannis Karatzas. Stochastic portfolio theory is based on diffusion models which allow for certain forms of arbitrage related to econometric facts on (ranked) capital distribution curves.

Objective

The aim of this course is to enable the students to carry out simulations and their mathematical convergence analysis for stochastic models from computational finance.

Content

Generation of random numbers
Monte Carlo methods for the numerical integration of random variables
Monte Carlo methods for random variables
Stochastic processes and Brownian motion
Stochastic ordinary differential equations (SODEs)
Numerical approximations of SODEs
Multilevel Monte Carlo methods for SODEs
Applications to computational finance: Option valuation
Lecture notes
Lecture Notes will be available.

P. Glassermann:
Monte Carlo Methods in Financial Engineering.

P. E. Kloeden and E. Platen:
Numerical Solution of Stochastic Differential Equations.

Prerequisites / notice
Prerequisites:
Mandatory: Probability and measure theory,
basic numerical analysis and
basics of MATLAB programming.

a) mandatory courses:
Elementary Probability,
Probability Theory I.

b) recommended courses:
Stochastic Processes.

Abstract

History, impact and principles of the design and operation of transport systems

Objective

Introduction of the basic principles of the design and operation of transport systems (road, rail, air) and of the essential pathways of their impacts (investment, generalised costs, accessibility, external effects)

Content

Classification of public transport systems; Characteristics of rail systems, bus systems, cable cars and funiculars, unconventional systems; introduction to logistics; fundamentals of rail freight transports; freight transport systems; intermodal transportation

Network layout and its impact on road traffic. Traffic control systems for urban and inter-urban areas. Fundamentals of road safety and infrastructure maintenance.

Lecture notes

Lecturer notes and slides as well as hints to further literature will be given during the course.

103-0317-00L Sustainable Spatial Development I

Abstract

The lectures impart important knowledge for solving spatial relevant conflicts and problems. Case studies will be used to demonstrate the implementation in practice.

Objective

Spatial development deals with the development and the design of our living space. To meet the expectations, the interests and the plans of the different actors, it is needed a planning approach considering the overview of both the actual and future situation. The concept of sustainable development in spatial planning leads necessarily to an efficient management of the resources, especially regarding the resource land. The basics of this important discipline will be the subject of this lecture, which is therefore organised in three parts:

1. Inner development
2. Integrated spatial and infrastructure development
3. Cross-border issues in spatial development

Content

Tasks of Spatial Planning and development
Issues of local and supra-local interest
Recurring spatial changes, impacts and key figures
Formal and informal instruments and procedures in spatial planning
Spatial Design - Ideas about the future
Reasoning and assessing the situation in spatial planning
Spatial planning as a sequence of decisions and interventions
Process and procedures management
Focus issues - Inner development before external development
Focus issues - Cross-border tasks
Focus Issues - Integrated spatial and infrastructure development

Lecture notes

Further information and the documents for the lecture can be found on the homepage of the Chair of Spatial Development.

103-0347-00L Landscape Planning and Environmental Systems

<table>

<th>Lecturers</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Only for master students, otherwise a special permission by the lecturers is required.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Abstract

In the course, methods for the identification and measurement of landscape characteristics, as well as measures and implementation of landscape planning are taught. Landscape planning is put into the context of the environmental systems (soil, water, air, climate, flora and fauna) and discussed with regard to socio-political questions of the future.

Objective

The aims of this course are:

1. To illustrate the concept of landscape planning, the economic relevance of landscape and nature in the context of the environmental systems (soil, water, air, climate, flora and fauna).
2. To show landscape planning as an integral information system for the coordination of different instruments by illustrating the aims, methods, instruments and their functions in landscape planning.
3. To show the importance of ecosystem services.
4. To point out basic information about nature and landscape: Analysis and assessment of the complex interactions between landscape elements, effects of existing and foreseeable utilization of space (nature goods and services and landscape functions).
5. To identify and measure the characteristics of landscape.
6. Learn how to use the instrument of GIS appropriately in landscape planning.

Content

In this course, the following topics are discussed:

- Definition of the concept of landscape
- Landscape change
- Landscape planning
- Methods, instruments and aims of landscape planning (politics)
- Socio-political questions of the future
- Environmental systems, IUCN Red List, ecological connectivity
- Urban landscape services
- Practice of landscape planning
- Use of GIS in landscape planning

Lecture notes

No script. The documentation, consisting of presentation slides are partly handed out and are provided for download on the PLUS website.

The contents of the course will be illustrated in the associated lecture 103-0347-01 U (Landscape Planning and Environmental Systems (exercises)). An combination of courses is recommended.
Reading data from files

The course provides the necessary knowledge to develop models supporting the solution of given planning problems. This is done by

- Knowledge of methods and algorithms commonly used in transport planning
- Understanding of algorithms and their implementations commonly used in transport planning

The course is composed of a lecture part, providing the theoretical knowledge, and a applied part, in which students develop their own models. This part takes place in form of a tutorial and consists in the development of a computer program. The programming part is closely guided and particularly suitable for students with little programming experience.

The course will be held in English and no prior knowledge on R is required.

**Introduction to R** by W. N. Venables and D. M. Smith

available online at http://cran.r-project.org/doc/manuals/R-intro.pdf

The course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics and more.

To cope with the forecasting problem it is first divided into sub-problems. Then, these are solved using various algorithms like iterative proportional fitting, shortest path algorithms and the method of successive averages.

The course is composed of a lecture part, providing the theoretical knowledge, and a applied part, in which students create their own models. This part takes place in form of a tutorial and consists in the development of a computer program. The programming part is closely guided and particularly suitable for students with little programming experience.

The slides of the lecture are provided electronically.

**Introduction to Mathematical Optimization**

W 5 credits 2V+1U R. Zenklusen

Introduction to basic techniques and problems of mathematical optimization.

The course is composed of a lecture part, providing the theoretical knowledge, and a applied part, in which students develop their own models.

The course provides the necessary knowledge to develop models supporting the solution of given planning problems. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

The course is composed of a lecture part, providing the theoretical knowledge, and a applied part, in which students create their own models. This part takes place in form of a tutorial and consists in the development of a computer program. The programming part is closely guided and particularly suitable for students with little programming experience.

The slides of the lecture are provided electronically.

**Introduction to the Data Analysis Software R**

W+ 1 credit 1G A. Grêt-Regamey, M. J. Van Strien

R is one of the most popular statistical open-source software for data analysis and data modeling. It has proved very useful for a variety of tasks commonly faced by planners, such as data preparation, exploratory analysis, model estimation or graphical display. R is also a programming language providing users with a more flexible and powerful tool for solving more complex problems.

The aim of this course is to provide participants with an introduction to the statistical open-source software R. Students will learn how to read data from files and write data to files, and how these data can be used to plot graphs and maps. Since R is a command-line software, that is, one has to type in text commands at a prompt, rather than just clicking menus and buttons, students will also learn how to write their own functions.

Reading data from files

Creating and handling R objects such as matrices, vectors and arrays

Plotting data: histograms, boxplots, scattered plots

Writing data to files

Reading raster and vector data

Writing for- and while-loops

Writing your own functions

Handouts of the lectures and exercises will be distributed

"Introduction to R" by W. N. Venables and D. M. Smith

available online at http://cran.r-project.org/doc/manuals/R-intro.pdf

The course will be held in English and no prior knowledge on R is required.

**Transport Planning Methods**

W 6 credits 4G K. W. Axhausen

Introduction to basic techniques and problems of mathematical optimization.

The course is composed of a lecture part, providing the theoretical knowledge, and a applied part, in which students develop their own models.

The course provides the necessary knowledge to develop models supporting the solution of given planning problems. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

The course is composed of a lecture part, providing the theoretical knowledge, and a applied part, in which students create their own models. This part takes place in form of a tutorial and consists in the development of a computer program. The programming part is closely guided and particularly suitable for students with little programming experience.

The slides of the lecture are provided electronically.

**Major in Transport Systems**

**Introduction to the Data Analysis Software R**

W+ 1 credit 1G A. Grêt-Regamey, M. J. Van Strien

Basics in Air Transport
Introduction to the Data Analysis Software R

Objectives of the lecture are:

1) Fundamentals of system and network planning: Mobility and transport systems; public transport systems; customer needs versus supply characteristics of regular services. (2) System and network planning in public passenger services: Goals of the system and network planning; generic planning process; demarcation, analysis of the situation, setting of targets; design of public transport services; evaluation and optimization; system planning. (3) Public transport services: long distance service offers; suburban and urban service offers; regional and local service offers; access to public transport and the last mile.

A. Grêt-Regamey

101-0427-01L System and Network Planning

W  6 credits  4G U. A. Weidmann

Abstract
Public transports in the context of the transport systems; customer needs in the transport market; service planning processes for regular public transport services; long distance, regional and urban public transport service strategies; access to public transport and the last mile

Objective
Students will develop a basic knowledge of all stages of the public transport planning process from market demand to service planning; they will understand the most relevant planning methods and will be able to use them

Content
(1) Fundamentals of system and network planning: Mobility and transport systems; public transport systems; customer needs versus supply characteristics of regular services. (2) System and network planning in public passenger services: Goals of the system and network planning; generic planning process; demarcation, analysis of the situation, setting of targets; design of public transport services; evaluation and optimization; system planning. (3) Public transport services: long distance service offers; suburban and urban service offers; regional and local service offers; access to public transport and the last mile.

Lecture notes
A script in German will be provided for the course. The slides are made available.

Literature
A. Grêt-Regamey

Prerequisites / notice
No remarks.

101-0499-00L Basics in Air Transport

W  4 credits  3G P. Wild

Abstract
The course explains main principles of air transport in general and elaborates on simple interdisciplinary topics.

Objective
Understand and explain basics, principles and contexts in the broader air transport industry.

Content
Weekly: 1h independent preparation; 2h lectures and 1 h training with an expert in the respective field

Concept: This course will be taught as Aviation I. A subsequent course is under evaluation.

Content: Transport as part of the overall transportation scheme; Aerodynamics; Aircraft (A/C) Designs & Structures; A/C Operations; Law Enforcement; Maintenance & Manufacturers; Airport Operations & Planning; Customs & Security; ATC & Airspace; Air Freight; General Aviation; Business Jet Operations; Business models within Airline Industry; Military Operations.

Guided tour: This course includes a guided tour at Zurich Airport (baggage sorting system, apron, ATC Tower).

Examination: written, 60 min, with open book

Literature
We will also use English papers

Prerequisites / notice
Literature will be provided by the lecturers respective there will be additional Information upon registration

Major in Spatial Development

103-0377-00L Introduction to the Data Analysis Software R

W  1 credit  1G A. Grêt-Regamey, M. J. Van Strien

Abstract
R is one of the most popular statistical open-source software for data analysis and data modeling. It has proved very useful for a variety of tasks commonly faced by planners, such as data preparation, exploratory analysis, model estimation or graphical display. R is also a programming language providing users with a more flexible and powerful tool for solving more complex problems.

103-0337-00L Site and Project Development

W  3 credits  2G G. Nussbaumer

Abstract
The main focus of the lecture is on site and project development questions in relation to recycling of industrial wasteland. A semester exercise covers a specific major project and serves as the semester grade (project report and presentation).

Objective
Objectives of the lecture are:

1) Get knowledge of comprehensive and multifunctional large-scale projects and their problem areas
2) Get deepened knowledge in selected fields (site analysis, market analysis, project development, cooperative planning, participation processes)
3) Practical orientation, insight into occupational fields
4) Independent acquirement and acquisition of theoretical knowledge
## Content

The lecture consists of several modules. The main focus is on site and project development questions in relation to recycling of industrial wasteland. Technical presentations, lectured by scientific staff of the division of Planning of Landscape and Urban Systems PLUS as well as well guest referees treat different subjects.

The subjects are:
- Site and market analysis
- Real estate development
- Project development from the perspective of project developers and investors
- Parking and transportation models
- Cooperative planning, participation processes, mediation

The theory is discussed and illustrated at case studies and exercises. Specific large-scale projects that are currently in the development phase will be discussed, for example the area Stihl-Manegg in Zurich (GreenCity) and the area Alter Platusmarkt (Niedfeld) Luzern. For one specific industrial wasteland area the students will develop a vision for a possible redevelopment and a new land-use concept, which will be discussed with experts.

### Lecture notes

- Handouts of the lectures
- Extracts from relevant scientific articles and theory literature
- Exercise material

### Objective

The participants know the interdependencies between the assessment of a situation, decision making, knowledge, and language. They know the nature of a decision dilemma and maximes, how to deal with it. Especially they learn that the requirement of information for a decision depends upon the preferences of the deciding acteur. They are also familiar with difficulties and pitfalls within these contexts and know what can be done against it.

### Content

Assessment of the situation, deciding, language and knowledge are the main parts.

**051-0363-00L**

**History of Urban Design I**

- Content: In the first semester an introduction to the discipline and the methods are given along the thematic issues from the beginning of urban culture until the mid-19th century.
  1. Introduction to the discipline and method: The history of urban design as a historical project
  2. Athens and Rome in the ancient world: Myth, self-portrayal and speculation
  3. From the spirit of equality to the colonial module: Greek and Roman City foundings
  4. From the urban ideal to new cities in the Middle Ages and the Renaissance
  5. Baroque strategies: The new organisation of Rome under Sixtus V, the production of Versailles under Louis XIV and the invention of St. Petersburg
  6. The city between Absolutism and Enlightenment: baroque defence-designs, the European colonization of the American continent and the reconstruction of Lisbon
  7. Ideology and speculation after the Glorious Revolution: landscapegardens and urban figurations in England from 1650-1850
  8. Between modernization, Grandeur and repression: Embellishment in Paris from 1750-1830
  9. The construction of the bourgeois city: Georges-Eugène Haussmann transforms Paris into the capital of the 19th century
  10. Architectural insertion and plan for the expansion of the city: From the Berlin of Karl Friedrich Schinkel to James Hobrecht
  11. Neoclassical power, bourgeois self-confidence and Marxian Idealism: The Viennese Ringstrasse and Ildefonso Cerdas Ensanche for Barcelona

**Lecture notes**

- The lectures are accompanied by a script (two semesters of the bachelor studies), that can be purchased at the chair for the history of urban design (HIL D 75.2) at the price of CHF 30. - The script serves as an auxiliary means to the attended lecture compiling the most important illustrations showed and the names and dates of the buildings and its builders along with a short introductory note.

**Literature**

Further recommended literature to consult is listed within the script.

**Prerequisites / notice**

History of Urban Design from antiquity to the 19th century
Goals

1) introduce students to techniques and issues associated with spatial modeling and decision support systems, including analytical technologies that are unique to spatial analysis
2) provide hands-on training in the use of these spatial tools in R while addressing real planning problems.

Content

This course will:

- Introduction to the Data Analysis Software R
- Reading data from files
- Creating and handling R objects such as matrices, vectors and arrays
- Writing data to files
- Reading raster and vector data
- Writing for- and while-loops
- Writing your own functions

Handouts of the lectures and exercises will be distributed available online at http://cran.r-project.org/doc/manuals/R-intro.pdf

Prerequisites / notice

The course will be held in English and no prior knowledge on R is required.

Literature

“Introduction to R” by W. N. Venables and D. M. Smith

Objective

Basic understanding of nature and function of space planning from a legal point of view. Basic knowledge of space planning instruments, the relationship between space planning and constitutional law (especially property rights), solving of practical cases.

Content

Lecture notes

Haller, Walter/Karlen, Peter, Raumplanung-, Bau- und Umweltrecht, 3.A., Zürich 1999

Hänni, Peter, Planungs-, Bau- und besonderes Umweltschutzrecht, 5.A., Bern 2008

103-0327-00L History of Spatial Planning W 1 credit 1G M. Koll-Schretzenmayr

Abstract

The course examines the patterns of cleavage, conflict, convergence of interest, and consensus that have structured spatial planning.

Objective

This course aims to provide students with knowledge of the historical background to understand the current spatial structure and to face the current challenges in spatial planning.

Content

Die Veranstaltung gibt einen Überblick über die Geschichte der Raumplanung. Sie möchte das Verständnis für die Ideengeschichte wecken und den historischen Kontext für die gegenwärtige Raumplanung und Raumstruktur vermitteln.

103-0307-00L Multi-Criteria Decision Analysis W 3 credits 2G A. Grêt-Regamey

Abstract

Planners need to make decisions about the best possible mix of land uses. With increasing availability of spatial databases and the analytical capabilities of GIS, more effective decision support systems can be developed. The goal of the course is to provide the basics of spatial analysis and to teach the integration of spatial data into multicriteria decision-making systems.

Objective

This course will:

1) introduce students to techniques and issues associated with spatial modeling and decision support systems, including analytical techniques that are unique to spatial analysis
2) provide hands-on training in the use of these spatial tools in R while addressing real planning problems.

The emphasis is on concepts, resources, and analysis tools that students can use in science, private companies and government careers.

- Handouts of the lectures

- Exercise material

Download: http://www.irl.ethz.ch/plus/education

The course will be held in German and English. It is highly recommended to attend the lecture “Introduction to the data analysis software R” (“Einführung in die R Umgebung für Datenanalysen”), providing the basic principles of using the R-Software.

103-0347-00L Landscape Planning and Environmental Systems (Exercises) W 3 credits 2U A. Grêt-Regamey, S. Huber, S.E. Rabe

Abstract

The course content of the lecture Landscape Planning and Environmental Systems (103-0347-00 V) will be illustrated.

Objective

To show the importance of ecosystem services.
Analysis and assessment of the complex interactions between landscape elements.
To identify and measure the characteristics of landscape.
Learn how to use the instrument of GIS appropriately in landscape planning.
Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional environmental systems, IUCN Red List, ecological connectivity

Landscape Architecture I

Abstract
Introduction to the history and theory of garden design and landscape architecture. Analysis of the design of historical gardens and landscapes within the cultural background.

Objective
The course covers the basic history and theory of garden design and landscape architecture from its beginnings to the 21st century. The course aims to raise awareness of a changing perception of nature and landscape.

Content
The lecture series on History and Theory of Garden Design and Landscape Architecture deals with the historical development of designed nature, from the beginnings of cultural landscapes and gardens to 21st century landscape architecture. In the analysis of each era, the focus is on the spatial and cultural relationship between the garden, the city and the landscape, as well as the changing perceptions of nature and its representation.

Lecture notes
Haller, Walter/Karlen, Peter, Raumplanung-, Bau- und Umweltrecht, 3.A., Zürich 1999
Hanni, Peter, Planungs-, Bau- und besonderes Umweltschutzrecht, 5.A., Bern 2008

Foundations of Ecosystem Management

Abstract
This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It explores case studies of ecosystem management approaches and considers their practicability, their achievements and possible barriers to their uptake.

Objective
Students should be able to
a) propose appropriate and realistic solutions to ecosystem management problems that integrate ecological, economic and social dimensions across relevant temporal and spatial scales,
b) identify important stakeholders, their needs and interests, and the main conflicts that exist among them in the context of land and resource management.

Content
Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional management has frequently resulted in catastrophic failures such as, for example, the collapse of fish stocks and biodiversity loss. These failures have stimulated the development of alternative ecosystem management approaches that emphasise the functionality of human-dominated systems. Inherent to such approaches are system-wide perspectives and a focus on ecological processes and services, multiple spatial and temporal scales, as well as the need to incorporate diverse stakeholder interests in decision making. Thus, ecosystem management is the science and practice of managing natural resources, biodiversity and ecological processes, to meet multiple demands of society. It can be local, regional or global in scope, and addresses critical issues in developed and developing countries relating to economic and environmental security and sustainability.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

Lecture notes
Introduction to the Data Analysis Software R

The main objectives of this lecture are:

- Introduction to fundamentals of traffic flow theory and operations. Includes understanding of traffic data collection and processing
- Concepts will be explained step-by-step through a set of case studies, and applied in lab by the students. The following principal steps are
  - Risk analysis - What can happen?
  - Characterize the processes and environmental measures that lead to a natural hazard and integrate modeling results of these processes.
  - Identify threats to human life and assets exposed to natural hazards and estimate possible drawbacks or damages.
  - Risk assessment - What are the acceptable levels of risk?
  - Apply principles to determine acceptable risks to human life and assets in order to identify locations which should receive added protection.
  - Explain causes for conflicts between risk perception and risk analysis.
- Risk management - What steps should be taken to manage risks?
  - Explain how various hazard mitigation approaches reduce risk.
  - Describe hazard scenarios as a base for adequate dimensioning of control measures.
  - Identify the best alternative from a set of thinkable measures based on an evaluation scheme.
  - Explain the principles of risk-governance.

Concepts will be explained step-by-step through a set of case studies, and applied in lab by the students. The following principal steps are

- Einführung ins Vorgehenskonzept (1W)
- Risikoanalyse (6W + Exkursion) mitt:
  - Systemabgrenzung
  - Gefahrenbeurteilung
  - Exposition- und Folgenanalyse
- Risikobewertung (2W)
- Risikomanagement (2W + Exkursion)
- Abschlussbesprechung (1W)

Die Vorlesung besteht aus folgenden Blöcken:

- Prerequisites / notice
  - The course will be held in English and no prior knowledge on R is required.
  - The course will be held in English and no prior knowledge on R is required.

**Abstract**

The lecture Energy and Transportation imparts profound knowledge of energy- and environment-related difficulties of the intersection of energy and transportation with focus on the motorized individual traffic. The students gain the ability to approach energy- and environment-related problems with special consideration of the demand side, and to evaluate possible solutions.

**Objective**

The main objectives of this lecture are:

(i) The students gain profound knowledge of energy- and environment-related difficulties of the intersection of energy and transportation, and learn strategies to cope with these difficulties.
(ii) The students are able to approach energy- and environment-related problems with special consideration of the demand side, and to evaluate possible solutions.

**Content**

The lecture Energy and Transportation deals with the intersection of energy and transportation with focus on the motorized individual traffic.

Main topics are:

(i) Fundamentals of energy use in the transportation sector, today's present state and future developments.
(ii) Technical potentials for the reduction of greenhouse gas (GHG) emissions and the dependence on fossil fuels: Evaluation of (a) alternative fuels, and (b) alternative propulsion systems.
(iii) The relevance of demand on efforts to reduce GHG emissions and the dependence on fossil fuels.
(iv) Strategies and measures for influencing the demand side.
The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk.

Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FOSM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and pre-post risk assessment methods are presented. Bayesian networks are introduced as a generic numerical tool for solving such problems. The course also includes a tutorial using a software dedicated to real world structural reliability analysis.

Benefits
- modeling of stakeholder benefits over time

Assessment
The course will be held in English and no prior knowledge on R is required.

Handouts of the lectures and exercises will be distributed online at
http://cran.r-project.org/doc/manuals/R-intro.pdf

1. Reading data from files
2. Creating and handling R objects such as matrices, vectors and arrays
3. Plotting data: histograms, boxplots, scattered plots
4. Writing data to files
5. Reading raster and vector data
6. Writing for- and while-loops
7. Writing your own functions

The following literature will be useful:
- "Introduction to R" by W. N. Venables and D. M. Smith
- available online at
  http://cran.r-project.org/doc/manuals/R-intro.pdf

Prerequisites / notice
The course will be held in English and no prior knowledge on R is required.
Objective

Part 1: The students shall acquire basic knowledge of the public law concerning civil engineering: space management, conception of buildings, protection of the environment, procedures

Part 2: The students shall acquire basic knowledge of the private law concerning civil engineering

Content

Teil 1: Jede Lektion behandelt für ein bestimmtes Stadium des Projekts ein Thema des öffentlichen Baurechts wie Bau- und Zonenordnungen, Quartierpläne, Umweltverträglichkeitsprüfungen, Baubewilligungsverfahren etc.

Teil 2: Grundzüge des privaten Baurechts wie Abnahme und Genehmigung von Bauwerken, Vollmacht des Architekten / Ingenieurs zu Rechtsverhandlungen namens des Bauherrn, Mängelrüge im Bauwesen, Mehrheit ertatpflichtiger Baubeteiligter, Generalunternehmervertrag, Haftung des Baumaterialverkäufers, Bauhandwerkerpfandrecht, Grundzüge der SIA-Norm 118, Baukonsortium, technische Normen, internationale Bauverträge, Architekten / Ingenieure als Gerichtsexperten, Aspekte des Bauzivilprozesses

Lecture notes

D. Trümpy; Tafeln zu den Grundzügen des schweizerischen Bauvertragsrechts (Vorlesungsunterlage)

Abstract

Introduction to Economic Policy - A Case Study Approach with Cost Benefit Analysis in Transport

This course was offered as "Transport Systems Evaluation" until HS14.

Urban and Spatial Economics

This course explores the economic factors which influence location decisions of households and firms, and it explores theories of how these decisions induce the formation of cities. The course will cover the neoclassical models of land use, concepts from the new economic geography, zoning, and transportation and traffic congestion.

Logistics, Operations and Supply Chain Management I

Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.
The main topics are:

- Strategic and tactical concepts in logistics, operations, and supply chain management: Conflicts of objectives and strategies and in the process industry.
- Transport and administrative policy, international and national regulation, business management of public transport companies, marketing, and quality assurance.

Course notes will be provided in German. Slides will be made available.

Strategic and tactical concepts in logistics, operations, and supply chain management: Conflicts of objectives and strategies and in the process industry.

References to technical literature will be included in the course script. An additional list of literature will be given during the course.

Due to the big number of students, about half of the students will play this game, instead of Oct. 1, at Friday afternoon, Oct. 2. Please be available. Thank you for your help in this matter.

Abstract
Railway safety policies and safety concepts, command and control technologies for railways, optimization systems, European Train Control System, reliability availability maintainability safety (RAMS) of railway systems.

Objective
The students comprehend the main principles of safety, reliability and optimization for railway systems and understand the basic concepts of command and control technologies for railways.

Content
Railway safety strategies
- Safety in public transport
- Safety relevant characteristic of railway transport
- Safety requirements for railway transport
- Safety concepts

Command and control technologies for railway systems
- protective functions
- ensure the sequence/spacing of trains
- ensure route protection
- ensure level crossing protection
- technical realization for protective functions
- European Train Control System

operational command/control systems
- dispatching
- operational control systems
- concepts of optimization

RAMS for railway systems
- accident investigation methods
- RAMS standards for railways
- risk analysis and hazard control
- RAMS methods
- design principles for availability and safety
- maintenance strategies
- Life Cycle Costs (LCC)
- Human Factor
- safety in long railway tunnels

tutorials in Railway Operation Laboratory
field trip to Siemens Wallisellen (command and control technologies)

Lecture notes
The slides will be provided in German.

Literature
References will be included in the lecture notes. An additional list of literature will be given during the course.

Prerequisites / notice
Some of the tutorials will be held at the IVTs Railway Operation Laboratory. The lecture Systems Dimensioning and Capacity is recommended.

363-0445-00L Logistics, Operations and Supply Chain Management I W 3 credits 2G P. Schönsleben, E. Scherer Casanova

Abstract
Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Objective
An effective and efficient flow of goods, data, and control in and between companies contributes significantly to the value added for the customer. Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Content
Strategic and tactical concepts in logistics, operations, and supply chain management: Conflicts of objectives and strategies and in the entrepreneurial context; business process analysis and fundamental logistics concepts; the MRP II / ERP concept: business processes and methods; the lean / just-in-time and repetitive manufacturing; concepts for product families and one-of-a-kind production; concepts for the process industry.

Lecture notes

This book also serves as textbook for LOS II (spring term) as well as ERP and SCM software systems (autumn term). In addition powerpoint-handouts and documents for case studies.

Sales at 17.9.15, from 12:45, before and during brakes of the first lecture.

Literature
see "script"

Prerequisites / notice
As for the lecture of the 3rd week (BEMAD, a much-liked Business Engineering and Management Ability Development game), this lecture (of Oct. 1) will follow a specific schedule in specific rooms. The schedule will be presented at Sept. 17 during the 1st lecture.

Due to the big number of students, about half of the students will play this game, instead of Oct. 1, at Friday afternoon, Oct. 2. Please be available. Thank you for your help in this matter.

363-0445-02L Logistics, Operations, and Supply Chain Management I (Additional Cases) W 1 credit 2A P. Schönsleben

Abstract
Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Objective
An effective and efficient flow of goods, data, and control in and between companies contributes significantly to the value added for the customer. Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Major in Spatial Development

Major in Landscape and Environmental Planning

Number Title Type ECTS Hours Lecturers
364-0517-00L Urban and Spatial Economics W 3 credits 2V R. H. van Nieuwkoop
This course explores the economic factors which influence location decisions of households and firms, and it explores theories of how these decisions induce the formation of cities. The course will cover the neoclassical models of land use, concepts from the new economic geography, zoning, and transportation and traffic congestion.

Prerequisite: one semester in microeconomics.

Objective

The objective of the course is to provide graduate students with an understanding of the economic factors which give rise to urban spatial structure and the models which have been employed to study these processes. The course aims to help students develop an appreciation for the use of economic models in both positive and normative frameworks. We will assess both the history of thought regarding the role of markets in creating urban development, and we will read about modern theories of externalities and economic factors which induce agglomeration. The final section of the course will focus on transportation problems in urban areas and the use of economic models to assess public policy measures to deal with congestion and associated externalities.

Content

Outline of Lectures

- Topic 1: Why do cities exist?
- Topic 2: The Basic Muth-Mills model
- Topic 3: The New Economic Geography
- Topic 4: Business demand for land and Von Thünen's model
- Topic 5: Urban spatial structure
- Topic 6: Land use control
- Topic 7: City size and city growth
- Topic 8: Traffic externalities and congestion
- Topic 9: Public transport

Lecture notes

- Further literature: will be presented during the course

Ancillary Texts

- Cities, agglomeration and spatial equilibrium by E. L. Glaeser, 2008, Oxford University Press.
- Cities, agglomeration and spatial equilibrium by E. L. Glaeser, 2008, Oxford University Press.

101-0258-00L River Engineering

Abstract

Main subjects treated:
- Fundamentals (e.g. sediment sampling methods), alluvial channel hydraulics, incipient motion, bed forms, bed load and suspended load, sediment budget and morphological changes, river morphology, scour, river management concepts and selected measures (e.g. bank and bed protection works).
- A practical exercise (voluntary, unmarked) is offered to deepen the learned subjects.

Objective

The students shall:
- be able to describe quantitatively the interrelation between discharge, sediment transport and channel evolution
- know the fundamentals and be able to apply the approaches and methods to treat river engineering problems associated with flood protection and river restoration

Content

The first part of the lecture treats the fundamentals required to deal with river engineering problems. Sampling methods for the river bed material and methods to calculate the discharge in alluvial rivers are presented. The process of river bed armoring and the principles of incipient motion, of bed load and suspended load transport are treated.

In the second part of the lecture the procedures to quantify the sediment budget and the morphological changes (erosion, aggradation) in river systems are explained. Furthermore, the process of natural channel formation and the different plan forms of rivers (straight, meandering, braided) are discussed. Own chapters are dedicated to the topics of bed forms, river morphology and scour.

The last part of the lecture concentrates on the design and dimensioning of river engineering works. The topics treated are the stabilization of banks and of the longitudinal profile of rivers.

101-0469-00L Road Safety

Abstract

The collection and the methods of statistical and geographical analysis of road accidents are important fundamentals of this course. Safety aspects in design of urban roads are discussed and measures for improving the safety situation are presented. Procedures of infrastructure safety management for administrations and police are another topic.

Objective

Imparting knowledge base about road safety and the event of accident, presenting possibilities to increase road safety

Content

- Accident origin, collection of road accidents, statistical (descriptive and multivariate, accident prediction models) and geographical analysis of road accidents, risk analysis and rehabilitation measures, road safety instruments for infrastructure with focus on road safety audit, Swiss and international transport policy
- Further literature: will be presented during the course

101-0492-00L Simulation of Traffic Operations

Abstract

The course introduces basics of microscopic simulation of traffic operations, including simulation model development, calibration, validation, data analysis, identification of strategies for improving traffic performance, and evaluation of such strategies. The modelling software used is VISSIM.
Objective

The objective of this course is to conduct a realistic traffic engineering project from beginning to end. During the process, students will also familiarize themselves with microscopic traffic simulation, and will use the simulation software for modeling and analyzing the traffic operations in reality. The emphasis is not only on building the simulation model, but also how to evaluate results. The final goal is to make valid and concrete engineering proposals based on the simulation model.

Content

In this course the students will complete a traffic engineering project with microscopic traffic simulator VISSIM. An emphasis will be on traffic signals at intersections.

Specific tasks will include:
1) Building a model with the simulator VISSIM in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/extending the model to improve the traffic performance.

Lecture notes

The lecture notes and additional handouts will be provided before the lectures.

Literature

Additional literature recommendations will be provided at the lectures.

Prerequisites / notice

There are no pre-requisites for this course. The course Transport Simulation (101-0438-00 G) and previous experience with VISSIM is helpful but not mandatory. In addition, simultaneously taking the course Traffic Engineering (101-0437-00 G) is encouraged.

Abstract

Track geometry including calculation and measuring as well as related data systems; interaction between track and vehicles, vehicle dynamics, stress; track construction including special features of railway bridges and tunnels; track diagnostics and forecast; track maintenance and related methods.

Objective

The lecture gives a deeper insight into track geometry, the interaction between track and vehicles as well as in construction and dimensioning of the track. Methods for the diagnosis of the state of the track and its forecast are shown. State-of-the-art maintenance strategies and technologies are presented.

Content

Track geometry including calculation and measuring as well as related data systems; interaction between track and vehicles, vehicle dynamics, stress; track construction including special features of railway bridges and tunnels; track diagnostics and forecast; track maintenance and related methods.

Lecture notes

The slides will be made available.

Literature

A list with related technical literature will be handed out.

Prerequisites / notice

The lecture Railway Infrastructures (Transportation II) is recommended.

Abstract

The course will provide an introduction to the human and computerized systems used to manage infrastructure.

Objective

Upon completion of the course students will have the fundamental knowledge required
- to identify and model the processes used in organizations to manage infrastructure
- to establish benchmarks that can be used to measure the performance of organizations that manage infrastructure, and
- to evaluate organizations that manage infrastructure
- Introduction
- Organisation types used to manage infrastructure
- Processes used in organizations that manage infrastructure
- Methods used to evaluate organizations that manage infrastructure, including the establishment of appropriate benchmarks

Lecture notes

Appropriate reading / and study material will be handed out during the course. Transparencies will be handed out at the beginning of each class.

Literature

Appropriate literature will be handed out when required.

Abstract

Working on a concrete interdisciplinary task on spatial development and infrastructure systems

Objective

Promote independent, structured and scientific work; learn to apply engineering methods; deepen the knowledge in the field of the treated task.

Content

The project work is supervised by a professor. Students can choose from different subjects and tasks.

******** Electives

The entire course programs of ETH Zurich and University Zurich are open to the students to individual selection. The students have themselves to check whether they meet the admission requirements for a course.

******** List of Electives Recommended by the Degree Programme

Students having enroled for 851-0703-03 earlier (i.e. bachelor's degree programme or as additional requirement for master's degree programme) cannot enrol for this again during master's degree programme.

Abstract

The course examines the patterns of cleavage, conflict, convergence of interest, and consensus that have structured spatial planning.

Objective

This course aims to provide students with knowledge of the historical background to understand the current spatial structure and to face the current challenges in spatial planning.

Social, cultural, and economic forces will be analyzed for the roles they have played in shaping the landscapes and cityscapes and the answers spatially. The course focuses on the history of planning ideas, paradigms and approaches. A link is made to current challenges in spatial planning.

Content

Die Veranstaltung gibt einen Überblick über die Geschichte der Raumplanung. Sie möchte das Verständnis für die Ideengeschichte wecken und den historischen Kontext für die gegenwärtige Raumplanung und Raumstruktur vermitteln.
Appropriate reading / and study material will be handed out during the course.

The lecture focuses on selected topics in hydraulic engineering, water management and aquatic ecology relating to hydropower and flood protection projects.

Different selected topics in hydraulic engineering will be focused on, e.g. dam safety, possible problems at reservoirs like sedimentation or natural hazards by impulse waves, the hydraulics of river flows, spillways and intake structures at dams and weirs, hydropower and ecology like fish-ecological aspects at low-head hydropower plants and eco-hydraulics like flow-vegetation interaction. Another focus will be put on typical approaches and procedures in the planning process of hydropower projects.

Selected Topics on Hydraulic Engineering

Prerequisites: 101-0247-01L Hydraulic Engineering II or equivalent course.

Abstract
The lecture focuses on selected topics in hydraulic engineering, water management and aquatic ecology relating to hydropower and flood protection projects.

Objective
to deepen knowledge on special aspects in hydraulic engineering and to understand the procedures and the planning sequence of hydropower projects

Content
Different selected topics in hydraulic engineering will be focused on, e.g. dam safety, possible problems at reservoirs like sedimentation or natural hazards by impulse waves, the hydraulics of river flows, spillways and intake structures at dams and weirs, hydropower and ecology like fish-ecological aspects at low-head hydropower plants and eco-hydraulics like flow-vegetation interaction. Another focus will be put on typical approaches and procedures in the planning process of hydropower projects.

Lecture notes
Lecture notes/handouts will be available online.

Lecture notes
All necessary materials (e.g. transparencies and hand-outs) will be handed out at the beginning of each class.

Appropriate reading material will be assigned when necessary.

Infrastructures Maintenance Processes

Prerequisites:
101-0247-01L Hydraulic Engineering II or equivalent course

Abstract
This course provides an introduction to:
- how to model the changes in infrastructure objects over time,
- how to monitor these changes and assess the benefits of monitoring,
- how to intervene to improve infrastructure performance and assess the benefits of interventions, and
- how to model the changes in stakeholders interests over time.

Objective
to provide the basic information and tools to be used to make decisions with respect to existing infrastructure Deterioration
- manifest and latent processes,
- modeling
Monitoring
- non-destructive and destructive techniques,
- evaluation of benefits of monitoring
Intervention
- types of intervention,
- evaluation of benefits of intervention
Benefits
- modeling of stakeholder benefits over time

Lecture notes
Lecture notes/handouts will be available online.

Lecture notes
All necessary materials (e.g. transparencies and hand-outs) will be handed out at the beginning of each class.

Appropriate reading material will be assigned when necessary.

Infrastructure Management Systems

Prerequisites:
101-0247-01L Hydraulic Engineering II or equivalent course

Abstract
The course will provide an introduction to the human and computerized systems used to manage infrastructure.

Objective
Upon completion of the course students will have the fundamental knowledge required
- to identify and model the processes used in organizations to manage infrastructure,
- to establish benchmarks that can be used to measure the performance of organizations that manage infrastructure, and
- to evaluate organizations that manage infrastructure

Content
- Introduction
- Organisation types used to manage infrastructure
- Processes used in organizations that manage infrastructure
- Methods used to evaluate organizations that manage infrastructure, including the establishment of appropriate benchmarks

Lecture notes
Lecture notes/handouts will be available online.

Appropriate reading / and study material will be handed out during the course.

Appropriate literature will be handed out when required.

Advanced Environmental, Social and Economic Assessments

Prerequisites:
101-0247-01L Hydraulic Engineering II or equivalent course

Abstract
This course deepens students' knowledge of environmental, economic, and social assessment methodologies and their various applications.

Objective
This course has the aim of deepening students' knowledge of the environmental, economic and social assessment methodologies and their various applications.

In particular, students completing the course should have the
- ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors
- knowledge about the current state of the scientific discussion and new research developments
- ability to properly plan, conduct and interpret environmental assessment studies

In the course element "Implementation of...", students will learn to
- describe key sustainability problems of the current economic system and measuring units.
- describe the management system of an organisation and illustrate how to improve its sustainability management (especially planning and controlling), based on current ISO management standards and additional frameworks.
- discuss approaches to measure environmental performance measurement of an organisation, including 'organisational LCA' (Ecobalance)
- explain the pros and cons of single score env. assessment methods
- demonstrate life cycle costing from a sustainability viewpoint
- interpret stakeholder relations of an organisation
- (if time allows) describe sustainable supply chain management

Data: 06.12.2017 12:57 Autumn Semester 2015 Page 1189 of 1432
**Content**

Part I (Advanced Environmental Assessments)
- Inventory database developments, transparency, data quality, data completeness, and data exchange formats, uncertainties
- Software tools (MFA, LCA)
- Allocation (multiooutput processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Impact assessment of waterborne chemical emissions, sum parameters, mixture toxicity
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Subjectivity in environmental assessments
- Case Studies

Part II (Implementation of Environmental and other Sustainability Goals):
- Sustainability problems of the current economic system and its measuring units;
- The structure of a management system, and elements to integrate environmental management (ISO 14001) and social management (SA8000 as well as ISO 26000), especially into strategy development, planning, controlling and communication;
- Sustainability Opportunities and Innovation
  - The concept of 'Continuous Improvement'
  - Life Cycle Costing, Life Cycle Management
- environmental performance measurement of an organisation, including `organisational LCA' (Ecobalance), based on practical examples of companies and new concepts
- single score env. assessment methods (Swiss ecopoints)
- stakeholder management and sustainability oriented communication
- an intro into sustainability issues of supply chain management

Students will get small exercises related to course issues.

**Lecture notes**

Part I: (-)  
Part II: Documents will be available on Ilias  
Part III Lab: (-)

**Literature**

This course should only be elected by students of environmental engineering with the Major in ESD, Air Quality Control and Waste Management. All other students should take the individual courses in Advanced Environmental Assessment and/or Implementation of Environmental goals (with or without exercise and lab).

Basic knowledge of environmental assessment tools is a prerequisite for this class. Students who have not yet had classwork in this topic are required to read an appropriate textbook before or at the beginning of this course (e.g. Baumann&Tillman, The Hitchhiker's Guide to LCA: An Orientation in Life Cycle assessment Methodology and Applications, Studentlitteratur, Lund, 2004).

**Prerequisites / notice**

103-0245-01L  
**Thematic Cartography**  
W  2 credits  2G  L. Hurni

**Abstract**

Thematic map types (focus on quantitative information), analysis of themes and application, base maps, generalisation

**Objective**

Knowing of most important thematic map types.
Ability to design adequate thematic maps from statistical data.

**Content**

- Thematic map types (focus on quantitative information)
- Analysis of themes and application using adequate structural types
- Use of adequate base maps
- Generalisation of thematic maps
- Dynamic thematic maps

**Lecture notes**

Will be distributed

**Literature**

- Terry A. Slocum, Terry et al. (2004): Thematic Cartography and Geographic Visualization. 2nd ed. Prentice Hall, ISBN 0130351237

Further information at http://www.karto.ethz.ch

**Prerequisites / notice**

Prerequisite: Cartography Introduction

103-0227-00L  
**Cartography III**  
W  5 credits  4G  L. Hurni

**Abstract**

Basic methods, technologies, scripting, and systems for interactive web mapping projects and in the internet cartography

**Objective**

Gain knowledge about basic methods, technologies, scripting, and systems for interactive web mapping projects. Assessment of existing products regarding production methods. Definition of useful methods for Web-based map projects.

**Content**

- Web mapping
- Web Map Services (WMS)
- User Interface design
- Symbolisation
- Programming
- Java Script
- Debugging
- Map production using GIS data
- 3D-applications in cartography

**Lecture notes**

Own script and instructions will be distributed.

**Literature**

- Stoll, Heinz (2001): Computergestützte Kartografie, SGK-Publikation Nr. 15 (see www.kartographie.ch)

**Prerequisites / notice**

Prerequisites: Kartografie I; Thematische Kartografie

401-0625-01L  
**Applied Analysis of Variance and Experimental Design**  
W  5 credits  2V+1U  L. Meier

**Abstract**

Key concepts of experimental design. Planning and analysis of single factor experiments, block designs, full factorial and fractional designs, split-plot and strip-plot designs. Random effects and mixed effects models.

**Objective**

Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.

Literature

751-1551-00L Ressourcen- und Umweltökonomie W 3 credits 2V L. Bretschger, A. Müller

Abstract
Relationship between economy and environment, market failure, external effects and public goods, contingent valuation, internalisation of externalities; economics of non-renewable resources, economics of renewable resources, cost-benefit analysis, sustainability, and international aspects of resource and environmental economics.

Objective
Understanding of the basic issues and methods in resource and environmental economics; ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

Topics are:
- Introduction to resource and environmental economics
- Importance of resource and environmental economics
- Main issues of resource and environmental economics
- Normative basis
- Utilitarianism
- Fairness according to Rawls
- Economic growth and environment
- Externalities in the environmental sphere
- Governmental internalisation of externalities
- Private internalisation of externalities: the Coase theorem
- Free rider problem and public goods
- Types of public policy
- Efficient level of pollution
- Tax vs. permits
- Command and Control Instruments
- Empirical data on non-renewable natural resources
- Optimal price development: the Hotelling-rule
- Effects of exploration and Backstop-technology
- Effects of different types of markets.
- Biological growth function
- Optimal depletion of renewable resources
- Social inefficiency as result of over-use of open-access resources
- Cost-benefit analysis and the environment
- Measuring environmental benefit
- Measuring costs
- Concept of sustainability
- Technological feasibility
- Conflicts sustainability / optimality
- Indicators of sustainability
- Problem of climate change
- Cost and benefit of climate change
- Climate change as international ecological externality
- International climate policy: Kyoto protocol
- Implementation of the Kyoto protocol in Switzerland
- Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

Literature

363-0541-00L Systems Dynamics and Complexity W 3 credits 3G F. Schweitzer, P. Mavrodiev

Abstract
Finding solutions: what is complexity, problem solving cycle.

Implementing solutions: project management, critical path method, quality control feedback loop.

Controlling solutions: Vensim software, feedback cycles, control parameters, instabilities, chaos, oscillations and cycles, supply and demand, production functions, investment and consumption

Objective
A successful participant of the course is able to:
- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyse the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics
Overview of the technical characteristics of railway systems

Transdisciplinary Methods and Applications

Handouts are provided by the lecturers

The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines.

Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.

At the end of the course students should:

- Know: Function, purpose and algorithm of a selected number of transdisciplinary methods
- Understand: Functional application in case studies and other problem oriented projects
- Be able to reflect on: Potential, limits, and necessity of transdisciplinary methods

Be prepared for:
- Transdisciplinary Case Study 2016

The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

Self-study tasks (discussion exercises, Vensim exercises), are provided as home work. Weekly exercise sessions (45 min) are used to discuss selected solutions. Regular participation in the exercises is an efficient way to understand the concepts relevant for the final exam.

Lecture notes

Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM.

Prerequisites / notice

Mathematical Optimization

Abstract

Mathematical treatment of diverse optimization techniques.

Objective

Content

1. Linear optimization: The geometry of linear programming, the simplex method for solving linear programming problems, Farkas’ Lemma and infeasibility certificates, duality theory of linear programming.
3. Integer optimization: Ties between linear and integer optimization, total unimodularity, complexity theory, cutting plane theory.
4. Combinatorial optimization: Network flow problems, structural results and algorithms for matroids, matchings and, more generally, independence systems.

Railway Systems I

Abstract

Basic characteristics of railway vehicles and their interfaces with the railway infrastructure:
- Transportation tasks and vehicle types
- Running dynamics
- Mechanical part of rail vehicles
- Brakes
- Traction chain and auxiliary supply
- Railway power supply
- Signalling systems
- Traffic control and maintenance
- Overview of the technical characteristics of railway systems
- Interrelationship between different fields of engineering sciences (mechanics, electro and information technology, transport systems)
- Understanding tasks and opportunities of engineers working in an environment which has strong economical and political boundaries
- Insight into the activities of the railway vehicle industry and railway operators in Switzerland
- Motivation of young engineers to start a career in the railway industry or with railway operators

Objective

### 751-0422-00L Economometrics II

**W 2 credits**

**P. Stalder**

**Abstract**

Introduction to Econometrics with practical work on the PC. The lecture builds on Econometrics I (regression analysis, autocorrelated and heteroscedastic disturbances) and addresses the problem of multicollinearity, the estimation of error-correction models, simultaneous equation models and the Probit model.

**Objective**

Practical comprehension of econometric methods and models.

**Content**

The lecture builds on Economometrics I (regression analysis, autocorrelated and heteroscedastic disturbances) and addresses four topics: (1) the problem of Multicollinearity, (2) the concept of Stationarity and Cointegration of time series and the related estimation of Error-correction models, (3) Simultaneous equation models, (4) Probit models. Practical exercises on the PC enhance the understanding (Program EViews).

**Lecture notes**

Abgabe der Unterlagen (gegen eine Schutzgebühr) zu Beginn des Semesters. Rechtzeitig eingeschriebene Teilnehmer können die Unterlagen auf Wunsch und gegen eine Zusatzgebühr auch in Farbe beziehen.

**Prerequisites / notice**

**Dozent:**

Dr. Markus Meyer, Emkamatik GmbH

Voraussichtlich ein oder zwei Gastvorträge von anderen Referenten.

### 851-0703-03L Introduction to Law for Civil Engineering

**W 2 credits**

**G. Hertig**

**Prerequisites / notice**

**Literature**

---

### 851-0733-00L Traffic Law / Traffic Commercial Law

**W 2 credits**

**S. Scherler**

**Abstract**

Within the scope of the lecture "Traffic Law / Traffic Commercial Law", besides an introduction into the legal basis of the national and international traffic, the main interest will be laid on actual political and economical questions and problems with respect to traffic (e.g. financing of traffic, road pricing, rail reform, air traffic vs. environment law etc.). With practical exercises and subsequent detailed reviews themes and subjects of special interest to participants are being treated more thoroughly.

**Objective**

Participants are acquiring a comprehensive summary about the system Traffic Law/Traffic Commercial Law in Switzerland. With practical exercises and subsequent detailed reviews themes and subjects of special interest to participants are being treated more thoroughly.

**Content**

Within the scope of the lecture "Traffic Law / Traffic Commercial Law", besides an introduction into the legal basis of the national and international traffic, the main interest will be laid on actual political and economical questions and problems with respect to traffic (e.g. financing of traffic, road pricing, rail reform, air traffic vs. environment law etc.). With practical exercises and subsequent detailed reviews themes and subjects of special interest to participants are being treated more thoroughly.

**Lecture notes**

Script will be distributed during the lecture.
Environmental Management

Abstract
An environmental management system has the objective to continuously improve the environmental performance of the activities, products and services of a company. The company has to introduce different management procedures. The goal of this lecture is to provide basics and specific procedure to implement the environmental dimension in the planning and decision making processes of an organisation.

Objective
Overview on environmental management and environmental management systems, general methods and principles.

Content
Introduction to environmental management / environmental management systems, energy and material flows; economical and ecological problems in industry; characterisation of an environmental management system; overview on the ISO 14001 ff. series; methods for environmental evaluation and assessment; integrated management systems; planning methodology and life-cycle-design; planning example.

Lecture notes
Information about environmental management and environmental management systems will be provided by a CD or mail.

Literature
A list with literatures and links will be provided.

Prerequisites / notice
Delivery of a case study, worked out in groups. Language: Teaching in English on request.

Fundamentals of Natural Hazards Management

Abstract
Risks to life and human assets result when settlement areas and infrastructure overlap regions where natural hazard processes occur. This course utilizes case studies to teach how a future natural hazards-specialist should analyze, assess and manage risks.

Objective
Concepts will be explained step-by-step through a set of case studies, and applied in lab by the students. The following principal steps are used when coping with natural hazard-risks. At each step, students will learn and apply the following skills:

Risk analysis - What can happen?
- Characterize the processes and environmental measures that lead to a natural hazard and integrate modeling results of these processes.
- Identify threats to human life and assets exposed to natural hazards and estimate possible drawbacks or damages.

Risk assessment - What are the acceptable levels of risk?
- Apply principles to determine acceptable risks to human life and assets in order to identify locations which should receive added protection.
- Explain causes for conflicts between risk perception and risk analysis.

Risk management - What steps should be taken to manage risks?
- Explain how various hazard mitigation approaches reduce risk.
- Describe hazard scenarios as a base for adequate dimensioning of control measures.
- Identify the best alternative from a set of thinkable measures based on an evaluation scheme.
- Explain the principles of risk-governance.

Content
Die Vorlesung besteht aus folgenden Blöcken:
1) Einführung ins Vorgehenskonzept (1W)
2) Risikoanalyse (6W + Exkursion) mit:
   - Systemabgrenzung
   - Gefahrenbeurteilung
   - Expositions- und Folgenanalyse
3) Risikobewertung (2W)
4) Risikomanagement (2W + Exkursion)
5) Abschlussbesprechung (1W)

Master Thesis

Number
Title
Type ECTS Hours
103-0010-00L Master's Thesis O 24 47D Supervisors

Abstract
Before starting the Master's thesis, students must have
a. obtained the Bachelor's degree;
b. fulfilled all specified admission conditions, if any;
c. acquired at least 90 credits in the Master's programme, including 12 credits in the area of the interdisciplinary project.

Objective
To work independently and to produce a scientifically structured work.

Content
The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

402-0811-00L Programming Techniques for Scientific Simulations I
- Type: O
-ECTS: 5
- Hours: 4G
- Lecturers: M. Troyer

Abstract
This lecture provides an overview of programming techniques for scientific simulations. The focus is on advances C++ programming techniques and scientific software libraries. Based on an overview over the hardware components of PCs and supercomputer, optimization methods for scientific simulation codes are explained.

401-0663-00L Numerical Methods for CSE
- Type: O
-ECTS: 7
- Hours: 4V+2U
- Lecturers: R. Hiptmair

Abstract
The course gives an introduction into fundamental techniques and algorithms of numerical mathematics which play a central role in numerical simulations in science and technology. The courses focuses on fundamental ideas and algorithmic aspects of numerical methods. The exercises involve actual implementation of numerical methods.

Objective
* Knowledge of the fundamental algorithms in numerical mathematics
* Knowledge of the essential terms in numerical mathematics and the techniques used for the analysis of numerical algorithms
* Ability to choose the appropriate numerical method for concrete problems
* Ability to interpret numerical results
* Ability to implement numerical algorithms efficiently

Content
1. Direct Methods for linear systems of equations
2. Interpolation
3. Iterative Methods for non-linear systems of equations
4. Krylov methods for linear systems of equations
5. Eigenvalues
6. Least Squares Techniques
7. Filtering Algorithms
8. Approximation of Functions
9. Numerical Quadrature
10. Clustering Techniques
11. Single Step Methods for ODEs
12. Stiff Integrators
13. Structure Preserving Integrators

Lecture notes
Lecture slides will be made available to participants.

Literature
- M. Hanke-Bourgeois "Grundlagen der Numerischen Mathematik und des wissenschaftlichen Rechnens", TG Teubner, 2002
- C. Moler, Numerical computing with MATLAB, SIAM, 2004

Prerequisites / notice
The course will be accompanied by programming exercises relying on the high level programming language MATLAB. A brief introduction to Matlab will be given during the first week.

Abstract
This class covers the following concepts: random variables, probability, discrete and continuous distributions, joint and conditional probabilities and distributions, the law of large numbers, the central limit theorem, descriptive statistics, statistical inference, inference for normally distributed data, point estimation, and two-sample tests.

Objective
Knowledge of the basic principles and statistics.

Content
Introduction to probability theory, some basic principles from mathematical statistics and basic methods for applied statistics.

Lecture notes
Lecture notes

Literature
Lecture notes
Information Systems for Engineers  O  4 credits  2V+1U  R. Marti

**Abstract**

Foundations of information systems from a user's viewpoint. The focus is on structured data: relational databases, the data language SQL, designing relational databases. Additional topics: Information Retrieval (searching documents), and estimating their relevance and authority with respect to free-text queries; XML as a format for data exchange; Characteristics and processing of "Big Data"

**Objective**

Following the course should enable students to

1. answer non-trivial queries on existing relational databases by formulating (entry-level) SQL statements, as well as to add new database content and to update or delete existing content,

2. formalize facts as perceived in the real world in terms of the entity-relationship model, and derive a set of normalized relations (tables) which define the structure of a relational database

3. explain how a database management system (DBMS) essentially works and what kind of services it provides

4. understand how a web search engine such as Google basically works

5. know and apply the core concepts to structure and query XML-documents

6. list the characteristics of "Big Data" and know the basics of processing "Big Data"

**Content**

Die Lehrveranstaltung vermittelt Grundlagen und Konzepte von Informationssystemen aus der Sicht eines Anwenders.

Im Zentrum stehen relationale Datenbanksysteme, die Abfrage- und Datenmanipulationssprache SQL, sowie der Entwurf bzw. die Strukturierung relationaler Datenbanken. Dieser Stoff wird auch in praktischen Übungen vertieft.

Weitere Themen sind der Umgang mit unstrukturierten und semistrukturierten Daten, die Integration von Daten aus verschiedenen autonomen Informationssystemen, sowie eine Übersicht der Architektur von Datenbanksystemen.

**Inhalt:**

1. Einleitung.
2. Das Relationenmodell.
3. Die Abfrage- und Datenmanipulationssprache SQL
5. Architektur relationaler Datenbanksysteme.

**Literature**

Vorlesungsunterlagen (PowerPoint Folien, teilweise auch zusätzlicher Text) werden auf der Web-Site publiziert. Der Kauf eines Buches wird nicht vorausgesetzt.

**Prerequisites / notice**

Voraussetzung:
Elementare Kenntnisse von Mengenlehre und logischen Ausdrücken.

401-0647-00L Introduction to Mathematical Optimization  O  5 credits  2V+1U  R. Zenklusen

**Abstract**

Introduction to basic techniques and problems of mathematical optimization.

**Objective**

The goal is to get a good understanding of some of the most important mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems.

**Content**

Topics covered in this course include:

- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, network flows, knapsack problem, ...).

**Literature**

Information about relevant literature will be given in the lecture.

**Prerequisites / notice**

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics and more.

----

**Block G3**

All course units within Block G3 are offered in the spring semester.

**Block G4**

Students that enrol for the second year in the CSE Bachelor Programme and whose first year examination did not involve the subject "Physics I" will instead take the "Physics I and II" (402-0043-00L and 402-0044-00L) courses with performance assessment as a yearly course.

**Number**  **Title**  **Type**  **ECTS**  **Hours**  **Lecturers**

402-0043-00L Physics I  W  4 credits  3V+1U  M. R. Meyer

**Abstract**

Introduction to the concepts and tools in physics with the help of demonstration experiments: mechanics of point-like and ridged bodies, periodic motion and mechanical waves.

**Objective**

The concepts and tools in physics, as well as the methods of an experimental science are taught. The student should learn to identify, communicate and solve physical problems in his/her own field of science.

**Content**

Mechanics (motion, Newton's laws, work and energy, conservation of momentum, rotation, gravitation, fluids)
Periodic Motion and Waves (periodic motion, mechanical waves, acoustics).

**Lecture notes**

The lecture follows the book "Physics" by Paul A. Tipler.

Abstract
This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering.

Objective
Introduction to HPC for scientists and engineers

Fundamental of:
1. Parallel Computing Architectures
2. MultiCores
3. ManyCores

Content
Programming models and languages:
1. C++ threading (2 weeks)
2. OpenMP (4 weeks)
3. MPI (5 weeks)

Computers and methods:
1. Hardware and architectures
2. Libraries
3. Particles: N-body solvers
4. Fields: PDEs
5. Stochastics: Monte Carlo

Abstract
Molecular models, Force fields, Boundary conditions, Electrostatic interactions, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.

For more information: www.csms.ethz.ch/education/CSCBP

Objective
Introduction to computer simulation of (bio)molecular systems, development of skills to carry out and interpret computer simulations of biomolecular systems.

Content
Molecular models, Force fields, Spatial boundary conditions, Calculation of Coulomb forces, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.
Two-dimensional irrotational (potential) flows: stream function and potential, complex notation, singularity method, unsteady flow, V

Available (copies of powerpoint slides distributed before each lecture)

Introduction to mathematical signal processing and system theory.

M. Morari

Lecture notes available.

Prerequisites

Analysis I/II, Knowledge of Fluid Dynamics I, thermodynamics of ideal gas

Prerequisites / notice

ECTS

This course provides an introduction and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. Its a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

For more information about the lecture: www.csms.ethz.ch/education/CSCBP

Data: 06.12.2017 12:57 Autumn Semester 2015 Page 1200 of 1432
### Lecture Notes will be available.

H. J. Herrmann

Topics to be covered include:

- Mathematical Foundations for Finance
- Einführung in die rechnergestützte Simulation physikalischer Probleme. Anhand einfacher Modelle aus der klassischen Mechanik,
- Course on numerical approximations of stochastic ordinary differential equations driven by Wiener processes. These equations have
  applications to computational finance: Option valuation
- Monte Carlo methods for random variables.

Lecture notes will be sold at the beginning of the course. Additional (background) references are given there.

R. Siegwart

The primary objective of this course is that the student deepens an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.

The course consists of three parts: First, we will refresh and deepen the student's knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related design and control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in robotics. The last part finally covers different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.

The contents of the following ETH Bachelor lectures or equivalent are assumed to be known: Mechanics and Dynamics, Control, Basics in Fluid Dynamics.

**Abstract**

First introduction to main modelling ideas and mathematical tools from mathematical finance.

**Objective**

This course gives a first introduction to the main modelling ideas and mathematical tools from mathematical finance. It aims at a double audience: mathematicians who want to learn the modelling ideas and concepts for finance, and non-mathematicians who need an introduction to the main tools from stochastic used in mathematical finance. The main emphasis will be on ideas, but important results will be given with (sometimes partial) proofs.

**Content**

- financial market models in finite discrete time
- absence of arbitrage and martingale measures
- valuation and hedging in complete markets
- basics about Brownian motion
- stochastic integration
- stochastic calculus: Itô’s formula, Girsanov transformation, Itô’s representation theorem
- Black-Scholes formula

**Lecture notes**

Lecture notes will be sold at the beginning of the course.

**Prerequisites / notice**

Prerequisites: Results and facts from probability theory as in the book "Probability Essentials" by J. Jacod and P. Protter will be used freely. Especially participants without a direct mathematics background are strongly advised to familiarise themselves with those tools before (or very quickly during) the course. (A possible alternative to the above English textbook are the (German) lecture notes for the standard course "Wahrscheinlichkeitsrechnung").

For those who are not sure about their background, we suggest to look at the exercises in Chapters 8, 9, 22-25, 28 of the Jacod/Protter book. If these pose problems, you will have a hard time during the course. So be prepared.

**Abstract**

Course on numerical approximations of stochastic ordinary differential equations driven by Wiener processes. These equations have several applications, for example in financial option valuation. This course also contains an introduction to random number generation and Monte Carlo methods for random variables.

**Objective**

The aim of this course is to enable the students to carry out simulations and their mathematical convergence analysis for stochastic models originating from applications such as mathematical finance. For this the course teaches a decent knowledge of the different numerical methods, their underlying ideas, convergence properties and implementation issues.

**Content**

Generation of random numbers
- Monte Carlo methods for the numerical integration of random variables
- Stochastic processes and Brownian motion
- Stochastic ordinary differential equations (SODEs)
- Numerical approximations of SODEs
- Multilevel Monte Carlo methods for SODEs
- Application to computational finance: Option valuation

**Lecture notes**

Lecture Notes will be available.
Prerequisites / notice

Prerequisites:

Mandatory: Probability and measure theory, basic numerical analysis and basics of MATLAB programming.

a) mandatory courses:
   Elementary Probability, Probability Theory I.

b) recommended courses:
   Stochastic Processes.

Abstract

Physical modelling plays an important role in the analysis and design of new structures, especially for micro and nano devices where fabrication and measurement are difficult. After the fundamentals of electromagnetics, mechanics, and thermodynamics, an introduction to the main concepts and most widely used codes for physical modelling is given and commercial codes are applied.

Objective

Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability 1) to select appropriate software, 2) to apply it for solving given problems, 3) to validate the results, 4) to interactively improve the models until sufficiently accurate results are obtained.

Content

Since the fabrication and characterization of micro- and nanostructures is difficult, expensive, and time-consuming, numerical modelling drastically reduced the design process. Although many commercial software packages are available, it is important to know the drawbacks and difficulties of the numerical methods behind them and to be able to validate the results obtained with such packages.

First, an introduction to the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics is given. This is important for understanding the problems to be analyzed and for validating results obtained from software packages. After this, the main concepts of numerical methods and of the most widely used codes for physical modelling are outlined and compared, which is essential for the adequate selection of software for solving given problems. After this, prominent commercial software packages are applied to various types of problems, ranging from electrodynamics to multiphysics. For becoming able to select appropriate software and to validate the results obtained, different commercial software packages will be used and compared during the exercises in form of small projects.

Abstract

In this course, students learn crucial partial differential equations (conservation laws) that are applicable to any continuum including the Earth’s mantle, core, atmosphere and ocean. The course will provide step-by-step introduction into the mathematical structure, physical meaning and analytical solutions of the equations. The course has a particular focus on solid Earth applications.

Objective

The goal of this course is to learn and understand few principal partial differential equations (conservation laws) that are applicable for analysing and modelling of any continuum including the Earth’s mantle, core, atmosphere and ocean. By the end of the course, students should be able to write, explain and analyse the equations and apply them for simple analytical cases. Numerical solving of these equations will be discussed in the Numerical Modelling I and II course running in parallel.
A provisional week-by-week schedule (subject to change) is as follows:

Week 1: The continuity equation  
Theory: Definition of a geological media as a continuum. Field variables used for the representation of a continuum. Methods for definition of the field variables. Eulerian and Lagrangian points of view. Continuity equation in Eulerian and Lagrangian forms and their derivation. 
Exercise: Computing the divergence of velocity field.

Week 2: Density and gravity  
Exercise: Computing density, thermal expansion and compressibility from an equation of state.

Week 3: Stress and strain  
Exercise: Analysing strain rate tensor for solid body rotation.

Week 4: The momentum equation  

Week 5: Viscous rheology of rocks  
Theory: Solid-state creep of minerals and rocks as the major mechanism of deformation of the Earth's interior. Dislocation and diffusion creep mechanisms. Rheological equations for minerals and rocks. Effective viscosity and its dependence on temperature, pressure and strain rate. Formulation of the effective viscosity from empirical flow laws.  
Exercise: Deriving viscous rheological equations for computing effective viscosities from empirical flow laws.

Week 6: The heat conservation equation  
Exercise: steady temperature profile in case of channel flow.

Week 7: Elasticity and plasticity  

Exercise: Computing the divergence of velocity field.

GRADING will be based on homeworks (30%) and oral exams (70%).  
Exam questions: http://www.erdw.ethz.ch/people/geophysics/tgerya/EXAM_QUESTIONS  
Exam questions: http://www.erdw.ethz.ch/people/geophysics/tgerya/EXAM_QUESTIONS

</table>

In this 13-week sequence, students learn how to write programs from scratch to solve partial differential equations that are useful for Earth science applications. Programming will be done in MATLAB and will use the finite-difference method and marker-in-cell technique. The course will emphasise a hands-on learning approach rather than extensive theory.

Exercise: Deriving viscous rheological equations for computing effective viscosities from empirical flow laws.

Week 1: The continuity equation  
Theory: Definition of a geological media as a continuum. Field variables used for the representation of a continuum. Methods for definition of the field variables. Eulerian and Lagrangian points of view. Continuity equation in Eulerian and Lagrangian forms and their derivation.  
Exercise: Computing the divergence of velocity field.

Week 3: Solving momentum and continuity equations in case of constant viscosity with stream function/vorticity formulation.  
Weeks 5: Conservative finite differences for the momentum equation. "Free slip" and "no slip" boundary conditions. Solving momentum and continuity equations in case of variable viscosity using pressure-velocity formulation with staggered grid.

Week 7: Advection in 2-D with Marker-in-cell method. Combining flow calculation and advection for buoyancy driven flow.  
Week 8: "Free surface" boundary condition and "sticky air" approach. Free surface stabilization. Runge-Kutta schemes.  
Week 9: Solving 2D heat conservation equation in case of constant thermal conductivity with explicit and implicit approaches.  
Week 10: Solving 2D heat conservation equation in case of variable thermal conductivity with implicit approach. Temperature advection with markers. Creating thermomechanical code by combining mechanical solution for 2D buoyancy driven flow with heat diffusion and advection based on marker-in-cell approach.  
Week 11: Subgrid diffusion of temperature. Implementing subgrid diffusion to the thermomechanical code.  
Week 12: Implementation of radioactive, adiabatic and shear heating to the thermomechanical code.  
Week 13: Implementation of temperature-, pressure- and strain rate-dependent viscosity, temperature- and pressure-dependent density and temperature-dependent thermal conductivity to the thermomechanical code. Final project description.

GRADING will be based on weekly programming homeworks (50%) and a term project (50%) to develop an application of their choice to a more advanced level.

Abstract
Seismic tomography is the science of interpreting seismic measurements (seismograms) to derive information about the structure of the Earth. The subject of this course is the formal relationship existing between a seismic measurement and the nature of the Earth, or of certain regions of the Earth, and the ways to use it, to gain information about the Earth.

Abstract
Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

Objective
The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

Content
Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genomic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.
We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

Abstract
The methods of fluid dynamics play an important role in the description of a chain of events, involving the release, spreading and dilution of dangerous fluids in the environment.
Tunnel ventilation systems and strategies are studied, which must meet severe requirements during normal operation and in emergency situations (tunnel fires etc.).

Objective
Generally applicable methods in fluid dynamics and gas dynamics are illustrated and practiced using selected current examples.

Content
Often experts fall back on the methodology of fluid dynamics when involved in the construction of environmentally friendly processing and incineration facilities, as well as when choosing safe transport and storage options for dangerous materials. As a result of accidents, but also in normal operations, dangerous gases and liquids may escape and be transported further by wind or flowing water. There are many possible forms that the resulting damage may take, including fire and explosion when flammable substances are mixed. The topics covered include: Emissions of liquids and gases from containers and pipelines, evaporation from pools and vaporization of gases kept under pressure, the spread and dilution of waste gas plumes in the wind, deflagration and detonation of inflammable gases, fires/balls in gases held under pressure, pollution and exhaust gases in tunnels (tunnel fires etc.)

Abstract
The course provides an introduction into stochastic methods that are applicable for example for the description and modeling of turbulent and subsurface flows. Moreover, mathematical techniques are presented that are used to quantify uncertainty in various engineering applications.

Objective
By the end of the course you should be able to mathematically describe random quantities and their effect on physical systems. Moreover, you should be able to develop basic stochastic models of such systems.
Visualization, Simulation and Interaction - Virtual Reality I

**Objective**

This lecture provides deeper knowledge on the possible applications of virtual reality, its basic technology, and future research fields. The goal is to provide a strong knowledge on Virtual Reality for a possible future use in business processes.

**Content**

- Introduction into Virtual Reality; basics of augmented reality; interaction with digital data, tangible user interfaces (TUI); basics of simulation; compression procedures of image-, audio-, and video signals; new materials for force feedback devices; introduction into data security; cryptography; definition of free-form surfaces; digital factory; new research fields of virtual reality

**Literature**

- Principles of Nonlinear Finite-Element-Methods: A. Kunz
- Visualization, Simulation and Interaction - Virtual Reality I: A. Kunz

**Lecture notes**

Detailed lecture notes will be provided.

**Prerequisites / notice**

- "Visualization, Simulation and Interaction - Virtual Reality I" is recommended.

---

Principles of Nonlinear Finite-Element-Methods

**Objective**

The goal of the lecture is to provide the students with the fundamentals of the nonlinear Finite Element Method (FEM). The lecture focuses on the principles of the nonlinear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Methods are simulations of:

- Crash
- Collapse of structures
- Materials in Biomechanics (soft materials)
- General forming processes

Special attention will be paid to the modeling of the nonlinear material behavior, thermo-mechanical processes and processes with large plastic deformations. The ability to independently create a virtual model which describes the complex nonlinear systems will be acquired through accompanying exercises. These will include the Matlab programming of important model components such as constitutive equations.

**Content**

- Fundamentals of continuum mechanics to characterize large plastic deformations
- Elasto-plastic material models
- Updated-Lagrange (UL), Euler and combined Euler-Lagrange (ALE) approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- Modeling of crack propagation
- Introduction of advanced FE-Methods

**Literature**

- Principles of Nonlinear Finite-Element-Methods: N. Manopulo, B. Berisha
- Introduction to Finite Elements and Sparse Linear System Solving: P. Arbenz, T. Kaman

**Lecture notes**

Yes

**Prerequisites / notice**

- If we will have a large number of students, two dates for the exercises will be offered.
- All topics are illustrated with application examples from engineering.

---

Introduction to Finite Elements and Sparse Linear System Solving

**Objective**

Students will know the most important direct and iterative solvers for sparse linear systems. They will be able to determine which solver to choose in particular situations.
I. THE FINITE ELEMENT METHOD

1. Introduction, model problems.
2. 1D problems. Piecewise polynomials in 1D.
3. 2D problems. Triangulations. Piecewise polynomials in 2D.
5. Implementation aspects.

II. DIRECT SOLUTION METHODS

6. LU and Cholesky decomposition.
7. Sparse matrices.

III. ITERATIVE SOLUTION METHODS

9. Stationary iterative methods, preconditioning.
11. Incomplete factorization preconditioning.
12. Multigrid preconditioning.
13. Nonsymmetric problems (GMRES, BiCGstab).

Literature

Prerequisites / notice

Prerequisites: Linear Algebra, Analysis, Computational Science. The exercises are made with Matlab.

263-5150-00L Scientific Databases
Scientific databases share many aspects with classical DBs, but have additional specific aspects. We will review Relational DBs, Object Oriented DBs, Knowledge DBs, textual DBs and the Semantic Web. All these topics will be studied from the point of view of the scientific applications (Bioinformatics, Physics, Chemistry, Health, Engineering). A toy SDB will be used for exercises.

Objective
The goals of this course are to:
(a) Familiarize the students with how existing DBs can be used for scientific applications.
(b) Recognize the areas where SciDBs differ and require additional features compared to classical DBs.
(c) Be able to understand more easily SciDBs, improve existing ones or design/create new ones.
(d) Familiarize the students with at least two examples of SciDBs.
Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing.

The goal of this course is to give an overview of Big Data technologies. All aspects are covered: data formats and models, programming languages, optimization techniques, systems, and applications.

Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans.

One of the key challenges of the information society is to turn data into information, information into knowledge, and knowledge into value.

There is no single textbook for this course.

There is no single textbook for this course.

A significant amount of material will be delivered in the lectures making lecture attendance highly recommended.

Several papers and online articles will be made available.

Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

| Content | 1) Introduction, Statement of the problem, course structure, exercises, why Scientific DBs (SDBs) do not fit exactly the classical DB area. Hierarchy: File systems, data bases, knowledge bases and variations. Efficiency issues and how they differ from classical DB.
| 2) - Relational DB used for scientific data, pros/cons Introduction to RDB, limitations of the model, basics of SQL, handling of metadata, examples of scientific use of RDBs.
| 3) - Object Oriented DB. Rich/structured objects are very appealing in SDB. OODB primitives and environments. OODB searching. Space and access time efficiency of OODBs.
| 4) - Knowledge bases, key-value stores, ontologies, workflow-based architectures. WASA.
| 5) - MapReduce / Hadoop
| 6) - Storing and sharing mathematical objects, Open Math, its relation with OODB and Knowledge bases. Also the problem of chemical formula representation.
| 7) - SGML and XML, human-readable databases, genomic databases. Advantages of human-readable databases (the huge initial success of genomic databases).
| 8) - Semantic web, Resource Description Framework (RDF) triples, SparQL. An example of very flexible database for knowledge storage. Goals of the Semantic Web, discussion about its future.
| 9) - An ideal scenario (and the design of a toy system with most of the desired features for exploration and exercises).
| 11) - Functional testing, Verifiers, Consistency, Short-circuit testing. Recovery and Automatic recovery, Backup (incremental) methods.
| 12) - Performance and space issues, various uses of compression, concurrency control. Hardware issues, clusters, Cloud computing, Crowd-sourcing.
| 13) - Guest speaker: Ioannis Xenarios (UniProtKB/Swiss-Prot).

<td>Introduction to discrete event systems. We start out by studying popular models of discrete event systems. In the second part of the course we analyze discrete event systems from an average-case and from a worst-case perspective. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Network Calculus.</td>
<td>Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss). The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems. In this lecture we give an introduction to discrete event systems. We start out the course by studying popular models of discrete event systems, such as automata and Petri nets. In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply Markov chains and queueing theory for an understanding of the typical behavior of a system. In the last part of the course we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queueing.</td>

Data: 06.12.2017 12:57 Autumn Semester 2015 Page 1207 of 1432
### Abstract

Context recognition in mobile communication systems like mobile phone and wearable computer will be studied using advanced methods from sensor data fusion, pattern recognition, statistics, data mining and machine learning. Context comprises the behavior of individuals and of groups, their activities as well as the local and social environment.

In the data path from the sensor level to signal segmentation to the classification of the context, advanced methods of signal processing, pattern recognition and machine learning will be applied. Sensor data generated by crowdsourcing methods are integrated. The validation using MATLAB is followed by implementation and testing on a smart phone.

Context recognition as the crucial function of mobile systems is the main focus of the course. Using MatLab the participants implement and verify the discussed methods also using a smart phone.

### Objective

Future mobile systems will act as personal and cooperative assistant by providing the appropriate information and services. The systems consist of a smart phone which communicates with sensors on-body and in the environment. Context comprises user's behavior, his activities, his local and social environment.

The main topics of the course include: Sensor nets, sensor signal processing, data fusion, time series (segmentation, similarity measures), supervised learning (Bayes Decision Theory, Decision Trees, Random Forest, kNN-Methods, Support Vector Machine, Hidden Markov Models, Adaboost), clustering (k-means, dbscan, topic models), Crowdsourcing.

The exercises show concrete design problems like motion and gesture recognition using distributed sensors, detection of activity patterns and identification of the local environment.

Presentations of the PhD students and the visit at the Wearable Computing Lab introduce in current research topics and international research projects.

### Information Theory I

**227-0417-00L**

**Abstract**
This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

**Objective**
The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

**Content**
The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, channel coding theorem, the source-channel separation theorem, feedback capacity

**Literature**
T.M. Cover and J. Thomas, Elements of Information Theory (second edition)

Content

The lecture covers topics in physically-based modeling, such as particle systems, mass-spring models, finite difference and finite element methods. These approaches are used to represent and simulate deformable objects or fluids with applications in animated movies, 3D games and medical systems. Furthermore, the lecture covers topics such as rigid body dynamics, collision detection, and character animation.

**Prerequisites / notice**

Fundamentals of calculus and physics, basic concepts of algorithms and data structures, basic programming skills in C++. Knowledge on numerical mathematics as well as ordinary and partial differential equations is an asset, but not required.

**401-3611-00L Advanced Topics in Computational Statistics**

**Abstract**

This lecture covers selected advanced topics in computational statistics, including various classification methods, the EM algorithm, clustering, handling missing data, and graphical modelling.

**Objective**

Students learn the theoretical foundations of the selected methods, as well as practical skills to apply these methods and to interpret their outcomes.

**Content**

The course is roughly divided in three parts: (1) Supervised learning via (variations of) nearest neighbor methods, (2) the EM algorithm and clustering, (3) handling missing data and graphical models.

**Lecture notes**

We assume a solid background in mathematics, an introductory lecture in probability and statistics, and at least one more advanced course in statistics.

**401-3627-00L High-Dimensional Statistics**

**Abstract**

"High-Dimensional Statistics" deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed.

**Objective**

Knowledge of methods and basic theory for high-dimensional statistical inference

**Content**

Lasso and Group Lasso for high-dimensional linear and generalized linear models; Additive models and many smooth univariate functions; Non-convex loss functions and 1-regularization; Stability selection, multiple testing and construction of p-values; Undirected graphical modeling

**Literature**

**Prerequisites / notice**

Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

**401-4623-00L Time Series Analysis**

**Abstract**

Statistical analysis and modeling of observations in temporal order, which exhibit dependence. Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. Implementations in the software R.

**Objective**

Understanding of the basic models and techniques used in time series analysis and their implementation in the statistical software R.

**Content**

This course deals with modeling and analysis of variables which change randomly in time. Their essential feature is the dependence between successive observations. Applications occur in geophysics, engineering, economics and finance. Topics covered: Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. The models and techniques are illustrated using the statistical software R.

**Lecture notes**

Not available

**Literature**

A list of references will be distributed during the course.

**401-3901-00L Mathematical Optimization**

**Abstract**

Mathematical treatment of diverse optimization techniques.

Advanced optimization theory and algorithms.

1. Linear optimization: The geometry of linear programming, the simplex method for solving linear programming problems, Farkas’ Lemma and infeasibility certificates, duality theory of linear programming.

3. Integer optimization: Ties between linear and integer optimization, total unimodularity, complexity theory, cutting plane theory.

4. Combinatorial optimization: Network flow problems, structural results and algorithms for matroids, matchings and, more generally, independence systems.

**402-0867-00L Programming Techniques for Scientific Simulations II**

**Abstract**

This course covers advanced general and C++ programming techniques relevant for scientific simulations.

This course covers advanced general and C++ programming techniques relevant for scientific simulations. The course will cover, in particular:

- generic algorithm and library design
- exception safety
- smart pointers and safe memory handling
- polymorphism at compile time, at run time and hybrid designs
- mixed language programs, in particular C++, C, Fortran and Python, and the Boost.Python library
- template meta programming and relevant libraries
- C++ libraries for parallel programming on distributed and shared memory machines
- Useful C++ libraries from Boost and other sources

**Prerequisites / notice**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: AST245

Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html
Acquire knowledge of main methodologies for computer-based models of astrophysical systems, the physical equations behind them, and train such knowledge with simple examples of computer programmes.

1. Integration of ODE, Hamiltonians and Symplectic integration techniques, time adaptivity, time reversibility
2. Large-N gravity calculation, collisionless N-body systems and their simulation
3. Fast Fourier Transform and spectral methods in general
4. Eulerian Hydrodynamics: Upwinding, Riemann solvers, Limiters
5. Lagrangian Hydrodynamics: The SPH method
6. Resolution and instabilities in Hydrodynamics
7. Initial Conditions: Cosmological Simulations and Astrophysical Disks
8. Physical Approximations and Methods for Radiative Transfer in Astrophysics

Galactic Dynamics (Binney & Tremaine, Princeton University Press),
Computer Simulation using Particles (Hockney & Eastwood CRC press),
Targeted journal reviews on computational methods for astrophysical fluids (SPH, AMR, moving mesh)

Some knowledge of UNIX, scripting languages (see www.physik.uzh.ch/lectures/informatik/python as an example), some prior experience programming, knowledge of C, C++ beneficial

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential 1-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time simulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconducance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions.

Understanding the characteristics of neuromorphic circuit elements.

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties

Neuromorphic Engineering I

Introduction to Neuroinformatics

Transport Phenomena I

Neuromorphic Engineering II

Introduction to Transport Phenomena

Teaching goals of this course are on five different levels:

1. Deep understanding of fundamentals: local balance equations, constitutive equations for fluxes, entropy balance, interfaces, idea of dimensionless numbers, ...
2. Ability to use the fundamental concepts in applications
3. Insight into the role of boundary conditions
4. Knowledge of a number of applications
5. Flavor of numerical techniques: finite elements, finite differences, lattice Boltzmann, Brownian dynamics, ...

Phenomenological approach to "Transport Phenomena" based on balance equations supplemented by thermodynamic considerations to formulate the undetermined fluxes in the local species mass, momentum, and energy balance equations; fundamentals, applications, and simulations

Approaching Transport Phenomena

Diffusion Equation

Brownian Dynamics

Refreshing Topics in Equilibrium Thermodynamics

Balance Equations

Forces and Fluxes

Measuring Transport Coefficients

Pressure-Driven Flows

Heat Exchangers

Complex Fluids

A detailed manuscript is provided; this manuscript will be developed into a book entitled "A Modern Course in Transport Phenomena" by David C. Venerus and Hans Christian Öttinger

Particular: The course is highly recommended for those who intend to take the spring semester course 'Neuromorphic Engineering II', that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

Prerequisites / notice

Some knowledge of UNIX, scripting languages (see www.physik.uzh.ch/lectures/informatik/python as an example), some prior experience programming, knowledge of C, C++ beneficial

The Planetary Boundary Layer (PBL) constitutes the interface between the atmosphere and the Earth’s surface. Theory on transport processes in the PBL and their dynamics is provided. This course treats theoretical background and idealized concepts. These are contrasted to real world applications and current research issues.

Overall goals of this course are given below. Focus is on the theoretical background and idealised concepts.

Students have basic knowledge on atmospheric turbulence and theoretical as well as practical approaches to treat Planetary Boundary Layer flows. They are familiar with the relevant processes (turbulent transport, forcing) within, and typical states of the Planetary Boundary Layer. Idealized concepts are known as well as their adaptations under real surface conditions (as for example over complex topography).

### Lecture notes

### Literature

### Prerequisites / notice

Umwelt-Fluidynamik (701-0479-00L) (environment fluid dynamics) or equivalent and basic knowledge in atmospheric science

---

### Additional Electives from the Fields of Specialization (CSE Master)

#### 651-4053-05L Boundary Layer Meteorology

**Abstract**
The Planetary Boundary Layer (PBL) constitutes the interface between the atmosphere and the Earth’s surface. Theory on transport processes in the PBL and their dynamics is provided. This course treats theoretical background and idealized concepts. These are contrasted to real world applications and current research issues.

**Objective**
Overall goals of this course are given below. Focus is on the theoretical background and idealised concepts.

Students have basic knowledge on atmospheric turbulence and theoretical as well as practical approaches to treat Planetary Boundary Layer flows. They are familiar with the relevant processes (turbulent transport, forcing) within, and typical states of the Planetary Boundary Layer. Idealized concepts are known as well as their adaptations under real surface conditions (as for example over complex topography).

**Content**
- Introduction
- Turbulence
- Statistical treatment of turbulence, turbulent transport
- Conservation equations in a turbulent flow
- Closure problem and closure assumptions
- Scaling and similarity theory
- Spectral characteristics
- Concepts for non-ideal boundary layer conditions available (i.e. in English)

**Literature**

**Prerequisites / notice**
Umwelt-Fluidynamik (701-0479-00L) (environment fluid dynamics) or equivalent and basic knowledge in atmospheric science

#### 701-1221-00L Dynamics of Large-Scale Atmospheric Flow

**Abstract**
Dynamic, synoptic Meteorology

**Objective**
Understanding the dynamics of large-scale atmospheric flow

**Content**
Dynamical Meteorology is concerned with the dynamical processes of the earth's atmosphere. The fundamental equations of motion in the atmosphere will be discussed along with the dynamics and interactions of synoptic system - i.e. the low and high pressure systems that determine our weather. The motion of such systems can be understood in terms of quasi-geostrophic theory. The lecture course provides a derivation of the mathematical basis along with some interpretations and applications of the concept.

**Literature**
- Pichler H., Dynamik der Atmosphäre, Bibliographisches Institut, 456 pp. 1997

**Prerequisites / notice**
Physics I, II, Environmental Fluid Dynamics

#### 252-0523-00L Computational Biology

**Abstract**
Study of computational techniques, algorithms and data structures used to solve problems in computational biology. Topics: basic biology, string alignment, phylogeny (distance, character, parsimony), molecular evolution, multiple sequence alignment, probabilistic and statistical models, Markov models, microarrays, dynamic programming, maximum likelihood and specialized DNA and protein analysis.

**Objective**
Familiarize the students with the basic concepts of molecular biology and the models and algorithms used to understand, classify and predict behaviour of living organism. This course is at the most basic level, where the main issues, mostly of molecular sequences, are studied.

**Content**
This course lies in the intersection between Computer Science and Molecular Biology. The main purpose is to study computational techniques, algorithms and data structures which are usually applied to solve problems in Molecular Biology and Biochemistry. The following topics are likely to be covered: Introduction, mathematical models of evolution, protein and DNA sequence alignment and its meaning, phylogenetic tree construction, multiple sequence alignments, secondary structure prediction, molecular dynamics, threading, role of bioinformatics in drug design, etc. From the computer science point of view we concentrate our attention in practical solutions for the above problems. Biological knowledge is an asset but not a prerequisite.

**Literature**
- Pichler H., Dynamik der Atmosphäre, Bibliographisches Institut, 456 pp. 1997

**Prerequisites / notice**
- Introduction, S. Pfahl

#### 529-0003-00L Advanced Quantum Chemistry

**Abstract**
Advanced, but fundamental topics central to the understanding of theory in chemistry and for solving actual chemical problems with a computer. Examples are:
- Operators derived from principles of relativistic quantum mechanics
- Relativistic effects + methods of relativistic quantum chemistry
- Open-shell molecules + spin-density functional theory
- New electron-correlation theories
Objective

The aim of the course is to provide an in-depth knowledge of theory and method development in theoretical chemistry. It will be shown that this is necessary in order to be able to solve actual chemical problems on a computer with quantum chemical methods.

The relativistic re-derivation of all concepts known from (nonrelativistic) quantum mechanics and quantum-chemistry lectures will finally explain the form of all operators in the molecular Hamiltonian - usually postulated rather than deduced. From this, we derive operators needed for molecular spectroscopy (like those required by magnetic resonance spectroscopy). Implications of other assumptions in standard non-relativistic quantum chemistry shall be analyzed and understood, too. Examples are the Born-Oppenheimer approximation and the expansion of the electronic wave function in a set of pre-defined many-electron basis functions (Slater determinants). Overcoming these concepts, which are so natural to the theory of chemistry, will provide deeper insights into many-particle quantum mechanics. Also revisiting the workhorse of quantum chemistry, namely density functional theory, with an emphasis on open-shell electronic structures (radicals, transition-metal complexes) will contribute to this endeavor. It will be shown how these insights allow us to make more accurate predictions in chemistry in practice - at the frontier of research in theoretical chemistry.

Content

1) Introductory lecture: basics of quantum mechanics and quantum chemistry
2) Relativistic special theory of relativity and the (classical) electromagnetic interaction of two charged particles
3) Klein-Gordon and Dirac equation; the Dirac hydrogen atom
4) Numerical methods based on the Dirac-Fock-Coulomb Hamiltonian, two-component and scalar relativistic Hamiltonians
5) Response theory and molecular properties, derivation of property operators, Breit-Pauli-Hamiltonian
6) Relativistic effects in chemistry and the emergence of spin
7) Spin in density functional theory
8) New electron-correlation theories: Tensor network and matrix product states, the density matrix renormalization group
9) Quantum chemistry without the Born-Oppenheimer approximation

Lecture notes

A set of detailed lecture notes will be provided, which will cover the whole course.

Literature

2) F. Schwabl: Quantenmechanik für Fortgeschrittene (QM II), Springer-Verlag, 1997
3) R. McWeeny: Methods of Molecular Quantum Mechanics, Academic Press, 1992

Prerequisites / notice

Strongly recommended (preparatory) courses are: quantum mechanics and quantum chemistry

151-0105-00L Quantitative Flow Visualization W 4 credits 2V+1U T. Rösgen

Abstract

The course provides an introduction to digital image analysis in modern flow diagnostics. Different techniques which are discussed include image velocimetry, laser induced fluorescence, liquid crystal thermography and interferometry. The physical foundations and measurement configurations are explained. Image analysis algorithms are presented in detail and programmed during the exercises.

Objective

Introduction to modern imaging techniques and post processing algorithms with special emphasis on flow analysis and visualization.

Content

Development of basic programming skills for (generic) imaging applications.

Fundamentals of optics, flow visualization and electronic image acquisition.

Frequently used mage processing techniques (filtering, correlation processing, FFTs, color space transforms). Image Velocimetry (tracking, pattern matching, Doppler imaging).

Surface pressure and temperature measurements (fluorescent paints, liquid crystal imaging, infrared thermography).

Laser induced fluorescence. (Digital) Schlieren techniques, phase contrast imaging, interferometry, phase unwrapping.

Wall shear and heat transfer measurements.

Pattern recognition and feature extraction, proper orthogonal decomposition.

151-0109-00L Turbulent Flows W 4 credits 2V+1U P. Jenny

Abstract

Laminar and turbulent flows, instability and origin of turbulence - Statistical description: averaging, turbulent energy, dissipation, closure problem - Scalings. Homogeneous isotropic turbulence, correlations, Fourier representation, energy spectrum - Free turbulence: wake, jet, mixing layer - Wall turbulence: Channel and boundary layer - Computation and modelling of turbulent flows

Objective

Basic physical phenomena of turbulent flows, quantitative and statistical description, basic and averaged equations, principles of turbulent flow computation and elements of turbulence modelling

Content

- Properties of laminar, transitional and turbulent flows.
- Origin and control of turbulence. Instability and transition.
- Statistical description, averaging, equations for mean and fluctuating quantities, closure problem
- Scalings, homogeneous isotropic turbulence, energy spectrum.
- Turbulent free shear flows. Jet, wake, mixing layer.
- Wall-bounded turbulent flows.
- Turbulent flow computation and modeling.

Literature

151-0207-00L Theory and Modeling of Reactive Flows W 4 credits 3G C. E. Frouzakis, I. Mantzaras

Abstract

The course first reviews the governing equations and combustion chemistry, setting the ground for the analysis of homogeneous gas-phase mixtures, laminar diffusion and premixed flames. Catalytic combustion and its coupling with homogeneous combustion are dealt in detail, and turbulent combustion modeling approaches are presented. Available numerical codes will be used for modeling.

Objective

Theory of combustion with numerical applications
The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations. Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations.

During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on.

Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course).

The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microflows among others.

Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.

The course builds upon three parts:
I. Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.
II. Theoretical basis of statistical mechanics and kinetic equations.
III. Lattice Boltzmann method for real-world applications.

The content of the course includes:

1. Background: Elements of statistical mechanics and kinetic theory:
   - Particle's distribution function, Liouville equation, entropy, ensembles; Kinetic theory: Boltzmann equation for rarefied gas. H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation;
   - Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

2. Basics of the Lattice Boltzmann Method and Simulations:
   - Minimal kinetic models: lattice Boltzmann method for single-component fluid, discretization of velocity space, time-space discretization, boundary conditions, forcing, thermal models, mixtures.

3. Hands on:
   - Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. Practical issues of LBM for fluid dynamics simulations:
   - Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.

5. Microflow:
   - Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. Advanced lattice Boltzmann methods:
   - Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

7. Introduction to LB models beyond hydrodynamics:
   - Relativistic fluid dynamics; flows with phase transitions.

Lecture notes on the theoretical parts of the course will be made available. Selected original and review papers are provided for some of the lectures on advanced topics. Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided.

The course addresses mainly graduate students (MSc/Ph D) but BSc students can also attend.

**Prerequisites / notice**

- Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

**Literature**

**Content**

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.
Objective

The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Content

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

636-0017-00L  Molecular Evolution, Phylogenetics and Phylodynamics

Abstract

The aim of the course is to provide up-to-date knowledge on how we can obtain an understanding of the evolution and population dynamics of organisms based on their genetic sequencing data, employing key concepts from molecular evolution, phylogenetics and phylodynamics. Throughout the course, we tie the models and methods closely with applications, mainly in the field of epidemiology and evolution.

Objective

Attendees will learn what information is contained in genetic sequencing data and how this information is extracted from the sequencing data. The main concepts introduced are:
* models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics
* stochastic processes

Attendees will apply these concepts to a number of applications yielding biological insight into:
* epidemiology
* pathogen evolution
* macroevolution of species

Content

The course consists of three parts. We first introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Second, we employ these evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades.

Lecture notes

Slides of the lecture will be available online.

Literature

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice

Basic knowledge in linear algebra, analysis, and statistics.

Target audience:
Third year Bachelor students;
Master students who cannot document to have received an adequate training in working scientifically.

Mandatory for all Bachelor and Master students with matriculation in the autumn semester 2014 or later.
Optional for Bachelor and Master students with matriculation until or before the spring semester 2014.
Example: You matriculated in the autumn semester 2013 into the first semester of the Bachelor programme, are now in the third year and plan to matriculate in the autumn semester 2016 into the first semester of the Master programme. In this case, you don't need "Scientific Works in Mathematics" in order to complete the Bachelor degree, but for the Master degree you will need it. In this case, we recommend that you register for "Scientific Works in Mathematics" in the autumn semester 2015 or spring semester 2016.

Directive

https://www.ethz.ch/content/dam/ethz/common/docs/weis
Introduction to scientific writing for students with focus on publication standards and ethical issues, especially in the case of citations (references to works of others.)

Objective
Learn the basic standards of scientific works in mathematics.

Content
- Types of mathematical works
- Publication standards in pure and applied mathematics
- Data handling
- Ethical issues
- Citation guidelines

Lecture notes
Moodle of the Mathematics Library: https://moodle-app2.let.ethz.ch/course/view.php?id=519

Prerequisites / notice
This course is completed by the optional course “Recherchieren in der Mathematik” (held in German) by the Mathematics Library. For more details see: http://www.math.ethz.ch/library/services/schulungen

Bachelor's Thesis
No direct enrolment to this course unit in myStudies. Please fill in the online application form.
Requirements and application form under www.math.ethz.ch/intranet/students/study-administration/theses.html
(Afterwards the enrolment will be done by the Study Administration.)

Abstract
The BSc thesis concludes the curriculum. In their BSc thesis, students should demonstrate their ability to carry out independent, structured scientific work. The purpose of the BSc thesis is to deepen knowledge in a certain subject and to bring students into closer contact with applications in an existing computational group. The BSc thesis requires approximately 160 hours of work.

Objective
In their BSc thesis students should demonstrate their ability to carry out independent, structured scientific work. The purpose is to deepen knowledge in a certain subject and to enable students to collaborate in an existing scientific group to take a computational approach to problems encountered in applications.

Prerequisites / notice
The supervisor responsible for the Bachelor thesis defines the task and determines the start and the submission date. The Bachelor thesis concludes with a written report. The Bachelor thesis is graded.

Zurich Colloquium in Applied and Computational Mathematics
Research colloquium

Abstract

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are assessed as Examination Lessons.

Objective

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content

Rewards / notice

Die Themen für die beiden Prüfungslektionen am Schluss des Praktikums erfahren die Studierenden in der Regel eine Woche vor dem Prüfungstermin. Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie bis am Vortrag um 12 Uhr den beiden Prüfungsexperten (Fachdidaktiker/-in, Departementsvertreter/-in) ein. Die gehaltenen Lektionen werden kriteriumsbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltenen Lektionen im Rahmen eines kurzen Kolloquiums.

Lecture notes

Unterlagen und Folien werden zur Verfügung gestellt.

Literature

### 263-2800-00L Design of Parallel and High-Performance Computing

**Objective**
The aim is for the students to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.

- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
- To try out different options for specialist further training in their profession.

**Content**
- Thematic Schwerpunkte:

  Lernformen:

**Literature**
- Die Literatur ist themenspezifisch. Sie muss je nach Situation selber beschafft werden oder wird zur Verfügung gestellt.

**Prerequisites / notice**
- Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

### 252-0341-01L Information Retrieval

**Abstract**
Introduction to information retrieval with a focus on text documents and images. Main topics comprise extraction of characteristic features from documents, index structures, retrieval models, search algorithms, benchmarking, and feedback mechanisms. Searching the web, images and XML collections demonstrate recent applications of information retrieval and their implementation.

**Objective**
In depth understanding of managing, indexing, and retrieving documents with text, image and XML content. Knowledge about basic search algorithms on the web, benchmarking of search algorithms, and relevance feedback methods.

**Literature**

**Prerequisites / notice**
- Solid basic knowledge in analysis, statistics and numerical methods for CSE. Experience in programming for solving the project tasks.

### 252-0535-00L Machine Learning

**Objective**
Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large concurrent software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

**Content**
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous machine learning algorithms on real world data.

**Lecture notes**
No lecture notes, but slides will be made available on the course webpage.

**Literature**

**Prerequisites / notice**
- To try out different options for specialist further training in their profession.

Content

The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a particularly well-suited model for the behaviour and interaction of such selfish users and programs. Classical game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

Outline:
- Introduction to classical game theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- The cost difference between an optimum under central control and an equilibrium under selfish agents, known as the "price of anarchy".
- Auction-like mechanisms and algorithms that "direct" the actions of selfish agents into a certain desired equilibrium situation.
- Selected current research topics of Algorithmic Game Theory, such as Web-Search Based Keyword Auctions, or Information Cascading in Social Networks

Lecture notes
No lecture notes.

Literature
"Game Theory and Strategy", Philip D. Straffin, The Mathematical Association of America, 5th printing, 2004

Prerequisites / notice

Several copies of both books are available in the Computer Science library.

Audience: Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.

Requirements: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.

ECTS European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Computational Science and Engineering Master

Core Courses (Programme Regulations 2014)

Two core courses out of three must be attended and examinations must be taken in both.

Abstract
This course covers some of the fundamental concepts of computer graphics, namely 3D object representations and generation of photorealistic images from digital representations of 3D scenes.

Objective
At the end of the course the students will be able to build a rendering system. The students will study the basic principles of rendering and image synthesis. In addition, the course is intended to stimulate the students' curiosity to explore the field of computer graphics in subsequent courses or on their own.

Content
This course covers fundamental concepts of modern computer graphics. Students will learn about 3D object representations and the details of how to generate photorealistic images from digital representations of 3D scenes. Starting with an introduction to 3D shape modeling and representation, texture mapping and ray-tracing, we will move on to acceleration structures, the physics of light transport, appearance modeling and global illumination principles and algorithms. We will end with an overview of modern image-based image synthesis techniques, covering topics such as lightfields and depth-image based rendering.

Lecture notes
no

Prerequisites / notice
Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++, Visual Computing course recommended.

The programming assignments will be in C++. This will not be taught in the class.

Abstract
This course acquaints students with core knowledge in computer graphics, image processing, multimedia and computer vision. Topics include: Graphics pipeline, perception and camera models, transformation, shading, global illumination, texturing, sampling, filtering, image representations, image and video compression, edge detection and optical flow.

Objective
This course provides an in-depth introduction to the core concepts of computer graphics, image processing, multimedia and computer vision. The course forms a basis for the specialization track Visual Computing of the CS master program at ETH.

Content
Course topics will include: Graphics pipeline, perception and color models, camera models, transformations and projection, projections, lighting, shading, global illumination, texturing, sampling theorem, Fourier transforms, image representations, convolution, linear filtering, diffusion, nonlinear filtering, edge detection, optical flow, image and video compression.

Lecture notes
A scriptum will be handed out for a part of the course. Copies of the slides will be available for download. We will also provide a detailed list of references and textbooks.

Literature

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:
- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non-parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

Lecture notes

252-0523-00L
Computational Biology
W 6 credits 3V+2U G. H. Gonnet

Abstract
Study of computational techniques, algorithms and data structures used to solve problems in computational biology. Topics: basic biology, molecular models, multiple sequence alignment, probabilistic and statistical models, Markov models, microarrays, dynamic programming, maximum likelihood and specialized DNA and protein analysis.

Objective
Familiarize the students with the basic concepts of molecular biology and the models and algorithms used to understand, classify and predict behaviour of living organisms. This course is at the most basic level, where the main issues, mostly of molecular sequences, are studied.

Content
This course lies in the intersection between Computer Science and Molecular Biology. The main purpose is to study computational techniques, algorithms and data structures which are usually applied to solve problems in Molecular Biology and Biochemistry. The following topics are likely to be covered: Introduction, mathematical models of evolution, protein and DNA sequence alignment and its meaning, phylogenetic tree construction, multiple sequence alignments, secondary structure prediction, molecular dynamics, threading, role of bioinformatics in drug design, etc. From the computer science point of view we concentrate our attention in practical solutions for the above problems. Biological knowledge is an asset but not a prerequisite.

6 credits

529-0003-00L
Advanced Quantum Chemistry
W 7 credits 3G M. Reiher, S. Knecht

Abstract
Advanced, but fundamental topics central to the understanding of theory in chemistry and for solving actual chemical problems with a computer. Examples are:

- Operators derived from principles of relativistic quantum mechanics
- Relativistic effects + methods of relativistic quantum chemistry
- Open-shell molecules + spin-density functional theory
- New electron-correlation theories

Objective
The aim of the course is to provide an in-depth knowledge of theory and method development in theoretical chemistry. It will be shown that this is necessary in order to be able to solve actual chemical problems on a computer with quantum chemical methods.

Content
1) Introductory lecture: basics of quantum mechanics and quantum chemistry
2) Einstein’s special theory of relativity and the (classical) electromagnetic interaction of two charged particles
3) Klein-Gordon and Dirac equation; the Dirac hydrogen atom
4) Numerical methods based on the Dirac-Fock-Coulomb Hamiltonian, two-component and scalar relativistic Hamiltonians
5) Response theory and molecular properties, derivation of property operators, Breit-Pauli-Hamiltonian
6) Relativistic effects in chemistry and the emergence of spin
7) Spin in density functional theory
8) New electron-correlation theories: Tensor network and matrix product states, the density matrix renormalization group
9) Quantum chemistry without the Born-Oppenheimer approximation

A set of detailed lecture notes will be provided, which will cover the whole course.

Literature
2) F. Schwabl, Quantenmechanik für Fortgeschrittene (QM II), Springer-Verlag, 1997 [english version available: F. Schwabl, Advanced Quantum Mechanics]
3) R. McWeeny: Methods of Molecular Quantum Mechanics, Academic Press, 1992

Note also the standard textbooks:
A) Szabo, N.S. Ostlund. Verlag, Dover Publications
B) I. N. Levine, Quantum Chemistry, Pearson

Prerequisites / notice
* New electron-correlation theories
* Open-shell molecules + spin-density functional theory
* Relativistic effects + methods of relativistic quantum chemistry

401-5940-00L
Seminar in Chemistry for CSE
W 4 credits 2S P. H. Hünenberger, M. Reiher

Data: 06.12.2017 12:57 Autumn Semester 2015 Page 1223 of 1432
The course provides an introduction to digital image analysis in modern flow diagnostics. Different techniques which are discussed include image velocimetry, laser induced fluorescence, liquid crystal thermography and interferometry. The physical foundations and measurement configurations are explained. Image analysis algorithms are presented in detail and programmed during the exercises.
Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over the world. These methods have been developed and refined over the years, offering powerful tools for simulating complex physical processes.

Introduction to modern imaging techniques and post processing algorithms with special emphasis on flow analysis and visualization. Theory and Modeling of Reactive Flows

Objective

Introduction to modern imaging techniques and post processing algorithms with special emphasis on flow analysis and visualization. Theory and Modeling of Reactive Flows

Abstract

The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations. Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over the world and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations.

During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on.

Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course).

The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microflows among others.

Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.

The content of the course includes:

1. Background: Elements of statistical mechanics and kinetic theory; Particle's distribution function, Liouville equation, entropy, ensembles; Kinetic theory; Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation; Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

3. Hands on: Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. Practical issues of LBM for fluid dynamics simulations: Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.

5. Microflow: Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. Advanced lattice Boltzmann methods: Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

Lecture notes

Lecture notes on the theoretical parts of the course will be made available. Selected original and review papers are provided for some of the lectures on advanced topics. Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided.

Prerequisites

Prerequisites: Fluid dynamics I, Numerical Mathematics, programming skills. Language: German on request.

151-0213-00L Fluid Dynamics with the Lattice Boltzmann Method

W 4 credits 3G I. Karlin

Abstract

The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations. Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations.

During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on.

Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course).

The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microflows among others.

Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.

The content of the course includes:

1. Background: Elements of statistical mechanics and kinetic theory; Particle's distribution function, Liouville equation, entropy, ensembles; Kinetic theory; Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation; Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

3. Hands on: Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. Practical issues of LBM for fluid dynamics simulations: Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.

5. Microflow: Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. Advanced lattice Boltzmann methods: Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

Lecture notes

Lecture notes on the theoretical parts of the course will be made available. Selected original and review papers are provided for some of the lectures on advanced topics. Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided.

Prerequisites

Prerequisites: Fluid dynamics I, Numerical Mathematics, programming skills. Language: German on request.

This course provides an introduction and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. Its a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

Robotics is often viewed from three perspectives: perception (sensing), manipulation (affecting changes in the world), and cognition (intelligence). Robotic systems integrate aspects of all three of these areas. This course provides an introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. This course is a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

An introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control.

The objectives of this course are:

- Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.
- Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensible to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.
- The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher’s LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

- Dimension reduction: principal component analysis (PCA) and beyond

No lecture notes, but slides will be made available on the course webpage.

Solid basic knowledge in analysis, statistics and numerical methods for CSE. Experience in programming for solving the project tasks.

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

The objectives of this course are:

1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

Introduction to Dynamic Programming and Optimal Control.

Dynamic Programming & Optimal Control.

Covers the fundamentals of Dynamic Programming & Optimal Control.

Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

We will provide an overview on how to kinematically and dynamically model typical robotic systems such as robot arms, legged robots, rotary wing systems, or fixed wing.

The primary objective of this course is that the student deepens an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.
Content

The course consists of three parts: First, we will refresh and deepen the student's knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related design and control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in robotics. The last part finally covers different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.

401-5860-00L Seminar in Robotics for CSE W 4 credits 2S J. Buchli

Abstract

This course provides an opportunity to familiarize yourself with the advanced topics of robotics and mechatronics research. The study plan has to be discussed with the lecturer based on your specific interests and/or the relevant seminar series such as the IRIS's Robotics Seminars and BiRONZ lectures, for example.

Objective

The students are familiar with the challenges of the fascinating and interdisciplinary field of Robotics and Mechatronics. They are introduced in the basics of independent non-experimental scientific research and are able to summarize and to present the results efficiently.

Content

This 4 ECTS course structure requires each student to discuss a study plan with the lecturer and select minimum 10 relevant scientific publications to read through, or attend 5-10 lectures of the public robotics oriented seminars (e.g. Public robotics seminars such as the IRIS's Robotics Seminars http://www.iris.ethz.ch/iris/series/, and BiRONZ lectures http://www.birl.ethz.ch/bironz/index are good examples). At the end of the semester, the results should be presented in an oral presentation and summarized in a report, which takes the discussion of the presentation into account.

Physics

For the field of specialization 'Physics' basic knowledge in quantum mechanics is required.

Number Title Type ECTS Hours Lecturers

402-0809-00L Introduction to Computational Physics W 8 credits 2V+2U H. Herrmann

Objective

This course offers an introduction to computer simulation methods for physics problems and their implementation on PCs and super computers: classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell’s equation), Monte Carlo simulations, percolation, phase transitions.

Content

Prerequisites / notice

Lecture and exercise lessons in english, exams in German or in English

402-0205-00L Quantum Mechanics I W 10 credits 3V+2U G. Blatter

Objective

Introduction to non-relativistic single-particle quantum mechanics. In particular, the basic concepts of quantum mechanics, such as the quantisation of classical systems, wave functions and the description of observables as operators on a Hilbert space, and the formulation of symmetries will be discussed. Basic phenomena will be analysed and illustrated by generic examples.

Content

Einführung in die quantenmechanische Theorie. Lernziele: Grundlagen der Quantenmechanik, speziell die quantenmechanische Modellbildung, die Beziehung von Quantenmechanik und klassischer Mechanik, Symmetrien. Ziel: Einführung in die Quantenmechanik für ein- und mehrdimensionale Systeme, Molekülphysik, Quantenelektrodynamik, Quantenfelder, Quanteninformationstechnik.

Prerequisites / notice

Lecture notes

Deutsch

401-5810-00L Seminar in Physics for CSE W 4 credits 2S A. Soluyanov

Abstract

In this seminar the students present a talk on an advanced topic in modern theoretical or computational physics.

Computational Finance

Number Title Type ECTS Hours Lecturers

401-3913-01L Mathematical Foundations for Finance W 4 credits 3V+2U E. W. Farkas, M. Schweizer

Objective

First introduction to basic mathematical tools from mathematical finance

Content

Topics to be covered include

- financial market models in finite discrete time
- absence of arbitrage and martingale measures
- valuation and hedging in complete markets
- basics about Brownian motion
- stochastic integration
- stochastic calculus: Ito’s formula, Girsanov transformation, Ito’s representation theorem
- Black-Scholes formula

Prerequisites / notice

Lecture notes

Lecture notes will be sold at the beginning of the course. Additional (background) references are given there.

For those who are not sure about their background, we suggest to look at the exercises in Chapters 8, 9, 22-25, 28 of the Jacod/Potter book. If these pose problems, you will have a hard time during the course. So be prepared.

401-4657-00L Numerical Analysis of Stochastic Ordinary Differential Equations W 6 credits 3V+1U A. Jentzen
Abstract

Course on numerical approximations of stochastic ordinary differential equations driven by Wiener processes. These equations have several applications, for example in financial option valuation. This course also contains an introduction to random number generation and Monte Carlo methods for random variables.

Objective

The aim of this course is to enable the students to carry out simulations and their mathematical convergence analysis for stochastic models originating from applications such as mathematical finance. For this the course teaches a decent knowledge of the different numerical methods, their underlying ideas, convergence properties and implementation issues.

Content

Generation of random numbers
Monte Carlo methods for the numerical integration of random variables
Stochastic processes and Brownian motion
Stochastic ordinary differential equations (SODEs)
Numerical approximations of SODEs
Multilevel Monte Carlo methods for SODEs
Applications to computational finance: Option valuation

Lecture notes

Lecture Notes will be available.

Literature

Prerequisites / notice

Mandatory: Probability and measure theory,
basic numerical analysis and
 basics of MATLAB programming.

a) mandatory courses:
Elementary Probability,
Probability Theory I.

b) recommended courses:
Stochastic Processes.

401-8905-00L Financial Engineering (University of Zurich) W 4.5 credits 3G University lecturers

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract

This lecture is intended for students who would like to learn more on equity derivatives modelling and pricing.

Objective

Quantitative models for European option pricing (including stochastic volatility and jump models), volatility and variance derivatives, American and exotic options.

Content

After introducing fundamental concepts of mathematical finance including no-arbitrage, portfolio replication and risk-neutral measure, we will present the main models that can be used for pricing and hedging European options e.g. Black-Scholes model, stochastic and jump-diffusion models, and highlight their assumptions and limitations. We will cover several types of derivatives such as European and American options, Barrier options and Variance Swaps. Basic knowledge in probability theory and stochastic calculus is required. Besides attending class, we strongly encourage students to stay informed on financial matters, especially by reading daily financial newspapers such as the Financial Times or the Wall Street Journal.

Lecture notes

Script.

Prerequisites / notice

Basic knowledge of probability theory and stochastic calculus.
Asset Pricing.

401-5820-00L Seminar in Computational Finance for CSE W 4 credits 2S D. Würtz

Abstract

The seminar establishes a guided self-study of original articles and advanced textbooks from the area of financial engineering. After an individual discussion with the seminar instructor each participant will deliver a 40 minutes talk (in English). Attendance during the entire semester is mandatory.

Objective

Content

Die Themen stammen aus den Gebieten Finanzmarktanalysen, Bewertung von Finanzmarktinstrumenten, Risiko Management, Portfolio Optimierung, Monte Carlo Methoden.

Literature

Papiere und Unterlagen werden in der ersten Semesterwoche verteilt.

Electromagnetics

Number Title Type ECTS Hours Lecturers
227-2037-00L Physical Modelling and Simulation W 5 credits 4G C. Hafner, J. Leuthold, J. Smajic

Abstract

Physical modelling plays an important role in the analysis and design of new structures, especially for micro and nano devices where fabrication and measurement are difficult. After the fundamentals of electromagnetics, mechanics, and thermodynamics, an introduction to the main concepts and most widely used codes for physical modelling is given and commercial codes are applied.
Typical optimization problems and their difficulties are outlined. Well-known deterministic search strategies, combinatorial minimization, and evolutionary algorithms are presented and compared. In engineering, optimization problems are often very complex. Therefore, new techniques based on the generalization and combination of known methods are discussed. To illustrate the procedure, various problems of practical interest are presented and solved with different optimization codes.

Lecture notes: PDF file see http://alphard.ethz.ch/hafner/Vorles/lect.htm
Prerequisites / notice: Lecture in the first half of the semester, exercises in form of small projects in the second half, presentation of the results in the last week of the semester.

651-4007-00L | Continuum Mechanics | W | 3 credits | 2V | T. Gerya

Abstract: In this course, students learn crucial partial differential equations (conservation laws) that are applicable to any continuum including the Earth’s mantle, core, atmosphere and ocean. The course will provide step-by-step introduction into the mathematical structure, physical meaning and analytical solutions of the equations. The course has a particular focus on solid Earth applications.

Objective: The goal of this course is to learn and understand few principal partial differential equations (conservation laws) that are applicable for analysing and modelling of any continuum including the Earth’s mantle, core, atmosphere and ocean. By the end of the course, students should be able to write, explain and analyse the equations and apply them for simple analytical cases. Numerical solving of these equations will be discussed in the Numerical Modelling I and II course running in parallel.
A provisional week-by-week schedule (subject to change) is as follows:

**Week 1: The continuity equation**
Exercise: Computing the divergence of velocity field.

**Week 2: Density and gravity**
Exercise: Computing density, thermal expansion and compressibility from an equation of state.

**Week 3: Stress and strain**
Exercise: Analysing strain rate tensor for solid body rotation.

**Week 4: The momentum equation**

**Week 5: Viscous rheology of rocks**
Theory: Solid-state creep of minerals and rocks as the major mechanism of deformation of the Earth's interior. Dislocation and diffusion creep mechanisms. Rheological equations for minerals and rocks. Effective viscosity and its dependence on temperature, pressure and strain rate. Formulation of the effective viscosity from empirical flow laws.
Exercise: Deriving viscous rheological equations for computing effective viscosities from empirical flow laws.

**Week 6: The heat conservation equation**
Exercise: steady temperature profile in case of channel flow.

**Week 7: Elasticity and plasticity**

---

**GRADING** will be based on homeworks (30%) and oral exams (70%).
Exam questions: [http://www.erdw.ethz.ch/people/geophysics/tgerya/EXAM_QUESTIONS](http://www.erdw.ethz.ch/people/geophysics/tgerya/EXAM_QUESTIONS)

**Abstract**
In this 13-week sequence, students learn how to write programs from scratch to solve partial differential equations that are useful for Earth science applications. Programming will be done in MATLAB and will use the finite-difference method and marker-in-cell technique. The course will emphasize a hands-on learning approach rather than extensive theory.

**Objective**
The goal of this course is for students to learn how to program numerical applications from scratch. By the end of the course, students should be able to write state-of-the-art MATLAB codes that solve systems of partial differential equations relevant to Earth and Planetary Science applications using finite-difference method and marker-in-cell technique. Applications include Poisson equation, buoyancy driven variable viscosity flow, heat diffusion and advection, and state-of-the-art thermomechanical code programming. The emphasis will be on commonality, i.e., using a similar approach to solve different applications, and modularity, i.e., re-use of code in different programs. The course will emphasize a hands-on learning approach rather than extensive theory, and will begin with an introduction to programming in MATLAB.

**Content**
A provisional week-by-week schedule (subject to change) is as follows:

**Week 1:** Introduction to the finite difference approximation to differential equations. Introduction to programming in Matlab. Solving of 1D Poisson equation.

**Week 2:** Direct and iterative methods for obtaining numerical solutions. Solving of 2D Poisson equation with direct method. Solving of 2D Poisson equation with Gauss-Seidel and Jacobi iterative methods.

**Week 3:** Solving momentum and continuity equations in case of constant viscosity with stream function/vorticity formulation.

**Weeks 4:** Staggered grid for formulating momentum and continuity equations. Indexing of unknowns. Solving momentum and continuity equations in case of constant viscosity using pressure-velocity formulation with staggered grid.

**Weeks 5:** Conservative finite differences for the momentum equation. "Free slip" and "no slip" boundary conditions. Solving momentum and continuity equations in case of variable viscosity using pressure-velocity formulation with staggered grid.

**Week 6:** Advection in 1-D. Eulerian methods. Marker-in-cell method. Comparison of different advection methods and their accuracy.

**Week 7:** Advection in 2-D with Marker-in-cell method. Combining flow calculation and advection for buoyancy driven flow.

**Week 8:** "Free surface" boundary condition and "sticky air" approach. Free surface stabilization. Runge-Kutta schemes.

**Week 9:** Solving 2D heat conservation equation in case of constant thermal conductivity with explicit and implicit approaches.

**Week 10:** Solving 2D heat conservation equation in case of variable thermal conductivity with implicit approach. Temperature advection with markers. Creating thermomechanical code by combining mechanical solution for 2D buoyancy driven flow with heat diffusion and advection based on marker-in-cell approach.

**Week 11:** Subgrid diffusion of temperature. Implementing subgrid diffusion to the thermomechanical code.

**Week 12:** Implementation of radioactive, adiabatic and shear heating to the thermomechanical code.

**Week 13:** Implementation of temperature-, pressure- and strain rate-dependent viscosity, temperature- and pressure-dependent density and temperature-dependent thermal conductivity to the thermomechanical code. Final project description.

**GRADING** will be based on weekly programming homeworks (50%) and a term project (50%) to develop an application of their choice to a more advanced level.
The aim of the course is to provide up-to-date knowledge on how we can obtain an understanding of the evolution and population dynamics.

Lecturers

Slides of the lecture will be available online.

ECTS

Title

2G

T. Stadler

Attendees will learn what information is contained in genetic sequencing data and how this information is extracted from the sequencing data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

Content

Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The exploration of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

Objective

The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

Geophysics: Subject 6

Offered in the spring semester

Biology

Number Title Type ECTS Hours Lecturers

636-0017-00L Molecular Evolution, Phylogenetics and Phyloinformatics W 4 credits 3G T. Stadler

Abstract

The aim of the course is to provide up-to-date knowledge on how we can obtain an understanding of the evolution and population dynamics of organisms based on their genetic sequencing data, employing key concepts from molecular evolution, phylogenetics and phyloinformatics. Throughout the course, we tie the models and methods closely with applications, mainly in the field of epidemiology and evolution.

Objective

Attendees will learn what information is contained in genetic sequencing data and how this information is extracted from the sequencing data. The main concepts introduced are:

* models in molecular evolution
* phylogenetic & phyloinformatic inference
* maximum likelihood and Bayesian statistics
* stochastic processes

Attendees will apply these concepts to a number of applications yielding biological insight into:

* epidemiology
* pathogen evolution
* macroevolution of species

Content

The course consists of three parts. We first introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Second, we employ these evolutionary concepts to infer ancestral relationships among organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phyloinformatics. The aim of that field is to understand and quantify the population dynamics (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades.

Lecture notes

Slides of the lecture will be available online.
Most problems in engineering are of nonlinear nature. The nonlinearities are caused basically due to the nonlinear material behavior, contact conditions and instability of structures. The principles of the nonlinear Finite-Element-Method (FEM) will be introduced in the scope of this lecture for treating such problems.

The goal of the lecture is to provide the students with the fundamentals of the non linear Finite Element Method (FEM). The lecture focuses on the principles of the nonlinear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Method are simulations of:

- Crash
- Collapse of structures
- Materials in Biomechanics (soft materials)
- General forming processes

Special attention will be paid to the modeling of the nonlinear material behavior, thermo-mechanical processes and processes with large plastic deformations. The ability to independently create a virtual model which describes the complex non linear systems will be acquired through accompanying exercises. These will include the Matlab programming of important model components such as constitutive equations.
Content
- Fundamentals of continuum mechanics to characterize large plastic deformations
- Elasto-plastic material models
- Updated-Lagrange (UL), Euler and combined Euler-Lagrange (ALE) approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- Modeling of crack propagation
- Introduction of advanced FE-Methods

Abstract
The finite element (FE) method is the method of choice for (approximately) solving partial differential equations on complicated domains. In the first third of the lecture, we give an introduction to the method. The rest of the lecture will be devoted to methods for solving the large sparse linear systems of equation that a typical for the FE method. We will consider direct and iterative methods.

Objective
Students will know the most important direct and iterative solvers for sparse linear systems. They will be able to determine which solver to choose in particular situations.

Content
I. THE FINITE ELEMENT METHOD
   1. Introduction, model problems.
   2. 1D problems. Piecewise polynomials in 1D.
   3. 2D problems. Triangulations. Piecewise polynomials in 2D.
   5. Implementation aspects.

II. DIRECT SOLUTION METHODS
   6. LU and Cholesky decomposition.
   7. Sparse matrices.

III. ITERATIVE SOLUTION METHODS
   9. Stationary iterative methods, preconditioning.
   11. Incomplete factorization preconditioning.
   12. Multigrid preconditioning.
   13. Nonsymmetric problems (GMRES, BiCGstab).

Abstract
Scientific databases share many aspects with classical DBs, but have additional specific aspects. We will review Relational DBs, Object Oriented DBs, Knowledge DBs, textual DBs and the Semantic Web. All these topics will be studied from the point of view of the scientific applications (Bioinformatics, Physics, Chemistry, Health, Engineering) A toy SDB will be used for exercises.

Objective
The goals of this course are to:
(a) Familiarize the students with how existing DBs can be used for scientific applications.
(b) Recognize the areas where SciDBs differ and require additional features compared to classical DBs.
(c) Be able to understand more easily SciDBs, improve existing ones or design/create new ones.
(d) Familiarize the students with at least two examples of SciDBs.
Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by studying popular models of discrete event systems from an average-case and from a worst-case perspective. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Network Calculus.

The goal of this course is to give an overview of Big Data technologies. All aspects are covered: data formats and models, programming languages, optimization techniques, systems, and applications.

There is no single textbook for this course. A significant amount of material will be delivered in the lectures making lecture attendance highly recommended.

Several papers and online articles will be made available. Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

| Content  | 1)  - Introduction, Statement of the problem, course structure, exercises, why Scientific DBs (SDBs) do not fit exactly the classical DB area. Efficiency issues and how they differ from classical DB.  
2)  - Relational DB used for scientific data, pros/cons Introduction to RDB, limitations of the model, basics of SQL, handling of metadata, examples of scientific use of RDBs.  
3)  - Object Oriented DB. Rich/structured objects are very appealing in SDB. OODB primitives and environments. OODB searching. Space and access time efficiency of OODBs.  
4)  - Knowledge bases, key-value stores, ontologies, workflow-based architectures. WASA.  
5)  - MapReduce / Hadoop  
6)  - Storing and sharing mathematical objects, Open Math, its relation with OODB and Knowledge bases. Also the problem of chemical formula representation.  
7)  - SGML and XML, human-readable databases, genomic databases. Advantages of human-readable databases (the huge initial success of genomic databases).  
8)  - Semantic web, Resource Description Framework (RDF) triples, SparQL. An example of very flexible database for knowledge storage. Goals of the Semantic Web, discussion about its future.  
9)  - An ideal scenario (and the design of a toy system with most of the desired features for exploration and exercises).  
11)  - Functional testing, Verifiers, Consistency, Short-circuit testing, Recovery and Automatic recovery, Backup (incremental) methods.  
12)  - Performance and space issues, various uses of compression, concurrency control. Hardware issues, clusters, Cloud computing, Crowd-sourcing.  
| Literature | Several papers and online articles will be made available.  
There is no single textbook for this course. A significant amount of material will be delivered in the lectures making lecture attendance highly recommended. |

| 263-3010-00L | Big Data | 6 credits | W 3V+2U+1A | T. Hofmann |
| Abstract | One of the key challenges of the information society is to turn data into information, information into knowledge, and knowledge into value. To turn data into value in this way involves collecting large volumes of data, possibly from many and diverse data sources, processing the data fast, and applying complex operations to the data. |
| Objective | To turn data into value in this way involves collecting large volumes of data, possibly from many and diverse data sources, processing the data fast, and applying complex operations to the data. This combination of requirements is typically referred to as Big Data and it has led to a completely new way to do business (e.g., develop new products and business models) and do science (sometimes referred to as data-driven science or the "fourth paradigm"). Unfortunately, big data grows faster than our ability to process the data so that new architectures and approaches for processing Big Data are needed. |

| 263-2800-00L | Design of Parallel and High-Performance Computing | 7 credits | W 3V+2U+1A | T. Hofmann, M. Püschel |
| Abstract | Advanced topics in parallel / concurrent programming. |
| Objective | Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large concurrent software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore. |

| 227-0102-00L | Discrete Event Systems | 6 credits | 4G | L. Thiele, L. Vanbeyver, R. Wattenhofer |
| Abstract | Introduction to discrete event systems. We start out by studying popular models of discrete event systems. In the second part of the course we analyze discrete event systems from an average-case and from a worst-case perspective. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Network Calculus. |
| Objective | Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss). The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems. In this lecture we give an introduction to discrete event systems. We start out the course by studying popular models of discrete event systems, such as automata and Petri nets. In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply Markov chains and queuing theory for an understanding of the typical behavior of a system. In the last part of the course we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queuing. |
Abstract
Context recognition in mobile communication systems like mobile phone and wearable computer will be studied using advanced methods from sensor data fusion, pattern recognition, statistics, data mining and machine learning. Context comprises the behavior of individuals and of groups, their activities as well as the local and social environment.

In the data path from the sensor level to signal segmentation to the classification of the context, advanced methods of signal processing, pattern recognition and machine learning will be applied. Sensor data generated by crowdsouring methods are integrated. The validation using MATLAB is followed by implementation and testing on a smart phone.

Context recognition as the crucial function of mobile systems is the main focus of the course. Using MatLab the participants implement and verify the discussed methods also using a smart phone.

Content
The next generation of mobile communication systems are integrated in our clothes and act as personal and cooperative assistant providing information we need just now (see www.wearable.ethz.ch). Context recognition - what is the situation of the user, his activity, his environment, how is he doing, what are his needs - as the central functionality of mobile systems constitutes the focus of the course.

The main topics of the course include
- Sensor nets, sensor signal processing, data fusion, time series (segmentation, similarity measures), supervised learning (Bayes Decision Theory, Decision Trees, Random Forest, kNN-Methods, Support Vector Machine, Hidden Markov Models, AdaBoost), clustering (k-means, dbscan, topic models)
- Crowdsourcing
- The exercises show concrete design problems like motion and gesture recognition using distributed sensors, detection of activity patterns and identification of the local environment.
- Presentations of the PhD students and the visit at the Wearable Computing Lab introduce in current research topics and international research projects.

Language: german/english (depending on the participants)

Lecture notes
Lecture notes for all lessons, assignments and solutions.
http://www.ife.ee.ethz.ch/education/wearable_systems_1

Literature
Literature will be announced during the lessons.

Prerequisites / notice
No special prerequisites
The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the course images that are ready to be fed to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention, and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

227-0417-00L Information Theory I W 6 credits 4G A. Lapidoth

This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

Objective: The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

Content: The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetical coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity

Literature: T.M. Cover and J. Thomas, Elements of Information Theory (second edition)

227-0427-00L Signal and Information Processing: Modeling, Filtering, Learning W 6 credits 4G H.A. Loeliger

Literature: Lecture notes

Prerequisites:
- local bachelors: course "Discrete-Time and Statistical Signal Processing" (5. Sem.)
- others: solid basics in linear algebra and probability theory

227-0627-00L Applied Computer Architecture W 6 credits 4G A. Gunzinger

Objective: Understand the function, the design and the performance modeling of parallel computer systems.

Content: The lecture "Applied Computer Architecture" gives technical and corporate insights in the innovative Computer Systems/Architectures (CPU, GPU, FPGA, special processors) and their real implementations and applications. Often the designs have to deal with technical limits.

Literature: Script and exercises sheets.

Prerequisites:
- Basics of computer architecture.

252-0237-00L Concepts of Object-Oriented Programming W 6 credits 3V+2U P. Müller

Objective: Understand the function, the design and the performance modeling of parallel computer systems.

Content: Course that focuses on an in-depth understanding of object-oriented programming and compares designs of object-oriented programming languages. Topics include different flavors of type systems, inheritance models, encapsulation in the presence of aliasing, object and class initialization, program correctness, reflection

Literature: Will be announced in the lecture.
**Randomized Algorithms and Probabilistic Methods**

*Abstract*  
Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks.

*Objective*  
After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.

*Content*  
Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas.

*Prerequisites / notice*  
Mastering at least one object-oriented programming language (this course will NOT provide an introduction to object-oriented programming); programming experience

---

**Numerical Analysis of High-Dimensional Problems**

*Abstract*  
In many applications of mathematics, efficient numerical methods for PDEs on high dimensional state and/or parameter spaces is required. This course provides succinct surveys of recently developed numerical methods, their computer implementation for model problems, and elements of their mathematical analysis for the efficient approximation of high- and infinite-dimensional PDE problems.

*Content*  
[not necessarily in order of appearance]  
1. Infinite-Dimensional Analysis
   - Probability spaces and measures,  
   - Tensor Products,  
   - Measures on function spaces,  
   - Covariance operators,  
   - PCA and KL-expansions,  
   - (generalized) polynomial chaos expansions,  
   - Kolmogoroff N-widths

2. Examples,  
   - Parametric Approximation Problems,  
   - Parametric ODEs (biochemical reaction pathways),  
   - Parametric PDEs (diffusion problems with random coefficients),  
   - PDEs in Parametric Domains (Scattering from random obstacles).

3. Stochastic Galerkin Methods  
   - Bayesian Inverse Problems

4. Stochastic Collocation Methods  
   - Smolyak's algorithm and its generalizations;  
   - sparse, adaptive interpolation algorithms

5. Reduced Basis Methods  
   - Monte Carlo Methods

6. Optimization  
   - Optimal Control of parametric ODEs and PDEs.
Books and Surveys:

Prerequisites / notice

ETH BSc Math or equivalent

and

Num. elliptic and Parabolic PDE

or

Num. hyperbolic PDE

or

ETH Doctoral Studies in applied mathematics or CSE.

Programming:

MATLAB (for MSc MATH)

or

Python and C/C++/MPI programming (MSc CSE).

401-3611-00L Advanced Topics in Computational Statistics W 4 credits 2V M. H. Maathuis, M. Mächler

Abstract

This lecture covers selected advanced topics in computational statistics, including various classification methods, the EM algorithm, clustering, handling missing data, and graphical modelling.

Objective

Students learn the theoretical foundations of the selected methods, as well as practical skills to apply these methods and to interpret their outcomes.

Content

The course is roughly divided in three parts: (1) Supervised learning via (variations of) nearest neighbor methods, (2) the EM algorithm and clustering, (3) handling missing data and graphical models.

Lecture notes

Lecture notes.

Prerequisites / notice

We assume a solid background in mathematics, an introductory lecture in probability and statistics, and at least one more advanced course in statistics.

401-3627-00L High-Dimensional Statistics W 4 credits 2V P. L. Bühlmann

Abstract

"High-Dimensional Statistics" deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed.

Objective

Knowledge of methods and basic theory for high-dimensional statistical inference

Content

Lasso and Group Lasso for high-dimensional linear and generalized linear models; Additive models and many smooth univariate functions; Non-convex loss functions and l1-regularization; Stability selection, multiple testing and construction of p-values; Undirected graphical modeling

Literature

Prerequisites / notice

Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

401-4623-00L Time Series Analysis W 6 credits 3G not available

Abstract

Statistical analysis and modeling of observations in temporal order, which exhibit dependence. Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. Implementations in the software R.

Objective

Understanding of the basic models and techniques used in time series analysis and their implementation in the statistical software R.

Content

This course deals with modeling and analysis of variables which change randomly in time. Their essential feature is the dependence between successive observations. Applications occur in geophysics, engineering, linear and generalized linear models. Topics covered: Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. The models and techniques are illustrated using the statistical software R.

Lecture notes

Not available

Literature

A list of references will be distributed during the course.

Prerequisites / notice

Basic knowledge in probability and statistics

401-3901-00L Mathematical Optimization W 11 credits 4V+2U R. Weismantel

Abstract

Mathematical treatment of diverse optimization techniques. Advanced optimization theory and algorithms.
1. Linear optimization: The geometry of linear programming, the simplex method for solving linear programming problems, Farkas' Lemma and infeasibility certificates, duality theory of linear programming.

3. Integer optimization: Ties between linear and integer optimization, total unimodularity, complexity theory, cutting plane theory.

4. Combinatorial optimization: Network flow problems, structural results and algorithms for matroids, matchings and, more generally, independence systems.

402-0867-00L Programming Techniques for Scientific Simulations II

**Abstract**

This course covers advanced general and C++ programming techniques relevant for scientific simulations. The course will cover, in particular:

- generic algorithm and library design
- exception safety
- smart pointers and safe memory handling
- polymorphism at compile time, at run time and hybrid designs
- mixed language programs, in particular C++, C, Fortran and Python, and the Boost, Python library
- template meta programming and relevant libraries
- C++ libraries for parallel programming on distributed and shared memory machines
- Useful C++ libraries from Boost and other sources

402-0777-00L Particle Accelerator Physics and Modeling I

**Abstract**

This is the first of two courses, introducing particle accelerators from a theoretical point of view and covers state-of-the-art modeling techniques. It emphasizes the multidisciplinary aspect of the field, both in methodology (numerical and computational methods) and with regard to applications such as medical, industrial, material research and particle physics.

**Objective**

You understand the building blocks of particle accelerators. Modern analysis tools allows you to model state-of-the-art particle accelerators. In some of the exercises you will be confronted with next generation machines. We will develop a Python simulation tool (AceCLEG0Rator) that reflects the theory from the lecture.

**Content**

- Particle Accelerators an Overview
- Relativity for Accelerator Physicists
- Building Blocks of Particle Accelerators
- Lie Algebraic Structure of Classical Mechanics and Applications to Particle Accelerators
- Symplectic Maps & Analysis of Maps
- Particle Tracking
- Linear & Circular Machines
- Cyclotrons
- Free Electron Lasers
- Collective effects in linear approximation
- Preview of Particle Accelerator Physics and Modeling II

401-7855-00L Computational Astrophysics (University of Zurich)

**Abstract**

No enrolment to this course at ETH Zürich. Book the corresponding module directly at UZH. UZH Module Code: AST245

**Objective**

Acquire knowledge of main methodologies for computer-based models of astrophysical systems, the physical equations behind them, and train such knowledge with simple examples of computer programmes

**Content**

1. Integration of ODE, Hamiltonians and Symplectic integration techniques, time adaptivity, time reversibility
2. Large-N gravity calculation, collisionless N-body systems and their simulation
3. Fast Fourier Transform and spectral methods in general
4. Eulerian Hydrodynamics: Upwinding, Riemann solvers, Limiters
5. Lagrangian Hydrodynamics: The SPH method
6. Resolution and instabilities in Hydrodynamics
7. Initial Conditions: Cosmological Simulations and Astrophysical Disks
8. Physical Approximations and Methods for Radiative Transfer in Astrophysics

**Literature**

Galactic Dynamics (Binney & Tremaine, Princeton University Press),
Computer Simulation using Particles (Hockney & Eastwood CRC press),
Targeted journal reviews on computational methods for astrophysical fluids (SPH, AMR, moving mesh)

**Prerequisites / notice**

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Some knowledge of UNIX, scripting languages (see www.physik.uzh.ch/lectures/informatik/python/ as an example), some prior experience programming, knowledge of C, C++ beneficial

227-1033-00L Neuromorphic Engineering I

**Abstract**

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

**Objective**

Understanding the characteristics of neuromorphic circuit elements.
Content

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations. Application domains of neuromorphic circuits include silicon retina and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifier, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Literature

S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

Prerequisites

Particular: The course is highly recommended for those who intend to take the spring semester course ‘Neuromorphic Engineering II’, that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

227-1037-00L

Introduction to Neuroinformatics

Abstract

The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

Objective

Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enigmas and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

Content

This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simple models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

151-0104-00L

Uncertainty Quantification for Engineering & Life Sciences

Abstract

Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective

The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content

Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Lecture notes

1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Literature

1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes
3. Class Notes

Prerequisites / notice

Fundamentals of Probability, Fundamentals of Computational Modeling

Transport Phenomena I

Abstract

Phenomenological approach to “Transport Phenomena” based on balance equations supplemented by thermodynamic considerations to formulate the undefined fluxes in the local species mass, momentum, and energy balance equations; fundamentals, applications, and simulations

Objective

The teaching goals of this course are on five different levels:
(1) Deep understanding of fundamentals: local balance equations, constitutive equations for fluxes, entropy balance, interfaces, idea of dimensionless numbers, ....
(2) Ability to use the fundamental concepts in applications
(3) Insight into the role of boundary conditions
(4) Knowledge of a number of applications
(5) Flavours of numerical techniques: finite elements, finite differences, lattice Boltzmann, Brownian dynamics, ...

Content

Approach to Transport Phenomena
Diffusion Equation
Brownian Dynamics
Refresher Topics in Equilibrium Thermodynamics
Balance Equations
Forces and Fluxes
Measuring Transport Coefficients
Pressure-Driven Flows
Heat Exchangers
Complex Fluids

Lecture notes

A detailed manuscript is provided; this manuscript will be developed into a book entitled “A Modern Course in Transport Phenomena” by David C. Venerus and Hans Christian Ottinger.

Target audience:
Third year Bachelor students;
Master students who cannot document to have received an adequate training in working scientifically.

Mandatory for all Bachelor and Master students with matriculation in the autumn semester 2014 or later.
Optional for Bachelor and Master students with matriculation until or before the spring semester 2014.
Example: You matriculated in the autumn semester 2013 into the first semester of the Bachelor programme, are now in the third year and plan to matriculate in the autumn semester 2016 into the first semester of the Master programme. In this case, you don't need "Scientific Works in Mathematics" in order to complete the Bachelor degree, but for the Master degree you will need it. In this case, we recommend that you register for "Scientific Works in Mathematics" in the autumn semester 2015 or spring semester 2016.

Directive

Abstract

Introduction to scientific writing for students with focus on publication standards and ethical issues, especially in the case of citations (references to works of others.)

Objective
Learn the basic standards of scientific works in mathematics.

Content
- Types of mathematical works
- Publication standards in pure and applied mathematics
- Data handling
- Ethical issues
- Citation guidelines

Lecture notes
Moodle of the Mathematics Library: https://moodle-app2.let.ethz.ch/course/view.php?id=519

Prerequisites / notice
This course is completed by the optional course "Recherchieren in der Mathematik" (held in German) by the Mathematics Library. For more details see: http://www.math.ethz.ch/library/services/schulungen

401-4990-01L Master's Thesis

Only students who fulfil the following criteria are allowed to begin with their master's thesis:

a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.

For Programme Regulations 2014 there are additional requirements.

No direct enrolment to this course unit in myStudies. Please fill in the online application form.

Abstract
The master's thesis concludes the study programme. Thesis work should prove the students' ability to independent, structured and scientific working.

Objective
Thesis work should prove the students' ability to independent, structured and scientific working.

151-0122-AAL | Fluid Dynamics for CSE | E- | 5 credits | 11R | T. Rösgen

Abstract
An introduction to the physical and mathematical foundations of fluid dynamics is given. Topics include dimensional analysis, integral and differential conservation laws, inviscid and viscous flows, Navier-Stokes equations, boundary layers, turbulent pipe flow. Elementary solutions and examples are presented.

Objective
An introduction to the physical and mathematical principles of fluid dynamics. Fundamental terminology/principles and their application to simple problems.

Content
Phänomene, Anwendungen, Grundfragen
Dimensionsanalyse und Ähnlichkeit; Kinematische Beschreibung; Erhaltungssätze (Masse, Impuls, Energie), integrale und differentielle Formulierungen; Reibungsfreie Strömungen: Euler-Gleichungen, Stromfadentheorie, Satz von Bernoulli; Reibungsbehaftete Strömungen: Navier-Stokes-Gleichungen; Grenzschichten; Turbulenz

Lecture notes
Eine erweiterte Formelsammlung zur Vorlesung wird elektronisch zur Verfügung gestellt.

Literature
Empfohlenes Buch: Fluid Mechanics, P. Kundu & I. Cohen, Elsevier

Prerequisites / notice
Performance Assessment: session examination

Allowed aids:
Textbook (free selection, list of assignments), list of formulars IFD, 8 Sheets (=4 Pages) own notes, calculator

406-0353-AAL Analysis III

Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
Introduction to partial differential equations. Differential equations which are important in applications are classified and solved. Elliptic, parabolic and hyperbolic differential equations are treated. The following mathematical tools are introduced: Laplace transforms, Fourier series, separation of variables, methods of characteristics.

Objective
Mathematical treatment of problems in science and engineering. To understand the properties of the different types of partial differential equations.
### Laplace Transforms:
- Laplace Transform, Inverse Laplace Transform, Linearity, s-Shifting
- Transforms of Derivatives and Integrals, ODEs
- Unit Step Function, t-Shifting
- Short Impulses, Dirac's Delta Function, Partial Fractions
- Convolution, Integral Equations
- Differentiation and Integration of Transforms

### Fourier Series, Integrals and Transforms:
- Fourier Series
- Functions of Any Period p=2L
- Even and Odd Functions, Half-Range Expansions
- Forced Oscillations
- Approximation by Trigonometric Polynomials
- Fourier Integral
- Fourier Cosine and Sine Transform

### Partial Differential Equations:
- Basic Concepts
- Modeling: Vibrating String, Wave Equation
- Solution by separation of variables; use of Fourier series
- D'Alembert Solution of Wave Equation, Characteristics
- Heat Equation: Solution by Fourier Series
- Heat Equation: Solutions by Fourier Integrals and Transforms
- Modeling Membrane: Two Dimensional Wave Equation
- Laplacian in Polar Coordinates: Circular Membrane, Fourier-Bessel Series
- Solution of PDEs by Laplace Transform

- Christian Blatter: Ingenieur-Analysis (Download PDF)

### Abstract
Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

### Objective
The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

### Content
From "Statistics for research" (online)
- Ch 1: The Role of Statistics
- Ch 2: Populations, Samples, and Probability Distributions
- Ch 3: Binomial Distributions
- Ch 6: Sampling Distribution of Averages
- Ch 7: Normal Distributions
- Ch 8: Student's t Distribution
- Ch 9: Distributions of Two Variables

From "Introductory Statistics with R (online)"
- Ch 1: Basics
- Ch 2: The R Environment
- Ch 3: Probability and distributions
- Ch 4: Descriptive statistics and tables
- Ch 5: One- and two-sample tests
- Ch 6: Regression and correlation

### Numerical Methods for CSE
Enrolment only for MSc students who need this course as additional admission requirement.

### Abstract
Introduction into fundamental techniques and algorithms of numerical mathematics which play a central role in numerical simulations in science and technology.

### Objective
- Knowledge of the fundamental algorithms in numerical mathematics
- Knowledge of the essential terms in numerical mathematics and the techniques used for the analysis of numerical algorithms
- Ability to choose the appropriate numerical method for concrete problems
- Ability to interpret numerical results
- Ability to implement numerical algorithms efficiently
The course will cover the following chapters:

1. Direct Methods for linear systems of equations
2. Interpolation
3. Iterative Methods for non-linear systems of equations
4. Krylov methods for linear systems of equations
5. Eigensolvers
6. Least Squares Techniques
7. Filtering Algorithms
8. Approximation of Functions
9. Numerical Quadrature
10. Clustering Techniques
11. Single Step Methods for ODEs
12. Stiff Integrators

Lecture notes
Comprehensive lecture materials are available upon request from the lecturer.

P. Deuflhard and A. Hohmann, "Numerische Mathematik I", DeGruyter, 2002

Prerequisites / notice
Solid knowledge about fundamental concepts and techniques from linear algebra & calculus as taught in the first year of science and engineering curricula.

Software Design  252-0232-AAL
Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
The course Software Design presents and discusses design patterns regularly used to solve problems in object oriented design and object oriented programming. The presented patterns are illustrated with examples from the Java libraries and are applied in a project.

Objective
The students
- know the principles of object oriented programming and can apply these.
- know the most important object oriented design patterns.
- can apply design patterns to solve design problems.
- discover in a given design the use of design patterns.

Statistical Physics and Computer Simulation  529-0483-AAL
Enrolment only for MSc students who need this course as additional requirement.

Abstract
Principles and applications of statistical mechanics and equilibrium molecular dynamics, Monte Carlo simulation, Stochastic dynamics. Exercises using a MD simulation program to generate ensembles and subsequently calculate ensemble averages.

Objective
Introduction to statistical mechanics with the aid of computer simulation, development of skills to carry out statistical mechanical calculations using computers and interpret the results.

Content
Principles and applications of statistical mechanics and equilibrium molecular dynamics, Monte Carlo simulation, Stochastic dynamics. Exercises using a MD simulation program to generate ensembles and subsequently calculate ensemble averages.

Abstract
Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective
The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content
Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Prerequisites / notice
Fundamentals of Probability, Fundamentals of Computational Modeling

Abstract
This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering.

Objective
Introduction to HPC for scientists and engineers Fundamental of:
1. Parallel Computing Architectures
2. MultiCores
3. ManyCores

Content
Programming models and languages:
1. C++ threading (2 weeks)
2. OpenMP (4 weeks)
3. MPI (5 weeks)

Computers and methods:
1. Hardware and architectures
2. Libraries
3. Particles; N-body solvers
4. Fields: PDEs
5. Stochastics: Monte Carlo

| 151-0509-00L | Microscale Acoustofluidics | W    | 4 credits | 3G | J. Dual |

Abstract
In this lecture the basics as well as practical aspects (from modelling to design and fabrication ) are described from a solid and fluid mechanics perspective with applications to microsystems and lab on a chip devices.

Objective
Understanding acoustophoresis, the design of devices and potential applications

Content
Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microrobotics to surface acoustic wave devices

Lecture notes

| 151-0563-01L | Dynamic Programming and Optimal Control | W    | 4 credits | 3G | R. D'Andrea |

Abstract
Introduction to Dynamic Programming and Optimal Control.

Objective
Covers the fundamental concepts of Dynamic Programming & Optimal Control.

Content
Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

Literature

Prerequisites / notice
Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra

| 151-0593-00L | Embedded Control Systems | W    | 4 credits | 6G | J. S. Freudenberg, M. Schmid Daners |

Abstract
This course provides a comprehensive overview of embedded control systems. The concepts introduced are implemented and verified on a microprocessor-controlled haptic device.

Objective
Familiarize students with main architectural principles and concepts of embedded control systems.
This course provides an introduction and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. Its a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

An introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. This course is a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

The course will be taught in English.
Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the

W

4 credits 2V+1U

R. Siegwart, M. Hutter, K. Rudin, T. Stastry

Abstract

We will provide an overview on how to kinematically and dynamically model typical robotic systems such as robot arms, legged robots, rotary wing systems, or fixed wing.

Objective

The primary objective of this course is that the student deepens an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.

Content

The course consists of three parts: First, we will refresh and deepen the student's knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related design and control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in robotics. The last part finally covers different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.

Prerequisites / notice

The contents of the following ETH Bachelor lectures or equivalent are assumed to be known: Mechanics and Dynamics, Control, Basics in Fluid Dynamics.

151-1116-00L Introduction to Aircraft and Car Aerodynamics

Abstract

Airplane aerodynamics: Atmosphere; aerodynamic forces (lift, drag); thrust.

Objective

An introduction to the basic principles and interrelationships of aircraft and automotive aerodynamics.

To understand the basic relations of the origin of aerodynamic forces (ie lift, drag). To quantify the aerodynamic forces for basic configurations of aerofoil and car components.

Illustration of the intrinsic problems and results using examples.

Using experimental and theoretical methods to illustrate possibilities and limits.

Content

Aircraft aerodynamics: atmosphere, aerodynamic forces (ascending force: profile, wings. Resistance, residual resistance, induced resistance); thrust (overview of the propulsion system, aerodynamics of the propellers), introduction to static longitudinal stability.

Lecture notes

1.) Grundlagen der Flugtechnik (Basics of flight science, script in german language)

2.) Einführung in die Fahrzeugaerodynamik (Introduction in car aerodynamics, script in german language)

Literature

English literature covering the content of the course:

227-0120-00L Discrete Event Systems

Abstract

Introduction to discrete event systems. We start out by studying popular models of discrete event systems. In the second part of the course we analyze discrete event systems from an average-case and from a worst-case perspective. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Network Calculus.

Objective

Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by studying popular models of discrete event systems, such as automata and Petri nets. In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply Markov chains and queuing theory for an understanding of the typical behavior of a system. In the last part of the course we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queuing.

Content

1. Introduction

2. Automata and Languages

3. Smarter Automata

4. Specification Models

5. Stochastic Discrete Event Systems

6. Worst-Case Event Systems

7. Network Calculus

Available
Control Systems

The class is intended to provide a comprehensive overview of the theory of linear dynamical systems, their use in control, filtering, and power electronics.

Power Electronic Systems I

J. W. Kolar

Slides can be downloaded from the course website. A printed version with additional content is offered via SPOD (student print on demand).

Prerequisites: Introductory course on power electronics.

227-0103-00L Control Systems W 6 credits 2V+2U M. Morari, F. Dörfler

Abstract
Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of control systems for single input - single output and multivariable systems.

Objective
Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of control systems for single input - single output and multivariable systems.

Content

Lecture notes
Slides can be downloaded from the course website. A printed version with additional content is offered via SPOD (student print on demand) for a fee (ca. 10-15 CHF).

Literature

Prerequisites / notice
Prerequisites: Signal and Systems Theory II.

MATLAB is used for system analysis and simulation.

227-0225-00L Linear System Theory W 6 credits 5G J. Lygeros, M. Kamgarpour

Abstract
The class is intended to provide a comprehensive overview of the theory of linear dynamical systems, their use in control, filtering, and estimation and their applications to areas ranging from avionics to systems biology.

Objective
By the end of the class students should be comfortable with the fundamental results in linear system theory and the mathematical tools used to derive them.

Content
- Rings, fields and linear spaces, normed linear spaces and inner product spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete time, time varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Controllability and observability, canonical forms, Kalman decomposition. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.
- Realization theory.

Lecture notes

Prerequisites / notice
Prerequisites: Control systems (227-0216-00 or equivalent) and sufficient mathematical maturity.

227-0247-00L Power Electronic Systems I W 6 credits 4G J. W. Kolar

Abstract
Basics of the switching behavior, gate drive and snubber circuits of power semiconductors are discussed. Soft-switching and resonant DC/DC converters are analyzed in detail and high frequency loss mechanisms of magnetic components are explained. Space vector modulation of three-phase inverters is introduced and the main power components are designed for typical industry applications.

Objective
Detailed understanding of the principle of operation and modulation of advanced power electronics converter systems, especially of zero voltage switching and zero current switching non-isolated and isolated DC/DC converter systems and three-phase voltage DC link inverter systems. Furthermore, the course should convey knowledge on the switching frequency related losses of power semiconductors and loss mechanisms of magnetic components of converter circuits are explained and approximate calculation methods are presented; the concept of space vector calculus for analyzing three-phase systems is introduced; finally, phase-oriented and space vector modulation of three-phase inverter systems are discussed related to voltage DC link inverter systems and the design of the main power components based on analytical calculations is explained.

Content
Basics of the switching behavior and gate drive circuits of power semiconductor devices and auxiliary circuits for minimizing the switching losses are explained. Furthermore, zero voltage switching, zero current switching, and resonant DC/DC converters are discussed in detail; the operating behavior of isolated full-bridge DC/DC converters is detailed for different secondary side rectifier topologies; high frequency loss mechanisms of magnetic components of converter circuits are explained and approximate calculation methods are presented; the concept of space vector calculus for analyzing three-phase systems is introduced; finally, phase-oriented and space vector modulation of three-phase inverter systems are discussed related to voltage DC link inverter systems and the design of the main power components based on analytical calculations is explained.

Lecture notes
Lecture notes and associated exercises including correct answers, simulation program for interactive self-learning including visualization/animation features.

Prerequisites / notice
Prerequisites: Introductory course on power electronics.
The electrical power transmission system, the energy management system, requirements of the electrical power transmission (demand
and supply). The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzes procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Course: Industrial Process Control

Overview of the most important concepts of system formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Abstract

The goal of this course is understanding the stationary and dynamic problems in electrical power systems. The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of linear and non-linear systems of equations related to electrical power networks.

Objective

The objective of the course is to understand the stationary and dynamic problems in electrical power systems. The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of linear and non-linear systems of equations related to electrical power networks.

Content

The electrical power transmission system, the energy management system, requirements of the electrical power transmission (demand oriented, operationally, economically), network planning and network operation, models of N-port network components (line, cables, shunts, transformers), the p.u. computation, computer oriented network models, linear networks (solution methods - direct, iterative), algorithms for the solution of non-linear set of equations, derived from the electrical power system (Newton-Raphson), power flow computation (problem definition, solution methods), three phase short-circuit computation, application of power flow algorithms. Introduction to power system stability.

Lecture notes

Lecture notes. Course is supported by WWW-teaching system.

Prerequisites / notice

Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.

The course language is English.

Power System Analysis

The goal of this course is understanding the stationary and dynamic problems in electrical power systems. The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of linear and non-linear systems of equations related to electrical power networks.

Objective

The objective of the course is to understand the stationary and dynamic problems in electrical power systems. The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of linear and non-linear systems of equations related to electrical power networks.

Content

The electrical power transmission system, the energy management system, requirements of the electrical power transmission (demand oriented, operationally, economically), network planning and network operation, models of N-port network components (line, cables, shunts, transformers), the p.u. computation, computer oriented network models, linear networks (solution methods - direct, iterative), algorithms for the solution of non-linear set of equations, derived from the electrical power system (Newton-Raphson), power flow computation (problem definition, solution methods), three phase short-circuit computation, application of power flow algorithms. Introduction to power system stability.

Lecture notes

Lecture notes. Course is supported by WWW-teaching system.

Prerequisites / notice

Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.

The course language is English.
This course will focus on the algorithms for inference and learning with statistical models. We use a framework called probabilistic graphical models which include Bayesian Networks and Markov Random Fields.

We will use examples from traditional vision problems such as image registration and image segmentation, as well as recent problems such as object recognition.

Objective
Students will be introduced to probabilistic graphical models and will learn how to apply them to problems in image analysis and understanding. The focus will be to study various algorithms for inference and parameter learning.

No lecture notes, but slides will be made available on the course webpage.

G. DeMicheli, R. Ernst and W. Wolf. Readings in Hw/Sw Co-design, M. Kaufmann, 2003.

Prerequisites for the course is a basic knowledge in the following areas: computer architecture, digital design, software design, embedded systems.
The papers will be presented in the first session of the seminar. In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover Advanced Topics in Computer Graphics and Vision, Advanced Topics in Machine Learning, Probabilistic Artificial Intelligence, Robotics Programming Laboratory, and Probabilistic Artificial Intelligence. The goal is to get an in-depth understanding of actual problems and research topics in the field of computer graphics as well as improve presentations and critical analysis skills. The courses "Computer Graphics I and II" (GDV I & II) are recommended, but not mandatory. Students read the papers and participate in the discussion.

The course provides an introduction to the field of human-computer interaction, emphasizing the central role of the user in system design. Through detailed case studies, students will be introduced to different methods used to analyze the user experience and shown how these can inform the design of new interfaces, systems, and technologies.

The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which rely more and more on machine learning methodology and statistical models.

In the seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistics, optimization, planning, and control and study applications in areas such as sensor networks, robotics, and the Internet. The course is open to students of computer science, electrical engineering, and mechanical engineering background (although students from other departments will be considered). In the Master Programme max. 10 credits can be accounted by Labs on top of the Interfocus Courses. Additional Labs will be listed on the Addendum.
Virtual Reality has the potential to support medical training and therapy. This lecture will derive the technical principles of multi-modal

1. Knowledge of basic software engineering principles and methods
2. Knowledge of how software engineering applies to robotics
3. Knowledge of the most common architectures, coordination and synchronisation methods
4. Experience in design of a small robotics system with aspects of sensing, planning and control

Software engineering tools
- Design patterns
- Software architecture
- ROS and Roboscoop
- Perception
- Mapping and localization
- Path planning and obstacle avoidance

Prerequisites / notice

Students will program Thymio II educational robot with a Carmine 1.09 RGBD camera as the sensor.

Combination of lectures and a semester-long project.

Limited to 18 students.

- Expected to work both individually and in teams of 2-3 students

263-5902-00L Computer Vision

Abstract

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main
corrections and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the
exercises.

Objective

The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Content

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape
matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts
before taking this course.

376-1279-00L Virtual Reality in Medicine

Abstract

Virtual Reality has the potential to provide descriptive and practical information for medical training and image analysis techniques. On the
basis of existing physiological constraints, this lecture will derive the technical requirements and principles of multi-modal input devices, displays,
and rendering techniques. Several examples are presented in the fields of surgical training, intra-operative augmentation, and rehabilitation.
The lecture is accompanied by practical courses and excursions.

Objective

The course will guide students through the design and evaluation process of such systems.

Prerequisites

Students must have a basic knowledge of computer vision and experience with programming in a high-level language.

Literature

Book: Virtual Reality in Medicine, Rieder, Robert; Harders, Matthias; 2012 Springer.

376-1504-00L Physical Human Robot Interaction (pHRI)

Abstract

This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics,
real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-
oriented robotic systems.

Objective

The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the
underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide
students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and
human factors - and use these to evaluate and de- sign safe and efficient assistive and rehabilitative robotic systems. Specifically, you
should be able to:
1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the defined design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components
   into a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical

setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

Number of participants limited to 29.
Content
This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for human applications such as transparency and safety, and the theoretical aspects will be identified and theoretical issues in design for human applications will be examined. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical and practical issues in design for human applications will be examined. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Lecture notes
Will be distributed through the document repository before the lectures.

http://www.relab.ethz.ch/education/courses/phri.html

Literature

Prerequisites / notice
Notice: The restriction is limited to 26 students
There are 4 credit points for this lecture.
The lecture will be held in English.
The students are expected to have basic control knowledge from previous classes.
http://www.relab.ethz.ch/education/courses/phri.html

636-0007-00L Computational Systems Biology W 6 credits 3V+2U J. Stelling

Abstract
Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

Objective
The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

Content
Biological systems have been the subject of intense biological investigation and this has led to the development of systematic approaches to the analysis of biological systems. The aim of this course is to provide an introductory overview of the most important computational methods for the modeling, simulation and analysis of biological networks. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

#### Abstract
The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

#### Objective
The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program.

#### Abstract
The main objective of the 12-week internship is to expose master's students to the work environment in an engineering company or in a research lab outside of the ETH domain. During this period, students have the opportunity to be involved in on-going projects at the host institution.

#### Objective
The main objective of the 12-week internship is to expose master's students to the work environment in an engineering company or in a research lab outside of the ETH domain.

#### Abstract
Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

#### Objective
The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem.

<td>Students acquire the contextual knowledge for analyzing public policies. They learn why and how public policies and laws are developed, designed, and implemented at national and international levels.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Public policies result from decision-making processes that take place within formal institutions of the state (parliament, government, public administration, courts). That is, policies are shaped by the characteristics of decision-making processes and the characteristics of public institutions and related actors (e.g. interest groups). In this course, students acquire the contextual knowledge for analyzing public policies. They learn why and how public policies and laws are developed, designed, and implemented at national and international levels. The course is organized in three modules. The first module (Stefan Bechtold) examines basic concepts and the role of law, law-making, and law enforcement in modern societies. The second module (Thomas Bernauer) deals with the functioning of legislatures, governments, and interest groups. The third module (Frank Schimmelfennig) focuses on the European Union and international organisations.</td>

Data: 06.12.2017 12:57 Autumn Semester 2015
This course picks up on the cornerstone course and goes into greater depth on issues covered in that course, as well as additional issues where science and technology are among the causes of societal challenges but can also help in finding solutions.

Week 1: (no class because of ISTP cornerstone course)
Week 2: Urban development
Week 3: Urban development
Week 4: Energy transitions
Week 5: Energy transitions
Week 6: Climate change
Week 7: Climate change
Week 8: International water management
Week 9: International water management
Week 10: Digital society
Week 11: Digital society
Week 12: Genetic engineering and synthetic biology
Week 13: Minerals
Week 14: end of semester exam

Abstract
Presentations by invited guest speakers from academia and practice/policy. Students are assigned to play a leading role in the discussion and write a report on the respective event.

Objective
Presentations by invited guest speakers from academia and practice/policy. Students are assigned to play a leading role in the discussion and write a report on the respective event.

860-0006-00L Statistical Data Analysis Number of participants limited to 20.

Abstract
This course introduces students to key statistical methods for analyzing social science data with a special emphasis on causal inference. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with statistical software such as Stata.

Objective
Students
- have a sound understanding of linear and logit regression
- know some basics about regression models for multinomial, ordered, or censored response variables, as well as for count data
- know strategies to test causal hypotheses using regression and quasi-experimental methods
- are able to formulate and implement a regression model for a particular research question and a particular type of data
- are able to critically interpret results of a regression model, in particular, regarding causal inference

Content
The topics covered in the first part of the course are linear and logit regression analysis. Extensions to regression models for ordered, multinomial or censored response variables, as well as for count data will be addressed briefly. The second part of the course focuses on causal inference and introduces methods such as panel data analysis, difference-in-difference methods, instrumental variable estimation, propensity score matching, and randomized controlled trials.

The course covers the following topics in relation to the application of the methodology.

- The course provides an overview of the state of the art in the field, to present it in a well understandable way to an interdisciplinary scientific audience, to develop models for open problems, to analyze them, and to defend their results in response to critical questions. In essence, participants should improve their scientific skills and learn to think scientifically about complex dynamical systems.

- The course provides an overview of the state of the art in the field, to present it in a well understandable way to an interdisciplinary scientific audience, to develop models for open problems, to analyze them, and to defend their results in response to critical questions. In essence, participants should improve their scientific skills and learn to think scientifically about complex dynamical systems.

- The course provides an overview of the state of the art in the field, to present it in a well understandable way to an interdisciplinary scientific audience, to develop models for open problems, to analyze them, and to defend their results in response to critical questions. In essence, participants should improve their scientific skills and learn to think scientifically about complex dynamical systems.
This course offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. The module provides an overview of the principles of management, teaches knowledge about management that is highly complementary to the students' technical knowledge, and provides a basis for advancing the knowledge of the various subjects offered at D-MTEC.

The lectures are structured on the basis of a coherent business model and will be presented by the respective area specialists at D-MTEC. To place themselves in the role of the decision maker, as they learn more about the specific case and identify the challenge they are faced with, students will be presented real case scenarios by industry guests from established corporations and will have to critically analyze specific issues. The case study exercise will provide an insight into the context of a managerial problem-solving and enhance the student’s ability to see the business and social consequences of their technical decisions.

Critical skills will be trained by the case study exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of the decision maker, as they learn more about the specific case and identify the challenge they are faced with. Students will be presented real case scenarios by industry guests from established corporations and will have to critically analyze specific issues. The case study exercise will provide an insight into the context of a managerial problem-solving and enhance the student’s ability to see the business and social consequences of their technical decisions.

Discovering Management introduces the mathematical software package MATLAB. Students should learn to implement models of various social processes and systems, and document their skills by a seminar thesis, a short oral presentation as well as a coding project. MATLAB is an integrated environment with a high level programming language which makes it possible to quickly find numerical solutions to a wide range of scientific problems. Furthermore, it includes a rich set of tools for graphically presenting the results.

After the students have learned the basic structure of the programming language, they should be able to implement social simulation models in MATLAB and document their skills by a seminar thesis, a coding project and finally give a short oral presentation.

Abstract
This course is offered complementary to the basis course 351-0778-00L, “Discovering Management”. The course offers additional exercises and case studies.

Objective
The students should learn how to use MATLAB as a tool to solve various scientific problems. MATLAB is an integrated environment with a high level programming language which makes it possible to quickly find numerical solutions to a wide range of scientific problems. Furthermore, it includes a rich set of tools for graphically presenting the results.

Content
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. Critical skills will be trained by the case study exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of the decision maker, as they learn more about the specific case and identify the challenge they are faced with. Students will be presented real case scenarios by industry guests from established corporations and will have to critically analyze specific issues. The case study exercise will provide an insight into the context of a managerial problem-solving and enhance the student’s ability to see the business and social consequences of their technical decisions.

Prerequisites / notice
Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Entrepreneurial Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich. No prior knowledge of business or economics is required to successfully complete this course.

**Abstract**

Students learn principles of teaching beyond classroom and regular PE-Lessons:
- Planning and organizing camps and events
- Teaching the "Ergänzungsfach Sport"
- Long-term-curricula in PE

**Objective**

Students know:
- How to plan events and camps
- To assess curricula critically and to use them properly
- How to combine theoretical and practical issues in the ‘Ergänzungsfach’

**Content**

1. LV Semestereinführung
2. LV Planung Outdoor-Weekend
3. LV Auswertung Outdoor-Event
4. LV Planung Event
5. LV Event-Präsentationen / Schlussveranstaltung

Prequisites / notice

EW2 is compulsory requirement for EW4 Sport

</table>

**Abstract**

This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

**Objective**

Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

**Content**

Thematische Schwerpunkte:
Lernen als Verhaltensänderung und als Informationsverarbeitung: Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzerwerb unter besonderer Berücksichtigung des Wissenstransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen: Intelligenztheorien, Geschlechtsunterschiede im Lernen

**Lecture notes**

Folien werden zur Verfügung gestellt.

**Literature**

**Prerequisites / notice**

This course is only apt for students who intend to enrol in the programs "Teaching Diploma" or "Teaching Certificate". It is about learning in childhood and adolescence.

Simultaneous enrolment in Mentored Work Subject Didactics Sport A and B is compulsory
Abstract
In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

Objective
planning and organization of a longer period of instruction in school.

Content
connection of educational goals and instruction

557-0210-00L Introductory Internship Sport

O 3 credits 6P O. Graf, R. Scharpf

Abstract
During the introductory teaching practice, the students sit in on five lessons given by the teacher responsible for their teaching practice, and then teach five lessons themselves. The students are given observation and reflection assignments by the teacher responsible for their teaching practice.

Objective
Right at the start of their training, students acquire initial experience with the observation of teaching, the establishment of concepts for teaching and the implementation of teaching. This early confrontation with the complexity of everything that teaching involves helps students decide whether they wish to and, indeed, ought to, continue with the training. It forms a basis for the subsequent pedagogical and subject-didactics training.

Content
Students observe and teach 5 lessons, supervised by experienced teachers

Data: 06.12.2017 12:57 Autumn Semester 2015 Page 1261 of 1432
This is a supplement to the Teaching Internship required to obtain a Teaching Diploma in Sports. It is aimed at enlarging the already

Students apply their theoretical background in practice. By teaching sports lessons they improve their teaching skills and classroom
9P - Expanding the professional fields of sports tuition.

557-0207-00L Teaching Internship Including Examination Lessons
Sport
Teaching Internship Sport ONLY for Teaching Diploma in 2 Subjects in One-Step Procedure and Sport as Second Subject.

Repetition of the Teaching Internship is excluded even if Examination Lessons are to be repeated.

Abstract
Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Objective
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content

In the final phase of their training, students have to apply and test the insights, abilities and skills they have acquired. They spend 3-5 weeks in an educational institution, during which time they observe 10 lessons and teach 30 lessons independently. Two of them are as assessed as Examination Lessons.

Examination Lessons are to be repeated.

| Abstract | Central aspects of Sport related pedagogy will be handled in these lectures. These aspects cover, amongst others, the subject and tasks of Sport related pedagogy. Furthermore, the general and sports relevant foundations of Sport related pedagogy will be covered. |
| Objective | To gain basic knowledge of sports pedagogy and to recognize starting points for applied sports pedagogical intervention in schools. |
Die Studierenden wenden die Bewegungs- und Lernziele des Sportunterrichts aus den kantonalen Lehrplänen im Unterricht an und können Unterrichtsmaterialien zu den einzelnen Veranstaltungen werden den Studierenden zur Verfügung gestellt.

Main Topics
- Introduction to sport psychology
- Emotions and stress
- Psychological aspects of sport-injury rehabilitation

Literature

Mentored Work Specialised Courses in the Respective
Subject with an Educational Focus Sport A

Only for Sport Teaching Diploma students.

Abstract
Pedagogical application of research projects for schools

Objective
The students combine and apply general educational aims with a general and specific background of research projects. They know different educational concepts of the above mentioned, recognise its strengths and weaknesses and are able to apply concepts appropriate to the situation.

Content
- Group dynamics in sport
- Coach-Athlete-Interaction
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Emotions and stress
- Cognitive aspects of sport-injury rehabilitation
- Sports history.

Literature
Specialized Courses in Respective Subject with Educational Focus II

At least 6 CP's must be acquired in this category. Further courses must be chosen from the "Sport Practical: Major Education and Specialized Education".

</table>
| Objective  | - To arouse and stimulate the interest for dancing  
- To enjoy dancing without prior knowledge and to experience the possibilities within dance from easy to hard  
- To gain insight into different dance styles  
- To improve one's own dance technique in framework of the topics offered: To acquire and expand personal skills and knowledge  
- To expand the diversity and repertoire of movements  
- To improve coordination with the help of music  
- To understand music and to be able to interpret the music's character  
- Dance enhances the consciousness about body and posture, helps in a holistic personality development and assists in body language: a way to express emotions  |      |      |       |                   |
| Content    | - Kennenlernen von verschiedenen Tanzstilen: HipHop/Streetdance, Jazz, Jive (RNR), Salsa...  
- Grundlagen von Techniken einzelner Tanzstile kennenlernen und verbessern  
- Erarbeiten von Tanzkombinationen  
- Der Tanz und die Bewegung beinhalten Ausdruck, Kraft, Ausdauer, Geschmeidigkeit, Flexibilität, rhythmische Bewegungsabläufe, Koordination und Tanzphasen mit Musik- gepaart mit Kreativität und Lebensfreude |      |      |       |                   |
STV / ESSM: Kernposenkonzept, Aarau 2009.

|            | Prerequisites: Practical course Movement Sciences I-III (BSc HMS) or Assessment III (BSc HST). Compulsory for Sport Teaching Diploma, new Programme Regulations. |      |      |       |                   |
| Abstract   | To get to know and understand the basics of movement (core movements) and its respective actions and functions on apparatuses, on the floor and in acrobatics as well as to create individual and cooperative combinations according to qualitative criteria. |      |      |       |                   |
| Objective  | The students should be able to:  
- acquire and consolidate apparatus related core movements as well as apply and create such combinations  
- utilize their own strength as well as the resulting impact in a differentiate way in order to precisely move the swinging, flying, falling and twisting body  
- gain orientation safety and room orientation while twisting and flying  
- gain sensitivity for social competences (e.g. to assist, to observe, to advise) within a small group.  |      |      |       |                   |
| Content    | - structural relationships within rotations (turnarounds, handsprings and free somersaults)  
- acrobatic cooperation in a threesome on a course of apparatuses  
- core poses as motor basic training  
- variety of position modifications in handstands  
- core movements and combinations on parallel bars, high bar, floor and in swinging rings  
- different forms of vaulting as well as springing in movements like handstands and somersaults |      |      |       |                   |

### Literature

- Chervet, Michel: Basketball. Fundamental skills for offensive play. Video (german / french). Magglingen, BASPO, 2003 (CHF 34.-). Order at video@baspo.admin.ch
- manual for monitors of the Swiss Youth & Sports program (available through the “Jugend & Sport” office, german / french / italian)
- Chervet, Michel: Basektball. Fundamental skills for offensive play. Video (geman / french). Magglingen, BASPO, 2003 (CHF 34.-). Order at video@baspo.admin.ch

### Soccer I

- **Prerequisites:** Practical course Movement Sciences -III (BSc HMS) or Assessment III (BSc HST).
- **Compulsory for Sport Teaching Diploma, new Programme Regulations.**
- **Abstract**
  Acquisition/consolidation basic skills for soccer.
- **Objective**
  Support and development the individual conditions/talent/skill and introduction of basic methods will be treated.
- **Content**
  Technique:
  - Dribble, short passport play, get the ball under control, shot,
  - Individual tactics:
    - offensive/defensive 1vs1; keep ball in own rows
  - various contests in support of different techniques and tactics
- **Literature**
  - Bucher, Walter (Hrsg.) 1020 Spiel- und Übungsformen im Kinderfussball, 7. unveränderte Auflage 2011, Hofmann-Verlag, Schorndorf
- **Prerequisites / notice**
  - 1. Prerequisites:
    Small being able in soccer.
    Readiness to train.
  - 2. After this course you can get the licence “manager for children”.
    Prerequisites: Only 1 absence from the lessons “football for children”, the book “Kinderfussball” can be bought in the course

### Floorball I

- **Prerequisites:** Practical course Movement Sciences I-III (BSc HMS) or Assessment III (BSc HST).
- **Compulsory for Sport Teaching Diploma, new Programme Regulations.**
- **Abstract**
  Experiencing Unihockey/Floorball as an indoor sportsgame
  Learning by doing to improve personal sport skills and widening personal abilities in ball sports
  Learning by practising/playing and linking that knowledge to theories of motor learning
- **Objective**
  Practising unihockey to improve personal sport skills and widening personal abilities in ball sports
  Improvement of personal unihockey-skills
  Learning by practising/playing and linking that knowledge with theories of motor learning
- **Content**
  Transfer of ideas into motor movements and motor skills
  Personal improvement by practising different motor skills as moving the ball/ballcontrol, passing, shooting
  Training of personal sports abilities in ballgames
  Analysis of play-situations and corresponding motor movement
  Understanding, learning and applying the rules of the game
  Practical test of skills and in game activities at the end of the semester
- **Lecture notes**
  Classes are based on insights from the book “unihockey basics” by B.Beutler, M.Wolf.
  ISBN 3-03700-043-0
- **Literature**
- **Prerequisites / notice**
  Please bring your personal hockey stick with you to class.

### Snowsports I

- **Prerequisites:** Assessment I+II (BSc HST) passed.
- **Compulsory for Sport Teaching Diploma, new Programme Regulations.**
- **Abstract**
  Education in the disciplines of winter sports (ski or snowboard)
- **Objective**
  The students:
  - experience the different winter sports
  - gain an understanding of how to ski off-piste
- **Content**
  To apply and vary personal technique of alpine skiing
  To apply and vary personal technique of snowboarding
  To acquire and vary personal technique of cross-country skiing
  Competition in ski-jumping, and giant slalom
  To gain an understanding in how to ski off-piste
- **Prerequisites / notice**
  Requirement: Assessment I + II (BSc HST)

### Trendsports

- **Prerequisites:** Assessment II passed (BSc HST or

### Trendsports

- **Prerequisites:** Assessment II passed (BSc HST or
### Handball I

**Prerequisites:** Practical course Movement Sciences III (BSc HMS) or Assessment III (BSc HST).

**Abstract:** Learn by playing - from three-a-side to four-a-side games.

**Objective:** The students improve their personal skills and demonstrate the game in teams as well as groups of 4 against 4. They deepen the development of the game and practice.

**Content:** Spielend Handball lernen - Über das Spiel zum Spiel (Vom Spiel 3/3 zum Spiel 4/4).

**Lecture notes:** Information is provided on Moodle.

**Prerequisites / notice:** Students need to be inscribed in LD Sport or must have passed assessment II.

#### Major Education

</table>
| 557-0555-00L | Basketball II  
Prerequisite: Basic course completed | W    | 2 credits | 2G | R. Maggi |

**Abstract:** Further development of the technical skills. Structural development of defensive behavior appropriate to the game situation. Introduction to the pre-tactical element of the pick away. Additionally the role and use of the inside players on offense and defense is looked at.

**Objective:**
- Further training of the individual basketball skills
- Participants know the tactical and technical aspects of the pick away.
- Participants can make the right decisions in various defensive situations and with that make it more difficult for the offense.
- Leadership of a team during the game and during physical education class.

**Content:**
- Individual basics Passing/Footwork/Dribbling/Shooting
- Basics in the man-to-man defense on ball/off ball/stop the cut
- Basics on offense getting open/cutting/scoring
- Movement of the inside players
- pick away
- Game management in the classroom combination of roles teacher/coach/referee

The lectures "Leadership I" (WS) and "Leadership II" (SS) have been designed as a two-semester lecture series, but may also be followed independently of one another or in reverse order. "Leadership I" covers the following fields: leadership basics, leadership theories and leadership styles, the concept of leadership responsibility and the role of communication in practical leadership.

The aim of this lecture is to give students an introductory overview of relevant topics regarding leadership research and practice, thus enabling them to gain a deeper understanding of the leadership phenomenon. Students should understand different concepts of leadership in the complex interaction between individuals, groups, organisation, context and situation. They should be informed about the evolution of the understanding of mankind in relation to working processes and its impact on organizations and the understanding of leadership theory in the past 100 years. They should grasp the concept of leadership responsibility (leadership ethics) and be able to derive consequences for leadership in practical situations. They should recognize the fundamental importance of communication in leadership situations and receive input which enables them to communicate adequately in specific situations.

The 1-hour written exam will take place during the last lecture in the semester.
Introduction to the economic decisions of households and firms, and their coordination through markets. Analysis of different market structures and of situations in which markets may lead to socially undesirable outcomes.

Objective: Understanding of basic microeconomic models. Ability to apply these models to real world economic situations.

Content: Economics as a science, division of labour and welfare (concept of comparative advantage), supply and demand (market equilibrium, elasticity), households (preferences, demand), firms (technology, cost analysis, profit maximisation, supply), perfect competition, monopoly and oligopoly, externalities, public goods, information, factor markets and income distribution

Lecture notes: via email

Prerequisites / notice: Course macroeconomics in the summer term

853-0725-00L History Part One: Europe O 3 credits 2V M. Mühlheim

Abstract: Using concrete regional examples, this lecture offers a survey and analysis of the crucial historical transformations that engendered "modernity" in Europe from the late 18th to the mid 20th centuries.

Objective: At the end of this lecture course, students can: (a) highlight the most important changes in the "long nineteenth century" in Europe (b) explain their long-term effects; and (c) relate these changes to global developments.

Content: The thematic foci include: the economic and social consequences of the industrial revolution, the genesis of political ideologies and social movements, shifts in gender roles, colonialism and imperialism, as well as the emergence of consumerism and a "leisure society."

Literature: Mandatory and further reading will be made available at https://ilias-app2.let.ethz.ch/goto.php?target=crs_85655&client_id=ilias_lda.

853-0037-00L Military Psychology and Pedagogy I O 4 credits 2V+1U H. Annen

Abstract: Examine the fundamentals of the two sciences and establish links with military life. Discuss various schools of thought in psychology and focus on content and process theories of motivation. Explore characteristics of pedagogical thinking and discuss the values of military education with reference to the young adult serving in the armed forces.

Objective: - Becoming acquainted with basic psychological views of human behaviour and experience
- Knowing the content and process theories of motivation and being able to transfer them to the military context
- Knowing the possibilities and limitations of military education and deriving consequences

Content: Overall, the objective is to become acquainted with the basics of both scientific areas and to make references to military practice. Military psychology is a branch of applied psychology; consequently selected aspects of psychological principles will be covered. Military pedagogy hasn't yet established itself firmly as an independent scientific discipline, it nevertheless can draw on a deep-seated tradition in Switzerland. Thus, the great importance that has been attached to the discussion of education in Swiss society and academia will be taken into account.

Subjects: - History of military psychology
- Psychological images of humanity (psychoanalysis, behaviourism, behavioural biology, humanistic psychology, cognitivism)
- Motivational theories
- Defence-, service-, operational- and combat motivation
- Swiss military pedagogy
- Education as defining feature of pedagogic thinking and acting

This course is completed by a compulsory one week course between terms.

- Stadelmann, J.: Führung unter Belastung, Huber, Frauenfeld 1998 (provided as pdf)

The lecture is supported by a virtual learning environment containing relevant documents (presentations and texts) and information to further literature.

Abstract: Teaching of formal requirements of scientific work (philosophy of science with a focus on the social sciences); literature reviews and the basics of conducting independent research on short as well as simple topics; basics of conceptualizing research designs for politically relevant questions and hypotheses.

Objective: 1) Understanding the goal and the basic procedures of (empirical social sciences) scientific work (philosophy of science, theory building, research design, as well as the correct employment of sources, data and literature).
2) Identification of relevant research questions.
3) Creating a common basis for a thorough and systematic analysis of these.

Content: Political Methodology I seeks to introduce students to the basics of scientific work and procedures in the social sciences, which in turn shall allow them - also in conjunction with Political Methodology II - to conduct work that fulfills satisfactory standards of research quality throughout their further studies.

With regard to Political Methodology I, this seminar primarily focuses on the philosophy and theory of (empirical social) sciences, its structure, and procedures. The seminar emphasizes substantive contents and ways of presenting them, research and, conceptual work. Additionally, it deals with the basis of establishing research designs with politically relevant questions and hypotheses.

Prerequisites / notice: Each student will be graded by two exercises (50% each).
Abstract
Beside of the most important terms of sociology, demographic changes and the related value and structure change will be analysed. The second part focuses on organizational sociology. Thirdly, the course examines to which extent armed forces can be considered as organizations like any other and to which extent they constitute a special case from an organizational and normative point of view.

Objective
Recognize and explain current changes (social change) in modern society (individualisation, pluralisation); describe demographic changes in Switzerland; explain the structures of societies; define issues and fields of research in modern military sociology and explain the foundations of organisational sociology; explain the military in terms of organisational sociology and identify specific traits of the military as an organisation.

Content
Societal change; organizations as societal phenomena; aims, structures, environments of organizations; specifics of the military as an organization; impacts of technological and societal changes on the armed forces in modern societies.

Literature
A reader with a set of texts will be handed out.

### Business Administration I

**Module Code:** 853-0065-00L  
**Credits:** 4  
**Language:** Only for Public Policy BA

**Objective:**  
- Develop corporate finance thinking  
- Record transactions and prepare financial statements  
- Master tools and methods used for financial management

**Content:**  
1. Financial Accounting  
   - Accounts  
   - Balance sheet and income statement  
   - Inventories,  
   - Value-added tax, prepayments and accruals  
   - Provisions, depreciation,  
   - Evaluation, hidden reserves  
2. Financial Management  
   - Financial report and -analysis  
   - Profitability and capital turnover  
   - Financial planning  
   - Cash budget  
   - Capital budgeting

---

### Military History I (with Exercises)

**Module Code:** 853-0063-00L  
**Credits:** 4  
**Language:** Only for Public Policy BA

**Objective:**  
- Distinguish between military history as a subject and historiography as a way of describing events;  
- Analyse the modern developments regarding armed forces and warfare in the context of socio-economic changes;  
- Based on the approach regarding revolution in military affairs, describe the evolution of the armed forces and of warfare;  
- Exemplify the issues regarding the evolution of the combat (First and Second World War, Vietnam War and Algerian War).

**Content:**  
- The lecture outlines the development of the armed forces (assets regarding manpower, technology and armament), the concepts of warfare and the actual warfare in the 19th and 20th century.  
- Based on the "Military Revolution" approach, the lecture examines the structural changes regarding the armed forces and the development of warfare from the 18th to the 20th century. Special emphasis will be put on how the battlefield was revolutionized due to the Napoleonic wars, the industrialization in the 19th century, the First World War, the mechanization and totalization during the Second World War and the period of the Cold War.

**Literature:**  

---

### Strategic Studies I

**Module Code:** 853-0082-00L  
**Credits:** 3  
**Language:** Only for Public Policy BA

**Objective:**  
- The participants know the classical conceptions of strategy and war theory from antiquity to the present against their specific background. They recognize aspects, which are useful for the understanding of modern/current conflicts. They are capable of analyzing critically original texts and modern scholarly works in the field of strategic studies.

**Content:**  
- The lecture series spread over two terms, deals with the leading concepts of (military) strategy and theories of war from antiquity to the present. It focuses in particular on the backgrounds of these concepts, their implementation as well as their significance for subsequent conceptual thinking.

**Literature:**  
see "Skript"

**Lecture notes**  
A textbook with primary sources and a list of further reading are available with the lecturer or electronically on the MILAK website (Lehre und Forschung/Dozentur/Vorlesungsunterlagen).  
Slides are being distributed.

---

### European Integration: Seminar

**Module Code:** 853-0302-00L  
**Credits:** 4  
**Language:** Only for Public Policy BA

**Objective:**  
- The seminar covers the theory, development, and core policy fields of European integration as well as structures and processes of the EU as a decision- and policy-making system.

**Abstract:**  
The seminar is designed to help students understand the European Union as a particular kind of political system that differs both from the nation-state and from other international organizations. It imparts basic knowledge on the development, institutions, procedures, and policies of the EU and provides an introduction to major approaches to integration theory and political science research on the EU.

**Data:** 06.12.2017 12:57  
**Autumn Semester 2015**  
**Page 1275 of 1432**
Auf der Basis der Definition von Grundbegriffen des Sicherheitsrechts werden die Akteure der Sicherheitspolitik im föderalistischen und
dezentralen Umfeld genauer untersucht. Weitere Schwerpunkte des Studiums fallen auf die wissenschaftliche Diskussion der grundlegenden
definitionen der Sicherheitspolitik im modernen politischen System. Die zentralen Themen der Sicherheitspolitik werden mit den
aktuellen internationalen und nationalen Bedingungen in Verbindung gebracht.

Participants should gain a solid understanding of current issues in international security policy as well as of the central academic debates.

This course provides an overview of the development of the international system and the central security challenges since the end of the
Cold War. The focus of this course will be on security issues of the post 9/11 era: new risks, arcs of crises, security strategies and core
actors will be presented during the course.

The legal status of individuals (members of the military forces; persons involved in security measures) is ventilated.

The knowledge and skills acquired in the second semester serve as a basis for further improvement in the areas of speaking, listening,
reading and writing, which will enable students to enroll for the Cambridge exams. The goal is to reach Council of Europe (CEFR) level C1
or C2 depending on the linguistic proficiency of the students.

This three-semester English course should enable the participants to successfully use the English language in an international military setting.

Activities pursued by the 'Western' world.

Participants are expected to study the compulsory texts provided at the beginning of the semester via the online platform Moodle.

After dealing with the major changes of the international security environment as compared to the cold war era, we will concentrate on some of the key
challenges (international terrorism, proliferation of weapons of mass destruction etc.). The third part of the lecture focuses on security
strategies pursued by the 'Western' world.

An online learning platform serves as a supplement to the lecture course.

Prerequisites / notice

Die Leistungskontrolle findet durch eine Seminarpräsentation und einen schriftlichen Schlussstest statt.

853-0416-00L  853-0049-00L  853-0060-00L
Abstract
This course analyzes the foundations and central challenges of Swiss foreign policy. After reviewing the history of foreign and neutrality policy conceptions since the early 20th century, the determining factors of Swiss foreign policy will be discussed, and issues such as the Ukraine crisis, Swiss-EU relations, and Switzerland and the Middle East will be examined.

Objective
Students should acquire a sound understanding of Swiss foreign policy and the relevant academic and political debates associated with it. After introducing the field of Foreign Policy Analysis, this course will focus on the historical foundations and the conceptual development of Swiss foreign policy. The focus will be on Switzerland's different reactions to the new international orders after 1918, 1945, and 1989 as well as on the significance of the 9/11 terrorist attacks and the global financial and debt crises since 2009 for Swiss foreign policy. We will also discuss the extent to which the Ukraine crisis and the annexation of Crimea by Russia mark a watershed in the international order - and how Switzerland should respond to these challenges. Subsequently, key determinants of Swiss foreign policy will be analyzed, with specific attention on neutrality, direct democracy, and the special case paradigm. Finally, the conclusion will center on current challenges and issues such as Swiss-EU relations, the Ukraine crisis and the OSCE engagement, Switzerland’s role in the UN, Swiss peacebuilding efforts, Swiss policy in the Middle East, and development cooperation.

The first hour will consist of a lecture; in the second hour, we will deepen and discuss the respective issues together with guest speakers from the Swiss foreign ministry, including Secretary of State Rossier.

Content
Prerequisites / notice
- Students will acquire a sound understanding of Swiss foreign policy and the relevant academic and political debates associated with it.
- A reading list will be handed out at the beginning of the semester.
- A course will be supported by an e-learning environment.

Literature
A reading list will be handed out at the beginning of the semester.

853-0321-00L Advanced Course II (Seminar) ▶ O 4 credits 3S J. Hagmann, M. M. Keupp
Precondition: Successful completion of Seminar I (853-0322-00L) in spring term.

Abstract
This two-semester course is divided into several groups. A core question relating to the topic of the seminar paper is being developed (I), which will be chosen in coordination and under the guidance of the respective lecturers. Upon conclusion, the paper will be presented in class (II). Based on the qualifications obtained in the Seminar I, a high academic standard is expected.

Objective
Based on the research design prepared in part I of the seminar, candidates write a comprehensive academic term paper. The term paper should be considered as a good preparation for the BA thesis.

Content
Seminar II builds on the findings of seminar I. Within the broader framework of the overall theme of the seminar (Foreign Policies and Security Strategies of the Great Powers) and based on the approved research design of seminar I, participants write their term paper (in close consultation with the lecturer).

Literature
A Reader was provided as part of seminar I (cf. online platform Moodle).

851-0000-00L Learning Environments for Training: Planning, Operation, Assessment ▶ O 4 credits 2G E. Ziegler, H. Annen, A. Deiglmayr
Only for Public Policy BA.

Abstract
In this lecture practical aspects of learning environments directed to training with respect to planning, operation and assessment are introduced comprising (a) presentations about their theoretical background, (b) discussions of practical aspects and (c) practical exercises.

Objective
The participants have the knowledge and skills necessary for planning, preparing, and implementing good lessons. They apply their knowledge adaptively and based on findings from the research on learning and instruction literature.

Content
The lecture consists of two parts: Basics of Learning skills and military didactics. The first part comprises insights in teaching and learning research, performance assessment, knowledge transfer and evaluation. Military didactics deal with specific aspects of military education: The planning of learning environments for schools and courses, the definition of learning objectives for military exercises, controlling and E-Learning within the army.

Literature
The lecture comprises interactive parts where the participants elaborate and extend their knowledge and skills. There is no comprehensive written documentation of the lecture: the participants can download presentation slides, learning materials, and templates from "Moodle".

Languages
Second Foreign Language

853-0402-00L German, Part II Only for Public Policy BA ▶ W 3 credits 2G O. Gwerder

Abstract
Based on the knowledge and skills acquired during the first semester, speaking and discussion skills related to military situations are examined and put into practice. Attention is focused on issues such as instruction, qualification and career interviews.

Objective
This two-semester course should enable the French and Italian speaking participants to fulfill their function as professional officers also in the German language.

Content
Read, analyse and write military and civilian documents
Listening comprehension using current radio or TV reports
Practise speaking with group discussions and short presentations
Systematic revision and extension of key grammar points
Systematic acquisition of general and military vocabulary

853-0404-00L French, Part II Only for Public Policy BA ▶ W 3 credits 2G O. Gwerder

Abstract
Based on the knowledge and skills acquired during the first semester, speaking and discussion skills related to military situations are examined and put into practice. Attention is focused on issues such as instruction, qualification and career interviews.

Objective
This two-semester course should enable the German speaking participants to fulfill their function as professional officers also in the French language.

Content
Read, analyse and write military and civilian documents
Listening comprehension using current radio or TV reports
Practise speaking with group discussions and short presentations
Systematic revision and extension of key grammar points
Systematic acquisition of general and military vocabulary

Bachelor Colloquium and Bachelor Thesis

853-0315-00L BA Colloquium ▶ O 2 credits 2K A. Wenger, M. Dunn Cavalty

Data: 06.12.2017 12:57  Autumn Semester 2015  Page 1277 of 1432
The BA Colloquium prepares students for their BA thesis with regard to content, administration, and methodology. During the colloquium, students choose a topic and a supervisor for their thesis. The skills students have acquired during the course of their studies are also enhanced and optimized.

Abstract
The BA Colloquium prepares students for their BA thesis with regard to content, administration, and methodology. During the colloquium, each student has to choose a topic for his/her BA-thesis. The students also choose their supervisors, whereas the goal is an even distribution of the supervisors. Finally, the methodological competences which were acquired during the first four semesters will be complemented.

Prerequisites / notice
If you have questions, please contact Prof. A. Wenger, wenger@sipo.gess.ethz.ch, 044 632 59 10.

853-0654-00L Bachelor’s Thesis O 10 credits 8D Lecturers
Abstract
The Bachelor Thesis completes the Bachelor program and consists of a scientific project carried out independently under the tutelage of an ETH or MILAK lecturer in Public Policy.
Objective
The elaboration of the Bachelor Thesis should further students’ capacities to work independently, structured and scientifically.

Abstract
The elective course Military Business Administration II builds on the mandatory course Military Business Administration I and adds to it. It deals with in-depth case studies from international security and economic policy with a special emphasis on the economic and practical relevance of these issues for the Swiss Armed Forces.

Objective
Students who are intrinsically interested in business-related issues will be provided with a big picture that transcends the micro view of business administration. Students learn how to integrate security and resource-related issues into a global economic analysis and how to derive relevant consequences, particularly economic ones, for Switzerland.

Content
The program of the course is organized into 14 units of 90 minutes each. The units combine the elements of lecture (where analytical concepts are taught) and application (where these concepts as applied). Additionally, guest lecturers will hold talks on selected issues.

- Swiss economic autarchy - madness or option?
- Global resource positions and world trade: Implications for the Swiss Armed Forces I
- Global resource positions and world trade: Implications for the Swiss Armed Forces II
- Economic causes of military instability
- Aggressive emerging economies: Economic growth and rearmament
- The process of an arms deal
- Costs and financing of a military conflict
- Economic analysis of terrorism
- Economic analysis of cyberwar
- Economic analysis of the present GSIO initiative: Compulsory military service vs. voluntary militia
- Global arms production and international arms trade
- The privatisation of military security
- Standardisation and interoperability: Does NATO membership increase Swiss military efficiency
- Written exam

Lecture notes
As this course has been completely redesigned and is being offered for the first time in the fall semester of 2013, a script is not yet available. However, the lecturer will distribute all necessary course material in time and directly to the students, either in the classroom or by uploading files to a public server.

Literature
The Lecturer will distribute all necessary literature directly to the students by disseminating pdf files or citing links to online references.

Prerequisites / notice
Exam “Military Business Administration I” passed successfully or profound basic knowledge of business administration and economics. The course is open to external participants.

Additional Elective Courses
These Electives may be chosen from the start of the Bachelor Study Programme.

Abstract
Comprehension for development and changes of sports from the ancient world to the present. Description of sports in services of national idea, from education and health promotion from the middle of the 18th century till this day.

Objective
Understanding for the development and adaptation of sports from the ancient world to present times.

Abstract
Central aspects of Sport related pedagogy will be handled in these lectures. These aspects cover, amongst others, the subject and tasks of Sport related pedagogy. Furthermore, the general and sports relevant foundations of Sport related pedagogy will be covered.

Objective
To gain basic knowledge of sports pedagogy and to recognize starting points for applied sports pedagogical intervention in schools.

Content
Inhaltliche Schwerpunkte der Vorlesung sind:
- Einführung in die Sportpädagogik
- Bedeutung des Sports im Kindes- und Jugendalter
- Leistungssport im Kindes- und Jugendalter
- Pädagogische Perspektiven des Sportunterrichts in der Schule
- Ein zeitgemäßer Schulsport
- Bewegungskulturelle Bildung: Bewegungserziehung, Spielerziehung

Lecture notes
Unterrichtsmaterialien zu den einzelnen Veranstaltungen werden den Studierenden zur Verfügung gestellt.

Abstract
This lecture is intended as an introduction to sport psychology and imparts knowledge on selected areas of the subject.
Sociology of Sport

- Introduction to sport psychology
- Cognitions in sports: mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

WebClass Introductory Course History of Technology

Main Topics
- to recognize the challenges and opportunities of technological change in terms of sustainable development
- to improve understanding of political decision-making processes in the regulation of science & technology
- to improve understanding of the role of science and technology in the context of human and societal development

Conflicts and politics: sports organizations, doping, violence

Selected materials for the lecture are available under www.LSSFB.ch

D. Gugerli

3 credits

Prerequisites /
notice

Weitere Informationen unter https://www.tg.ethz.ch/de/programme/

Technology and Innovation for Development

- to recognize the challenges and opportunities of technological change in terms of sustainable development
- to become familiar with policy instruments to promote innovation
- to improve understanding of political decision-making processes in the regulation of science & technology
- improved understanding of the role of science and technology in the context of human and societal development

Conflicts and politics: sports organizations, doping, violence

Selected materials for the lecture are available under www.LSSFB.ch

D. Gugerli

3 credits

Prerequisites /

Weitere Informationen unter https://www.tg.ethz.ch/de/programme/
Science and Technology Policy is normally associated with the improvement of national competitiveness; yet, it is also an integral part of effective environmental and development policies. The course will discuss the challenges and opportunities of technological change in terms of sustainable development and show how public policy on the national and the international level is responding to this change. In this context, students are to become familiar with the basic principles of political economy and New Growth Theory and how such theories help explain political decisions as well as political outcomes in the area of Science, Technology and Innovation. State interventions are either designed to regulate (e.g. environmental regulations, anti-trust law) or facilitate (e.g. intellectual property rights protection, public investment in R&D and technical education, technology transfer) technological change. This will be illustrated by looking at different industries and different national systems of innovation. Subsequently the positive and negative consequences for society and the natural environment will be discussed from a short-term and a long-term perspective.

The 2-hour course (5-7 p.m.) will be held as a series of lectures. The course materials will be available in form of an electronic Reader at the beginning of the semester. The class will be taught in English.

Students will be asked to give a (a) presentation (15 Minutes) or write a review paper based on a article selected from the electronic script, and (b) they will have to pass a written test at the end of the course in order to obtain 3 credit points in the ECTS System. In the final mark (a) will have a weight of 40% and (b) 60%.

851-0594-00L International Environmental Politics W 4 credits 2V T. Bernauer

Particularly suitable for students of D-ITET, D-USYS

Abstract This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

Objective The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.

Content This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 4 ECTS credit points. The workload is around 120 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

Lecture notes Slides and reading material will be made available at www.ib.ethz.ch (teaching, materials, then menu on the left side of the screen). They are password protected. Use your Nethz username and password to access the material.

Literature See www.ib.ethz.ch (teaching, materials)
Introduction to Management

Students from ETH will receive 4 ECTS credit points if they attend classes regularly and obtain a grade of 4.0 or higher for the written exam in the final week of the semester. Students who obtain a grade of less than 4.0 for the end-of-semester test will have a second chance in the first week of the following semester. The rules of the game are defined in detail on the course syllabus. Students who do not participate in the end of semester test will not have access to the repeat exam unless they submit compelling and documented reasons for why they were unable to participate in the first test. Except for language dictionaries, no additional materials and no laptops and mobile phones are allowed during the exam.

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

The workload for this course is approx. 120 hours (all inclusive).

Abstract

This course deals with fundamental and proven management concepts. The lecturers emphasize the practical applicability of concepts.

Objective

Students will get to know the basic organisational issues and the essential types of organisations.

Content

Management is a mass profession described by clear tasks and corresponding tools.

Lecture notes

Skripten werden elektronisch zur Verfügung gestellt.

Literature

Empfohlen werden folgende Titel für die Vertiefung einzelner Themen:

Content
- From strategic planning to implementation (Project phases, goals, constraints, and feasibility)
- Project leadership (Leadership, Teams)
- Project organization (Structure)
- Project planning (Schedule, cost and resource planning)
- Project controlling
- Risk and Quality Management
- Project completion

Lecture notes
Yes
The transparencies will be available for download from the website at least one week before each class.
Copies of all necessary documents will be distributed at appropriate times.

<tr>
<td></td>
<td>Participants should learn to get an overview of the state of the art in the field, to present it in a well understandable way to an interdisciplinary scientific audience, to develop models for open problems, to analyze them, and to defend their results in response to critical questions. In essence, participants should improve their scientific skills and learn to think scientifically about complex dynamical systems.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Content</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>This course starts with a discussion of the typical and often counter-intuitive features of complex dynamical systems such as self-organization, emergence, (sudden) phase transitions at &quot;tipping points&quot;, multi-stability, systemic instability, deterministic chaos, and turbulence. It then discusses phenomena in networked systems such as feedback, side and cascade effects, and the problem of radical uncertainty. The course progresses by demonstrating the relevance of these properties for understanding societal and, at times, global-scale problems such as traffic jams, crowd disasters, breakdowns of cooperation, crime, conflict, social unrests, political revolutions, bubbles and crashes in financial markets, epidemic spreading, and/or &quot;tragedies of the commons&quot; such as environmental exploitation, overfishing, or climate change. Based on this understanding, the course points to possible ways of mitigating techno-socio-economic-environmental problems, and what data science may contribute to their solution.</td>

</tbody>
</table>
Objective

Understanding of the basic issues and methods in resource and environmental economics; ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

Topics are:
Introduction to resource and environmental economics
Importance of resource and environmental economics
Main issues of resource and environmental economics
Normative basis
Utilitarianism
Fairness according to Rawls
Economic growth and environment
Externalities in the environmental sphere
Governmental internalisation of externalities
Private internalisation of externalities: the Coase theorem
Free rider problem and public goods
Types of public policy
Efficient level of pollution
Tax vs. permits
Command and Control Instruments
Empirical data on non-renewable natural resources
Optimal price development: the Hotelling-rule
Effects of exploration and Backstop-technology
Effects of different types of markets.
Biological growth function
Optimal depletion of renewable resources
Social inefficiency as result of over-use of open-access resources
Cost-benefit analysis and the environment
Measuring environmental benefit
Measuring costs
Concept of sustainability
Technological feasibility
Conflicts sustainability / optimality
Indicators of sustainability
Problem of climate change
Cost and benefit of climate change
Climate change as international ecological externality
International climate policy: Kyoto protocol
Implementation of the Kyoto protocol in Switzerland

Content

Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

Lecture notes

The script and lecture material are provided at:
https://moodle-app2.let.ethz.ch/course/view.php?id=140

Literature

Für die Kreditvergabe sind die vorgeschriebenen Semesterarbeiten und die Präsenz zwingend. Die Benotung erfolgt durch eine schriftliche Arbeit.

Planung
Die Planungsunterlagen werden zu Semesterbeginn abgegebenen, sind provisorisch und können vom Dozenten geändert werden. Die Praxislektionen werden jeweils am Mittwoch von 13.00 - 15.00 abgehalten. Die Termine werden in Absprache festgelegt.

Die Semesterarbeit ist 4 Wochen nach Semesterende abzugeben.

Statistics Master

The following courses belong to the curriculum of the Master's Programme in Statistics. The corresponding credits do not count as external credits even for course units where an enrolment at ETH Zurich is not possible.

Core Courses

In each subject area, the core courses offered are normally mathematical as well as application-oriented in content. For each subject area, only one of these is recognised for the Master degree.

Regression

<table>

</tr>
</tbody>
</table>

Abstract

This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life.

Objective

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content

The course starts with the basics of linear regression modeling, and then proceeds to parameter estimation, tests and confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, categorical input variables, shrinkage and general modeling strategies.

The last third of the course is dedicated to an introduction into generalized linear regression models: this includes logistic regression for binary response variables, Poisson regression for count data, cumulative logit models for ordered, and multinomial regression for categorical response variables.

Lecture notes

A script will be available.

Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

Prerequisites / notice

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

Abstract

Statistical analysis and modeling of observations in temporal order, which exhibit dependence. Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. Implementations in the software R.

Objective

Understanding of the basic models and techniques used in time series analysis and their implementation in the statistical software R.

Content

This course deals with modeling and analysis of variables which change randomly in time. Their essential feature is the dependence between successive observations. Applications occur in geophysics, engineering, economics and finance. Topics covered: Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. The models and techniques are illustrated using the statistical software R.

| Prerequisites / notice | Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics). |

| 401-3627-00L | High-Dimensional Statistics                                        | W    | 4    | 2V    | P. L. Bühlmann      |
| Abstract | “High-Dimensional Statistics” deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed. |
| Objective | Knowledge of methods and basic theory for high-dimensional statistical inference |
| Content | Lasso and Group Lasso for high-dimensional linear and generalized linear models; Additive models and many smooth univariate functions; Non-convex loss functions and l1-regularization; Stability selection, multiple testing and construction of p-values; Undirected graphical modeling |
| Prerequisites / notice | Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics). |

| 401-3611-00L | Advanced Topics in Computational Statistics                        | W    | 4    | 2V    | M. H. Maathuis, M. Mächler |
| Abstract | This lecture covers selected advanced topics in computational statistics, including various classification methods, the EM algorithm, clustering, handling missing data, and graphical modelling. |
| Objective | Students learn the theoretical foundations of the selected methods, as well as practical skills to apply these methods and to interpret their outcomes. |
| Content | The course is roughly divided in three parts: (1) Supervised learning via (variations of) nearest neighbor methods, (2) the EM algorithm and clustering, (3) handling missing data and graphical models. |
| Lecture notes | Lecture notes. |
| Prerequisites / notice | We assume a solid background in mathematics, an introductory lecture in probability and statistics, and at least one more advanced course in statistics. |

| 401-4633-00L | Data Analytics in Organisations and Business                      | W    | 5    | 2V+1U | I. Flückiger |
| Abstract | On the end-to-end process of data analytics in organisations & business and how to transform data into insights for fact based decisions. Presentation of the process from the beginning with framing the business problem to presenting the results and making decisions by the use of data analytics. For each topic case studies from the financial service, healthcare and retail sectors will be presented. |
| Objective | The goal of this course is to give the students the understanding of the data analytics process in the business world, with special focus on the skills and techniques used besides the technical skills. The student will become familiar with the "business language", current problems and thinking in organisations and business and tools used. |
| Content | Framing the Business Problem  
Framing the Analytics Problem  
Data Methodology  
Model Building  
Deployment  
Model Lifecycle  
Soft Skills for the Statistical/Mathematical Professional |
| Lecture notes | Lecture Notes will be available. |
| Prerequisites / notice | Prerequisites: Basic statistics and probability theory and regression |

| 401-6217-00L | Using R for Data Analysis and Graphics (Part II)                 | W    | 1    | 1G    | A. J. Papritz, C. B. Schwierz |
| Abstract | The course provides the second part an introduction to the statistical software R for scientists. Topics are data generation and selection, graphical functions, important statistical functions, types of objects, models, programming and writing functions.  
Note: This part builds on "Using R... (Part I)", but can be taken independently if the basics of R are already known. |
| Objective | The students will be able to use the software R efficiently for data analysis. |
The course provides the second part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part II of the course builds on part I and covers the following additional topics:
- Elements of the R language: control structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of arrays, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tayloring R: options;
- Extending basic R: packages

Resampling Methods

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Starting with an overview of selected results from parametric inference, kernel smoothing (including local polynomials) will be introduced along with some asymptotic theory, optimal bandwidth selection, data driven algorithms and some special topics. Examples from environmental research will be used for motivation, but the methods will also be applicable elsewhere.

Nonparametric tests, randomization tests, jackknife and bootstrap, as well as asymptotic approximations and robustness properties of estimators.

References:
The students will learn about methods of kernel smoothing and application of concepts to data. The aim will be to build sufficient interest in the topic and intuition as well as the ability to implement the methods to various different datasets.

Rough Outline:

- Parametric estimation methods: selection of important results
  - Maximum likelihood
  - Least squares: regression & diagnostics
- Nonparametric curve estimation
  - Density estimation, Kernel regression, Local polynomials, Bandwidth selection
  - Selection of special topics (as time permits, we will cover as many topics as possible) such as change points, modes & monotonicity, robustness, partial linear models, roughness penalty, local likelihoods, etc.
- Applications: potential areas of applications will be discussed such as, change assessment, trend and surface estimation, probability and quantile curve estimation, and others.

The course resources will be provided via the Moodle web learning platform. Please login (with your ETH (or other University) username+password) at https://moodle-app2.let.ethz.ch/enrol/users.php?id=1145. Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

Lecture notes

Brief summaries or outlines of some of the lecture material will be posted at http://www.wsl.ch/info/mitarbeitende/ghosh/index_EN (click on "ETH Course" in the left panel).

NOTE: The posted notes will tend to be just sketches whereas only the in-class lessons will contain complete information.

LOG IN: In order to have access to the posted notes, you will need the course user id & the password. These will be given out on the first day of the lectures.

Prerequisites:

Basic knowledge of R equivalent to "Using R .. (part 1)" ( = 401-6215-00L ) is a prerequisite for this course.

Content

401-0627-00L 4 credits

Overview

This course covers several generally useful statistical methods:
- Nonparametric tests, randomization tests, jackknife and bootstrap, as well as asymptotic approximations and robustness properties of estimators.

Objective

For the classical parametric models there are optimal statistical estimators and test statistics, and their distributions can often be determined exactly. The methods covered in this course allow for finding statistical procedures for more general models and to derive exact or approximate distributions of complicated estimators and test statistics. They thus make it possible to use specific models for any applications under consideration and to derive corresponding statistical procedures.

Content

401-6201-00L 2 credits

Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to kanzlie@rektorat.ethz.ch. The Registrar's Office will then register you for the course.

Abstract

This course covers several generally useful statistical methods:
- Nonparametric tests, randomization tests, jackknife and bootstrap, as well as asymptotic approximations and robustness properties of estimators.
Literature

Only for parts of the course

author = {A. C. Davison and D. V. Hinkley},
title = {Bootstrap methods and their application},
publisher = {Cambridge University Press},
year = 1997,
note = {includes 1 disk},
series = {Cambridge Series in Statistical and Probabilistic Mathematics}

Prerequisites / notice

This course is part of the programme for the certificate and diploma in Advanced Studies in Applied Statistics. It is given every second year in the winter semester break.

401-6221-00L Nonparametric Regression W 1 credit 1G

Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to kanzlei@rektorat.ethz.ch. The Registrar's Office will then register you for the course.

Abstract

This course focusses on nonparametric estimation of probability densities and regression functions. These recent methods allow modelling without restrictive assumptions such as 'linear function'. These smoothing methods require a weight function and a smoothing parameter. Focus is on one dimension, higher dimensions and samples of curves are treated briefly. Exercises at the computer.

Objective

Knowledge on estimation of probability densities and regression functions via various statistical methods. Understanding of the choice of weight function and of the smoothing parameter, also done automatically. Practical application on data sets at the computer.

401-6233-00L Spatial Statistics W 1 credit 1G

Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to kanzlei@rektorat.ethz.ch. The Registrar's Office will then register you for the course.

Abstract

In many research fields, spatially referenced data are collected. When analysing such data the focus is either on exploring their structure (dependence on explanatory variables, autocorrelation) and/or on spatial prediction. The course provides an introduction to geostatistical methods that are useful for such purposes.

Objective

The course will provide an overview of the basic concepts and stochastic models that are commonly used to model spatial data. In addition, the participants will learn a number of geostatistical techniques and acquire some familiarity with software that is useful for analysing spatial data.

Content

After an introductory discussion of the types of problems and the kind of data that arise in environmental research, an introduction into linear geostatistics (models: stationary and intrinsic random processes, modelling large-scale spatial patterns by regression, modelling autocorrelation by variogram; kriging: mean-square prediction of spatial data) will be taught. The lectures will be complemented by data analyses that the participants have to do themselves.

Lecture notes

Slides, descriptions of the problems for the data analyses and worked-out solutions to them will be provided.

Literature

263-5200-00L Data Mining: Learning from Large Data Sets W 4 credits 2V+1U A. Krause

Abstract

Many scientific and commercial applications require insights from massive, high-dimensional data sets. This courses introduces principled, state-of-the-art techniques from statistics, algorithms and discrete and convex optimization for learning from such large data sets. The course both covers theoretical foundations and practical applications.

Objective

Many scientific and commercial applications require us to obtain insights from massive, high-dimensional data sets. In this graduate-level course, we will study principled, state-of-the-art techniques from statistics, algorithms and discrete and convex optimization for learning from such large data sets. The course will both cover theoretical foundations and practical applications.

Content

Topics covered:
- Dealing with large data (Data centers; Map-Reduce/Hadoop; Amazon Mechanical Turk)
- Fast nearest neighbor methods (Shingling, locality sensitive hashing)
- Online learning (Online optimization and regret minimization, online convex programming, applications to large-scale Support Vector Machines)
- Multi-armed bandits (exploration-exploitation tradeoffs, applications to online advertising and relevance feedback)
- Active learning (uncertainty sampling, pool-based methods, label complexity)
- Dimension reduction (random projections, nonlinear methods)
- Data streams (Sketches, coresets, applications to online clustering)
- Recommender systems

Prerequisites / notice

Prerequisites: Solid basic knowledge in statistics, algorithms and programming. Background in machine learning is helpful but not required.

401-6245-00L Data Mining W 1 credit 1G

Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to kanzlei@rektorat.ethz.ch. The Registrar's Office will then register you for the course.

Abstract

Block course only on prediction problems, aka "supervised learning".

Part 1, Classification: logistic regression, linear/quadratic discriminant analysis, Bayes classifier; additive and tree models; further flexible ("nonparametric") methods.

Part 2, Flexible Prediction: additive models, MARS, Y-Transformation models (ACE,AVAS); Projection Pursuit Regression (PPR), neural nets.
**Mathematical Foundations for Finance**

Part 1, Classification, recalls logistic regression and linear / quadratic discriminant analysis (LDA/QDA) and extends these (in the framework of Bayes classifier) to (generalized) additive (GAM) and tree models (CART), and further mentions other flexible ("nonparametric") methods.

Part 2, Flexible Prediction (of continuous or "class" response/target) contains additive models, MARS, Y-Transformation models (ACE, AVAS); Projection Pursuit Regression (PPR), neural nets.

The block course is based on (German language) lecture notes. The exercises are done exclusively with the (free, open source) software "R" (http://www.r-project.org). A final exam will also happen at the computers, using R (and your brains!).

**Bayes Methods**

Bayes statistics is attractive, because it allows to make decisions under uncertainty where a classical frequentist statistical approach fails. The course provides an introduction into bayesian methods. It is moderately mathematically technical, but demands a flexibility of mind, which should not underestimated.

Bayesian statistics is an essential tool for the analysis of data in the life sciences. This is also because there is a lot of missing information about how samples are drawn, and this information is explicitly taken into account. Due to this, the information is used better, and therefore the statistical analysis better reflects the underlying reality.

Bayes Methods is a course that provides a comprehensive introduction to Bayesian data analysis. The course covers the fundamentals of Bayesian inference, including the principles of Bayes theorem, prior and posterior distributions, and hierarchical models.

The course emphasizes the practical application of Bayesian methods, with a focus on real-world data analysis problems. The course also introduces computational methods for Bayesian inference, such as Markov chain Monte Carlo (MCMC) and variational inference.

The course is suitable for students with a background in statistics, mathematics, or computer science, as well as those interested in data analysis and machine learning. Students will gain a deep understanding of Bayesian data analysis and its applications, and will be equipped with practical skills to apply these methods in their own research.

**Mathematical Optimization**

Mathematical treatment of diverse optimization techniques.

1. Linear optimization: The geometry of linear programming, the simplex method for solving linear programming problems, Farkas' Lemma and infeasibility certificates, duality theory of linear programming.

3. Integer optimization: Ties between linear and integer optimization, total unimodularity, complexity theory, cutting plane theory.

4. Combinatorial optimization: Network flow problems, structural results and algorithms for matroids, matchings and, more generally, independence systems.

**Statistical Analysis of High-Throughput Genomic and Transcriptomic Data (University of Zurich)**

*No enrolment to this course at ETH Zurich. Book the time.*
Mind the enrolment deadlines at UZH: 
http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
A range of topics will be covered, including basic molecular biology, genomics technologies and in particular, a wide range of statistical and computational methods that have been used in the analysis of DNA microarray and high throughput sequencing experiments.

Objective
- Understand the fundamental "scientific process" in the field of Statistical Bioinformatics
- Be equipped with the skills/tools to preprocess genomic data (Unix, Bioconductor, mapping, etc.) and ensure reproducible research (Sweave)
- Have a general knowledge of the types of data and biological applications encountered with microarray and sequencing data
- Have the general knowledge of the range of statistical methods that get used with microarray and sequencing data
- Gain the ability to apply statistical methods/knowledge/software to a collaborative biological project
- Gain the ability to critically assess the statistical bioinformatics literature
- Write a coherent summary of a bioinformatics problem and its solution in statistical terms

Content
Lectures will include: microarray preprocessing; normalization; exploratory data analysis techniques such as clustering, PCA and multidimensional scaling; Controlling error rates of statistical tests (FPR versus FDR versus FWER); limma (linear models for microarray analysis); mapping algorithms (for RNA/ChIP-seq); RNA-seq quantification; statistical analyses for differential count data; isoform switching; epigenomics data including DNA methylation; gene set analyses; classification

Discussion of the different statistical methods that are used in microarray and sequencing data analysis. This course is accompanied by practical machine learning projects.

Lecture notes, published manuscripts

Prerequisites / notice
Prerequisites: Basic knowledge of the programming language R, sufficient knowledge in calculus, linear algebra, probability, statistics

Course title: Statistical Methods for the Analysis of Microarray and Short-Read Sequencing Data

Former course title: Statistical Methods for the Analysis of Microarray and Short-Read Sequencing Data

252-0535-00L Machine Learning
W 6 credits 3V+2U J. M. Buhmann

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensible to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:
- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
Solid basic knowledge in analysis, statistics and numerical methods for CSE. Experience in programming for solving the project tasks.
Statistical and Mathematical Courses: not eligible for credits

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
401-6215-00L | Using R for Data Analysis and Graphics (Part I) | E- | 1 credit | 1G | A. J. Papritz, C. B. Schwierz

Abstract
The course provides the first part an introduction to the statistical software R for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

Objective
The students will be able to use the software R for simple data analysis.

Content
The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

- Part I of the course covers the following topics:
  - What is R?
  - R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
  - Types of data: numeric, character, logical and categorical data, missing values;
  - Simple (statistical) functions: summary, mean, var, etc.; simple statistical tests;
  - Writing simple functions;
  - Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www rstudio.org

Lecture notes
An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

Prequisites / notice
The course resources will be provided via the Moodle web learning platform Please login (with your ETH (or other University) username+password) at https://moodle-app2.let.ethz.ch/enrol/users.php?id=1145

Choose the course "Using R for Data Analysis and Graphics” and follow the instructions for registration.

Application Areas
Students select one area of application and look for suitable courses in which quantitative methods and modeling play a role. They need the consent by the Advisor (http://stat.ethz.ch/~kalisch/) that the chosen courses are eligible in the category “Application Areas”.

For the category assignment of eligible courses keep the choice “no category” and take contact with the Study Administration Office (www.math.ethz.ch/studiensekretaria/tstaff/ekuenti) after having received the credits. The Study Administration Office needs the Advisor’s consent.

Seminar or Semester Paper

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
401-3630-06L | Semester Paper | W | 6 credits | 9A | Professors

Abstract
Semester papers serve to delve into a problem in statistics and to study it with the appropriate methods or to compile and clearly exhibit a case study of a statistical evaluation.

401-3630-04L | Semester Paper | W | 4 credits | 6A | Professors

Abstract
Semester papers serve to delve into a problem in statistics and to study it with the appropriate methods or to compile and clearly exhibit a case study of a statistical evaluation.

252-5051-00L | Advanced Topics in Machine Learning | W | 2 credits | 2S | J. M. Buhmann, T. Hofmann, A. Krause

Abstract
In this seminar, recent papers of the pattern recognition and machine leaning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine leaning.

Objective
The seminar “Advanced Topics in Machine Learning” familiarizes students with recent developments in pattern recognition and machine learning. Original articles have to be presented and critically reviewed. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar presentation is to summarize the essential ideas of the paper in sufficient depth while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations.

Data: 06.12.2017 12:57
Autumn Semester 2015
Page 1291 of 1432
The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.

The papers will be presented in the first session of the seminar.

**Compulsory Electives in Humanities, Social and Political Sciences**

Recommended GESS compulsory elective courses (Type B) for D-MATH.

see GESS Compulsory Electives: Type A: Enhancement of Reflection Capability

see GESS Compulsory Electives: Language Courses ETH/UZH

**Master Thesis**

Target audience:
Third year Bachelor students;
Master students who cannot document to have received an adequate training in working scientifically.

Mandatory for all Bachelor and Master students with matriculation in the autumn semester 2014 or later.
Optional for Bachelor and Master students with matriculation until or before the spring semester 2014.
Example: You matriculated in the autumn semester 2013 into the first semester of the Bachelor programme, are now in the third year and plan to matriculate in the autumn semester 2016 into the first semester of the Master programme. In this case, you don't need "Scientific Works in Mathematics" in order to complete the Bachelor degree, but for the Master degree you will need it. In this case, we recommend that you register for "Scientific Works in Mathematics" in the autumn semester 2015 or spring semester 2016.

Directive

Abstract
Introduction to scientific writing for students with focus on publication standards and ethical issues, especially in the case of citations (references to works of others.)

Objective
Learn the basic standards of scientific works in mathematics.

Content
- Types of mathematical works
- Publication standards in pure and applied mathematics
- Data handling
- Ethical issues
- Citation guidelines

Lecture notes
Moodle of the Mathematics Library: https://moodle-app2.let.ethz.ch/course/view.php?id=519

Prerequisites / notice
This course is completed by the optional course "Recherchieren in der Mathematik" (held in German) by the Mathematics Library. For more details see: http://www.math.ethz.ch/library/services/schulungen

Only students who fulfill the following criteria are allowed to begin with their master's thesis:
a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme;
c. They have acquired at least 16 credits in the category Core Courses.

No direct enrolment to this course unit in myStudies.
Please fill in the online application form.
Requirements and application form under
www.math.ethz.ch/intranet/students/study-administration/theses.html
(Afterwards the enrolment will be done by the Study Administration.)

Abstract
The master's thesis concludes the study programme. Thesis work should prove the students' ability to independent, structured and scientific working.

Objective
Thesis work should prove the students' ability to independent, structured and scientific working.

Content
Five-month project to solve a research question. The content can be more theoretical (e.g. proving a new result) or applied (developing new methods or making a very sophisticated application and adapting existing methods).

Prerequisites / notice
Supervisors are chosen on a first-come-first-served basis. Collaborations with industry are possible.

Abstract

General Chemistry I: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium.

Objective

Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

Content

1. Stoichiometry
2. Atoms and Elements (Quantenmechanical Model of the Atom)
3. Chemical Bonding
4. Thermodynamics
5. Chemical Kinetics
6. Chemical Equilibrium (Acids and Bases, Solubility Equilibria)

Lecture notes

ca. 360 Seiten mit vielen Figuren und durchgerechneten Beispielen.

Abstract

This course will cover the basic topics in Physics and will show/display/explain with a variety of experiments the most important physical effects. The course will address classical as well as modern physics, and the interplay between basic research and applications.

Objective

Content

Lecture notes

Manuskript und Übungsblätter

Literature

Hans J. Paus, Physik in Experimenten und Beispielen, Carl Hanser Verlag München Wien (als unterrichtsbegleitendes und ergänzendes Lehrbuch)

101-0203-01L | Hydraulics I | O | 5 | 3V+1U | R. Stocker |

Abstract

The course teaches the basics of hydromechanics, relevant for civil and environmental engineers.

Objective

Familiarization with the basics of hydromechanics of steady state flows

Content

Properties of water, hydostatics, continuity, Euler equation of motion, Navier Stokes equation, similarity, Bernoulli principle, momentum equation for finite volumes, potential flows, ideal fluids-real fluids, boundary layer, pipe flow, open channel flow, flow in porous media, flow measurements, demonstration experiments in the lecture hall and in the laboratory

Lecture notes

Script and collection of problems available

Literature

Bollrich, Technische Hydromechanik 1, Verlag Bauwesen, Berlin

103-0233-01L | GIS I | O | 3 | 2G | A. Donaubauer |

Abstract

Fundamentals of geoinformation technologies: spatial data modeling, metrics & topology, vector and raster data, thematic data, spatial queries and analysis, spatial databases; labs with GIS software

Objective

Knowing the fundamentals of geoinformation technologies for the realization, application and operation of geographic information systems in engineering projects.

Content

Einführung GIS & GIScience
Konzeptionelles Modell & Datenschema
Vektorgeometry & Topologie
Rastergeometry und -algebra
Thematische Daten
Räumliche Abfragen & Analysen
Geodatenbanken

Lecture notes

Vorlesungspräsentationen werden digital zur Verfügung gestellt.

Literature

102-0293-00L | Hydrology | O | 3 | 2G | P. Burlando |

Abstract

The course introduces the students to engineering hydrology. It covers first physical hydrology, that is the description and the measurement of hydrological processes (precipitation, interception, evapotranspiration, runoff, erosion, snow), and it introduces then the basic mathematical models of the single processes and of the rainfall-runoff transformation, thereby including flood analysis.

Objective

Know the main features of engineering hydrology. Apply methods to estimate hydrological variables for dimensioning hydraulic structures and managing water resources.
Teaching of basic knowledge in microbiology.

This lecture presents an introduction to ecology. It includes basic ecological concepts and the most important levels of complexity in ecological research.

Generelle Ökologie:
M. Ackermann

Hours

Interzeption: Messung und Schätzung.

Evaporation und Evapotranspiration: Prozesse, Messung, Schätzung, potentielle und effektive Evapotranspiration, Energiebilanzmethode, empirische Methode.

Infiltration: Messung, Horton-Gleichung, empirische und konzeptionelle Methoden, F-index und Prozentuale Methode, SCS-CN Methode.

Einzugsgebietskarakteristik: Morphologie der Einzugsgebiete, topografische und unterirdische Wasserscheide, hysometrische Kurve, Gefälle, Dichte des Entwässerungsnetzes.

Schnee und Eis: Schneeeigenschaften und -messungen Schätzungen des Schneeschmelzprozesses durch die Energiebilanzmethode, Abfluss aus Schneeschmelze, Temperatur-Index- und Grad-Tag-Verfahren.

Lecture notes
Ein internes Skript ist zur Verfügung (kostenpflichtig, nur Herstellungskosten)

Literature
Die Kopie der Folien zur Vorlesung können auf den Webseiten der Professur für Hydrologie und Wasserwirtschaft herunterladen werden

Prerequisites / notice
Vorbereitende zu Hydrologie I sind die Vorlesungen in Statistik. Der Inhalt, der um ein Teil der Übungen zu behandeln und um ein Teil der Vorlesungen zu verstehen notwendig ist, kann zusammengefasst werden, wie hinteriederex es beschrieben wird:

701-0243-01L
Biology III: Essentials of Ecology
O 3 credits 2V S. Güsewell, C. Vorburger

Abstract
This lecture presents an introduction to ecology. It includes basic ecological concepts and the most important levels of complexity in ecological research. Ecological concepts are exemplified by using aquatic and terrestrial systems; corresponding methodological approaches are demonstrated. In a more applied part of the lecture threats to biodiversity and the appropriate management are discussed.

Objective
The objective of this lecture is to teach basic ecological concepts and the different levels of complexity in ecological research: the individual, the population, the community and the ecosystem level.

The students should learn ecological concepts at these different levels in the context of concrete examples from terrestrial and aquatic ecology. Corresponding methods for studying the systems will be presented.

A further aim of the lecture is that students achieve an understanding of biodiversity, why it is threatened and how it can be managed.

Content
- Übersicht der aquatischen und terrestrischen Lebensräume mit ihren Bewohnern
- Einfluß von Umweltfaktoren (Temperatur, Strahlung, Wasser, Nährstoffe etc.) auf Organismen; Anpassung an bestimmte Umweltbedingungen
- Populationsdynamik: Ursachen, Beschreibung, Vorhersage und Regulation
- Interaktionen zwischen Arten (Konkurrenz, Koexistenz, Prädation, Parasitismus, Nahrungsnetze)
- Lebensgemeinschaften: Struktur, Stabilität, Sukzession
- Ökosysteme: Kompartimente, Stoff- und Energieflusse
- Biodiversität: Variation, Ursachen, Gefährdung und Erhaltung
- Aktuelle Naturschutzprobleme und -massnahmen
- Evolutionäre Ökologie: Methodik, Spezialisierung, Coevolution

Lecture notes
Unterlagen, Vorlesungsfolien und relevante Literatur sind in der Lehrdokumentenablage abrufbar. Die Unterlagen für die nächste Vorlesung stehen jeweils spätestens am Freitagmorgen zur Verfügung.

Literature
Generelle Ökologie:

Aquatische Ökologie:
Lampert & Sommer 1999. Limnökologie, Thieme, 4. Aufl., ca. Fr. 55.-

Naturschutzbiologie:

Wird von den jeweiligen Dozenten ausgegeben.

Die Behandlung der Themen erfolgt auf der Basis des Lehrbuchs Brock, Biology of Microorganisms.

**Abstract**

Building on the biology courses in the 1st and 2nd semesters, this course covers basic biochemical knowledge in the areas of enzymology and metabolism. Those completing the course are able to describe and understand fundamental cellular metabolic processes.

**Objective**

- Students are able to understand
  - the structure and function of biological macromolecules
  - the kinetic bases of enzyme reactions
  - thermodynamic and mechanistic basics of relevant metabolic processes

- Students are able to describe the relevant metabolic reactions in detail

**Content**

- Introduction, basics, composition of cells, biochemical units, repetition of relevant organic chemistry
- Structure and function of proteins
- Carbohydrates
- Lipids and biological membranes
- Enzymes and enzyme kinetics
- Catalytic strategies
- Metabolism: Basic concepts and design. Repetition of basic thermodynamics
- Glycolysis, fermentation
- The citric acid cycle
- Oxidative phosphorylation
- Fatty acid metabolism

Written material and copies of the overheads will be available.

Prerequisite: Basic knowledge in biology and chemistry is a precondition.

### 5. Semester

#### Compulsory Courses 5. Semester

#### Examination Block 3

As of examination session winter 2015, examination block 3 will be implemented in its new structure (i.e. new, Earth Observation will be examined within examination block 3 instead of within examination block 4). The new structure is valid for those students NOT having taken exams of examination block 3 nor of examination block 4 for the first time. All other students take the exams of examination block 3 as well as of examination block 4 in the present structure, including repetition where applicable.

**Abstract**

**Objective**

- Consolidation of the basic procedures for design and operation of technical networks in water engineering.

**Content**

- Demand Side Management versus Supply Side Management
- Optimierung von Wasserverteilnetzen
- Druckstöße
- Kalkausfällung, Korrosion von Leitungen
- Hygiene in Verteilsystemen
- Siedlungshydrologie: Niederschlag, Abluffsbildung
- Instationäre Strömungen in Kanalisationen
- Stafftransport in der Kanalisation
- Einleitbedingungen bei Regenwetter
- Versickerung von Regenwasser
- Generelle Entwässerungsplanung (GEP)

Written material and copies of the overheads will be available. Prerequisite: Introduction to Urban Water Management

**Abstract**

The course provides an introduction into quantitative analysis of groundwater flow and transport. It is focussed on formulating flow and transport problems in groundwater, which are to be solved analytically or numerically.

**Objective**

- a) Students understand the basic concepts of flow and contaminant transport processes and boundary conditions in groundwater.
- b) Students are able to formulate simple practical flow and transport problems.
- c) Students are able to understand and apply simple analytical solutions to simple flow and transport problems.
- d) Students are able to use simple numerical codes to adequately solve simple flow (and transport) problems.
Introduction, aquifers, groundwater use, sustainability, porosity.

Properties of porous media.
Exercises: Groundwater use, porosity, grain size analysis.

Flow properties, Darcy’s law, filter.

Flow equations, stream function.
Exercises: Darcy’s law.

Analytical solutions, confined aquifers, steady-state flow.
Exercises: Head isolines.

Use of superposition principles, transient flow, free surface flow.
Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems I.
Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems II.
Exercises: Finite difference formulations to flow problems.

Transport processes.
Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems I.
Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems II.
Exercises: Analytical solutions to transport problems.

Path lines, groundwater protection.
Exercises: Analytical solutions to transport problems.

Groundwater remediation, groundwater management.
Exercises: Groundwater remediation.

102-0635-01L Air Pollution Control O 6 credits 4G B. Buchmann, P. Hofer

Abstract
The lecture provides in the first part an introduction to the formation of air pollutants by technical processes, the emission of these chemicals into the atmosphere and their impact on air quality. The second part covers different strategies and techniques for emission reduction. The basic knowledge is deepened by the discussion of specific air pollution problems of today's society.

Objective
The students gain general knowledge of the factors resulting in air pollution and the techniques used for air pollution control. The students can identify major air pollution sources and understand the methods for measurement, data collection and analysis. The students can evaluate possible control methods and equipment, design a control system and estimate the efficiency and cost. The students know the different techniques of air pollution control and their scientific basements. They are able to incorporate goals concerning the air quality into their engineering work.

Content
Part 1 Emission, Immission, Transmission
Fluxes of pollutants and their environmental impact
- physical and chemical processes leading to emission of pollutants
- mass and energy of processes
- Emission measurement techniques and concepts
- quantification of emissions from individual and aggregated sources
- extent and development of the emissions (Switzerland and global)
- propagation and transport of pollutants (transmission)
- meteorological parameters influencing air pollution dispersion
- deterministic and stochastic models, describing the air pollution dispersion
- dispersion models (Gaussian model, box model, receptor model)
- measurement concepts for ambient air (immission level)
- extent and development of ambient air mixing ratios
- goal and instrument of air pollution control

Part 2 Air Pollution Control Technologies
- The reduction of the formation of pollutants is done by modifying the processes (process-integrated measures) and by different engineering operations for the cleaning of waste gas (downstream pollution control). It will be demonstrated, that the variety of these procedures can be traced back on the application of a few basic principles of physical chemistry.
- Procedures for the removal of particles (inertial separator, filtration, electrostatic pre-cipitators, scrubbers) with their different mechanisms (field forces, impaction and diffusion processes) and the modelling of these mechanisms.
- Procedures for the removal of gaseous pollutants and the description of the driving forces involved, as well as the equilibrium and the kinetics of the relevant processes (absorption, adsorption as well as thermal, catalytic and biological conversions).
- Discussion of the technical possibilities to solve the actual air pollution problems.
The aim of the course is to provide the fundamental knowledge about earth observation sensors, techniques and methods for bio/geophysical environmental parameter estimation.

Objective
The aim of the course is to provide the fundamental knowledge about earth observation sensors, techniques and methods for bio/geophysical environmental parameter estimation. Students should know at the end of the course:
1. Basics of measurement principle
2. Fundamentals of image acquisition
3. Basics of the sensor-specific geometries
4. Sensor-specific determination of environmental parameters

Content
Die Lehrveranstaltung gibt einen Einblick in die heutige Erdbeobachtung mit dem folgenden skizzierten Inhalt:
1. Einführung in die Fernerkundung von Luft- und Weltraum gestützten Systemen
2. Einführung in das Elektromagnetische Spektrum
3. Einführung in optische Systeme (optisch und hyperspektral)
4. Einführung in Mikrowellen-Technik (aktiv und passiv)
5. Einführung in atmosphärische Systeme (meteo und chemisch)
6. Einführung in die Techniken und Methoden zur Bestimmung von Umweltparametern
7. Einführung in die Anwendungen zur Bestimmung von Umweltparametern in der Hydrologie, Glaziologie, Forst und Landwirtschaft, Geologie und Topographie

Lecture notes
Folien zu jeden Vorlesungsblock werden zur Verfügung gestellt.

Literature
Ausgewählte Literatur wird am Anfang der Vorlesung vorgestellt.

In place of the German course 851-0703-03L Introduction to Law for Civil Engineering students can take the French course 851-0709-00L Droit civil.

As of examination session summer 2015, examination block 4 will be implemented in its new structure (i.e. new, Earth Observation will be examined within examination block 3 instead of within examination block 4). The new structure is valid for those students NOT having taken exams of examination block 3 nor of examination block 4 for the first time. All other students take the exams of examination block 3 as well as of examination block 4 in the present structure, including repetition where applicable.

Number Title Type ECTS Hours Lecturers
101-0031-02L Business Administration O 2 credits 2V J.P. Chardonnens

102-0675-00L Earth Observation O 4 credits 3G I. Hajnsek, E. Baltsavias, further lecturers
The aim of the course is to provide the fundamental knowledge about earth observation sensors, techniques and methods for bio/geophysical environmental parameter estimation.

To introduce the methods and tools of project management. To impart knowledge in the areas of project organisation and structure, including repetition where applicable.

There will be 'Lecture Notes' (in German) for this course, starting in Fall 2015.

- From strategic planning to implementation (Project phases, goals, constraints, and feasibility)
- Project completion
- Risk and Quality Management
- Project controlling
- Project planning (Schedule, cost and resource planning)
- Project organization (Structure)
- Project leadership (Leadership, Teams)
- Examen au 1er propédeutique; convient pour travail de semestre.

Students who have attended or will attend the lecture "Introduction to Law for Architecture " (851-0703-01L) cannot register for this course unit.

Sont indispensables:
- le Code civil et le Code des obligations;
- Sont conseillés:
  - Nef, Urs Ch., Le droit des obligations à l’usage des ingénieurs et des architectes, trad. Bovay, J., éd. Payot, Lausanne

Remarques
- Le cours de droit civil et le cours de droit public (2e sem.) sont l’équivalent des cours "Recht I" et "Recht II" en langue allemande et des exercices y relatifs.
- Les examens peuvent se faire en français ou en italien.
- Examen au 1er propédeutique; convient pour travail de semestre.

Copies of all necessary documents will be distributed at appropriate times.

The transparencies will be available for download from the website at least one week before each class.

For information on future exam dates and details, please visit the course website or contact the instructor directly.
The course is organized in the form of seminars held by the students. Topics selected from the core disciplines of the curriculum (water resources, urban water engineering, material fluxes, waste technology, air pollution, earth observation) are discussed in the class on the basis of scientific papers that are illustrated and critically reviewed by the students.

Objective
Learn about recent research results in environmental engineering and analyse practical applications in environmental engineering.

★★★ Elective Blocks

★★★ Elective Block: Environmental Planning

Number Title Type ECTS Hours Lecturers

Abstract
The students will understand the basics of noise abatement: acoustics, impact of noise, measurement techniques and legislation. The students will be able to analyze different noise prob-lems and they will be able to solve simple problems of noise abatement.

Content

Lecture notes
Skript "Lärmbekämpfung" erhältlich zu Beginn der Vorlesung.

Abstract
Introduction of basic knowledge about problems with contaminated sites, investigation of this sites, risks management, remediation and reclamation techniques as well as monitoring systems. Introduction in landfill design and engineering with focus on barrier- and drainage systems and lining materials, evaluation of geotechnical problems, e.g. stability

Objective
Introduction of basic knowledge about problems with contaminated sites, investigation of this sites, risks management, remediation and reclamation techniques as well as monitoring systems. Introduction in landfill design and engineering with focus on barrier- and drainage systems as wellas lining materials, evaluation of geotechnical problems, e.g. stability
Definition of contaminated sites, site investigation methods, historical research and technical investigation, risk assessment, contamination transport, remediation, clean-up and retaining techniques (e.g. bioremediation, incineration, retaining walls, pump-and-treat, permeable reactive barriers), monitoring, research projects and results

The basics of wastewater hydraulics are described from the environmental and the hydraulic points of view thereby presenting also examples from engineering practice. Typical case studies are further discussed during a laboratory visit of VAW.

The understanding and the computation of the essential hydraulic processes in wastewater hydraulics are presented. On the one hand, free-surface hydraulics is reviewed with particular reference to problems in wastewater hydraulics, whereas various special hydraulic structures such as manholes, separation structures and collector channels are analyzed with a hydraulic approach on the other hand.

Particularities of wastewater schemes including depositions and the choking of a sewer as the abrupt transition from free-surface to pressurised high-speed flow are highlighted.

Prerequisites / Literature

- Exhaustive references are contained in the 'scripts'.

Prerequisites / Literature

- Side channel, Bottom opening, Lateral overflow, Venturi flume, Mobile discharge measurement, Drop and vortex drop, Bend and junction manhole, Sideweil, Lateral overflow, Side channel, Venturi flume, Mobile discharge measurement, Drop and vortex drop, Bend and junction manhole, Sideweil, Lateral overflow, Bottom opening, Side channel

Abstract: The Bachelor Programme concludes with the Bachelor Thesis. This project is supervised by a professor. Writing up the Bachelor Thesis encourages students to show independence and to produce structured work.

Objective: Encourages students to show independence, to produce scientifically structured work and to apply engineering working methods.

Content: The contents base upon the fundamentals of the Bachelor Programme. Students can choose from different subjects and tasks. The thesis consists of both a written report and an oral presentation.

**Abstract**

Technical systems are investigated in projects with measurement campaigns and numerical modeling. The students learn how to answer given questions with target oriented methodologies.

**Objective**

Technical systems are investigated in projects with measurement campaigns and numerical modeling. The students learn how to answer given questions with target oriented methodologies.

**Content**

The following projects are conducted:
- Construction, operation and characterisation of a mini wastewater treatment plant
- Characterization of aquifers with pumping experiments
- Modeling of hydrological systems
- Measuring and modeling of nanoparticles at workplaces
- Measuring and modeling of sediment transport in rivers
- Investigations of polluted terrain

**Lecture notes**

Written material will be available.

**Abstract**

In the course Numerical Hydraulics the basics of numerical modelling of flows are presented.

**Objective**

The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use commercial software in a responsible and critical way.

**Content**

The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.

All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as Hydraulic Systems and HEC RAS for non-steady flows are used.

**Lecture notes**

Lecture notes, powerpoints shown in the lecture and programs used can be downloaded. They are also available in German.

**Abstract**

The course presents an integrated view of the river basin and fluvial system. The fluvial system is viewed in terms of the dynamics in the transfer of water and sediment, the resulting geomorphology of the river network and streams, and finally the basin and river management options for conservation and restoration.

**Objective**

The goal of the course is to develop process-understanding of fluvial systems and to introduce the students to appropriate analysis tools.

**Content**

In the first section the estimation of basin sediment supply from upland sheet, rill and gully erosion, and basin sediment yield are discussed. The second section focuses on sediment transport in rivers in general, e.g. basic mechanics of sediment laden flows, bedforms, flow resistance, sediment type and load measurement and estimation, the morphology of rivers. It is illustrated how the river network can be analysed in terms of its connectivity and topological characteristics. Channel stability and channel erosion modelling are discussed. The third section looks at fluvial system management in terms of engineering and nonstructural sediment (e.g. upland and channel erosion protection) and water (e.g. the importance of the natural streamflow regime on riverine ecosystem integrity, river rehabilitation) resource management.

**Lecture notes**

There is no script.

**Literature**

Study materials (lecture handouts and selected papers) are distributed in class and available on the web.

**Prerequisites / notice**

Prerequisites: Hydrology 1 and Hydrology 2 (or contact instructor).

**Abstract**

Introduction of kinetic models for activated sludge systems and biological nutrient removal as a basis for design and dynamic simulation: Nitrification, denitrification, biological phosphorus removal (ASM1 to ASM3). Kinetics of biofilms, application to full scale reactors. Anaerobic treatment schemes, industrial waste, biogas production, sludge handling. Aerobic thermophilic processes.
The goal of this unit is to provide the background for the understanding, design and simulation of today's biological wastewater treatment and sludge stabilization processes. The students shall be capable to apply and recognize the limits of the kinetic models which have been developed to simulate these systems.

Objective

Content

- Microbial transformation processes
- Introduction to the activated sludge process
- Modeling activated sludge systems
- Nitrification / denitrification / biological P elimination
- Enrichment, selectors, filamentous growth
- Biofilm kinetics and application to full scale plants
- Anaerobic processes, industrial applications, sludge stabilization
- Aerobic thermophilic processes

Lecture notes

Copies of overheads will be made available.

Literature

There will be a required textbook that students need to purchase (see http://www.ifu.ethz.ch/SWW/education/lectures/Proc_Eng_I for further information).

Prerequisites / notice

This course will be offered together with the course Systems Analysis and Mathematical Modeling. It is advantageous to follow both courses simultaneously. For detailed information on prerequisites and information needed from Systems Analysis and Mathematical Modeling the student should consult the lecture program and important information (syllabus) of Process Engineering I that can be downloaded at http://www.ifu.ethz.ch/SWW/education/lectures/Proc_Eng_I.

Abstract

Objective

The goal of this course is to provide the students with an understanding and the tools to develop their own mathematical models, to plan experiments, to evaluate error propagation and to test simple process control strategies in the field of process engineering in urban water management.

Content

- The course will provide a broad introduction into the fundamentals of modeling water treatment systems. The topics are:
  - Introduction into modeling and simulation
  - The material balance equations, transport processes, transformation processes (kinetics, stoichiometry, conservation)
  - Ideal reactors
  - Hydraulic residence time distribution and modeling of real reactors
  - Dynamic behavior of reactor systems
  - Systems analytical tools: Sensitivity, parameter identification, error propagation, Monte Carlo simulation
  - Introduction to process control (PID controller, fuzzy control)

Lecture notes

Copies of overheads will be made available.

Literature

There will be a required textbook that students need to purchase:

Prerequisites / notice

This course will be offered together with the course Process Engineering I. It is advantageous to follow both courses simultaneously.

102-0307-00L Advanced Environmental, Social and Economic Assessments

Abstract
This course deepens students' knowledge of environmental, economic, and social assessment methodologies and their various applications.

Objective
This course has the aim of deepening students' knowledge of the environmental, economic and social assessment methodologies and their various applications.

In particular, students completing the course should have the
- ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors
- knowledge about the current state of the scientific discussion and new research developments
- ability to properly plan, conduct and interpret environmental assessment studies

In the course element "Implementation of...," students will learn to
- describe key sustainability problems of the current economic system and measuring units;
- describe the management system of an organisation and its measuring units;
- discuss approaches to measure environmental performance measurement of an organisation, including 'organisational LCA' (Ecobalance);
- explain the pros and cons of single score env. assessment methods
- demonstrate life cycle costing from a sustainability viewpoint
- interpret stakeholder relations of an organisation
- (if time allows) describe sustainable supply chain management

Content
Part I (Advanced Environmental Assessments)
- Inventory database developments, transparency, data quality, data completeness, and data exchange formats, uncertainties
- Software tools (MFA, LCA)
- Allocation (multifunctional processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Impact assessment of waterborne chemical emissions, sum parameters, mixture toxicity
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Subjectivity in environmental assessments
- Case Studies

Part II (Implementation of Environmental and other Sustainability Goals):
- Sustainability problems of the current economic system and its measuring units;
- The structure of a management system, and elements to integrate environmental management (ISO 14001) and social management (SA8000 as well as ISO 26000), especially into strategy development, planning, controlling and communication;
- Sustainability Opportunities and Innovation
- The concept of 'Continuous Improvement'
- Life Cycle Costing, Life Cycle Management
- environmental performance measurement of an organisation, including 'organisational LCA' (Ecobalance), based on practical examples of companies and new concepts
- single score env. assessment methods (Swiss ecopoints)
- stakeholder management and sustainability oriented communication
- an intro into sustainability issues of supply chain management

Students will get small excercises related to course issues.

Part III (Computer Lab): this is an exercise and software lab to apply the methods from Part I and II of this lecture.

Lecture notes
Part I: (-)
Part II: Documents will be available on liaas
Part III Lab: (-)

Literature
Will be made available in class.

Prerequisites / notice
This course should only be elected by students of environmental engineering with the Major in ESD, Air Quality Control and Waste Management. All other students should take the individual courses in Advanced Environmental Assessment and/or Implementation of Environmental goals (with or without exercise and lab).

Basic knowledge of environmental assessment tools is a prerequisite for this class. Students who have not yet had classwork in this topic are required to read an appropriate textbook before or at the beginning of this course (e.g. Baumann&Tillman, The Hitchhiker's Guide to LCA: An Orientation in Life Cycle Assessment Methodology and Applications, Studentlitteratur, Lund, 2004).

102-0357-00L Waste Recycling Technologies 0 3 credits 2G R. Bunge

Abstract
Waste Recycling Technology (WRT) is sub-discipline of Mechanical Process Engineering. WRT is employed in production plants processing contaminated soil, construction wastes, scrap metal, recovered paper and the like. While WRT is well established in Central Europe, it is only just now catching on in emerging markets as well.

Objective
At the core of this course is the separation of mixtures of solid bulk materials according to physical properties such as color, electrical conductivity, magnetism and so forth. After having taken this course, the students should have concept not only of the unit operations employed in WRT but also of how these unit operations are integrated into the flow sheets of production plants.

Content
Introduction
Waste Recycling; Scope and objectives
Waste recycling technologies in Switzerland

Fundamentals
Properties of particles; Liberation conditions, Particle size and shape, Porosity of bulk materials
Fluid dynamics of particles: Stationary particle beds, Fluidized beds, Free settling particles
Flow sheet basics: Balancing mass flows
Standard processes: batch vs. continuous
Assessment of separation success: Separation function, grade vs. recovery

Separation Process
Separation according to size and shape (Classification): Screening, Flow separation
Separation according to material properties (Concentration): Manual Sorting, Gravity concentration; Magnetic separation, Eddy current separation, Electrostatic separation, Sensor technology, Froth flotation

Lecture notes
The script consists of the transparencies shown during the lectures. Background material will be provided on the script-server.

Literature
A list of recommended books will be provided.

Prerequisites / notice
We will approach this topic from the perspective not of theory, but of practical application. However, solid fundamentals in physics (in particular in mechanics) are strongly recommended.

102-0377-00L Air Pollution Modeling and Chemistry 0 3 credits 2G S. Henne, A. C. Gerecke

Abstract
This course deepens students' knowledge of environmental, economic, and social assessment methodologies and their various applications.

Objective
This course has the aim of deepening students' knowledge of the environmental, economic and social assessment methodologies and their various applications.

In particular, students completing the course should have the
- ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors
- knowledge about the current state of the scientific discussion and new research developments
- ability to properly plan, conduct and interpret environmental assessment studies

In the course element "Implementation of...," students will learn to

### 102-0377-00L Landfilling, Contaminated Sites and Radioactive Waste Repositories

**Abstract**

Practices of landfilling and remediation of contaminated sites and disposal of radioactive waste are based on the same concepts that aim to protect the environment. The assessment of contaminants that may leach into the environment as a function of time and how to reduce the rate of their release is key to the design of chemical, technical and geological barriers.

**Objective**

Upon successful completion of this course students are able to:
- assess the risk posed to the environment of landfills, contaminated sites and radioactive waste repositories in terms of fate and transport of contaminants
- describe technologies available to minimize environmental contamination
- describe the principles in handling of contaminated sites and to propose and evaluate suitable remediation techniques
- explain the concepts that underlie radioactive waste disposal practices

**Content**

- A short overview of the principles of environmental protection in waste management and how this is applied in legislation.
- A overview of the chemistry underlying the release and transport of contaminants from the landfilled/contaminated material/radioactive waste repository focusing on processes that control redox state and pH buffer capacity; mobility of heavy metals and organic compounds
- Technical barrier design and function. Clay as a barrier.
- Contaminated site remediation: Site evaluation, remediation technologies
- Concepts and safety in radioactive waste management
- Role of the geological and engineered barriers and radionuclide transport in geological media.

**Lecture notes**

Hand-outs of lecture material with extended comments will be made available along with the lecture.

**Literature**

Lists of suitable books and papers will be provided in the lecture.

**Prerequisites / notice**

strongly recommended: 102-0635-01L Luftreinhaltung (Air Pollution Control) or similar

### 102-0617-00L Basics and Principles of Radar Remote Sensing for Environmental Applications

**Objective**

The course will provide the basics and principles of Radar Remote Sensing (specifically Synthetic Aperture Radar (SAR)) and its imaging techniques for the use of environmental parameter estimation.

At the end of the course the student has the understanding of:
1. SAR basics and principles,
2. SAR polarimetry,
3. SAR interferometry and
4. environmental parameter estimation from multi-parametric SAR data
The course is giving an introduction into SAR techniques, the interpretation of SAR imaging responses and the use of SAR for different environmental applications. The outline of the course is the following:

1. Introduction into SAR basics and principles
2. Introduction into electromagnetic wave theory
3. Introduction into scattering theory and decomposition techniques
4. Introduction into SAR interferometry
5. Introduction into polarimetric SAR interferometry
6. Introduction into bio/geophysical parameter estimation (classification/segmentation, soil moisture estimation, earth quake and volcano monitoring, forest height inversion, wood biomass estimation etc.)

Lecture notes
Handouts for each topic will be provided

Literature
First readings for the course:

Prerequisites / notice
This course in combination with 102-0627-00-G: Applied Radar Remote Sensing for Environmental Parameter Estimation is providing a profound basis for independent data analysis. It is recommended to take both courses together.

As replacement of 101-0314-99 Soil Mechanics, one of following three courses is compulsory for students of major Soil Protection:

1. 651-4033-00L Soil Mechanics and Foundation (HS), or
2. 751-3404-00L Nutrient Fluxes in Soil-Plant Systems (FS), or
3. 701-1802-00L Ökologie von Waldböden (FS).

Number Title Type ECTS Hours Lecturers

701-0535-00L Environmental Soil Physics/Vadose Zone Hydrology O 3 2G+2U D. Or

The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

Students are able to:
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media,
- quantify driving forces and resulting fluxes of water, solute, and heat in soils,
- apply modern measurement methods and analytical tools for hydrological data collection
- conduct and interpret a limited number of experimental studies
- explain links between physical processes in the vadose-zone and major societal and environmental challenges

Data: 06.12.2017 12:57 Autumn Semester 2015 Page 1308 of 1432
The course deals in-depth with the major biogeochemical processes controlling the cycling of different groups of trace elements (heavy metals, redox-sensitive and chalcophile elements) in the environment. Sources and cycling of trace elements as related to interactions with abiotic and biotic geosphere components, and abiotically and biotically driven transformations will be discussed. Relevant methods/techniques to study these processes will be presented. The techniques most commonly used to study these processes will be presented as well.

Week 11 to 12: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.

Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:
- Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.
- Biological Processes in the Vadose Zone An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.

Lab notes:
- Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller (available at the beginning of the semester)
- http://www.step.ethz.ch/education/active-courses/vadose-zone-hydrology

Literature:
- Supplemental textbook (not mandatory) - Environmental Soil Physics, by: D. Hillel

701-1315-00L Biogeochemistry of Trace Elements O 3 credits 2G A. Voegelin, J. G. Wiederhold, L. Winkel

Abstract:
The course addresses major biogeochemical processes that drive the cycling of different groups of trace elements (heavy metals, redox-sensitive trace elements, chalcophile elements) in the environment, and the chemical methods that are used to study the behavior of these elements in the geosphere.

Objective:
The students gain a detailed understanding of the sources and the cycling of trace elements in the terrestrial and aquatic environment. The interaction of environmentally important trace elements with abiotic and biotic geosphere components as well as their abiotically and biotically driven transformations will be discussed. Relevant methods/techniques to study these processes will be presented.

Content:
The course deals in-depth with the major biogeochemical processes controlling the cycling of different groups of trace elements (heavy metals, redox-sensitive and chalcophile elements) in the environment. Sources and cycling of trace elements as related to interactions with abiotic and biotic geosphere components, and abiotically and biotically driven transformations will be discussed. The techniques most commonly used to study these processes will be presented as well.

Lecture notes:
Selected handouts (lecture notes, literature, exercises) will be distributed during the course.

Prerequisites / notice:
Students are expected to be familiar with the concepts of aquatic or soil chemistry covered in the respective classes at the bachelor level.

This lecture is a prerequisite for attending the laboratory course "Trace elements laboratory".

701-1681-00L Element Balancing and Soil Functions in Managed Ecosystems O 3 credits 2G A. Keller

Abstract:
Applying element balances of agricultural soils and the assessment of soil functions for real applications in computer exercises to design preventive strategies against soil pollution and to support sustainable management of regional agroecosystems also in the context of spatial planning procedures.

Objective:
The students learn to critical assess changes in land use management on element cycles in agro-ecosystems and to assess soil services (soil functions). You design solutions for chemical problems in soil protection at the regional scale and learn to assess soil functions using different methods.

Content:
The students apply a regional balance model for Swiss regions in computer exercises and assess major soil functions of agricultural soils. You assess the sustainability of current land use and analyse management options improving nutrient and metal cycling in agro-ecosystems. The students will have the opportunity to calculate specific scenarios regarding land use management and environmental changes. Special focus we be paid on the soil services such as regulation-, production function and soil as habitat, and the assessment of these functions based on soil mapping data.

Lecture notes:
Literature and Exercises for a case study

Literature will be provided.
The course consists of lectures and computer exercises. The course take place every 2 weeks à 4 hours. Recommended prerequisites for attending this course:
- Bodenschutz und Landnutzung
- Biochemistry of Trace Elements
- Angewandte Bodenkologie

This course supports the course in Biological Wastewater Treatment (102-0217-00L). It is therefore advantageous to follow both courses simultaneously.

The objective of this course is to provide the students with an understanding and the tools to develop their own mathematical models, to plan experiments, to evaluate error propagation and to test simple process control strategies in the field of process engineering in urban water management.

The course will provide a broad introduction into the fundamentals of modeling water treatment systems. The topics are:
- Modeling activated sludge systems and biological nutrient removal as a basis for design and dynamic simulation:
  - Nitrification, denitrification, biological phosphorus removal (ASM1 to ASM3).
  - Kinetics of biofilms, application to full scale reactors.
  - Anaerobic treatment schemes, industrial waste, biogas production, sludge handling. Aerobic thermophilic processes.

This course will be offered together with the course Process Engineering I. It is advantageous to follow both courses simultaneously.

This course will be offered together with Systems Analysis and Mathematical Modeling (102-0227-00L). It is therefore advantageous to follow both courses simultaneously.

Microbial transformation processes.
- Introduction to the activated sludge process
- Modeling activated sludge systems
- Nitrification / denitrification / biological P elimination
- Enrichment, selectors, filamentous growth
- Biofilm kinetics and application to full scale plants
- Anaerobic processes, industrial applications, sludge stabilization
- Aerobic thermophilic processes

The goal of this course is to provide the students with an understanding and the tools to design and simulate of todays biological wastewater treatment and sludge stabilization processes. The students shall be capable to apply and recognize the limits of the kinetic models which have been developed to simulate these systems.

This lecture is supported by the textbook: "Geotechnical Engineering" by Donald P. Coduto, 2nd edition, 2011; ISBN-13: 978-0-13-135425-8

Courses recommended:
- Eng Geol Site Investigations
- Eng Geol Field Course I (soils)
- Clay Mineralogy

<tr>
<td></td>
<td>The goal of the course is to develop process-understanding of fluvial systems and to introduce the students to appropriate analysis tools. In the first section the estimation of basin sediment supply from upland sheet, rill and gully erosion, and basin sediment yield are discussed. The second section focuses on sediment transport in rivers in general, e.g. basic mechanics of sediment laden flows, bedforms, flow resistance, sediment type and load measurement and estimation, the morphology of rivers. It is illustrated how the river network can be analysed in terms of its connectivity and topological characteristics. Channel stability and channel erosion modelling are discussed. The third section looks at fluvial system management in terms of engineering and nonstructural sediment (e.g. upland and channel erosion protection) and water (e.g. the importance of the natural streamflow regime on riverine ecosystem integrity, river rehabilitation) resource management.</td>

<tr>
<td></td>
<td>The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated. All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as Hydraulic Systems and HEC RAS for non-steady flows are used.</td>

**Sustainability Goals**

- Case Studies
- Multiobjective analysis
- Subjectivity in environmental assessments
- Uncertainty analysis
- Spatial differentiation in Life Cycle Assessment
- Recent development in impact assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Allocation (multinput processes and recycling)
- Hybrid LCA methods.
102-0307-00 Advanced Environmental, Social and Economic Assessments (6KP) and 102-0327-01 Implementation of Environmental and other Sustainability Goals (2KP) cannot be chosen both. 102-0327-01 is already included in 102-0307-00.

Abstract
How to make sustainability operational - in industry, services and other organizations: You will learn how to put sustainability into practice by integrating environmental, social and economic aspects into organisations' management and processes. The course contains both a management view, as well as a sustainability view - and how to combine them.

Objective
To provide understanding of how sustainability can be made operational in an organisation. To do so, students will understand how to integrate sustainability thinking into the typical current organisational environment and processes, such as planning, implementing and controlling.

Content
We meet for five 3-hour-lectures, with discussions and case studies during course time. Additionally, small case studies in-between courses will be given at most course days. Course topics are:

- Sustainable Development and its meaning for Management
- Management Standards for Sustainability (ISO and others)
- Sustainability Opportunities and Innovation
- Organisation and Implementation
- The concept of Continuous Improvement
- Environmental Performance Measurement (Concepts, Standards, Methods)
- Life Cycle Costing, Life Cycle Management
- (Sustainable) Supply Chain Management
- Communication of Sustainability Issues

Lecture notes
Course documentation as well as case study descriptions will be provided during the course via the "Ilias" repository. A list of recommended books will be provided.

Literature
There are two ways to approach the course's issues:

c) We will touch upon the hotel sustainable scheme and label "Ibex" see: http://www.e2mc.com/images/stories/e2_bilder/downloads/Umweltfocus_d.pdf (for an english version, pls contact the lecturer at arthurb@ethz.ch)

Prerequisites / notice
If you have specific interests or questions, let me know at arthurb@ethz.ch. Maybe I can include your issues - or I can't :-)

Abstract

The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.

The goal of the course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. After this course the students will have refreshed their knowledge of probability theory and statistics to model uncertainties in view of engineering applications. They will be able to analyze the reliability of a structure and to use risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FOSM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods, Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and pre-post risk assessment methods are presented. Bayesian networks are introduced as a generic numerical tool for solving such problems. The course also includes a tutorial using a software dedicated to real world structural reliability analysis.

Abstract

The course is providing practical exercises for the use of Radar Remote Sensing, specifically Synthetic Aperture Radar (SAR) to estimate environmental parameters.

The course should enable the independent use and handling of SAR data for environmental parameter estimation. At the end of the course the student has the ability to:

1. Read and display multi-parametric SAR data
2. Apply and pre-process SAR data (speckle filtering, polarimetric and interferometric processing steps)
3. Derivation of bio/geophysical environmental parameter

Content

The main focus of the course is the handling of multi-parameter SAR data for environmental parameter estimation with the following content:

1. Read and display multi-parametric SAR data
2. Application of different speckle filtering techniques
3. Derivation of the coherency and covariance matrix
4. Application of polarimetric correlation functions
5. Application of different decomposition techniques
6. Generation of a polarimetric SAR interferometry data set from a simulated forest
7. Processing of the polarimetric SAR interferometry data set
8. Estimation of environmental parameters (segmentation, soil moisture estimation, forest height estimation, etc.)

Lecture notes

Handouts for each topic will be provided.

Literature

First readings for the course:

This course in combination with 102-0627-00-G: Applied Radar Remote Sensing for Environmental Parameter Estimation is providing a profound basis for independent data analysis. It is recommended to take both courses together.
Projects on chemical assessment with the focus on the following aspects:

* Analysis and assessment of basic substance data for selected chemical classes: physical chemical properties, environmental behaviour (distribution, persistence), human and eco-toxicity (biochemical metabolism, effect mechanisms), safety.
* Analysis and modelling of technical processes determining chemical release into the environment, e.g., chemicals applications.
* Characterisation of environmental and health risks on the basis of exposure and effect models, QSARs from environmental chemistry, toxicology and methods of risk analysis.
* Risk assessment on the basis of quality and safety goals. Estimation of the model and data uncertainty.
* Demonstration of possibilities and limits of precaution and safety measures (technical, organisational, concerning personnel) including effectiveness and efficiency.

Lecture notes
Project teaching; time frame totals ca. 80 hours.

Literature
See recommended literature.

Prerequisites / notice
Co-operation with chemical companies.

### 701-0423-00L Chemistry of Aquatic Systems

**Objective**
Understanding of chemical processes in aquatic systems. Quantitative application of chemical equilibria to processes in natural waters.

**Content**
Evaluation of analytical data from aquatic systems.

**Lecture notes**
Script is distributed.

**Literature**

### 529-0193-00L Renewable Energy Technologies I

**Objective**
Scenarios for world energy demand and CO2 emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry). Wind and ocean energy, heat pumps, geothermal energy, energy from waste. CO2 sequestration.

**Content**
Scenarios for the development of world primary energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO2 emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

**Lecture notes**
Lecture notes will be distributed during the course.

**Literature**
- Heinloth, K., Die Energiefrage (Vieweg, 2003)

### 363-0387-00L Corporate Sustainability

**Objective**
Understand the limits and the potential of corporate sustainability for sustainable development

**Content**
Develop critical thinking skills that are useful for corporate sustainability (argumentation, communication, evaluative judgment)

**Lecture notes**
Presentation slides will be distributed prior to lectures.

**Literature**
Literature recommendations will be distributed during the lecture.
The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines.

Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.

At the end of the course students should:

Know:
- Function, purpose and algorithm of a selected number of transdisciplinary methods

Understand:
- Functional application in case studies and other problem oriented projects

Be able to reflect on:
- Potential, limits, and necessity of transdisciplinary methods

Be prepared for:
- Transdisciplinary Case Study 2016

The course is seminar-like, interactive.

The format of the course is seminar-like, interactive. Students learn to apply methods within a functional framework.

At the end of the course students should:

Know:
- core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

The course is seminar-like, interactive.

The course deals with the concepts and methodologies for the analysis and assessment of sustainable development. A special focus is given to the social dimension and to social justice as a guiding principle of sustainability as well as to trade-offs between the three dimensions of sustainability.

The course is seminar-like, interactive.

At the end of the course students should:

Know:
- core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

The course is seminar-like, interactive.

At the end of the course students should:

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.
Science and Technology Policy is normally associated with the improvement of national competitiveness; yet, it is also an integral part of effective environmental and development policies. The course will discuss the challenges and opportunities of technological change in terms of sustainable development and show how public policy on the national and the international level is responding to this change.

In this context, students are to become familiar with the basic principles of political economy and New Growth Theory and how such theories help explain political decisions as well as political outcomes in the area of Science, Technology and Innovation. State interventions are either designed to regulate (e.g. environmental regulations, anti-trust law) or facilitate (e.g. intellectual property rights protection, public investment in R&D and technical education, technology transfer) technological change. This will be illustrated by looking at different industries and different national systems of innovation. Subsequently the positive and negative consequences for society and the natural environment will be discussed from a short-term and a long-term perspective.

Lecture notes
Reader with issue-specific articles. E-version is partly available under http://www.ib.eh.tzh.ch/teaching/material/stpp

Content
- The seminar is specifically suitable for PhD or PostDoc researchers. It is open to master students (minor "global change and sustainability") and further interested people, who preferably are preparing, or working on, a project/thesis.
- Literature

Prerequisites / notice
- The 2-hour course (5-7 p.m.) will be held as a series of lectures. The course materials will be available in form of an electronic Reader at the beginning of the semester.
- The class will be taught in English. Students will be asked to give the (a) presentation (15 Minutes) or write a review paper based on a article selected from the electronic script, and (b) they will have to pass a written test at the end of the course in order to obtain 3 credit points in the ECTS System. In the final mark (a) will have a weight of 40% and (b) 60%.

- Abstract
  - The seminar is designed for students and researchers (MA, PhD, PostDoc) who use inter- and transdisciplinary elements in their projects. It addresses the challenges of this research: How to integrate disciplines? How (and in which sequence) to include societal actors? How to bring results to fruition? We discuss these questions based on case studies and theories and on the participant's projects.

- Objective
  - The participants understand the specific challenges of inter- and transdisciplinary research in general and in the context of sustainable development in particular. They know methods and concepts to address these challenges and apply them to their research projects.

- Content
  - The seminar covers the following topics:
    - Theories and concepts of inter- and transdisciplinary research
    - The specific challenges of inter- and transdisciplinary research
    - Involving stakeholders
    - Collaborating disciplines
    - Exploration of tools and methods
    - Analysing participants’ projects to improve inter- and transdisciplinary elements

- Literature

- Prerequisites / notice
  - Literature will be made available to the participants.

- Abstract
  - This lecture introduces the theoretical principles and the observational and analytical methods of atmospheric dynamics. Based on these principles, the following aspects are discussed: the energetics of the global circulation, the basic synoptic- and meso-scale flow phenomena, in particular the dynamics of extratropical cyclones, and the influence of mountains on the atmospheric flow.

- Objective
  - The students are able to:
    - explain up-to-date meteorological observation techniques and the basic methods of theoretical atmospheric dynamics
    - to discuss the mathematical basis of atmospheric dynamics, based on selected atmospheric flow phenomena
    - to explain the basic dynamics of the global circulation and of synoptic- and meso-scale flow features
    - to explain how mountains influence the atmospheric flow on different scales

- Content
  - Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer

- Lecture notes
  - Lecture notes and slides
The students apply a regional balance model for Swiss regions in computer exercises and assess major soil functions of agricultural soils.

Main subjects treated:
Biogeochemistry of Trace Elements

A. Keller
3 credits

This course covers the basic physical concepts and mathematical equations used to describe environmental fluid systems on the rotating Earth. Fundamental concepts (e.g. vorticity dynamics and waves) are formally introduced, applied quantitatively and illustrated using examples. Exercises help to deepen knowledge of the material.

Objective
Students are able
- to name the bases, concepts and methods of environmental fluid dynamics.
- to understand and discuss the components of the basic physical equations in fluid dynamics
- to apply basic mathematical equations to simple problems of environmental fluid dynamics

Content
Basic physical terminology and mathematical laws:
Continuum hypothesis, forces, constitutive laws, state equations and basic principles of thermodynamics, kinematics, laws of mass and momentum on rotating earth.
Concepts and illustrative flow systems: vorticity dynamics, boundary layers, instability, turbulence - with respect to environmental fluid systems.
Scale analysis: dimensionless variables and dynamical similarity, simplification of the fluid system, e.g. shallow water assumption, geostrophic flow.
Waves in environmental fluid systems.

Lecture notes
In English language

Literature
Will be presented in class.
See also: web-site.

Biogeochemistry of Trace Elements

W 3 credits 2G  A. Voegelin, J. G. Wiederhold, L. Winkel

The course addresses major biogeochemical processes that drive the cycling of different groups of trace elements (heavy metals, redox-sensitive trace elements, chalcophile elements) in the environment, and the chemical methods that are used to study the behavior of these elements in the geosphere.

Objective
The students gain a detailed understanding of the sources and the cycling of trace elements in the terrestrial and aquatic environment. The interaction of environmentally important trace elements with abiotic and biotic geosphere components as well as their abiotically and biotically driven transformations will be discussed. Relevant methods/techniques to study these processes will be presented.

Content
The course deals in-depth with the major biogeochemical processes controlling the cycling of different groups of trace elements (heavy metals, redox-sensitive and chalcophile elements) in the environment. Sources and cycling of trace elements as related to interactions with abiotic and biotic geosphere components, and abiotically and biotically driven transformations will be discussed. The techniques most commonly used to study these processes will be presented as well.

Lecture notes
Selected handouts (lecture notes, literature, exercises) will be distributed during the course.

Prerequisites / notice
Students are expected to be familiar with the concepts of aquatic or soil chemistry covered in the respective classes at the bachelor level.

This lecture is a prerequisite for attending the laboratory course "Trace elements laboratory".

Element Balancing and Soil Functions in Managed Ecosystems

W 3 credits 2G  A. Keller

Abstract
Applying element balances of agricultural soils and the assessment of soil functions for real applications in computer exercises to design preventive strategies against soil pollution and to support sustainable management of regional agroecosystems also in the context of spatial planning procedures.

Objective
The students learn to critical assess changes in land use management on element cycles in agro-ecosystems and to assess soil services (soil functions). You design solutions for chemical problems in soil protection at the regional scale and learn to assess soil functions using different methods.

Content
The students apply a regional balance model for Swiss regions in computer exercises and assess major soil functions of agricultural soils. You assess the sustainability of current land use and analyse management options improving nutrient and metal cycling in agro-ecosystems. The students will have the opportunity to calculate specific scenarios regarding land use management and environmental changes. Special focus will be paid on the soil services such as regulation-, production function and soil as habitat, and the assessment of these functions based on soil mapping data.

Lecture notes
Literature and Exercises for a case study

Literature
Literature will be provided.

River Engineering

W 3 credits 2G  G. R. Bezzola

Abstract
Main subjects treated:
Fundamentals (e.g. sediment sampling methods), alluvial channel hydraulics, incipient motion, bed forms, bed load and suspended load, sediment budget and morphological changes, river morphology, scour, river management concepts and selected measures (e.g. bank and bed protection works).
A practical exercise (voluntary, unmarked) is offered to deepen the learned subjects.

Objective
The students shall
- be able to describe quantitatively the interrelation between discharge, sediment transport and channel evolution
- know the fundamentals and be able to apply the approaches and methods to treat river engineering problems associated with flood protection and river restoration

Content
The students shall
The first part of the lecture treats the fundamentals required to deal with river engineering problems. Sampling methods for the river bed material and methods to calculate the discharge in alluvial rivers are presented. The process of river bed armoring and the principles of incipient motion, of bed load and suspended load transport are treated.
In the second part of the lecture the procedures to quantify the sediment budget and the morphological changes (erosion, aggradation) in river systems are explained. Furthermore, the process of natural channel formation and the different plan forms of rivers (straight, meandering, braided) are discussed. Own chapters are dedicated to the topics of bed forms, river morphology and scour.
The last part of the lecture concentrates on the design and dimensioning of river engineering works. The topics treated are the stabilization of banks and of the longitudinal profile of rivers.

Lecture notes
Autography River Engineering (in German)

Literature
The autography contains a comprehensive list of references to relevant literature.
The voluntary and unmarked exercise bases on field data, which are collected by the students on a river in nature. Besides the collection of fundamentals and field data, the exercise comprehends the calculation of the stage-discharge relationship, of the critical discharges at the onset of bed load transport and bed erosion and of the annual sediment load in a given river reach.

102-0337-00L  Landfilling, Contaminated Sites and Radioactive Waste Repositories

<table>

102-0377-00L  Air Pollution Modeling and Chemistry

| Objective | Air pollutants cause negative effects on humans, wildlife and buildings. To control and reduce the impact of air pollutants, their transfer from sources to receptors needs to be known. This transfer includes transport within the atmospheric boundary layer, chemical transformation reactions and phase-transfer processes from air to liquid and solid materials (aerosols, water, porous media). |

<table>
<thead>
<tr>
<th>Content</th>
<th>The students understand the fundamental principles of atmospheric transport, dispersion and chemistry of pollutants on the local to regional scale and their transfer between air and condensed phases (aerosols, water, solids). This includes the knowledge of important atmospheric reactions, sources and sinks. The obtained understanding enables the students to apply computational tools to predict the transport and transformation of chemicals at the local to regional scale.</th>

Data: 06.12.2017 12:57  Autumn Semester 2015  Page 1319 of 1432
Weeks 1 to 3: Physical Properties of Soils and Other Porous Media. Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior.

Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity.

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing.

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:
Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.

Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.

Part 2 - Unsaturated steady state flow: unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.
Midterm exam

Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.

Part 3 - Use of Hydrus model for simulation of unsaturated flow.

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils. Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.

Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:
Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

Biological Processes in the Vadose Zone An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmospheric gas exchange; and challenges for bio- and phytoremediation.

Lecture notes:
Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller (available at the beginning of the semester)
http://www.step.ethz.ch/education/active-courses/vadose-zone-hydrology

Literature:
Supplemental textbook (not mandatory) - Environmental Soil Physics, by: D. Hillel

102-0317-01L Advanced Environmental Assessment (Computer Lab and Exercises) W 3 credits 2U+2P S. Pfister
102-0317-01 Advanced Environmental Assessments (Exercises) (2KP) and 102-0317-02 Advanced Environmental Assessment (Lab) (2KP) cannot be chosen if 102-0307-00 Advanced Environmental, Social and Economic Assessments (6KP) is selected. 102-0317-01 and 102-0317-02 are already included in 102-0307-00.

Abstract:
Technical systems are investigated in projects with numerical modeling. The students learn how to answer given questions with target oriented methodologies using various software programs for environmental assessment.

Objective:
Become acquainted with various software programs for environmental assessment including Life Cycle Assessment, Environmental Risk Assessment, Probabilistic Modelling, Material Flow Analysis.

Minors Limited to 6 KP Totaly

Abstract:

Objective:
The students will understand the basics of noise abatement: acoustics, impact of noise, measure-ment techniques and legislation. The students will be able to analyze different noise problems and they will be able to solve simple problems of noise abatement.

Content:
Physikalische Grundlagen: Schalldruck, Wellen, Quellenarten.
Akustische Messtechnik: Umgang mit Dezibel, Akustische Masse, Schallpegelmesser, Spektralanalyse.

Lecture notes:
Skript "Lärmbekämpfung" erhältlich gegen der Vorlesung.

Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

Objective
The understanding and the computation of the essential hydraulic processes in wastewater hydraulics are presented. On the one hand, free-surface hydraulics is reviewed with particular reference to problems in wastewater hydraulics, whereas various special hydraulic structures such as manholes, separation structures and collector channels are analyzed with a hydraulic approach on the other hand. Particularities of wastewater schemes including depositions and the choking of a sewer as the abrupt transition from free-surface to pressurized high-speed flow are highlighted.

101-0339-00L  Environmental Geotechnics  W  3 credits  2G  L. M. Plötze

Abstract
Introduction of basic knowledge about problems with contaminated sites, investigation of this sites, risque management, remediation and reclamation techniques as well as monitoring systems.

Objective
Introduction in landfill design and engineering with focus on barrier- and drainage systems as well as lining materials, evaluation of geotechnical problems, e.g. stability.

Content
Introduction of basic knowledge about problems with contaminated sites, investigation of this sites, risque management, remediation and reclamation techniques as well as monitoring systems.

Lecture notes
Visit of VAW hydraulic laboratories to add to applied resources. Description of a number of selected, at the time available hydraulic models.

Prerequisites / notice
Dr. R. Hermanns Stengele, Dr. M. Plötze: Environmental Geotechnics (german) digital excursion

101-0501-00L  Pedosphere  W  3 credits  2V  R. Kretzschmar

Abstract
Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

Objective
Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

Content
Definition of the pedosphere, soil functions, rocks as parent materials, minerals and weathering, soil organisms, soil organic matter, physical soil properties and functions, chemical soil properties and functions, soil formation, principles of soil classification, global soil regions, soil fertility, land use and soil degradation.
Lecture notes
Lecture notes can be purchased during the first lecture (15.- SFr)

Literature

Prerequisites / notice
Prerequisites: Basic knowledge in chemistry, biology and geology.

701-0533-00L  
**Title:** Soil Chemistry  
Type: W  
ECTS: 3 credits  
Hours: 24A  
Lecturers: R. Kretzschmar, D. I. Christl

**Abstract:** This course discusses chemical and biogeochemical processes in soils and their influence on the behavior and cycling of nutrients and pollutants in terrestrial systems. Approaches for quantitative modeling of the processes are introduced.

**Objective:** Understanding of important chemical soil properties and processes and their influence on the behavior (e.g., speciation, bioavailability, mobility) of nutrients and pollutants.

**Content:** Important topics include the structure and properties of clays and oxides, the chemistry of the soil solution, gas equilibria, dissolution and precipitation of mineral phases, cation exchange, surface complexation, chemistry of soil organic matter, redox reactions in flooded soils, soil acidification and soil salinization.

The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

102-0010-10L Master's Thesis in Urban Water Management
- Only students who fulfill the following criteria are allowed to begin with their master thesis:
  a. successful completion of the bachelor programme;
  b. fulfilling of any additional requirements necessary to gain admission to the master programme.
- To work independently and to produce a scientifically structured work.
- The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 16 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

- Only students who fulfill the following criteria are allowed to begin with their master thesis:
  a. successful completion of the bachelor programme;
  b. fulfilling of any additional requirements necessary to gain admission to the master programme.
- To work independently and to produce a scientifically structured work.

</table>
This course provides an introduction and an overview over the topics of urban water management (water supply, urban drainage, wastewater treatment, sewage sludge treatment). It supports the understanding of the interactions of the relevant technical and natural systems. Simple design models are introduced.

Overview over the field of urban water management.
Introduction into systems analysis.
Characterization of water and water quality.
Requirement of drinking water, production of wastewater and pollutants.
Production and supply of drinking water.
Urban drainage, treatment of combined sewer overflow.
Wastewater treatment, nutrient elimination, sludge handling.
Planning of urban water infrastructure.

This self-study course the students must work through and understand selected sections from the following book:

Students must understand and be able to discuss the required reading in a 30 min oral exam. The required reading is explained in detail on the website of the professorships of urban water management. Additional information can be asked during the office hours of the professors’ assistants.

The required reading and studying should correspond roughly the time invested in the course Siedlungswasserwirtschaft GZ. Students are welcome to ask the assistants for help with questions they have regarding the reading.

Applications of these methods to case studies. Students can identify and apply the appropriate tool in a given situation. Also, they are able to critically assess existing studies.

This course is required for further in-depth courses in urban water management.

Prerequisite: Hydraulics I and Hydrology

---

**102-0324-AAL Ecological Systems Analysis**

Enrolment only for MSc students who need this course as additional admission requirement.

Methodological basics and application of various environmental assessment tools.

Students learn about environmental assessment tools, such as material flow analysis, risk assessment, and life cycle assessment. They can identify and apply the appropriate tool in a given situation. Also, they are able to critically assess existing studies.

Application of these methods to case studies.

No script, but literature available on homepage.

None

**102-0325-AAL Waste Management**

Enrolment only for MSc students who need this course as additional admission requirement.

Introduction into the problems of waste handling with the goal to get the ability of seeing and improving the influence of commodities and products with there packaging to the environment - as they are becoming waste. Knowing the different mechanical and chemical processes, which are applicable in the field of waste management.

To know the problems of a modern waste management (C4)
To see and to improve the influence of commodities and products to the environment (C5)
To recognize waste and his components as raw material and resources and to get the know how for a correct handling (C6)
To know the different mechanical and chemical processes, which are applicable in the field of waste management (C6)

The composition of waste as a mirror of the human evolution
Waste definition (formation, amount, energy content, waste composition)
Several recycling possibilities and processes
Thermal waste treatment (electricity/district heat as products), including off-gas cleaning and incineration residue handling with regards to the final residue storage in a landfill and the problems which have to be solved there
Special fields like biological waste handling (composting, fermentation), handling of special wastes and municipal sewage sludge treatment
Economical aspects

Basic of chemical processes has to be known

**102-0455-AAL Groundwater I**

Enrolment only for MSc students who need this course as additional admission requirement.

The course provides an introduction into quantitative analysis of groundwater flow and transport. It is focussed on formulating flow and transport problems in groundwater, which are to be solved analytically or numerically.
Objective

a) Students understand the basic concepts of flow and contaminant transport processes and boundary conditions in groundwater.

b) Students are able to formulate simple practical flow and transport problems.

c) Students are able to understand and apply simple analytical solutions to simple flow and transport problems.

d) Students are able to use simple numerical codes to adequately solve simple flow (and transport) problems.

Content

Introduction, aquifers, groundwater use, sustainability, porosity.

Properties of porous media.

Exercises: Groundwater use, porosity, grain size analysis.

Flow properties, Darcy’s law, filter.

Flow equations, stream function.

Exercises: Darcy’s law.

Analytical solutions, confined aquifers, steady-state flow.

Exercises: Head isolines.

Use of superposition principles, transient flow, free surface flow.

Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems I.

Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems II.

Exercises: Finite difference formulations to flow problems.

Transport processes.

Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems I.

Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems II.

Exercises: Analytical solutions to transport problems.

Path lines, groundwater protection.

Exercises: Analytical solutions to transport problems.

Groundwater remediation, groundwater management.

Exercises: Groundwater remediation.

102-0635-AAL Air Pollution Control E- 6 credits 4R J. Wang, B. Buchmann

Abstract

The lecture provides an introduction to the formation of air pollutants by technical processes, the emission of these chemicals into the atmosphere and the impact on air quality. Theoretical description and modeling of these processes, air quality measurement techniques and pollution control techniques are covered.

Objective

The students gain general knowledge of the factors resulting in air pollution and the techniques used for air pollution control. The students can identify major air pollution sources and understand the methods for measurement, data collection and analysis. The students can evaluate possible control methods and equipment, design a control system and estimate the efficiency and cost.

Content

- the physical and chemical processes leading to emission of pollutants
- air quality analysis
- the meteorological parameters influencing air pollution dispersion
- deterministic and stochastic models, describing the air pollution dispersion
- measurement concepts to observe ambient air pollution
- removal of gaseous pollutants by absorption and adsorption
- control of NOx and SOx
- fundamentals of particulate control
- design and application of wet scrubbers

Literature

Text book

Prerequisites / notice

College lectures on basic physics, chemistry and mathematics.
The course offers an introduction to the basics of water resources analysis and management covering the topics of water demand vs. availability, water exploitation and reservoir design, aquatic physics, water quality and pollution, water conservation and remediation in rivers, lakes and aquifers, sustainable water use.

### Objective

Introduction to the basics of water resources management based on physical and chemical processes; principle of sustainability

### Content

Wassergüte: Anforderungen, Schadstoffausbreitung, Selbst reinigung, Thermische Belastung, relevante Schadstoffe und Quellen, Stossbelastungen, Zeit kon stanten und Größenord nungen.

Wasserwirtschaft: Struktur von Dargebot und Nachfrage.

Optionen zur Schließung der Disparität: Reservoire, Grund wasser speicher, Überleitungen, Wasser wirtschaft liche Rahm enplanung (Masterplan) , Gewässerschutz, Sanierung und Renaturierung (Oberflächengewässer und Grundwasser), Variabilität, Stochastik und Risiko.

Nachhaltigkeit: Definitionen, Beispiele für nicht- nachhaltiges Wirtschaften, Wasserprobleme der Entwicklungsländer, Wasser und Landwirtschaft, Projekt bewertung und Umwelt verträglichkeitsprüfung. Ökonomische und Soziologische Bezü ge.

Alle Aspekte sollen mit Fallbeispielen illustriert werden.

### Lecture notes

Skript in wöchentlichen Folgen.

#### 252-0846-AAL

**Computer Science II**

Enrolment only for MSc students who need this course as additional admission requirement.

- **Objective**: The students will be able to write simple programs and to modify existing programs.
- **Content**: This course offers an introduction to variables, control structures (branch, loop), algorithms and data structures, as well as an outlook to modularisation and object oriented techniques.

#### 529-2001-AAL

**Chemistry I and II**

Enrolment only for MSc students who need this course as additional admission requirement.

- **Objective**: Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.
- **Content**: 1. Stoichiometry
  2. Atoms and Elements (Quantenmechanical Model of the Atom)
  3. Chemical Bonding
  4. Thermodynamics
  5. Chemical Kinetics
  6. Chemical Equilibrium (Acids and Bases, Solubility Equilibria)
  7. Electrochemistry

#### 529-2002-AAL

**Chemistry II**

Enrolment only for MSc students who need this course as additional admission requirement.

- **Objective**: Erarbeiten der Grundlagen von anorganischer und organischer Stoffchemie
- **Content**: 1. Redox reactions
  2. Inorganic Chemistry

#### Literature

Housecroft and Constable, MODERN CHEMISTRY

Based on the biology and chemistry courses in the 1. and 2. semester more detailed biochemical knowledge about enzymology, membrane structure and function, and the most important metabolic reactions.

Principles of Biochemistry (5th Edition)

Enrolment only for MSc students who need this course as additional admission requirement.

Abstract

Introduction to basic biochemistry and the most important organic chemistry structures and function of proteins.

Objective

Based on the biology and chemistry courses in the 1. and 2. semester more detailed biochemical knowledge about enzymology, membrane structure and function, and the most important metabolic reactions.

Content

Introduction, basics, composition of cells, biochemical units, repetition of relevant organic chemistry structures and function of proteins.

Carbohydrates, structure of DNA

Lipids and biological membranes

Enzymes and enzyme kinetics

Catalytic strategies

Metabolism: Basic concepts and design. Repetition of basic thermodynamics

Glycolysis

The citric acid cycle

Oxidative phosphorylation

Fatty acid metabolism

Lecture notes

by Laurence A. Moran (Author), Robert A Horton (Author), Gray Scrimgeour (Author), Marc Perry (Author)

Prerequisites / notice

Basic knowledge in biology and chemistry is a precondition.

Microbiology

Enrolment only for MSc students who need this course as additional admission requirement.

Abstract

Teaching of basic knowledge in microbiology with main focus on Microbial Cell Structure and Function, Molecular Genetics, Microbial Growth, Metabolic Diversity, Phylogeny and Taxonomy, Prokaryotic Diversity, Human-Microbe Interactions, Biotechnology.

Objective

Teaching of basic knowledge in microbiology.

Content

Hydrology

Enrolment only for MSc students who need this course as additional admission requirement.

Abstract

Objective

Kenntnis der Grundzüge der Hydrologie. Kennenlernen von Methoden, zur Abschätzung hydrologischer Größen, die zur Dimensionierung von Wasserbauwerken und für die Nutzung von Wasserressourcen relevant sind.

Content

Die Behandlung der Themen erfolgt auf der Basis des Lehrbuchs Brock, Biology of Microorganisms.

Niederschlag: Niederschlagsmechanismen, Regenmessung, räumliche/zeitliche Verteilung des Regens, Niederschlagsregime, Punktniederschlag/Gebietsniederschlag, Isohyeten, Thiessenpolygon, Extremniederschlag, Dimensionierungsniederschlag.

Interzeption: Messung und Schätzung.

Evaporation and Evapotranspiration: Prozesse, Messung und Schätzung, potentielle und effektive Evapotranspiration, Energobilanzmethode, empirische Methode.

Infiltration: Messung, Horton-Gleichung, empirische und konzeptionelle Methoden, F-index und Prozentuale Methode, SCS-CN Methode.

Schnee und Eis: Schneeeigenschaften und -messungen Schätzung des Schneeschmelzprozesses durch die Energiebilanzmethode, Abfluss aus Schneeschmelze, Temperatur-Index- und Grad-Tag-Verfahren.

Lecture notes

Ein internes Skript ist zur Verfügung (kostenpflichtig, nur Herstellungskosten)

Die Kopie der Folien zur Vorlesung können auf den Webseiten der Professur für Hydrologie und Wasserwirtschaft herunterladen werden.

Literature

Literature

Prerequisites / notice
Vorberend zu Hydrologie I sind die Vorlesungen in Statistik. Der Inhalt, der um ein Teil der Übungen zu behandeln und um ein Teil der Vorlesungen zu verstehen notwendig ist, kann zusammengefasst werden, wie hintereinander es beschrieben wird:
Elementare Datenverarbeitung: Hydrologische Messungen und Daten, Datenreduzierung (grafische Darstellungen und numerische Kenngrössen).

The successful participation in EW1 ("Human Learning") and EW2 ("Designing Learning Environments for School") is recommended, but not a mandatory prerequisite.

**Abstract**
In this class, students will learn concepts and skills for coping with psychosocial demands of teaching.

**Objective**
Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

1. They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).
2. They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions).

**Abstract**
General Chemistry I: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium.

**Objective**
Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

**Content**
1. Stoichiometry
2. Atoms and Elements (Quantenmechanical Model of the Atom)
3. Chemical Bonding
4. Thermodynamics
5. Chemical Kinetics
6. Chemical Equilibrium (Acids and Bases, Solubility Equilibria)

**Lecture notes**
ca. 360 Seiten mit vielen Figuren und durchgerechneten Beispielen.

**Abstract**
This course covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems - notably through ordinary differential equations.

**Objective**
Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of both of these courses.

**Content**
1. Single-Variable Calculus:
   - review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.

2. Linear Algebra and Complex Numbers:
   - systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvectors and eigenvalues, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.

3. Ordinary Differential Equations:
   - Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).

**Prerequisites / notice**
- Prerequisites: familiarity with the basic notions from Calculus, in particular those of function and derivative.

**Abstract**
This course covers the bases for understanding micro- and macroeconomic issues and theories. Participants are given the tools to argue in economic and political terms and to evaluate the corresponding measures. Group and individual exercises deepen the knowledge gained.

**Objective**
Students are able to
- describe fundamental micro- and macroeconomic issues and theories.
- apply suitable economic arguments to a given theme.
- evaluate economic measures.

**Content**
Supply and demand behaviour of firm and households; market equilibrium and taxation; national income and indicators; inflation; unemployment; growth; macroeconomic policies

**Abstract**
Imparting basic understanding of systematical problem-solving and target-oriented process presentations. Introduction of methods for working out environmentally relevant problems. Practical application of theoretical knowledge on a case study on renewable energy. Practice of communication skills, especially of writing a scientific report.
Objective
- Imparting basic understanding of systematical problem-solving and target-oriented process presentations.
- Introduction of methods for working out environmentally relevant problems.
- Practical application of theoretical knowledge on a case study.
- Writing of a scientific report.

Content
In the lecture "Problemfeld management in the context of projects" the following contents are addressed:
- Dimensions of project management (logistics, processes, project steering).
- Problem-oriented, comprehensive and process-oriented strategies.
- Project management and project management methods.
- Models of process organization and project steering.
- Cooperation in the framework of projects and teams (project leadership, team moderation, groupware concepts, interactive electronic communication concepts).

The lecture is the first in a series of two lectures given over two semesters for students of agricultural and food sciences, as well as of environmental sciences.

The students should learn ecological concepts at these different levels in the context of concrete examples from terrestrial and aquatic ecosystems, as well as of environmental sciences.

The Campbell Chapters 1-4 (10th edition) under the heading "The role of chemistry in biology" are expected. We will treat the following Campbell chapters:

5 Biochemistry Biological Macromolecules and Lipids
6 Cell Biology Cell Structure and Function
7 Cell Biology Cell Membranes
8 Cell Biology Cellular Respiration: An Introduction to Metabolism
9 Cell Biology Cellular Respiration
10 Cell Biology Photosynthesis

Lecture notes
- Abgabe ausgewählter Literatur zum Fall
- Abgabe eines Skripts

Literature
Abgabe einer Fall bezogenen Literaturliste

Prerequisites / notice
The lecture is the first in a series of two lectures given over two semesters for students with biology as a basic subject.

The understanding of some basic principles of biology: the hierarchy of the structural levels of biological organisation, with particular emphasis on the cell and its functions, as well as metabolism, inheritance and evolution.

The objective of this lecture is to teach basic ecological concepts and the different levels of complexity in ecological research. Ecological concepts are exemplified by using aquatic and terrestrial systems; corresponding methodological approaches are demonstrated. In a more applied part of the lecture threats to biodiversity and the appropriate management are discussed.

The objective of this lecture is to teach basic ecological concepts and the different levels of complexity in ecological research: the individual, the population, the community and the ecosystem level.

The students should learn ecological concepts at these different levels in the context of concrete examples from terrestrial and aquatic ecosystems. Corresponding methods for studying the systems will be presented.

A further aim of the lecture is that students achieve an understanding of biodiversity, why it is threatened and how it can be managed.

- Übersicht der aquatischen und terrestrischen Lebensräume mit ihren Bewohnern
- Einfluss von Umweltfaktoren (Temperatur, Strahlung, Wasser, Nährstoffe etc.) auf Organismen; Anpassung an bestimmte Umweltbedingungen
- Populationsdynamik: Ursachen, Beschreibung, Vorhersage und Regulation
- Interaktionen zwischen Arten (Konkurrenz, Koexistenz, Prädation, Parasitismus, Nahrungsnetze)
- Lebensgemeinschaften: Struktur, Stabilität, Sukzession
- Ökosysteme: Kompartimente, Stoff- und Energiestrom
- Biodiversität: Variation, Ursachen, Gefährdung und Erhaltung
- Aktuelle Naturschutzprobleme und -massnahmen
- Evolutionäre Ökologie: Methodik, Spezialisierung, Koevolution
Students learn to apply selected concepts and tools from computer science for working on interdisciplinary projects. The following topics are covered: publishing over the internet, processing and visualizing time series, visualizing multi-dimensional data, managing data with lists and tables and with relational databases, introduction to macro programming, universal methods for algorithm design.

The students learn to
- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data,
- know universal methods for algorithm design.

Content
1. Simulation and Modeling
2. Visualizing multi dimensional data
3. Data management with lists and tables
4. Data management with a relational database
5. Introduction to macro programming
6. Introduction to programming with Python

Lecture notes
- All materials for the lecture are available at www.evim.ethz.ch
- The students spend most of their time working through electronic tutorials and discussing their results with teaching assistants

Additional First Year Compulsory Courses

Number Title Type ECTS Hours Lecturers
529-0030-00L Laboratory Course: Elementary Chemical Techniques O 3 credits 6P N. Kober, M. Morbidelli

This practical course provides an introduction to elementary laboratory techniques. The experiments cover a wide range of techniques, including analytical and synthetic techniques (e.g. investigation of soil and water samples or the preparation of simple compounds). Furthermore, the handling of gaseous substances is practised.

This course is intended to provide an overview of experimental chemical methods.

The handling of chemicals and proper laboratory techniques represent the main learning targets. Furthermore, the description and recording of laboratory processes is an essential part of this course.
The classification and analysis of natural and artificial compounds is a key subject of this course. It provides an introduction to elementary laboratory techniques, and the experiments cover a wide range of analytic and synthetic tasks:

Selected samples (e.g. soil and water) will be analysed with various methods, such as titrations, spectroscopy or ion chromatography. The chemistry of aqueous solutions (acid-base equilibria and solvation or precipitation processes) is studied.

The synthesis of simple inorganic complexes or organic molecules is practised.

Furthermore, the preparation and handling of environmentally relevant gaseous species like carbon dioxide or nitrogen oxides is a central subject of the Praktikum.

### Literature

A thorough study of all script materials is requested before the course starts.

Data: 06.12.2017 12:57  Autumn Semester 2015  Page 1334 of 1432
Students are able to understand - the structure and function of biological macromolecules - the kinetic bases of enzyme reactions - thermodynamic and mechanistic basics of relevant metabolic processes

Students are able to describe the relevant metabolic reactions in detail

Introduction, basics, composition of cells, biochemical units, repetition of relevant organic chemistry

Structure and function of proteins

Carbohydrates

Lipids and biological membranes

Enzymes and enzyme kinetics

Catalytic strategies

Metabolism: Basic concepts and design. Repetition of basic thermodynamics

Glycolysis, fermentation

The citric acid cycle

Oxidative phosphorylation

Fatty acid metabolism

Horton et al. (Pearson) serves as lecture notes.

Basic knowledge in biology and chemistry is a precondition.

This course introduces important questions about the evolutionary processes involved in the generation and maintenance of biological diversity across all domains of life and how evolutionary science investigates these questions.

These topics are important for the understanding of a number of evolutionary problems in the basic and applied sciences.

Textbook:

Evolutionary Analysis

Scott Freeman and Jon Herron

The exam is based on lecture and textbook.

- Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

- Understanding of basic physical and chemical processes in the atmosphere. Understanding of mechanisms of and interactions between: weather - climate, atmosphere - ocean - continents, troposphere - stratosphere. Understanding of environmentally relevant structures and processes on vastly differing scales. Basis for the modelling of complex interrelations in the atmosphere.

- Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

- Written information will be supplied.

- Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

- Mixing and transport processes are described and the coupling of the hydrosphere with the atmosphere and the solid Earth are discussed.

- Qualitative and quantitative understanding of the physical processes that control the terrestrial water cycle. Energy and mass exchange, mixing and transport processes are described and the coupling of the hydrosphere with the atmosphere and the solid Earth are discussed.

- Qualitative and quantitative understanding of the physical processes that control the terrestrial water cycle. Energy and mass exchange, mixing and transport processes are described and the coupling of the hydrosphere with the atmosphere and the solid Earth are discussed.

- Topics of the course.

- Physical properties of water (i.e. density and equation of state) - global water resources - exchange at boundaries - energy (thermal & kinetic), gas exchange - mixing and transport processes in open waters - vertical stratification, large scale transport - turbulence and mixing - mixing and exchange processes in rivers - groundwater and its dynamics - ground water as part of the terrestrial water cycle - ground water hydraulics, Darcy's law - aquifers and their properties - hydrochemistry and tracer - ground water use - Case studies - 1. Water as resource, 2. Water and climate

- Topics of the course.

- Physical properties of water (i.e. density and equation of state) - global water resources - exchange at boundaries - energy (thermal & kinetic), gas exchange - mixing and transport processes in open waters - vertical stratification, large scale transport - turbulence and mixing - mixing and exchange processes in rivers - groundwater and its dynamics - ground water as part of the terrestrial water cycle - ground water hydraulics, Darcy's law - aquifers and their properties - hydrochemistry and tracer - ground water use - Case studies - 1. Water as resource, 2. Water and climate

- In addition to the suggested literature handouts are distributed.

- Suggested literature.

The case studies and the analysis of the questions and problems are integral part of the course.
Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

This laboratory course aims to provide basic knowledge of observation networks - the combination of individual instruments - as the starting point of quantitative environmental studies. The structure of the pedosphere, soil functions, rocks as parent materials, minerals and weathering, soil organisms, soil organic matter, physical soil properties and functions, chemical soil properties and functions, soil formation, principles of soil classification, global soil regions, soil fertility, land use and soil degradation.

Lecture notes can be purchased during the first lecture (15.- SFr)

### Objective
Students:
will be familiar with basic general management concepts.
will learn about the fundamental concepts of strategy development with practical examples.
will get to know the basic organisational issues and the essential types of organisations.
will get a rough overview on the concepts of financial management.
will learn about the strategic positioning of small departments within larger organisations.
will learn about the fundamental mechanisms for handling change, and will be able to recognise these situations.
will learn the basic principles of project management and of successful self-management.
will reflect on customer oriented information representation.

|-------------------------|-------------|----|---------|

**Abstract**
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. The module provides an overview of the principles of management, teaches knowledge about management that is highly complementary to the students’ technical knowledge, and provides a basis for advancing the knowledge of the various subjects offered at D-MTEC.

**Objective**
Discovering Management offers an integrated learning system, which combines in an innovate format a set of lectures, an advanced business game simulation and a set of group exercises involving industry speakers (ranging from leading venture capitalists to executives at established corporations). Unlike more traditional courses, the learning model for Discovering Management involves 'learning by doing'. While the 13 different lectures, in-class discussions and assigned readings provide the theoretical and conceptual foundations, the experiential learning outcomes result from the interrelated group activities: 1) the interactive case studies and exercises, and 2) the business game simulation.

By discovering the key aspects of entrepreneurial management, the purpose of the course is to advance students' understanding of factors driving company success, where success is understood as a broad construct including financial return, employee, customer and supplier satisfaction as well as social and ecological responsibility.

Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Entrepreneurial Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich. No prior knowledge of business or economics is required to successfully complete this course.
The lectures for Discovering Management are designed to broaden the participant's understanding of the principles of entrepreneurial management, emphasizing the interdependence of various specialties in the development and management of a firm. For this reason, the lectures are structured on the basis of a coherent business model and will be presented by the respective area specialists at D-MTEC. The lectures broaden the view and the understanding of technology by interlinking it with society. Corporate sustainability, for example, introduces economic, ecological and social issues that are relevant to all engineering disciplines. Practical examples stimulate the students to assess these issues and be aware of their responsibilities as engineers. Technology and innovation management, to mention a second example, focuses on the interplay of technical and organizational change, and how these often neglected interactions explain why many new technologies are never used. It fosters the students' ability to see the business and social consequences of their 'technical' decisions.

Critical skills will be trained by the case study exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of the decision maker, as they learn more about the specific case and identify the challenge they are faced with. Students will be presented real case scenarios by industry guests from established corporations and will have to critically analyze specific issues. The case study exercise will provide an insight into the context of a managerial problem-solving and enhance the participant's appreciation for the complex tasks companies deal with.

Discovering Management attempts to overcome the limitations of traditional teaching curricula of management in technical universities, which often merely focus on transferring specific skills to students, e.g. planning or forecasting. In response to the new challenges for entrepreneurial decision-making, students will be offered the opportunity to actively engage in an advanced business game simulation; a business game that establishes a link between business management theory and business management in practice. The simulation presents a realistic model of a company and provides participants with the opportunity to quickly gain the lastest effects of practical experience in a risk-free environment. All this provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyze the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities.

Prerequisites / Notice
Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Business Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich.

No prior knowledge of business or economics is required to successfully complete this course.

Please refer to the course website for further information on the content, credit conditions and schedule of the module: www.dm.ethz.ch
The course gives economic and empirical foundations for a sound understanding of the instruments, prospects and limitations of international development aid.

Students have a theoretically and empirically sound understanding of the prospects and limitations of international development aid.

Students are able to critically discuss the various aid instruments of bi- and multilateral donors and NGOs.

Introduction to the Determinants of Underdevelopment; History of Aid; Aid and Development: Theories and Empirics; Political Economy of Aid; Experience and Impact of Aid; New Instruments of Aid; e.g. Micro-Finance, Budget-Support; Fair-Trade.

Environmental Policy of Switzerland I

This course presents the basics of policy analysis and the specific characteristics of Swiss environmental policy. Political instruments, actors and processes are addressed theoretically as well as by means of current Swiss environmental policy examples.

Beyond acquiring basic knowledge about policy analysis, this course teaches students how to analytically address current and concrete questions of environmental policy. Through exercises the students learn about political science concepts and frameworks as well as real-life political decision-making processes. The well-grounded examination of complex political conflict situations is an important precondition for the entry into the (environmental policy) workforce or a future research career.

The processes of change, overuse or destruction of the natural environment through humans have historically placed high demands on social and political institutions. In the interplay between the environment, society and economy, the environmental policy field encompasses the sum of public measures that have the goal to eliminate, reduce or avoid environmental degradation. The course provides insight into the development of Swiss environmental policy and systematically presents the basics of environmental policy actors, instruments, programs and processes as well as their change over time. A key aspect is the distinction between politics and political science and specifically environmental policy.

Instead of lecture notes different texts on policy analysis and Swiss environmental policy are made available to the students.

Principles of Political Science

This course covers the basics questions, concepts, theories, methods, and empirical findings of political science.

This course is based on the following textbook:

This course is based on the following textbook:

Students attending this course and passing the required tests (one in the middle, the other at the end of the semester) will obtain 4 ECTS credit points.

Politics of Environmental Problem Solving in Developing Countries

The course focuses on processes and drivers of decision-making on natural resources management issues in developing countries. It gives insights into the relevance of ecological aspects in developing countries. It covers concepts, instruments, processes and actors in environmental politics at the example of specific environmental challenges of global importance.

After completion of the module, students will be able to:
- Identify and appraise ecological aspects in development cooperation, development policies and developing countries’ realities
- Analyze the forces, components and processes, which influence the design, the implementation and the outcome of ecological measures
- Characterize concepts, instruments and drivers of environmental politics and understand, how policies are shaped, both at national level and in multilateral negotiations
- Study changes (improvements) in environmental politics over time as the result of the interaction of processes and actors, including international development organizations
- Analyze politics and design approaches to influence them, looking among others at governance, social organization, legal issues and institutions

This course is based on the following textbook:

This course is based on the following textbook:

The detailed semester program (syllabus) is made available to the students at the beginning of the semester.
Content Key issues and basic concepts related to environmental politics are introduced. Then the course predominantly builds on case studies, providing information on the context, specifying problems and potentials, describing processes, illustrating the change management, discussing experiences and outcomes, successes and failures. The analysis of the cases elucidates factors for success and pitfalls in terms of processes, key elements and intervention strategies.

Different cases not only deal with different environmental problems, but also focus on different levels and degrees of formality. This ranges from local interventions with resource user groups as key stakeholders, to country level policies, to multi- and international initiatives and conventions. Linkages and interaction of the different system levels are highlighted. Special emphasis is given to natural resources management.

The cases address the following issues:
- Land use and soil fertility enhancement: From degradation to sustainable use
- Common property resource management (forest and pasture): Collective action and property rights, community-based management
- Ecosystem health (integrated pest management, soil and water conservation)
- Payment for environmental services: Successes in natural resources management
- Climate change and agriculture: Adaptation and mitigation possibilities
- Biodiversity Convention: Implications for conservations and access to genetic resources
- Diversity as a means for more secure livelihoods: Agroforestry and intercropping
- The Millennium Development Goals: Interactions between poverty and the environment
- Poverty and natural resources management: Poverty reduction strategies, the view of the poor themselves
- Food security: Policies, causes for insecurity, the role of land grabbing
- Biofuels and food security: Did politics misfire?
- Strategy development at global level: IAASTD and World Development Report 2008

Lecture notes Information concerning the case studies and specific issues illustrated therein will be provided during the course (uploaded on Moodle).

Prerequisites / notice The performance assessment will consist of an individual essay to be written by each student based on at least five references in addition to the sources provided in the course. Students can choose from a list of topics. Criteria for assessment will be communicated at the beginning of the course.

701-0731-00L Environmental Sociology W 2 credits 2S H. Bruderer Enzler

Abstract This introductory class in environmental sociology covers different theoretical approaches but the main focus is on recent empirical research on topics such as environmental behavior, environmental concern, social dilemmas, social norms, environmental justice, and risk perception.

Objective Basic knowledge of environmental sociology

Overview on current fields of research in environmental sociology and their relevance for environmental protection

Basic notion of the structure of empirical research papers in social sciences

Content Das Seminar führt in die Umweltsoziologie ein. Dabei werden verschiedene theoretische Ansätze besprochen (Fokus: Rational Choice).

Der Schwerpunkt des Kurses liegt auf aktuellen empirischen Untersuchungen zu Themen wie Umweltverhalten, Umweltbewusstsein, soziale Dilemmata, soziale Normen, Umweltgerechtigkeit und Risikowahrnehmung.

Fragen, die uns dabei beispielsweise beschäftigen: Wer belastet die Umwelt besonders stark oder ist besonders starken Umwelteinflüssen ausgesetzt? Was beeinflusst das Umweltverhalten der Menschen? Welche Rolle spielen äußere Faktoren (Möglichkeiten, Kosten etc.)? Welchen Einfluss haben soziale Aspekte oder Einstellungen? Wovon hängt es ab, ob eine Technologie als risikoreich eingestuft wird?

701-0985-00L Social Intercourse with Current Environmental Risks W 1 credit 1V B. Nowack, C. M. Som-Koller

Abstract The lecture treats the social intercourses with risks of technical systems. The notion of risk and the perception of risk are discussed by case studies (e.g. nanotechnology) and socio-political instruments for decision-making are presented. Methods are presented that can be applied to deal with environmental risks and how they can be used for sustainable innovation.

Objective

- Getting acquainted to the extended risk concept
- Evaluation of the risks caused by technology within the societal context
- Knowledge about the mode science and society handle current environmental risks (examples gene- and nanotechnology)
- Knowledge about handling risks (e.g. precautionary principle, protection goal, damage definition, ethics)

Content

Knowledge about possibilities for sustainable innovation

- Risks and technical systems (risk categories, risk perception, risk management)
- Illustration with case studies (nanotechnology)
- Implementation (politics, science, media, etc.)
- Decision making (technology assessment, cost/benefit analysis etc.)
- The role of the media
- prospects for future developments

Lecture notes Copies of slides and selected documents will be distributed

Prerequisites / notice The lecture is held biweekly (for 2 hours). The dates are 21.9., 28.9 (attention, out of schedule) ; 19.10, 2.11, 16.11, 30.11, 14.12

227-0802-02L Sociology W 2 credits 2V A. Diekmann

Abstract Various studies are used to introduce basic sociological concepts, theories and empirical research methods, along with selected sociological topics. The goal of the course is to provide participants with an understanding of working practice in empirical sociology and the central findings of sociological studies.

Objective To learn about methods of empirical social research and key results of classic and modern sociological studies.
How do various interest groups influence the methods of production, distribution, and use of digital resources? Current models focusing on

Slides and other material (both usually in English) will be made available on a weekly basis as the lecture proceeds.

Technical reality: Within minutes you can make perfect copies of high-value digital goods of knowledge or culture (as text, audio, video,...

Folien der Vorlesung im Internet

Digital Sustainability in the Knowledge Society

M. M. Dapp

At the heart of the discourse is the handling of digital goods and intellectual property in society. Digitization and the Internet allow handling

knowledge in a way, which directly contrasts with the traditional understanding of "intellectual property" and the industries based on it. Starting from economic and legal basics, we compare proprietary and open/free models. Sustainable development as a concept is transferred to digital goods, taking into account the particular nature of digital stuff.

After the lecture, you should (hopefully) be able to

- characterize the nature of digital goods vs. physical goods
- critique the basic concepts of copyright and patent rights
- explain the political/legal and economic differences between proprietary and open approaches to the production and use of digital goods
- using an example, explain the meaning of digital sustainability and argue why it is relevant for a knowledge society
- transfer the ideas of the free/open source software model to other digital goods (e.g., open content, open access)

Content

Technical reality: Within minutes you can make perfect copies of high-value digital goods of knowledge or culture (as text, audio, video, image or software) and distribute them around the globe for free. «Digitization plus Internet» allows for the first time in humankind's history the (theoretically) free access and global exchange of knowledge at minimal cost. A tremendous opportunity for societal development, in north and south. «Cool, so what's the problem?»

The problem is, that this reality poses a fundamental threat to today's business model of the knowledge and culture industries (starting from the music label and Hollywood, via publishers, up to software vendors). Powerful commercial interests are at stake as «knowledge» (the fourth factor of production) will become ever more important in the 21st century. Accordingly, «piracy» and «file-sharing» are attacked with all means. At the core lies the question about the design of property in digital assets for. That, we apply a concept of «intellectual property», which is several hundred years old and does not address digital reality in an adequate manner, sometimes leading to absurd situations. Its original goal seems to get forgotten: to help society develop by spreading knowledge as much as possible.

Using the PC becomes the new cultural technique of the 21st century. In contrast to «reading, writing and arithmetic», this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency extends to the provider of the infrastructure, who can define technical rules, which can take away or restrict the user's freedom. Even advanced users may have difficulties in recognizing these, often hidden, restrictions and in evaluating their societal relevance. But exactly these invisible consequences we need to understand and investigate, because they decide about access, distribution and usage of digital knowledge. Comparable to the environmentalist movement of the 60s and 70s, a growing political movement for «Free Software» exists today, with GNU/Linux as its most popular symbol. The movement fights against treating software code as private property but as a central cultural good available to all without private interests. Based on the success of the Free Software movement, new initiatives extend the concepts to other domains (e.g. scientific knowledge, music)...

As a «teaser» to the lecture, you are invited to read the essay «ETH Zurich - A Pioneer in Digital Sustainability!». It can be downloaded from www.essays2030.ethz.ch.

More on teach.digisius.info starting from September. Stay tuned.

Lecture notes

Slides and other material (both usually in English) will be made available on a weekly basis as the lecture proceeds.

Content of the following books is covered (PDFs freely available online):

Other recommended books are:

1 (general) Chris DiBona et al., Open Sources Voices from the Open Source Revolution, O'Reilly, 1999.

Prerequisites / notice

For administrative and didactic reasons (high level of interaction and credit group assignments on current hot topics), the number of participants is limited to 45.

Of course, any interested person is invited to attend the lecture without doing the group assignment. The website is actively used for the lecture.

International Environmental Politics

Particularly suitable for students of D-ITET, D-USYS

This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

The objectives of this course are to

1. gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint;
2. learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way;
3. gain an overview of important global and regional environmental problems.

Content

This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 4 ECTS credit points. The workload is around 120 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

Lecture notes

Slides and reading material will be made available at www.ib.ethz.ch (teaching, materials, then menu on the left side of the screen). They are password protected. Use your Netzh username and password to access the material.

Literature

See www.ib.ethz.ch (teaching, materials)

Prerequisites / notice

Students from ETH will receive 4 ECTS credit points if they attend classes regularly and obtain a grade of 4.0 or higher for the written exam in the final week of the semester. Students who obtain a grade of less than 4.0 for the end-of-semester test will have a second chance in the first week of the following semester. The rules of the game are defined in detail on the course syllabus. Students who do not participate in the end of semester test will not have access to the repeat exam unless they submit compelling and documented reasons for why they were unable to participate in the first test. Except for language dictionaries, no additional materials and no laptops and mobile phones are allowed during the exam.

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

The workload for this course is approx. 120 hours (all inclusive).

Autumn Semester 2015
ECTS Hours

The lecture explores various strands in philosophy of science in a critical way, focusing on the notion of rationality in science, especially in relation to ethical issues.

A list of introductory literature and handbooks will be distributed to the students.

### Course Contents

#### I. Introduction
- Topics: Environment, Science, Risks, Media
- Forms, Functions, Effects of Public and Mass Communication

#### II. Stakeholders and their Public Relations Efforts
- Public Relations and Science PR: Theoretical Perspectives, Instruments

#### III. Science and Environmental Issues in the Media
- Forms and Functions of Science Journalism
- Problems of Selection, Interpretation, Quality
- Media Content Analysis
- Online Communication

#### IV. Uses and Effects of Science and Environmental Communication
- Extent of Media Use
- Effects on Knowledge, Risk Perceptions, Environmental Attitudes
- Effects on Science itself

Lecture notes

### Content

#### Abstract

The lecture explores various strands in philosophy of science in a critical way, focusing on the notion of rationality in science, especially in relation to ethical issues.

#### Objective

Students learn to engage with problems in the philosophy of science and to relate them to natural and environmental sciences, thus developing their skills in critical thinking about science and its use. They know the most important positions in philosophy of science and the objections they face. They can identify, structure and discuss issues raised by the use of science in society.

#### Content

1. Core differences between classical Greek and modern conceptions of science.
2. Classic positions in the philosophy of science in the 20th century: logical empiricism and critical rationalism (Popper); the analysis of scientific concepts and explanations.
3. Objections to logical empiricism and critical rationalism, and further developments: What is the difference between the natural sciences, the social sciences and the arts and humanities? What is progress in science (Kuhn, Fleck, Feyerabend)? Is scientific knowledge relativistic? What is the role of experiments and computer simulations?
4. Issues raised by the use of science in society: The relation between basic and applied research; inter- and transdisciplinarity; ethics and accountability of science.

#### Lecture notes

A reader will be available for students.

#### Literature

A list of introductory literature and handbooks will be distributed to the students.

#### Prerequisites / notice

Oral examination during the Prüfungssession.

The optional exercises accompany the lecture and offer the opportunity for an in-depth discussion of selected texts from the reader.

Abstract

The exercises in philosophy of science serve to develop skills in critical thinking by discussing seminal texts about the rationality of science. Topics discussed include the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

Objective

Students can engage with problems in the philosophy of science and to relate them to natural and environmental sciences. They learn to analyze and summarize philosophical texts. In this way, they develop their skills in critical thinking with a focus on the rationality of science.

Content

The optional exercises accompany the lecture and serve to develop skills in critical thinking with a focus on the rationality of science, based on discussing seminal texts. The texts cover important positions in the philosophy of science and their critics. Topics discussed include the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

Prerequisites / notice

A reader will be available for students.

Environmental History - Introduction and Overview  701-0791-00L

Abstract

Our society faces a serious ecological crisis. Of what historical dimension is this crisis? How have human societies already in earlier times changed their environment, and, consequently, perhaps also ours? What were the main ecological challenges for societies and how did they change over time? And how did societies adapt to changing environmental conditions?

Objective

Introduction into environmental history; survey of long-term development of human-nature-interrelations; discussion of selected problems. Improved ability to assess current problems from a historical perspective and to critically interrogate one's own standpoint.

Content

Prerequisites / notice

Students are asked to write an exam during the second last session (11.12.2015).

Abstract

Basic knowledge of the anatomy and physiology of tissues, of the embryonal and postnatal development, of the basic terminology of pathology, the neuro-muscular system, the cardiovascular system and the respiratory system.

Objective

Basic knowledge of human anatomy and physiology and basics of clinical pathophysiology.

Content

Anatomy and Physiology I (fall term):
- Basics of cytology, histology, embryology, general pathology; nervous system, muscles, cardiovascular system, respiratory system

Anatomy and Physiology II (spring term):
- Digestive system, kidney and urinary tract, endocrine system, skin, thermoregulation, sensory organs, male and female reproductive system, pregnancy and child birth.
Important topics include the structure and properties of clays and oxides, the chemistry of the soil solution, gas equilibria, dissolution and speciation, bioavailability, and the role of plants on hydrological cycles, soil organic matter, redox reactions in flooded soils, and the mobility of nutrients and pollutants.

The nutrients are described in relation to digestion, absorption and metabolism. Special aspects of homeostasis and homeorhesis are emphasized.

Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung".

This course introduces basic concepts of micro- and macronutrient nutrition. Micronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fat and carbohydrates. Special attention is given to nutrient digestion, bioavailability, metabolism and excretion with some focus on energy metabolism.

The nutrients are described in relation to digestion, absorption and metabolism. Special aspects of homeostasis and homeorhesis are emphasized.

Lecturers
- Prof. Wolfrum introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism.
- Vaccines, immune-therapeutic interventions
- Hypersensitivities
- Allergies
- Th1 and Th2 cells, regulatory T cells
- Cytotoxic T cells and NK cells
- Autoimmunity
- Thymus and T cell selection
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Basic knowledge of the mechanisms and the regulation of an immune response.

 getContent
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"
### Content

Weeks 1 to 3: Physical Properties of Soils and Other Porous Media. Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior

Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:

- Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.

- Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.

- Part 2 - Unsaturated steady state flow: unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.

Midterm exam

- Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.

- Part 3 - Use of Hydrus model for simulation of unsaturated flow

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils. Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.

Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:

- Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

- Biological Processes in the Vadose Zone An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bi- and phytoremediation.

### Methods of Statistical Data Analysis

Abstract

Statistical methods from current publications in environmental sciences are presented and applied. Students are enabled to understand the methods, clean datasets, analyse them using the software package R and present the results in a suitable form. They will be able to describe strengths and weaknesses of the methods for given fields of application.
Students are able to
- use suitable statistical methods for data analysis in their subject area.
- characterize data sets using explorative methods
- check the suitability of data sets to answer a given question, prepare data sets for import to a statistics program and conduct the analysis.
- interpret statistical analyses and process them graphically for use in presentations and publications.
- describe the basics of statistical methods used in current publications.
- use the software package R for statistical analysis

Statistische Methoden: Regression (lineare Modelle; generalisierte lineare Modelle; GLMs); Varianzanalyse; gemischte Modelle für gruppierte Daten (mixed-effects models); Fragebogenstatistik; Tests (t Test; Chi quadrat Test; Fisher Test); Power-Analyse

Werkzeuge: Explorative Datenanalyse für Hypothesenbildung; Auswahlverfahren für geeignete statistische Verfahren; Datenaufbereitung (Excel -> R; Datenbereinigung); graphische Darstellung von Resultaten; statistische Verfahren in Publikationen erkennen
Wir arbeiten mit dem Softwarepamkt R.

Form: Im Wochenrhythmus finden alternierend Einführungen in eine neue Methode und Übungsstunden zum Thema statt.
Besuch von "Mathematik IV: Statistik" oder vergleichbare Lehrveranstaltung

Students should have a good understanding of the concepts of general sampling theory in a modern framework. They should also master the specific problems arising in forest inventory and be able, if necessary, to read more specialized books or research papers.

Sampling techniques for forest inventories. Daniel Mandallaz, Chapman and Hall. A free electronic copy of the book is also available. A PDF file containing parts of the book will be mailed to the participants.

Sampling methods, remote sensing and GIS multisource forest inventory
M. Köhl, S. Magnusson, M. Marchetti, 2006, Springer.

Sampling techniques for forest inventories, Daniel Mandallaz, 2007, Chapman and Hall.

Sampling techniques for forest inventories. Daniel Mandallaz, Chapman and Hall. A free electronic copy of the book is also available. A PDF file containing parts of the book will be mailed to the participants.

Sampling methods, remote sensing and GIS multisource forest inventory
M. Köhl, S. Magnusson, M. Marchetti, 2006, Springer.

Sampling techniques for forest inventories, Daniel Mandallaz, 2007, Chapman and Hall.

A software simulation will be used throughout the lectures to illustrate the theoretical developments. Upon request a half day field demonstration can be organized at the WSL outside the lecture time. A repetition for the exam is also offered.

The course provides the first part an introduction to the statistical software R for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

The students will be able to use the software R for simple data analysis.

The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

The course resources will be provided via the Moodle web learning platform
Please login (with your ETH (or other University) username+password) at https://moodle-phy2.let.ethz.ch/enrol/users.php?id=1149
Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

<td><strong>Abstract</strong></td>
<td>The course offers an overview on the ecology and conservation biology of birds and mammals. Important concepts from physiology, behavioural ecology, population biology, biogeography and community ecology will be linked to applications in conservation and management. A worldwide perspective will be complemented by a focus on the Central European fauna and its dynamics.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>The students are familiar with important topics in animal ecology, with an emphasis on birds and mammals. They are able to link theoretical concepts with visible ecological phenomena, and view them against an evolutionary backdrop. They can thus appraise applied aspects of the conservation and the use of animal populations, such as the influence of larger predators on prey populations or of herbivores on vegetation, the effects of hunting, landscape change, or of other human influences on animal populations. They understand the biogeographical characteristics of the Central European vertebrate fauna and its temporal and spatial dynamics.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>The course deals with a number of main topics that include feeding and resource use, spatial behaviour and migrations, reproduction, population dynamics, competition and predation, biodiversity and distributions, and dynamics of the Central European fauna. There is an emphasis on linking theory with management issues in conservation and management of wildlife populations. During the first half of the course, examples will be drawn worldwide whereas during the second half, the course will focus more strongly on the European fauna, particularly of the Alpine region. Although the course is not designed to teach natural history of the native species, examples will cover much of the taxonomic breadth of the European fauna. Students are expected to read one paper and to present it to the audience. In addition, two optional field trips will be offered on weekends during the semester (2 days in the Swiss National Park: probably 10-11 October, one day in an important wetland for waterbirds: a Saturday in Nov./Dec., by arrangement). For the detailed program, see the German text.</td>

Data: 06.12.2017 12:57   Autumn Semester 2015   Page 1349 of 1432
Abstract

In this course the important freshwater ecosystems, on a global perspective, will be presented. The foci of the lectures are basic ecological properties of those aquatic systems, their anthropogenic influences and subsequent modifications. The learning is organized along case studies, for which conflicting interests, as well as concepts and methods for sustainable management will be discussed.

Objective

- basics concerning the functioning of the most important freshwater ecosystems
- basics of the sustainable management of aquatic ecosystems
- application of these principles with case studies
- critical analyses, organization of discussion groups

Content

1. Globaler Zustand der Binnengewässer und Entwicklungen
2. Globale Wasserkonflikte
3. Stauhaltungen und downstream Effekte
4. Restwasser und Schwalm-Sunk Management, Thermische Verunreinigung
5. Renaturierung von Fließgewässern
6. Interessenskonflikte bei Renaturierung: Trinkwasser, Hochwasserschutz und Biodiversität
7. Feuchtgebiete
8. Management urbaner Gewässer, wasserbürtige Krankheiten
9. Gewässerschutz und gesetzliche Grundlagen
10. Invasion artsfremder Arten und Biodiversität
11. Europäische Wasserrahmenrichtlinie

Abstract

This course presents significant organic environmental pollutants and the physical-chemical bases required to understand their environmental behavior, and deepens this knowledge through exercises. The most important analytical methods for the qualitative and quantitative determination of organic pollutants in environmental samples are discussed.

Objective

The students are able to:
- name and recognise the most important classes of environmentally-relevant anthropogenic chemicals.
- explain, on the basis of physical-chemical foundations, the most important processes which determine the environmental behavior of organic pollutants.
- name fundamental methods of trace analysis of organic pollutants in environmental sampling.
- propose experimental methods for determining substance-specific properties.
- identify, on the basis of chemical structure, the processes relevant for the environmental behavior of a compound.
- critically evaluate published work and data.

Content

- Overview of the most important classes of environmental organic pollutants
- Molecular interactions that determine the partitioning behavior (adsorption and absorption processes) of organic compounds between different environmental compartments (gas, liquid, solid)
- Physical-chemical properties (vapor pressure, aqueous solubility, air-water partition constant, organic solvent-water partition constants, etc) and partitioning behavior of organic compounds between environmentally relevant phases (air, aerosols, soil, water, biota)
- Basics of trace analytical methods to determine organic compounds (enrichment techniques, separation (chromatography), detection)
- Chemical transformation reactions of organic pollutants in aquatic and in terrestrial systems (reactions with nucleophiles incl. hydrolysis, elimination, addition)

Lecture notes

Script will be distributed

Literature

Prerequisites / notice

The Lehrveranstaltung richtet sich nicht nur an jene Studierenden, welche sich später chemisch vertiefen wollen, sondern ausdrücklich auch an alle jene, welche sich mit der Problematik von organischen Schadstoffen in der Umwelt vertraut machen wollen, um dieses Wissen in anderen Vertiefungen anzuwenden

701-0225-00L Organic Chemistry

Abstract

Introduction to Isomerism.

Objective

The students are able to differentiate between structural and stereoisomers.

Content

- Isomerism (structural isomers, stereoisomers)
- Descriptive chemistry of natural products (glycerides, peptides, saccharides)
- Reaction mechanisms (substitutions, additions, eliminations, condensations)
- The citric acid cycle, the gloxylate cycle
- Biosynthesis of terpenes

Literature

Carsten Schmuck, Basisbuch Organische Chemie, Pearson

701-0297-00L Applied Ecotoxicology

Abstract

Besides regarding basic concepts, this lecture focus on applied aspects of ecotoxicology. Case studies and effects of environmental chemicals on cells, organisms up to ecosystems are regarded. In a multidisciplinary approach based on toxicological concepts, pollutants are analysed, in particular hormonally active compounds and their effects on reproduction.
Environmental Fluid Dynamics

This course covers the basic physical concepts and mathematical equations used to describe environmental fluid systems on the rotating Earth. Fundamental concepts (e.g. vorticity dynamics and waves) are formally introduced, applied quantitatively and illustrated using examples. Exercises help to deepen knowledge of the material.

Objective
- Students are able to name the bases, concepts and methods of environmental fluid dynamics.
- To understand and discuss the components of the basic physical equations in fluid dynamics.
- To apply basic mathematical equations to simple problems of environmental fluid dynamics.

Content
- Basic physical terminology and mathematical laws:
  - Continuum hypothesis, forces, constitutive laws, state equations and basic principles of thermodynamics, kinematics, laws of mass and momentum on rotating earth.
  - Concepts and illustrative flow systems: vorticity dynamics, boundary layers, instability, turbulence - with respect to environmental fluid systems.
  - Scale analysis: dimensionless variables and dynamical similarity, simplification of the fluid system, e.g. shallow water assumption, geostrophic flow.
- Waves in environmental fluid systems.

Lecture notes
- In English language
- Will be presented in class.
- See also: web-site.

Prerequisites / notice
- Exercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounds" (4th semester) is recommended.

Environmental Physics

Analytical Chemistry I

Introduction into the most important spectroscopical methods and their applications to gain structural information.

Objective
- Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications.

Content
- Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:
  - Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
  - IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra.
  - Raman spectroscopy.
  - UV/VIS spectroscopy: Basics, interpretation of electron spectra, Circular dichroism (CD) and optical rotation dispersion (ORD).

Prerequisites / notice
- Script will be for the production price

Hydraulics I

The course teaches the basics of hydromechanics, relevant for civil and environmental engineers.

Objective
- Familiarization with the basics of hydromechanics of steady state flows.

Content
- Properties of water, hydrostatics, continuity, Euler equation of motion, Navier Stokes equation, similarity, Bernoulli principle, momentum equation for finite volumes, potential flows, ideal fluids-real fluids, boundary layer, pipe flow, open channel flow, flow in porous media, flow measurements, demonstration experiments in the lecture hall and in the laboratory.

Groundwater I

The course provides an introduction into quantitative analysis of groundwater flow and transport. It is focussed on formulating flow and transport problems in groundwater, which are to be solved analytically or numerically.

Objective
- a) Students understand the basic concepts of flow and contaminant transport processes and boundary conditions in groundwater.
- b) Students are able to formulate simple practical flow and transport problems.
- c) Students are able to understand and apply simple analytical solutions to simple flow and transport problems.
- d) Students are able to use simple numerical codes to adequately solve simple flow (and transport) problems.
Content

Introduction, aquifers, groundwater use, sustainability, porosity.

Properties of porous media.
Exercises: Groundwater use, porosity, grain size analysis.

Flow properties, Darcy's law, filter.

Flow equations, stream function.
Exercises: Darcy's law.

Analytical solutions, confined aquifers, steady-state flow.
Exercises: Head isolines.

Use of superposition principles, transient flow, free surface flow.
Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems I.
Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems II.
Exercises: Finite difference formulations to flow problems.

Transport processes.
Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems I.
Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems II.
Exercises: Analytical solutions to transport problems.

Path lines, groundwater protection.
Exercises: Analytical solutions to transport problems.

Groundwater remediation, groundwater management.
Exercises: Groundwater remediation.

651-3561-00L Cryosphere W 3 credits 2V M. Funk, M. Huss, K. Steffen

Abstract
This course introduces the different parts of the cryosphere - snow, glaciers, sea ice, permafrost - and their role in the climate system. A significant physical aspect is the focus in each part. Those completing the course are able to describe the dynamics of cryosphere components both formally and using examples.

Objective
Students are able to:
- to qualitatively describe the main components of the cryosphere and their role in the climate system
- to formally describe the relevant physical processes which determine the state of cryosphere components

Content
Introduction into the different components of the Cryosphere: Snow, glaciers, sea ice and permafrost, and their roles in the climate system.
Each part is used to emphasize on one specific physical aspect: material qualities of ice, mass balance and dynamics of glaciers and energy balance of sea ice.

701-0951-00L GIS - Introduction into Geoinformation Science and Technology W 5 credits 2V+3P M. A. M. Niederhuber, S. Salvini

Abstract
Theoretical basics and fundamental concepts of Geographic Information Science (GIS) are imparted and subsequently further elaborated with the software ArcGIS. At the end, the students will be able to independently solve basic realistic GIS problems.

Objective
Students are able to:
- elucidate the theoretical and conceptional foundations of geographic information systems (GIS)
- independently perform normal GIS work using commercial software and practical examples
Renewable Energy

Number of participants limited to 30.

Abstract
Realization of projects in the field of renewable energies, analysis of frame conditions and risks. The students learn basics of renewable energy project realization from acknowledged experts active in the field. They identify the different tasks of various investor types. They develop sample projects in practice within groups.

Objective
You become acquainted with the regulative, juridical and economic requirements of project development in renewable energies. You learn to launch and judge projects by exercises in groups. You recognize chances and risks of renewable energy projects.

Content
Business models for renewable energy projects
Introduction of market trends, market structure, technical trends and regulation in Switzerland and in the EU internal energy market
Necessary frame conditions for profitable projects
Project development samples and exercises in wind power
hydro power
photovoltaics
due diligence and country assessment.

Exact Program in German below

Lecture notes
PPT presentation will be distributed (in German) special frames:
http://www.rechsteiner-basel.ch/Lehrmittel.27.0.html

Literature
REN21 Renewables GLOBAL STATUS REPORT http://www.ren21.net
Mit einer grünen Anlage schwarze Zahlen schreiben  http://www.rechsteiner-basel.ch/uploads/media/Mit_einer_gruenen_Anlage_schwarze_Zahlen_schreiben.pdf

For group exercise and presentation reasons the number of participants is limited to 30 students. For exercises students build learning and presentational groups.
The lecture series will introduce tools for reading contemporary urban conditions, urban models and operational modes. Urban

Objective
Scenarios for the development of world primary energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO2 emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

Content

Lecture notes
Lecture notes will be distributed during the course.

Literature

Prerequisites / notice
Fundamentals of chemistry and physics are a prerequisite for this course.

Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.

<tr>
<td>Abstract</td>
<td>The lecture series will introduce tools for reading contemporary urban conditions, urban models and operational modes. Urban development will be deciphered, presented as operational tools, extracted from cities where they have been tested and became exemplary samples, most relevant for providing the understanding of how urban landscape has taken shape as well as inspiration for future practice.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>How can a glossary of tools be used as a basis for reading cities and recognizing in them current trends and urban phenomena? The lectures series will produce a glossary of operational urban tools with collected urban knowledge that provides students with an 'improved' manual to navigate theories. Urban Stories is a lecture series that aims to amplify your repertoire of urban instruments and empowers you to read cities and to critically reflect on the urban environment. The course will approach a series of case studies, employing an analytical, research-based model for crosscutting scale, political, economical and social components. Through this lens, and with our toolbox, we aim to tell the fundamental story of our cities from today and provide information, analysis and knowledge to help students prepare for justifiable own contributions and interventions in the future. Also the aspect of knowledge transfer will be considered in order to sensibilize the students to understand how to operate in an international context.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>How did cities develop into the cities we live in now? Which urban plans, instruments, visions, political decisions, economic reasonings, cultural inputs and social organization have been used to operate in urban settlements in specific moments of change? Which cities are exemplary in illustrating how these instruments have been implemented and how they have shaped urban environments? Can these instruments be transcribed into urban operational tools that we recognize within existing tested cases in contemporary cities across the globe? The form cannot be reduced to the physical space. Cities are the result of social construction, under the influence of technologies, ecology, culture, the impact of experts and accidents. Urban unconnected processes respond to political interests, economic pressure, cultural inclinations, along with the imagination of architects and planers and the informal powers at work in complex adaptive systems. Current urban phenomena are the result of an urban evolution. The facts stored in urban environments include contributions from its entire lifecycle. That is true for the physical environment, but also for non-physical aspects, the imaginary city that exists along with its potentials and problems and with the conflicts that have evolved over time. Knowledge and understanding along with a critical observation of the actions and policies are necessary to understand the diversity and instability present in the contemporary city and to understand how urban form evolved to its current state. This lecture series will introduce urban knowledge and the way it has introduced urban models and operational modes within different concrete realities, therefore shaping cities. Urban knowledge will be translated into operational tools, extracted from cities where they have been tested and become exemplary samples, most relevant for providing the understanding of how urban landscape has taken shape. Case studies will be identified to compile documents and an archive, that we use as templates to read the city and to critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life as well as to provide instruments for valuable contributions and interventions.</td>

Prerequisites / notice
EXERCISE
After each lecture, students are asked to produce an exercise based on the presented tools. The format of the exercise is an A3 or an A4, according to the given template. Each student has one week to prepare each exercise, and it should be delivered, in form of a physical copy, in the next lecture. (Language: preferably English, German).

The exercise tasks are a valuable preparation for the Exam (Exam only relevant for the "Semesterkurs" students) therefore it is highly recommendable to finalize all weekly Exercise tasks, as an individually conducted piece of work.

"Semesterkurs" (semester course) students from other departments or students taking this lecture as GEES / Studium Generale course as well as exchange students must submit a research paper, which will be subject to the performance assessment: "Bestanden" (pass) or "Nicht bestanden" (failed) as the performance assessment type, for "Urban Design I: Urban Stories" taken as a semester course, is categorized as "unbenotete Semesterleistung" (ungraded semester performance).

751-4801-00L System-Oriented Management of Herbivore Insects I W 2 credits 2G D. Mazzi

Abstract
The focus is on the potential to assess strategies and tactics of pest management, taking into account the demands from the economy, the environment and the society. Significant agricultural approaches will be evaluated using practical examples, including prevention using natural resources, surveillance and forecasting, resistance management, as well as product registration, incl. ecotoxicolegy.

Objective
The students gain a good understanding of fundamental aspects of pest management in agroecosystems. They will have the ability to assess options for action in view of requirements from the economy, the ecology and the society. Further, they will learn to perform searches on relevant issues in pest management, and to critically evaluate case studies.

Courses of the Specialisation in an Environmental System

► Specialization in an Environmental System

►► Biogeochemistry

Number Title Type ECTS Hours Lecturers
701-0216-00L Biogeochemical Cycles W 3 credits 2G B. Wehrli

Abstract
Biogeochemical cycles in aquatic systems are discussed from a global or regional perspective, important methods to determine reaction rates and pathways are introduced and typical mechanisms are discussed on a molecular level.

Objective
The course aims at:
* connecting global and molecular ideas;
* informing the students how to determine rates and pathways of biogeochemical cycles;
* providing insights on coupling mechanisms between biological and geochemical processes.

Content
Biogeochemical cycles in aquatic systems will be discussed from three perspectives: 1) Case studies with a global or regional point of view will document the relevant background information on rates, time-scales and reservoirs of selected element cycles such as C, N, P, S, Fe, Mn Cd, Cu, Mo and As. 2) From a practical perspective we will compare the potential and limits of different methods to quantify biogeochemical processes in aquatic systems. 3) On a molecular level we will discuss mechanisms and pathways of relevant reactions.

Lecture notes
Lecture notes and assignments will be available in German

Literature

701-0419-00L Seminar for Bachelor Students: Biogeochemistry O 2 credits 2S G. Furrer, R. Kretzschmar, B. Wehrli

Abstract
The seminar provides an introduction to the literature in biogeochemistry of aquatic and terrestrial systems. The students present their summary and review of recent or classical papers. Therefore they get familiar with online-access tools and improve their communication and presentation skills.

Objective
Getting to know relevant journals in the field of biogeochemistry. Reading, assessing and discussing scientific publications. Improving of presentation skills. Exercising and Improving of moderation skills.

Content
Part 2: Common literature study; online-exchange of information. Presentation and discussion moderated by the students.

Lecture notes
Selected handouts will be distributed in class.
https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php

Prerequisites / notice
Basic knowledge in chemistry and systems analysis

701-0423-00L Chemistry of Aquatic Systems W 3 credits 2G L. Winkel

Abstract
This course gives an introduction to chemical processes in aquatic systems and shows applications to various systems. The following topics are treated: acid-base reactions and carbonate system, solubility of solids and weathering, redox reactions, complexation of metals, reactions at the solid/water interface, applications to lakes, rivers and groundwater.

Objective
Understanding of chemical processes in aquatic systems. Quantitative application of chemical equilibria to processes in natural waters. Evaluation of analytical data from aquatic systems.

Content
Introduction to the chemistry of aquatic systems. Regulation of the composition of natural waters by chemical, geochemical and biological processes. Quantitative application of chemical equilibria to processes in natural waters. The following topics are treated: acid-base reactions, carbonate system; solubility of solid phases and weathering; complexation of metals and metal cycling in natural waters; redox reactions; reactions at the interface solid phase-water; applications to lakes, rivers, groundwater.

Lecture notes
Script is distributed.

Literature

701-0533-00L Soil Chemistry W 3 credits 2G R. Kretzschmar, D. I. Christl

Abstract
This course discusses chemical and biogeochemical processes in soils and their influence on the behavior and cycling of nutrients and pollutants in terrestrial systems. Approaches for quantitative modeling of the processes are introduced.

Objective
Understanding of important chemical soil properties and processes and their influence on the behavior (e.g., speciation, bioavailability, mobility) of nutrients and pollutants.

Content
Important topics include the structure and properties of clays and oxides, the chemistry of the soil solution, gas equilibria, dissolution and precipitation of mineral phases, cation exchange, surface complexation, chemistry of soil organic matter, redox reactions in flooded soils, soil acidification and soil salinization.

Lecture notes
Handouts in lectures.

Literature

701-0535-00L Environmental Soil Physics/Vadose Zone Hydrology W 3 credits 2G+2U D. Or
Abstract
The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

Objective
Students are able to
- characterize qualitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media;
- quantify driving forces and resulting fluxes of water, solute, and heat in soils;
- apply modern measurement methods and analytical tools for hydrological data collection
- conduct and interpret a limited number of experimental studies
- explain links between physical processes in the vadose-zone and major societal and environmental challenges

Content
Weeks 1 to 3: Physical Properties of Soils and Other Porous Media
Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior

Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostistics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:
Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.
Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.
Part 2 - Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.
Midterm exam
Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.
Part 3 - Use of Hydrus model for simulation of unsaturated flow

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils
Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.
Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:
Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

Biological Processes in the Vadose Zone
An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.

Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller
(available at the beginning of the semester)
http://www.step.ethz.ch/education/active-courses/vadose-zone-hydrology

Supplemental textbook (not mandatory) - Environmental Soil Physics, by: D. Hillel

Atmosphere and Climate

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
701-0459-00L | Seminar for Bachelor Students: Atmosphere and Climate | W | 2 credits | 2S | R. Knutti, E. M. Fischer, O. Stelber

Abstract
In this seminar all students in the realm of atmospheric and climate science convene to train presentation techniques (talks, posters) by means of classic and modern scientific articles.

Objective
In this seminar all students in the realm of atmospheric and climate science convene to train presentation techniques (talks, posters) by means of classic and modern scientific articles.

Content
1st week: course organisation and presentation of the institute
2nd and 3rd week: introduction to oral presentation technique week 4 to 10: students talks
11th week: introduction to poster presentation technique
12th and 13th week: poster design
14th week: concluding poster presentation

Lecture notes
Documents are offered via the course's web page.

Prerequisites / notice
This course can only be offered to a limited number of students, however, in any case for everybody having to attend it compulsory. We beg you to sign in to this course early.

701-0461-00L | Numerical Methods in Environmental Sciences | W | 3 credits | 2G | C. Schär, O. Fuhrer

Abstract
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.
Atmospheric Physics

This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

Classification of numerical problems, introduction to finite-difference methods, time integration schemes, non-linearity, conservative numerical techniques, an overview of spectral and finite-element methods. Examples and exercises from a diverse cross-section of Environmental Science.

Three obligatory exercises, each two hours in length, are integrated into the lecture. The implementation language is Matlab (previous experience not necessary: a Matlab introduction is given). Example programs and graphics tools are supplied.

Is provided (CHF 10.- per person).

List of literature is provided.

Die Vorlesung verlangt Vorkenntnisse in Lineare Algebra, Analysis und Physik (z.B. komplexe Zahlen, Beschreibung von ebenen Wellen, einfache gewöhnliche Differentialgleichungen)

Abstract

The lecture provides an introduction to atmospheric chemistry at bachelor level. It introduces the kinetics of gas phase and heterogeneous reactions on aerosols and in clouds and explains the chemical and physical mechanisms responsible for global (e.g. stratospheric ozone depletion) as well as regional (e.g. urban air pollution) environmental problems.

The students will understand the basics of gas phase and heterogeneous reactions and will know the most relevant atmospheric chemical processes taking place in the gas phase as well as between different phases including aerosols and clouds.

The students will also acquire a good understanding of atmospheric environmental problems including air pollution, stratospheric ozone destruction and changes in the oxidative capacity of the global atmosphere.

Origin and properties of the atmosphere: structure, large scale dynamics, UV radiation

- Thermodynamics and kinetics of gas phase reactions: enthalpy and free energy of reactions, rate laws, mechanisms of bimolecular and termolecular reactions.
- Tropospheric photochemistry: Photolysis reactions, photochemical C3 formation, role and budget of HOx, dry and wet deposition
- Aerosols and clouds: chemical properties, primary and secondary aerosol sources
- Multiphase chemistry: heterogeneous kinetics, solubility and hygroscopicity, N2O5 chemistry, SO2 oxidation, secondary organic aerosols
- Air quality: role of planetary boundary layer, summer- versus winter-smog, environmental problems, legislation, long-term trends
- Stratospheric chemistry: Chapman cycle, Brewer-Dobson circulation, catalytic ozone destruction cycles, polar ozone hole, Montreal protocol
- Global aspects: global budgets of ozone, methane, CO and NOx, air quality - climate interactions

Abstract

This lecture introduces the theoretical principles and the observational and analytical methods of atmospheric dynamics. Based on these principles, the following aspects are discussed: the energetics of the global circulation, the basic synoptic- and meso-scale flow phenomena, in particular the dynamics of extratropical cyclones, and the influence of mountains on the atmospheric flow.

The students are able to
- explain up-to-date meteorological observation techniques and the basic methods of theoretical atmospheric dynamics
- to discuss the mathematical basis of atmospheric dynamics, based on selected atmospheric flow phenomena
- to explain the dynamics of the global circulation and of synoptic- and meso-scale flow features
- to explain how mountains influence the atmospheric flow on different scales

Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer

Abstract

This course covers the basics of atmospheric physics, which consist of: cloud and precipitation formation, thermodynamics, aerosol physics, radiation as well as the impact of aerosols and clouds on climate and artificial weather modification.

Students are able to
- to explain the mechanisms of cloud and precipitation formation using knowledge of humidity processes and thermodynamics.
- to evaluate the significance of clouds and aerosol particles for climate and artificial weather modification.

Moist processes/thermodynamics; aerosol physics; cloud formation; precipitation processes, storms; importance of aerosols and clouds for climate and weather modification, clouds and precipitation

Abstract

This course provides the ecological systems’ knowledge needed to question applied solutions to current environmental issues. Our central aim is to balance participants’ respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.
Objective

At the end of the course...

...you know how to structure your inquiry and how to proceed the analysis when faced with a complex environmental issue. You can formulate the relevant questions, find answers (supported by discussions, input from the lecturers and the literature), and you are able to present your conclusions clearly and cautiously.

...you understand the complexity of interactions and structures in ecosystems. You know how ecosystem processes, functions and services interact and feed back across multiple spatio-temporal scales (in general, plus in depth case examples).

...you understand that biodiversity and the interaction between organisms are an integral part of ecosystems. You are aware that the link between biodiversity and process/function/service is rarely fully understood. You know how to honestly deal with this lack of understanding and can nevertheless find, critically analyse and communicate solutions.

...you understand the importance of ecosystem services for society.

...you have an overview of the methods of ecosystem research and have a deeper insight into some of them, e.g. ecosystem observation, manipulation and modelling.

...you have reflected on ecology as a young discipline at the heart of significant applied questions.

Content

This course provides the ecological systems' knowledge needed to question applied sustainability solutions. We will critically assess the complexity of current environmental issues, illustrating basic ecological concepts and principles. Our central aim is to balance participants' respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

The course is structured around four larger topical areas: (1) Integrated Water Management -- Green infrastructure (land management options) as an alternative to engineered solutions (e.g. large reservoirs) in flood and drought management; (2) Fire dynamics, the water cycle and biodiversity -- The surprising dynamics of species life cycles and populations in arid landscapes; (3) Rewilding, e.g. re-introducing apex predators (e.g. wolves), or large ungulates (e.g. bison) in protected areas -- A nature conservation trend with counterintuitive effects; (4) Coupling of aquatic and terrestrial systems: carbon, nitrogen and phosphorus transfers of global importance on landscape scale.

Lecture notes

We would be happy to collaborate with interested participants to produce an (online)script of this course on the basis of our materials (this will be handed out during classes). This course provides the ecological systems' knowledge needed to question applied sustainability solutions. We will critically assess the complexity of current environmental issues, illustrating basic ecological concepts and principles. Our central aim is to balance participants' respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

Literature

It is not essential to borrow/buy the following books. We will continuously provide excerpts and other literature during the course.

Schulze et al. (2005) Plant Ecology; Springer.

Prerequisites / notice

The course combines elements of a classic lecture, group discussions and problem based learning. It is helpful, but not essential to be familiar with the "seven stages" method (see e.g. course 701-0352-00L "Analysis and Assessment of Environmental Sustainability" by Christian Pohl et al.).

701-0320-00L Seminar for Bachelor Students: Environmental Biology O 2 credits 2S D. Rameiser

Abstract

In the seminar, students explore a specific topic in environmental biology (ecology, evolution, health). They find and read scientific articles, structure contents around core questions, talk to specialists about them, prepare a scientific presentation and lead a discussion. They are introduced to literature search and scientific presentations.

Objective

Students will acquire skills in:
- finding literature in scientific databases
- structuring a scientific topic through research questions
- giving a clear scientific presentation
- contributing constructively to a scientific discussion

Content

Week 1: Choice of topics and tutors
Week 3: Literature search
Week 5: course for presentation techniques
Weeks 1 - 7: Meetings with tutors, preparation of presentations
Weeks 8 - 14: Presentations and discussions

Lecture notes

Will be handed out during classes

701-0323-00L Plant Ecology W 3 credits 2V S. Güsewell, J. Levine

Abstract

This class focuses on ecological processes involved with plant life, mechanisms of plant adaptation, plant-animal and plant-soil interactions, plant strategies and implications for the structure and function of plant communities. The discussion of original research examples familiarises students with research questions and methods; they learn to evaluate results and interpretations.

Objective

Students will be able to:
- propose methods to study ecological processes involved with plant life, and how these processes depend on internal and external factors;
- analyse benefits and costs of plant adaptations;
- explain plant strategies with relevant traits and trade-offs;
- explain and predict the assembly of plant communities;
- explain implications of plant strategies for animals, microbes and ecosystem functions;
- evaluate studies in plant ecology regarding research questions, assumptions, methods, as well as the reliability and relevance of results.

Content

Plants represent the matrix of natural communities. The structure and dynamics of plant populations drives the function of ecosystems. This course presents essential processes and plant traits involved with plant life. We focus on research questions that have been of special interest to plant ecologists as well as current topical questions. We use original research examples to discuss how ecological questions are studied and how results are interpreted.

- Growth: what determines the production of a plant?
- Nutrients: consumption or recycling; opposite strategies and feedbacks on soils;
- Clonality: collaboration and division of labour in plants;
- Plasticity: benefits and costs of plant intelligence;
- Flowering and pollination: how expensive is sex?
- Seed types, dispersal, seed banks and germination: strategies and trade-offs in the persistence of plant populations;
- Development and structure of plant populations;
- Stress, disturbance and competition as drivers of different plant strategies;
- Herbivory: plant-animal feedbacks and functioning of grazing ecosystems
- Fire: impacts on plants, vegetation and ecosystems.
- Plant functional types and rules in the assembly of plant communities.

Lecture notes

Handouts and further reading will be available electronically at the beginning of the semester.
**Prerequisites / notice**

**LANGUAGE**
Lectures and handouts are normally in German, but we shall switch to English on request. Non German-speaking students who intend to attend the course should contact S. Güsewell before the start of the semester to ask for the change in language.

**Prerequisites**
- General knowledge of plant functioning (Biologie I+II)
- General ecological concepts (Biologie III)
- Overview of plant taxonomy and vegetation types (Biologie IV)

**701-1413-00L**  
**Population and Quantitative Genetics**  
**W**  
3 credits  
2V  
**T. Städler, P. C. Brunner**

**Abstract**
This course is an introduction to the rapidly developing fields of population and quantitative genetics, emphasizing the major concepts and ideas over mathematical formalism. An overview is given of how mutation, genetic drift, gene flow, mating systems, and selection affect the genetic structure of populations. Evolutionary processes affecting quantitative and Mendelian characters are discussed.

**Objective**
Students are able to
- describe types and sources of genetic variation.
- describe fundamental concepts and methods of quantitative genetics.
- use basic mathematical formalism to describe major population genetic concepts.
- discuss the main topics and developments in population and quantitative genetics.
- model population genetic processes using specific computer programs.

**Content**
Population Genetics:
- Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.

Quantitative Genetics:
- Continuous variation: measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher's fundamental theorem.

**Lecture notes**
Handouts

**Literature**

**Prerequisites / notice**
There will be 5 optional extra sessions for the population genetics part (following lectures 2-6) for computer simulations, designed to help understand the course material.

---

**701-1413-01L**  
**Ecological Genetics**  
**W**  
3 credits  
2V  
**A. Widmer, M. C. Fischer, A. Guggisberg**

**Abstract**
This course provides an introduction to the concepts and methods used in ecological genetics. Topics covered include genetic diversity, adaptation, reproductive isolation, hybridization and speciation.

**Objective**
To understand how knowledge from individual disciplines can be combined to understand how organisms interact with each other and their environment.

**Content**
Concepts and methods for the study of genetic diversity, adaptation, reproductive isolation, hybridization and speciation.

**Lecture notes**
Handouts will be distributed in the lectures.

---

**701-1415-00L**  
**Population Biology**  
**W**  
3 credits  
2V  
**A. Guggisberg**

**Abstract**
This course provides an understanding of the basic concepts of population biology. It presents models regarding the dynamics and evolution of populations, and experimental designs for investigating population biology hypotheses (e.g., population growth, species interactions, epidemiology, metapopulations, life history evolution, local adaptation, evolution of sex, and coevolution).

**Objective**
Students are able
- to describe and apply population biology models (e.g. growth, species interactions)
- to describe and apply epidemiological models
- to substantiate evolutionary concepts (e.g., life history evolution, coevolution, evolution of sex) using population biology arguments and provide examples
- to propose population biology experiments

**Content**
Population growth, population regulation, predator-prey interactions, host-pathogen interactions, competition, metapopulations, life history evolution, local adaptation, mating systems, sexual selection, coevolution.

**Lecture notes**
Handouts of lectures

**Literature**

**Abstract**
Analysis of central mechanisms of the anthroposphere: ecological economics, theory of institutions and innovation, development economics.

**Objective**
Introduction to the theoretical foundations of the analysis of central mechanisms of the anthroposphere in a sustainable development perspective.

Knowledge of the different scientific and political discussions on sustainable development.

Knowledge of selected analytical tools (Ecological Economics, economic analysis of institutions, innovation theory, Ordnungstheorie, Theory of liberal economic policy).

Ability to identify central non sustainable mechanisms and policies, to formulate adequate research questions, to choose and to use adequate analytical tools, and to elaborate solutions.
Course: "Modelling of Human-Environment Systems"

Objectives:
- Describe approaches for modelling (collective) human behavior and concepts and methods for integrating scientific and social-scientific models to steer human-environment systems.
- Analyze, as an example, the interaction of nutrition and climate change as a human-environment system.
- Observe human-environment systems from the stakeholder perspective.
- Systemically analyze resource problems in the anthroposphere on various levels (company, region, nation).
- Contribute to the development of resource management concepts for the integration of scientific and social-scientific models to steer human-environment systems.

Further reading and citations are listed in the script and mentioned in the course.

Prerequisites:
- Willingness to prepare intensively the topics and to participate actively in the course.

Further reading:
Ecological Systems

Abstract
The course will focus on integrated landscape approaches for the management of tropical forest landscapes, by addressing the complex interactions between ecological processes, stakeholders’ strategies and public policies. Dedicated tools such as games and simulation models to improve knowledge and foster collective decision-making processes will be explored.

Objective
Through the course the students will learn:
1. To master definitions and concepts: SES; Vulnerability; Resilience; Environmentalist Paradox.
2. To gain exposure to methods for assessing stakeholders perceptions/practices/knowledge.

Section 2: Recognising diversity & Interdisciplinarity
1. To understand points of views/normative views and how these shape management objectives and practices.
2. Gain familiarity with drivers of deforestation; degradation; reforestation.
3. Knowledge of global arenas affecting the international forest regime, and their impact at the local level.
4. To recognise and understand trade-offs between conservation and development in a forest/agroforest context;

A major objective of the course is to encourage students to develop a critical analysis of existing conservation and development narratives within the frame of agroforestry and forested agricultural landscapes. The course will also provide students with methods and tools to assess stakeholders perceptions/practices and knowledge, that will be of use in their professional life.

Content
The course will address:
1- Definitions of forests and agroforests, deconstructing the rigid historical divisions between these two, and showing the complexities and implications legal definitions will have on the management systems. We will also address the definitions of Social and Ecological System (SES) and Resilience, useful for the entire course. We will provide insights on how to describe the SES using the ARDI methodology (Actors, Resources, Dynamics and Interactions)
2- Methodological frameworks to understand drivers and coping strategies of stakeholders (Sustainable livelihood framework & Vulnerability; Ecosystem Services & trade-offs; Companion Modelling and Adaptive Management; Surveys and Participatory Appraisals) Building upon this, and introducing the Forest Transition curve as guiding framework for the course, a series of case studies will be presented, highlighting the different drivers and issues at each stage of the transition curve (Kanninen et al. 2007).

Literature

Course material is provided on OLAT.

4- Reforestation and Agroforestry: Plantations.
5- Conclusion - Future trends; Global Arenas and Local Governance.

The course will tackle new and emerging topics such as the role of forests and trees in adaptation to climate change, the links between forest, poverty and food security, and the need to mainstream conservation of biodiversity outside protected areas. The course will draw from diverse disciplines, from ecology, economy, sociology, political sciences and legal studies as the most preeminent ones. The course will enlarge the scope of the students from the ecological process to the social and political components of tropical social and ecological systems. It will address topics and case studies that the students will have little opportunity to address elsewhere, linking them to issues of global relevance in environmental sciences.

701-0791-00L
Environmental History - Introduction and Overview
W 2 credits 2V D. Speich Chassé

Abstract
Our society faces a serious ecological crisis. Of what historical dimension is this crisis? How have human societies already in earlier times changed their environment, and, consequently, perhaps also ours? What were the main ecological challenges for societies and how did they change over time? And how did societies adapt to changing environmental conditions?

Objective
Introduction into environmental history; survey of long-term development of human-nature-interrelations; discussion of selected problems.

Lecture notes
Course material is provided on OLAT.

Literature

Prerequisites / notice
Students are asked to write an exam during the second last session (11.12.2015).

701-0963-00L
Energy and Mobility
W 3 credits 2G P. J. de Haan van der Weg, M. Müller

Abstract
The lecture Energy and Transportation imparts profound knowledge of energy- and environment-related difficulties of the intersection of energy and transportation with focus on the motorized individual traffic. The students gain the ability to approach energy- and environment-related problems with special consideration of the demand side, and to evaluate possible solutions.

Data: 06.12.2017 12:57 Autumn Semester 2015 Page 1361 of 1432
The main objectives of this lecture are:
(i) Fundamental concepts of energy use in the transportation sector, today's present state and future developments.
(ii) Technical potentials for the reduction of greenhouse gas (GHG) emissions and the dependence on fossil fuels: Evaluation of (a) alternative fuels, and (b) alternative propulsion systems.
(iii) The relevance of demand on efforts to reduce GHG emissions and the dependence on fossil fuels.
(iv) Strategies and measures for influencing the demand side.

**Lecture notes**
- Lecture notes will be delivered (in English and partially in German).

**Literature**
- Students seeking recognition of this course in the Bologna process have to show adequate knowledge of the landscape ecology topics described above and have to read selected chapters of

**Prerequisites / notice**
- Lecture with some exercises. For this course and the part landscape ecology in the Systempraktikum Forest and Landscape (summer semester) it is highly recommended to acquire basic skills in Geographic Information Systems (GIS).

**Objective**
- To analyze scientific original articles and other complex materials critically and to present the results in an understandable way.
- To understand selected processes, cases and methods related to forest and landscape issues.
- To be able to analyze problems related to forest ecosystems and landscape from the viewpoint of various disciplines.

**Content**
- Biological, ecological, physical and technical processes with impacts on the community, ecosystem and landscape scale. Social processes and institutions with relation to land use. Products and services of forest ecosystems and landscapes. Forest management systems. The contributions can be organized around topical clusters.

**Abstract**
- Interdisciplinary seminar on forest and landscape issues with particular emphasis on the key processes shaping the development of forest ecosystems and landscapes.

**Objective**
- To summarize the fundamentals of forest ecology at the autecological, demecological and synecological level
- To explain, how trees dominate the physiognomy and dynamics of forest ecosystems
- To describe the qualitative and quantitative importance of forest ecosystems at the global and regional scales, with an emphasis on central Europe and the European Alps.

**Content**
- Introduction and overview of the forests of the world

**Abstract**
- This course conveys the basics of forest ecology with an emphasis on trees as those organisms that dominate the physiognomy and the quantitative importance of forest ecosystems at the global and regional scales, with a focus on central Europe.

**Objective**
- Students are able to
  - summarize the fundamentals of forest ecology at the autecological, demecological and synecological level
  - explain, how trees dominate the physiognomy and dynamics of forest ecosystems
  - describe the qualitative and quantitative importance of forest ecosystems at the global and regional scales, with an emphasis on central Europe and the European Alps.

**Content**
- Introduction and overview of the forests of the world
- Forest ecosystem ecology: Production ecology of forests
- Autecology: light, temperature, wind, water, and nutrients
- Demecology: regeneration ecology, forest growth, mortality
- Synecology: Fundamentals of trophic interactions (forest-ungulate interactions, herbivory by insects), succession
ECTS Concepts will be explained step-by-step through a set of case studies, and applied in lab by the students. The following principal steps are

- Handouts (mixture of overhead slides and full text chapters) are sold at cost
- By developing the bachelor’s thesis, students learn to (a) analyse a problem using scientific methods and concepts, (b) write a report according to scientific standards and (c) correctly cite scientific literature. Depending on the chosen orientation of the thesis, the students learn these skills through an empirical analysis, a literature review, via design tasks or through an applied project.
- A short bachelor’s thesis should consist of a text, with graphs and figures, of 15-20 pages.

Prerequisites / notice

Knowledge from the following courses of the 2nd year of the USYS BSc are an asset:

- Forest and Tree Diseases
- Fundamentals of Natural Hazards Management
- Systematische Botanik

Lecture notes

Handouts (mixture of overhead slides and full text chapters) are sold at cost

Literature

701-0563-00L Forest and Tree Diseases W 3 credits 3G O. Holdenrieder, T. N. Sieber

Abstract

Diseases and abiotic damage influence the use and maintenance of forest ecosystems, tree populations and individual trees. This course provides a basic overview of important infectious diseases and abiotic damage in woody plants, with a focus on Central Europe.

Objective

Students are able to
- describe the basic processes of pathogenesis in trees.
- explain methods of disease diagnosis and control.
- name and identify ecologically or economically significant tree and forest diseases.

Content

Lecture notes

Lecture slides are available in electronic form.

Literature

Prerequisites / notice

Prerequisites: Basics in General and Systematic Biology, good knowledge of morphology and biology of the most common forest tree species in Switzerland.

The course includes practical work (microscopy).

701-0565-00L Fundamentals of Natural Hazards Management W 3 credits 3G H. R. Heinimann, B. Krummenacher, S. Löw

Abstract

Risks to life and human assets result when settlement areas and infrastructure overlap regions where natural hazard processes occur. This course utilizes case studies to teach how a future natural hazards-specialist should analyze, assess and manage risks.

Objective

Concepts will be explained step-by-step through a set of case studies, and applied in lab by the students. The following principal steps are used when coping with natural hazard-risks. At each step, students will learn and apply the following skills:
- Risk analysis - What can happen?
- Describe hazard scenarios as a base for adequate dimensioning of control measures.
- Risk management - What steps should be taken to manage risks?
- Explain causes for conflicts between risk perception and risk analysis.
- Explain how various hazard mitigation approaches reduce risk.
- Describe hazard scenarios as a base for adequate dimensioning of control measures.
- Identify the best alternative from a set of thinkable measures based on an evaluation scheme.
- Explain principles of risk-governance.

Content

Die Vorlesung besteht aus folgenden Blöcken:
1) Einführung ins Vorgehenskonzept (1W)
2) Risikobewertung (2W + Exkursion) mit:
   - Systemabgrenzung
   - Gefahrenbeurteilung
   - Expositions- und Folgenanalyse
3) Risikobewertung (2W)
4) Risikomanagement (2W + Exkursion)
5) Abschlussbesprechung (1W)

Bachelor Thesis

Students can choose between one Bachelor thesis of 10 KP or two Bachelor theses of 5 KP each

Bachelor Thesis

Students can choose between one Bachelor thesis of 10 KP or two Bachelor theses of 5 KP each.

A bachelor's thesis in "Natural sciences" deals with a topic at the interface of natural sciences, the environment and sustainability. The methods of data collection, analysis and interpretation appropriate to the natural sciences are used. A thesis in "Engineering" deals with the environmental effects of use and application. The thesis may take the form of an analysis or review of a current technology, or the design of a future technological application. In an inter- or transdisciplinary thesis, knowledge from various fields and disciplines would be merged on the basis of an overarching question, or developed via the input of key societal actors. A short bachelor's thesis should consist of a text, with graphs and figures, of 15-20 pages.

**Abstract**
The lecture provides an introduction to atmospheric chemistry at bachelor level. It introduces the kinetics of gas phase and heterogeneous reactions on aerosols and in clouds and explains the chemical and physical mechanisms responsible for global (e.g. stratospheric ozone depletion) as well as regional (e.g. urban air pollution) environmental problems.

**Objective**
The students will understand the basics of gas phase and heterogeneous reactions and will know the most relevant atmospheric chemical processes taking place in the gas phase as well as between different phases including aerosols and clouds.

**Content**
- Origin and properties of the atmosphere: structure, large scale dynamics, UV radiation
- Thermodynamics and kinetics of gas phase reactions: enthalpy and free energy of reactions, rate laws, mechanisms of bimolecular and termolecular reactions.
- Tropospheric photochemistry: Photolysis reactions, photochemical G3 formation, role and budget of HOx, dry and wet deposition
- Aerosols and clouds: chemical properties, primary and secondary aerosol sources
- Multiphase chemistry: heterogeneous kinetics, solubility and hygroscopicity, N2O5 chemistry, SO2 oxidation, secondary organic aerosols
- Air quality: role of planetary boundary layer, summer- versus winter-smog, environmental problems, legislation, long-term trends
- Stratospheric chemistry: Chapman cycle, Brewer-Dobson circulation, catalytic ozone destruction cycles, polar ozone hole, Montreal protocol
- Global aspects: global budgets of ozone, methane, CO and NOx, air quality - climate interactions

**Abstract**
This lecture introduces the theoretical principles and the observational and analytical methods of atmospheric dynamics. Based on these principles, the following aspects are discussed: the energetics of the global circulation, the basic synoptic- and meso-scale flow phenomena, in particular the dynamics of extratropical cyclones, and the influence of mountains on the atmospheric flow.

**Objective**
The students are able to explain up-to-date meteorological observation techniques and the basic methods of theoretical atmospheric dynamics
- to discuss the mathematical basis of atmospheric dynamics, based on selected atmospheric flow phenomena
- to explain the basic dynamics of the global circulation and of synoptic- and meso-scale flow features
- to explain how mountains influence the atmospheric flow on different scales

**Content**
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer

**Lecture notes**
Lecture notes and slides

**Abstract**
This course covers the basics of atmospheric physics, which consist of: cloud and precipitation formation, thermodynamics, aerosol physics, radiation as well as the impact of aerosols and clouds on climate and artificial weather modification.

**Objective**
Students are able to explain the mechanisms of cloud and precipitation formation using knowledge of humidity processes and thermodynamics.
- to evaluate the significance of clouds and aerosol particles for climate and artificial weather modification.

**Content**
Moist processes/thermodynamics; aerosol physics; cloud formation; precipitation processes, storms; importance of aerosols and clouds for climate and weather modification, clouds and precipitation

**Lecture notes**
Powerpoint slides and script will be made available

Rogers and Yau, A Short Course in Cloud Physics, Pergamon Press, 1989; Wallace and Hobbs, Atmospheric Science; An Introductory Survey, Elsevier, 2006

**Prerequisites / notice**
50% of the time we use the concept of "flipped classroom" (en.wikipedia.org/wiki/Flipped_classroom), which we introduce at the beginning.

We offer a lab tour, in which we demonstrate with some instruments how some of the processes, that are discussed in the lectures, are measured.

There is a additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

**Abstract**
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

**Objective**
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

**Content**
Classification of numerical problems, introduction to finite-difference methods, time integration schemes, non-linearity, conservative numerical techniques, an overview of spectral and finite-element methods. Examples and exercises from a diverse cross-section of Environmental Science.

Three obligatory exercises, each two hours in length, are integrated into the lecture. The implementation language is Matlab (previous experience not necessary: a Matlab introduction is given). Example programs and graphics tools are supplied.

**Lecture notes**
Is provided (CHF 10. - per copy).

**Literature**
List of literature is provided.

**Prerequisites / notice**
Die Vorlesung verlangt Vorkenntnisse in Lineare Algebra, Analysis und Physik (z.B. komplexen Zahlen, Beschreibung von ebenen Wellen, einfache gewöhnliche Differentialgleichungen)

Abstract
Clouds are a fascinating climate phenomenon central to the hydrological cycle and the Earth's radiation balance. Interactions between cloud particles can result in precipitation, glaciation or evaporation of the cloud depending on its microstructure and microphysical processes. In this course the sought-after topic of ice formation in clouds is studied from a theoretical and empirical perspective.

Objective
Students will be able to understand the microphysics cloud and precipitation formation. To this end, we will discuss the relevant chapters in the textbook of Lamb & Verlinde with the same title as this lecture.

Observation networks and numerical climate and forecasting models deliver large primary datasets. The use of this data in practice and in research requires specific techniques of statistical data analysis. This lecture introduces a range of frequently used techniques, and enables students to apply them and to properly interpret their results.

Themes: exploratory methods, hypothesis tests, analysis of climate trends, measuring the skill of climate and forecasting models, analysis of extreme events, principal component analysis and maximum covariance analysis.

The lecture also provides an introduction into R, a programming language and graphics tool frequently used for data analysis in meteorology and climatology. During hands-on computer exercises the student will become familiar with the practical application of the methods.

Lecture notes
- Documentation and supporting material include:
  - documented view graphs used during the lecture
  - exercise sets and solutions
  - R-packages with software and example datasets for exercise sessions

All material is made available via the lecture web-page.

Suggested literature:
- R-packages with software and example datasets for exercise sessions
- excercise sets and solutions
- documented view graphs used during the lecture
- R-packages with software and example datasets for exercise sessions

<tr>
<td>Abstract</td>
<td>The Planetary Boundary Layer (PBL) constitutes the interface between the atmosphere and the Earth's surface. Theory on transport processes in the PBL and their dynamics is provided. This course treats theoretical background and idealized concepts. These are contrasted to real world applications and current research issues.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Objective
Overall goals of this course are given below. Focus is on the theoretical background and idealised concepts. Students have basic knowledge on atmospheric turbulence and theoretical as well as practical approaches to treat Planetary Boundary Layer flows. They are familiar with the relevant processes (turbulent transport, forcing) within, and typical states of the Planetary Boundary Layer. Idealized concepts are known as well as their adaptations under real surface conditions (as for example over complex topography).

Content
- Introduction
- Turbulence
- Statistical treatment of turbulence, turbulent transport
- Conservation equations in a turbulent flow
- Closure problem and closure assumptions
- Scaling and similarity theory
- Spectral characteristics
- Concepts for non-ideal boundary layer conditions

Lecture notes
available (i.e. in English)

Abstract
Understanding the dynamics of large-scale atmospheric flow

Objective
Dynamical Meteorology is concerned with the dynamical processes of the earth's atmosphere. The fundamental equations of motion in the atmosphere will be discussed along with the dynamics and interactions of synoptic system - i.e. the low and high pressure systems that determine our weather. The motion of such systems can be understood in terms of quasi-geostrophic theory. The lecture course provides a derivation of the mathematical basis along with some interpretations and applications of the concept.

Abstract
The course "Climate history and paleoclimatology gives an overview on climate through geological time and it provides insight into methods and tools used in paleoclimate research.

Objective
The student will have an understanding of evolution of climate and its major forcing factors -orbital, atmosphere chemistry, tectonics- through geological time. He or she will understand interaction between life and climate and he or she will be familiar with the use of most common geochemical climate "proxies" he or she will be able to estimate quality of marine and terrestrial sedimentary paleoclimate archives. The student will be able to estimate rates of changes in climate history and to recognize feedbacks between the biosphere and climate.

Content
Climate system and earth history - climate forcing factors and feedback mechanisms of the geosphere, biosphere, and hydrosphere.

- Geological time, stratigraphy, geological archives, climate archives, paleoclimate proxies
- Climate through geological time: "lessons from the past"
  - Cretaceous greenhouse climate
  - The Late Paleocene Thermal Maximum (PETM)
  - Cenozoic Cooling
  - Onset and Intensification of Southern Hemisphere Glaciation
  - Onset and Intensification of Northern Hemisphere Glaciation
  - Pliocene warmth
  - Glacial and Interglacials
  - Millennial-scale climate variability during glaciations
  - The last deglaciation(s)
  - The Younger Dryas
- Holocene climate - climate and societies

Abstract
Clouds are a fascinating climate phenomenon central to the hydrological cycle and the Earth’s radiation balance. Interactions between cloud particles can result in precipitation, glaciation or evaporation of the cloud depending on its microstructure and microphysical processes. In this course the sought-after topic of ice formation in clouds is studied from a theoretical and empirical perspective.

Objective
Students will gain an appreciation and understanding of the complex processes in clouds and the necessary physical phenomenon that are involved and need to be accounted for in order to study cloud and precipitation formation.

Content
- Microstructure of clouds and precipitation, aerosol activation to form cloud droplets, ice crystal nucleation (homogeneous freezing of supercooled aerosol and heterogeneous freezing), precipitation formation
- Powerpoint slides will be made available

Literature
- At least one introductory course in Atmospheric Science or Instructor’s consent.

Air Pollution Control

<td>6</td>
<td>4G</td>
<td>B. Buchmann, P. Hofer</td>
</tr>
</tbody>
</table>

Abstract
The lecture provides in the first part an introduction to the formation of air pollutants by technical processes, the emission of these chemicals into the atmosphere and their im pact on air quality. The second part covers different strategies and techniques for emission reduction. The basic knowledge is deepened by the discussion of specific air pollution problems of today's society.

Objective
Students will have an understanding of evolution of climate and its major forcing factors -orbital, atmosphere chemistry, tectonics- through geological time. He or she will understand interaction between life and climate and he or she will be familiar with the use of most common geochemical climate "proxies" he or she will be able to estimate quality of marine and terrestrial sedimentary paleoclimate archives. The student will be able to estimate rates of changes in climate history and to recognize feedbacks between the biosphere and climate.

Content
- Cretaceous greenhouse climate
- The Late Paleocene Thermal Maximum (PETM)
- Cenozoic Cooling
- Onset and Intensification of Southern Hemisphere Glaciation
- Onset and Intensification of Northern Hemisphere Glaciation
- Pliocene warmth
- Glacial and Interglacials
- Millennial-scale climate variability during glaciations
- The last deglaciation(s)
- The Younger Dryas
- Holocene climate - climate and societies
Content
Part 1 Emission, Immission, Transmission
- Fluxes of pollutants and their environmental impact
- physical and chemical processes leading to emission of pollutants
- mass and energy of processes
- Emission measurement techniques and concepts
- quantification of emissions from individual and aggregated sources
- extent and development of the emissions (Switzerland and global)
- propagation and transport of pollutants (transmission)
- meteorological parameters influencing air pollution dispersion
- deterministic and stochastic models, describing the air pollution dispersion
- dispersion models (Gaussian model, box model, receptor model)
- measurement concepts for ambient air (immission level)
- extent and development of ambient air mixing ratios
- goal and instrument of air pollution control

Part 2 Air Pollution Control Technologies
- The reduction of the formation of pollutants is done by modifying the processes (process-integrated measures) and by different engineering operations for the cleaning of waste gas (downstream pollution control). It will be demonstrated, that the variety of these procedures can be traced back on the application of a few basic principles of physical chemistry.
- Procedures for the removal of particles (inertial separator, filtration, electrostatic pre-cipitators, scrubbers) with their different mechanisms (field forces, impaction and diffusion processes) and the modelling of these mechanisms.
- Procedures for the removal of gaseous pollutants and the description of the driving forces involved, as well as the equilibrium and the kinetics of the relevant processes (absorption, adsorption as well as thermal, catalytic and biological conversions).
- Discussion of the technical possibilities to solve the actual air pollution problems.

Lecture notes
- Brigitte Buchmann, Air pollution control, Part I
- Peter Hofer, Air pollution control, Part II
- Lecture slides and exercises

Literature
- List of literature included in scrip

Prerequisites / notice
- College lectures on basic physics, chemistry and mathematics
Content

Weeks 1 to 3: Physical Properties of Soils and Other Porous Media  Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior

Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:
Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.
Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.

Part 2 - Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.
Midterm exam
Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.

Part 3 - Use of Hydrus model for simulation of unsaturated flow

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils  Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.

Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:
Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

Biological Processes in the Vadose Zone  An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.

Objective

The course provides an introduction into quantitative analysis of groundwater flow and transport. It is focussed on formulating flow and transport problems in groundwater, which are to be solved analytically or numerically.

Objective

a) Students understand the basic concepts of flow and contaminant transport processes and boundary conditions in groundwater.

b) Students are able to formulate simple practical flow and transport problems.

c) Students are able to understand and apply simple analytical solutions to simple flow and transport problems.

d) Students are able to use simple numerical codes to adequately solve simple flow (and transport) problems.
Content

1. Introduction to groundwater problems. Concepts to quantify properties of aquifers.
2. Flow equation. The generalized Darcy law.
3. The water balance equation.
5. Analytical solutions to flow problems I
6. Analytical solutions to flow problems II
7. Finite difference solution to flow problems.
12. Analytical solutions to transport problems I.
13. Analytical solutions to transport problems II

Abstract
The lecture will introduce the student to the thematics of solar ultraviolet radiation and its effects on the atmosphere and the biosphere. The lecture will cover the modelling and the measurement of solar ultraviolet radiation. The instruments used for solar radiation measurements will also be introduced.

Objective
The lecture should enable the student to understand the specific problematics related to solar ultraviolet radiation and its interaction with the atmosphere and the biosphere.
1) Einführung in die Problematik - Motivation
Begriffe (UV-C, UV-B, UV-A,...)
Einfluss der UV Strahlung auf Biosphäre (Mensch, Tier, Pflanzen)
Positive und schädliche Effekte
Wirkungsspektrum, Konzept, Beispiele
UVIndex

2) Geschichtlicher Rückblick
Rayleigh - Himmelsblau
1907: Dorno, PMOD
1970: Bener, PMOD
1980: Berger, erythemal sunburn meter
1990-: State of the Art

3) Extraterrestrische UV Strahlung
Spektrum
Energieverteilung
Variabilität (Spektral, zeitlich, relativ zu Totalstrahlung)
Satellitenmessungen, Übersicht

4) Einfluss der Atmosphäre auf die solare UV Strahlung
Atmosphärenaufbau
Beinflussende Parameter (Ozon, Wolken, ...)
Ozon, Stratosphärisches versus troposphärisches
Geschichte: Ozondepletion, Polare Ozonlöcher und Einfluss auf die UV Strahlung
Wolken
Aerosole
Rayleighstreuung
Trends (Ozon, Wolken, Aerosole)
Radiation Amplification Factor (RAF)

5-6) Strahlungstransfer
Strahlungstransfergleichung
Modellierung, DISORT
libRadtran, TUV, FASTRT
Parameter
Sensitivitätsstudien
Vergleiche mit Messungen
3-D Modellierung (MYSTIC)
Beer-Lambert Gesetz

7) Strahlungsmessungen
Instrumente zur Strahlungsmessung
Messgrössen: Irradiance (global, direct, diffus), radiance, aktinischer Fluss
Horizontale und geneigte Flächen
Generelle Problematic: Freiluftmessungen...
Qualitätssicherung

8) Solare UV Strahlungsmessungen
Problematic: Dynamik, Spektrale Variabilität, Alterung
Stabilität
Spezifische Instrumente: Filterradiometer, Spektroradiometer, Dosimetrie
Übersicht Aufbau und Verwendung

9-10) Solare UV Strahlungsmessgeräte
Spektroradiometer, Filterradiometer (Breit und schmalbandig)
Charakterisierung
Kalibriermethoden (im Labor, im Feld)
Qualitätssicherung, Messkampagnen

11-12) Auswerteverfahren
Atmosphärische Parameter aus Strahlungsmessungen
Ozon, SO2
Albedo (Effektiv versus Lokal)
Aerosol Parameter (AOD, SSA, g, Teilchenverteilungen)
Zusammenspiel Messungen - Modellierung
Aktinische UV-Strahlungsflüsse und Bestimmung von atmosphärischen Photolysefrequenzen

13) UV Klimatologie
Trends
UV Klimatologie durch Messnetze
UV Klimatologie durch Satellitenmessungen am Beispiel von TOMS
Modellierung am Beispiel Meteosat-JRC
UV Rekonstruktionen

14) Aktuelle Forschungen
Internationale Projekte, Stand der Forschung

Abstract
This course gives an introduction to programming in FORTRAN95, and is suitable for students who have only minimal programming experience. The focus will be on Fortran 95, but Fortran 77 will also be covered for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts.

Objective
FORTRAN 95 is a modern programming language that is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95, but Fortran 77 will also be covered for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

Lecture notes
See http://jupiter.ethz.ch/~pjt/FORETRAN/ForetranClass.html
This course gives an introduction to programming in FORTRAN 95, and is suitable for students who have only minimal programming experience. The focus will be on Fortran 95, but Fortran 77 will also be covered for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts.

**Objective**

FORTRAN 95 is a modern programming language that is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95, but Fortran 77 will also be covered for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

**Content**

The project consists of writing a Fortran program to solve a problem agreed upon between the instructor and student; the topic is often related to (and helps to advance) the student's Masters or PhD research. The project is typically started towards the end of the main Fortran class when the student has acquired sufficient programming skills, and is due by the end of Semesterprüfung week.

<td>Isotopic and Organic Tracers in Biogeochemistry</td>
<td>W</td>
<td>3</td>
<td>2G</td>
<td>R. Kipfer, C. Schubert</td>
</tr>
</tbody>
</table>

**Abstract**

The course introduces the scientific concepts and typical applications of tracers in biogeochemistry. The course covers stable and radiative isotopes, geochemical tracers and biomarkers and their application in biogeochemical processes as well as regional and global cycles. The course provides essential theoretical background for the lab course "Isotopic and Organic Tracers Laboratory".

**Objective**

The course aims at understanding the fractionation of stable isotopes in biogeochemical processes. Students learn to know the origin and decay modes of relevant radiogenic isotopes. They discover the spectrum of possible geochemical tracers and biomarkers, their potential and limitations and get familiar with important applications.

**Content**

Geogenic and cosmogenic radionuclides (sources, decay chains); stable isotopes in biogeochemistry (naturally abundance, fractionation); geochemical tracers for processes such as erosion, productivity, redox fronts; biomarkers for specific microbial processes.

**Lecture notes / Literature**

Handouts will be provided for every chapter.

**Prerequisites / notice**

Students should have a basic knowledge of biogeochemical processes (BSc course on Biogeochemical processes in aquatic systems or equivalent).

**Abstract**

The course addresses major biogeochemical processes that drive the cycling of different groups of trace elements (heavy metals, redox-sensitive trace elements, chalcophile elements) in the environment, and the chemical methods that are used to study the behavior of these elements in the geosphere.

**Objective**

The students gain a detailed understanding of the sources and the cycling of trace elements in the terrestrial and aquatic environment. The interaction of environmentally important trace elements with abiotic and biotic geosphere components as well as their abiotically and biotically driven transformations will be discussed. Relevant methods/techniques to study these processes will be presented.

**Content**

The course deals in-depth with the major biogeochemical processes controlling the cycling of different groups of trace elements (heavy metals, redox-sensitive and chalcophile elements) in the environment. Sources and cycling of trace elements as related to interactions with abiotic and biotic geosphere components, and abiotically and biotically driven transformations will be discussed. The techniques most commonly used to study these processes will be presented as well.

**Lecture notes / Literature**

Selected handouts (lecture notes, literature, exercises) will be distributed during the course.

**Prerequisites / notice**

Students are expected to be familiar with the concepts of aquatic or soil chemistry covered in the respective classes at the bachelor level.

This lecture is a prerequisite for attending the laboratory course "Trace elements laboratory".

</table>

**Abstract**

The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. Natural processes, anthropogenic pollution, legislation of groundwater and surface water and of drinking water as well as water treatment will be discussed for industrialized and developing countries.

**Objective**

The goal of this lecture is to give an overview over the whole path of drinking water from the source to the tap and understand the involved physical, chemical and biological processes which determine the drinking water quality.

**Content**

The various water resources, particularly groundwater and surface water, are discussed as part of the natural water cycle influenced by anthropogenic activities such as agriculture, industry, urban water systems. Furthermore legislation related to water resources and drinking water will be discussed. The lecture is focused on industrialized countries, but also addresses global water issues and problems in the developing world. Finally unit processes for drinking water treatment (filtration, adsorption, oxidation, disinfection etc.) will be presented and discussed.

**Lecture notes / Literature**

Handouts will be distributed.

</tbody>
</table>

**Abstract**

The reduction of CO2 emissions is the only option for keeping future climate change within reasonable bounds. In this course, we will discuss a portfolio of options involving the alteration of natural carbon sinks and carbon sequestration. The course includes introductory lectures, presentations from guest speakers from industry and the public sector, and final presentations by the students.

**Objective**

The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences.

**Content**

From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.

**Lecture notes / Literature**

None

Will be identified based on the chosen topic.

**Prerequisites / notice**

Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion.
Upon successful completion of this course students are able to:

- Successful application of knowledge gained in the traditional disciplines of environmental sciences (e.g. biogeochemistry, environmental chemistry) to elucidate nanomaterial fate and behavior in the environment
- Identify key parameters of nanomaterials that potentially influence their environmental fate and behavior
- Get acquainted with the most common analytical tools for the quantification of nanomaterials in the environment
- Critical assessment of current state of research in this juvenile field, including the sometimes controversial literature data

Topics
- Definitions; nano-effects; engineered, natural and incidental nanoparticles
- Sources and release; Material flow modeling
- Analysis in environmental samples
- Fate in technical systems: water treatment, waste incineration
- Fate in the environment: water and soil
- Effects: nano-ecotoxicology
- Environmental risk assessment

Group work
Case studies about specific nanomaterials in environmental systems, topics will be provided
Written report submitted and presentation at the end of the lecture
Handouts will be provided

Abstract
The ability to critically evaluate original (scientific) literature and to summarize the information in a succinct manner is an important skill for any student. This course aims to practise this ability, requiring each student to write a term paper on a topic of relevance for research in the areas of biogeochemistry and pollutant dynamics.
Attendees will learn what information is contained in genetic sequencing data and how this information is extracted from the sequencing.

In addition, the accurate use of citations, attribution of ideas, and the judicious use of figures, tables, equations and references are critical components of a successful paper. Specialized knowledge is not expected, nor required, neither is new research.

Content

Each student is expected to write a paper with a length of approximately 15 pages. The students can choose from a list of topics prepared by the supervisors, but the final topic will be determined based on a balance of choice and availability. The students will be guided and advised by their advisors throughout the term. The paper itself should contain the following elements: Motivation and context of the given topic (25%), Concise presentation of the state of the science (50%), Identification of open questions and perhaps outline of opportunities for research (25%).

Lecture notes

Guidelines and supplementary material will be handed out at the beginning of the class.

Prerequisites / notice

There is no final exam. Grade is assigned based on the quality of the term paper and the submission of another student’s review.

Students are expected to take Term Paper Writing and Term Paper Seminar classes in sequence.

<td>Objective</td>
<td>The aim of the course is to provide up-to-date knowledge on how we can obtain an understanding of the evolution and population dynamics of organisms based on their genetic sequencing data, employing key concepts from molecular evolution, phylogenetics and phylogeography. Throughout the course, we tie the models and methods closely with applications, mainly in the field of epidemiology and evolution.</td>
<td></td>

</table>
| Prerequisites / notice | Attendees will learn what information is contained in genetic sequencing data and how this information is extracted from the sequencing data. The main concepts introduced are:  
- models in molecular evolution  
- phylogenetic & phylogeographic inference  
- maximum likelihood and Bayesian statistics  
- stochastic processes  
Attendees will apply these concepts to a number of applications yielding biological insight into:  
- epidemiology  
- pathogen evolution  
- macroevolution of species |

Data: 06.12.2017 12:57  Autumn Semester 2015  Page 1378 of 1432
The course consists of three parts. We first introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Second, we employ these evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylogeography. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets, giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades.

### Literature
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.
- Basic knowledge in linear algebra, analysis, and statistics.

### Content
- **Seminar in Evolutionary Ecology of Infectious Diseases**
  - W 3 credits
  - 2G
  - D. Croll, S. Bonhoeffer, R. R. Regös

### Objective
- This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

### Literature
- Publications and class notes can be downloaded from a web page announced during the lecture.
- Slides of the lecture will be available online.

### Prerequisites / notice

- Online course
- Course language is English
- Literature
- Prerequisites / notice

- **Alpine Ecology and Environments**
  - W 2 credits
  - 2G
  - S. Dietz, D. Ramsier

- **Landscape Genetics**
  - Number of participants limited to 14.
  - Prerequisites: good knowledge in population genetics and experience in using GIS is required.

- **Biogeochemistry and Sustainable Management**
  - W 2 credits
  - 2G
  - L. Merbold, N. Buchmann

- **Abstract**
  - The online course ALPECOLe provides a global overview of the complex ecosystems of mountain regions, and of their great diversity of habitats and organisms. The course is strongly interdisciplinary and the various approaches are designed to help understand the past, present and future of mountain ecosystems.

- **Objective**
  - Knowledge of alpine environments worldwide and their ecology

- **Content**
  - The online course is subdivided into
    - 5 lessons on abiotic factors: geology, soils and their forming processes, climate, and disturbance factors
    - 12 lessons on plants: diversity, patterns and processes, trees, lines, water & nutrients, carbon cycle, atmospheric influences, sexual and clonal reproduction, and one specific lesson on aquatic environments
    - 5 lessons on animals: habitats and adaptations, origin of species, food ecology and impact of domestic livestock
    - 3 lessons on landscape evolution: quaternary paleoenvironments, methods like radiocarbon dating, pollen records, dendrochronology, stable isotopes, and historical data
    - 1 lesson on global change

- **Prerequisites / notice**
  - Additionally to the online lessons, three supplementary papers will be read and discussed during the tutorials.
  - Online exercises and tests allow to test the learned matter.

- **Hand-outs will be distributed.**

- **Grading will be according to a short written report (4 pages) on one of the themes of the course (workload: about 8 hours) and according to student contributions during the course.**

- **Biogeochemistry and Sustainable Management**
  - This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.
Objective
Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small (interdisciplinary) teams.

Content
Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Lecture notes
Handouts will be available on the webpage of the course.

Literature
Will be discussed in class.

Prerequisites / notice
Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Course will be taught in English.

751-4805-00L Recent Advances in Biocommunication

Objective
Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods.

Abstract
Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods. Students will engage in discussion and critical analyses of relevant papers and present their evaluations in a seminar setting.

B. Applications

Applications to Conservation and Management

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
701-1453-00L | Ecological Assessment and Evaluation | W | 3 credits | 3G | F. Knaus, U. Bollens Hunziker

Abstract
The course provides methods and tools for ecological evaluations dealing with nature conservation or landscape planning. It covers census methods, ecological criteria, indicators, indices and critically appraises objectivity and accuracy of the available methods, tools and procedures. Birds and plants are used as main example guiding through different case studies.

Objective
Students will be able to:
1) critically consider biological data books and local, regional, and national inventories;
2) evaluate the validity of ecological criteria used in decision making processes;
3) critically appraise the handling of ecological data and criteria used in the process of evaluation;
4) perform an ecological evaluation project from the field survey up to the descision making and planning.

Lecture notes
Powerpoint slides are available on the webpage. Additional documents are handed out as copies.

Literature
Basic literature and references are listed on the webpage.

Prerequisites / notice
The course structure changes between lecture parts, seminars and discussions. The didactic atmosphere is intended as working group.

Prerequisites for attending this course are skills and knowledge equivalent to those taught in the following ETH courses:
- Pflanzen- und Vegetationsökologie
- Systematische Botanik
- Raum- und Regionalentwicklung
- Naturschutz und Stadtbioökologie

701-1613-01L Advanced Landscape Research

Abstract
This course introduces landscapes as socially perceived, spatially and temporally dynamic entities that are shaped by natural and societal factors. Concepts and qualitative and quantitative methods to study landscapes from an ecological, societal and historical perspective are presented. In a term paper students work on a landscape-related topic of their choice.

Objective
Students will:
- learn about concepts and methods to quantify structural and functional connectivity in landscapes, particularly
- be introduced to the topic of landscape genetics and its benefits and (current) limitations for applied conservation
- learn about concepts and methods in scenario-based land-use change modelling
- approach an understanding of landscape as perceived environment
- learn about concepts of landscape preference and related measurement methods
- understand the role of landscape for human well-being
- be introduced into approaches of actively influencing attitudes and behavior as well as related scientific evaluation
- make use of various historical sources to study landscapes and their dynamics
- interpret landscapes as a result of ecological constraints and anthropogenic activities.

- interpret landscapes as a result of ecological constraints and anthropogenic activities.
This class provides students with an overview of techniques for data analysis used in modern ecological research, as well as practical experience in running these analyses with R and interpreting the results. Topics include linear models, generalized linear models, mixed models, model selection and randomization methods. Students should be able to:

- describe the aims and principles of important techniques for the analysis of ecological data
- choose appropriate techniques for given problems and types of data
- evaluate assumptions and limitations
- implement the analyses in R
- represent the relevant results in graphs, tables and text
- interpret and evaluate the results in ecological terms

Content
- Linear models for experimental and observational studies
- Model selection
- Introduction to likelihood inference and Bayesian statistics
- Analysis of counts and proportions (generalised linear models)
- Models for non-linear relationships
- Grouping and correlation structures (mixed models)
- Randomisation methods

Prerequisites / notice
Basic Landscape Ecology courses at Bachelor level

Abstract
This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It explores case studies of ecosystem management approaches and considers their practicability, their achievements and possible barriers to their uptake.

Objective
Students should be able to:

- propose appropriate and realistic solutions to ecosystem management problems that integrate ecological, economic and social dimensions across relevant temporal and spatial scales.
- identify important stakeholders, their needs and interests, and the main conflicts that exist among them in the context of land and resource management.

Content
Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional management has frequently resulted in catastrophic failures such as, for example, the collapse of fish stocks and biodiversity loss. These failures have stimulated the development of alternative ecosystem management approaches that emphasise the functionality of human-dominated systems. Inherent to such approaches are system-wide perspectives and a focus on ecological processes and services, multiple spatial and temporal scales, as well as the need to incorporate diverse stakeholder interests in decision making. Thus, ecosystem management is the science and practice of managing natural resources, biodiversity and ecological processes, to meet multiple demands of society. It can be local, regional or global in scope, and addresses critical issues in developed and developing countries relating to economic and environmental security and sustainability.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental wellbeing. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

Lecture notes
No Script

Literature
After an introduction (one afternoon), students will have 3 weeks to work independently or in groups through different protocols. At the end of the course, students will be able to:

- identify aquatic macroinvertebrates from a variety of habitats;
- assess habitat quality and biodiversity;
- apply statistical and graphical methods to analyze and present data;
- interpret and communicate results to non-specialists.

During this course you will get an overview of the typical aquatic macroinvertebrates in Switzerland and the common sampling techniques. The practical part contains 1-day excursions to a lake (Greifensee) and rivers (Sense, Töss) as well as research projects in small groups within research groups at Eawag.

Prerequisites
- Basic statistical training (e.g. Mathematik IV in D-USYS): Data distributions, descriptive statistics, hypothesis testing, linear regression, analysis of variance.
- Basic experience in data handling and data analysis in R.

Individual preparation
Students without the required knowledge are asked to contact the lecturer before Christmas for support with individual preparation.

This course combines Limnology (the study of inland waters in its broad sense) with Ecological and Evolutionary concepts. It deals with rivers, groundwaters and lakes. This course contains a lecture part, an experimental part as well as 1-day excursions.

Content
The course contains a lecture part, an experimental part and field excursions.

Objective
During this course you will get an overview of the world's typical freshwater ecosystems. After this course you will be able to understand how aquatic organisms have adapted to their habitat, and how the interactions (e.g. food web) between organisms work.

During the experimental part of this course you will learn the principles of doing research to observe interrelations in aquatic ecosystems. You will measure and interpret biological and physical data (e.g. during experiments, field work) and present the collected knowledge.

In short: apply the theoretical / lecture knowledge to field situations in a lake and river.

Prerequisites
- Basic statistical training (e.g. Mathematik IV in D-USYS): Data distributions, descriptive statistics, hypothesis testing, linear regression, analysis of variance.
- Basic experience in data handling and data analysis in R.
Content
The taxonomic part will cover macroinvertebrates (e.g., Crustacean, aquatic insects). The goal is to get to know the most common aquatic taxa in Switzerland, and to identify them with commonly used identification literature, and to get an idea how these organisms are used in research and practice. (language: German, translation of the most important things during the course possible)

The field excursion takes place Wednesday 21.10.2015.

Lecture notes
Course notes and power point presentations provided during the course.

Prerequisites / notice
The maximal participating number of students is 8 from D-USYS and 14 from D-BIOL. In case of too many students, those that simultaneously participate in the courses “701-1437-00 Limnoecology” and “701-1437-02 Bestimmungskurs aquatische Mikroinvertebraten und Kryptogamen” are given priority. Sign in until 10.9.2015, free places will be distributed 11.9.2015.

The field excursion takes place Wednesday afternoon 15.10.2014 from 13-17.

701-1437-02L Practical Course Microinvertebrates and Cryptogames W 2 credits 2P J. Jokela

Abstract
This course gave an overview of the typical aquatic microinvertebrate groups and cryptogames in Switzerland. Beside a theoretical background of the different groups the focus was laid on the recognition of the most important species groups and their indetification traits. Practical experience was collected during an excursion.

Objective
During this course you will get an overview of the typical aquatic microinvertebrates and algae in Switzerland. After this course you will know the most important aquatic species groups and the most important identification traits.

You will apply the theoretical knowledge during an excursion.

Content
The taxonomic part will cover microinvertebrates and cryptogames. The goal is to get to know the most common aquatic taxa in Switzerland, to identify them and to get an idea how these organisms are used in research and practice. (language: German, translation of the most important things during the course possible)

The excursion takes place Friday 03.10.2014 from 13-17.

Lecture notes
Course notes and power point presentations provided during the course.

Prerequisites / notice
The maximal participating number of students is 8 from D-USYS and 14 from D-BIOL. In case of too many students, those that simultaneously participate in the courses “701-1437-00 Limnoecology” and “701-1437-01 Bestimmungskurs aquatische Makroinvertebraten” are given priority. Sign in until 11.9.2014, free places will be distributed 12.9.2014.

The field excursion takes place Friday afternoon 03.10.2014 from 13-17.

C. Term Paper and Seminar

<table>

Abstract
Individual writing of an essay-type review paper about a specialized topic in the field of ecology and evolution, based on substantial reading of original literature and discussions with a senior scientist.

Objective
- Students acquire a thorough knowledge on a topic in which they are particularly interested
- They learn to assess the relevance of original literature and synthesize information
- They make the experience of becoming "experts" on a topic and develop their own perspective
- They practise academic writing according to professional standards in English

Content
Topics for the essays are proposed by the professors and lecturers of the major in Ecology and Evolution at a joint meeting at the beginning of the semester (the date will be communicated by e-mail to registered students).

Students will:
- choose a topic
- search and read appropriate literature
- develop a personal view on the topic and structure their arguments
- prepare figures and tables to present ideas or illustrate them with examples
- write a clear, logical and well-structured text
- refine the text and present the paper according to professional standards

In all steps, they will benefit from the advice and detailed feedback given by a senior scientist acting as personal tutor of the student.

Abstract
The colloquium introduces students to the disciplines in plant sciences and provides integrated knowledge from the molecular level to ecosystems and from basic research to applications, making use of the synergies between the different research groups of the PSC. The colloquium offers a unique chance to approach interdisciplinary topics as a challenge in the field of plant sciences.

Objective
- introduction of graduate students and Master students to the broad field of plant sciences
- promotion of an interdisciplinary and integrative teaching program
- promotion of active participation and independent work of students
- promotion of presentation and discussion skills
- increased interaction among students and professors

Content
Challenges in Plant Sciences will cover the following topics:
- Chemical communication among plants, insect and pathogens.
- Specificity in hormone signaling.
- Genetic networks.
- Plant-plant interactions.
- Resilience of tropical ecosystems.
- Regulatory factors controlling cell wall formation.
- Chlorophyll breakdown.
- Innate immunity.
- Disease resistance genes.
- Sustainable agroecosystems.

751-4504-00L Plant Pathology I W 2 credits 2G F. Talas, B. McDonald, J. Palma Guerrero, A. Sanchez Vallet
Abstract
Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Objective
Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.

Content
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule
Week 1  No Lecture: First day of autumn semester

Week 2  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nematode attack strategies and types of damage.

Week 5  Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6  Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, peroxisomal chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7  Pisatin and pisatin demethylase. Local and systemic acquired resistance, signal molecules.

Week 8  Pathogen effects on food quality and safety.

Week 9  Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 10  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11  Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELISA, PCR, rDNA and rep-PCR.

Week 12  Strategies for minimizing disease risks: principles of disease control and management.

Week 13  Disease control strategies: economic thresholds, physical control methods.

Week 14  Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

Lecture notes
Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

701-0290-00L  Seminar in Microbial Evolution and Ecology (HS)  Z  0 credits  2S  S. Bonhoeffer
Seminar of the groups Ackermann, Bonhoeffer, Schmid-Hempel, Velicer. Talks given by members of these groups and external visitors.

In-depth introduction into microbial evolution and ecology, especially the aspects that are the focus of on-going research in this area at D-USYS.

Major in Human-Environment-Systems
Students can register for the Major in Human-Environment-Systems in autumn semester 2015 for the last time.

Abstract
This course deepens students' knowledge of the environmental assessment methodologies and their various applications.

Objective
This course has the aim of deepening students' knowledge of the environmental assessment methodologies and their various applications. In particular, students completing the course should have the:
- Ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors
- Knowledge about the current state of the scientific discussion and new research developments
- Ability to properly plan, conduct and interpret environmental assessment studies
- Knowledge of how to use LCA as a decision support tool for companies, public authorities, and consumers

Data: 06.12.2017 12:57  Autumn Semester 2015  Page 1384 of 1432
Content
- Inventory developments, transparency, data quality, data completeness, and data exchange formats
- Allocation (multioput put processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Recent development in impact assessment
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Uncertainty analysis
- Subjectivity in environmental assessments
- Multicriteria analysis
- Case Studies

Lecture notes
No script. Lecture slides and literature will be made available.

Literature
Literature will be made available.

Prerequisites / notice
Basic knowledge of environmental assessment tools is a prerequisite for this class. Students that have not done coursework in this topic before are recommended to read an appropriate textbook before or at the beginning of this course (e.g., Baumann/Tillman, The Hitch Hiker's Guide to LCA: An Orientation in Life Cycle Assessment Methodology and Applications, Studentlitteratur, Lund, 2004).

102-0317-01L Advanced Environmental Assessment (Computer Lab and Exercises) 3 credits 2U+2P S. Pfister

Abstract
Technical systems are investigated in projects with numerical modeling. The students learn how to answer given questions with target oriented methodologies using various software programs for environmental assessment.

Objective
Become acquainted with various software programs for environmental assessment including Life Cycle Assessment, Environmental Risk Assessment, Probabilistic Modelling, Material Flow Analysis.

701-1631-00L Foundations of Ecosystem Management W 5 credits 3G J. Ghazoul, C. Garcia

Abstract
This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It explores case studies of ecosystem management approaches and considers their practicability, their achievements and possible barriers to their uptake.

Objective
Students should be able to
a) propose appropriate and realistic solutions to ecosystem management problems that integrate ecological, economic and social dimensions across relevant temporal and spatial scales.
b) identify important stakeholders, their needs and interests, and the main conflicts that exist among them in the context of land and resource management.

Content
Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional management has frequently resulted in catastrophic failures such as, for example, the collapse of fish stocks and biodiversity loss. These failures have stimulated the development of alternative ecosystem management approaches that emphasise the functionality of human-dominated systems. Inherent to such approaches are system-wide perspectives and a focus on ecological processes and services, multiple spatial and temporal scales, as well as the need to incorporate diverse stakeholder interests in decision making. Thus, ecosystem management is the science and practice of managing natural resources, biodiversity and ecological processes, to meet multiple demands of society. It can be local, regional or global in scope, and addresses critical issues in developed and developing countries relating to economic and environmental security and sustainability.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

Literature
This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient. The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are the key elements of environmental governance and how legitimate and effective are these approaches in addressing persistent environmental challenges?

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

We recommend that students have (a) Three-years BSc education of a (technical) university; (b) Successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) Familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy).

**Abstract**

Every day humans interact with various systems. Strategies of interaction, individual needs, physical & mental abilities, and system properties are important factors in controlling the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction & overall performance.

**Objective**

The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

**Content**

- Physiological, physical, and cognitive factors in sensation and perception
- Body spaces and functional anthropometry
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

**Abstract**

The course addresses environmental policies, focusing on new approaches, which are generally summarized as environmental governance. The course also provides a broader introduction to social science concepts to provide students with tools to analyze environmental policy processes and assess the key features of environmental governance by examining various practical environmental policy examples.

**Objective**

To understand how an environmental problem may (or not) become a policy and explain political processes, using basic concepts and techniques from political science.

To analyze the evolution as well as the key elements of environmental governance.

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

**Content**

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are the key elements of environmental governance and how legitimate and effective are these approaches in addressing persistent environmental challenges?

**Literature**

**Prerequisites / notice**

A detailed course schedule will be made available at the beginning of the semester.

We will mostly work with readings from the following books:

**Notice**

We recommend that students have (a) Three-years BSc education of a (technical) university; (b) Successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) Familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy).

**Abstract**

This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

**Objective**

The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.
The aim of this course is to make students with a technical scientific background aware of the legal and political context of environmental policy. The focus of the course will be on international and European issues and regulatory tools used in the political process. The course is directed at legally trained regulators. More generally, it aims to inform students with a technical scientific background of the legal and political context of environmental policy. The course will be on international and European issues and regulatory frameworks - where relevant, the position of Switzerland within these international networks will also be discussed.

The course is (inter)related to materials discussed in Politikwissenschaft: Grundlagen (851-0577-00 V), Ressourcen- und Umweltökonomie (751-1551-00 V), Umweltrecht: Konzepte und Rechtsgebiete (851-0705-01 V), Rechtlicher Umgang mit natürlichen Ressourcen (701-0708-00 V) or an equivalent course. No specific pre-existing legal knowledge is required, however all students must have successfully completed Grundzüge des Rechts (851-0708-00 V) or an equivalent course.

During the second week of the teaching period, students will have individual 30-minute meetings with the lecturer to discuss their project. Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

The workload for this course is approx. 120 hours (all inclusive).

The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines. Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.
Objective

At the end of the course students should:

Know:
- Function, purpose and algorithm of a selected number of transdisciplinary methods
- Analysis of a selected number of transdisciplinary methods focusing problem framing, problem analysis, and impact
- Practical application of the methods in a broader project setting

Understand:
- Functional application in case studies and other problem oriented projects

Be able to reflect on:
- Potential, limits, and necessity of transdisciplinary methods

Be prepared for:
- Transdisciplinary Case Study 2016

Content

The lecture is structured as follows:

- Overview of concepts and methods of inter/transdisciplinary integration of knowledge, values and interests (approx. 20%)
- Importance and application of sustainability in science, politics, society, and economy; (approx. 50%)
- Analysis and evaluation methods of sustainable development with a focus on social justice; (approx. 30%)
- Tradeoffs in selected examples.

Lecture notes

Handouts provided by the lecturers

Literature

Selected scientific articles and book-chapters

Prerequisites / notice

This course is recommended for students participating in the Transdisciplinary Case Study 2016.

701-1551-00L  Sustainability Assessment  W  3 credits  2G  P. Krütli

Abstract

The course deals with the concepts and methodologies for the analysis and assessment of sustainable development. A special focus is given to the social dimension and to social justice as a guiding principle of sustainability as well as to trade-offs between the three dimensions of sustainability.

Objective

At the end of the course students should:

Know:
- core concepts of sustainable development,
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

Content

The course is structured as follows:

- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;

Lecture notes

Handouts.

Literature

Selected scientific articles & book chapters

Policy, Decision Analysis and Modeling

Objective

At the end of the course students should:

Know:
- Tradeoffs in selected examples.
- Analysis and evaluation methods of sustainable development with a focus on social justice;

Understand and reflect on:
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- core concepts of sustainable development, and;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Content

The course is structured as follows:

- Overview of concepts and methods of inter/transdisciplinary integration of knowledge, values and interests (approx. 20%)
- Importance and application of sustainability in science, politics, society, and economy; (approx. 50%)
- Analysis and evaluation methods of sustainable development with a focus on social justice; (approx. 30%)
- Tradeoffs in selected examples.

Lecture notes

Handouts.

Literature

Selected scientific articles & book chapters

Electives

Objective

Upon completion of this course, the student should have acquired:

- Knowledge on the foundations of several methods of multivariate data analysis, along with the conditions under which their use is appropriate
- Skilled in the estimation, specification and diagnostics of the various models
- Hands-on experience with those methods through the use of appropriate software and actual data sets in the PC lab

Content

The course will proceed through a series of policy analysis and modeling exercises, involving real-world or hypothetical problems. The specific examples around which work will be done will concern the environment, energy, health, and natural hazards management.

Number  Title  Type  ECTS  Hours  Lecturers
701-1541-00L  Multivariate Methods  W  3 credits  2V+1U  R. Hansmann

Abstract

The course teaches multivariate statistical methods such as linear regression, analysis of variance, cluster analysis, factor analysis and logistic regression.

Objective

Upon completion of this course, the student should have acquired:

- Knowledge on the foundations of several methods of multivariate data analysis, along with the conditions under which their use is appropriate
- Skill in the estimation, specification and diagnostics of the various models
- Hands-on experience with those methods through the use of appropriate software and actual data sets in the PC lab

Content

The course will begin with an introduction to multivariate methods such as analysis of variance and multiple linear regression, where a metric dependent variable is "explained" by two or more independent variables. Then two methods for structuring complex data, cluster analysis and factor analysis will be covered. In the last part, procedures for the analysis of relationships involving dichotomous or polytomous dependent variables (e.g., the choice of a mode of transportation) will be discussed.
Will be announced at the beginning of the course.

701-1553-00L Introduction to Cultural Ecology  W  3 credits  2G  K. T. Seeland

Abstract
This lecture introduces to the basic principles of cultural ecology in a historical and cross-cultural perspective. It presents the most important scientific theories and methods in cultural studies and relates them to selected case studies relevant to environment and ecology. Human and social environment interactions are analysed in various European and Non-European settings.

Objective
The objective of this lecture is to demonstrate the cultural foundations of ecological phenomena and the use and management of nature and natural resources as responses of man and society towards their environment. An introduction into the rationale of cultural processes of nature appropriation shall enable students to understand human and social development processes throughout the history of culture and mind.

Abstract
The course addresses environmental policies, focusing on new approaches, which are generally summarized as environmental governance. The course also provides a broader introduction to social science concepts to provide students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

Objective
To understand how an environmental problem may (or not) become a policy and explain political processes, using basic concepts and techniques from political science.
To analyze the evolution as well as the key elements of environmental governance.
To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

Content
Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such as giving rise to government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors’ behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of 'environmental governance' and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Lecture notes
Lecture slides and additional course material will be provided throughout the semester.

Literature

Prerequisites / notice
We recommend that students have (a) Three-years BSc education of a (technical) university; (b) Successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) Familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)

701-1553-00L Introduction to Cultural Ecology  W  3 credits  2G  K. T. Seeland

Abstract
This lecture introduces to the basic principles of cultural ecology in a historical and cross-cultural perspective. It presents the most important scientific theories and methods in cultural studies and relates them to selected case studies relevant to environment and ecology. Human and social environment interactions are analysed in various European and Non-European settings.

Objective
The objective of this lecture is to demonstrate the cultural foundations of ecological phenomena and the use and management of nature and natural resources as responses of man and society towards their environment. An introduction into the rationale of cultural processes of nature appropriation shall enable students to understand human and social development processes throughout the history of culture and mind.

851-0589-00L Technology and Innovation for Development  W  3 credits  2V  P. Aerni

Abstract
Technological change plays a crucial role in efforts to create a more sustainable future. In this context, policy decision makers must design rules that minimize its risks and maximize its benefits for society at large. The course discusses this challenge from an interdisciplinary perspective taking into account legal, economic, historical, development and environmental aspects.

Objective
- to recognize the challenges and opportunities of technological change in terms of sustainable development
- to become familiar with policy instruments to promote innovation
- to improve understanding of political decision-making processes in the regulation of science & technology
- improved understanding of the role of science and technology in the context of human and societal development

Content
Science and Technology Policy is normally associated with the improvement of national competitiveness; yet, it is also an integral part of effective environmental and development policies.

The course will discuss the challenges and opportunities of technological change in terms of sustainable development and show how public policy on the national and the international level is responding to this change.

In this context, students are to become familiar with the basic principles of political economy and New Growth Theory and how such theories help explain political decisions as well as political outcomes in the area of Science, Technology and Innovation. State interventions are either designed to regulate (e.g. environmental regulations, anti-trust law) or facilitate (e.g. intellectual property rights protection, public investment in R&D and technical education, technology transfer) technological change. This will be illustrated by looking at different industries and different national systems of innovation. Subsequently the positive and negative consequences for society and the natural environment will be discussed from a short-term and a long-term perspective.

Lecture notes
Reader with issue-specific articles. E-version is partly available under http://www.ib.ethz.ch/teaching/material/stpp

Data: 06.12.2017 12:57  Autumn Semester 2015  Page 1389 of 1432
The lectures will introduce students to the principles of quantitative policy analysis, namely the methods to predict and evaluate the social, economic and environmental effects of alternative strategies to achieve public objectives. A series of graded assignments will give students an opportunity for students to apply those methods to a set of case studies.

## Literature

The 2-hour course (5-7 p.m.) will be held as a series of lectures. The course materials will be available in form of an electronic Reader at the beginning of the semester.

The class will be taught in English.

Students will be asked to give a (a) presentation (15 Minutes) or write a review paper based on a article selected from the electronic script, and (b) they have to pass a written test at the end of the course in order to obtain 3 credit points in the ECTS System. In the final mark (a) will have a weight of 40% and (b) 60%.

### Modeling and Statistical Analysis

#### Number | Title | Type | ECTS | Hours | Lecturers
---|---|---|---|---|---
701-1561-00L | Modeling Environmental Policy Problems | W | 3 credits | 2G | A. Patt, T. Schmidt, E. Trutnevye, O. van Vliet

**Abstract**

The lectures introduce students to the principles of quantitative policy analysis, namely the methods to predict and evaluate the social, economic, and environmental effects of alternative strategies to achieve public objectives. A series of graded assignments will give students an opportunity for students to apply those methods to a set of case studies.

**Objective**

The objectives of this course are to develop the following key skills necessary for policy analysts:

- Identifying the critical quantitative factors that are of importance to policy makers in a range of decision-making situations.

- Developing conceptual models of the types of processes and relationships governing these quantitative factors, including stock-flow dynamics, feedback loops, optimization, sources and effects of uncertainty, and agent coordination problems.

- Develop and program numerical models to simulate the processes and relationships, in order to identify policy problems and the effects of policy interventions.

- Communicate the findings from these simulations and associated analysis in a manner that makes transparent their theoretical foundation, the level and sources of uncertainty, and ultimately their applicability to the policy problem.

The course will proceed through a series of policy analysis and modeling exercises, involving real-world or hypothetical problems. The specific examples around which work will be done will concern the environment, energy, health, and natural hazards management.

#### Literature

Articles and book abstracts will be uploaded to a course website.

#### Prerequisites / notice

- Knowledge on the foundations of several methods of multivariate data analysis, along with the conditions under which their use is appropriate
- Skill in the estimation, specification and diagnostics of the various models
- Hands-on experience with those methods through the use of appropriate software and actual data sets in the PC lab

**Prerequisites:**

- Modeling Environmental Policy Problems (701-1561-00L)
- Multivariate Methods (701-1541-00L)

**Content**

- One of the lectures 701-1541-00L (autumn semester) OR 752-2110-00L (spring semester) are highly recommended for students in Environmental Sciences with the Major Environmental systems and Policy.

**Objective**

- Developing conceptual models of the types of processes and relationships governing these quantitative factors, including stock-flow dynamics, feedback loops, optimization, sources and effects of uncertainty, and agent coordination problems.

- Develop and program numerical models to simulate the processes and relationships, in order to identify policy problems and the effects of policy interventions.

- Communicate the findings from these simulations and associated analysis in a manner that makes transparent their theoretical foundation, the level and sources of uncertainty, and ultimately their applicability to the policy problem.

The course will proceed through a series of policy analysis and modeling exercises, involving real-world or hypothetical problems. The specific examples around which work will be done will concern the environment, energy, health, and natural hazards management.

**Literature**

**GIS - Introduction into Geoinformation Science and Technology**

*Number of participants limited to 80.*

**Abstract**

Theoretical basics and fundamental concepts of Geographic Information Science (GIS) are imparted and subsequently further elaborated with the software ArcGIS. At the end, the students will be able to independently solve basic realistic GIS problems.

**Objective**

Students are able to:
- elucidate the theoretical and conceptional foundations of geographic information systems (GIS)
- independently perform normal GIS work using commercial software and practical examples

**Content**

The course covers the following topics:
- What is GIS? What are spatial data?
- The representation of reality by means of spatial data models: vector, raster, TIN
- The four phases of data modelling: Spatial, conceptual, logical and physical model
- Basic concepts of database management systems and spatial databases
- Possibilities of data collection
- Transition of reference frame
- Spatial Analysis I: query and manipulation of vector data
- Spatial Analysis II: operators and functions with raster data
- Digital elevation models and derived products
- Process modelling with vector and raster data
- Presentation possibilities of spatial data

One Friday is reserved for a field trip or guest speaker;

**Literature**

**Prerequisites / notice**

Aufgrund der Grösse des verfügbaren EDV-Schulungsraumes ist die Teilnehmerzahl auf 80 Studierende beschränkt! Für die Übungen werden die Studierenden auf verschiedene Zeitfenster aufgeteilt. Pro Zeitfenster können maximal 20 Studierende betreut werden.
Content

Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical systems dynamics, nonlinear dynamics and macroeconomic modeling.

The course is structured along three main tasks:
1. Finding solutions
2. Implementing solutions
3. Controlling solutions

PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Lecture notes

The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

Prerequisites / notice

Self-study tasks (discussion exercises, Vensim exercises), are provided as home work. Weekly exercise sessions (45 min) are used to discuss selected solutions. Regular participation in the exercises is an efficient way to understand the concepts relevant for the final exam.

Policy Engagement

Number  Title | Type | ECTS | Hours | Lecturers

701-0967-00L  Project Development in Renewable Energies | W | 2 credits | 2G | R. Rechsteiner, A. Appenzeller, A. Wanner

Abstract

Project development in renewable Energies
Realization of projects in the field of renewable energies, analysis of frame conditions and risks. The students learn basics of renewable energy project realization from acknowledged experts active in the field. They identify the different tasks of various investor types. They develop sample projects in practice within groups.

Objective

You become acquainted with the regulative, juridical and economic requirements of project development in renewable energies.
You learn to launch and judge projects by exercises in groups.
You recognize chances and risks of renewable energy projects.

Content

Business models for renewable energy projects
Introduction of market trends, market structure, technical trends and regulation in Switzerland and in the EU internal energy market.
Necessary frame conditions for profitable projects
Project development samples and exercises in wind power, hydro power, photovoltaics, due diligence and country assessment.
Exact Program in German below

Lecture notes

PPT presentation will be distributed (in German) special frames:
http://www.rechsteiner-basel.ch/Lehrmittel_27.0.html

Literature

Longlist:
REN21 Renewables GLOBAL STATUS REPORT http://www.ren21.net
Mit einer grünen Anlage schwarzene Zahlen schreiben http://www.rechsteiner-basel.ch/uploads/media/Mit_einer_gruenen_Anlage_schwarze_Zahlen_schreiben.pdf

Prerequisites / notice

For group exercise and presentation reasons the number of participants is limited at 30 students. For exercises students build learning and presentational groups.

701-1543-00L  Transdisciplinary Methods and Applications | W | 3 credits | 2G | P. Krüttli, M. Stauffacher
Abstract
The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines.

Objective
At the end of the course students should:

Know:
- Function, purpose and algorithm of a selected number of transdisciplinary methods

Understand:
- Functional application in case studies and other problem oriented projects

Be able to reflect on:
- Potential, limits, and necessity of transdisciplinary methods

Be prepared for:
- Transdisciplinary Case Study 2016

Content
The lecture is structured as follows:

- Overview of concepts and methods of inter-/transdisciplinary integration of knowledge, values and interests (approx. 20%)
- Analysis of a selected number of transdisciplinary methods focusing problem framing, problem analysis, and impact (approx. 50%)
- Practical application of the methods in a broader project setting (approx. 30%)

Lecture notes
Handouts are provided by the lecturers

Literature
Selected scientific articles and book-chapters

Prerequisites / notice
This course is recommended for students participating in the Transdisciplinary Case Study 2016.

701-1551-00L Sustainability Assessment W 3 credits 2G P. Krütli, C. E. Pohl

Abstract
The course deals with the concepts and methodologies for the analysis and assessment of sustainable development. A special focus is given to the social dimension and to social justice as a guiding principle of sustainability as well as to trade-offs between the three dimensions of sustainability.

Objective
At the end of the course students should

Know:
- core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

Content
The course is structured as follows:

- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;
- Tradeoffs in selected examples.

Lecture notes
Handouts.

Literature
Selected scientific articles & book chapters

851-0735-11L Environmental Regulation: Law and Policy W 3 credits 1S J. van Zeben

Abstract
The aim of this course is to make students with a technical scientific background aware of the legal and political context of environmental policy in order to place technical solutions in their regulatory context.

Objective
The aim of this course is to equip students with a legal and regulatory skill-set that allows them to translate their technical knowledge into a policy brief directed at legally trained regulators. More generally, it aims to inform students with a technical scientific background of the legal and political context of environmental policy. The focus of the course will be on international and European issues and regulatory frameworks - where relevant, the position of Switzerland within these international networks will also be discussed.

Content
Topics covered in lectures:

(1) Environmental Regulation
a. Perspectives
b. Regulatory Challenges of Environment Problems
c. Regulatory Tools
(2) Law: International, European and national laws
a. International law
b. European law
c. National law
(3) Policy: Case studies

Assessment:
(i) Class participation (25%): Students will be expected to contribute to class discussions and prepare short memos on class readings.
(ii) Exam (75%) consisting of three parts:
- Policy brief - a maximum of 2 pages (including graphs and tables);
- Background document to the policy brief - this document sets out a more detailed and academic overview of the topic (maximum 8 pages including graphs and tables);
- Presentation of the policy brief: presentations can use a maximum of 5 slides and can last 7 minutes.
Advanced Forest Pathology

Stress and disease, virulence and resistance, disease diagnosis and damage assessment, tree disease epidemiology, disease
2G

1. Encompassing concepts and approaches

In-depth understanding of concepts, insight into current research and experience with methods of Forest Pathology based on selected
, J. Bolliger, U. Gimmi,
To know current biological and ecological research on selected diseases, to be able to comment on it and to understand the methods.
An electronic copy of relevant readings will be provided to the students at no cost before the start of the lectures.

No specific pre-existing legal knowledge is required, however all students must have successfully completed Grundzüge des Rechts (851-0708-00 V) or an equivalent course.
The course is (inter)related to materials discussed in Politikwissenschaft: Grundlagen (851-0577-00 V), Ressourcen- und Umweltökonomie (751-1551-00 V), Umweltrecht: Konzepte und Rechtsgebiete (851-0705-01 V), Rechtlicher Umgang mit natürlichen Ressourcen (701-0743-01 V), Environmental Governance (701-1651-00 G), Policy and Economics of Ecosystem Services (701-1653-00 G), International Environmental Politics: Part I (851-0594-00 V).

Major in Forest and Landscape Management

Natural Science Foundations

Lecture notes
The course is taught as a small interactive seminar and significant participation is expected from the students. Participation will be capped at 15 in order to maintain the interactive nature of the classes. All classes, readings, and assignments, are in English.
Teaching will take place over two weeks in September and October. The exam date will be in December.

During the second week of the teaching period, students will have individual 30-minute meetings with the lecturer to discuss their project.

No specific pre-existing legal knowledge is required, however all students must have successfully completed Grundzüge des Rechts (851-0708-00 V) or an equivalent course.

Platforms for In-Session Learning and Assessment

The course is (inter)related to materials discussed in Politikwissenschaft: Grundlagen (851-0577-00 V), Ressourcen- und Umweltökonomie (751-1551-00 V), Umweltrecht: Konzepte und Rechtsgebiete (851-0705-01 V), Rechtlicher Umgang mit natürlichen Ressourcen (701-0743-01 V), Environmental Governance (701-1651-00 G), Policy and Economics of Ecosystem Services (701-1653-00 G), International Environmental Politics: Part I (851-0594-00 V).

Elective courses offered per semester:

The course is (inter)related to materials discussed in Politikwissenschaft: Grundlagen (851-0577-00 V), Ressourcen- und Umweltökonomie (751-1551-00 V), Umweltrecht: Konzepte und Rechtsgebiete (851-0705-01 V), Rechtlicher Umgang mit natürlichen Ressourcen (701-0743-01 V), Environmental Governance (701-1651-00 G), Policy and Economics of Ecosystem Services (701-1653-00 G), International Environmental Politics: Part I (851-0594-00 V).

- **Major in Forest and Landscape Management**

- **Natural Science Foundations**

#### Lecture notes

**Abstract**

This course introduces landscapes as socially perceived, spatially and temporally dynamic entities that are shaped by natural and societal factors. Concepts and qualitative and quantitative methods to study landscapes from an ecological, societal and historical perspective are presented. In a term paper students work on a landscape-related topic of their choice.

**Objective**

Students will:
- learn about concepts and methods to quantify structural and functional connectivity in landscapes, particularly
- be introduced to the topic of landscape genetics and its benefits and (current) limitations for applied conservation
- learn about concepts and methods in scenario-based land-use change modelling
- approach an understanding of landscape as perceived environment
- learn about concepts of landscape preference and related measurement methods
- understand the role of landscape for human well-being
- be introduced into approaches of actively influencing attitudes and behavior as well as related scientific evaluation
- make use of various historical sources to study landscapes and their dynamics
- interpret landscapes as a result of ecological constraints and anthropogenic activities.

**Content**

1. Encompassing concepts and approaches
   - European Landscape Convention (ELC)
   - Ecosystem Services (ES): introduction and critical evaluation

   **Thematic topics**
   2. Ecological approach:
      - green infrastructure (e.g., ecological conservation areas)
      - landscape connectivity
      - landscape genetics and management applications
      - concepts of specific quantitative methods: least cost paths, resistance surfaces, Circuitscape, networks (Conefor), land-use change models, various statistical methods

   3. Social-science approach:
      - principle of landscape as perceived and connoted environment
      - theories on landscape preference and place identity
      - role of landscapes for recreation, health and well-being
      - intervention approaches for influencing attitudes and related behavior
      - methods of investigating the human-landscape relationship and evaluating interventions

   4. Historical approach:
      - land use history of Switzerland (agricultural history, forest and woodland history)
      - historical legacies of land use in landscapes and ecosystems
      - historic-ecological approaches and applications

   5. Land change science:
      - modelling future land-use (CLUE, other scenario-based models)
      - landscape functions and services

**Lecture notes**

Handouts will be available in the course and for download

**Type** W
**ECTS** 3 credits
**Hours** 2G
**Lecturers** O. Holdeniiede, T. N. Sieber

In-depth understanding of concepts, insight into current research and experience with methods of Forest Pathology based on selected pathosystems.

To know current biological and ecological research on selected diseases, to be able to comment on it and to understand the methods.

To understand the dynamics of selected pathosystems.

To be able to diagnose tree diseases and injuries.

To know forest protection strategies and to be able to comment on them.

**Content**

Stress and disease, virulence and resistance, disease diagnosis and damage assessment, tree disease epidemiology, disease management, ecosystem pathology.

Systems (examples): Air pollution and trees, endophytic fungi, mycorrhiza, wood decay, conifer- root rot, Phytophthora diseases, chestnut canker and its hypoviruses, urban trees, complex diseases, emerging diseases.

- **Abstract**

Mountain Forest Hydrology

**Abstract**

This course presents a process-based view of the hydrology, biogeochemistry, and geomorphology of mountain streams. Students learn how to integrate process knowledge, data, and models to understand how landscapes regulate the fluxes of water, sediment, nutrients, and pollutants in streams, and to anticipate how streams will respond to changes in land use, atmospheric deposition, and climate. They will practice using data and models to frame and test hypotheses about connections between streams and landscapes.

**Objective**

Students will have a broad understanding of the hydrological, biogeochemical, and geomorphological functioning of mountain catchments. They will practice using data and models to frame and test hypotheses about connections between streams and landscapes.

**Content**

Streams are integrated monitors of the health and functioning of their surrounding landscapes. Streams integrate the fluxes of water, solutes, and sediment from their contributing catchment area; they reflect the spatially integrated hydrological, ecophysiological, biogeochemical, and geomorphological processes in the surrounding landscape. At a practical level, there is a significant public interest in managing forested upland landscapes to provide a reliable supply of high-quality surface water and to minimize the risk of catastrophic flooding and debris flows, but the scientific background for such management advice is still evolving.

Using a combination of lectures, field exercises, and data analysis, we explore the processes controlling the delivery of water, solutes, and sediment to streams, and how those processes are affected by changes in land cover, land use, and climate. We review the connections between process understanding and predictive modeling in these complex environmental systems. How well can we understand the processes controlling watershed-scale phenomena, and what uncertainties are unavoidable? What are the relative advantages of top-down versus bottom-up approaches? How much can "black box" analyses reveal about what is happening inside the black box? Conversely, can small-scale, micro-mechanistic approaches be successfully "scaled up" to predict whole-watershed behavior? Practical problems to be considered include the effects of land use, atmospheric deposition, and climate on streamflow, water quality, and sediment dynamics, illustrated with data from experimental watersheds in North America, Scandinavia, and Europe.

**Literature**

Handouts will be available as they are developed.

Ecosystem Management

**Number**

701-1631-00L

**Title**

Foundations of Ecosystem Management

**Type**

W

**ECTS**

5

**Hours**

3G

**Lecturers**

J. Ghazoul, C. Garcia

**Abstract**

This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It explores case studies of ecosystem management approaches and considers their practicability, their achievements and possible barriers to their uptake.

**Objective**

Students should be able to

a) propose appropriate and realistic solutions to ecosystem management problems that integrate ecological, economic and social dimensions across relevant temporal and spatial scales,

b) identify important stakeholders, their needs and interests, and the main conflicts that exist among them in the context of land and resource management.

**Content**

Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional management systems have frequently resulted in catastrophic failures such as, for example, the collapse of fish stocks and biodiversity loss. These failures have stimulated the development of alternative ecosystem management approaches that emphasise the functionality of human-dominated systems. Inherent to such approaches are system-wide perspectives and a focus on ecological processes and services, multiple spatial and temporal scales, as well as the need to incorporate diverse stakeholder interests in decision making. Thus, ecosystem management is the science and practice of managing natural resources, biodiversity and ecological processes, to meet multiple demands of society. It can be local, regional or global in scope, and addresses critical issues in developed and developing countries relating to economic and environmental security and sustainability.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

**Literature**

Multifunctional Forest Management

**Abstract**

Multifunctional forest management needs to control natural processes such that they efficiently provide the diverse services and goods for society in a sustainable and close to nature way. This course provides the basic knowledge, the principles and the management tools for successful multifunctional forest management.

**Objective**

Forests in heavily populated areas need to provide diverse ecosystem services and goods for the benefit of society. Multifunctional forest management thus needs to control natural processes such that they efficiently provide these services and goods in a sustainable and close to nature way. This course provides the knowledge, the principles and the management tools for multifunctional forest management.

**Content**

Different strategies and management options are presented and discussed.

Understanding of the important natural processes and their spatial and temporal dynamics in the most important forest ecosystems of Europe.

**Lecture notes**

No class notes or text books

Lecture presentations are available for download

**Literature**

Reading assignments are given in class

A bibliography of cited literature will be available
Prerequisites / notice

Course language is German. Prerequisites: Sufficient German language skills

In addition to the lectures students need to attend 4 all day field excursions. Topic: Near natural and efficient tending concepts. Participating on all 4 field trips is a prerequisite for credits

Additional field excursions focusing on the Swiss femelschlag system, the Plenter- and other irregular systems will be offered during spring term in an optional course named “AK des multifunktionalen Waldmanagements”. 9 days of field trips will provide the possibility to consolidate theoretical knowledge, to apply it to real examples in the field, to discuss and further consolidate what has been taught in this class. The additional course is an important part of the overall formation on forest management and is highly recommended.

<tr>
<td>Abstract</td>
<td>The course addresses environmental policies, focusing on new approaches, which are generally summarized as environmental governance. The course also provides a broader introduction to social science concepts to provide students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>To understand how an environmental problem may (or not) become a policy and explain political processes, using basic concepts and techniques from political science. To analyze the evolution as well as the key elements of environmental governance. To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of 'environmental governance' and how legitimate and effective are these approaches in addressing persistent environmental challenges?</td>

| **Objective** | - explain functioning of sensors that are used for characterization of landscapes and terrestrial systems  
- select appropriate measurement methods and sampling design to quantify key variables and processes in the subsurface  
- deploy sensors in the field and maintain sensor network  
- interpret collected laboratory and field data and report main conclusions deduced from measurements |      |      |       |                    |
| **Content** | 1) Measurement Science: Measurement precision and accuracy; sensing footprint, sampling design and sampling errors, uncertainty reduction, spatial and temporal variability, sampling network design and information costs  
2) Electronics: Basic introduction to electronic components, voltage and current measurements, A/D converters, power requirements, power consumption calculations, batteries, storage capacity, solar panels  
3) Datalogging (Lecture): Data Logging, data transfer, storage, and sensing technologies; basic data logger programming; overview of soil sensor types and sensor calibration; including programming in the laboratory  
4) Geophysical methods on Subsurface Characterization: Basic principles of ERT, GPR, and EM;  
5) Soil and Groundwater Direct Sampling (Lab): Soil physical sampling; profile characterization, disturbed and undisturbed soil sampling, direct-push geoprobe sampling; soil water content profiles and transects;  
6) Electronics Laboratory: Setup and measurement of simple circuits, selection and use of voltage dividers, batteries and solar panels; pressure and temperature measurements;  
7) Deployment of monitoring network: Field installation of TDR, temperature probes, tensiometers, data loggers and power supply  
8) Geophysics lab: Demonstration and application of geophysical methods in the field;  
9 & 10) Forest characterization/ inventory: Principles of LIDAR; structures and features of the tree crowns, size/volume of the leaf area tree positions and diameters at breast height  
11 & 12) Ecological hydrological and Soil Monitoring Networks- Data management for long term monitoring networks Tereno, and other critical zone observatories |      |      |       |                    |

The field course in Belize will develop an understanding of, and solutions to, issues of landscape management relevant to conservation and natural resources. Students will be expected to integrate skills in quantitative natural science with social science approaches in real world, and hence highly complex, settings.

The aim of this course is to equip students with a legal and regulatory skill-set that allows them to translate their technical knowledge into a policy brief directed at legally trained regulators. More generally, it aims to inform students with a technical scientific background of the legal and political context of environmental policy. The focus of the course will be on international and European issues and regulatory frameworks - where relevant, the position of Switzerland within these international networks will also be discussed.

Topics covered in lectures:

1. Environmental Regulation
   a. Perspectives
   b. Regulatory Challenges of Environment Problems
   c. Regulatory Tools

2. Law: International, European and national laws
   a. International law
   b. European law
   c. National law

3. Policy: Case studies

Assessment:
(i) Class participation (25%): Students will be expected to contribute to class discussions and prepare short memos on class readings.
(ii) Exam (75%) consisting of three parts:
   a. Policy brief - a maximum of 2 pages (including graphs and tables);
   b. Background document to the policy brief - this document sets out a more detailed and academic overview of the topic (maximum 8 pages including graphs and tables);
   c. Presentation of the policy brief: presentations can use a maximum of 5 slides and can last 7 minutes.

The course is taught as a small interactive seminar and significant participation is expected from the students. Participation will be capped at 15 in order to maintain the interactive nature of the classes. All classes, readings, and assignments, are in English.

Teaching will take place over two weeks in September and October. The exam date will be in December.

During the second week of the teaching period, students will have individual 30-minute meetings with the lecturer to discuss their project.

No specific pre-existing legal knowledge is required, however all students must have successfully completed Grundzüge des Rechts (851-0708-00 V) or an equivalent course.

The course is fully booked Particularly suitable for students of D-USYS

Number of participants limited to 15.

Particularly suitable for students of D-USYS

**Abstract**

Introduction to design and model assisted sampling theory for finite populations as well as to the infinite population model for forest inventory. Two-phase two-stage forest inventories with simple or cluster sampling. Small area estimation. Presentation of the Swiss National Inventory.

Short introduction to Kriging techniques.

**Objective**

Students should have a good understanding of the concepts of general sampling theory in a modern framework. They should also master the specific problems arising in forest inventory and be able, if necessary, to read more specialized books or research papers.

**Content**

- Model assisted procedures. Formalism of sampling theory in forest inventory. One-phase simple and cluster sampling schemes.

**Lecture notes**

Sampling techniques for forest inventories. Daniel Mandallaz, Chapman and Hall. A free electronic copy of the book is also available. A PDF file containing parts of the book will be mailed to the participants.

**Literature**

- Sampling methods, remote sensing and GIS multisource forest inventory. M. Kohl, S. Magnusson, M. Marchetti, 2006, Springer.
- Sampling techniques for forest inventories, Daniel Mandallaz, 2007, Chapman and Hall.

**Prerequisites / notice**

A simulation software will be used throughout the lectures to illustrate the theoretical developments. Upon request a half day field overview of the lab work can be organized at the WSL outside the lecture time. A repetitorium for the exam is also offered.

**701-1682-00L**

**Dendroecology**

W 3 credits 3G 5C.

**Abstract**

The course dendroecology offers theoretical and practical aspects of dendrochronology. The impact of different environmental influences on tree-ring characteristics will be shown. The students learn various methods to date tree rings and they understand how ecological and environmental processes and patterns can be reconstructed using tree rings.

**Objective**

The students...
- understand, how wood is configured and how tree-ring structures are formed.
- are able to identify and describe different tree-ring structures.
- understand the theoretical and practical aspects of the dating of tree rings.
- know the effects of different abiotic and biotic environmental influences (climate, site, competition, insects, fire, physical-mechanical influences) on trees and tree rings.
- discover a tool for understanding and reconstructing global change processes.
- learn software to date, standardize and analyze tree rings.
- get hands-on experience based on the demonstration of wood (increment cores, stem discs, wedges), sampling in the field, and measuring and dating of tree rings in the tree-ring lab.
- solve R-based exercises (R tutorial will be provided) and answer questions in Moodle.
- work out an independent research question related to a dendroecological topic and write a short literature review based on scientific papers.

**Content**

- Overview and history of dendrochronology
- Principles of dendrochronology
- Evolution of tree rings
- Formation and structure of wood and tree rings
- Intra-seasonal tree-ring growth
- Continuous and discontinuous tree-ring characteristics
- Sampling and measuring
- Crossdating methods (visual, skeleton plots, quantitative)
- Standardization of tree-ring series
- Development of tree-ring chronologies
- Dendrochronology, dendrohydrology, dendroglaciology
- Stable isotopes
- Climate, climate-growth relationships, climate reconstructions
- Age and size structures, forest dynamics (regeneration, growth, competition, mortality)
- Disturbance ecology (fire, insects, blowdown)
- Application of tree-ring research in practice and in interdisciplinary research projects
- Field and lab day (date for one entire day or two half days will be searched together with the students in the beginning of the semester):
  - discussion of different dendroecological questions in the forest;
  - sampling of trees; insight into different tree-ring projects in the lab (Swiss National Forest Inventory).
- Application of tree-ring research in practice and in interdisciplinary research projects
- Field and lab day (date for one entire day or two half days will be searched together with the students in the beginning of the semester):
  - discussion of different dendroecological questions in the forest;
  - sampling of trees; insight into different tree-ring projects in the lab (Swiss National Forest Inventory).
- Application of tree-ring research in practice and in interdisciplinary research projects
- Field and lab day (date for one entire day or two half days will be searched together with the students in the beginning of the semester):
  - discussion of different dendroecological questions in the forest;
  - sampling of trees; insight into different tree-ring projects in the lab (Swiss National Forest Inventory).

**Lecture notes**

Lecture notes (in English) will be handed out in the class.

**Literature**

The lecture notes and further documents (papers, software) can also be downloaded from Moodle (https://moodle-app2.let.ethz.ch) following registration for the course.

**Prerequisites / notice**

Time schedule (total of 90 hours): There will be 12 lectures with each two hours (total of 24 hours presence) as well as a field and lab day (8 hours presence). In addition, the students are expected to put 18 hours into the preparation of the lectures as well as 18 hours for the exercises. 4 hours are reserved for the lab work and 18 hours for the project.

The class language is German and English, on request English only.

**Requirements**

Basics of biology, ecology and forest ecology

**701-1776-00L**

**Geographic Data Processing with Python and ArcGIS**

W 1 credit 2U 5A.

**Abstract**

The course gives a general introduction into the geoprocessing framework of ArcGIS and shows how to use python scripts to access and automate geoprocessing tasks. Furthermore, the basics of the programming language Python will be communicated which is required for the implementation of multilevel spatial analysis and dynamic models.

**Objective**

The students learn the basics of geographic data processing based on the programming language Python and ArcGIS (arcpy). They get the ability to implement their own processing sequences and models for geoprocessing.

**Content**

The course communicates a deepend understanding of geoprocessing frameworks arcpy and covers basic language concepts of Python e.g. like control structures, functions and sequences.

**Lecture notes**

Lecture notes, exercises and worked out solutions to them will be provided.

**Literature**

**Prerequisites / notice**

The course will be taught in German. All material will be provided in English. Knowledge of ArcGIS is assumed.
Starting with an overview of selected results from parametric inference, kernel smoothing (including local polynomials) will be introduced along with some asymptotic theory, optimal bandwidth selection, data driven algorithms and some special topics. Examples from environmental research will be used for motivation, but the methods will also be applicable elsewhere.

- Parametric estimation methods: selection of important results
- Maximum likelihood
- Least squares: regression & diagnostics
- Nonparametric curve estimation
- Density estimation, Kernel regression, Local polynomials, Bandwidth selection
- Selection of special topics (as time permits, we will cover as many topics as possible) such as change points, modes & monotonicity, robustness, partial linear models, roughness penalty, local likelihoods, etc.

- Applications: potential areas of applications will be discussed such as, change assessment, trend and surface estimation, probability and quantile curve estimation, and others.

Brief summaries or outlines of some of the lecture material will be posted at http://www.wsl.ch/info/mitarbeitende/ghosh/index_EN (click on "ETH Course" in the left panel).

**Colloquium**

**Number** 701-1691-00L

**Title** Colloquium Forest and Landscape Management

**Type** Z 0 credits 1.5K

**ECTS** 40 credits

**Hours** 5K

**Lecturers** H. R. Heinimann

**Objective**

Austausch-Plattform zwischen Forschung und Praxis im Waldbereich der Schweiz (in German)

**Major in Human Health, Nutrition and Environment**

**Public Health**

**Number** 752-6105-00L

**Title** Epidemiology and Prevention

**Type** W 3 credits 2V

**ECTS** 40 credits

**Hours** 5K

**Lecturers** M. Eichholzer

**Abstract**

The module Epidemiology and prevention gives a brief introduction to epidemiology with the aim to enable students to judge the scientific evidence on dietary habits and health. The importance of nutrition in the prevention of chronic diseases such as type 2 diabetes, cardiovascular diseases, cancer, obesity etc. is presented.

**Objective**

Students are able

- to evaluate the scientific evidence on the effects of diet on human health
- to describe the role of nutritional factors in the prevention of chronic diseases
- to assess the nutritional status of a population (Switzerland taken as an example)
- to put forward preventive measures addressing individuals but also our society in relation to the obesity epidemic

**Content**

The module Epidemiology and prevention gives a brief introduction to epidemiology with the aim to enable students to judge the scientific evidence on dietary habits and health. The importance of nutrition in the prevention of chronic diseases such as type 2 diabetes, cardiovascular diseases, cancer, obesity etc. is presented. Switzerland taken as an example, the health risks associated with our nutritional habits will be evaluated. Finally, examples of preventive measures addressing individuals but also the society in relation to the obesity epidemic and other threats to health are discussed.

**Number** 752-6151-00L

**Title** Public Health Concepts

**Type** W 3 credits 2V

**ECTS** 40 credits

**Hours** 5K

**Lecturers** R. Heusser

**Abstract**

The module "public health concepts" offers an introduction to key principles of public health. Students get acquainted with the concepts and methods of epidemiology. Students also learn to use epidemiological data for prevention and health promotion purposes. Public health concepts and intervention strategies are presented, using examples from infectious and chronic diseases.

**Objective**

At the end of this module students are able

- to interpret the results of epidemiological studies
- to critically assess scientific literature
- to know the definition, dimensions and determinants of health
- to plan public health interventions and health promotion projects

**Content**

Concepts of descriptive and analytical epidemiology, study designs, measures of effect, confounding and bias, screening, surveillance, definition of health and health promotion, health dimensions and health determinants, prevention strategies, public health interventions, public health action cycle, epidemiology and prevention of infectious and chronic diseases (HIV, Tuberculosis, Obesity, Public health nutrition).

**Lecture notes**

Handouts are provided to students in the classroom.

**Prerequisites / notice**

Language of the course is English

**Number** 401-0629-00L

**Title** Applied Biostatistics

**Type** W 4 credits 3G

**ECTS** 75 credits

**Hours** 10K

**Lecturers** M. Müller

**Abstract**

The students will learn about methods of kernel smoothing and application of concepts to data. The aim will be to build sufficient interest in the topic and intuition as well as the ability to implement the methods to various different datasets.

**Objective**

- Statistical Inference, by S.D. Silvey, Chapman & Hall.
- Density Estimation, by B.W. Silverman, Chapman and Hall.
- Kernel Smoothing, by M.P. Wand and M.C. Jones, Chapman and Hall.
- Nonparametric Simple Regression, by J. Fox, Sage Publications.

Additional references will be given out in the lectures.

**Prerequisites** A background in Linear Algebra, Calculus, Probability & Statistical Inference including Estimation and Testing.

**References**

- Applied Smoothing Techniques for Data Analysis with S-Plus Illustrations, by A. W. Bowman, A. Azzalini, Oxford University Press.
- Density Estimation, by B. W. Silverman, Chapman and Hall.
- Nonparametric Simple Regression, by J. Fox, Sage Publications.

**LOG IN:** In order to have access to the posted notes, you need the course user id & the password. These will be given out on the first day of the lectures.

**Lecture notes**

- Additional references will be given out in the lectures.
- The posted notes will tend to be just sketches whereas only the in-class lessons will contain complete information.

**Prerequisites / notice**

- Statistical Inference, by S.D. Silvey, Chapman & Hall.
- Density Estimation, by B.W. Silverman, Chapman and Hall.
- Kernel Smoothing, by M.P. Wand and M.C. Jones, Chapman and Hall.
- Nonparametric Simple Regression, by J. Fox, Sage Publications.

**Additional references** will be given out in the lectures.
Seminar in Evolutionary Ecology of Infectious Diseases

Principles and main methods in biostatistics with emphasis on practical aspects. Experimental and observational studies. Regression and analysis of variance. Introduction into survival analysis.

Getting an overview of the problems and statistical methods used in health sciences. Practise in using the software R to analyze data and interpreting the suites.

The statistical package R will be used in the exercises.
If you are unfamiliar with R, I highly recommend the online R course etutor.

Prerequisites / notice

- Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occuring in the field.
- This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.
- A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.
- Publications and class notes can be downloaded from a web page announced during the lecture.

- Papers will be assigned and downloaded from a web page announced during the lecture.

- This course provides a detailed understanding of - the development of T and B cells - the dynamics of a immune response during acute and chronic infection - mechanisms of immunopathology - modern vaccination strategies
- Obtain a detailed understanding of - the development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses, - recognition of pathogenic microorganisms by the host cells and molecular events thereafter, - events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells, - Optimization of B cell responses by intelligent design of new vaccines
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the “Danger” concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections
- Documents of the lectures are available for download at: https://moodle-app2.let.ethz.ch/course/view.php?id=998

#### Abstract
- This course focuses on food consumer behavior, consumer's decision-making processes and consumer's attitudes towards food products.
- The course provides an overview about the following topics: Factors influencing consumer's food choice, food and health, attitudes towards new foods and food technologies, labeling and food policy issues.
- This integration course will discuss new applications of microorganisms with functional properties in food and functional food products. Selected topics will be used to illustrate the rapid development but also limits of basic knowledge for applications of functional microorganisms to produce food with high quality, safety and potential health benefits for consumers.
- To understand the principles, roles and mechanisms of microorganisms with metabolic activities of high potential for application in traditional and functional foods utilization with high quality, safety and potential health benefits for the consumers. This course will integrate basic knowledge in food microbiology, microbial physiology, biochemistry, and technology.
- This course will address selected and current topics on new applications of microorganisms with functional properties in food and functional food products and characterization of functionality and safety of food bacteria. Specialists from the Laboratory of Food Biotechnology, as well as invited speakers from the industry will contribute to the selected topics as follows:
  - Probiotics and Prebiotics: Probiotics, functional foods and health, towards understanding molecular modes of probiotic action; Challenges for the production and addition of probiotics to foods; Prebiotics and other microbial substrates for gut functionality.
  - Bioprotective Cultures and Antimicrobial Metabolites: Antifungal cultures and applications in foods; Antimicrobial peptide-producing cultures (bacteriocins) for enhancing food quality and safety; Development of new protective cultures, the long path from research to industry.
  - Legal and Protection Issues Related Functional Foods
  - Industrial Biotechnology of Flavor and Taste Development
  - Safety of Food Starter Cultures and Prebiotics

#### Objective
- To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.
- To understand the principles, roles and mechanisms of microorganisms with metabolic activities of high potential for application in traditional and functional foods utilization with high quality, safety and potential health benefits for the consumers. This course will integrate basic knowledge in food microbiology, microbial physiology, biochemistry, and technology.
- The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

#### Content
- Students will be required to complete a group project on food products and ingredients with of from functional bacteria. The project will involve information research and analysis followed by an oral presentation and short written report.
- Nutrigenomics - toward personalized nutrition? Breakthroughs in biology recently led nutrition scientists to apply modern tools (genomics, transcriptomics, proteomics, metabolomics, genetics, epigenetics) to the analysis of the interactions of food with humans. The lecture presents these tools and illustrates their application in selected topics relevant to human nutrition and food sciences.
- Overall understanding of the transdisciplinary research being conducted under the term nutrigenomics.
- Overall understanding of the omics technologies used in nutrigenomics and their applications to human nutrition and food science.
- Ability to critically evaluate the potential and risks associated with the field of nutrigenomics
- The lecture is completed by an optional project entitled 'Personalized Nutrition' in which the students have the opportunity to receive a personalized nutritional guidance that is based on their own genetic makeup. The scientific literature on which the genetic tests are based is presented by the students during the lecture.

#### Literature
- No compulsory prerequisites, but prior completion of Human Nutrition I + II (Humanernährung I+II) is strongly advised.

#### Notice
- Copy of the power point slides from lectures will be provided.
- A list of references will be given at the beginning of the course for the different topics presented during this course.
- There is no script. Powerpoint presentations will be made available on-line to students.
Lecture notes  
The script is composed of circa 450 slides (ca 18 slides/lecture) organized in 9 modules

Module A  
From biochemical nutrition research to nutrigenomics

Module B  
Nutritional genomics

Module C  
Nutrigenetics

Module D  
Nutri-epigenomics

Module E  
Transcriptomics in nutrition research

Module F  
Proteomics in nutrition research

Module G  
Metabolomics in nutrition research

Module H  
Nutritional systems biology

Module I  
Individualized nutrition - opportunities and challenges

Literature  
No extra reading requested. Most slides in the lecture are referenced with web addresses.

Prerequisites / notice  
Basic training in biochemistry, molecular biology, physiology, and human nutrition. Interest in interdisciplinary sciences linking molecular biology to human health. Interest in the application of analytical laboratory methods to the understanding of human biology, in particular nutrition.

Abstract  
The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. Natural processes, anthropogenic pollution, legislation of groundwater and surface water and of drinking water as well as water treatment will be discussed for industrialized and developing countries.

Objective  
The goal of this lecture is to give an overview over the whole path of drinking water from the source to the tap and understand the involved physical, chemical and biological processes which determine the drinking water quality.

Content  
The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. The various water resources, particularly groundwater and surface water, are discussed as part of the natural water cycle influenced by anthropogenic activities such as agriculture, industry, urban water systems. Furthermore legislation related to water resources and drinking water will be discussed. The lecture is focused on industrialized countries, but also addresses global water issues and problems in the developing world. Finally unit processes for drinking water treatment (filtration, adsorption, oxidation, disinfection etc.) will be presented and discussed.

Lecture notes  
Handouts will be distributed

Literature  
Will be mentioned in handouts

Abstract  
Writing of a review paper of scientific quality on a topic in the domain of Human Health, Nutrition and Environment based on critical evaluation of scientific literature.

Objective  
- Acquisition of knowledge in the field of the review paper
- Assessment of original literature as well as synthesis and analysis of the findings
- Practising of academic writing in English
- Giving an oral presentation with discussion on the topic of the review paper

Content  
Topics are offered in the domains of the major 'Human Health, Nutrition and Environment' covering 'Public Health', 'Infectious Diseases', 'Nutrition and Health' and 'Environment and Health'.

Lecture notes  
Guidelines will be handed out in the beginning.

Literature  
Literature will be identified based on the topic chosen.

Abstract  
Project development in renewable Energies
Realization of projects in the field of renewable energies, analysis of frame conditions and risks. The students learn basics of renewable energy project realization from acknowledged experts active in the field. They identify the different tasks of various investor types. They develop sample projects in practice within groups

Objective  
You become acquainted with the regulative, juridical and economic requirements of project development in renewable energies.
You learn to launch and judge projects by exercises in groups
You recognize chances and risks of renewable energy projects

Data: 06.12.2017 12:57  Autumn Semester 2015  Page 1403 of 1432

**701-1346-00L**  
**Objective**  
The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences.  
**Content**  
From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.  
**Lecture notes**

**Prerequisites / notice**  
Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion.  

| Content | Energy- and Climate Systems I  
The lecture contains concepts, physics and components of building technologies for the efficient and sustainable energy supply and climatisation of buildings and their interaction with architecture and urban design. Using calculations, students learn to aquire relevant numbers and assess the performance of solutions.  
**Objective**  
The lecture's target is the knowledge of the physical basics and technical components of relevant systems for a efficient and sustainable climatisation and maintenance of buildings and their interdependency with the architectonic design and construction. By learning rough calculation methods, determination of relevant dimensions and identification of important parameters become possible. Hence, adequate approaches for the own design can be chosen, reviewed quantitatively and qualitatively and set in with a synergistic effect.  
**Content**  
1. Introduction  
2. Thermal systems  
3. Ventilation  
4. Daylight and artificial lighting  
**Lecture notes**  
The Slides from the lecture serve as lecture notes and are available as download. |
| Literature | A bibliography will be distributed at the beginning of the lecture. |

| Content | Power Market I - Portfolio and Risk Management  
Portfolio and risk management in the electrical power business, Pan-European power market and trading, futures and forward contracts, hedging, options and derivatives, performance indicators for the risk management, modelling of physical assets, cross-border trading, ancillary services, balancing power market, Swiss market model, strategy development and positioning.  
**Objective**  
| Literature | None |
Seminar on Transdisciplinary Research for A. Wokaun

Lecture notes will be distributed during the course.

Scenarios for the development of world primary energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO₂ emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

The seminar covers the following topics:

1. Pan-European power market and trading
   1.1. Power trading
   1.2. Development of the European power markets
   1.3. Energy economics
   1.4. Spot and OTC trading
   1.5. European energy exchange EEX

2. Market model
   2.1. Market place and organisation
   2.2. Balance groups / balancing energy
   2.3. Ancillary services
   2.4. Market for ancillary services
   2.5. Cross-border trading
   2.6. Capacity auctions

3. Portfolio and Risk management
   3.1. Portfolio management 1 (introduction)
   3.2. Forward and futures contracts
   3.3. Risk management 1 (m²m, VaR, hΦfc, volatility, cVaR)
   3.4. Risk management 2 (PaR)
   3.5. Contingency analysis (HPFC)
   3.6. Portfolio management 2
   2.8. Risk Management 3 (enterprise wide)

4. Energy & Finance I
   4.1. Options 1 basics
   4.2. Options 2 hedging with options
   4.3. Introduction to derivatives (swaps, cap, floor, collar)
   4.4. Financial modelling of physical assets
   4.5. Trading and hydros power
   4.6. Incentive regulation

5. Strategy
   5.1. Strategic Positioning
   5.2. Development of strategies and examples
   5.3. Cases for team work

Lecture notes

Prerequisites / notice

1 excursion per semester, 2 case studies, guest speakers for specific topics

529-0193-00L Renewable Energy Technologies I
The lectures Renewable Energy Technologies I (529-0193-00L) and Renewable Energy Technologies II (529-0191-01L) can be taken independently from one another.

Abstract
Scenarios for world energy demand and CO₂ emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry). Wind and ocean energy, heat pumps, geothermal energy, energy from waste. CO₂ sequestration.

Objective
Scenarios for the development of world primary energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO₂ emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

Content

Lecture notes
Lecture notes will be distributed during the course.

Literature

Prerequisites / notice
Fundamentals of chemistry and physics are a prerequisite for this course.

Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.

<td>2</td>
<td>2S</td>
<td>C. E. Pohl, M. Stauffacher</td>
</tr>
</tbody>
</table>

Abstract
The seminar is designed for students and researchers (MA, PhD, PostDoc) who use inter- and transdisciplinary elements in their projects. It addresses the challenges of this research: How to integrate disciplines? How (and in what role) to include societal actors? How to bring results to fruition? We discuss these questions based on case studies and theories and on the participant's projects.

Objective
The participants understand the specific challenges of inter- and transdisciplinary research in general and in the context of sustainable development in particular. They know methods and concepts to address these challenges and apply them to their research projects.

Content
The seminar covers the following topics:
(1) Theories and concepts of inter- and transdisciplinary research
(2) The specific challenges of inter- and transdisciplinary research
(3) Involving stakeholders
(4) Collaborating disciplines
(5) Exploration of tools and methods
(6) Analysing participants' projects to improve inter- and transdisciplinary elements

Literature
Literature will be made available to the participants

Prerequisites / notice
The seminar is specifically suitable for PhD or PostDoc researchers. It is open to master students (minor "global change and sustainability") and further interested people, who preferably are preparing, or working on, a project/thesis.
The course deals with the concepts and methodologies for the analysis and assessment of sustainable development. A special focus is given to the social dimension and to social justice as a guiding principle of sustainability as well as to trade-offs between the three dimensions of sustainability.

The course is seminar-like, interactive.

At the end of the course students should:

Know:
- core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

The course is structured as follows:
- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;
- Tradeoffs in selected examples.

Lectures and reading material will be made available at www.ib.ethz.ch (teaching, materials, then menu on the left side of the screen). They are password protected. Use your Nethz username and password to access the material.

Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 4 ECTS credit points. The workload is around 120 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

The workload for this course is approx. 120 hours (all inclusive).

### Minor in Transdisciplinarity for Sustainable Development

</table>

The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines.

Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.

At the end of the course students should:

Know:
- Function, purpose and algorithm of a selected number of transdisciplinary methods

Understand:
- Functional application in case studies and other problem oriented projects

Be able to reflect on:
- Potential, limits, and necessity of transdisciplinary methods

Be prepared for:
- Transdisciplinary Case Study 2016
The course is structured as follows:
- Overview of concepts and methods of inter-/transdisciplinary integration of knowledge, values and interests (approx. 20%)
- Analysis of a selected number of transdisciplinary methods focusing problem framing, problem analysis, and impact (approx. 50%)
- Practical application of the methods in a broader project setting (approx. 30%)

**Abstract**
This course deepens students' knowledge of the environmental assessment methodologies and their various applications.

**Objective**
This course has the aim of deepening students' knowledge of the environmental assessment methodologies and their various applications.

In particular, students completing the course should have the
- Ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors
- Knowledge about the current state of the scientific discussion and new research developments
- Ability to properly plan, conduct and interpret environmental assessment studies
- Knowledge of how to use LCA as a decision support tool for companies, public authorities, and consumers

**Content**
- Inventory developments, transparency, data quality, data completeness, and data exchange formats
- Allocation (multioutput processes and recycling)
- Hybrid LCA methods
- Consequential and marginal analysis
- Recent development in impact assessment
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Uncertainty analysis
- Subjectivity in environmental assessments
- Multicriteria analysis
- Case Studies

This course was offered as "Sustainable Construction" until HS14.
Abstract
This year the UN Conference in Paris will shape future world objectives to tackle climate change. This course provides an introduction to the notion of sustainable development when applied to our built environment.

Objective
At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmental aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focusing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

Content
The following topics give an overview of the themes that are to be worked on during the lecture.
- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development
- Case Study 1: Sustainable construction, the role of construction industry (national/international)
- Case Study 2: Cities, forms of settlements
- Case Study 3: Material resources, scenarios, energy, construction materials, urban metabolism
- Case Study 4: Buildings, heating/cooling, consumers, prosumers and other stakeholder, cooperations
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Economics for sustainable construction
- Method 3: Construction, flexibility, modularity
- Synthesis 1: Climate Change mitigation and adaptation in cities
- Synthesis 2: Transition to sustainable development

Lecture notes
All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

Abstract
Modern mass spectrometry, hyphenated analytical methods, speciation, methods of surface analysis, chemometrics.

Objective
Comprehensive knowledge about the analytical methods introduced in this course, and their applications.

Content
Coupling of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: Time of flight and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Methods of surface analysis (ESCA, Auger, SIMS, raster microscopy methods). Employment of computer science for processing data in chemical analysis (chemometrics).

Lecture notes
Lecture notes will be available in the lecture at production cost.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

Prerequisites / notice
Exercises are an integral part of the lecture. Prerequisites:

Minor in Biogeochemistry
Abstract
The course introduces the scientific concepts and typical applications of tracers in biogeochemistry. The course covers stable and radioactive isotopes, geochemical tracers and biomarkers and their application in biogeochemical processes as well as regional and global cycles. The course provides essential theoretical background for the lab course “Isotopic and Organic Tracers Laboratory.”

Objective
The course aims at understanding the fractionation of stable isotopes in biogeochemical processes. Students learn to know the origin and decay modes of relevant radiogenic isotopes. They discover the spectrum of possible geochemical tracers and biomarkers, their potential and limitations and get familiar with important applications.

Content
Geogenic and cosmogenic radionuclides (sources, decay chains); stable isotopes in biogeochemistry (natural abundance, fractionation); geochemical tracers for processes such as erosion, productivity, redox fronts; biomarkers for specific microbial processes.

Lecture notes
Handouts will be provided for every chapter

Literature
A list of relevant books and papers will be provided

Prerequisites / notice
Students should have a basic knowledge of biogeochemical processes (BSc course on Biogeochemical processes in aquatic systems or equivalent)

102-0337-00L Landfilling, Contaminated Sites and Radioactive Waste Repositories W 3 credits 2G W. Hummel, L. M. Plötze

Abstract
Practices of landfilling and remediation of contaminated sites and disposal of radioactive waste are based on the same concepts that aim to protect the environment. The assessment of contaminants that may leach into the environment as a function of time and how to reduce the rate of their release is key to the design of chemical, technical and geological barriers.

Objective
Upon successful completion of this course students are able to:
- assess the risk posed to the environment of landfills, contaminated sites and radioactive waste repositories in terms of fate and transport of contaminants
- describe technologies available to minimize environmental contamination
- describe the principles in handling of contaminated sites and to propose and evaluate suitable remediation techniques
- explain the concepts that underlie radioactive waste disposal practices

Content
This lecture course comprises of lectures with exercises and guided case studies.
- A short overview of the principles of environmental protection in waste management and how this is applied in legislation.
- A overview of the chemistry underlying the release and transport of contaminants from the landfilled/contaminated material/radioactive waste repository focusing on processes that control redox state and pH buffer capacity; mobility of heavy metals and organic compounds
- Technical barrier design and function. Clay as a barrier.
- Contaminated site remediation: Site evaluation, remediation technologies
- Concepts and safety in radioactive waste management
- Role of the geological and engineered barriers and radionuclide transport in geological media.

Lecture notes
Short script plus copies of overheads

Literature
Literature will be made available.

Prerequisites / notice
This is an interdisciplinary course aimed at environmental scientists and environmental engineers.

651-3525-00L
Introduction to Engineering Geology

This introductory course starts from a descriptions of the behavior and phenomena of soils and rocks under near surface loading conditions and their key geotechnical properties. Lab and field methods for the characterization of soils, rocks and rock masses are introduced. Finally practical aspects of ground engineering, including tunneling and landslide hazards are presented.

701-0565-00L
Fundamentals of Natural Hazards Management

Risks to life and human assets result when settlement areas and infrastructure overlap regions where natural hazard processes occur. This course utilizes case studies to teach how a future natural hazards-specialist should analyze, assess and manage risks.

Concepts will be explained step-by-step through a set of case studies, and applied in lab by the students. The following principal steps are used when coping with natural hazard-risks. At each step, students will learn and apply the following skills:

Risk analysis - What can happen?
- Characterize the processes and environmental measures that lead to a natural hazard and integrate modeling results of these processes.
- Identify threats to human life and assets exposed to natural hazards and estimate possible drawbacks or damages.

Risk assessment - What are the acceptable levels of risk?
- Apply principles to determine acceptable risks to human life and assets in order to identify locations which should receive added protection.
- Explain causes for conflicts between risk perception and risk analysis.

Risk management - What steps should be taken to manage risks?
- Explain how various hazard mitigation approaches reduce risk.
- Describe hazard scenarios as a base for adequate dimensioning of control measures.
- Identify the best alternative from a set of thinkable measures based on an evaluation scheme.
- Explain the principles of risk-governance.

Autumn Semester 2015
Lecture notes

This book also serves as textbook for LOS II (spring termn) as well as ERP and SCM software systems (autumn term). In addition powerpoint-handouts and documents for case studies.

Sales at 17.9.15, from 12:45, before and during brakes of the first lecture.

see "script"

Literature
Prerequisites / notice
As for the lecture of the 3rd week (BEMAD, a much-liked Business Engineering and Management Ability Development game), this lecture (of Oct. 1) will follow a specific schedule in specific rooms. The schedule will be presented at Sept. 17 during the 1st lecture.

Due to the big number of students, about half of the students will play this game, instead of Oct. 1, at Friday afternoon, Oct. 2. Please be available. Thank you for your help in this matter.

363-0445-02L Logistics, Operations, and Supply Chain Management W I (Additional Cases) 1 credit 2A P. Schönleslen

Abstract
Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Objective
An effective and efficient flow of goods, data, and control in and between companies contributes significantly to the value added for the customer. Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Prerequisites / notice
Basic knowledge of environmental assessment tools is a prerequisite for this class. Students that have not done classwork in this topic before are required to read an appropriate textbook before or at the beginning of this course (e.g. Baumann&Tillman, The Hitch Hiker’s Guide to LCA: An Orientation in Life Cycle assessment Methodology and Applications, Studentlitteratur, Lund, 2004).

102-0317-01L Advanced Environmental Assessment (Computer Lab and Exercises) W 3 credits 2U+2P S. Pfister

Abstract
Technical systems are investigated in projects with numerical modeling. The students learn how to answer given questions with target oriented methodologies using various software programs for environmental assessment.

Objective
Become acquainted with various software programs for environmental assessment including Life Cycle Assessment, Environmental Risk Assessment, Probabilistic Modelling, Material Flow Analysis.

Minor in Soil-Plant Relations and Land Use

Number Title Type ECTS Hours Lecturers
701-1681-00L Element Balancing and Soil Functions in Managed Ecosystems W 3 credits 2G A. Keller

Abstract
Applying element balances of agricultural soils and the assessment of soil functions for real applications in computer exercises to design preventive strategies against soil pollution and to support sustainable management of regional agroecosystems also in the context of spatial planning procedures.

Objective
The students learn to critically assess changes in land use management on element cycles in agro-ecosystems and to assess soil services (soil functions). You design solutions for chemical problems in soil protection at the regional scale and learn to assess soil functions using different methods.

Content
The students apply a regional balance model for Swiss regions in computer exercises and assess major soil functions of agricultural soils. You assess the sustainability of current land use and analyse management options improving nutrient and metal cycling in agro-ecosystems. The students will have the opportunity to calculate specific scenarios regarding land use management and environmental changes. Special focus we be paid on the soil services such as regulation-, production function and soil as habitat, and the assessment of these functions based on soil mapping data.

Lecture notes
Literature and Exercises for a case study
Radio-Isotopes in Plant Nutrition

**Abstract**
The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine element availability. Finally, published studies from other groups will be analyzed and presented by the students.

**Objective**
At the end of this course the students are familiar with the principles on which radioisotope works are based and they have learned from case studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotopic work.

**Content**
Radioisotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, radionuclides) within a given system and to assess the importance of processes controlling these fluxes (e.g. exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.). The course will first present the assumptions and the theoretical framework that underlay the work with radioisotopes. It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g. number and size of compartments). Secondly, case studies on isotopic dilution and tracer work will be presented for instance on the isotopic exchange kinetics method to determine nutrients or pollutants availability. The case studies will be adapted to the ongoing research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.

**Lecture notes**
Documents will be distributed during the lecture

**Literature**
Will be given during the lecture

---

Biogeochemistry and Sustainable Management

**Abstract**
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems and reclamation projects change are mainly driven by effects on biogeochemical cycles and ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

**Objective**
Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small (interdisciplinary) teams.

**Content**
Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

**Lecture notes**
Handouts will be available on the webpage of the course.

---

Rhizosphere Ecology

**Abstract**
This course emphasizes interactions among physicochemical and biological processes and highlights implications for plant nutrition, growth, and health. Nutrient mobilization and acquisition by plants in response to fertilization, other plants, and microbes, are explored in model systems. Newly gained knowledge is applied to understand results of a pot experiment and thereby critically reflected.

**Objective**
To gain a holistic understanding of resource-driven and regulatory processes in natural and agronomic plant-microbe-soil systems.
To practice abilities to read scientific literature, understand it, present it and discuss it with peers.
To combine available and newly acquired knowledge from soil physics, chemistry and (micro)-biology, plant physiology, pathology, and ecology and reflect on their relative importance for plant production, bioremediation, and nature conservation when considered together.
To practice manual skills in handling seedlings, soil, plant, and DNA samples, laboratory equipment, and working with different computer software.
To make observations, analyse, display, interpret and present own data.
To get familiar with (bio-)chemical, molecular genetic, and simple bioinformatics analyses.
To prepare as a group of course participants a poster on one selected aspect of a bigger pot experiment, present it, and discuss findings and posters of other course participants.
To combine findings with available knowledge, generate explanatory hypotheses, and identify potentially informative further analyses and experiments.

**Content**
This course comprised lectures, the set-up, harvest and data analysis of an experiment, soil (bio-)chemical, microbiological and molecular genetic analyses in the laboratory and practical computational data analyses. The focus is set on a better understanding of the role played by spatial and temporal physicochemical and microbiological gradients and various soil organisms in plant mineral nutrition. Mutualistic associations between plant roots and microbes, such as the root symbiosis with mycorrhizal fungi and root nodule-inducing bacteria are discussed. Rhizobia are isolated from field-collected root nodules and characterized, using molecular genetic tools. A short introduction into DNA-based bioinformatics and phylogenetic analyses is given to demonstrate how bacterial species are identified and potential host ranges of isolated rhizobia can be inferred, using so-called functional genes. A pot experiment in the glasshouse on cereal-legume mixed intercropping, including effects of pot size, intra- and interspecific plant competition, and root traits, allows to relate scientifically interesting research topics to practical application, while simultaneously stimulating critical reflections.

**Lecture notes**
Lecture slides and laboratory protocols are being made available in the directory ‘751-5123-00L Rhizosphere Ecology’ of the electronic document exchange platform ILIAS, LDA-ELBA: https://ilias-app2.let.ethz.ch/ilos.php?ref_id=8894&cmdClass=ilrepositorygui&cmdNode=el&baseClass=ilRepositoryGUI
### Objective
Spatial development deals with the development and the design of our living space. To meet the expectations, the interests and the plans of the different actors, it is needed a planning approach considering the overview of both the actual and future situation. The concept of sustainable development in spatial planning leads necessarily to an efficient management of the resources, especially regarding the resource land. The basics of this important discipline will be the subject of this lecture, which is therefore organised in three parts:

- Inner development
- Integrated spatial and infrastructure development
- Cross-border issues in spatial development

### Contents
- Tasks of Spatial Planning and development
- Issues of local and supra-local interest
- Recurring spatial changes, impacts and key figures
- Formal and informal instruments and procedures in spatial planning
- Spatial Design - Ideas about the future
- Reasoning and assessing the situation in spatial planning
- Spatial planning as a sequence of decisions and interventions
- Process and procedures management
- Focus issues - Inner development before external development
- Focus issues - Cross-border tasks
- Focus Issues - Integrated spatial and infrastructure development

### Lecture notes
Further information and the documents for the lecture can be found on the homepage of the Chair of Spatial Development.

#### Minor in Agricultural Plant Production and Environment
Master and PhD students are introduced to current areas of research in soil sciences and get first-hand experience in scientific discussion.

Download: [http://www.irl.ethz.ch/plus/education](http://www.irl.ethz.ch/plus/education)
The focus will be on the basic principles of biology and ecology of weeds, crop-weed interactions and basic knowledge of chemical, physical and biological weed control with their respective (dis-) advantages.

Furthermore students will get an introduction on the mechanisms of weed management in different farming systems and crops.

Abstract

Current Topics in Grassland Sciences (HS) W 2 credits 2S N. Buchmann

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Objective

Students will be able to understand and evaluate experimental design and data interpretation of on-going studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

Content

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Lecture notes

none

Prerequisites / notice

Prerequisites: Basic knowledge of plant ecophysiology, terrestrial ecology and management of agro- and forest ecosystems. Course will be taught in English.

Alternative Crops W 2 credits 2V A. Walter, B. Büter

Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.

Objective

During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

Agroecologists without Borders W 2 credits 2S C. Decock, A. Hofmann, J. Six

In this seminar students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

Objective

(1) Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
(2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
(3) Students articulate complexity and challenges in agricultural development interventions.
(4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

Prerequisites / notice

Students signing up for this class should have a strong interest in tropical agriculture and science communication.

Sustainable Agroecosystems II W 2 credits 2V J. Six, A. Hofmann

This class is intended to convey methods of agroecological research through selected case studies from current research projects and hands-on exercises. Students will gain an overview on actors in the field of sustainable agricultural development.

Objective

(1) Get to know methods for field and laboratory investigations in agroecology, (2) Analyze case studies from current agroecological research, (3) Place institutions and related projects into the context of sustainable agricultural development

Literature

Prerequisites / notice

Prior participation in the lecture Nachhaltige Agrarökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (in spring semester) recommended; classes taught mostly in English

Minor in Environmental, Resource and Food Economics

Number Title Type ECTS Hours Lecturers

Resource and Environmental Economics W 3 credits 2G L. Bretschger, A. Vinogradova

Relationship between economy and environment, market failure, external effects and public goods, contingent valuation, internalisation of externalities; economics of non-renewable resources, economics of renewable resources, cost-benefit analysis, sustainability, and international aspects of resource and environmental economics.
Objective

Understanding of the basic issues and methods in resource and environmental economics; ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

Topics are:
Introduction to resource and environmental economics
Importance of resource and environmental economics
Main issues of resource and environmental economics
Normative basis
Utilitarianism
Fairness according to Rawls
Economic growth and environment
Externalia in the environmental sphere
Governmental internalisation of externalia
Private internalisation of externalia: the Coase theorem
Free rider problem and public goods
Types of public policy
Efficient level of pollution
Tax vs. permits
Command and Control Instruments
Empirical data on non-renewable natural resources
Optimal price development: the Hotelling-rule
Effects of exploration and Backstop-technology
Effects of different types of markets.
Biological growth function
Optimal depletion of renewable resources
Social inefficiency as result of over-use of open-access resources
Cost-benefit analysis and the environment
Measuring environmental benefit
Measuring costs
Concept of sustainability
Technological feasibility
Conflicts sustainability / optimality
Indicators of sustainability
Problem of climate change
Cost and benefit of climate change
Climate change as international ecological externality
International climate policy: Kyoto protocol
Implementation of the Kyoto protocol in Switzerland

Content
Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

Lecture notes
Learning material and script can be found here:
https://moodle-app2.let.ethz.ch/course/view.php?id=328

Literature
The course focuses on the role of agricultural trade in a rapidly globalizing world. We analyze the impact of trade policy instruments on welfare and distribution. By means of case studies the following specific aspects of agricultural trade are analyzed: trade and food security; trade and environment/natural resources; trade and development.

Content

The course will provide students with opportunities to read, discuss, evaluate and interpret key texts that have shaped the environmental movement and, more specifically, the environmental sciences. Students will gain familiarity with the foundational texts, but also understand the historical context within which their academic and future professional work is based. More directly, the course will encourage debate and discussion of each text that is studied, from both the historical context as well as the modern context. In so doing students will be forced to consider and justify the current societal relevance of their work.

Objective

The course will be run as a book reading club. The first session will provide a short introduction as to how to explore a particular text (that is not a scientific paper) to identify the key points for discussion. Thereafter, in each week a text (typically a chapter from a book or a paper) considered to be seminal or foundational will be assigned by a course lecturer. The lecturer will introduce the selected text with a brief background of the historical and cultural context in which it was written, with some additional biographical information about the author. He/she will also briefly explain the justification for selecting the particular text.

The students will read the text, with two to four students (depending on class size) being assigned to present it at the next session. Presentation of the text requires the students to prepare by, for example:

- identifying the key points made within the text
- identifying issues of particular personal interest and resonance
- considering the impact of the text at the time of publication, and its importance now
- evaluating the text from the perspective of our current societal and environmental position

Such preparation would be supported by a mid-week tutorial discussion (about 1 hour) with the assigning lecturer. These students will then present the text (for about 15 minutes) to the rest of the class during the scheduled class session, with the lecturer facilitating the subsequent class discussion (about 45 minutes). Towards the end of the session the presenting students will summarise the main points and overall evaluation of the text (e.g. whether it was a seminal piece of work).

The students will then discuss the text and consider its relevance and applicability for our modern society. They will also evaluate their understanding and the correctness of their interpretation of the text. Discussions might also encompass films or other forms of media and communication about nature.

Literature

The specific texts selected for discussion will vary, but examples include:

- Leopold (1949) A Sand County Almanach
- Carson (1962) Silent Spring
- Jared Diamond (2005) Collapse

Discussions might also encompass films or other forms of media and communication about nature.

= Environmental Mineralogy

The lecture Environmental Mineralogy provides an outline of chemical and physical properties of iron oxides, clays, and carbonates. Analytical methods (XRD, spectroscopy and magnetics) are presented in order to identify and characterize minerals in natural samples as a tool for the reconstruction of weathering in soils, of diagenesis in sediment, and of phase transitions in hydrothermal systems.

Objective

Knowledge of the most important minerals (Fe-oxides, carbonates, and sheet silicates) in environmental systems
- Knowing about the technical and analytical tools for the identification and characterization of mineral phases.
- Development of strategies for the analytical handling of multiminerals systems.
- The application of mineralogical informations to solve specific environmental problems.

Content

- Short introduction to mineral sciences
- Inorganic minerals and biominerals
- Analytical methods for the identification and characterization of minerals
- Weathering & diagenesis and the formation of minerals
- Minerals as environmental indicators (tropical soils and lacustrine sediments as case studies)
- The use of minerals in the environmental management (e.g. controlled landfills)
- Weathering and conservation of building materials

Lecture notes / literature

- Hand-outs are delivered
- Voraussetzungen: Bodenchemie

**Abstract**
In the mandatory internship outside of ETH, the students in Environmental Sciences learn about how environmental issues are handled professionally through their own practical work and by applying the knowledge they acquired. They will analyse complex environmental problems on scientific, technical and social levels and develop solutions in conjunction with social actors.

**Objective**
The students experience political/legal, economic, social and psychological aspects in a professional working environment and acquire key skills such as communication and planning skills, cooperation with non-specialists or recognition of relevant aspects. Further they make useful contacts for starting their careers.

**Content**
This internship takes place outside of ETH. The main locations of an internship are the following:
- environmental consulting firms
- planning and engineering offices
- industrial and service companies
- public administration
- environmental organisations (nature conservation and protection, development cooperation).

The internship is a mandatory part of the two-year Master programme and lasts for at least 18 weeks (30 credit points). The internship agreement is a condition for the performance assessment of the internship.

The students look for a placement themselves.

**Lecture notes**
Instructions for the mandatory internship during the Master programme see www.usys.ethz.ch/en/studies/environmental-sciences/master/internship.html

**Prerequisites / notice**
Listed in the Praxisregister are Swiss companies that offer internship to students in Environmental Sciences, some explicitly offer internships in English: www.intranet.usys.ethz.ch/UMNW/berufspraxis/Praxisregister

Current employment opportunities can be found at www.intranet.usys.ethz.ch/UMNW/stellen-plattform/

To get an overview, subjects of previous internships can be found at www.intranet.usys.ethz.ch/UMNW/berufspraxis/Berufspraxisarbeiten

If publication is permitted, reports of former internships are available online as PDF-files.

Please find further information at www.usys.ethz.ch/en/studies/environmental-sciences/master/internship.html

**Master's Thesis**
Only students who fulfil the following criteria are allowed to begin with their Master thesis:
- The signed request for the Bachelor's Degree Certificate has been submitted (if the Bachelor's programme has been finished at ETHZ).
- At least 32 CP of coursework related to the major have been acquired.
- All additional requirements (as stated in the admissions decision), including any assessment repetitions, are fulfilled.

Please submit the registration form, downloadable at www.usys.ethz.ch/docs/env/master, at the beginning of your thesis!

**Abstract**
The course is completed by a Master thesis. This component is designed to enable the students to explore how the course content can be applied to an actual scientific problem. The thesis also provides an opportunity for the students to exercise initiative and to demonstrate that they are capable of working independently and in a scientifically structured manner.

**Objective**
This component is designed to enable the students to explore how the course content can be applied to an actual scientific problem. The thesis also provides an opportunity for the students to exercise initiative and to demonstrate that they are capable of working independently and in a scientifically structured manner.

**Abstract**
Introduction to the concepts and tools in physics: mechanics of point-like and rigid bodies, elasticity theory, elements of hydrostatics and hydrodynamics, periodic motion and mechanical waves.

**Objective**
Introduction to the scientific methodology. The student should develop his/her capability to turn physical observations into mathematical models, and to solve the latter.

The student should acquire an overview over the basic concepts in mechanics.

**Content**
Book:

Chapters:
1, 2, 3, 4, 5, 6 (without: 6-5, 6-6, 6-8), 7, 8 (without 8-9), 9, 10 (without 10-10), 11 (without 11-7), 13 (without 13-13, 13-14), 14 (without 14-6), 15 (without 15-3, 15-5)
A. Cannas da Silva
Multivariable Differential Calculus:
Introduction to the scientific methodology. The student should develop his/her capability to turn physical observations into mathematical models, and to solve the latter.
The student should acquire an overview over the basic concepts used in the theory of heat and electricity.

Content

Mathematics I
- Chapters:

Mathematics II
- Chapters:

Mathematics I & II
- Chapters:
  - Thomas, G. B.: Thomas' Calculus, Parts 2 (Pearson Addison-Wesley).

Objective
- Multivariable Calculus:
  - functions of several variables, partial differentiation, curves and surfaces in space, scalar and vector fields, gradient, curl and divergence.
  - Partial Differential Equations:
    - separation of variables, Fourier series, heat equation, wave equation, Laplace equation, Fourier transform.
  - Thomas, G. B.: Thomas’ Calculus, Parts 2 (Pearson Addison-Wesley).

Additional Admission Requirement
Enrolment only for MSc students who need this course as additional admission requirement.
Content

1. Linear Algebra and Complex Numbers:
   systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.

2. Single-Variable Calculus:
   review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.

3. Ordinary Differential Equations:
   separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

4. Multivariable Differential Calculus:
   functions of several variables, partial differentiation, curves and surfaces in space, scalar and vector fields, gradient, curl and divergence.

5. Multivariable Integral Calculus:
   multiple integrals, line and surface integrals, work and flow, Green, Gauss and Stokes theorems, applications.

6. Partial Differential Equations:
   separation of variables, Fourier series, heat equation, wave equation, Laplace equation, Fourier transform.

Literature

- Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).
- Thomas, G. B.: Thomas’ Calculus, Parts 2 (Pearson Addison-Wesley).

406-0603-AAL  Stochastics (Probability and Statistics)  E-  4 credits  9R  M. Kalisch

Enrolment only for MSc students who need this course as additional admission requirement.

Abstract

Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

Objective

The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

Content

From "Statistics for research" (online)
Ch 1: The Role of Statistics
Ch 2: Populations, Samples, and Probability Distributions
Ch 3: Binomial Distributions
Ch 4: Sampling Distribution of Averages
Ch 5: Normal Distributions
Ch 8: Student's t Distribution
Ch 9: Distributions of Two Variables

From "Introductory Statistics with R (online)"
Ch 1: Basics
Ch 2: The R Environment
Ch 3: Probability and distributions
Ch 4: Descriptive statistics and tables
Ch 5: One- and two-sample tests
Ch 6: Regression and correlation

529-2001-AAL  Chemistry I and II  E-  9 credits  19R  H. Grützmacher, W. Uhlig

Enrolment only for MSc students who need this course as additional admission requirement.

Abstract

General Chemistry I and II: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium, kinetics, acids and bases, electrochemistry

Objective

Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

Content

1. Stoichiometry
2. Atoms and Elements (Quantenmechanical Model of the Atom)
3. Chemical Bonding
4. Thermodynamics
5. Chemical Kinetics
6. Chemical Equilibrium (Acids and Bases, Solubility Equilibria)
7. Electrochemistry

551-0001-AAL  General Biology I  E-  3 credits  6R  U. Sauer, A. Widmer
Abstract
Basics of structure, formation and function of cells and biomacromolecules, principles of metabolism, as well as basic classical and molecular genetics and evolutionary biology.

This is a virtual self-study lecture for non-german speakers of the "Allgemeine Biology I (551-0001-00L) lecture. The exam will be written jointly with the participants of this lecture.

Objective
The understanding of some basic principles of biology; the hierarchy of the structural levels of biological organisation, with particular emphasis on the cell and its functions, as well as metabolism, inheritance and evolution.

Content
The structure and function of biomacromolecules; basics of metabolism; cell biology; membrane structure and function; basic energetics of cellular processes; respiration, photosynthesis; cell cycle, meiosis and sexual life cycles; Mendelian and molecular genetics; animal reproduction and behavior; sensory and motor mechanisms; population biology and evolution; principles of phylogeny.

The Campbell Chapters 1-4 (10th edition) under the heading "The role of chemistry in biology" are expected. We will treat the following Campbell chapters:

5 Biochemistry Biological Macromolecules and Lipids
7 Cell biology Cell Structure and Function
8 Cell biology Cell Membranes

Literature

Prerequisites
This is a virtual self-study lecture for non-german speakers of the "Allgemeine Biology I (551-0001-00L) lecture. The exam will be written jointly with the participants of this lecture.

Example exam questions will be discussed during the lectures, and old exam questions are kept by the various student organisations. If necessary, please contact Prof. Alexander Widmer (alex.widmer@env.ethz.ch) for details regarding the exam.

551-0002-AAL General Biology II

E- 3 credits 6R  U. Sauer, R. Aebersold, H.M. Fischer, W. Gruissem

Abstract
Basics of structure, formation and function of cells and biomacromolecules, principles of metabolism, basic molecular genetics, form and function of plants.

Objective
The understanding of some basic concepts of biology: the hierarchy of the structural levels of biological organisation, with particular emphasis on the cell and its functions, the fundamentals of metabolism and molecular genetics, as well as form and function of vascular plants.

Content
The structure and function of biomacromolecules; basics of metabolism; tour of the cell; membrane structure and function; basic energetics of cellular processes; respiration, photosynthesis; cell cycle, from gene to protein; bacteria and archaea; structure and growth of vascular plants, resource acquisition and transport, soil and plant nutrition.

Lecture notes
No script

Literature

Prerequisites
Basic general and organic chemistry

701-0023-AAL Atmosphere

E- 3 credits 6R  H. Wernli, T. Peter

Abstract
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Objective
Understanding of basic physical and chemical processes in the atmosphere. Understanding of mechanisms of and interactions between weather - climate, atmosphere - ocean - continents, troposphere - stratosphere. Understanding of environmentally relevant structures and processes on vastly differing scales. Basis for the modelling of complex interrelations in the atmosphere.

Content
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Lecture notes
Written information will be supplied.

Literature

701-0243-AAL Biology III: Essentials of Ecology

E- 3 credits 6R  J. Levine

Abstract
This course assigns reading for students needing further background for understanding ecological processes. Central problems in ecology, including population growth and regulation, the dynamics of species interactions, the influence of spatial structure, the controls over species invasions, and community responses to environmental change will be explored from basic and applied perspectives.
Objective

Students will understand how ecological processes operate in natural communities. They will appreciate how mathematical theory, field experimentation, and observational studies combine to generate a predictive science of ecological processes.

Upon completing the course, students will be able to:

Understand the factors determining the outcome of species interactions in communities, and how this information informs management.

Apply theoretical knowledge on species interactions to predict the potential outcomes of novel species introductions.

Understanding the role of spatial structure in mediating population dynamics and persistence, species interactions, and patterns of species diversity.

Use population and community models to predict the stability of interactions between predators and prey and between different competitors.

Content

Readings from a text book will focus on understanding central processes in community ecology. Topics will include demographic and spatial structure, consumer resource interactions, food webs, competition, invasion, and the maintenance of species diversity. Each of these more conceptual topics will be discussed in concert with their applications to the conservation and management of species and communities in a changing world.

**701-0401-AAL Hydrosphere**

- **Enrolment only for MSc students who need this course as additional admission requirement.**

**Abstract**

Qualitative and quantitative understanding of the physical processes that control the terrestrial water cycle. Energy and mass exchange, mixing and transport processes are described and the coupling of the hydrosphere with the atmosphere and the solid Earth are discussed.

**Objective**

Qualitative and quantitative understanding of the physical processes that control the terrestrial water cycle. Energy and mass exchange, mixing and transport processes are described and the coupling of the hydrosphere with the atmosphere and the solid Earth are discussed.

**Content**

Topics of the course.

Physical properties of water (i.e. density and equation of state)

- Global water resources
- Exchange at boundaries
- Energy (thermal & kinetic), gas exchange
- Vertical stratification, large scale transport
- Turbulence and mixing
- Mixing and exchange processes in rivers
- Groundwater and its dynamics
- Ground water as part of the terrestrial water cycle
- Ground water hydraulics, Darcy’s law
- Aquifers and their properties
- Hydrochemistry and tracer
- Ground water use
  
  Case studies
  - 1. Water as resource, 2. Water and climate

**Lecture notes**

In addition to the self-learning literature handouts are distributed.

**Literature**

Textbooks for self-studying.

Surface water:

  - Chapters 1 - 6, 8, 10, 11.

Optional additional readers.

**701-0501-AAL Pedosphere**

- **Enrolment only for MSc students who need this course as additional admission requirement.**

**Abstract**

Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

**Objective**

Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

**Content**

Definition of the pedosphere, soil functions, rocks as parent materials, minerals and weathering, soil organic matter, physical soil properties and functions, chemical soil properties and functions, soil formation, principles of soil classification, global soil regions, soil fertility, land use and soil degradation.

**Lecture notes**

Lecture notes can be purchased during the first lecture (15.- SFr).

**Literature**

**701-0721-AAL Psychology**

- **Enrolment only for MSc students who need this course as additional admission requirement.**

- **Prerequisites / notice**

  Prerequisites: Basic knowledge in chemistry, biology and geology.
Abstract
This is an introductory course in psychology. This course will emphasize cognitive psychology and the psychological experiment.

Objective
Knowledge of key concepts and exemplary theories of psychology and their relation to “daily” psychology. Comprehension of relation between theory and experiment in psychology.

Goals: Learning how psychologists are thinking, a side change from the ETH natural science perspective to psychological thinking.

Domains of psychology:
- Psychology fields
- Concept definitions of psychology
- Theories of psychology
- Methods of psychology
- Results of psychology

Capability:
Be able to define a psychological research question
Basics understanding of role of psychology

Comprehension:
Psychology as a science of experience and behavior of the human

Content
Einführung in die psychologische Forschung und Modellbildung unter besonderer Berücksichtigung der kognitiven Psychologie und des psychologischen Experiments. Themen sind u.a.: Wahrnehmung; Lernen und Entwicklung; Denken und Problemlösen; Kognitive Sozialpsychologie; Risiko und Entscheidung.

Literature
English book of Zimbardo (http://www.amazon.de/Psychology-Life-Discovering-Psych-Lab/dp/0205654770/ref=sr_1_2?s=books-intl-de&ie=UTF8&qid=1317208260&sr=1-2)

Prerequisites / notice
Determine with Prof. Dr. Michael Siegrist the chapters in "Zimbardo" which are compulsory reading

Read the two Psychology chapters (6 + 7) from the book of Prof. Roland W. Scholz

701-0757-AAL Principles of Economics
Enrolment only for MSc students who need this course as additional requirement.

Abstract
Students understand basic microeconomics and macroeconomics problems and theories. They are able to argue along economic principles and to judge policy measures.

Objective
Students should be enabled to understand basic microeconomics and macroeconomics problems and theories. They should be able to argue along economic principles and to judge policy measures.

Content
Supply and demand behaviour of firm and households; market equilibrium and taxation; national income and indicators; inflation; unemployment; growth; macroeconomics policies

Lecture notes
available on electronic platform

Literature

Prerequisites / notice

701-1901-AAL Systems Analysis
Enrolment only for MSc students who need this course as additional requirement.

Abstract
Self study course in Systems Analysis to fulfill requirements for enrollment into the master program. Topics covered include linear box models with one and several variables; non-linear box models with one or several variables; discrete-time models; and continuous models in space and time.

Objective
The aim of this course is to develop an understanding of the dynamical behavior of environmental systems and how this behavior can be captured and understood using mathematical concepts.

Abstract
This summer school will function as an inter-disciplinary think-tank, exploring the requisites for sustainable urban development in Barranquilla through the lens of architecture, engineering, and environmental sciences. You will be challenged to work in an intensive cross-cultural setting and develop solutions in a complex, real-life context with local practitioners and stakeholders.

Objective
You will receive full support on-site from Universidad del Norte and ETH tutors from your discipline. In developing the scenarios you will work side by side with young professionals with a grounded knowledge of the field, and be joined by a wide variety of local stakeholders. The program will combine site visits, expert lectures and workshops to allow you to develop the following skills:

The capacity to work to address urban challenges in an inter-disciplinary team
Apply Scenario Analysis technique to structure and integrate knowledge from various fields
Cross cultural understanding and skills in an international collaboration
Mechanisms to collaborate and communicate with practitioners and stakeholders
Understanding of integrated and sustainable urban development
Ability to use stakeholder participation to solve real world problems
Mid-sized cities in Latin America are growing at unprecedented rates. The next decade will be decisive in terms of demographic and economic growth, creating a time window to respond to unprecedented demands on resources, such as land, water and energy.

Are these boomtowns doomed to follow the fate of megacities or will they successfully avoid the pitfalls of rapid urban development? This program is part of a three-year ambitious collaboration with the Inter American Development Bank’s Emerging and Sustainable Cities Initiative and the Swiss Ministry for Economic Cooperation (SECO). It will influence decision makers and engage with real issues.

ETH is teaming up with the leading Universidad del Norte in Colombia to focus on Barranquilla, a rapidly growing city of 1.2 million inhabitants on the Atlantic coast of Colombia. Following a period of decline, vast sums of foreign investment are now flowing into this port city, with the potential to reverse current inequalities and spark more sustainable development.

In a team, you will produce alternative urban scenarios for the redevelopment of Barranquillas Central Market. You will contribute your expertise and unpack the realities of sustainable development in a tropical climate. How can knowledge from the ETH be combined with leading Colombian research and translated to a Latin American context? Through debate, controversy and collaboration it is expected you produce scenarios that integrate your different disciplines and question the preconceptions of sustainable urban development.

This immersive summer school will be structured in three interlocking modules:

In the first module you will investigate the central market and gain a strong understanding of the social, environmental and built context in Barranquilla. You will employ and combine your varied disciplinary methodologies to gain insight into the sustainability challenges facing the city and the redevelopment of the avenue.

In the second module, you will develop a series of scenarios for the central market in Barranquilla, proposing alternatives for its sustainable future. You will build on research from the first module, and explore the potential of your ideas with local stakeholders and professionals from your field. You will document these scenarios using creative and varied representational methods.

In the final module you will pitch your scenarios to decision makers. During this high-level event you will measure their preferences, debate the associated trade-offs, and provide a series of orientations for those planning the future of Barranquilla.

More information on our blog: www.marketsinthetropics.com

Who should apply?
Enthusiastic students currently enrolled in a masters program in ETH Zurich and Universidad del Norte, Barranquilla Colombia. A balanced group of 12 ETH master students from the D-ARCH, D-USYS and D-BAUG departments will be selected. They will be joined by 12 Colombian students from our partner university in Barranquilla, Universidad del Norte.

Applicants should have a strong interest in sustainable urban development and trans disciplinary collaborative research. They should be able to demonstrate their academic strength, motivation, interest and expertise. Knowledge of Spanish is welcomed but not obligatory.

ETH participants will be charged a fee of 300 CHF to cover local activities, travel and accommodation.

Additional travel grants are available for ETH students.

Students will be responsible for organising visa, health insurance, and transportation to and from Barranquilla. Flights to Barranquilla from Zurich cost approximately 1700 CHF. Applications can be submitted including curriculum vitae, portfolio where relevant and letter of motivation as portable document format (pdf) by May 30th, 17:00 CET to hertzog@usys.ethz.ch

Notification for admission June 1st.

</table>

**Abstract**

This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering.

**Objective**

Introduction to HPC for scientists and engineers

Fundamental of:
1. Parallel Computing Architectures
2. MultiCores
3. ManyCores

**Content**

Programming models and languages:
1. C++ threading (2 weeks)
2. OpenMP (4 weeks)
3. MPI (5 weeks)

Computers and methods:
1. Hardware and architectures
2. Libraries
3. Particles: N-body solvers
4. Fields: PDEs
5. Stochastics: Monte Carlo

Class notes, handouts

| 151-0213-00L| Fluid Dynamics with the Lattice Boltzmann Method | W    | 4 credits | 3G    | I. Karlin                  |

**Abstract**

The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations.

**Objective**

Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations.

During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on.

Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course).

The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microwaves among others.

Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.

**Content**

The course builds upon three parts:
I Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.
II Theoretical basis of statistical mechanics and kinetic equations.
III Lattice Boltzmann method for real-world applications.

The content of the course includes:

1. Background: Elements of statistical mechanics and kinetic theory:
   - Particle's distribution function, Liouville equation, entropy, ensembles; Kinetic theory: Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation;
   - Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

2. Basics of the Lattice Boltzmann Method and Simulations:
   - Minimal kinetic models: lattice Boltzmann method for single-component fluid, discretization of velocity space, time-space discretization, boundary conditions, forcing, thermal models, mixtures.

3. Hands on:
   - Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. Practical issues of LBM for fluid dynamics simulations:
   - Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.

5. Microflow:
   - Rarefraction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. Advanced lattice Boltzmann methods:
   - Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

7. Introduction to LB models beyond hydrodynamics:
   - Relativistic fluid dynamics; flows with phase transitions.

Lecture notes

Lecture notes on the theoretical parts of the course will be made available.

Selected original and review papers are provided for some of the lectures on advanced topics.

Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided.

Prerequisites / notice

The course addresses mainly graduate students (MSc/Ph D) but BSc students can also attend.

Process Simulation and Flowsheeting
E. Capón García, K. Hungerbühler

This course encompasses the theoretical principles of chemical process simulation, as well as its practical application in process analysis and optimization. The techniques for simulating stationary and dynamic processes are presented, and illustrated with case studies.

Commercial software packages are presented as a key engineering tool for solving process flowsheeting and simulation problems.

This course aims to develop the competency of chemical engineers in process flowsheeting and simulation. Specifically, students will develop the following skills:
- Deep understanding of chemical engineering fundamentals: the acquisition of new concepts and the application of previous knowledge in the area of chemical process systems and their mechanisms are crucial to intelligently simulate and evaluate processes.
- Modeling of general chemical processes and systems: students have to be able to identify the boundaries of the system to be studied and develop the set of relevant mathematical relations, which describe the process behavior.
- Mathematical reasoning and computational skills: the familiarization with mathematical algorithms and computational tools is essential to be capable of achieving rapid and reliable solutions to simulation and optimization problems. Hence, students will learn the mathematical principles necessary for process simulation and optimization, as well as the structure and application of process simulation software. Thus, they will be able to develop criteria to correctly use commercial software packages and critically evaluate their results.

Overview of process simulation and flowsheeting
- Definition and fundamentals
- Classification: stationary (steady-state) versus dynamic (transient state) systems
- Fields of application
- Case studies

Process modeling
- Modeling strategies of process systems
- Mass conservation
- Species balance
- Energy conservation
- Momentum balance
- Multiphase-systems: equilibrium & non-equilibrium models
- Process system model

Process simulation
- Process specification
- Introduction to process specification
- Classification of mathematical models: AMS, DOE, DAE, PDE
- Model validation
- Software tools
- Solution methods for process flowsheeting
- Simultaneous methods
- Sequential methods
- Dynamic simulation
- Numerical solution: explicit and implicit methods
- Continuous-discrete simulation: handling of discontinuities

Process optimization and analysis
- Classification of optimization problems
- Linear programming
- Non-linear programming
- Dynamic programming
- Optimization methods in process flowsheeting
- Sequential methods
- Simultaneous methods

Commercial software for simulation: Aspen Plus
- Thermodynamic property methods
- Reaction and reactors
- Separation / columns
- Convergence & debugging
Prerequisites / notice
A basic understanding of material and energy balances, thermodynamic property methods and typical unit operations (e.g., reactors, flash separations, distillation/absorption columns etc.) is required.

636-0001-00L
Separations in Biotechnology and Bioprocess
W 6 credits 3G S. Panke

Abstract
Separations play an integral part of any biotechnological process. This course aims at enabling students specifically with a background in chemistry/biology background to select & roughly design suitable separation processes for typical biotechnological products such as monoclonal antibodies, antibiotics, and fine chemicals and at providing a basic set of purification operations & judge on process economy.

Objective
Students should be able to select for a given biotechnological product a suitable set of purification operations and judge on process economy.

Content
Introduction membrane operations adsorption and chromatography crystallization overall process economics

Lecture notes
Handouts during course

626-0007-00L
Microbial Biotechnology
W 6 credits 3V S. Panke

Abstract
Introduction into the field of microbial biotechnology, covering possible products, fermentation and downstream technology.

Objective
The student should be able to identify opportunities for microbial bioprocesses and to go through basic and advanced design procedures for microbial bioprocesses.

Content
Students will obtain a thorough overview over microbial biotech products and the elements of bioprocess design: cellular growth and its modelling; mass transfer in fermentation; bioreactor engineering; bioreactors; downstream processing

Lecture notes
Handout in class

Literature
eg Nielsen/Villadsen, Bioreaction Engineering Principles (Kluwer) van t Riet/Tramper: Basic bioreactor design Stephanopoulos/Aristidou/Nielsen: Metabolic Engineering Angelothen in: Biotech BSc, Biotech MSc, PE MSc

Prerequisites / notice

151-0185-00L
Radiation Heat Transfer
W 4 credits 2V+1U A. Steinfeld, A. Z'Graggen

Abstract
Advanced course in radiation heat transfer

Objective
Fundamentals of radiative heat transfer for high-temperature applications. Examples are combustion and solar thermal/thermochemical processes, and other applications in the field of energy conversion and material processing.

Content

Lecture notes
Copy of the slides presented.

Literature

151-0104-00L
Uncertainty Quantification for Engineering & Life Sciences
W 4 credits 3G J. Beck, P. Koumoutsakos

Abstract
Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective
The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content
Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Lecture notes
The class will largely be based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Literature
1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes
3. Class Notes

Prerequisites / notice
Fundamentals of Probability, Fundamentals of Computational Modeling

151-0509-00L
Microscale Acoustofluidics
W 4 credits 3G J. Dual

Abstract
In this lecture the basics as well as practical aspects (from modelling to design and fabrication ) are described from a solid and fluid mechanics perspective with applications to microsystems and lab on a chip devices.

Objective
Understanding acoustophoresis, the design of devices and potential applications

Content
Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microbiotics to surface acoustic wave devices

Lecture notes

Literature

Prerequisites / notice
Solid and fluid continuum mechanics. Notice: The exercise part is a mixture of presentation, lab session and hand in homework.
Multidisciplinary Courses

The students are free to choose individually from the entire course offer of ETH Zurich, ETH Lausanne and the Universities of Zurich and St. Gallen.

The subject of the Master Thesis and the choice of the supervisor (ETH-professor) are to be approved in advance by the tutor.

Abstract

The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

Objective

The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program.

Industrial Internship

Abstract

The main objective of the 12-week internship is to expose master's students to the industrial work environment. During this period, students have the opportunity to be involved in on-going projects at the host institution.

Objective

The main objective of the 12-week internship is to expose master's students to the industrial work environment.

Compulsory Electives in Humanities, Social and Political Sciences

Recommended GESS compulsory elective courses (Type B) for D-MAVT.

Only students who fulfill the following criteria are allowed to begin with their Master Thesis:

a. Successful completion of the Bachelor programme
b. Any additional requirements for admission to the degree programme have been fulfilled
c. Successful completion of the Semester Project and Industrial Internship (the corresponding credits have been acquired)

The subject of the Master Thesis and the choice of the supervisor (ETH-professor) are to be approved in advance by the tutor.

To choose an adjunct professor of D-MAVT as a supervisor (http://www.mavt.ethz.ch/people/adjunct/index), please contact the Student Administration Office of D-MAVT.

Abstract

Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

Objective

The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem.

Data: 06.12.2017 12:57
The goal of the lecture is to convey a basic knowledge in the area of FV materials as well as their construction and production processes and to empower the students to apply the knowledge gained to address current problems in research and practice.

Students attend and give research presentations for the research they plan to do and at the end of the semester they defend their results and answer questions from research scientists. Familiarize the students with the latest in this field.

Abstract Research colloquium

Abstract About 5 talks on applied statistics.

Objective See how statistical methods are applied in practice.

Content There will be about 5 talks on how statistical methods are applied in practice.

Prerequisites / notice This is no lecture. There is no exam and no credit points will be awarded. The current program can be found on the web: http://stat.ethz.ch/events/zukost

Course language is English or German and may depend on the speaker.
