**Abstract**
Das agrarwissenschaftliche Praktikum besteht aus dem Betriebsaufenthalt, der Betriebsaufnahme (Betriebsheft) und der agronomischen Fachaufgabe. Die Leistungskontrolle erfolgt über die Rückmeldung zu den einzelnen Bestandteilen des Praktikums.

**Objective**
The farm placement aims to motivate students towards a system oriented approach to agricultural science, connecting science and practice.

**Lecture notes**
Das Betriebsheft zur Betriebsaufnahme und weitere Dokumente werden vom Praktikantendienst nach Anfrage zur Verfügung gestellt.

**Literature**
Merkblätter, Lehrbücher und Software stehen den Studierenden beim Praktikantendienst Agrarwissenschaft zur Verfügung.

**Abstract**
General Chemistry I: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium.

**Objective**
Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

**Content**
1. Stoichiometry
2. Atoms and Elements (Quantenmechanical Model of the Atom)
3. Chemical Bonding
4. Thermodynamics
5. Chemical Kinetics
6. Chemical Equilibrium (Acids and Bases, Solubility Equilibria)

**Abstract**
This course covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems - notably through ordinary differential equations.

**Objective**
Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of both of these courses.

**Content**
1. Single-Variable Calculus:
   review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.

2. Linear Algebra and Complex Numbers:
   systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.

3. Ordinary Differential Equations:
   separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

**Literature**
- Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).

**Prerequisites / notice**
Prerequisites: familiarity with the basic notions from Calculus, in particular those of function and derivative.

Assistance:
Mondays 12-13, Tuesdays 17-19, Wednesdays 17-19, in Room HG E 41.

**Abstract**
Basics of structure, formation and function of cells and biomacromolecules, principles of metabolism, as well as basic classical and molecular genetics and evolutionary biology. First in a series of two lectures given over two semesters for students of agricultural and food sciences, as well as of environmental sciences.

**Objective**
The understanding of some basic principles of biology; the hierarchy of the structural levels of biological organisation, with particular emphasis on the cell and its functions, as well as metabolism, inheritance and evolution.
### Content

The structure and function of biomacromolecules; basics of metabolism; cell biology; membrane structure and function; basic energetics of cellular processes; respiration, photosynthesis; cell cycle, meiosis and sexual life cycles; Mendelian and molecular genetics; animal reproduction and behavior; sensory and motor mechanisms; population biology and evolution; principles of phylogeny.

The Campbell Chapters 1-4 (10th edition) under the heading "The role of chemistry in biology" are expected. We will treat the following Campbell chapters:

### Lecture notes

Lecture notes: no script

### Literature

### Prerequisites / notice

The lecture is the first in a series of two lectures given over two semesters for students with biology as a basic subject.

**701-0243-01L**  | 701-0243-02L  
--- | ---
**Biology III: Essentials of Ecology**  | **Earth and Natural Production Systems**
**Abstract**  | **Abstract**
This lecture presents an introduction to ecology, it includes basic ecological concepts and the most important levels of complexity in ecological research. Ecological concepts are exemplified by using aquatic and terrestrial systems; corresponding methodological approaches are demonstrated. In a more applied part of the lecture threats to biodiversity and the appropriate management are discussed.  | The lecture provides a science-based exploration of key aspects of our planet: from its formation, to its properties and resources (minerals, soils, climate, water, vegetation), to agricultural production.

### Objective

**Objective**
The objective of this lecture is to teach basic ecological concepts and the different levels of complexity in ecological research: the individual, the population, the community and the ecosystem level. The students should learn ecological concepts at these different levels in the context of concrete examples from terrestrial and aquatic ecology. Corresponding methods for studying the systems will be presented.  | Overview and understanding of key aspects of planet earth and its role for agricultural production, including consideration of current challenges such as climate change, water crises, deforestation, north-south conflict and biodiversity.

### Content

**Content**
- Übersicht der aquatischen und terrestrischen Lebensräume mit ihren Bewohnern
- Einfluss von Umweltfaktoren (Temperatur, Strahlung, Wasser, Nährstoffe etc.) auf Organismen; Anpassung an bestimmte Umweltbedingungen
- Populationsdynamik: Ursachen, Beschreibung, Vorhersage und Regulation
- Interaktionen zwischen Arten (Konkurrenz, Koexistenz, Prädation, Parasitismus, Nahrungsnetze)
- Lebensgemeinschaften: Struktur, Stabilität, Sukzession
- Ökosysteme: Kompartimente, Stoff- und Energieflüsse
- Biodiversität: Variation, Ursachen, Gefährdung und Erhaltung
- Aktuelle Naturschutzprobleme und -massnahmen
- Evolutionäre Ökologie: Methodik, Spezialisierung, Koevolution

Naturschutzbiologie:

### 701-0025-00L  
**Principles of Economics**
**Abstract**
This course covers the bases for understanding micro- and macroeconomic issues and theories. Participants are given the tools to argue in economic and political terms and to evaluate the corresponding measures. Group and individual exercises deepen the knowledge gained.

### Objective

**Objective**
Students are able to  
- describe fundamental micro- and macroeconomic issues and theories.  
- apply suitable economic arguments to a given theme.  
- evaluate economic measures.

### Content

**Content**
Supply and demand behaviour of firm and households; market equilibrium and taxation; national income and indicators; inflation; unemployment; growth; macroeconomics policies

### Lecture notes

Available on electronic platform
**751-0013-00L**  
**World Food System**

**Type**: O  
**ECTS**: 4  
**Credits**: 4V

**N. Buchmann, M. Kreuzer, M. Loessner, D. Moretti, M. Sonneveld, E. J. Windhab**

**Abstract**

Knowledge about the World Food System will be provided, based on case studies along food value chains in countries with various development stages and dependent on multiple boundary conditions. This shall generate profound understanding of the associated global challenges especially food scarcity, suboptimal diet and nutrition, food quality and safety as well as effects on the environment.

**Objective**

Attending this course, the students will recognize the elements of the World Food System (WFS) approach and its problems it this supposed to treat. They will especially comprehend the four pillars of global food security, namely (I) food availability (including sustainable production and processing), (II) access to food (physical and monetary), (III) food use (including quality and safety as well as the impact on human health and well being) and (IV) resilience to the boundary conditions (environmental, economic and political). This insight will make them aware of the global driving forces behind our EHT research on food security and is expected to alleviate motivation and understanding for the association of subsequent specific courses within a general context. The course equivalently implements agricultural and food sciences, thus supporting the interdisciplinary view on the WFS scope.

**Content**

Case studies on certain foods of plant and animal origin serve to demonstrate the entire food value chain from the production of raw material to processed food and its consumer relevant property functions. In doing so, important corresponding aspects for developed, emerging and developing countries are demonstrated, by use of engineering as well as natural and social science approaches.

**Lecture notes**

Handouts and links are provided online.

**Literature**

Information on books and other literature references is communicated during the course.

**Prerequisites / notice**

The course shall particularly elucidate the cross section of Agro- and Food Sciences in the context of important global problems to be solved. Furthermore the students in the first year of studies shall be given some insight and outlook supporting the development of their views and interests in agricultural and food sciences further. The course is part of the block exam after the first study year. Paper copies can be used (“Open Book”) during the on-line exam, but no other means are not allowed. The course is taught in German.

Groups of a maximum of 30 students.

**Literature**

For further reading (not obligatory):

Gerhard Wanner: Mikroskopisch-Botanisches Praktikum, Georg Thieme Verlag, Stuttgart.
Objective

The students learn to
- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data,
- know universal methods for algorithm design.

Content

1. Simulation and Modeling
2. Visualizing multidimensional data
3. Data management with lists and tables
4. Data management with a relational database
5. Introduction to macro programming
6. Introduction to programming with Python

Lecture notes

All materials for the lecture are available at www.evim.ethz.ch

Prerequisites / notice

This course is based on application-oriented learning. The students spend most of their time working through electronic tutorials and discussing their results with teaching assistants.

Abstract

Introduction to the "way of thinking" and the methodology in Physics, with the help of demonstration experiments. The Chapters treated are Electromagnetism, Refraction and Diffraction of Waves, Elements of Quantum Mechanics with applications to Spectroscopy, Thermodynamics, Phase Transitions, Transport Phenomena. Whenever possible, examples relevant to the students' main field of study are given.

Objective

Introduction to the scientific methodology. The student should develop his/her capability to turn physical observations into mathematical models, and to solve the latter.

Content

Elektromagnetismus, Elektromagnetische Wellen, Wellenoptik, Strahleneoptik, Quantenoptik, Quantenmechanik, Thermische Eigenschaften, Transportphänomene, Wärmestrahlung

Lecture notes

Skript wird verteilt.

701-0071-00L  Mathematics III: Systems Analysis  O  4 credits  2V+1U  N. Gruber, P. Landschützer

Abstract

The objective of the systems analysis course is to deepen and illustrate the mathematical concepts on the basis of a series of very concrete examples. Topics covered include: linear box models with one or several variables, non-linear box models with one or several variables, time-discrete models, and continuous models in time and space.

Objective

Learning and applying of concepts (models) and quantitative methods to address concrete problems of environmental relevance.

Understanding and applying the systems-analytic approach, i.e., Recognizing the core of the problem - simplification - quantitative approach - prediction.

Wird von den jeweiligen Dozenten Dozenten ausgegeben.

Literature

Die Behandlung der Themen erfolgt auf der Basis des Lehrbuchs Brock, Biology of Microorganisms

701-0255-00L  Biochemistry  O  2 credits  2V  H.P. Kohler
### Abstract
Building on the biology courses in the 1st and 2nd semesters, this course covers basic biochemical knowledge in the areas of enzymology and metabolism. Those completing the course are able to describe and understand fundamental cellular metabolic processes.

### Objective
Students are able to understand
- the structure and function of biological macromolecules
- the kinetic bases of enzyme reactions
- thermodynamic and mechanistic basics of relevant metabolic processes

Students are able to describe the relevant metabolic reactions in detail

### Content
**Program**

Introduction, basics, composition of cells, biochemical units, repetition of relevant organic chemistry

Structure and function of proteins

Carbohydrates

Lipids an biological membranes

Enzymes and enzyme kinetics

Catalytic strategies

Metabolism: Basic concepts and design. Repetition of basic thermodynamics

Glycolysis, fermentation

The citric acid cycle

Oxidative phosphorylation

Fatty acid metabolism

**Lecture notes**

Horton et al. (Pearson) serves as lecture notes.

**Prerequisites / notice**

Basic knowledge in biology and chemistry is a precondition.

**Objective**

To understand accounting not as an isolated discipline, but as a part of the complex system of the enterprise

**Content**

Accounting system as a part of management economics.

The different steps for scheduling and evaluation of the accountancy will be studied. The main part of the lecture is dedicated to the financial accounting. Nevertheless the fundamentals of the internal cost-accounting will also be presented. The lecture will also include the clarification of concrete cases and the calculation of practical exercises.

**Lecture notes**

Lecture notes can be purchased during the first lecture (15.- SFr)

**Abstract**

This course introduces basic concepts of micro- and macronutrient nutrition. Micronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fat and carbohydrates.

**Objective**

To introduce the students to the both the macro- and the micronutrients.

**Content**

The lectures on micronutrients are given by Prof. Zimmermann and the lectures on macronutrients are given by Prof. Wolfrum. Prof. Zimmermann discusses the micronutrients, including fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. Prof. Wolfrum introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism.

**Lecture notes**

There is no script. Powerpoint presentations will be made available.

**Abstract**

Relationship between economy and environment, market failure, external effects and public goods, contingent valuation, internalisation of externalities; economics of non-renewable resources, economics of renewable resources, cost-benefit analysis, sustainability, and international aspects of resource and environmental economics.
Objective
Understanding of the basic issues and methods in resource and environmental economics; ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

Topics are:
- Introduction to resource and environmental economics
- Importance of resource and environmental economics
- Main issues of resource and environmental economics
- Normative basis
- Utilitarianism
- Fairness according to Rawls
- Economic growth and environment
- Externalities in the environmental sphere
- Governmental internalisation of externalities
- Private internalisation of externalities: the Coase theorem
- Free rider problem and public goods
- Types of public policy
- Efficient level of pollution
- Tax vs. permits
- Command and Control Instruments
- Empirical data on non-renewable natural resources
- Optimal price development: the Hotelling-rule
- Effects of exploration and Backstop-technology
- Effects of different types of markets.
- Biological growth function
- Optimal depletion of renewable resources
- Social inefficiency as result of over-use of open-access resources
- Cost-benefit analysis and the environment
- Measuring environmental benefit
- Measuring costs
- Concept of sustainability
- Technological feasibility
- Conflicts sustainability / optimality
- Indicators of sustainability
- Problem of climate change
- Cost and benefit of climate change
- Climate change as international ecological externality
- International climate policy: Kyoto protocol
- Implementation of the Kyoto protocol in Switzerland
- Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

2V
2V

Objective
A general introduction explains the needs of appropriately managing nutrients in plant production. Afterwards, we will study the physiology of plant nutrition (nutrient uptake by roots; water and nutrient transports in the plant; physiological roles of nutrients in the plant). Then the assimilation of nutrients in the plant, the effect of nutrients on crop yield and quality, the role of the soil as a source of nutrients for crops, and the basic principles of fertilization of different crop types using mineral and organic fertilizers.

Content
- The aim of these lecture is to present the processes controlling the uptake and transport of nutrients and water by the plant, the assimilation of nutrients in the plant, the effect of nutrients on crop yield and quality, the role of the soil as a source of nutrients for crops, and the basic principles of fertilization of different crop types using mineral and organic fertilizers.
- At the end of the lecture, students know how mineral nutrients and water are taken up through roots and circulate in the plants and what their roles in plants are. They understand the importance of nutrients for yield formation and for crop product quality. They are able to propose fertilization plans adapted for field crops growing under Swiss conditions.
- A general introduction explains the needs of appropriately managing nutrients in plant production. Afterwards, we will study the physiology of plant nutrition (nutrient uptake by roots; water and nutrient transports in the plant; physiological roles of nutrients in the plant). Then the role of nutrients for yield formation and their effects on crop quality is dealt with. Finally, the bases of crop fertilization are taught (availability of nutrient in soil; N, P and K fertilization; different types of fertilizers).

Lecture notes
At the end of the lecture, students know how mineral nutrients and water are taken up through roots and circulate in the plants and what their roles in plants are. They understand the importance of nutrients for yield formation and for crop product quality. They are able to propose fertilization plans adapted for field crops growing under Swiss conditions.

Literature
Schubert S 2006 Pflanzenernährung Grundwissen Bachelor Ulmer UTB
ACW and ART presenting the recommendations for the fertilization of crops and grassland in Switzerland (GRUDAF/DBF).

Objective
Imparts a basic understanding of physiology an anatomy in man and domestic animals, focusing on the interrelations between morphology and function of the organism, in particular of domestic animals. This is fostered by discussing all subjects from a functional point of view.

The lecture consists of two consecutive parts.

Lecture notes will be available for purchase at the cost of reproduction.

Literature

751-6301-00L Animal Breeding
W 2 credits 2V S. Neuenschwander

Abstract
Introduction to basics of animal breeding. Importance of animal production. Species of livestock and their products, performance recording, functional traits, genetic diversity, breeding goals. Qualitative and quantitative traits. Basic knowledge of breeding methods: genetic and environmental variation, heritability, genetic correlation, estimation of breeding values, selection, mating systems.

Objective
Show the importance of animal production for Swiss and international agriculture. Name the livestock species, their products, systematic classification and breeding and production goals. Describe methods to measure animal performance (performance recording) and functional traits. Define the most important parameters and methods in animal breeding.

Content

Lecture notes
Transparencies and single chapters of textbook are made available on homepage.

Literature
Tierzucht (Willam/Simianer) UTB 3526 (2011)
Additional literature to be announced in the lecture.

Abstract
Introduction into Area Planning in Switzerland, basics, legal aspects and instruments. Overview and state of the art. Practical regional development based on concrete experience and projects; basics, legal aspects and state of the art.

Objective
Goals:
- The student gets an overview over Area Planning in Switzerland with legal aspects, instruments and the actual state of the art.
- Awareness raising for complex regional planning and developing questions. Introduction in regional development and politics, based on existing and future regulations and their effects on different political levels.

Content
Area Planning:
- Basics of area planning
- Overview over existing regulations in Switzerland
- State of the art in Switzerland
- links between area planning and environmental protection

regional development:
- Basics for a successful regional development based on personal field experience
- discussion of the different instruments
- stake holders and their role in regional politics
- case studies for developing strategies (in small study groups)

Lecture notes
no script will be delivered, mainly for technical reasons; all necessary stuff will be delivered as papers or via internet.

Literature
no literature
Prerequisites / notice
german spoken (with translation of french and italian technical terms)

751-1651-00L World Food Economy and Agricultural Markets
W 2 credits 2V R. Jörin

Abstract
Following microeconomic courses we teach in this course economic aspects of the world food situation and the international and national agricultural markets. It contains aspects of supply, demand, price determination, market structures and instruments of the agricultural trade.

Objective
Economic understanding of agricultural markets and the aspects of the world food problem.

Content
Part I: Principles of agricultural economics
- Microeconomic analysis of supply, demand, and price determination in agricultural markets.

Part II: Aspects of globalization, development, natural resources and public health.

Part III: Analysis of selected agricultural and commodity markets: grains, oilseeds, sugar, ethanol and crude oil, milk and meat.

Lecture notes
Handouts (power point presentations)

Autumn Semester 2015
Abstract
This course is an introduction into forage cropping and grassland sciences. Topics include: extensive/intensive use, grassland evaluation, grassland maintenance, management using fertilization, cutting, etc. Relationships between site, vegetation composition and management will be explored.

Objective
Die Studierenden werden wichtige Mischungen und Pflanzengemeinschaften mitteleuropäischer Graslandökosysteme kennen, klassische und aktuelle Arbeiten der Bestandsökophysiologie kennen, in der Lage sein, den Einfluss von Umweltfaktoren und Bewirtschaftung nicht nur auf Einzelartefolge sondern auf Pflanzenbestände und ihre Erträge abzuschätzen, und üben, ein wissenschaftliches Thema schriftlich prägnant zusammenzufassen.

Content
In diesem Kurs werden die verschiedenen Typen des Futterbaus und die wichtigsten Mischungen, aber auch natürliche Pflanzengemeinschaften in Mitteleuropa vorgestellt (Bestandesbeurteilung). Basierend auf der Ökophysiologie von Einzelpflanzen wird die Ökophysiologie von Pflanzensystemen erarbeitet. Es werden verschiedene Arten der Bewirtschaftung vorgestellt (z. B. Bestandesdienstleistung durch Düngung, Beweidung, Schnittermine, etc.) und ihre Auswirkungen auf die Bestandeszusammensetzung und auf die Erträge diskutiert. Feedback-Mechanismen zwischen Umwelt und Futternutzungsanwendung kommen angesprochen.

Lecture notes
Handouts werden auf dem Netz zur Verfügung gestellt.

Prerequisites / notice
Course will be given in German. Course builds on the Ertrags- and Ökophysiologie lecture and provides the basics for the Grasslandsysteme.

751-4101-00L Crops

W+ 2 credits 2G
A. Walter, F. Liebsch, W. Richner

Abstract
Presentation of the central crops of our regions (cereals, oil and fibre plants, legumes, root and tuber plants) with respect to their biology, site requirements, reaction to environmental conditions and farming practice. A few crops of other regions will be discussed for these aspects as well.

751-4201-00L Horticulture I

W 2 credits 2V
L. Bertschinger, F. Gasser, J.L. Spring

Abstract
Overview on horticulture (international and national), insights into principles of practical fruit production (pre- and post-harvest), viticulture (incl. some hints on wine making), berry production and vegetable production in Switzerland.

Objective
Insights into fruit production (world and Switzerland), particularly...

- Main production areas (international & national)
- Relevance (international & national)
- Key aspects of production (Switzerland), i.e. selected aspects referring to varieties, production techniques incl. physiology and plant protection, economics
- Key challenges (Switzerland)
- Selected, interesting research and development projects

Content
The relevance of horticulture at the international level will be treated in the first block. During the semester in autumn (Horticultural Crops I), post harvest aspects in fruit production are discussed in 2 blocks of 4h. Following on this, viticulture (incl. some aspects of wine making) will be looked at in 3 blocks of 4h. During the spring semester (Horticultural Crops II), 3 blocks of 4h deal with vegetable production, and 2 blocks of 4h are addressing berry production.

751-4701-00L Applied Animal Nutrition

W 2 credits 2G
M. Kreuzer, G. Bee, F. Leiber, R. Messkommers, F. Sutter

Abstract
The basics of planning of feeding and formulation of diets incl. the implications on nutrient cycles and balances are taught. In the part dealing with ruminants, forage-based diets and the application of feed formulation programs are central and exercised on-farm. With pigs and poultry, the basics of energy and nutrient requirements are deepened through practical examples.

Objective
The students are able, based on the knowledge they obtain in this course, to deal with problems in the nutrition of ruminants, pigs and poultry on farm.

Content
- Programmteil Wiederkäuer: Einführung in die Winterfütterungsplanung für Milchkühe, Betriebsbeschau (Erfassung aller notwendigen Daten inkl. Futterprobenentnahme für eine konkrete Planung auf einem Praxistriebet), Besonderheiten der Milchviehfütterung (Laktationsverlauf, Jahrestrieb, etc.); Einführung in den LBL-Fütterungsplan; Möglichkeiten der Futterbeurteilung und - bewertung mit praktischer Beurteilung der gesammelten Proben, Berechnungen und Besprechung Fütterungsplaner, Aufstellung der Mineralstoffbilanz, Vorführung von PC-Software zur Fütterungsplanung Vorstellen und diskutieren des Fütterungsplanes auf dem Praxistriebet durch die Gruppe.
- Programmteil Nicht-Wiederkäuer: Der Energie- und spezifische Nährstoffbedarf beim Schwein und Geflügel; Besonderheiten der Fütterung in den verschiedenen Produktionsphasen; Fütterungsempfehlungen und -hinweise. Rationengestaltung und Rezeptoptimierung für Mischfuttermittel anhand verschiedener Beispiele; Einsatzgrenzen von Futtermittel; technologische Futterbearbeitung.

Lecture notes
Handouts in Halbtagesform; eingeschlossen sind Betriebsbesuche. Fach mit benoteter Semesterleistung.

751-7103-00L Animal Feed and Feeding of Ruminant

W+ 2 credits 2V
M. A. Boessinger

Abstract
The knowledge of the nutrition of ruminants and of the feeds used is deepened. Particular emphasis is put on the variety of home-grown feeds, their production and conservation and their application in the nutrition of dairy cows, cattle and small ruminants. Finally, information on specific problems of animal nutrition is communicated.
Die Grundlagen zu aktuellen Problemen der Tiergesundheit und Tierhaltung werden vor diesem Hintergrund verstanden. Die Studierenden sind fähig, mit fundierten Kenntnissen aktuelle Themen zu diskutieren.

**Lecture notes**
Script is available in German language and will be provided by each lecturer when starting his part the lecture.

**Prerequisites / notice**
Fach mit benoteter Semesterendprüfung

### Course: Regulatory Physiology

**751-6121-00L**

**Title:** Regulatory Physiology

**Type:** W

**ECTS Credits:** 2

**Hours:** 2V

**Lecturers:** S. E. Ulbrich, M. C. Härdi-Landerer

**Objective:**
Die Grundlagen zu aktuellen Problemen der Tiergesundheit und Tierhaltung werden vor diesem Hintergrund verstanden. Die Studierenden sind fähig, mit fundierten Kenntnissen aktuelle Themen zu diskutieren.

**Abstract:**
Hormone und Zytokine spielen als Signalmediatoren eine besondere Rolle bei der Regulation der Hombostase von Körperfunktionen (Flüssigkeits-, Temperatur-, Energie-Homöostase, Immunität). Insbesondere im Zusammenhang mit pathologischen Konstellationen (Fieber, Stress, metabolische Imbalance, Schmerzen) wird diese komplexe Funktion verständlich, Vermittlung von Methoden zur Hormonanalytik.

---

### Course: Plant Pathology I

**751-4504-00L**

**Title:** Plant Pathology I

**Type:** W

**ECTS Credits:** 2

**Hours:** 2G

**Lecturers:** F. Talas, B. McDonald, J. Palma Guerrero, A. Sanchez Vallet

**Objective:**
Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

**Content:**
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses.

---

**Complementary Courses in Agricultural Natural Sciences**

### Course: Sustainable Agroecosystems II

**751-5003-00L**

**Title:** Sustainable Agroecosystems II

**Type:** W

**ECTS Credits:** 2

**Hours:** 2V

**Lecturers:** J. Six, A. Hofmann

**Objective:**
This class is intended to convey methods of agroecological research through selected case studies from current research projects and hands-on exercises. Students will gain an overview on actors in the field of sustainable agricultural development.

**Literature:**

---

### Course: Managerial Economics Agri-Food Chain: Strategic Concepts

**751-1307-00L**

**Title:** Managerial Economics Agri-Food Chain: Strategic Concepts

**Type:** W

**ECTS Credits:** 2

**Hours:** 2G

**Lecturers:** B. Höltlschi, M. Weber
Abstract
Learn and exercise strategic concepts in the Agri-Food chain, i.e. theories of economics based decision making combined with entrepreneurial practice.

Objective
The main objective is to understand strategic decisions along the value chain in the Agri-Food Chain.

Content
- Basics of strategy & strategic concepts
- Classic process of strategy process
- Selected alternative processes
- Case studies

Lecture notes
Dokuments will be distributed per lecture.

Literature
Lombriser Roman & Aplanalp Peter: Strategisches Management

751-1501-01L Development Economics II W 2 credits 2V A. C. Crole-Rees, U. Egger
Abstract
The course
Objective
The objectives of this course are to: understand the role of agriculture in the development process; learn about the relevant actors, the small-scale farmers, and how to integrate them into economic development and to be able to derive sound policy measures.

Content
Development economics II is a follow-up of "Development economics I".

The main topic is the role of agriculture and in the development process. The main features of this sector will be presented. In many developing countries that are at the beginning of economic development the largest share of the population is often involved in agriculture. In agriculture the production factor land is more important than in other sectors. Agriculture together with fisheries is the only sector that produces food. Food can either be produced locally or imported.

Farmers, even small-scale farmers, are integrated in the monetary world. Trade is very important for growth, food security and environment conservation.

The following topics will be tackled: role of agriculture in economic development, definition of sustainability, role of the various stakeholders in the agricultural sector.

Lecture notes
PPT and selected articles. A monograph is also distributed.

Literature

Prerequisites / notice
Prerequisite: Attendance of introductory micro- and macroeconomics classes. Development economics I & II are one unit.

752-2120-00L Consumer Behaviour I W 2 credits 2V M. Siegrist, C. Keller, B. S. Sütterlin
Abstract
Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior

Objective
Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior

Content
- Determinants of consumer behavior
- Environmental influences on consumer behavior
- Influencing consumer behavior

751-8001-00L Agricultural Engineering I W 2 credits 2V M. Schick, M. Sax
Abstract
Presentation of basics in planning of agricultural buildings, work economics. This lecture forms the basis for the Agrartechnik II course (indoor and outdoor work processes).

Objective
Main objectives: The students acquire comprehensive functional knowledge about agricultural engineering systems (including construction) enabling them to plan and assess the use of those systems in practice.

Subobjectives:
- Basics in agricultural construction will show that a professional implementation of functional, animal-friendly, environmentally sound (and economically advantageous) construction of buildings is feasible.
- Profound knowledge of planning tools based on work economics will help the students to correctly plan the substitution of agricultural work by efficient technical solutions.

Content
Part 1: Agricultural building
- Basics of structural engineering. Dimensioning of simple supported and cantilevered beams and roof structures. Tension, compression, bending.
- Evaluation of typical roof structures in agricultural buildings.
- Loads: snow, wind, dead and live loads
- Physical properties of building materials: timber, steel, concrete.
- Reinforcement of concrete
- Housing systems for cattle, pigs, poultry, horses
- Storage plants for slurry, manure, feed.
- Planning. Space and functioning programme, building concepts, financing, permit of building, detailed plans, contractors
- Planning and designing exercise.

P.S.: Indoor work processes: 'Agrartechnik II' spring term 2009

Part 2: Work economics
- work-economics-related guiding figures (time measurements, statistical processing, data recording using a work diary, sources of work-economics-related planning data, application for 'Agroscope FAT' (machine costs lists, 'LBL' planning basics, etc.).
- working time models (work and production process level, process comparisons, process optimisation through growth and/or specialising of farm, cooperation with others, work productivity) including PROOF model to calculate time consumption off different procedures
- 'Agroscope FAT' (agricultural research station in Tänikon) work budget (integration of modules in entire farm, available field work days and weather risk, farm management-related work and special tasks, use of a detailed or global work budget, comparison of target and actual situation in terms of work economics

P.S.: Outdoor mechanisation: 'Agrartechnik II' spring term 2009

Focus Agricultural and Resource Economics

Operations Research: Linear and Non-Linear 751-0401-00L W+ 2 credits 3G S. Peter

Autumn Semester 2015

Objective: Gives an introduction in to the methods of Operations Research (OR) aiming to solve conceptual tasks by means of mathematical models.

Content: As a basic course for Operations Research (OR) the most important models and algorithms of OR will be worked out. A first part deals with the theory of linear programming (LP) (incl. duality). Practical exercises as well as on paper as on the computer serve to better understand the theoretical part of the course. The second part is about the basics of non-linear programming (NLP) (FOC, SOC, Lagrange, Kuhn-Tucker). Here as well, exercises help to improve the understanding of theoretical basics.

Lecture notes: Handed out during lecture.

Literature: In the lecture one indicates.

751-1307-00L Managerial Economics Agri-Food Chain: Strategic Concepts

Abstract: Learn and exercise strategic concepts in the Agri-Food chain, i.e. theories of economics based decision making combined with entrepreneurial practice.

751-4801-00L  System-Oriented Management of Herbivore Insects I  W  2 credits  2G  D. Mazzi
Abstract  The focus is on the potential to assess strategies and tactics of pest management, taking into account the demands from the economy, the environment and the society. Significant agricultural approaches will be explained using practical examples, including prevention using natural resources, surveillance and forecasting, resistance management, as well as product registration, incl. ecotoxicology.
Objective  The students gain a good understanding of fundamental aspects of pest management in agroecosystems. They will have the ability to assess options for action in view of requirements from the economy, the ecology and the society. Further, they will learn to perform searches on relevant issues in pest management, and to critically evaluate case studies.

Abstract  The basics of planning of feeding and formulation of diets incl. the implications on nutrient cycles and balances are taught. In the part dealing with ruminants, forage-based diets and the application of feed formulation programs are central and exercised on-farm. With pigs and poultry, the basics of energy and nutrient requirements are deepened through practical examples.
Objective  The students are able, based on the knowledge they obtain in this course, to deal with problems in the nutrition of ruminants, pigs and poultry on farm.
Content  - Programmteil Wiederkäuer: Einführung in die Winterfütterungsplanung für Milchkühe, Betriebsbesuch (Erfassung aller notwendigen Daten inkl. Futterprobenentnahme für eine konkrete Planung auf einem Praxisbetrieb), Besonderheiten der Milchviehfütterung (Laktationsverlauf, Jahreszeit, etc.); Einführung in den LBL-Fütterungsplan, Möglichkeiten der Futterbeurteilung und - bewertung mit praktischer Beurteilung der gesammelten Proben, Berechnungen und Besprechung Fütterungsplan, Aufstellung der Mineralstoffbilanz, Vorführung von PC-Software zur Fütterungsplanung Vorstellen und diskutieren des Fütterungsplanes auf dem Praxisbetrieb durch die Gruppe.

751-5003-00L  Sustainable Agroecosystems II  W  2 credits  2V  J. Six, A. Hofmann
Abstract  This class is intended to convey methods of agroecological research through selected case studies from current research projects and hands-on exercises. Students will gain an overview on actors in the field of sustainable agricultural development.
Objective  Prior participation in the lecture Nachhaltige Agrarökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (in spring semester) recommended; classes taught mostly in English
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  No Lecture: First day of autumn semester

Week 2  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nematode attack strategies and types of damage.

Week 5  Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6  Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7  Pisinat and pisinat demethylase. Local and systemic acquired resistance, signal molecules.

Week 8  Pathogen effects on food quality and safety.

Week 9  Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 10  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11  Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELISA, PCR, rDNA and rep-PCR.

Week 12  Strategies for minimizing disease risks: principles of disease control and management.

Week 13  Disease control strategies: economic thresholds, physical control methods.

Week 14  Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

Lecture notes

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

Abstract
Die Studierenden kennen die Grundlagen und die Konventionen des wissenschaftlichen Schreibens in den Naturwissenschaften, können wissenschaftliche Literatur suchen und verwalten sowie wissenschaftliche Publikationen analysieren.

Objective
Die Studierenden kennen die Grundlagen und die Konventionen des wissenschaftlichen Schreibens in den Naturwissenschaften, können wissenschaftliche Literatur suchen und verwalten sowie wissenschaftliche Publikationen analysieren. Die Studierenden setzen das Gelernte beim Schreiben eines Textes in deutscher Sprache zu einem agrarwissenschaftlichen Thema ihrer Wahl um. Die Lehrveranstaltung bereitet die Studierenden auf weitere schriftliche Arbeiten im Studium der Agrarwissenschaften vor, beispielsweise auf die Bachelor- und Master-Arbeiten.

Abstract
This lecture gives an introduction to the scientific work with data (from data acquisition to statistical analyses and their graphical presentation). Getting organized with a spreadsheet program (OpenOffice, Excel) and being able to analyse the data in the open-source R package will be the primary focus. Field data gathered with Prof. E. Frossard in the previous semester are used.

Objective
This lecture with exercises gives an introduction to the scientific work with data, starting with data acquisition and ending with statistical analyses as they are often required for a bachelor thesis (descriptive statistics, linear regression etc.). Getting organized with a spreadsheet program (OpenOffice, Excel) and being able to analyse the data in the open-source R package will be the primary focus. An important aspect will be to learn which graphical representation of data are best suited for the task (how can data be presented clearly and still scientifically correct?)
Content

Tentative Programme:

1. Introduction
2. Data acquisition, data organization, data storage, working with data
3. Graphical presentations I - Spreadsheets
5. Correct and problematic graphical data displays
6. Introduction to 'R'
7. Data import and graphical presentation
8. Statistical distribution and confidence intervals
9. Statistical tests - Repetition and hands-on applications
10. Linear regressions
11./12. Analysis of Variance
13. ANOVA - Discussion of results with Prof. E. Frossard

Last week of semester: examination (Leistungskontrolle)

Lecture notes

German

Prerequisites / notice

Theoretical background in ensemble statistics from the mandatory course in the 4th semester; students should have cleared the examination of that fundamental course to be able to follow

Bachelor Thesis

Special students and auditors need special permission from the lecturers.
Get to know cognitively activating instructions in MINT subjects

Human Learning (EW1)

This lecture is only apt for students who intend to enrol in the programs "Teaching Diploma" or "Teaching Certificate". It is about learning in childhood and adolescence.

Abstract

This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

Objective

Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Content

Thematic Schwerpunkte:
- Lernen als Verhaltensänderung und als Informationsverarbeitung: Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzerwerb unter besonderer Berücksichtigung des Wissenstransfer; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen; Intelligenztheorien, Geschlechtsunterschiede beim Lernen

Lernformen:

Lecture notes

Folien werden zur Verfügung gestellt.

Literature from the learning sciences is critically discussed with a focus on research methods.

Cognitively Activating Instructions in MINT Subjects

Enrollment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Number of participants limited to 30.

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Abstract

This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

Objective

- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice

Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

Human Intelligence

Enrollment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Number of participants limited to 30.

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Abstract

The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objective

- Understanding research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

Research Methods in Educational Science

Number of participants limited to 30.

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Abstract

Literature from the learning sciences is critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and two further meetings will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

Objective

- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

Coping with Psychosocial Demands of Teaching (EW4 W DZ)

Number of participants limited to 20.

This lecture is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.
Teaching Internship Including Examination Lessons

Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

- They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).
- They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions).

Abstract

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Objective

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.

Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content

The Themen für die beiden Prüfungslektionen am Schluss des Praktikums erfahren die Studierenden in der Regel eine Woche vor dem Prüfungstermin. Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie bis am Vortrag um 12 Uhr den beiden Prüfungsexperten (Fachdidaktiker/-in, Departementsvertreter/-in) ein. Die gehaltenen Lektionen werden kriteriumsbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltenen Lektionen im Rahmen eines kurzen Kolloquiums.

Lecture notes

Dokument; schriftliche Vorbereitung für Prüfungslektionen.

Literature

Wird von der Praktikumslehrperson bestimmt.

</tbody>
</table>

Abstract

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

Objective

- To familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
- To independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readers.
- To try out different options for specialist further training in their profession.

Content

Thematic Schwerpunkte:

- Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

Literature

Die Literatur ist themenspezifisch. Sie muss je nach Situation selber beschafft werden oder wird zur Verfügung gestellt.

Prerequisites / notice

Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

Disciplinary Competences

Ruminant Science

<table>
<thead>
<tr>
<th>Number</th>
<th>Title</th>
<th>Type</th>
<th>ECTS</th>
<th>Hours</th>
<th>Lecturers</th>
</tr>
</thead>
</table>

Abstract
The course provides the scientific basis of the central aspects of reproduction, husbandry and nutrition physiology of ruminants, and of the implications for animal welfare, product quality, breeding programs, and organic livestock systems. Means of knowledge transfer include interdisciplinary approaches, disciplinary parts, web-based learning and self-study.

Objective
At the end of the course the students are able to apply, by a comprehensive understanding of the underlying mechanisms, their knowledge in various fields of ruminant science. They will be able to develop and recommend best strategies for breeding programs, feed formulation, improving forage quality, increasing animal health and welfare etc. They will be trained to carry out interdisciplinary and disciplinary research at the highest level. The course Ruminant Science (FS) offered in spring has a similar structure but is complementary to this course.

Content
Fields (contact hours)
- Introduction: 2 h
- Special topics: 12 h
  - Lameness
  - Fertility in Cows
  - Food Intake of Ruminants
- Disciplinary topics: 36 h
  - Ruminant Husbandry: 16 h
  - Ruminant Nutrition Physiology: 10 h
  - Reproduction in Ruminants: 8 h
- Lectures held by the students: 4 h

In summary
- Contact hours: 52 h
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)
- Self-study in semester break: 38 h
Total: 120 h

Lecture notes
Documents, links and other materials will be provided at the start of the course

Literature
Information on books and other references will be communicated during the course

Prerequisites / notice
The specialty of this course is that for the first time the animal science disciplines are unified. This is realised with a particular emphasis on interdisciplinary special topics and new forms of teaching. At the same time the essential basics in the central fields are communicated.

The field of Ruminant Science will also be a part of the spring semester (special topics: Organic Ruminant Systems, Tropical Ruminant Systems, Mastitis; disciplinary courses: Cattle, Sheep and Goat Breeding, Ruminant Diseases and Prophylaxis, Ruminant Nutrition and the Environment). However both courses are organized independently.

Conditions for successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as ‘optional courses’ in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.

The control of performance will consist of:
- an own lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details

<td>Ruminal Digestion</td>
<td>W+</td>
<td>1</td>
<td>1G</td>
<td>A. Schwarm</td>
</tr>
</tbody>
</table>

Abstract
This course broadens the knowledge in one of the most important aspects of ruminant nutrition: the microbial digestion in the rumen (and in the hindgut). For a comprehensive understanding of the rumen microbial ecosystem, the mechanisms of nutrient fermentation and the synthesis of microbial protein, thorough basics are provided. Apart from lectures, laboratory exercises are included.

Objective
The course enables students to understand in detail how ruminal digestion works and how this knowledge can be applied to design optimal feeding diets using highly fibrous forages and a variety of other feeds. The students also are able to show how to modify the most important rumen microbes beneficially by nutritional means.

Content
Structure of the contact hour part of the course (14 h):
- 2 h Introduction and blackboard exercise
- 8 h Basic topics in ruminal digestion:
  - Systematics of the microbes involved in microbial digestion
  - Measurement of microbial digestion
  - Interactions of microbes and epithelium of the digestive tract
  - Differences between ruminal and hindgut microbial digestion
  - Microbial nutrient degradation and its modification
  - Efficiency of microbial protein synthesis
  - Manipulation of the ruminal digestion
- 2 h Laboratory exercise with a rumen fistulated cow and the Rumen Simulation Technique
- 2 h Concluding seminary

The non-contact hour part is to comprehend the information given and to prepare either the written report or the oral presentation (cf. “Besonderes”)

Lecture notes
A documentation will be provided at the start of the course.

Literature
Will be communicated at the start of the course.
The course is a balanced mixture of blackboard exercise, laboratory exercise, lecture and student seminar presentation. Credit point associated with grade of either a written report or an oral presentation in the concluding seminar (both on a self-chosen related topic).

---

### Non-Ruminant Science

</tr>
</tbody>
</table>

**Abstract**
The overall goal of the course is to provide the essential scientific knowledge of the genetic, physiological and special nutritional aspects of pigs metabolism, animal health and behaviour, and of the implications for environment, product quality, housing and animal welfare, and breeding programs.

**Objective**
- Students will understand the complex interactions of nutrition, quality traits of products, breeding and reproduction, health management, behaviour and husbandry.
- be trained to understand interdisciplinary and disciplinary research.
- be able to critically analyze published research data.
- be able to present precise scientific reports in oral and written form.

**Content**
Four main topics in Pig Science:
- Behaviour and Husbandry of pigs: behavioral needs, husbandry related behavioral disorders, design and construction of housing systems in accordance with welfare requirements and legal regulations.
- Planning of reproductive cycle in practice
- welfare monitoring in practice
- pigs in organic farming
- Animal Health and Diseases: animal hygiene, immunology/vaccinations, metabolic diseases, diarrhoe, legislation, thermoregulation, important infections, prophylaxis.
- poster, exam and evaluation

<td>W+</td>
<td>2</td>
<td>1S</td>
<td>M. Kreuzer, S. Bauersachs, E. Hillmann, S. Neuenschwander</td>
</tr>
</tbody>
</table>

**Abstract**
This forum is a platform for the critical reflection of highly relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

**Objective**
In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.

**Content**
The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:
- Element 1: Oral Presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturers are the audience.
- Element 2: Scientific writing: Option 1: preparation of a short scientific type of paper from a result table offered by the lecturers; Option 2: preparation of an abstract with limited word count from a scientific paper; Option 3: writing of a critical review of a paper. The students have to select 2 of the three options each. There will be a discussion be a discussion in small groups at two dates.

**Lecture notes**
no script

**Prerequisites / notice**
Requirements for allocation of the two credit points:
- Theatre presentation (with handout) at the forum
- Delivery of written documents of sufficient quality
- Active participation during the presentations by the other participants

**Abstract**
Farm animals play an important role in most agro/eco - systems, but conditions for a successful management and nutrition in the tropics are diverse. In this course a wide range of aspects are examined.

**Objective**
The aim of this course is to know and understand animal production systems in the different zones of the tropics taking into consideration the local and social structure of the population. We will deal with different aspects of animal nutrition in the tropics.

**Content**
- Introduction to the tropics
- Special problems and challenges in tropical regions
- Importance of livestock in the tropics
- Animal production and livestock production systems in the tropics
- Special challenges for livestock in the tropics
- Feeds available in the tropics
- Tropical pasture systems and their characteristics
- Quality of feeds in the tropics
- Problems and challenges of animal nutrition in the tropics

---
Abstract
This course deals with unconventional animals or production forms and specific aspects of keeping them in Europe or, more specifically, in Switzerland. This includes e.g. rare breeds, wild cattle, deer, camelds, ostrich and fish. Particular emphasis will be given to the regulations and the problems occurring with import, housing and marketing of the products.

Objective
At the end of the course the students are able to describe the conditions of keeping unconventional livestock and to develop recommendations for farmers intending to include niche production into the farm enterprise.

Content
The contact hour part of the course (16 h) is conceptually a block course which is subdivided into one day of lecture and one day of excursion.

The non-contact hour part (14 h) is to comprehend the information given and to prepare for the examination.

Lectures notes
A documentation will be provided at the start of the course.

Literature
Will be communicated at the start of the course.

Prerequisites / notice
Lecture and excursion have the same weight with respect to time allocation.

Scheduled dates of the course for 2011:
- Theory part: Monday 29 October 2012
- Excursion: Monday 5 November 2012
- The date of examination is to be coordinated between lecturers and students.

Abstract
Technologies of molecular animal-, immuno- and biochemical genetics will be shown and applied to selected domestic and farm animals. The students will perform laboratory tests for genome analysis (identification of gene loci, gene mapping), gene expression (mRNA, proteins), diagnostics (analysis of hereditary diseases) and verification of animals and animal products (parentage control, forensics).

Objective
Get to know and apply the basic laboratory methods to systematically identify loci controlling important performance and disease traits and analysis of the molecular nature of variation at the loci. At the end of the course the students are able to understand the underlying mechanisms influencing genetic variations and to analyze gene variants in the laboratory. The students know the importance of the technologies for animal breeding, animal health and quality of animal products in Switzerland and internationally.

Content
- Introduction to the course (aims, program, written examination)
- Porcine E.coli test. Determination of the mutation in FUT1
- Sequencing of DNA
- Marker-/microsatellite analyses
- Forensics
- Cytogenetics
- Cell cultures
- Inheritance of coat colour
- Gene expression and biotechnology

Contact hours: 42 h

Self-study (preparation for courses and examination): additionally

Specific literature will be indicated individually by the lecturers.

**Literature**
In the autumn semester, the two addressed cropping systems and value chains are fruit-production and viticulture. Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

The course builds on basic knowledge delivered in ‘Horticultural Crops I’ and ‘Horticultural Crops II’. If these courses have not been included. In a final colloquium, each group presents a report on their case study and their conclusions.

The tentative schedule contain the following topics:

- Introduction To Experimental Design and Applied Statistics
- Introduction to R*/ Revival of 'R' Skills
- Designs of Field and Growth Chamber Experiments
- Nonlinear Regression Fits
- Multivariate Techniques: Principle Component Analysis, Canonical Correpondence Analysis (CCA), Cluster Analysis
- ANOVA using linear and mixed effect models
- Error Analysis, Error Propagation and Error Estimation
- Introduction to autoregression and autocorrelations in temporal and spatial data and how to consider them in ANOVA-type analysis

This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor’s course “Wissenschaftliche Datenauswertung und Datenpräsentation” (751-0441-00L)

### Project Management and Presentation Skills

<tr>
<td>751-4203-00L</td>
<td>Horticultural Science: Case Studies (HS)</td>
<td>W+</td>
<td>2</td>
<td>2G</td>
<td>L. Bertschinger, J. Rösti, V. J. U. Zufferey</td>
</tr>
</tbody>
</table>

**Abstract**

Lectures address 2 horticultural cropping systems and value chains, each one in 4 2h-lecture blocks. Afterwards, the students split in 2 groups for addressing a case study focusing on one of the cropping systems treated before. An excursion to a research site might be included. In a final colloquium, each group presents a report on their case study and their conclusions.

**Objective**

Achieve a deepened understanding of horticultural value chain challenges relating to ecological intensification, resource efficiency, climate change and healthy and safe food, and the problem solution strategies and scientific principles behind.

Deliver in a team effort a report and a presentation providing a comprehensive insight into a problem of the horticultural value chain and its science-based solution strategy.

**Content**

In the autumn semester, the two addressed cropping systems and value chains are fruit-production and viticulture.

In the spring semester, the two addressed cropping systems and value chains are vegetable-production- and berry-production or glasshouse-horticulture.

The selected topics address challenges with regard to ecological intensification, resource efficiency or climate change and branch into ongoing research and development projects.

**Lecture notes**

Documents handed out during the case studies.

**Literature**

As provided by the case study leaders.

**Prerequisites / notice**

The course builds on basic knowledge delivered in ‘Horticultural Crops I’ and ‘Horticultural Crops II’. If these courses have not been followed by interested participants, equivalent knowledge and experience will greatly support a successful and productive participation of the participating student.

Language: spoken E, G or F, Documents: Preferably English, G/F possible.

</tbody>
</table>

**Abstract**

Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.
Objective
During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

751-3603-00L Plant Breeding II

Abstract
The course consists of two parts. First, important plant breeding concepts such as, molecular breeding and genetic engineering but also organic and participatory breeding are introduced and discussed. Furthermore, we look at the legislation affecting these concepts. Second, the application of different plant breeding methodologies and their effect on the evolution of major crops is highlighted.

Content
In the first part of the course, we will discuss most important plant breeding tools and concepts. The lectures include lessons on genetic engineering utilizing genetic variation across species; organic plant breeding focussing on the need of organic agriculture; participatory plant breeding involving farmers in the breeding progress as well as genomic selection using a genome-wide coverage of molecular markers to predict the performance of a genotype. You will learn how new marker technologies and breeding tools in combination with precise phenotyping may influence the breeding progress in the future and how knowledge of the genetic architecture of crops can be utilized for selection. Furthermore, we will cover the legislation around the conservation of crop genetic resources for food and agriculture (PGRFA), the plant breeding rights (UPOV), gene patenting and the release of genetically modified organisms into the environment.

Prerequisites / notice
The participation in this course requires a basic understanding of plant breeding as taught in ‘Pflanzenzüchtung 1’ (formerly Pflanzenzüchtung), or similar lectures at other universities.

<td>M. Meissle, A. Hund, B. Studer</td>
<td></td>
</tr>
</tbody>
</table>

Objective
This is an introductory course in insect ecology. Students will learn about the ways in which insects interact with and adapt to their abiotic & biotic environments and their roles in diverse ecosystems. The course will entail lectures, outside readings, and critical analysis of contemporary literature.

Content
Students completing this course should become familiar with the application of ecological principles to the study of insects, as well as major areas of inquiry in this field. Highlighted topics will include insect behavior, chemical and sensory ecology, physiological responses to biotic and abiotic stressors, plant-insect interactions, community and food-web dynamics, and disease ecology. The course will emphasize insect evolution and adaptation in the context of specific interactions with other organisms and the abiotic environment. Examples from the literature incorporated into lectures will highlight the methods used to study insect ecology.

<td>W+</td>
<td>2 credits</td>
<td>2G</td>
<td>L. Meissle, N. Buchmann</td>
<td></td>
</tr>
</tbody>
</table>

Objective
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Content
Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small interdisciplinary teams.
Content

Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Lecture notes

Handsouts will be available on the webpage of the course.

Literature

Will be discussed in class.

Prerequisites / notice

Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Course will be taught in English.

751-5115-00L Current Aspects of Nutrient Cycle in Agro-Ecosystems W+ 2 credits 1S E. Frossard

Abstract

The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. It offers to deepen the knowledge on a specific theme related to nutrients. It is composed by presentations of national and international speakers and by an excursion. The students write a report where they compile the obtained information, relate it to their own knowledge and include literature.

Objective

Listen and understand expert's presentations. Ask questions and contribute to the discussion during the talk sessions and the excursion. Link the information obtained during the seminar with knowledge from previous lessons and with literature searched to complement the matter. Expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem.

751-4003-01L Current Topics in Grassland Sciences (HS) W+ 2 credits 2S N. Buchmann

Abstract

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Objective

Students will be able to understand and evaluate experimental design and data interpretation of on-going studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

Content

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

751-5001-00L Agroecologists without Borders W 2 credits 2S C. Decock, A. Hofmann, J. Six

Abstract

In this seminar students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

Objective

(1) Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
(2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
(3) Students articulate complexity and challenges in agricultural development interventions.
(4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

Prerequisites / notice

Students signing up for this class should have a strong interest in tropical agriculture and science communication.

751-4805-00L Recent Advances in Biocommunication Number of participants limited to 25 W+ 2 credits 2S C. De Moraes

Abstract

Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods.

Objective

Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods. Students will engage in discussion and critical analyses of relevant papers and present their evaluations in a seminar setting.

751-3405-00L Radio-Isotopes in Plant Nutrition W+ 3 credits 2G E. Frossard

Abstract

The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine element availability. Finally, published studies from other groups will be analyzed and presented by the students.
Objective
At the end of this course the students are familiar with the principles on which radioisotope works are based and they have learned from case studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotope work.

Content
Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, radionuclides) within a given system and to assess the importance of processes controlling these fluxes (e.g. exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.). The course will first present the principles, the basic assumptions and the theoretical framework that underlay the work with radioisotopes. It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g. number and size of compartments). Secondly, case studies on isotopic dilution and tracer work will be presented for instance on the isotopic exchange kinetics method to determine nutrients or pollutants availability. The case studies will be adapted to the ongoing research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.

Lecture notes
Documents will be distributed during the lecture

Literature
Will be given during the lecture

Prerequisites / notice
The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at: http://www.pe.ipw.agrl.ethz.ch/about/reach

751-5123-00L Rhizosphere Ecology W+ 4 credits 4G H. A. Gamper, E. K. Bünemann König, T. I. McLaren

Abstract
This course emphasizes interactions among physicochemical and biological processes and highlights implications for plant nutrition, growth, and health. Nutrient mobilization and acquisition by plants in response to fertilization, other plants, and microbes, are explored in model systems. Newly gained knowledge is applied to understand results of a pot experiment and thereby critically reflected.

Objective
To gain a holistic understanding of resource-driven and regulatory processes in natural and agronomic plant-microbe-soil systems.
To practice abilities to read scientific literature, understand it, present it, and discuss it with peers.
To combine available and newly acquired knowledge from soil physics, chemistry and (micro-)biology, plant physiology, pathology, and ecology and reflect on their relative importance for plant production, bio remediation, and nature conservation when considered together.
To practice manual skills in handling seedlings, soil, plant, and DNA samples, laboratory equipment, and working with different computer software.
To make observations, analyse, display, interpret and present own data.
To get familiar with (bio-)chemical, molecular genetic, and simple bioinformatics analyses.
To prepare as a group of course participants a poster on one selected aspect of a bigger pot experiment, present it, and discuss findings and posters of other course participants.
To combine findings with available knowledge, generate explanatory hypotheses, and identify potentially informative further analyses and experiments.

Content
This course comprised lectures, the set-up, harvest and data analysis of an experiment, soil (bio-)chemical, microbiological and molecular genetic analyses in the laboratory and practical computational data analyses. The focus is set on a better understanding of the role played by spatial and temporal physicochemical and microbiological gradients and various soil organisms in plant mineral nutrition. Mutualistic associations between plant roots and microbes, such as the root symbiosis with mycorrhizal fungi and root nodule-inducing bacteria are discussed. Rhizobia are isolated from field-collected root nodules and characterized, using molecular genetic tools. A short introduction into DNA-based bioinformatics and phylogenetic analyses is given to demonstrate how bacterial species are identified and potential host ranges of isolated rhizobia can be inferred, using so-called functional genes. A pot experiment in the glasshouse on cereal-legume mixed intercropping, including effects of pot size, intra- and interspecific plant competition, and root traits, allows to relate scientifically interesting research topics to practical application, while simultaneously stimulating critical reflections.

Lecture notes
Lecture slides and laboratory protocols are being made available in the directory '751-5123-00L Rhizosphere Ecology' of the electronic document exchange platform ILIAS, LDA-ELBA:

Ecological Understanding (Second Edition)
The Nature of Theory and the Theory of Nature:

Prerequisites / notice

For students of the Agricultural Sciences of D-USYS: Lectures in Plant Nutrition I and II (Nutrient cycling in agroecosystems by Prof. E. Frossard).

We ask all other course participants to read and understand the e-learning module Plant Nutrition I by Prof. E. Frossard:
https://moodle-app2.let.ethz.ch/course/view.php?id=279

For students of the Agricultural Sciences of D-USYS: Lectures in Plant Nutrition I and II (Nutrient cycling in agroecosystems by Prof. E. Frossard).

We ask all other course participants to read and understand the e-learning module Plant Nutrition I by Prof. E. Frossard:
https://moodle-app2.let.ethz.ch/course/view.php?id=279

This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and water 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.

</tr>
</tbody>
</table>
The two objectives of the class are:

- to provide an overview of the important issues related to food markets and supply chains.
- to present the economics concepts and tools that are useful to understand the functioning of food supply chains under various governance regimes or policies (emphasis on welfare analysis)

The course is balanced between presentation of economics concepts and illustration by case-studies. The lecture titles include:

- Demand for food.
- Matching demand with supply.
- Industrial organization in the food supply chain.
- Non-quality attributes of food.
- When information is costly.
- Food production and the environment.
- The food sector within human economies.

In addition, the students collectively identify and address an applied research question. We implement an empirical strategy to tackle the question before results are discussed individually by students during the final written examination.

Lecture notes

Lecture notes are made available after each lecture.

Literature

Readings in the standard economics literature include:

- Coase 1937,
- Mussa Rosen 1978,
- Lancaster 1966,

Prerequisites /

Students are expected to master basic microeconomics concepts such as demand, supply, or consumer and producer surplus. We will review how to calculate elasticities, tax and quota impacts on prices etc...but the class focuses on applications of these tools rather than on basic understanding. Students are expected to have taken at least one intermediary microeconomics class.

Prerequisites / notice

Basic knowledge in management concepts (e.g. lecture “Management” in D-USYS).

Environmental and Resource Use Economics

The course addresses environmental policies, focusing on new approaches, which are generally summarized as environmental governance. The course also provides a broader introduction to social science concepts to provide students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

- To understand how an environmental problem may (or not) become a policy and explain political processes, using basic concepts and techniques from political science.
- To analyze the evolution as well as the key elements of environmental governance.
- To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of ‘environmental governance’ and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Lecture notes

Lecture slides and additional course material will be provided throughout the semester.
The course focuses on agricultural trade in a rapidly globalizing world. We analyze the impact of trade policy instruments on welfare and distribution. By means of case studies the following specific aspects of agricultural trade are analyzed: trade and food security; trade and environment/natural resources; trade and development.

### Literature

### Prerequisites / notice

We recommend that students have (a) Three-years BSc education of a (technical) university; (b) Successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) Familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)

### Content

- Trade and development
- Trade and environment
- Trade and food security

### Prerequisites / notice

- Students from ETH will receive 4 ECTS credit points if they attend classes regularly and obtain a grade of 4.0 or higher for the written exam in the final week of the semester. Students who obtain a grade of less than 4.0 for the end-of-semester test will have a second chance in the first week of the following semester. The rules of the game are defined in detail on the course syllabus. Students who do not participate in the end of semester test will not have access to the repeat exam unless they submit compelling and documented reasons for why they were unable to participate in the first test. Except for language dictionaries, no additional materials and no laptops and mobile phones are allowed during the exam.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 4 ECTS credit points. The workload is around 120 hours (meetings, reading assignments, preparation of test).

Objective
Focus: Policy Evaluation

The students are to...
- have a critical look at different angles of agri-economic research
- study scientific literature of the focus theme
- consider strengths, weaknesses and the application of research approaches
- apply knowledge gained from other courses with respect to the focus theme
- get insights in agricultural economic research of the national research institutions by visiting Agroscope Reckenholz-Tänikon ART and the Research Institute of Organic Agriculture (FiBL)
- be capable to conduct evaluations and critically reflect evaluation results

Content
Unit: Subject

01: Introduction in the issue of policy evaluation
02: The normative frame for policy evaluation
03: Evaluation of public policies
04: Context and use of evaluations
05: Quantitative policy evaluation
06: Qualitative policy evaluation
07: Group work
08: Agricultural Economics Research at ART
09: Agricultural Economics Research at FiBL
10: Examination, Feedback

Lecture notes
Handouts (power point presentations)

Literature
1) Bussmann Werner, Klöti Ulrich und Knoepfel Peter, 2004 (Hrsg). Einführung in die Politikevaluation. Helbling&Lichtenhahn. In German language. Will be privided by the lectures in unit 01.

Prerequisites / notice
Unit 08: 1 day course at ART in Tänikon, 8356 Ettenhausen, www.art.admin.ch
Unit 09: 1 day course at FiBL in 5070 Frick, www.fibl.org

★★★★ Methodology Competences
★★★★ Methods in Food and Resource Use Economics

<table>

</thead>
</table>

Abstract
In this course, different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem sciences. Both manipulative (field and laboratory) experiments and surveys are addressed and students work with a selection of basic techniques and methods to analyse data using a hands-on approach. Methods range from simple t-tests to multi-factorial approaches

Objective
Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.

Content
The course program uses a learning-by-doing approach ("hands-on minds-on"). New topics are introduced in the lecture hall, but most of the work is done in the computer lab to allow for the different speeds of progress of the student while working with data and analyzing results. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contain the following topics:
- Introduction To Experimental Design and Applied Statistics
- Introduction to 'R' / Revival of 'R' Skills
- Designs of Field and Growth Chamber Experiments
- Nonlinear Regression Fits
- Multivariate Techniques: Principle Component Analysis, Canonical Correspondence Analysis (CCA), Cluster Analysis
- ANOVA using linear and mixed effect models
- Error Analysis, Error Propagation and Error Estimation
- Introduction to autoregression and autocorrelations in temporal and spatial data and how to consider them in ANOVA-type analysis

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

Lecture notes
Handouts will be available (in English)

Literature
A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture.

Prerequisites / notice
This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor’s course “Wissenschaftliche Datenauswertung und Datenpräsentation” (751-0441-00L)

Abstract
Finding solutions: what is complexity, problem solving cycle.

Implementing solutions: project management, critical path method, quality control feedback loop.

Controlling solutions: Vensim software, feedback cycles, control parameters, instabilities, chaos, oscillations and cycles, supply and demand, production functions, investment and consumption

Objective
A successful participant of the course is able to:
- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyse the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics
### Introduction to Mathematical Optimization

**Course Information**

- **Credit**: 2 credits
- **Objective**: To get a good understanding of some of the most important mathematical optimization techniques used to solve linear programs
- **Prerequisites**: Basic knowledge of linear algebra, calculus, and discrete mathematics.

**Content**

- **Topics**: Linear programming, duality, simplex method, duality theory, shadow prices, spanning trees, network flows, knapsack problem.
- **Literature**:

**Lecture Notes**

Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM. The lecture slides are provided as handouts including notes and literature sources. Self-study tasks (discussion exercises, Vensim exercises) are provided as homework. Weekly exercise sessions (45 min) are used to discuss selected solutions.

**Prerequisites / Notice**

This course is meant for students who did not already attend the course "Mathematical Optimization," which is a more advanced lecture covering similar topics and more.

### Risk Analysis

**Course Information**

- **Credit**: 2 credits
- **Objective**: To develop a better understanding of decision making under uncertainty and risk.
- **Prerequisites**: Basic knowledge of probability theory.

**Content**

- **Topics**: Risk preferences, expected utility theory, mean-variance approach, stochastic dominance criterion, portfolio optimization (risk efficient frontier), state-contingent approach, utility-efficient modeling, stochastic processes, Bayesian inference.
- **Literature**:

**Lecture Notes**

Handouts will be distributed in the lecture and available on the Moodle. References to the relevant literature will be made in the course.

**Prerequisites / Notice**

This course is meant for students who did not already attend the course "Mathematical Optimization," which is a more advanced lecture covering similar topics and more.

### Econometrics II

**Course Information**

- **Credit**: 2 credits
- **Objective**: Introduction to econometrics with practical work on the PC. The lecture builds on Econometrics I (regression analysis, autocorrelated and heteroscedastic disturbances) and addresses the problem of multicollinearity, the estimation of error-correction models, simultaneous equation models, and the Probit model.

**Content**

- **Topics**: Regression analysis, autocorrelation, heteroscedasticity, estimation of error correction models, simultaneous equation models, Probit model.
- **Literature**:

**Lecture Notes**

Summary handouts are available in the Teaching documents repository.

**Prerequisites / Notice**

### Dynamic Simulation in Agricultural and Regional Economics

**Course Information**

- **Credit**: 1 credit
- **Objective**: Students in this class develop a dynamic simulation model that represents the basic mechanisms underlying food security in developing countries in a highly aggregated way. Students then proceed to extending the simulation model with one policy to improve food security and they analyze the dynamic impacts of this policy on production and environmental outcomes.

**Content**

- **Topics**: Students learn the basic theory and practice of dynamic simulation.
- **Literature**:
  - B. Kopainsky, *Dynamic Simulation in Agricultural and Regional Economics*, 2015

**Lecture Notes**

Slides (will be provided during the class)

Abstract
- Acquiring competence in
  - searching, analyzing and synthesizing scientific information on a specific subject
  - writing a scientific paper
  - making a scientific oral presentation, alone (with poster) and with the team
  - animating and moderating a discussion (teamwork)

Objective
- Acquiring competence in
  - searching, analyzing and synthesizing scientific information on a specific subject
  - writing a scientific paper
  - making a scientific oral presentation, alone (poster) and with the team
  - animating and moderating a discussion (teamwork)

Content
- Workshops
  - how to make a poster
  - how to present (with video-feedback)
  - how to moderate a discussion
  - scientific writing (different types of documents)
  - individual assessment:
    - make a poster and present it
    - write a review or a statement
    - team assessment:
      - write a recommendation (executive summary)
      - present the recommendation
      - moderate a discussion

Abstract
- The course addresses environmental policies, focusing on new approaches, which are generally summarized as environmental governance. The course also provides a broader introduction to social science concepts to provide students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

Objective
- To understand how an environmental problem may (or not) become a policy and explain political processes, using basic concepts and techniques from political science.
- To analyze the evolution as well as the key elements of environmental governance.
- To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

Content
- Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of 'environmental governance' and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Lecture notes
- Lecture slides and additional course material will be provided throughout the semester.
- We will mostly work with readings from the following books:

Prerequisites / notice
A detailed course schedule will be made available at the beginning of the semester.

We recommend that students have (a) Three-years BSc education of a (technical) university; (b) Successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) Familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)
The course focuses on the role of agricultural trade in a rapidly globalizing world. We analyze the impact of trade policy instruments on welfare and distribution. By means of case studies the following specific aspects of agricultural trade are analyzed: trade and food security; trade and environment/natural resources; trade and development.

Objectives

1. Knowledge of the mechanisms of agricultural trade
2. Impact of trade policy instruments on welfare and distribution
3. Specific aspects of agricultural trade and links to other courses:
   - Trade and food security
   - Trade and environment
   - Trade and development

Content

The course focuses on the role of agricultural trade in a rapidly globalizing world. We analyze the impact of trade policy instruments on welfare and distribution. By means of case studies the following specific aspects of agricultural trade are analyzed: trade and food security; trade and environment/natural resources; trade and development.

Prerequisites / notice

- Basic knowledge in management concepts (e.g. lecture “Management” in D-USYS).
- Selected contemporary models for managing in the complex organizational world.
- A basic framework for shaping and governing intelligent organizations.
- State, reasons and effects of complexity in the organizational world.

Handouts (power point presentations)

- be capable to conduct evaluations and critically reflect evaluation results
- have a critical look at different angles of agri-economic research
- study scientific literature of the focus theme
- consider strengths, weaknesses and the application of research approaches
- apply knowledge gained from other courses with respect to the focus theme
- get insights in agricultural economic research of the national research institutions by visiting Agroscope Reckenholz-Tänikon ART and the Research Institute of Organic Agriculture (FiBL)
- get insights in agricultural economic research with particular focus on policy evaluation. We impart insights in the issue of policy evaluation as part of agricultural economics research.

Focus: Policy Evaluation

Unit: Subject

01: Introduction in the issue of policy evaluation
02: The normative frame for policy evaluation

10: Examination, Feedback

Literature

1) Bussmann Werner, Köbi Ulrich und Knoepfel Peter, 2004 (Hrsg). Einführung in die Politikevaluation. Helbling&Lichtenhahn. In German language. Will be provided by the lectures in unit 01.

Prerequisites / notice

Unit 08: 1 day course at ART in Tänikon, 8356 Ettenhausen, www.art.admin.ch
Unit 09: 1 day course at FiBL in 5070 Frick, www.fibl.org

751-2205-00L Advanced Management in the Agri-Food-Chain

W 2 credits 2G M. Weber

Objective

After the lecture the students 
... know the characteristics and consequences of complexity in the organizational world,
... know and can apply selected comprehensive models for managing in complex situations,
... know possible practical applications and examples of the treated contents to organizations in the Agri-Food Chain and
... are able to deepen the relevant topics in an autonomous way.

Content

In the lecture the following contents will be treated:
- State, reasons and effects of complexity in the organizational world.
- A basic framework for shaping and governing intelligent organizations.
- Selected contemporary models for managing in the complex organizational world.
- Transfer and adaption of the models to organizations in the Agri-Food Chain.

Lecture notes

Reader with selected contents.

Prerequisites / notice

Basic knowledge in management concepts (e.g. lecture “Management” in D-USYS).

751-5001-00L Agroecologists without Borders

W 2 credits 2S C. Decock, A. Hofmann, J. Six
In this seminar students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

Objective
(1) Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
(2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
(3) Students articulate complexity and challenges in agricultural development interventions.
(4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

Prerequisites / notice
Students signing up for this class should have a strong interest in tropical agriculture and science communication.

851-0594-00L International Environmental Politics W 4 credits 2V T. Bernauer

Abstract
This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

Objective
The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.

Content
This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 4 ECTS credit points. The workload is around 120 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

Lecture notes
Slides and reading material will be made available at www.ib.ethz.ch (teaching, materials, then menu on the left side of the screen). They are password protected. Use your Netzh username and password to access the material.

Literature
See www.ib.ethz.ch (teaching, materials)

Prerequisites / notice
Students from ETH will receive 4 ECTS credit points if they attend classes regularly and obtain a grade of 4.0 or higher for the written exam in the final week of the semester. Students who obtain a grade of less than 4.0 for the end-of-semester test will have a second chance in the first week of the following semester. The rules of the game are defined in detail on the course syllabus. Students who do not participate in the end of semester test will not have access to the repeat exam unless they submit compelling and documented reasons for why they were unable to participate in the first test. Except for language dictionaries, no additional materials and no laptops and mobile phones are allowed during the exam.

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

The workload for this course is approx. 120 hours (all inclusive).

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 35 of 1432
Seminar in Evolutionary Ecology of Infectious Diseases

**Abstract**
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

**Objective**
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

**Content**
A core set of 10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

**Lecture notes**
Papers will be assigned and downloaded from a web page announced during the lecture.

**Literature**
Publications and class notes can be downloaded from a web page announced during the lecture.

---

Alien Organisms in Agriculture

**Abstract**
The course focuses on alien organisms in agriculture as well as the scientific assessment and regulatory management of their effects on the environment and agricultural production.

**Objective**
Students will understand the consequences arising from the unintentional or deliberate introduction of alien organisms into agricultural systems. They will be able to understand the concept of environmental risk assessment and be able to evaluate risk management options.

**Content**
Alien organisms in agriculture is a topic that receives an increasing awareness among farmers, agricultural scientists, regulators and the general public. Students of this course will learn about the nature of alien organisms such as invasive species, biocontrol organisms and genetically modified organisms. With a particular focus on arthropods, plants and their interactions we will look at the potential threats the novel organisms pose, the benefits they provide and how both of these effects can be scientifically assessed. Students will learn how the topic of alien organisms in agriculture is intrinsically tied to policy making and regulation and get to know current examples and future challenges in research. In the last part of the course students will be able to apply the acquired knowledge in a practical exercise (case study).

**Lecture notes**
Material will be distributed during the course.

---

Agroecologists without Borders

**Abstract**
In this seminar students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

**Objective**
(1) Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
(2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
(3) Students articulate complexity and challenges in agricultural development interventions.
(4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

**Prerequisites / notice**
Students signing up for this class should have a strong interest in tropical agriculture and science communication.

<td>Radio-Isotopes in Plant Nutrition</td>
<td>W+</td>
<td>3</td>
<td>2G</td>
<td>E. Frossard</td>
</tr>
</tbody>
</table>

**Abstract**
The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine element availability. Finally, published studies from other groups will be analyzed and presented by the students.

**Objective**
At the end of this course the students are familiar with the principles on which radioisotopes works are based and they have learned from case studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotope work.

**Content**
Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, radionuclides) within a given system and to assess the importance of processes controlling these fluxes (e.g. exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.). The course will first present the principles, the basic assumptions and the theoretical framework that underlay the work with radioisotopes. It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g. number and size of compartments). Secondly, case studies on isotopic dilution and tracer work will be presented for instance on the isotopic exchange kinetics method to determine nutrients or pollutants availability. The case studies will be adapted to the ongoing research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.

**Lecture notes**
Documents will be distributed during the lecture.

**Literature**
Will be given during the lecture.

**Prerequisites / notice**
The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at: http://www.pe.ipw.agrl.ethz.ch/about/reach

| 751-4003-01L | Current Topics in Grassland Sciences (HS) | W+ | 2 | 2S | N. Buchmann |

**Abstract**
Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

**Objective**
Students will be able to understand and evaluate experimental design and data interpretation of on-going studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

**Content**
Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

**Lecture notes**
none

**Prerequisites / notice**
Prerequisites: Basic knowledge of plant ecophysiology, terrestrial ecology and management of agro- and forest ecosystems. Course will be taught in English.

| 751-4104-00L | Alternative Crops | W | 2 | 2V | A. Walter, B. Büter |

**Abstract**
Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.
Objective

During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

</tbody>
</table>

**Abstract**

Lectures address 2 horticultural cropping systems and value chains, each one in 4 2h-lecture blocks. Afterwards, the students split in 2 groups for addressing a case study focusing on one of the cropping systems treated before. An excursion to a research site might be included. In a final colloquium, each group presents a report on their case study and their conclusions.

**Objective**

Achieve a deepened understanding of horticultural value chain challenges relating to ecological intensification, resource efficiency, climate change and healthy and safe food, and the problem solution strategies and scientific principles behind. Deliver in a team effort a report and a presentation providing a comprehensive insight into a problem of the horticultural value chain and its science-based solution strategy.

**Content**

- In the autumn semester, the two addressed cropping systems and value chains are fruit-production and viticulture.
- In the spring semester, the two addressed cropping systems and value chains are vegetable-production- and berry-production or glasshouse-horticulture.
- The selected topics address challenges with regard to ecological intensification, resource efficiency or climate change and branch into ongoing research and development projects.

**Lecture notes**

Documents handed out during the case studies.

**Literature**

As provided by the case study leaders.

**Prerequisites / notice**

The course builds on basic knowledge delivered in 'Horticultural Crops I' and 'Horticultural Crops II'. If these courses have not been followed by interested participants, equivalent knowledge and experience will greatly support a successful and productive participation of the participating students.

Language: spoken E, G or F. Documents: Preferably English, G/F possible.

**Abstract**

This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

**Objective**

Students will know and understand the complex and interacting processes of biogeochemistry, and biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small (interdisciplinary) teams.

**Content**

Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

**Lecture notes**

Handouts will be available on the webpage of the course.

**Literature**

Will be discussed in class.

**Prerequisites / notice**

Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Course will be taught in English.

</tbody>
</table>

**Abstract**

The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. It offers to deepen the knowledge on a specific theme related to nutrients. It is composed by presentations of national and international speakers and by an excursion. The students write a report where they compile the obtained information, relate it to their own knowledge and include literature.

**Objective**

Listen and understand expert's presentations. Ask questions and contribute to the discussion during the talk sessions and the excursion. Link the information obtained during the seminar with knowledge from previous lessons and with literature searched to complement the matter. Expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem.

**751-5123-00L**

**Rhizosphere Ecology**

<table>
<thead>
<tr>
<th>Course Code</th>
<th>Credits</th>
<th>L.</th>
<th>Authors</th>
</tr>
</thead>
</table>

**Abstract**

This course emphasizes interactions among physicochemical and biological processes and highlights implications for plant nutrition, growth, and health. Nutrient mobilization and acquisition by plants in response to fertilization, other plants, and microbes, are explored in model systems. Newly gained knowledge is applied to understand results of a pot experiment and thereby critically reflected.

**Objective**

To gain a holistic understanding of resource-driven and regulatory processes in natural and agronomic plant-microbe-soil systems.

To practice abilities to read scientific literature, understand it, present it, and discuss it with peers.

To combine available and newly acquired knowledge from soil physics, chemistry and (micro-)biology, plant physiology, pathology, and ecology and reflect on their relative importance for plant production, bioremediation, and nature conservation when considered together.

To practice manual skills in handling seedlings, soil, plant, and DNA samples, laboratory equipment, and working with different computer software.

To make observations, analyse, display, interpret and present own data.

To get familiar with (bio-)chemical, molecular genetic, and simple bioinformatics analyses.

To prepare as a group of course participants a poster on one selected aspect of a bigger pot experiment, present it, and discuss findings and posters of other course participants.

To combine findings with available knowledge, generate explanatory hypotheses, and identify potentially informative further analyses and experiments.

**Content**

This course comprised lectures, the set-up, harvest and data analysis of an experiment, soil (bio-)chemical, microbiological and molecular genetic analyses in the laboratory and practical computational data analyses. The focus is set on a better understanding of the role played by spatial and temporal physicochemical and microbiological gradients and various soil organisms in plant mineral nutrition. Mutualistic associations between plant roots and microbes, such as the root symbiosis with mycorrhizal fungi and root nodule-inducing bacteria are discussed. Rhizobia are isolated from field-collected root nodules and characterized, using molecular genetic tools. A short introduction into DNA-based bioinformatics and phylogenetic analyses is given to demonstrate how bacterial species are identified and potential host ranges of isolated rhizobia can be inferred, using so-called functional genes. A pot experiment in the glasshouse on cereal-legume mixed intercropping, including effects of pot size, intra- and interspecific plant competition, and root traits, allows to relate scientifically interesting research topics to practical application, while simultaneously stimulating critical reflections.
Stable Isotope Ecology of Terrestrial Ecosystems

**Abstract**

This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and water 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

**Objective**

Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small ISOProject, practice to search and analyze literature as well as to give an oral presentation.

**Prerequisites / notice**

For students of the Agricultural Sciences of D-USYS: Lectures in Plant Nutrition I and II (Nutrient cycling in agroecosystems by Prof. E. Frossard).

We ask all other course participants to read and understand the e-learning module Plant Nutrition I by Prof. E. Frossard: https://moodle-app2.let.ethz.ch/course/view.php?id=279

Ecological Understanding (Second Edition)

Prerequisites / notice

For students of the Agricultural Sciences of D-USYS: Lectures in Plant Nutrition I and II (Nutrient cycling in agroecosystems by Prof. E. Frossard).

We ask all other course participants to read and understand the e-learning module Plant Nutrition I by Prof. E. Frossard: https://moodle-app2.let.ethz.ch/course/view.php?id=279

This course on Rhizosphere Ecology is complementary to those on Radioisotopes in Plant Nutrition, and Nutrient Fluxes in Soil-Plant Systems. However, a limited number of thematic overlaps cannot be avoided. Particular emphasis is given to the ecophysiology of interacting organisms and detection, enumeration, culturing, and molecular genetic identification of root-associated microbes. A written closed book exam will take place on Friday January 8, 2016, from 10.15-12.15am in Eschikon.

Maximum number of participants: 18.

Students of the agricultural sciences of D-USYS will be reimbursed for travel expenses upon handover of collected tickets of the public transport systems, excluding the tax zone of the town of Zurich.

**Lecture notes**

Lecture slides and laboratory protocols are being made available in the directory ‘751-5125-00L Rhizosphere Ecology’ of the electronic document exchange platform ILIAS, LDA-ELBA:

https://ilias-app2.let.ethz.ch/ilias.php?ref_id=85894&cmdClass=ilrepositorygui&cmdNode=el&baseClass=ilRepositoryGUI

Stable Isotope Ecology of Terrestrial Ecosystems

- W+ 2 credits
- 2G

R. A. Werner, N. Buchmann, R. Siegwolf

**Likelihood**

Arbuscular mycorrhizas in soil nutrient management, e-learning module of Sustainable Plant Systems by Gamper, HA, van der Heijden, MGA, Hofmann, A.: https://www.olat.uzh.ch/olat/auth/1%3A1%3A0%3A0/
Content
The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

Lecture notes
Handouts will be available on the webpage of the course.

Literature
This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

Prerequisites / notice
The participation in this course requires a basic understanding of plant breeding as taught in 'Pflanzenzüchtung' (formerly Plant Breeding I) or similar lectures at other universities.

751-3603-00L
Plant Breeding II
W 2 credits 2G A. Hund, B. Studer

Abstract
The course consists of two parts. First, important plant breeding concepts such as, molecular breeding and genetic engineering but also organic and participatory breeding are introduced and discussed. Furthermore, we look at the legislation affecting these concepts. Second, the application of different plant breeding methodologies and their effect on the evolution of major crops are highlighted.

Content
In the first part of the course, we will discuss most important plant breeding tools and concepts. The lectures include lessons on genetic engineering utilizing genetic variation across species; organic plant breeding focussing on the need of organic agriculture; participatory plant breeding involving farmers in the breeding progress as well as genomic selection using a genome-wide coverage of molecular markers to predict the performance of a genotype. You will learn how new marker technologies and breeding tools in combination with precise phenotyping may influence the breeding progress in the future and how knowledge of the genetic architecture of crops can be utilized for selection. Furthermore, we will cover the legislation around the conservation of crop genetic resources for food and agriculture (PGRFA), the plant breeding rights (UPCOV), gene patenting and the release of genetically modified organisms into the environment.

Differences in legislation on worldwide scale, in Europe and in Switzerland will be highlighted. At the end of this section, you will be able to critically discuss the pros and cons of different concepts of plant breeding ranging from organic and participatory breeding to genetic modification and gene patenting.

In the second part of the course, you will learn most important aspect of crop evolution and breeding of maize, wheat, rapeseed, sugar beet, potatoes and forage crops. This includes: the most important domestication traits; crop evolution; genetics and cytogenetic; reproductive biology, germplasm resources; major breeding aims and common breeding methods. At the end of this section you will be able to discuss the most important achievement of our major crops in a plant breeding context.

Prerequisites / notice
Students signing up for this class should have a strong interest in tropical agriculture and science communication.

751-5101-00L
Biogeochemistry and Sustainable Management
W 2 credits 2G L. Merbold, N. Buchmann

Abstract
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Objective
Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small (interdisciplinary) teams.
Content
Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Lecture notes
Handouts will be available on the webpage of the course.

Prerequisites / notice
Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Course will be taught in English.

751-5115-00L Current Aspects of Nutrient Cycle in Agro-Ecosystems

Abstract
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. It offers to deepen the knowledge on a specific theme related to nutrients. It is composed by presentations of national and international speakers and by an excursion. The students have to prepare a report where they compile the obtained information, relate it to their own knowledge and include literature.

Objective
Listen and understand expert's presentations. Ask questions and contribute to the discussion during the talk sessions and the excursion. Link the information obtained during the seminar with knowledge from previous lessons and with literature searched to complement the matter. Expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem.

751-5001-00L Agroecologists without Borders

Abstract
In this seminar students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

Objective
(1) Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
(2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
(3) Students articulate complexity and challenges in agricultural development interventions.
(4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

Prerequisites / notice
Students signing up for this class should have a strong interest in tropical agriculture and science communication.

Non-Ruminant Science

Number Title Type ECTS Hours Lecturers
751-6001-00L Forum: Livestock in the World Food System W 2 credits 1S M. Kreuzer, S. Bauersachs, E. Hillmann, S. Neuenschwander

Abstract
This forum is a platform for the critical reflection of highly relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

Objective
In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected for a 2-hour seminar. Subsequently the students have to work in small groups at two dates. There will be a discussion in small groups at two dates.

Content
The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

Element 1. Oral Presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturers are the audience.

Element 2. Scientific writing: Option 1: preparation of a short scientific type of paper from a result table offered by the lecturers; Option 2: preparation of an abstract with limited word count from a scientific paper; Option 3: writing of a critical review of a paper. The students have to select 2 of the three options each. There will be a discussion be a discussion in small groups at two dates.

Lecture notes
no scriptum

Prerequisites / notice
Requirements for allocation of the two credit points:
- Theatre presentation (with handout) at the forum
- Delivery of written documents of sufficient quality
- Active participation during the presentations by the other participants

751-6305-00L Livestock Breeding and Genomics I

Abstract
Methods for analysing livestock data, in particular for the estimation of breeding values: principles of selection index, correction of records for fixed effects, introduction to BLUP, application of common models used, relationship matrix, methods for the estimation of variance components. The material will be illustrated via exercises and assignments.

Objective
The students are able to estimate breeding values for the most common population structures using the selection index. They are able to set up design matrices, the relationship matrix and its inverse as well as the Mixed Model equations to estimate BLUP breeding values for smaller examples.

Content
- Selection index (various sources of information, one trait, multiple traits)
- Relationship matrix and its inverse
- Correction of fixed effects
- BLUP: one trait, repeated observations, multiple traits, economic indices
- Introduction to methods for the estimation of variance components
- Assignments

Lecture notes
Copies of the slides are available on the net.

Literature
To be announced in the lectures.

751-6601-00L Pig Science (HS)

W 3 credits 3V E. Hillmann, M. C. Härdi-Landerer
Abstract
The overall goal of the course is to provide the essential scientific knowledge of the genetic, physiological and special nutritional aspects of pigs metabolism, animal health and behaviour, and of the implications for environment, product quality, housing and animal welfare, and breeding programs.

Objective
Students will
- understand the complex interactions of nutrition, quality traits of products, breeding and reproduction, health management, behaviour and husbandry.
- be trained to understand interdisciplinary and disciplinary research.
- be able to critically analyze published research data.
- be able to present precise scientific reports in oral and written form.

Content
Four main topics in Pig Science:
- Behaviour and Husbandry of pigs: behavioral needs, husbandry related behavioral disorders, design and construction of housing systems in accordance with welfare requirements and legal regulations.
- Planning of reproductive cycle in practice
- welfare monitoring in practice
- pigs in organic farming
- Animal Health and Diseases: animal hygiene, immunology/vaccinations, metabolic diseaases, diarrhoe, legisalation, thermoregulation, important infections, prophyaxis.
- poster, exam and evaluation

Lecture notes
Handouts/scripts are distributed by the lecturers.

Literature
Specific literature is indicated by the lecturers.

Prerequisites / notice
The lecture corresponds with the lecture "Ruminant Science" and knowledge in animal health, nutrition and breedin as wellas applied ethology and animal welfare are recommended.

The lecture usually is in German, but there is always the possibility to change to English.

751-7603-00L Livestock Breeding and Genomics II

Abstract
The course provides methods to use molecular genetics information in livestock breeding. First, linkage disequilibrium, its measurement and applications are introduced. Genomic selection, genome wide association studies, and estimation of breeding values are further topics. The theory is applied in assignments.

Objective
The students are able to interpret and apply linkage disequilibrium. They are able to discuss the principles of genomic selection, genome wide association studies and breeding value estimation.

Content
- Linkage disequilibrium
- Genomic selection and estimation of breeding values
- Genomewide association studies
- Assignments

Lecture notes
Copies of the slides are available on the net.

Literature
Specific literature is indicated by the lecturers.

751-7703-00L Tropical Animal Nutrition

Abstract
Farm animals play an important role in most agro/eco - systems, but conditions for a successful management and nutrition in the tropics are diverse. In this course a wide range of aspects are examined.

Objective
The aim of this course is to know and understand animal production systems in the different zones of the tropics taking into consideration the local and social structure of the population. We will deal with different aspects of animal nutrition in the tropics.

Content
- Introduction to the tropics
- Special problems and challenges in tropical regions
- Importance of livestock in the tropics
- Animal production and livestock production systems in the tropics
- Special challenges for livestock in the tropics
- Feeds available in the tropics
- Tropical pasture systems and their characteristics
- Quality of feeds in the tropics
- Problems and challenges of animal nutrition in the tropics

751-6113-00L Endocrinology and Biology of Reproduction

Abstract
Die Systematik der Reproduktionshormone und der Hormonrezeptoren wird erläutert, die Wirkungsmechanismen (Bildung; orale Bioverfügbarkeit; Elimination) erklärt. Mit diesen Grundlagen wird das Verständnis der Regulation der Fortpflanzung umfassend erörtert.

Objective
Die Studierenden erlangen das grundlegende theoretische Verständnis und Fachwissen zur Endokrinologie der Reproduktion und zur weiblichen und männlichen Reproduktionsbiologie. Sie können darüber hinaus pathologische Situationen (Fortpflanzungsstörungen) und deren vielfältige Ursachen in den physiologischen Kontext einordnen.

Ruminant Science

751-6001-00L Forum: Livestock in the World Food System

Abstract
This forum is a platform for the critical reflection of highly relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

Objective
In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.
The course enables students to understand in detail how ruminal digestion works and how this knowledge can be applied to design optimal feeding diets using highly fibrous forages and a variety of other feeds. The students also are able to show how to modify the most important rumen microbes beneficially by nutritional means.

For a comprehensive understanding of the rumen microbial ecosystem, the mechanisms of nutrient fermentation and the synthesis of microbial protein, thorough basics are provided. Apart from lectures, laboratory exercises are included.

Element 1. Oral Presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturers are the audience.

Element 2. Scientific writing: Option 1: preparation of a short scientific type of paper from a result table offered by the lecturers; Option 2: preparation of an abstract with limited word count from a scientific paper; Option 3: writing of a critical review of a paper. The students have to select 2 of the three options each. There will be a discussion be a discussion in small groups at two dates.

In summary
- Contact hours: 92 h
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)
- Self-study in semester break: 38 h
Total: 120 h

Conditions for successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as ‘optional courses’ in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.

The control of performance will consist of:
- an own lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details
The two objectives of the class are:
- Linkage disequilibrium
- Genomic selection and estimation of breeding values
- Genomewide association studies
- Assignments

The course is a balanced mixture of blackboard exercise, laboratory exercise, lecture and student seminar presentation.

The non-contact hour part is to comprehend the information given and to prepare either the written report or the oral presentation (cf. “Besonderes”)

The aim of this course is to know and understand animal production systems in the different zones of the tropics taking into consideration the local and social structure of the population. We will deal with different aspects of animal nutrition in the tropics.

The students are able to interpret and apply linkage disequilibrium. They are able to discuss the principles of genomic selection, genome wide association studies and breeding value estimation.

A documentation will be provided at the start of the course.

The two objectives of the class are:
- Systematics of the microbes involved in microbial digestion
- Measurement of microbial digestion
- Interactions of microbes and epithelium of the digestive tract
- Differences between ruminal and hindgut microbial digestion
- Microbial nutrient degradation and its modification
- Efficiency of microbial protein synthesis
- Manipulation of the ruminal digestion

The course provides methods to use molecular genetics information in livestock breeding. First, linkage disequilibrium, its measurement and applications are introduced. Genomic selection, genome wide association studies, and estimation of breeding values are further topics. The theory is applied in assignments.

The course is designed to introduce students to important issues in food production, supply, and consumption using the concepts and tools of microeconomics.

The course is designed to provide an overview of the important issues related to food markets and supply chains. The course is designed to present the economics concepts and tools that are useful to understand the functioning of food supply chains under various governance regimes or policies (emphasis on welfare analysis).

The theory is applied in assignments.

**Objective**

**752-2122-00L Food and Consumer Behaviour**

1. Knowledge of the mechanisms of agricultural trade
2. Impact of trade policy instruments on welfare and distribution
3. Specific aspects of agricultural trade and links to other courses:
   - Trade and food security
   - Trade and environment
   - Trade and development

**752-2307-00L Nutritional Aspects of Food Composition and Processing**

- describe and compare the major concepts/criteria used for the evaluation of the nutritional quality of food
- apply these criteria when assessing the effects of selected processing technologies on nutritional quality
- evaluate recent formulation strategies aimed to achieve additional physiological benefits for targeted population groups (i.e. functional foods)

**751-2401-00L Food and Agricultural Trade Policy**

The course focuses on food consumer behavior, consumer’s decision-making processes and consumer’s attitudes towards food products.

**751-4203-00L Horticultural Science: Case Studies (HS)**

Lectures address 2 horticultural cropping systems and value chains, each one in 2h-lecture blocks. Afterwards, the students split in 2 groups for addressing a case study focusing on one of the cropping systems treating one of the cropping systems. An excursion to a research site might be included. In a final colloquium, each group presents a report on their case study and their conclusions.

Achieve a deepened understanding of horticultural value chain challenges relating to ecological intensification, resource efficiency, climate change and healthy and safe food, and the problem solution strategies and scientific principles behind.

In the spring semester, the two addressed cropping systems and value chains are vegetable-production- and berry-production or glasshouse-horticulture. The selected topics address challenges with regard to ecological intensification, resource efficiency or climate change and branch into ongoing research and development projects.

As provided by the case study leaders.

The course builds on basic knowledge delivered in 'Horticultural Crops I’ and ‘Horticultural Crops II’. If these courses have not been followed by interested participants, equivalent knowledge and experience will greatly support a successful and productive participation of the participating student.

Language: spoken E, G or F. Documents: Preferably English, G/F possible.

This forum is a platform for the critical reflection of highly relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The content framework includes the following modules: world food system overview; agricultural production; Global change drivers; near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

Students are able to:
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media,
- quantify driving forces and resulting fluxes of water, solute, and heat in soils,
- apply modern measurement methods and analytical tools for hydrological data collection,
- conduct and interpret a limited number of experimental studies,
- explain links between physical processes in the vadose-zone and major societal and environmental challenges.

No prerequisites. Program is open to Masters, PhD and upper level Bachelor students.

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 45 of 1432
Weeks 1 to 3: Physical Properties of Soils and Other Porous Media. Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior.

Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity.

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing.

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:
Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.
Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.
Part 2 - Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties. Midterm exam.
Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.
Part 3 - Use of Hydrus model for simulation of unsaturated flow.

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils. Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.

Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:
Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

Biological Processes in the Vadose Zone. An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.

E. K. Bünemann König.
Abstract
This course emphasizes interactions among physicochemical and biological processes and highlights implications for plant nutrition, growth, and health. Nutrient mobilization and acquisition by plants in response to fertilization, other plants, and microbes, are explored in model systems. Newly gained knowledge is applied to understand results of a pot experiment and thereby critically reflected.

Objective
To gain a holistic understanding of resource-driven and regulatory processes in natural and agronomic plant-microbe-soil systems.
To practice abilities to read scientific literature, understand it, present it, and discuss it with peers.
To combine available and newly acquired knowledge from soil physics, chemistry and (micro-)biology, plant physiology, pathology, and ecology and reflect on their relative importance for plant production, bioremediation, and nature conservation when considered together.
To practice manual skills in handling seedlings, soil, plant, and DNA samples, laboratory equipment, and working with different computer software.
To make observations, analyse, display, interpret and present own data.
To get familiar with (bio-)chemical, molecular genetic, and simple bioinformatics analyses.
To prepare as a group of course participants a poster on one selected aspect of a bigger pot experiment, present it, and discuss findings and posters of other course participants.
To combine findings with available knowledge, generate explanatory hypotheses, and identify potentially informative further analyses and experiments.

Content
This course comprised lectures, the set-up, harvest and data analysis of an experiment, soil (bio-)chemical, microbiological and molecular genetic analyses in the laboratory and practical computational data analyses. The focus is set on a better understanding of the role played by spatial and temporal physicochemical and microbiological gradients and various soil organisms in plant mineral nutrition. Mutualistic associations between plant roots and microbes, such as the root symbiosis with mycorrhizal fungi and root nodule-inducing bacteria are discussed. Rhizobia are isolated from field-collected root nodules and characterized, using molecular genetic tools. A short introduction into DNA-based bioinformatics and phylogenetic analyses is given to demonstrate how bacterial species are identified and potential host ranges of isolated rhizobia can be inferred, using so-called functional genes. A pot experiment in the glasshouse on cereal-legume mixed intercropping, including effects of pot size, intra- and interspecific plant competition, and root traits, allows to relate scientifically interesting research topics to practical application, while simultaneously stimulating critical reflections.

Lecture notes
Lecture slides and laboratory protocols are being made available in the directory '751-5123-00L Rhizosphere Ecology' of the electronic document exchange platform ILIAS, LDA-ELBA: https://ilias-app2.let.ethz.ch/ilias.php?ref_id=85894&cmdClass=ilrepositorygui&cmdNode=el&baseClass=ilRepositoryGUI
This course provides an overview about the applicability of stable isotopes (carbon $^{13}$C, nitrogen $^{15}$N, oxygen $^{18}$O and water $^{2}$H) to R. A. Werner

2 credits

Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Students of the agricultural sciences of D-USYS will be reimbursed for travel expenses upon handover of collected tickets of the public transportation system, excluding the tax zone of the town of Zurich.

Autumn Semester 2015

R. Siegwolf
Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, etc.) within a given system and to assess the importance of processes controlling these fluxes (e.g. exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.). The course will first present the principles, the basic assumptions and the theoretical framework that underlay the work with radioisotopes. It will present how the introduction of an isotope into a system can be done so as to get some information on the structure of the system. Case studies will be presented to determine element availability. Finally, published studies from other groups will be analyzed and presented by the students.

Objective

(1) Students study concrete examples of agricultural development projects in tropical agroecosystems.
(2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
(3) Students articulate complexity and challenges in agricultural development interventions.
(4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

Prerequisites / notice

Students signing up for this class should have a strong interest in tropical agriculture and science communication.

Master Thesis

Number Title Type ECTS Hours Lecturers

751-0023-00L ETH Week 2015: The Story of Food W 1 credit 3S S. Brusoni, K. Fenner, A. Walter, C. Bratrich, N. Buchmann, A. Champetier de Ribes, M. Grant, W. Langhans

Abstract

The ETH Week is a new and innovative course designed to foster critical and independent thinking and creative learning. Students from all departments as well as professors and external experts will work together for one week in interdisciplinary teams. They will develop ideas and interventions that could play a role in solving some of our most pressing global challenges: the global food systems.
Objective

- Domain-specific knowledge: Students have immersed knowledge about a certain complex, societal topic which will be selected every year. They understand the complex system context of the current topic, by comprehending its scientific, technical, political, social, ecological and economic perspectives. The focus in 2015 is the global food system.

- Analytical skills: The ETH Week participants are able to structure complex problems using selected methods. With the help of experts and team tutors, they are able to acquire further knowledge and critically analyse knowledge in interdisciplinary groups.

- Design skills: The students are able to use problem solving and decision making skills to develop concrete approaches for addressing a selected problem statement, critically reflect these approaches, assess their feasibility, transfer them into a concrete form (physical model, prototypes, strategy paper,...) and to present this work in a creative way (role-plays, videos, exhibitions, etc.).

- Self-competence: The students are able to plan their work effectively, efficiently and autonomously. By considering approaches from different disciplines they are able to make a judgment and form a personal opinion. They are able to communicate appropriately with non-academic partners from business, politics, administration, non-governmental organizations and media, present their results professionally and creatively and convince a critical audience.

- Social competence: The students are able to work in multidisciplinary teams, i.e., they can reflect critically their own discipline, debate with students from other disciplines and experts in a critical-constructive and respectful way and can relate their own positions to different intellectual approaches. They can assess how far they are able to actively make a contribution to society by using their personal and professional talents and skills and as ‘Change Agents’.

Content

The week puts a focus on developing problem solving and design thinking skills within the context of understanding the world of food. During ETH Week students will have the opportunity to work in small interdisciplinary groups, allowing them to critically analyse both their own approaches and those of other disciplines, and to integrate these into their work.

While deepening their knowledge about how the food system works, students will be introduced to various methods and tools for generating creative ideas and understand how different people are affected by each part of the system. In addition to lectures and literature, students will acquire knowledge via excursions into the real world, empirical observations, and conversations with researchers and experts.

A key attribute of the ETH Week is that students are expected to find their own problem, rather than solve the problem that has been predefined. Therefore, teams will spend the first three days of the week identifying a problem to work on, and the last two days of the week generating solutions for the problem and communicating the team’s ideas.

A panel of experts will judge your presentations at the end of the week. The winning teams will receive attractive prizes.

Literature

Participants will receive preparation reading materials before the course commences.

Prerequisites / notice

No prerequisites. Program is open to Bachelor and Masters from all ETH Departments. Students must register to attend the course by 17 May at www.ethz.ch/ETHWeek.

European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
In the triad of typology, topology and tectonics, the latter is the primary focus of the theoretical discourse. The series of lectures identifies aspects of the architectonical space will be exemplified and put into a theoretical context. In a series of lectures, architectural space is defined as the sum of structure, functional requirements, aesthetics and psychology. The main objective of the course is to train a conscious perception and a conceptual understanding of the architectural space as well as techniques for its representation.

**Architecture I**

**Title:** Architecture I  
**ECTS:** 1 credit  
**Hours:** 2V

**Objective:** Training of a conscious perception and a conceptual understanding of the architectural space as well as techniques for its representation.

**Abstract:** In a series of lectures, aspects of the architectonical space will be exemplified and put into a theoretical context. Effective visualization and representation of the architectural space are important aspects of the course. The students will be introduced to graphical methods such as axonometry, orthographic projection, and cross-sections. The lectures will cover the fundamentals of architectural drawing and the use of computer-aided design (CAD) software for visualization. The course will also explore the importance of materials and their role in the architectural expression.

**Content:** Knowledge of construction principles and their historical context. Cognition of correlation between concept, buildings structure, material form, and function.

**Lecture notes:**

**ECTS:** 1 credit  
**Hours:** 2V

**Objective:** Sociology I investigates the relation between social developments and the production of the built environment from a macro-sociological point of view. It examines central aspects of social change, historical and present-day forms of urbanization, and typical examples of models of urbanization.

**Abstract:** Sociology I deals with the macro-sociological point of view, and investigates the relation between social developments and the production of the built environment. In the first part some central aspects of social change are examined in particular the transition from Fordism to Postfordism and from Modernism to Postmodernism, and the interlinked processes of globalization and regionalization. The second part deals with historical and present-day forms of urbanization. Among other aspects treated here are the changed significance of urban-rural contrasts, the processes of suburbanization and periurbanization, the formation of global cities and metropolitan regions, the growth of new urban configurations in centres (gentrification) and on urban peripheries (edge city, exopolis). In the third part these general processes are illustrated by typical models of urbanization.

**Content:** Sociology I focuses on the sociological aspects of architecture, including urbanization, social change, and cultural shifts in the built environment. The course will examine historical and contemporary examples of urban development, and explore the ways in which architecture reflects social, economic, and cultural changes.

**Lecture notes:**  
http://http://www.block.arch.ethz.ch/equilibrium

**Literature:**  

**Building Materials I**

**Title:** Building Materials I  
**ECTS:** 2 credits  
**Hours:** 2V

**Objective:** The lecture describes the fundamental properties of the most important construction materials: concrete and other mineral materials, metals, wood, glass and polymers. Furthermore, the content includes the relevant ecological aspects such as availability of raw materials, effort for production, emission of hazardous substances, disposal and recycling are treated as well.

**Abstract:** Building Materials - Structure, Quality, Usage  
*concrete and other mineral materials  
metals, wood, glass and polymers  
ecological aspects*

**Sociology I**

**Literature:**  
Acquirement of basic knowledge of the history of art and architecture, resp. of methodical basic knowledge of historical working.

Objective
Acquirement of basic knowledge of the history of art and architecture, resp. of methodical basic knowledge of historical working.

Content
The history of art and architecture is part of our reality: it confronts us in the historically shaped environment of the city and plays an essential role in the creation of architecture. The historical lectures are therefore part of the fundamental courses of the undergraduate programme in architecture. On the basis of cultural and art-historical research this course imparts knowledge about architecture and art from ancient times to the present. At the same time they sharpen the perception for the conditions and capabilities of building activity in history. Moreover, they convey methodical knowledge and technical language skills and are meant as a preparation for the independent handling of historical sources and scientific literature.

The first one-year course aims at these goals in the form of exemplary epoch representations which through light upon the historical continuities. The main focus will be laid on the architecture of the Greco-Roman antiquity, the Middle Ages, the Renaissance and the era between Baroque, Enlightenment, and Modernity.

Lecture notes
3 Skripte sind auf der Professur, HIL C 70.5-B, erhältlich:
- Architektur der Klassischen Antike, Fr. 15.-
- Renaissance und Barock, Fr. 15.-
- Aufklärung bis Moderne, Fr. 15.-

Prerequisites / notice
Zu beziehen am Dienstag und Donnerstag

The course can not be taken by Master students of the D-ARCH, who have already completed it within the Bachelor programme.

Economics I
Introduction to economics and to the analysis of markets.

Objective
Understanding of the basic economic concepts and models and of their application to real world situations, notably on property markets.

Content
The course in economics extends over two semesters. The focus during the Fall term is on an introduction to economic thought. These considerations provide the fundamental requirements for the economic analysis of land, housing and urban markets in the following Spring term.

Lecture notes
Course material in e-learning environment www.vwl.ethz.ch/architektur

Literature

M. Salvi

Mathematics I
Vertiefen und Ergänzen der mathematischen Kenntnisse und Fertigkeiten

Objective
Erkennen, dass mathematische Beschreibung und Abstraktion zu neuen Einsichten führen und verborgene Zusammenhänge erschliessen können

Content
First Semester: Description and discussion of curves and surfaces focusing on their generation by movement: Parameterization, tangent vector, tangent plane, ruled surfaces, developable surfaces. (Methods of vector geometry and differential calculus are used.)

Second Semester: Description and discussion of polygons and polyhedra: Platonic solids, Euler's formula, scale properties, proportions, golden mean, Fibonacci series, isometries, symmetry groups

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 53 of 1432
How can a glossary of tools be used as a basis for reading cities and recognizing in them current trends and urban phenomena? The lectures discuss determining factors in architectural design based on the basic terms place, structure, shell, program and materiality.

Title: Structural Design III

Addresses construction as integrating component of design processes, including considerations based on contemporary case studies.

Abstract: The lectures discuss significant determining factors in architectural design based on five basic terms: place, structure, shell, program and materiality. Several architectural examples are being examined within their specific societal context with an emphasis on the interrelation of architecture, science, culture and art.

Objective: The lectures aim at conveying an integral understanding of architecture: its development, its determining factors, and the influence of its societal context.

Content: The lectures discuss significant determining factors in architectural design based on five basic terms: place, structure, shell, program and materiality. Several architectural examples are being examined within their specific societal context with an emphasis on the interrelation of architecture, science, culture and art.

Lecturer: D. Eberle

ECTS: 2

Hours: 2V

Number: 051-0113-00L

Title: Architectural Technology III

Addresses construction as integrating component of design processes, including considerations based on contemporary case studies. Elaboration of construction principles on the basis of solid and filigree structure theories.

Objective: Addresses construction as integrating component of design processes, including considerations based on contemporary case studies. Elaboration of construction principles on the basis of solid and filigree structure theories.

Abstract: The lectures will introduce tools for reading contemporary urban conditions, urban models and operational modes. Urban development will be deciphered, presented as operational tools, extracted from cities where they have been tested and became exemplary samples, most relevant for providing the understanding of how urban landscape has taken shape as well as inspiration for future practice.

Objective: How can a glossary of tools be used as a basis for reading cities and recognizing in them current trends and urban phenomena? The lectures series will produce a glossary of operational urban tools with collected urban knowledge that provides students with an 'improved' manual to navigate theories. Urban Stories is a lecture series that aims to amplify your repertoire of urban instruments and empowers you to read cities and to critically reflect on the urban environment. The course will approach a series of case studies, employing an analytical, research-based model for crossing scale, political, economical and social components. Through this lens, and with our toolbox, we aim to transfer the fundamental story of our cities from today and provide information, analysis and knowledge to help students prepare for justifiable own contributions and interventions in the future. Also the aspect of knowledge transfer will be considered in order to sensibilize the students to understand how to operate in an international context.

Content: How did cities develop into the cities we live in now? Which urban plans, instruments, visions, political decisions, economic reasonings, cultural inputs and social organization have been used to operate in urban settlements in specific moments of change? Which cities are exemplary in illustrating how these instruments have been implemented and how they have shaped urban environments? Can these instruments be transcribed into urban operational tools that we recognize within existing tested cases in contemporary cities across the globe? Urban form cannot be reduced to the physical space. Cities are the result of social construction, under the influence of technologies, ecology, culture, the impact of experts and accidents. Urban unconcluded processes respond to political interests, economic pressure, cultural inclinations, along with the imagination of architects and planners and the informal powers at work in complex adaptive systems. Current urban phenomena are the result of urban evolution. The facts stored in urban environments include contributions from its entire lifecycle. That is true for the physical environment, but also for non-physical aspects, the imaginary city that exists along with its potentials and problems and with the conflicts that have evolved over time. Knowledge and understanding along with a critical observation of the actions and policies are necessary to understand the diversity and instability present in the contemporary city and to understand how urban form evolved to its current state. This lecture series will introduce urban knowledge and the way it has introduced urban models and operational modes within different concrete realities, therefore shaping cities. Urban knowledge will be translated into operational tools, extracted from cities where they have been tested and become exemplary samples, most relevant for providing the understanding of how urban landscape has taken shape. Case studies will be identified to compile documents and an archive, that we use as templates to read the city and to critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life as well as to provide instruments for valuable contributions and interventions.

Lecture notes: The script can be downloaded from the student-server.

Literature: The learning material can be downloaded from the student-server: afp://brillembourg-klumpner-server.ethz.ch

Prerequisites / notice: Please check also the Chair website: http://u-tt.arch.ethz.ch

EXERCISE: After each lecture, students are asked to produce an exercise based on the presented tools. The format of the exercise is an A3 or an A4, according to the given template. Each student has one week to prepare each exercise, and it should be delivered, in form of a physical copy, in the next lecture. (Language: preferably English, German). The Exercise tasks are a valuable preparation for the Exam (Exam only relevant for the "Jahreskurs" students) therefore it is highly recommendable to finalize all weekly Exercise tasks, as an individually conducted piece of work.

"Semesterkurs" (semester course) students from other departments or students taking this lecture as GESS / Studium Generale course as well as exchange students must submit a research paper, which will be subject to the performance assessment: "Bestanden" (pass) or "Nicht bestanden" (failed) as the performance assessment type, for "Urban Design I: Urban Stories" taken as a semester course, is categorized as "unbenotete Semesterleistung" (ungraded semester performance).

Autumn Semester 2015
There will be 'Lecture Notes' (in German) for this course, beginning in Fall 2015. The Slides from the lecture serve as lecture notes and are available as download. Handouts, supporting material and exercises are provided online (http://www.carmeliet.arch.ethz.ch/Education/ with Building Physics II: Moisture in the Documents section). The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

Prior knowledge of "BP I: heat" is required.

**Abstract**

After a review of essential facts from the first year the course will be examine the interplay of architectural concept and structural system by analyzing buildings of exemplary quality. The focus will be on the integration of specifics of structural systems made out reinforced concrete or steel into architectural design.

**Objective**

Students are enabled to integrate essential characteristics of structural systems made out reinforced concrete or steel into their architectural design.

**Literature**

Editions officielles récentes des lois fédérales, en langue française (Code civil et Code des obligations) ou italienne (Codice civile e Codice delle obbligazioni), disponibles auprès de la plupart des librairies. De plus, il est donné un bref aperçu du droit de la procédure et de l'exécution forcée.

**Prerequisites / notice**

Prior knowledge of "BP I: heat" is required.

**Prerequisites / notice**

Students who have attended or will attend the lecture "Introduction to Law for Civil Engineering" (851-0703-03L) cannot register for this course unit.

**Literature**

A bibliography will be distributed at the beginning of the lecture.

**Prerequisites / notice**

This class introduces students to basic features of the legal system. Questions of constitutional and administrative law, contract law, tort liability, liability limitations. Basics of corporate and civil procedure law.

Further information is available at http://www.hertig.ethz.ch/courses.htm

**Prerequisites / notice**

- Remarques
  - Le cours de droit civil et le cours de droit public (2e sem.) sont l'équivalent des cours "Recht I" et "Recht II" en langue allemande et des exercices y relatifs.
  - Les examens peuvent se faire en français ou en italien.
  - Examen au 1er propédeutique; convient pour travail de semestre.
The two-semester lecture aims to introduce architecture students to the complexity of methods in the subject. The aim is to give an overview of crucial events and works of art, buildings and theories since the beginning of the 19th century up to today. The course should enhance the comprehension of historical and theoretical issues, and allow the students to localize their own practice within a broader historical context.

The subject of this lecture course is the history and theory of architecture since the beginning of the 19th century up to today. It examines the architectural answers to the changing technical inventions and social practices. Consequently, the focus will be less on individual architects or buildings than on various themes that determined the architecture of the period.

Further recommended literature to consult is listed within the script.

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Objective</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>This course analyzes the history of urban architecture primarily in its existing three dimensional form as a complex human artefact. It also explores the inspirations that prompted the creation of this artefact: philosophical and religious concepts, social conditions, property relationships and the mechanisms that exploit the economics of real estate and the influence of building technology. Intellectual, literary or artistic modes of thought will also be assessed with regard to their impact on urban development. Urbanism has its own distinctive approach as a discipline, but it is also clearly responsive to the influence of related disciplines. Study is made of actual cities and urban expansion plans which are in the process of implementation, as well as unrealized projects and visions of the future. These projects sometimes illustrate ways of thinking that are equal to, or clearer than, actual urban situations.</td>

Autumn Semester 2015
Page 56 of 1432
The two-semester course offers an introduction to the history of modern and contemporary art and architecture since ca. 1970. Motivated by questions of the current discourse, central topics and exemplary works of art and architecture are discussed. Concepts such as “labor”, “economy”, “experience”, “research”, “nature”, “diversity” or “surface” are used to focus on specific historical developments and connections. Art and architecture is considered as a field of cultural change as well as an indicator of social, economic, and political conflicts which in turn helps to understand historical dynamics. The course “Lehrkanape” (one hour) is part of the course and treats alternative methods of teaching and learning.

Lecture notes
http://www.ursprung.arch.ethz.ch/courses

051-0155-00L Architectural Technology V

Objective
The final part of the lecture series Konstruktion V/VI aims to analyse (structural) construction techniques and their formal appearance and expression in their interrelation.
The different themed parts of structural design, building shell and knowledge of material get connected with architectural design in practice and reflected in the wider context of architectural theory. The intention is to consolidate the understanding of the connection between structure, process and formal appearance and expression in the architecture of the 20th century.

Content
The lecture series in the course entitled Architecture and Construction explores the correlation among intentions of design, architectonic expression and construction premises. Each lecture is focused on individual themes, as for example, the application of certain materials (glass, or natural stone), of particular construction systems (tectonic, hybrid) or design generators (grids, series) and alternatively the search for a definable, tangible architectural expression (vernacular architecture, readymades). These critical areas or aspects of study, which are presented with their respective theoretical backgrounds and historical development, are pluralistically associated and brought into relation with varying contemporary opinion. The yearlong lecture cycle is comprised of twenty individual lectures, in which the majority of projects being analyzed date from the last few decades.

Lecture notes
no script

Literature
list of literature per lecture

Prerequisites / notice
General remarks (on exam as well as exam preparation)
The comprehensive topics of the lectures are the subject matter of the exam. The lectures are scheduled for a full year (Konstruktion V/VI) and therefore the knowledge of the subject matter of the running as well as of the preceding semester’s lectures is required. To improve your chances to pass the examination at first try, we strongly recommend you to take the exam after having visited the lecture during two semesters. If you are an exchange student, or a student from a different department and wish to take a partial examination covering only the subject matter of the last semester (Konstruktion V or VI), you need to contact the chair in advance.

The brochures published by the chair offer additional help. Knowledge of these brochures and their key subjects is recommended for the exam. The brochures can be ordered at the chair after the last lecture before the examination. However, the subject matters of the brochures and the lectures are not identical, the brochures provide information for a deeper understanding of the lectures. Apart from additional articles written by the chair, the brochures are composed of three modules: Project documentation, crucial texts on the work reception as well as theoretical articles about the particular thematic priorities by various authors. Concerning their content these anthologies allow insights into a wide range of theories, lines of reasoning and fields of research up to diverging point of views of specific problems.

051-0615-00L Design and Strategies in Urban Space I

Abstract
Means and potentials of the course entitled Architecture and Construction are depicted from different perspectives to illustrate how the city can be designed as a sustainable and humane environment. For this purpose general basic principles and specific methods of urban design are going to be presented. The lectures will be given by members of the chair and invited speakers.

Objective
This lecture series imparts advanced knowledge in urban planning. The main focus is to illustrate the complex manner in which various themes are embedded in the everyday practice of planning and design by addressing pressing questions of contemporary urban design practice and theory. The goal is to communicate a broad-based systemic knowledge base, which enables students to synthesize and evaluate complex urban design and planning problems.

Content
The fall semester introduces the notion of strategic design and imparts further knowledge about the structure and models of the contemporary city. It is structured in two parts:

Part 1: Strategic Design
The first part of the lecture series imparts general basics to understand the city and the field of urban design. Different approaches and methods of analysis are presented, the dealing with uncertainty in planning is addressed and practical methods of urban design are identified.

Part 2: Structures and Models
Urban space is shaped on different levels. The city ground plan, the relationship between public space and private infrastructure and mobility needs as well as various spatially relevant stakeholders offer the basic means to steer the development. The second part of the lecture series is dedicated to these structures of the city and to the models describing them.

Lecture notes
There is no script accompanying the lecture series. At the end of the semester the lecture slides and at the end of the 3rd year course a reader with secondary literature will be available for download on the homepage of the chair of architecture and urban design:
http://www.christiaanse.arch.ethz.ch

Literature
At the end of the 3rd year course a reader with secondary literature will be available for download on the homepage of the chair of architecture and urban design: http://www.christiaanse.arch.ethz.ch

Exam Block 5

051-0115-00L Theory of Architecture I

Abstract
The first series of lectures studies existing models of the construction of theory in the works of specific architects. How does a coherent architectural language of form arise? How is it conceptualized by the architects themselves? How is it verbalized, how does it find expression in a theory, and how is it interpreted by critics? What is the role of conventions in this process? Does theory evolve before, during or after the design process? Departing from these, and similar, questions, the course seeks insights into the dialectics between built work and theory, or, rather, between built work and interpretation.

Objective
The lecture series of architecture theory is continued with a comparison of different approaches to define architecture and to discuss its boundaries and limitations. Nature and technology as imaginary utopias or the myth of timeless way of building versus the edifice as an autonomous work of art will be opposed with each other. The complexity of terms like meaning in an architectural context will be demonstrated with case studies of contemporary architecture. In addition to the aesthetics of the building there are the ecological and technical boundaries of every day. Theory aims at the goal to make these realms transparent and describable. Finally we will discuss the question, in as much architectural design as a process of reflection and projection incorporates already an utopian dimension.

Literature

051-0757-00L Building Process I

Abstract
The Building and the Construction of Theory

Objective

Content
The Building and the Construction of Theory

Literature

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 57 of 1432
Abstract
The building process is the main focus of this lecture series. The process is understood as a sequence of criteria in time.
Topics: Acquisition and Building legislation, building economics and facility management, the people involved and their work, construction and planning organization.

Objective
Process thinking and a glance at our foreign neighbours complete the series.

Content
Alongside a discussion of the basic principles, trends and terminologies, a closer look will be taken at each topic using case studies that investigate current structures as well as those relevant in terms of architecture and urban design. Active participation as well as interdisciplinary and process-oriented thinking on the part of students is a prerequisite.

051-0161-00L  Landscape Architecture I  O  1 credit  2V  C. Girot

Abstract
Introduction to the history and theory of garden design and landscape architecture. Analysis of the design of historical gardens and landscapes within the cultural background.

Objective
The course covers the basic history and theory of garden design and landscape architecture from its beginnings to the 21st century. The course aims to raise awareness of a changing perception of nature and landscape.

Content
The lecture series on History and Theory of Garden Design and Landscape Architecture deals with the historical development of designed nature, from the beginnings of cultural landscapes and gardens to 21st century landscape architecture. In the analysis of each era, the focus is on the spatial and cultural relationship between the garden, the city and the landscape, as well as the changing perceptions of nature and its representation.

Lecture notes
No script. Handouts and learning material will be provided.

Literature
A reading list will be provided for the exams.

Prerequisites / notice
General Information for the Final Exam:
Bachelor students: Relevant for the examination will be the content of the lectures, the handouts and literature provided by the Chair. The lecture series is conceived as a yearlong course. Since the written session examination will test knowledge from both semesters, it is necessary to fully attend the lectures of both courses. The themes of the examination will be announced at the end of the semester. The Chair will provide scripts and literature available for download.

Exchange students or students from other departments: Students, who are attending only one semester, may pass the oral examination. Handouts and literature will also be provided for this purpose. The students are additionally requested to contact the Chair.

Subjects with Semester Grade (Only for Programme Regulations 2007)

Number  Title  Type  ECTS  Hours  Lecturers
051-0713-00L  CAAD I  Only for Programme Regulations 2007.

Abstract
The course has been divided into a lecture series given by Prof. Ludger Hovestadt, as well as lectures and tutorials to the accompanying exercises. Each semester, several exercises in six different in-depth themes are offered in small groups in a seminar format, from which one exercise must be completed per semester. The exercises will be graded. Attendance to lectures is mandatory!

Objective
Introduction to information technology for architects. First, theoretical part. Information technologies are today a constituent part both for architectural work and our built environment. Hardware and software are pervasive, inexpensive and easy to use. Conventional planning and building processes are accelerated and improved in the good case. In this course we ask the qualitative question about new attitudes and meanings on this new plateau. CAAD I describes this new plateau in its different facets in the lectures. CAAD I closes off with an experimental exercise beyond the possibilities of the usually employed commercial hard- and software.

Content
Information technologies are important components of design and building construction today. The architecture currently being produced by prominent offices is unthinkable without modern information technologies. Computer-assisted machines and logistic make contemporary form language and building structures possible. Moreover, in the meantime, the software and hardware required to do this kind of work is so advanced that the general computer skill level would alone suffice for an architecture degree on a technical university. Still, architects and theoreticians are often critical or helpless when confronted with these technologies. As a result, reactive reflections as well as questions of method and theory have come to the forefront. This situation has led the lecture series CAAD I-II to be conceived as an introduction to a future 'tenet in digital design and building construction' for the first time.

The course has been divided into a lecture series given by Prof. Ludger Hovestadt, as well as lectures and tutorials to the accompanying exercises.

Architectural Design

Architectural Design (3. Semester)

Number  Title  Type  ECTS  Hours  Lecturers
051-1501-15L  Architectural Design III: From the City to the House (D.Eberle)  W  12 credits  12U  D. Eberle

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php). Students who do not wish to change the design class must not enrol.

Abstract
The design course is built on various exercises. During Fall Term, the students are concerned with the conversion and densification of existing building structures at three different sites in Zurich.
Wir werden uns im Semester mit der Idee «Origen» beschäftigen und zusammen mit Giovanni Netzer versuchen einen Beitrag zu einer architectural design V-IX: Spatial Transformation in Conveying a way of thinking that is also able to understand complex contexts and act on various levels is one of the focuses of the chair. Architecture requires a fine perception of the existing and a brave vision for the future. The condition for both is a firm attitude coming out of systemic and methodical design and construction development. Full range from concept to detail. Fall semester highlights fundamentals of “collective housing”, under the specific aspect of building depth. Discusses relations with current interdisciplinary sets of problems. The design course is built on four exercises. Based on the existing buildings, the themes Place, Structure and Shell are being examined - according to each theme. At the House Level the students develop designs addressing the themes in groups of two.

**Objective**
Achieving the goal of competent architects requires a method that teaches a clearly structured, precisely formulated approach and communicates the simultaneity of complex tasks and processes.

**Content**
The design course is built on four exercises. Based on the existing buildings, the themes Place, Structure and Shell are being examined - first separately and then combined in a final project. The extension and densification of existing building structures are being carried out at three different sites in Zurich; the new use is planned for work and living. The exercises are divided into a City Level and a House Level. At the City Level a group of students examines the three building sites according to each theme. At the House Level the students develop designs addressing the themes in groups of two.

**Abstract**
Systematic and methodical design and construction development. Full range from concept to detail. Fall semester highlights fundamentals of “collective housing”, under the specific aspect of building depth. Discusses relations with current interdisciplinary sets of problems. The target of the design work is to improve and widen the basic knowledge of domestic architecture and housing and also to get to the bottom of former ideas.

**Objective**
Achieving the goal of competent architects requires a method that teaches a clearly structured, precisely formulated approach and communicates the simultaneity of complex tasks and processes.

**Content**
The design course is built on four exercises. Based on the existing buildings, the themes Place, Structure and Shell are being examined - according to each theme. At the House Level the students develop designs addressing the themes in groups of two.

**Literature**
Dietmar Eberle, Pia Simmendinger, From city to house - a design theory, gta Verlag 2007

**Abstract**
Exercises will involve design and construction, from the definition of a concept to the execution of the detailed work. Work will include procedural methods for spatial designs through form, function, technology, and materials. To promote interdisciplinarity through integrated teaching.

**Objective**
Achieving the goal of competent architects requires a method that teaches a clearly structured, precisely formulated approach and communicates the simultaneity of complex tasks and processes.

**Content**

Never before the world has seen such levels of connectivity and interaction between people as it is happening in the beginning of the XXI century. Urbanization, democratisation of air travelling and widespread access to telecommunications make us global citizens. Cultural exchange happens everywhere at any time. Post-colonial, post-industrial times require parallel, alternative ways of thinking to deal with the legacy of all kinds of built structures. Reuse, refurbishment, transformation, demolition, substitution. What is our attitude as architects? What is the role of architecture in such a fast-changing world?

Welcome to the age of obsolescence!

Case 1 (Fall Semester 2015): Zürich, Switzerland - Papierwerd-Areal

Case 2 (Spring Semester 2016): Guangzhou, China - abandoned cement factory

What are the stage of development and the meaning of obsolescence in both places today? How can one analyse these two very different background conditions and explore new, creative common ways for the future?

"Obsolescence never meant the end of anything, it's just the beginning." - Marshall McLuhan

**Architectural Design V-IX: Open (Gastdozentur) [W]**

13 credits 16U to be announced

**Abstract**

Portraits is a series of critical assessments on contemporary issues. Its specificity lies in the association of mutually enlightening, yet seemingly antagonistic programs. Its method claims no historical loyalty, as sources and facts are being intentionally set up to serve a reducing purpose. Portraits evaluates contradictory encounters and stresses cross-fertilization as a key asset in the design process.

**Objective**

Portraits is a series of critical assessments on contemporary issues. Its specificity lies in the association of mutually enlightening, yet seemingly antagonistic programs. **Architectural Design V-IX: Eastopia - Utopia in the People's Republic of Poland (M. Angélil) [W]**

13 credits 16U M. Angélil

**Abstract**

In the studio we will move between a landscape of ideas and the actual built landscape in East Germany, between visions and shrinking cities, between different social systems and layers of time with the goal of recovering interesting concepts from failed plans.

**Objective**

Develop various analytical and notation techniques for understanding culturally/ideologically molded architectural landscape: theoretical discussion of the social and architectural types of socialism with visionary potential; critical evaluation of compiled instruments; designing relevant architecture through examination of East Germany.

**Content**

"Draw from the heavens to the drawing board", this quote - the title of an essay collection by East German architect Herman Henselmann - speaks of the euphoria, the optimism of progress, and the belief in the messianic potential of architecture and city planning characteristic of the early years of the GDR (1). Particularly when it was a young socialist state, the hope reigned that a better and more equal society could be developed through urban planning and architecture. The many socialist utopias are products of this revolutionary thinking. As the state actually developed, however, an ever-greater disillusionment grew instead. The initial hope dimmed in the face of authoritarian government and economic mismanagement. Since reunification, consensus has been based on the GDR's system and its social visions have failed - a condemnation that is now being questioned.

In the studio we will pursue the assumption that many of the hopeful utopian approaches and social attitudes upon which the socialist types were based could still be of interest today. In this sense, we will move between a landscape of ideas and the actual built landscape, between visions and shrinking cities, between different social systems and layers of time with the goal of recovering interesting concepts from failed plans.

The first step will be an archaeological investigation of the utopian fragments within the ruins of former visions, assembling an inventory of projects and socialist types with visionary potential. In a critical reflection from a contemporary perspective, the content of the architectural imprint of socialism is to be explored in order to find tools for dealing with today's territories of emigration and economic collapse.

In this way, could it be possible to develop a future for East Germany and elsewhere that doesn't put a false 'heaven' of growth and repopulation back on the drawing board, but rather, considerably and critically continues the past trajectory in a new light? Could we develop both visionary and pragmatic architectural interventions that enliven the landscape without actually imagining that it flourishes? (2)

**Architectural Design V-IX: Manifesta HS15 (Emerson) [W]**

13 credits 16U T. Emerson

**Abstract**

This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).
Objective Qualification to control the design process increasingly independent and with sole responsibility and to find to an individual design methodology and attitude.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Abstract Designing Architecture, which sounds the potential of its usage, its location, the city, the society and its culture and transforms these into a coherent spatiality and materiality by a distinct concept.

Objective Capability to develop a design from an idea, a concept to an advanced project, to question the intermediate stages in a self-critical way, thereby finding an individual design method and attitude.

Content Design work in different fields of architecture and urbanism with integration of the knowledge acquired in the first years of studies, supported by experts in related sciences (e.g. structural engineering, landscape architecture, history of art and architecture, historic preservation etc.)

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Abstract The studio will plan a school complex for approx. 600 students near Phnom Penh, Cambodia. Here, class rooms, general assembly rooms and necessary infrastructures need to be integrated in an already existing rural neighborhood. Attention has to be given to the climatic condition, available resources and the development of easily applicable construction principles.

Objective It is the educational objective to teach students a socially responsible interdisciplinary between the discipline of architecture and clients belonging to a low- or no-income group in one of the poorest societies of the world. Future urbanization will happen mostly in these developing territories. It is the aim of the course to equip students with the ability to understand and act in such territories and to develop the necessary skills to propose meaningful and engaged design strategies which are developed and operate from within a field of first hand knowledge. Design decisions should be based on questions of climatic conditions, availability, responsibility, functionality and the respect for social and cultural settings. Students will start their design work by studying those local conditions through field research with local architects and decision makers. Designs will react to those findings by proposing adequate strategies on the neighbourhood as well as the object level. It is the aim to develop construction methods and details, which will react and respect local available skills as well as materials and deepen this thinking by an integrated structural design concept together with the Professorship of Building Structure as well as the Professorship of Building Systems. In addition, financial impacts have to be kept in mind. It is also important to interact with local architects and planners.

Content A seminar week visiting Cambodia will be offered to those students who would like to attend. Participation is highly recommended but not mandatory. Materials produced will include the representation of small neighbourhood schemes as well as drawings and models representing the construction scale. The aim is to realize the most convincing design with the Swiss NGO Smiling Gecko.

Content We are planning a school in rural Cambodia within an existing village structure about two hours north of the capital Phnom Penh. The school consists of several classrooms, a cafeteria, an auditorium as well as medical and infrastructural buildings.

We plan within the specific context of a society which is dominated on one hand by the fascinating history of the Khmer culture and on the other hand a dramatic demographic development due to the brutal civil war in the past. 52.1% of the population of Cambodia are under the age of 24 years, the average of the total population is 23.5 years. The question of education and care is thus socially relevant and urgent.

In addition to these specific social conditions, the availability of material resources, talent and technical skills as well as the climatic, ecological and economic conditions have to be considered in the design. The question of contemporary didactical concepts and their spatial implementation is an important issue in the semester. Together with local professionals we will develop a reasonable and customized strategy how the school system and the necessary infrastructure can be implemented in several phases. It is the declared aim of the course to develop designs that are feasible in terms of architecture and construction, from urban and neighborhood issues to the constructive detailing of individual buildings. The results of the studio should be a relevant contribution to the contemporary architectural culture of Cambodia, respecting the specific social and climatic conditions. The client considers the realization of the project.

Prerequisites / notice A seminar week is offered on this subject to interested students. Participation is strongly recommended but not mandatory. The designs created include material-specific, architectural as well as constructive investigations, drawings and models.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Abstract This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).

Objective The goal is to communicate a broad-based systemic knowledge base, methodologies and strategies, which helps to enable students to evaluate complex urban design and planning problems and to synthesize their knowledge in an urban design project.

Prerequisites / notice Detailed information on design studios will be announced in advance to the registration process on the homepage of the chair of architecture and urban design: http://www.christiaanse.arch.ethz.ch The number of participants is limited to max. 36 students.

051-1123-15L Architectural Design V-IX: A Proposal (Guest Lecturer P. Flammer)
Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Abstract Starting position are your thoughts, wishes and imagination from what you formulate your architectonic idea. This idea, in general, should be explicable and conceptional. Thereof you generate a form. So, the construction is relevant and not the evolutionary history anymore. Hence, this construct can't be the solution, but a proposition.

Objective Competence to generate an architectonic project out of a own idea.

051-1125-15L Architectural Design V-IX: Winery "Chilesteig", Zurich

Content Autumn Semester 2015
Prerequisites / notice
- Accompaniment by Professur für Landschaftsarchitektur Günther Vogt

Architecture and Wine go together well. An exceptional design of landscape, building and space in combination with upscale interior and exhibition architecture contribute to the unique atmosphere of the winery - which includes a wine press, a wine tasting bar, a venue for shows and an exhibition space.

The immediate context - architecture of Höngg and Zürich - provide the main points of references for shape and atmosphere.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Further information about this semester can be found at: www.christgantenbein.arch.ethz.ch.

The “Chillesteig” winery is located just below the Höngg cemetery, facing south toward the "Europa" bridge and the Limmat.

The immediate context - architecture of Höngg and Zürich - provide the main points of references for shape and atmosphere.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

The history of art and architecture, monuments conservation etc.

Further information about this semester can be found at: www.christgantenbein.arch.ethz.ch.

The latter will be the base for individual projects, developed in groups of two. Working with references will be an important aspect of the studio: the typological collection of buildings gathered by the chair will provide the raw material for the own projects. Model photography will be the primary design tool, which will be professionally assisted be the photograph Roman Keller. A workshop will take place in Brussels during the second studio week, from the 22nd to the 24th of September. The trip and accommodation costs will be taken in charge by the chair.

The Alps as Common Ground

With each design semester the Chair of Professor Vogt is working its way around the Alpine arc with the thesis that it can be read as an urban Common Ground. The task of each design semester is to verify this thesis by focusing on a metropolitan region and enquiring as to its specific relationship with the Alps.

Independent thinking and acting.
The Alps as Common Ground

With each design semester the Chair of Professor Vogt is working its way around the Alpine arc with the thesis that it can be read as an urban Common Ground. The task of each design semester is to verify this thesis by focusing on a metropolitan region and enquiring as to its specific relationship with the Alps.

In the coming semester we shall be working with the urban territory of Lyon, which snakes between the Massif Central, Jura mountains and the Alps and reaches from the Mediterranean via the plateaus of the Bas-Dauphiné, Bresse and Dombes right up to the roof of Europe, Mont Blanc, 4,810 metres above sea level.

We understand design not as an end product but as a process. Our first step is to investigate Lyon’s large scale relationships. A four day long field trip complements this analytical gaze with a personal take on the area. Students then develop an individual programme as the foundation for their design. The proposed interventions can vary between urban planning and landscape scenarios and concrete architectural proposals.

Lecture notes
The Workbook is released in the first week.

Literature
The relevant literature is included in the workbook.

Prerequisites / notice
Process Cartography

Abstract
The focus of this semester is engaging with earthen building, emphasizing in particular the topics of decay and life cycles. These aspects, inherent to architectural design, are inadequately addressed by current dialogues. The project will be a structure of medium-scale planned to the level of construction detailing.

Objective
Just build.

Content
The focus of this semester is engaging with earthen building, emphasizing in particular the topics of decay and life cycles. These aspects, inherent to architectural design, are inadequately addressed by current dialogues. The project will be a structure of medium-scale planned to the level of construction detailing.

Prerequisites / notice
Methodological Focus:
- architectural design
- construction detailing
- working models / mockups

Abstract
This semester we will ask students to imagine flexible commercial spaces where producers and consumers engage with each other to form a revitalized kind of market place: a SUPER MERCATO. The studio will attempt to translate the analogy of a market hall with mixed uses for the village of San Patrignano into newly conceived spaces for the production, presentation and purchase of goods.

Objective
This entire area within the village perimeter is regarded as one or a collection of many potential sites. Analyses on site and of exemplary communities will allow students to develop first arguments for the scale and type of their potential project. Each student is expected to develop an initial concept for a community-oriented building intervention. Once the specific site and approach is determined, students will further develop their individual projects to an appropriate level of detail. The rural context of the Emilia-Romagna province and the village culture of San Patrignano will act as immediate sources of inspiration and points of reference.

The studio will help frame an understanding of the forces enabling the production of goods within communities and the potential behaviors, requirements and practices of its residents. It will also encourage the development of a critical position on the potential role of the architect to mediate a design process within a broader social, political and economic discourse.
For decades, our society has been increasingly facing an alienation from the production of food and consumer goods in general. Industrialization and mass production allowed higher efficiencies, lower prices and larger quantities while securing a comfortable level of supply for most industrialized countries. Mass consumption in highly specialized supermarkets and department stores has been the consequence and become the norm. Each production and marketing strategy is carefully implemented or quickly adapted according to changing demands. As a consequence, today, a growing number of consumers demands goods that are produced locally, sustainably or organically. And the industry has equally diversified its branding strategies. Terms such as green, organic, sustainable and local have become important adjectives for marketing campaigns, often disguising and ridiculing the actual origin of a product. As green is going mainstream it is becoming increasingly difficult to distinguish between packaging and product.

Consequently, authenticity and specificity have become rare goods for those new consumers in search for a more special and refined product. They are becoming increasingly interested in the origin of their purchased goods. The producer has become part of their decision process. In many cities the rather old-fashioned concept of a weekly market has turned into a newly branded farmer's market. It is the stories these local producers tell and the authentic image they personify that add to the purchasing experience and (better) conscience of their customers. While for the majority of consumers the price of a good still seems to outweigh its quality, there is a new tendency of local small-scale producers to capitalize on their limited capacity and regional uniqueness. They have created their own niche markets for specific and more unique goods.

There exist few examples where small communities have managed to distance themselves from the downsides of industrial production. These exceptional communities offer rejuvenated forms of collective production while producing highly competitive products for a variety of customers. Although a community producing food and other goods is not a particularly new phenomenon, such small-scale environments seem to offer refreshing conditions for people to re-engage with the origins of their consumer products. This semester we intend to re-investigate this relationship between producer and consumer from a newly conceived spatial perspective.

The Italian village of San Patrignano in the Emilia-Romagna province is a unique community that is in a constant state of internal transformation and adaptation. The high degree of self-sufficiency is at the same time part of its existence and nationwide success. Originally founded in 1978 to provide secluded spaces for drug-rehabilitation, San Patrignano today consists of around 1600 residents. While overcoming their former drug-addiction the residents live and work together in a small hillside enclave, isolated from inner-city temptations. Part of their rehabilitation therapy is to spend time learning to produce and further advance the production of food, furniture and other goods. These unique products are then consumed and sold locally or beyond its borders.

San Patrignano's growth pattern has always followed a path of improvisation and step-by-step planning. The success of its rehabilitation method has evolved into an increasing demand for additional living spaces. Simultaneously, there appears to be a great potential to also extend and rethink the spaces where goods are produced, presented and purchased.

Students will begin the semester with a series of precedent analyses in small groups. Lectures will be held on topics such as communities involved in producing goods and commercial spaces in general. Students will then begin developing individual design proposals for their notion of a SUPER MERCATO. Weekly discussions on thematic topics will take place, building to a comprehensive understanding of relationship between local producers and consumers. Three main reviews will take place throughout the semester, including the final review.

The design studio is also planned in conjunction with the Seminar Week trip to San Patrignano, Italy through the Brillenburg & Klumper Chair of Architecture and Urban Design. Enrollment in the San Patrignano Seminar Week is NOT required but is highly recommended as it forms an essential part of the studio and maximizes design output.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

The class material can be downloaded from the student-server.

For more information on this studio, please refer to our Chair's website: http://u-tt.arch.ethz.ch/classes/

The Autumn Semester 2015 of the Chair of Architecture and Urban Design is being offered by A. Caruso. The class is offered in English and does not require knowledge of Italian.

The Architectural Design V-IX: Atmosphere (A.Caruso) studio is designed as a design project course. It is offered in conjunction with the San Patrignano Seminar Week, which is NOT required but is highly recommended as it forms an essential part of the studio and maximizes design output.

This semester is about the production of atmosphere, about making spaces that have a precise and relevant spatial character. It was once self-evident that this was the main task of the architect, to make buildings and spaces that supported the rituals of daily life whether that was praying in a chapel, debating matters of state in parliament, or enjoying cakes and tea at home. In order to narrow down the theme of atmosphere and avoid becoming overly philosophical, we will look specifically at the installation and experience of art. We will begin by looking at the history of art in European society, specifically charting how the development of art has come out of, and reflects the different contexts for which it is made and displayed. The project will be to design a small suite of galleries for specific collections of art, a small museum for a site in Zurich.

The project will be to design a small suite of galleries for specific collections of art, a small museum for a site in Zurich. The semester will be run in collaboration with Fredi Fischli and Niels Olsen of gta exhibitions.

| Content | For decades, our society has been increasingly facing an alienation from the production of food and consumer goods in general. Industrialization and mass production allowed higher efficiencies, lower prices and larger quantities while securing a comfortable level of supply for most industrialized countries. These unique products are then consumed and sold locally or beyond its borders. San Patrignano's growth pattern has always followed a path of improvisation and step-by-step planning. The success of its rehabilitation method has evolved into an increasing demand for additional living spaces. Simultaneously, there appears to be a great potential to also extend and rethink the spaces where goods are produced, presented and purchased. Students will begin the semester with a series of precedent analyses in small groups. Lectures will be held on topics such as communities involved in producing goods and commercial spaces in general. Students will then begin developing individual design proposals for their notion of a SUPER MERCATO. Weekly discussions on thematic topics will take place, building to a comprehensive understanding of relationship between local producers and consumers. Three main reviews will take place throughout the semester, including the final review. The design studio is also planned in conjunction with the Seminar Week trip to San Patrignano, Italy through the Brillenburg & Klumper Chair of Architecture and Urban Design. Enrollment in the San Patrignano Seminar Week is NOT required but is highly recommended as it forms an essential part of the studio and maximizes design output.

| Objective | Qualification to control the design process increasingly independent and with sole responsibility and to find an individual design methodology and attitude. |

| Content | This semester is about the production of atmosphere, about making spaces that have a precise and relevant spatial character. It was once self-evident that this was the main task of the architect, to make buildings and spaces that supported the rituals of daily life whether that was praying in a chapel, debating matters of state in parliament, or enjoying cakes and tea at home. In order to narrow down the theme of atmosphere and avoid becoming overly philosophical, we will look specifically at the installation and experience of art. We will begin by looking at the history of art in European society, specifically charting how the development of art has come out of, and reflects the different contexts for which it is made and displayed. The project will be to design a small suite of galleries for specific collections of art, a small museum for a site in Zurich. This project will be to design a small suite of galleries for specific collections of art, a small museum for a site in Zurich. The semester will be run in collaboration with Fredi Fischli and Niels Olsen of gta exhibitions. |
Free diplomas are offered only, on agreement with the chair.

This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).

The students will develop and design a room which will be built in the Swiss Pavilion of the Architecture Biennale 2016 in Venezia.

Constructive and technical bearing structure problems of transformation are mainly taught. The focus is set on a creative argumentation as a didactic target a profound debate on supporting structure, on construction and on room creation is declared.

Room as a physical phenomenon:
A interdisciplinary. ETH internal collaboration within the chairs of the professors Christian Kerez (architectural design), Joseph Schwartz (chair of structural design), Ludger Hovestadt (Computer Aided Architectural Design CAAD) and Olga Sorkine-Hornung (Interactive Geometry Lab, D-INFK) will supervise a free design semester. Hence, the students' models are currently tested regarding their static powerness, producibility and room-geometric qualities, are possibly modified or produced with gained knowledge under other conditions. Target of the semester is to investigate and produce digital data, physical models and 1:1 Mock-Ups of room parts which will serve as a pre-stage for the physical production.

Room as a cultural phenomenon:
The Architectural Biennale and at the same time the possibility to present the results of this spatial, static and constructive research to the large public in a built form should be taken as occasion to stimulate a critical reflexion in form of a theoretical and historical research. At the exposition in Venice, the built room in the Swiss pavilion will be shown also as a cultural phenomenon.

Therefore, on the one hand, relations to historic relevant projects and steps shall be made, on the other hand, the room should also be arranged kuratorically - this should express the attitude that architecture can be catched sterically, independently of conventions and historic references.

The goal is to communicate a broad-based systemic knowledge base, methodologies and strategies, which helps to enable students to evaluate complex urban design and planning problems and to synthesize their knowledge in an urban design project. Qualification to control the design process increasingly independent and with sole responsibility and to find to an individual design methodology and attitude.

As a didactic target a profound debate on supporting structure, on construction and on room creation is declared. Due to the

051-1145-15L Architectural Design V-IX: A Room for the Biennale ■ W 13 credits 16U C. Kerez

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Tuesday and Wednesday all day.
Please note: This course takes place in 8952 Schlieren, Enstringerstrasse 5 f

Abstract
The students will develop and design a room which will be built in the Swiss Pavilion of the Architecture Biennale 2016 in Venezia.

Objective
Experimental discussion to "built rooj" in the form of phisical and virtual models. theoretical discussions to "show architecture"; critical evaluation of the realized intermediate results; interdisciplinary collaboration with the chairs of Prof. Karin Sander, Ludger Hovestadt and Joseph Schwartz.

Content
The Biennale project will be integrated into the Giardini, as an interdisciplinary research of statics, geometry and construction of a room with maximal komplexe room mantling. Moreover, a theoretical and historical examination of the the room development shall serve as a basis for its programming with curatic work and enable localization within the contemporary architectural discourse.

Due to the

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Abstract
The HS15 design studio "at work" is following a invitation for a cooperation with the chair for the "Manifesta 11" taking place in summer 2016. It is about work places and work rooms in the city - and on how they avert from urban publicity or integrate themselves as a matter of course.

Objective
To develop concepts of architectural and urban design and its specific formulation. Understanding architecture as cultural practice with a strong but unstable connection to society, i.e. to the city and the history of our built environment. Through design and means of architecture, being able to deliver a critical contribution to a specific discourse within the disciplin. Working with the speculative reality of architecture.
The integrated focal work has to accompany the design, though the focal work has to be an autonomous work. The written essay should be 2 pages.

Integrated Discipline History of Urban Design
An urban history case study with a clear topic and a clear formulation of a question. The findings and the discoveries shall be part of the base of the design.

Lecturers
D. Mettler, D. Studer

Prerequisites / notice
It is a must to take part in the introduction course to "Integrated Discipline Construction".

Integrated Discipline Landscape Architecture (C. Girot)
Design concepts ranging from architectural objects to urban planning are developed together with the discipline of landscape architecture. Students gain an insight into the integrated discipline of design in architecture together with landscape architecture.

Lecturers
C. Girot

Prerequisites / notice
For students who attend the architectural design only.

Additional Integrated Disciplines

Integrated Discipline Building Research and Preservation of Cultural Heritage (U. Hassler)
The formal framework needs to be discussed with the staff members. A study in building research and preservation of building heritage with a clear topic.

Abstract
The formal framework needs to be discussed with the staff members.

Objective
An urban history case study with a clear topic and a clear formulation of a question. The findings and the discoveries shall be part of the base of the design.

Lecture notes
There is no reader.

Prerequisites / notice
Voraussetzung ist die Anmeldung unter mystudies.ethz.ch und per e-mail an die Professur bis zum Ende der ersten Semesterwoche unter Angabe des Entwursthemas und der betreuenden Professur, sowie die Teilnahme am Kolloquium in der zweiten Semesterwoche zur allgemeinen Einführung und konkreten Besprechung der Integrationsleistung (Ort und Uhrzeit des Kolloquiums werden auf der Homepage des Lehrstuhls Lampugnani bekannt gegeben). Die Abgabefrist erfolgt analog zum Entwurf.

Integrated Discipline History of Urban Design (V. Magnago Lampugnani)
The integrated focal work has to accompany the design, though the focal work has to be an autonomous work. The formal framework needs to be discussed with the assistants.

Abstract
The integrated focal work has to accompany the design, though the focal work has to be an autonomous work. The formal framework needs to be discussed with the assistants.

Objective
An urban history case study with a clear topic and a clear formulation of a question. The findings and the discoveries shall be part of the base of the design.

Integrated Discipline History of Art and Architecture (P. Ursprung)
Works in the integrated discipline art and architectural history evolve in close connection with projects in design. Textual and creative works are possible. The length of the text or the extent of the creative project will be decided upon individually. Interested students are asked to develop a (textual or diagrammatic) concept sketch explaining the content and the form.

Abstract
Works in the integrated discipline art and architectural history evolve in close connection with projects in design. Textual and creative works are possible. The length of the text or the extent of the creative project will be decided upon individually. Interested students are asked to develop a (textual or diagrammatic) concept sketch explaining the content and the form.

Objective
We expect that students pursue their examination of the design process independently and in an original manner or that they develop a related theme from the perspective of the history of art and architecture. The work should be part of the design process and interact with it formally and in regard to content.
The aim is a profound examination of a topic of history of art and architecture. The gained insights will be converted into the design process. Alongside a discussion of the basic principles, trends and terminologies, a closer look will be taken at each topic.

**Prerequisites / notice**

Students interested in this course are required to enroll via mystudies.ethz.ch and apply via e-mail at the chair until the end of the first week of the semester. Students are asked to indicate the theme of the design and the chair they are working with. The work is handed in at the same time as the design.

**051-1209-15L**

**Integrated Discipline History of Art and Architecture**

- **W**
- **3 credits**
- **2U**
- **I. Heinze-Greenberg**

Abstract

A short written essay and/or design work will be integrates in the design project.

Objective

The aim is a profound examination of a topic of history of art and architecture. The gained insights will be converted into the design process.

---

**051-1211-15L**

**Integrated Discipline Theory of Architecture (A. Moravanszky)**

- **W**
- **3 credits**
- **2U**
- **A. Moravanszky**

Abstract

Analysis of the design project with methods of architectural theory.

Objective

Theoretical reflection on the principles which guide the design process.

---

**051-1213-15L**

**Integrated Discipline Theory of Architecture (L. Stalder)**

- **W**
- **3 credits**
- **2U**
- **L. Stalder**

Abstract

In the bachelor program, the integration of architectural theory into the design process is only offered in cooperation with the chair of architectural design for the whole design studio. On the basis of a reading of theoretical texts the conventions of architectural practice are critically debated. The theoretical perspective will be discussed in the midterm and/or final design studio criticism.

Objective

The goal is a critical debate on the conventions of architectural practice, the insights of which shall inform the design process.

---

**051-1215-15L**

**Integrated Discipline Building Physics (J.Carmeliet)**

- **W**
- **3 credits**
- **2U**
- **J. Carmeliet**

Abstract

Hygrothermal analysis of a building wall component Detailing regarding hygrothermal behaviour

Objective

The goal is that the students learn to evaluate hygrothermal performance of the building in the different stages of the design process. The students learn to evaluate and optimize their design, to choose adequate wall solutions and materials, to design details from a perspective of hygrothermal performance.

---

**051-1217-15L**

**Integrated Discipline CAAD (L.Hovestadt)**

- **W**
- **3 credits**
- **2U**
- **L. Hovestadt**

Abstract

This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).

Objective

Today architectural sketching without the employment of information technologies is only meaningful in exceptional cases. CAD plans, three-dimensional rendering, CNC model construction etc. are pervasive media for the development and presentation of architectural drafts. This elective course tries to follow questions on a new plateau: Which are the common traits of current design methods and modern information technologies and how can they symbiotically lead to a new architectural expressions in formal and constructional regard. Draft-accompanying, these questions are pursued on a theoretical level, in order to be able to find its expression in the concrete draft. Ascertained technical applications are not meant to be of priority.

---

**051-1219-15L**

**Integrated Discipline Building Systems (A. Schlüter)**

- **W**
- **3 credits**
- **2U**
- **A. Schlüter**

Abstract

The integrated discipline Building Systems adresses specific questions about building systems and system concepts. Energetic analysis and system designs are carried out on the students individual design projects.

Objective

The course aims for an ability to understand concepts of sustainable building technology coherently integrated into an architectural design. The focus lies on LowEx-systems.

---

**051-1221-15L**

**Integrated Discipline Architecture and Building Process (S.Menz)**

- **W**
- **3 credits**
- **2U**
- **S. Menz**

Abstract

This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines.

Objective

Alongside a discussion of the basic principles, trends and terminologies, a closer look will be taken at each topic.

**Prerequisites / notice**

Grant by lecturer is required.
The Integrated Discipline deals with the interrelation between material and algorithmic design. The direct control of production data opens up new possibilities for design strategies that are exempt from the limitations of standard CAD software. The integration of process, function, and design allows for a new approach to the production of architecture.

We use the term digital materiality to describe an emergent transformation in the expression of architecture. Materiality is increasingly being enriched with digital characteristics, which substantially affect architectures physis. Digital materiality evolves through the interplay between digital and material processes in design and construction. The synthesis of two seemingly distinct worlds - the digital and the material - generates new, self-evident realities. Data and material, programming and construction are interwoven. This synthesis is enabled by the techniques of digital fabrication, which allows the architect to control the manufacturing process through design data. Material is thus being enriched by information; material becomes informed. In the future, architects will perceive the fabrication process in its entirety. This new situation transforms the possibilities and thus the professional scope of the architect.

This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).

Apart from learning about and experiencing Information Architecture, the course also introduces research and management skills that will distinguish the future trained ETH architect.

*Abstract*

The lecture covers the time of the 20th century and describes with theories, projects and implemented plannings the history of the modern city. The lectures emphasizes on the historical plannings and methods and presents each specific urban development within a broader context.

*Objective*

This course analyzes the history of urban architecture primarily in its existing three dimensional form as a complex human artefact. It also explores the inspirations that prompted the creation of this artefact: philosophical and religious concepts, social conditions, property relationships and the mechanisms that exploit the economics of real estate and the influence of building technology. Intellectual, literary or artistic modes of thought will also be assessed with regard to their impact on urban development. Urbanism has its own distinctive approach as a discipline, but it is also clearly responsive to the influence of related disciplines. Study is made of actual cities and urban expansion plans which are in the process of implementation, as well as unrealized projects and visions of the future. These projects sometimes illustrate ways of thinking that are equal to, or clearer than, actual urban situations.
The lecture which will be held only in one semester includes the developments of the 20th century

1. Le Corbusier: theories, visions and clearcut in the name of the autorité
2. The United States in the Jazz Age: Between Metropolis of Tomorrow and Broadacre City
3. Italy in the Fascist Era: Monumental ensembles and new town between assiduousness of modernization and obsession of representation
4. Urban design under totalitarian regimes: The architects of the "Tausendjährige Reich" and the "engineers of luck" of the Soviet Union of Stalin
5. Coming to terms with the past and the Cold War: Reconstruction in the two German states
6. The myth of the human scale: the 1950s in Spain, Great Britain, Scandinavia and Italy
7. Postwar Experiments: Rationalistic classicism in France
8. Two new towns in the 20th century: Chandigarh and Brasilia
9. Fictions and visions: The international utopia of the city
10. The second conquest of the North American territorium: The automobile and the city in the USA

11. Analysis, analogy and renewal: The adventure of the typological city

To each lecture an overview is listet within a script, that can be purchased at the chair for the history of urban design (HIL D 75.2) at the price of CHF 25.­. The script serves as an auxiliary means to the attended lecture compiling the most important illustrations showed and the names and dates of the buildings and its builders along with a short introductory note. The case studies in the lectures as well as the processing of individual topics within the framework of elective work permit and require students active participation.

**Design and Building Process MBS** is a brief manual covering the competencies and the responsibilities of all involved parties through the design and building process. Lectures on the topics of the profession, design quality, the project, organisation, coordination, costing, contracts and agreements, tendering and construction management, life cycle, real estate market, building trade and getting started will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship.
Content

"Design and Building Process MBS" is a brief manual covering the competencies and the responsibilities of involved parties through the design and building process. Twelve compact aspects regarding the establish building culture are gaining importance in an increasingly specialised, complex and international surrounding. Lectures on the topics of the profession, design quality, the project, organisation, coordination, costing, contracts and agreements, tendering and construction management, life cycle, real estate market, building trade, and getting started will guide the participants, bringing the individual pieces of knowledge to a superordinate relationship. The course introduces the key figures, depicts the measurable and non-measurable criteria of the project and highlights the provided services of the consultants. In addition to discussing the basics, the terminologies and the tendencies, the lecture units will refer to the studios as well as the practices. Teaching-based case studies will compliment and deepen the understanding of the twelve selected aspects. The course is presented as a moderated seminar to allow students the opportunity for individual input: active collaboration between the students and their tutor therefore required.

063-0311-15L Transitional Periods: Swiss Renaissance and Baroque W 1 credit 1V M. Gnehm

Abstract
The lecture discusses the striking presence of hybrid forms in Swiss architecture of the 16th to the 18th centuries by means of secular and religious buildings from all parts of Switzerland.

Objective

The objective of the lecture is to understand peculiarities of Swiss Renaissance and Baroque architecture in its relation to diverse social contexts and cultural changes.

Content

Swiss architecture of the 16th to the 18th centuries often defies stylistic classifications under the headings of Renaissance and Baroque. The notion of "hybrid style" was applied, meaning e.g. the blending of Gothic and antique elements, and 17th-century buildings were ascribed to the Renaissance. All these features were termed as "stylistic belatedness" and explained as arising from the political situation of Switzerland as a "borderland" (divided also in itself) that intended to preserve elements of its own against foreign forces. In revising opinions like these, the lecture discusses by means of the analysis of single buildings and their context (amongst others the Hôtel de Ville in Geneva, the cathedral of Lugano, the Maison des Halles in Neuchâtel, the Stockalper Palace in Brig, the orphanage in Zurich or the Abbey church of St Gall) the qualities of hybrid forms and anachronisms (to be found also in the surrounding Europe) as an expression of the will to accommodate cultural changes.

063-0363-00L Urban History Online. Methods for Text and Plan Analysis W 2 credits 2U

Abstract
In obtaining the necessary knowledge and understanding of historical complexities, this in-depth course will give you at hand critical and analytical as well as strategic and planning skills. The course consists of three learning blocks (e-learning), which are embedded in an interactive learning environment, which have to be completed within a given time period.

Objective

The topic of the course is the history of the architecture of the city. In addition to the above-mentioned skills, you will be reflecting on continuities, which are to be found at different times in the urban history. All competences, which are to be taught in this course will be exemplified in urban case studies, i.e. plans, photos, models, and in theoretical treatises. If you are inscribed into the lecture «The history of the city from modernity until today» you will enhance your skills in creating a mental model, where with the help of especially developed learn activities (e-learning) you will understand, handle, reproduce and even widen your methodical competences. If you are solely attending the in-depth course you will immerse in the basic knowledge of the history of urban design and learn fundamental methods of analysing of texts and plans. The time of this examination can be chosen within a given time period.

Content

The content of the course emphasizes on the profound discussion and examination of interrelations of selected, exemplary urban theories and projects thought and built in the 20th century. Within three conceptually designed learning blocks (e-learning) you will develop and train basal methods of analysing of texts and plans. The time of this examination can be chosen within a given time period.

051-0317-15L History of Art and Architecture: Situating Climate Change W 4 credits 3G E. E. Scott

Abstract

This seminar explores the admittedly vast topic of global climate change by way of case studies that link specific sites with its various facets—ecological, legal, infrastructural, etc. It aims to offer entry points into a defining phenomenon of our age, one that moreover carries direct implications for architecture at the scale of territorial thinking/planning down to individual building design.

Objective

Students should come away with broadened, interdisciplinary knowledge of climate change as a phenomenon that is at once environmental and social, and unfolds at both planetary and highly local scales. They will also be pushed to examine its implications for architecture, including beyond purely technological or infrastructural considerations.

Content

This seminar explores the admittedly vast topic of global climate change, with the aim of rendering it simultaneously less abstract and more complex. As a phenomenon, climate change is dizzyingly convoluted, entailing many things happening in many places at once, at varying rates and scales, and with myriad types and degrees of consequence.

As a whole, the seminar aims to offer new entry points into a defining phenomenon of our age, one that moreover carries direct implications for architecture at the scale of territorial thinking/planning down to individual building design.

Class will meet for three hours each week, involving both a lecture and discussion. There will additionally be multiple guest speakers, one to two fieldtrips, a final assignment, and a graded exam.

Lecture notes
A syllabus, required readings, and other course materials will be published/downloadable from the website of Professor Ursprung's chair at the beginning of the semester.

Prerequisites / notice
The three blocks of the course are related to the lecture «The history of the architecture of the city». The course can be attended in two modes, either in combination with the above-mentioned lecture or independently as a single course. The entire course is held in german.

063-0623-15L Zurich from the Outside (a Map of Metropolitan Territory, Field Trips) W 2 credits 4U M. Topalovic

Abstract

Talk about and devise architectonic ways of perceiving, studying and portraying urban territories that lay beyond the limits of the city.

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 73 of 1432
Objective
The architecture's ways of looking are unstable at territorial scales, and yet, urban territories are crucial contexts of architecture. Seeing and understanding territory as part of the city, its mirror, reflects back in the ways we see the city itself and its architectures. How can architecture extend beyond the limits of the city, into the field? How can architects look at, study and design the "city's constitutive outside;" the periphery; the aggl; the country; the hinterland? What are the motives (aesthetic, political) we can have in these territories? What is the importance of being there, in the flesh, on-site? How to move in the field, how to discover it? What are the visual and narrative strategies that can capture the character of territory and its sites?

Content
Weekly studio exercises and on-site expeditions. (The product of the weekly exercises are shown in a common booklet that will serves as a portrait, or a "map" of the chosen urban territory in Switzerland. The character of the work is positioned between architecture, urbanism and visual arts).

**Abstract**

This seminar aims at providing access to the prelinguistic space of artistic thinking and agency, in order to be able to observe the artists in their immediate working process. This space can only be entered if we successfully leave all layers of mediation behind us and cease to force an understanding.

**Objective**

The seminar, of course, with its claim to teach the critical faculty to be astonished, is also part of these layers of mediation. We will measure this paradox of art directly up against our own ambitions. A productive tension will be established within us when we open up to artistic practices potentially contradicting our own.

We will approach the prelinguistic space of artistic thinking and agency from its context, which supports, mediates, criticizes, sells and preserves its productions - the artworks. We will listen to the various protagonists of this space - cultural agents in civil service institutions, art mediators, critics, curators, gallerists, custodians; for in this space surrounding the prelinguistic one, nothing is left to chance. When these essays first appeared in Artforum in 1976, their impact was immediate. They were discussed, annotated, cited, collected, and translated; the three issues of Artforum in which they appeared have become nearly impossible to obtain. Having Brian O'Doherty's provocative essays available again is a signal event for the art world. This edition also includes "The Gallery as Gesture," a critically important piece published ten years after the others.

**Literature**

**Prerequisites / notice**

Application for the course with the lecuturer also via e-mail: stefan.keller@arch.ethz.ch

Number of participants limited to 35.

</tr>
</tbody>
</table>

**Abstract**

With the architectural drawing we can refer to one of the most important and primary design tools. Imaginations, ideas, as also the observation of important scenarios and impressions could be visualized with the appropriate technique.

**Objective**

Based on the process of the concrete, practical drawing, we can sensitize our perception and enhance also the interaction between head and hand. Also the digital drawing with iPad and Wacom tablet (if available) should not be missed out as an additional challenge.

**Content**

The focus of the drawings are determined in the study of architectural references as: figure, plasticity, body, space, light, atmosphere, etc. The second hour of lecture is booked for the review of the weekly exercises.

**Prerequisites / notice**

The number of participants is limited by 136.

**Objective**

The objective is that the students engage in a debate of a differentiated functional planning as a basis for complex buildings which are to be successful functionally, operationally and in design.

On the basis of a given scope of themes the students carry out research aiming for possible improvements for example in health facility planning. The scope of subjects is announced at the beginning of each semester.

---

### Lecture notes

The script is provided by the teaching chair and can be purchased the day the elective course starts.

### Prerequisites / notice

Limited places (enrolment on lecturer's acceptance only).
Complex buildings such as health care buildings are subject to constant change. In a new hospital building 60% of the diagnostic and treatment areas are subject to building changes within the first 10 years of operation. Architecture has to develop concepts which accommodate this level of dynamics into the building structure in a better way. In the coming years this need for adaptability is going to be challenges even further by the even more reducing health care resources. The paper should discuss in this context a specific question in detail by analysing problems and developing and discussing potential planning solutions.

The slides from the presentations will be made available.

Presentations of the lecturer and guests will be made available.

### Content

1. Introduction
   - Introduction to construction knowledge
   - Importance of understanding the construction process

2. Moisture Transport
   - Determination of moisture transport properties
   - Analysis of transport in cracked materials

3. Poromechanics
   - Moisture and mechanics: poro-elasticity
   - Poro-elasticity and salt crystallisation
   - Case studies

4. Multiscale analysis
   - Problem statement
   - Multiscale transport model
   - Multiscale coupled transport - damage model

### Prerequisites

- Basic knowledge of moisture transport and related degradation processes in building and civil engineering materials and structures
- Introduction to concepts of poromechanics and multiscale analysis
- Application of knowledge by the analysis of damage cases

### Literature

Built Environment
This is the 1955 book published by Pier Luigi Nervi, covers crucial factors for building that, outlined by him, are still today all the more relevant as a lesson for architecturally and structurally justified buildings. His thoughts represent valuable criteria and indispensable tools for observation and carrying out investigations of the built environment.

Lessons learned from this can enrich the design work of today's and tomorrow's architects. All of these (see abstract) i.e. analyses, observances, hypotheses, groupings and cross-comparisons, will help the students in their careers to find their own strategies and approaches to design and to be awarded their. And so, according to the advice of Pier Luigi Nervi : "...At every stage of his training, the future architect should be constantly and methodically guided to search for essential elements in each problem, be it large or small. The study of the architectural works of the past should consist in the critical examination of their functional and structural solutions and of the relation between these and form, in order to show that form is a consequence and not a determinant of functional and structural needs." [P.L. Nervi: Costruire correttamente, Milano 1955, English version titled "Structures", 1956, p.28].

The main thread of this course, that runs over two semesters (*), are buildings of all ages that could be categorised under notions such as « most viewed », « most technically daring », « most unknown », « most discussed » or « most worthy of discussion », and carry instructive aspects of the teachings of Pier Luigi Nervi ("costruire correttamente"). In the lecture, these buildings will be investigated on-the-spot, described from the designers' point-of-view and will be commented on with reference to any redesign resulting from the interplay of architectural and structural concepts. Harmonies and discords should be discovered. Occasionally there will be guest lectures. These people, who were directly involved with a certain building, will portray the emergence and development of the project.

In this sense, the course is also intended for civil / structural engineering students and presents a possible bridge between the two prospective project partners - architect and engineer.

(*) Begins in the autumn semester. Entry into the course in the spring is possible.

An Introduction to Sustainable Development in the
Built Environment
W 3 credits
2G
G. Habert
Abstract
This was offered as "Sustainable Construction" for the
Built Environment
This course was offered as "Sustainable Construction" until HS14.

Objective
In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable
devlopment. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today
definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and
environmental aspects.

The course aims to promote an integral view and understanding of sustainable development and describing different spheres (social/cultural,
ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and
applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.
The City of Zurich rises there where Celtic tribes settled and the Romans founded a city. In the past two millennia authorities, planners, and architects shaped the city upon the Limmat. The physical outcome of these interventions stand in close relationship with the knowledge of the time and reflect the prevailing positions and theories, which were thought, published and built elsewhere. For that matter, the history of urban design of Zurich can be well understood as a branch of the history of European urban design, as well as the individual steps of development are offspring of international reflections and tendencies. Presentations in the seminar room and the visit of the selected ensembles in Zurich will help to tell the story of the urban development from the Middle Ages up to today. With this basic knowledge gained in the seminar and the walks the students will have to discuss the historical theories and developments as well as the urban qualities of the ensembles.

This will help the students not only to better understand the city but will also allow them to sample different urban situations and gather spatial experiences, which can also facilitate their design process.

- The course is accompanied by a workbook with texts and background information.
- Enrolment after Agreement only!

**Lecture notes**
- The course is limited to 24 students. The restriction follows the time of the inscription. In order to enroll in the course, students must participate in a two-days trip to Lyon on the weekend of 3/4.10. The contribution to expenses will be 200.- CHF.
- Enrolment after Agreement only!

**Prerequisites / notice**
- The course is accompanied by an iBook.
- The seminar will focus on case studies in order to reveal strategies for dealing with the modern city. Built urban-development ensembles from the twentieth century will be embedded in their architectural and historical context, studied with an eye to their constitutive elements and discussed in connection with current urban-planning projects. In addition to various forms of methodological engagement with urban contexts, students will experience how the disciplines of urban-planning history and urban development can be considered in a more integrated way. Moreover, they will receive feedback on how to present the result of their analyses in concise, well-structured talks and in drawings.
- Limited number of participants. Enrolment in agreement with the lecturer only.

**Abstract**
- The term ‘Urban Food’ implicitly questions how the production, processing, distribution, consumption and disposal of food influence the relationship between city and countryside.

**Objective**
- Specific knowledge about relation and various processes in cities and countrysides, with regard to production, handling, logistics, consumption habits and disposal of foodstuff.

**Content**
- The production, processing, distribution, consumption, and disposal of food have perpetually affected the relationship between city and countryside. In that sense, the industrialization and globalization of food systems contributed to the urbanization of the landscape. On the other hand, logistic systems and consumer behavior are strongly affected by processes of urbanization, which shows that the city and its food system have a mutual influence on each other.

**Prerequisites / notice**
- The course is limited to 24 students. The restriction follows the time of the inscription. In order to enroll in the course, students must participate in a two-days trip to Lyon on the weekend of 3/4.10. The contribution to expenses will be 200.- CHF.
- Enrolment after Agreement only!

**Lecture notes**
- There will be no script handed out.
- There will be no script handed out.
- There will be no script handed out.

**Literature**
- Literature will be distributed as bibliographical list at the first session.

**Autumn Semester 2015**
**Page 80 of 1432**
More information on our blog: www.marketsinthetropics.com

You will receive full support on-site from Universidad del Norte and ETH tutors from your discipline. In developing the scenarios you will look at those patterns from two sides. One being the view of a planner asking to find bottlenecks or the ideal place for amenities and the other being the view of visitors. We will program different behaviours that should compete against each other in order to compare their different strategies. As a case study we will use the CaliFest Festival in Zurich.

For deepening the learnt in a semester thesis we offer to optimise the created simulations to make them available in interactive planning workshops. Additionally they could be converted into interactive web apps.

The elective course "Action! On the City" will focus on developing a board game that facilitates the decision-making and design processes to answer complex, real-life urban transformations. The course aims to explore the requisites for a sustainable urban development through the lens of various disciplines, such as architecture, engineering, and environmental sciences.

By developing this board game, students will learn how to articulate decisions, to facilitate negotiations, and to define common visions in a trans-disciplinary framework. The course will teach both systematic and creative approaches, strengthening the role of the future planners as moderators for an integrated city development.

The program will combine site visits, expert lectures and workshops to allow you to develop the following skills:

- The capacity to work to address urban challenges in an inter-disciplinary team
- Apply Scenario Analysis technique to structure and integrate knowledge from various fields
- Cross cultural understanding and skills in an international collaboration
- Mechanisms to collaborate and communicate with practitioners and stakeholders

Understanding of integrated and sustainable urban development

Ability to use stakeholder participation to solve real world problems

Mid-sized cities in Latin America are growing at unprecedented rates. The next decade will be decisive in terms of demographic and economic growth, creating a time window to respond to unprecedented demands on resources, such as land, water and energy.

Are these boomtowns doomed to follow the fate of megacities or will they successfully avoid the pitfalls of rapid urban development? This program is part of a three-year ambitious collaboration with the Inter American Development Bank’s Emerging and Sustainable Cities Initiative and the Swiss Ministry for Economic Cooperation (SECO). It will influence decision makers and engage with real issues.

ETH is teaming up with the leading Universidad del Norte in Colombia to focus on Barranquilla, a rapidly growing city of 1.2 million inhabitants on the Atlantic coast of Colombia. Following a period of decline, vast sums of foreign investment are now flowing into this port city, with the potential to reverse current inequalities and spark more sustainable development.

In a team, you will produce alternative urban scenarios for the redevelopment of Barranquillas Central Market. You will contribute your expertise and unpack the realities of sustainable development in a tropical climate. How can knowledge from the ETH be combined with leading Colombian research and translated to a Latin American context? Through debate, controversy and collaboration it is expected you produce scenarios that integrate your different disciplines and question the preconceptions of sustainable urban development.

This immersive summer school will be structured in three interlocking modules:

- In the first module you will investigate the central market and gain a strong understanding of the social, environmental and built context in Barranquilla. You will employ and combine your varied disciplinary methodologies to gain insight into the sustainability challenges facing the city and the redevelopment of the avenue.

- In the second module, you will develop a series of scenarios for the central market in Barranquilla, proposing alternatives for its sustainable future. You will build on research from the first module, and explore the potential of your ideas with local stakeholders and professionals from your field. You will document these scenarios using creative and varied representational methods.

- In the final module you will pitch your scenarios to decision makers. During this high-level event you will measure their preferences, debate the associated trade-offs, and provide a series of orientations for those planning the future of Barranquilla.

Other relevant information:
- The course is taught by H. Klumpner and A. Brillembourg.
- The course is part of a three-year ambitious collaboration with the Inter American Development Bank’s Emerging and Sustainable Cities Initiative.
- The course aims to explore the requisites for a sustainable urban development through the lens of various disciplines, such as architecture, engineering, and environmental sciences.

For more information, please visit the Future Cities Website at: http://www.futurecities.ethz.ch during the entire course. The iBook INFORMATION CITIES is available in the iBooks Store for free.
### Prerequisites / notice

**Who should apply?**

Enthusiastic students currently enrolled in a masters program in ETH Zurich and Universidad del Norte, Barranquilla Colombia. A balanced group of 12 ETH master students from the D-ARCH, D-USYS and D-BAUG departments will be selected. They will be joined by 12 Colombian students from our partner university in Barranquilla, Universidad del Norte.

Applications should have a strong interest in sustainable urban development and trans disciplinary collaborative research. They should be able to demonstrate their academic strength, motivation, interest and expertise. Knowledge of Spanish is welcomed but not obligatory.

ETH participants will be charged a fee of 300 CHF to cover local activities, travel and accommodation.

Students will be responsible for organising visa, health insurance, and transportation to and from Barranquilla. Flights to Barranquilla from Zurich cost approximately 1700 CHF. Additional travel grants are available for ETH students.

Applications can be submitted including curriculum vitae, portfolio where relevant and letter of motivation as portable document format (pdf) by May 30th, 17:00 CET to hertzog@usys.ethz.ch

Notification for admission June 1st.

### 051-0827-15L Sand: an (in)finite Resource? - Engineering for Development (E4D) Winter School

<table>
<thead>
<tr>
<th>Number of participants limited.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Abstract</strong></td>
</tr>
<tr>
<td>The programme revolves around the so-far untapped resource desert sand and the question of how to activate its potential as an alternative building material. The E4D winter school will be composed of 30 master and doctoral students of different disciplines related to the topic from ETH Zurich and from other academic institutions. They will be joined by faculty members and external experts.</td>
</tr>
<tr>
<td><strong>Objective</strong></td>
</tr>
<tr>
<td>The E4D winter school aims to develop an integrated vision to a global challenge of today's construction industry: the non-usability of desert sand. The programme of the E4D Winter School aims at developing alternative methods to activate the so-far unusable resource of desert sand for the construction industry. Lead by different experts from around the world, students will not only learn the theoretic background of this resource but experiment with current and future technologies to transform desert sand. In workshop experiments the acquired knowledge will be tested and applied. The students will attend workshops along three lines of investigation that could mobilise desert sand for construction and other applications: (i) bio-cementation, (ii) sintering and (iii) 3D printing.</td>
</tr>
<tr>
<td><strong>Content</strong></td>
</tr>
<tr>
<td>Sand is the most used raw material for the production of goods on our planet. It is found in concrete, glass, computers, deterrents and even toothpaste. But sand is a finite resource: what took millions of years to come into being through erosion and sedimentation, man is mining at rivers and ocean coasts in a so-far unknown speed. Sand is the megastar of the industrial and digital era - our culture is literally built upon this resource. But sand is not equal to sand: The construction industry requires grain sizes and rough shapes that are only found in river beds, lakes and the oceans. Over the turn of millions of years, mountains gradually eroded into gravel, sand and dust. Eventually, rainfalls carry these particles through existing watercourses to the sea. Sand is mostly composed of quartz, a mineral form of silicon dioxide. It is one of the most abundant materials on the earth surface and also one of the strongest. These properties make it valuable to various industries. Desert sand on the other hand is presently unsuitable to the construction industry: Gradual wind erosion polishes the sand particles into round and even forms and therefore reduces their friction capacity; desert sand is simply too fine and spherical in shape to act as a high-friction aggregate in a concrete matrix.</td>
</tr>
<tr>
<td><strong>Prerequisites / notice</strong></td>
</tr>
<tr>
<td>Open for students of all Departments of ETH!</td>
</tr>
</tbody>
</table>

**Taking place from 9 to 28 January 2016 at the TU Berlin Campus in El-Gouna, Egypt.**

**Costs:** CHF 500, including board and accommodation. All participants are responsible for organising and financing their own domestic or international travel to El Gouna.

**The Engineering for Development (E4D) Winter School 2016 will invite 30 master and doctoral students from different disciplines related to the topic of the winterschool. Applicants will be selected based on their academic record and previous work experiences.**

**Applicants must send a one-page CV and one-page letter of motivation in PDF format stating their interest, to Mrs. Patricia Heuberger, patricia.heuberger@sl.ethz.ch**

**Deadline:** 30 September 2015

**Notification:** 20 October 2015

**Further information:** bit.ly/E4Dwinterschool_sand_2016

### 051-0623-15L Travellers. On the Ways of Seeing Urban Territories (Lectures and Dialogues)

<table>
<thead>
<tr>
<th>W</th>
<th>1 credit</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Abstract</strong></td>
<td>Travellers is a series of five lectures and conversations about ways of perceiving, studying and portraying urban territories. Each of the guest speakers is a traveler - a person who places the direct observation and experience of urban landscapes in the core of their practice.</td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>The architectural ways of looking, concepts and techniques are unstable at large territorial scales, and yet, urban territories can be seen as crucial contexts for the production of architecture. Seeing an extended urban territory as part of the city - its mirror - can reflect back in the ways we see the city itself, and its architectures. With students and invited guests, we will consider: How can architects look at, study and design urban territories or the &quot;city's constitutive outside&quot;: the periphery, the agglomeration, the countryside and the hinterland? What are the motives (aesthetic, political) architects can have in engaging with these territories? The aim is to discuss concepts and techniques for territorial investigations and projects.</td>
</tr>
</tbody>
</table>
We will be looking at urban territories through the eyes, lenses and concepts of an urban geographer, a cartographer, a photographer, an artist and an architect.

12.10.2015
CHRISTIAN SCHMID
urban sociologist and professor at ETH Zurich

MILICA TOPALOVIC
architect, assistant professor at ETH Zurich

5.15pm Inaugural lecture at ETH Zentrum HG, Audi Max F30

Mon, 5.30 - 7 pm, ONA Focushalle

Content

Utopias arise as fictive antitheses to a perceived imperfect reality. An intact world has no use for utopias, whereas visions of a different, better and more beautiful life are in great demand in times of crisis, such as in the Age of Reformation or in the 19th century with its technological and social upheaval. Thomas More coined the term in 1516 for his novel “Utopia”. Defined as “non-places” (from the ancient Greek ou-topo), utopias do not insist upon their realization. Nonetheless, the far-distant ideal form of existence has been the driving force par excellence beyond progress. The utopian projection is the point of departure for every planning. The utopia serves as the daily bread not only of philosophers, theologians and state theoreticians, but of architects and city planners as well, as exhibited in the tension between vision and realization.

The seminar will deal with the conventions of the contemporary architectural practice. The proposed topics should be researched out of a twofold, historical as well as systemic perspective. A detailed description of the syllabus can be found on the homepage of the professorship: http://stalder.gta.arch.ethz.ch/seminarien.php

Lecture notes

Data: 06.10.2017 12:56
Autumn Semester 2015
Page 83 of 1432
This seminar focuses on the interview, and more broadly oral history within art and architectural history. In the class, we will read and discuss texts as well as prepare and conduct interviews with protagonists who shaped the formation and history of the Institute for the History and Theory of Architecture (gta) at ETH Zurich, founded in 1967. We will approach the interview both as a historical and theoretical subject while also developing practical interview skills. One short presentation in class as well as an interview are required.

The seminar will span two semesters, fall 2015 and spring 2016. The relevant texts will be available for download.

Das Seminar ist für Masterstudenten und Doktorandinnen und Doktoranden.

---

**ECTS**

**Sociology: Planetary Urbanization - A Theory**

This elective course highlights the sociological perspective on architectural practice and provides an introduction to sociological research. It focuses on two main procedures: on the one hand, a systematic reading and discussion of theoretical texts, and on the other, empirical case studies of social aspects of the production of the built environment. In this course, a wide set of qualitative research methods is used (including various forms of interview, participant observation, image and text analyses). This approach enables students to gain their own experience by dealing with the various participants and constellations in the social field of architecture and building construction, and to familiarize themselves with the approaches and perceptions of various different participants.

In this theory seminar we read and discuss a range of recent papers and book chapters which analyze these new phenomena of planetary urbanization, such as the implosion and explosion of urban regions, the disintegration of contiguous “hinterlands”, the emergence of corridor urbanization, the large scale industrialization and urbanization of agricultural areas, the production of extended urban fabrics of landscapes, the creation and extension of operational landscapes, as well as processes that lead to the end of the “wilderness” and the urbanization of ocean space.

The relevant texts will be distributed in the seminar. A very good overview is provided in the following edited volume: Brenner, Neil (ed.): Implosions / Explosions: Towards a Study of Planetary Urbanization. Jovis, Berlin, 2014.

</tr>
<tr>
<td>Abstract</td>
<td>Practical application and realization of the elective study in collaboration with the current architectural design project, or as a separate independent project.</td>
</tr>
<tr>
<td>Objective</td>
<td>The architectural drawing establishes itself from the very first sketch up to a representative image as an important &quot;decision-maker&quot; for the progress of the design project. The necessary intensity, technology and experimental keen, as also the search for new forms of representations should be sought.</td>
</tr>
<tr>
<td>Prerequisites / notice</td>
<td>The visit of the elective is assumed.</td>
</tr>
<tr>
<td>Prerequisites</td>
<td>Project proposal please to: <a href="mailto:faesser@arch.ethz.ch">faesser@arch.ethz.ch</a></td>
</tr>
<tr>
<td>Abstract</td>
<td>An elective master thesis in architectural theory is a written student assignment of an architectural problem or question, which is to be elaborated into a scientific paper in consultation with the advisors of the chair. The examination of a specific problem asks for a conscious and critical reflection of interdisciplinary approaches and methods.</td>
</tr>
<tr>
<td>Objective</td>
<td>Within the framework of an elective master thesis the student can enhance the acquired knowledge in architectural theory in written form. The master thesis serves the acquisition of scientific methods, the recreation, development and verbalization of conclusions and the contextualization within a theoretical setting. In a broader sense it serves the training of verbal skills, the development of a critical verbal, cognitive and imaginary access to problems in the realm of architecture and its neighboring disciplines in the humanities.</td>
</tr>
<tr>
<td>Prerequisites / notice</td>
<td>Consultation for the individual elective thesis will be available during semester as well as during the free period. The oral examination at the end of the semester break is based on the written thesis, handed in before the the examination (watch the deadline in summer/winter).</td>
</tr>
<tr>
<td>Prerequisites</td>
<td>Appointments for consultation with the junior faculty by arrangement.</td>
</tr>
<tr>
<td>063-0317-15L</td>
<td><strong>History of Art and Architecture (Thesis Elective)</strong></td>
</tr>
<tr>
<td>Abstract</td>
<td>The objective is to write an independent thesis on a monographic or thematic topic within the scope of the history of art and architecture.</td>
</tr>
<tr>
<td>Objective</td>
<td>The focus is thus exemplify a comprehensive view of the approach and methods towards the modern history of art.</td>
</tr>
<tr>
<td>Content</td>
<td>The objective of the elective subject is, in coordination with the advisors, to work autonomously on a subject from the history of architecture. Beside own ideas also positions of research should be considered; we set value on a correct scientific form as well as a clear language. The work should cover about 36000 signs as well as image material if needed. At the beginning and before delivery of the work an elaborate discussion will take place.</td>
</tr>
<tr>
<td>Prerequisites / notice</td>
<td>Please contact the assistants before the inscription.</td>
</tr>
<tr>
<td>Abstract</td>
<td>Essay on a Subject from the Field of Architectural History</td>
</tr>
<tr>
<td>Objective</td>
<td>Independent preparation of a scholarly essay on a topic from the field of architectural history.</td>
</tr>
<tr>
<td>Content</td>
<td>The aim of the elective course paper is to discuss a topic freely selected from the field of architectural history, in agreement with the assistant lecturer(s). In addition to original ideas, positions taken in the history of research on the subject should also be discussed. It is important to use the correct scholarly format and clear language. The paper should be approximately 40'000 characters in length and should also include as much pictorial material as needed.</td>
</tr>
<tr>
<td>063-0355-15L</td>
<td><strong>Preservation of Cultural Heritage (Thesis Elective)</strong></td>
</tr>
<tr>
<td>Abstract</td>
<td>The Elective Subject Degree Tests are meant to enable a deeper level of individual engagement with the contents of the elective subjects. Topics of electives can be elaborated into elective degree tests.</td>
</tr>
<tr>
<td>Objective</td>
<td>The general aim of this intensification is teaching competency in analysis and interpretation in the following areas: knowledge of artifacts, dynamics of systems, historical contexts, history of knowledge and theory as well as an approach to scholarly work.</td>
</tr>
<tr>
<td>Content</td>
<td>Contents depend on the specific curriculum of each semester and will be determined in consultation with the faculty advisor. Independent study is possible, however, only after consultation.</td>
</tr>
<tr>
<td>Abstract</td>
<td>Within three elective courses the students need to fulfill an elective work (seminar work). Elective works serve the independent way of dealing with the contents of the according elective course.</td>
</tr>
<tr>
<td>Objective</td>
<td>Aim of this seminar work is to learn how to write a small thesis on a case study. This work should include a creative text, but also to obey certain rules, which turn a regular text into a scientific one.</td>
</tr>
<tr>
<td>Prerequisites / notice</td>
<td>Einer Anmeldung zum Wahlfach muss ein Gespräch mit einem der Assistenten des Lehrstuhls vorangehen. Es ist daher vor einer Anmeldung ratsam Kontakt zu einem der Betreuungsassistenten aufzunehmen.</td>
</tr>
<tr>
<td>Abstract</td>
<td>Feminine theory of urban design (18th-21st century). The task of this seminar is working with texts about the city written by women. The texts will be analysed, compared and examined employing different scientific methods.</td>
</tr>
<tr>
<td>Objective</td>
<td>The main aim of this seminar is learning the scientific handling of theoretical texts on the city. These texts range from pamphlets, to commentaries and literary products.</td>
</tr>
<tr>
<td>Abstract</td>
<td>The efforts for entanglements of architectonic and constructive concepts had resulted in wide discussions and in unique buildings during different time periods (i.e. ferroconcrete in the nineteen-thirties and nineteen-fifties), furthermore to architectonic and technical enrichments.</td>
</tr>
<tr>
<td>Objective</td>
<td>Content</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>Getting to know important critical figures between architecture and engineering as well as their attitudes and concepts and the most distinguished buildings.</td>
<td>Seminar to the studies and for discussion of important texts and buildings of the most famous construction engineers and architects by listening to reviews, presentations and models, input lectures and guest speeches, films and joint surveys.</td>
</tr>

</table>

| Abstract | Objective | 063-0515-15L Building Physics (Thesis Elective) | Within three elective courses the students need to fulfill an elective work (seminar work). Elective works serve the independent way of dealing with the contents of the according elective course. | The aim of the elective work is to gain comprehensive insight in specific issues related to urban physics and low-energy buildings. These issues may concern: wind & thermal comfort in the built environment, heat islands, cross-ventilation, driving rain, pollution dispersion, new technologies for low-energy buildings, design of building systems, optimal control. The work may include computational modelling and prototype testing in laboratory. |

| Prerequisites | notice | 063-0515-15L Building Physics (Thesis Elective) | It's imperative that the topic of the work is discussed with and accepted by the chair in advance. | |

<th>6 credits</th>
<th>11A</th>
<th>G. Vogt</th>
</tr>
</thead>
<tbody>
<tr>
<td>The term “pairi-daeza”, Persian for “a wall surrounding a garden”, is the point of origin for an elective series addressing basic elements of landscape architecture. This semester, students will deal with the topic ‘Threshold’, developing a design for a metropolitan park in Lyon.</td>
<td>The term ‘paradise’ and its religious implications originate from ‘pairi-daeza’. Old Persian for ‘a wall surrounding a garden’.Pairi-daeza is the title of an elective course series addressing basic elements of landscape architecture within the context of public space in European Metropolis, including the topics of border, threshold, water, vegetation, topography, choreography, and metaphor. The elective course serves as an introduction to landscape architectural design. Architecture students develop a project based on the perception of place, cognizance of landscape-architectonic typologies, and conception of public space. They become familiar with model building as a design methodology as well as with representation in plan form. The design process is accompanied by workshops, lectures, excursions, critiques, and a workbook.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| Lecture notes | Prerequisites | 063-0629-15L Pairi-Daeza: Threshold (Elective Thesis) | The course is accompanied by a workbook with texts and background information. | For the elective Thesis it is a necessary condition to visit the elective course. |

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 88 of 1423
The thesis elective represents a consolidation or one or more stages of a topic, that are outlined in the objectives. These stages include the analysis, understanding, interpretation and application of this knowledge in one's own design.

063-0813-15L Sociology (Thesis Elective) □

W 6 credits 11A C. Schmid, P. Klaus

Abstract
Individual thesis with connection to a Master course in sociology III

Objective
Thesis Electives are reports oriented on the standards of social sciences. Students learn to write a scientific report which follows the state of the art in respect of content, methods, format, internal coherence and scientific validity.

063-0815-15L ACTION! Empowering the Real City (Thesis Elective) □

W 6 credits 11A A. Brillembourg, H. Klumpner

Abstract
In relation to the elective course "ACTION!" students will have the possibility to extend their research into the behaviours and components that make up the urban realm. A special focus on the processes and mechanisms of (in)formal urban forms and systems will characterise the research. Specific research goals tailored to individual interests will be discussed before proceeding.

Objective
The course will help frame an understanding of the forces shaping (in)formal settlements and the critical behaviours, requirements and practices of its inhabitants. It will also encourage the development of an analytical and critical position on the potential role of the architect to mediate a design process within broader socio-economic, political and ecological systems.

Literature
The class material can be downloaded from the student-server.
http://u-it.arch.ethz.ch

Prerequisites / notice
Maximum 30 students (working in groups of 3.
Please note the course starts at 14:45 pm.

W 6 credits 11A T. Guthknecht

Abstract
Individually written scientific paper concerning a subject in the area of health facility planning and design with special focus upon the dynamic changes in health care services and the according planning and building reactions to them.

Objective
The objective is that the students engage in a debate of a differentiated functional planning as a basis for health care buildings which are to be successful medically, operationally and in design.

Content
On the basis of a given scope of themes the students carry out research aiming for possible improvements in health facility planning. The scope of subjects is announced at the beginning of each semester.

Health care buildings are subject to constant change. In a new hospital building 60% of the diagnostic and treatment areas are subject to building changes within the first 10 years of operation. Architecture has to develop concepts which accommodate this level of dynamics into the building structure in a better way.

In the coming years this need for adaptability is going to be challenges even further by the even more reducing health care resources. The paper should discuss in this context a specific question in detail by analysing problems and developing and discussing potential planning solutions.

063-0823-15L Material-Lab (Thesis Elective) □

W 6 credits 11A A. Spiro

Abstract
The elective works serves an in depth case study through the construction of a 1:1 mock-up.

Objective
Independent in depth study and examination of the contents according to the elective course.

Content
Content and output of the study to be agreed with the lecturer of the elective course.

063-0855-15L Master Class Construction (Thesis Elective) □

W 6 credits 11A C. Vogt

Abstract
Within three elective courses the students need to fulfill an elective work (seminar work). Elective works serve the independent way of dealing with the contents of the according elective course.

Objective
The aim of the Thesis Elective is an independent engagement with the subjects of the related Elective Course.

Course Units for Additional Admission Requirements

The courses below are only available for MSc students with additional admission requirements.
Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php)

Abstract
For Master students with additional obligations only! - Out of the offered courses "Architectural Design V-IX" the student is required to achieve 13 ECTS. There are 2 attempts only.

Objective
Qualification to control the design process increasingly independent and with sole responsibility and to find to an individual design methodology and attitude.

</tr>
<tr>
<td>Content</td>
<td>Dynamic Meteorology is concerned with the dynamical processes of the earth's atmosphere. The fundamental equations of motion in the atmosphere will be discussed along with the dynamics and interactions of synoptic system - i.e. the low and high pressure systems that determine our weather. The motion of such systems can be understood in terms of quasi-geostrophic theory. The lecture course provides a derivation of the mathematical basis along with some interpretations and applications of the concept.</td>

<td>Climate and the Global Circulation of the Atmosphere</td>
<td>W</td>
<td>4</td>
<td>3G</td>
<td>T. Schneider</td>
</tr>
<tr>
<td>Abstract</td>
<td>Key features of the global climate (e.g., the wind and temperature distribution) can be understood by considering how basic physical balances such as the angular momentum and energy balance constrain global atmospheric circulations. This course gives an overview of the physical balances involved and explores some of their implications for maintaining the surface climate.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Understanding the basic physical processes involved in maintaining the global circulation of the atmosphere and the surface climate (winds, temperature, precipitation, etc.). Ability to reason how climate may change on long timescales.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Introduction to the physical balances and dynamical mechanisms governing global atmospheric circulations and the surface climate: angular momentum balance and its role in controlling winds; energy balance and its role in controlling temperatures; the hydrologic cycle and its role in controlling humidity and aridity; tracer transport and connections to the surface. The relative importance of mean circulations, transient eddies, and stationary eddies in these balances will be discussed, as will be the dynamics of their generation and maintenance. The course gives an overview of the dominant processes that govern the surface climate, with a focus on phenomenology and order-of-magnitude physics that is applicable to climates generally, including those of Earth's distant past and of other planets.</td>
<td></td>
<td></td>
<td></td>
<td></td>

Aerosols I deals with basic physical and chemical properties of aerosol particles. The importance of aerosols in the atmosphere and in other fields is discussed.

Part 1 Emission, Immission, Transmission

Air Pollution Control

The lecture provides in the first part an introduction to the formation of air pollutants by technical processes, the emission of these chemicals into the atmosphere and their im-pact on air quality. The second part covers different strategies and techniques for emis-sion reduction. The basic knowledge is deepened by the discussion of specific air pollution problems of today's society.

The students gain general knowledge of the factors resulting in air pollution and the techniques used for air pollution control. The students can identify major air pollution sources and understand the methods for measurement, data collection and analysis. The students can evaluate possible control methods and equipment, design a control system and estimate the efficiency and cost. The students know the different techniques of air pollution control and their scientific backgrounds. They are able to incorporate goals concerning the air quality into their engineering work.

Part 2 Air Pollution Control Technologies

- The reduction of the formation of pollutants is done by modifying the processes (pro-cess-integrated measures) and by different engineering operations for the cleaning of waste gas (downstream pollution control). It will be demonstrated, that the variety of these procedures can be traced back on the application of a few basic principles of physical chemistry.
- Procedures for the removal of particles (inertial separator, filtration, electrostatic pre-cipitators, scrubbers) with their different mechanisms (field forces, impaction and diffu-sion processes) and the modelling of these mechanisms.
- Procedures for the removal of gaseous pollutants and the description of the driving forces involved, as well as the equilibrium and the kinetics of the relevant processes (absorption, adsorption as well as thermal, catalytic and biological conversions).
- Discussion of the technical possibilities to solve the actual air pollution problems.

Lecture notes

- Brigitte Buchmann, Air pollution control, Part I
- Peter Hofer, Air pollution control, Part II
- Lecture slides and exercises

Literature

- List of literature included in scrip

Prerequisites

College lectures on basic physics, chemistry and mathematics

Stratospheric Chemistry

The lecture gives an overview on the manifold reactions which occur in the gas phase, in stratospheric aerosol droplets and in polar cloud particles. The focus is on the chemistry of stratospheric ozone and its influence through natural and anthropogenic effects. Especially the intercontinental air traffic and the ozone depletion caused by FCKW CFC in the mid-latitude and the polar regions as well as coupling with the greenhouse effect.

Short presentation of thermodynamical and kinetic basics of chemical reactions: bi- and thermermolecular reactions, photo-dissociation. Introduction to the chemical family concept: active species, their source gases and reservoir gases. Detailed treatment of the pure oxygen family (odd oxygen) according to the Chapman chemistry. Radical reactions of the oxygen species with nitric oxide, active halogens (chlorine and bromine) and odd hydrogen. Ozone depletion cycles. Methane depletion and ozone production in the lower stratosphere (photo-smog reactions). Heterogeneous chemistry on the background aerosol and its significance for heavy air traffic. Chemistry and dynamics of the ozone hole: Formation of polar stratospheric clouds and chloride activation.

Documents are provided in the contact hours.

Prerequisites: Basics in physical chemistry are required and an overview equivalent to the bachelor course in atmospheric chemistry (lecture 701-0471-01) is expected.

Climate History and Paleoclimatology

701-1233-00L

Stratigraphic Chemistry

Thermodynamical and kinetic basics: bi- and termolecular reactions, photo-dissociation. Chemical family concept. Chapman chemistry. Radical reactions of oxygen species with nitric oxide, active halogens and odd hydrogen. Ozone depletion cycles. Methane depletion and ozone production in the lower stratosphere. Heterogeneous chemistry on background aerosol. Chemistry and dynamics of the ozone hole. The focus is on the chemistry of stratospheric ozone and its influence through natural and anthropogenic effects. Especially the intercontinental air traffic and the ozone depletion caused by FCKW CFC in the mid-latitude and the polar regions as well as coupling with the greenhouse effect.

Short presentation of thermodynamical and kinetic basics of chemical reactions: bi- and thermermolecular reactions, photo-dissociation. Introduction to the chemical family concept: active species, their source gases and reservoir gases. Detailed treatment of the pure oxygen family (odd oxygen) according to the Chapman chemistry. Radical reactions of the oxygen species with nitric oxide, active halogens (chlorine and bromine) and odd hydrogen. Ozone depletion cycles. Methane depletion and ozone production in the lower stratosphere (photo-smog reactions). Heterogeneous chemistry on the background aerosol and its significance for heavy air traffic. Chemistry and dynamics of the ozone hole: Formation of polar stratospheric clouds and chloride activation.

Documents are provided in the contact hours.

Prerequisites: Basics in physical chemistry are required and an overview equivalent to the bachelor course in atmospheric chemistry (lecture 701-0471-01) is expected.

Climate History and Paleoclimatology

701-1233-00

V starts in the first week of the semester. The exercises 701-1233-00 U will start only in the 2nd week of the semester.
This course will introduce some of the main quantitative methods available for the quantitative treatment of geochemical data, as well as the main modelling tools. Emphasis will both be on conceptual understanding of these methods as well as on their practical application, using key software packages to analyse real geochemical datasets.

The following approaches will be discussed in detail: major and trace element modelling of magmas, with application to igneous systems; methods and statistics for calculation of isochrons and model ages; reservoir dynamics and one-dimensional modelling of ocean chemistry; modelling speciation in aqueous (hydrothermal, fresh water sea water) fluids.

We will discuss how these methods are applied in a range of Earth Science fields, from cosmochemistry, through mantle and crustal geochemistry, volcanology and igneous petrology, to chemical oceanography.

A special emphasis will be put on dealing with geochemical problems through modeling. Where relevant, software packages will be introduced and applied to real geochemical data.

Pre-requisite: Geochemistry (651-3400-00L), Isotope Geochemistry and Geochronology (651-3501-00L).

Climate History and Palaeoclimatology (651-4057-00L)

The course "Climate history and palaeoclimatology gives an overview on climate through geological time and it provides insight into methods and tools used in palaeoclimate research.

The student will have an understanding of evolution of climate and its major forcing factors -orbital, atmosphere chemistry, tectonics-through geological time. He or she will understand interaction between life and climate and he or she will be familiar with the use of most common geochemical climate "proxies", he or she will be able to evaluate quality of marine and terrestrial sedimentary palaeoclimate archives. The student will be able to estimate rates of changes in climate history and to recognize feedbacks between the biosphere and climate.

Geological time, stratigraphy, geological archives, climate archives, paleoclimate proxies

Climate through geological time: "lessons from the past"

Cretaceous greenhouse climate

The Late Paleocene Thermal Maximum (PETM)

Cenozoic Cooling

Onset and Intensification of Southern Hemisphere Glaciation

Onset and Intensification of Northern Hemisphere Glaciation

Pliocene warmth

Glacial and Interglacials

Millennial-scale climate variability during glaciations

The last deglaciation(s)

The Younger Dryas

Holocene climate - climate and societies

Sedimentology II: Biological and Chemical Processes in Lacustrine and Marine Systems (651-4043-00L)

The course "Sedimentology I" (651-4041-00L) is a condition.

The course will focus on biological and chemical aspects of sedimentation in marine environments. Marine sedimentation will be traced from coast to deep-sea. The use of stable isotopes palaeoceanography will be discussed. Neritic, hemipelagic and pelagic sediments will be used as proxies for environmental change during times of major perturbations of climate and oceanography.

-You will understand chemistry and biology of the marine carbonate system

-You will be able to relate carbonate mineralogy with facies and environmental conditions

-You will be familiar with cool-water and warm-water carbonates

-You will see carbonate and organic-carbon rich sediments as part of the global carbon cycle

-You will be able to recognize links between climate and marine carbonate systems (e.g. acidification of oceans and reef growth)

-You will be able to use geological archives as source of information on global change

-You will have an overview of marine sedimentation through time

-carbonates,.; chemistry, mineralogy, biology

-carbonate sedimentation from the shelf to the deep sea

-carbonate facies

-cool-water and warm-water carbonates

-organic-carbon and black shales

-C-cycle, carbonates, Corg : CO2 sources and sink

-carbonates: their geochemical proxies for environmental change: stable isotopes, Mg/Ca, Sr

-marine sediments thorough geological time

-carbonates and evaporites

-lacustrine carbonates

-economic aspects of limestone

no script. scientific articles will be distributed during the course

We will read and critically discuss scientific articles relevant for "biological and chemical processes in marine and lacustrine systems"

Abstract
The course provides an introduction into quantitative analysis of groundwater flow and transport. It is focused on formulating flow and transport problems in groundwater, which are to be solved analytically or numerically.

Objective
a) Students understand the basic concepts of flow and contaminant transport processes and boundary conditions in groundwater.

b) Students are able to formulate simple practical flow and transport problems.

c) Students are able to understand and apply simple analytical solutions to simple flow and transport problems.

d) Students are able to use simple numerical codes to adequately solve simple flow (and transport) problems.

Content
1. Introduction to groundwater problems. Concepts to quantify properties of aquifers.
2. Flow equation. The generalized Darcy law.
3. The water balance equation.
5. Analytical solutions to flow problems I
6. Analytical solutions to flow problems II
7. Finite difference solution to flow problems.
12. Analytical solutions to transport problems I.
13. Analytical solutions to transport problems II

Literature
de Marsily G., Quantitative Hydrogeology, Academic Press, 1986

102-0287-00L | Fluvial Systems | W | 3 credits | 2G | P. Molnar |

Abstract
The course presents an integrated view of the river basin and fluvial system. The fluvial system is viewed in terms of the dynamics in the transfer of water and sediment, the resulting geomorphology of the river network and streams, and finally the basin and river management options for conservation and restoration.

Objective
The goal of the course is to develop process-understanding of fluvial systems and to introduce the students to appropriate analysis tools.

Content
In the first section the estimation of basin sediment supply from upland sheet, rill and gully erosion, and basin sediment yield are discussed. The second section focuses on sediment transport in rivers in general, e.g. basic mechanics of sediment laden flows, bedforms, flow resistance, sediment type and load measurement and estimation, the morphology of rivers. It is illustrated how the river network can be analysed in terms of its connectivity and topological characteristics. Channel stability and channel erosion modelling are discussed. The third section looks at fluvial system management in terms of engineering and nonstructural sediment (e.g. upland and channel erosion protection) and water (e.g. the importance of the natural streamflow regime on riverine ecosystem integrity, river rehabilitation) resource management.

Lecture notes
There is no script.
The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/ near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

Students are able to:
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media.
- quantify driving forces and resulting fluxes of water, solute, and heat in soils.
- apply modern measurement methods and analytical tools for hydrological data collection
- conduct and interpret a limited number of experimental studies
- explain links between physical processes in the vadose-zone and major societal and environmental challenges

Weeks 1 to 3: Physical Properties of Soils and Other Porous Media Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior

Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:
Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.
Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.

Part 2 - Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.
Midterm exam
Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.

Part 3 - Use of Hydrus model for simulation of unsaturated flow

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.
Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:
Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

701-0471-01L Atmospheric Chemistry W 3 credits 2G M. Ammann, D. W. Brunner

Prerequisites: Hydrology 1 and Hydrology 2 (or contact instructor).
701-0473-00L  Weather Systems  W  3 credits  2G  M. A. Sprenger, C. Grams

Abstract
This course gives an introduction to programming in FORTRAN95, and is suitable for students who have only minimal programming experience. FORTRAN 95 is a modern programming language that is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95, but Fortran 77 will also be covered for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

Lecture notes
Vorlesungsunterlagen (Folien) werden laufend während des Semesters jeweils mind. 2 Tage vor der Vorlesung zur Verfügung gestellt.

Prerequisites / notice
Attendance of the lecture “Atmosphäre” LV 701-0023-00L or equivalent is a pre-requisite.

701-0475-00L  Atmospheric Physics  W  3 credits  2G  U. Lohmann, A. A. Mensah

Abstract
This course covers the basics of atmospheric physics, which consist of: cloud and precipitation formation, thermodynamics, aerosol physics, radiation as well as the impact of aerosols and clouds on climate and artificial weather modification.

Objective
The students are able to
- explain how mountains influence the atmospheric flow on different scales
- to explain the mechanisms of cloud and precipitation formation using knowledge of humidity processes and thermodynamics.

Content
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situtations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer

Atmospheric Science, An Introductory Survey
John M. Wallace and Peter V. Hobbs, Academic Press

701-0461-00L  Numerical Methods in Environmental Sciences  W  3 credits  2G  C. Schär, O. Fuhrer

Abstract
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

Objective
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

Content
Numerical methods, introduction to finite-difference methods, time integration schemes, non-linearity, conservative numerical techniques, an overview of spectral and finite-element methods. Examples and exercises from a diverse cross-section of Environmental Science.

Lecture notes
Is provided (CHF 10.- per copy).

Literature
List of literature is provided.

Prerequisites / notice
Die Vorlesung verlangt Vorkenntnisse in Linearer Algebra, Analysis und Physik (z.B. komplexe Zahlen, Beschreibung von ebenen Wellen, einfache gewöhnliche Differentialgleichungen)

Course Catalogue of ETH Zurich

Minors

Minor in Physical Glaciology
### Applied Glaciology

**Title**: Application of basic physical concepts to glaciers and ice caps. Understanding glaciers and ice sheets with simple physical concepts.

**Lecturers**: M. Lüthi, R. Kipfer

**Objective**

- To understand the fundamental physical processes in glaciology.
- To learn some basic numerical modelling techniques for glacier flow.
- To identify glaciological hazards and to learn some assessment and mitigation possibilities.

**Content**

- Basics in physical glaciology
- Dynamics of glaciers: deformation of glacier ice, role of water in glacier motion, reaction of glaciers to climate changes, glacier calving, surges
- Ice falls, ice avalanches
- Glacier floods
- Lake ice and bearing capacity

**Prerequisites / notice**

Handouts are available. Relevante Literatur wird während der Vorlesung angegeben. Für aktuelle Fallbeispiele werden risikobasierte Massnahmen bei glaziologischen Naturgefahren diskutiert.

**Lecture notes**

Handouts are available at [http://people.ee.ethz.ch/~luethim/teaching.html](http://people.ee.ethz.ch/~luethim/teaching.html)

**Literature**

Relevante Literatur wird während der Vorlesung angegeben. Voraussetzungen: Es werden Grundkenntnisse in Mechanik und Physik vorausgesetzt.

### Physics of Glaciers

**Title**: Physics of Glaciers

**Lecturers**: W. Zumbühl, M. Lüthi, G. Jouvet, F. T. Walter

**Objective**

- The course outlines the physical principles governing the gravity-driven motion of glacier ice. This is applied to understand the response of glaciers and ice sheets to changes in their environment. Polar ice caps, ice streams and mountain glaciers and their recent rapid changes are discussed.
- The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a closer look at ice deformation, basal motion, heat flow and glacier hydraulics. The specific dynamics of tide water and calving glaciers is investigated, as is the reaction of glaciers to changes in mass balance (and therefore climate).

**Lecture notes**

Handouts are available at [http://people.ee.ethz.ch/~luethim/teaching.html](http://people.ee.ethz.ch/~luethim/teaching.html)

### Quantification and Modeling of the Cryosphere

**Title**: Quantification and Modeling of the Cryosphere: Dynamic Processes (University of Zurich)

**Lecturers**: University lecturers

**Objective**

- No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.
- UZH Module Code: GEO815

**Abstract**

Mind the enrolment deadlines at UZH: [http://www.uzh.ch/studies/application/mobilitaet_en.html](http://www.uzh.ch/studies/application/mobilitaet_en.html)

**Content**

- Overview of the most important earth surface processes and landforms in cold regions (regions with glaciers and intense frost) with emphasis on high-mountain aspects. Discussion of present research challenges.
- Erosion and sedimentation by glaciers as a function of topography, englacial temperature, sediment balance, sliding and melt water runoff.
- Processes and landforms in regions of seasonal and perennial frost (frost weathering, rock falls, debris cones/talus, solifluction, permafrost creep/rock glaciers, debris flows).
- Glacial and periglacial geomorphodynamics in high-mountain regions. Ca. 100 pages.

**Prerequisites / notice**

Basic knowledge about geomorphology and glaciers/permafrost from corresponding courses at ETH/UZH or from the related lecture notes.

### Seminar in Glaciology

**Title**: Seminar in Glaciology

**Lecturers**: A. Bauder

**Objective**

**Prerequisites / notice**

Studium aktueller und klassischer Arbeiten der glaziologischen Forschung wird benötigt. Unterlagen werden im Verlauf der Veranstaltung abgegeben.

### Minor in Biogeochemistry

**Number**: 651-1581-00L

**Title**: Minor in Biogeochemistry

**ECTS**: 3 credits

**Hours**: 2S

**Lecturers**: A. Bauder

**Abstract**

**Literature**

A list of relevant books and papers will be provided.

**Prerequisites / notice**

Students should have a basic knowledge of biogeochemical processes (BSc course on Biogeochemical processes in aquatic systems or equivalent).

### Isotopic and Organic Tracers in Biogeochemistry

**Number**: 701-1313-00L

**Title**: Isotopic and Organic Tracers in Biogeochemistry

**ECTS**: 3 credits

**Hours**: 2G

**Lecturers**: R. Kipfer, C. Schubert

**Abstract**

The course introduces the scientific concepts and typical applications of tracers in biogeochemistry. The course covers stable and radioactive isotopes, geochemical tracers and biomarkers and their application in biogeochemical processes as well as regional and global cycles. The course provides essential theoretical background for the lab course "Isotopic and Organic Tracers Laboratory".

**Content**

- Stable isotopes in biogeochemistry (natural abundance, fractionation);
- geochemical tracers for processes such as erosion, productivity, redox fronts; biomarkers for specific microbial processes.

**Lecture notes**

Handouts will be provided for every chapter.

**Literature**

A list of relevant books and papers will be provided.

### Biogeochemistry of Trace Elements

**Number**: 701-1315-00L

**Title**: Biogeochemistry of Trace Elements

**ECTS**: 3 credits

**Hours**: 2G

**Lecturers**: A. Vaegelin, J. G. Wiederhold, L. Winkel

**Abstract**

The course addresses major biogeochemical processes that drive the cycling of different groups of trace elements (heavy metals, redox-sensitive trace elements, chalcophile elements) in the environment, and the chemical methods that are used to study the behavior of these elements in the geosphere.
The seminar is designed for students and researchers (MA, PhD, PostDoc) who use inter- and transdisciplinary elements in their projects.

Water Resources and Drinking Water

The course is structured as follows:

- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;
- Tradeoffs in selected examples.

Objective

The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their

Will be mentioned in handouts

The reduction of CO2 emissions is the only option for keeping future climate change within reasonable bounds. In this course, we will
discuss a portfolio of options involving the alteration of natural carbon sinks and carbon sequestration. The course includes introductory
lectures, presentations from guest speakers from industry and the public sector, and final presentations by the students.

Carbon Mitigation

The goal of this course is to give an overview over the whole path of drinking water from the source to the tap and understand the involved
physical, chemical and biological processes which determine the drinking water quality.

The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. The

various water resources, particularly groundwater and surface water, are discussed as part of the natural water cycle influenced by
anthropogenic activities such as agriculture, industry, urban water systems. Furthermore legislation related to water resources and drinking
water will be discussed. The lecture is focused on industrialized countries, but also addresses global water issues and problems in the
developing world. Finally unit processes for drinking water treatment (filtration, adsorption, oxidation, disinfection etc.) will be presented and
discussed.

Abstract

The seminar is designed for students and researchers (MA, PhD, PostDoc) who use inter- and transdisciplinary elements in their projects.

The course deals in-depth with the major biogeochemical processes controlling the cycling of different groups of trace elements (heavy
metals, redox-sensitive and chalcophile elements) in the environment. Sources and cycling of trace elements as related to interactions
with abiotic and biotic geosphere components, and abiotically and biotically driven transformations will be discussed. The techniques most
commonly used to study these processes will be presented as well.

Lecture notes

Selected handouts (lecture notes, literature, exercises) will be distributed during the course.

Prerequisites / notice

Students are expected to be familiar with the concepts of aquatic or soil chemistry covered in the respective classes at the bachelor level.

This lecture is a prerequisite for attending the laboratory course "Trace elements laboratory".

Objective

The seminar covers the following topics:

- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

Content

The seminar covers the following topics:

- important empirical methods for the analysis and assessment of local / regional sustainability issues.
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- and the respective impacts on individual and societal decision-making.

The course is seminar-like, interactive.

Know:

- core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:

- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

The course is seminar-like, interactive.

**Abstract**
The lecture contains concepts, physics and components of building technologies for the efficient and sustainable energy supply and climatisation of buildings and their interaction with architecture and urban design. Using calculations, students learn to acquire relevant numbers and assess the performance of solutions.

**Objective**
The lecture's target is the knowledge of the physical basics and technical components of relevant systems for an efficient and sustainable climatisation and maintenance of buildings and their interdependency with the architectonic design and construction. By learning rough calculation methods, determination of relevant dimensions and identification of important parameters become possible. Hence, adequate approaches for the own design can be chosen, reviewed quantitatively and qualitatively and set in with a synergistic effect.

**Content**
1. Introduction
2. Thermal systems
3. Ventilation
4. Daylight and artificial lighting

EK I lectures focus on technical components in use as well as their rough calculation methods and their integration into design and construction.

Based on EK I, the EK II lectures focus on all possible systems and concepts available to the architect for a sustainable design.

**Lecture notes**
The Slides from the lecture serve as lecture notes and are available as download.

**Literature**
A bibliography will be distributed at the beginning of the lecture.

---

227-0731-00L Power Market I - Portfolio and Risk Management

**Abstract**
Portfolio and risk management in the electrical power business, Pan-European power market and trading, futures and forward contracts, hedging, options and derivatives, performance indicators for the risk management, modelling of physical assets, cross-border trading, ancillary services, balancing power market, Swiss market model, strategy development and positioning.

**Objective**

**Content**
1. Pan-European power market and trading
   1.1. Power trading
   1.2. Development of the European power markets
   1.3. Energy economics
   1.4. Spot and OTC trading
   1.5. European energy exchange EEX

2. Market model
   2.1. Market place and organisation
   2.2. Balance groups / balancing energy
   2.3. Ancillary services
   2.4. Market for ancillary services
   2.5. Cross-border trading
   2.6. Capacity auctions

3. Portfolio and Risk management
   3.1. Portfolio management 1 (introduction)
   3.2. Forward and futures contracts
   3.3. Risk management 1 (m2m, VaR, hpcf, volatility, cVaR)
   3.4. Risk management 2 (PdrF)
   3.5. Contract valuation (HPFC)
   3.6. Portfolio management 2
   2.8. Risk Management 3 (enterprise wide)

4. Energy & Finance I
   4.1. Options 1 basics
   4.2. Options 2 hedging with options
   4.3. Introduction to derivatives (swaps, cap, floor, collar)
   4.4. Financial modelling of physical assets
   4.5. Trading and hydro power
   4.6. Incentive regulation

5. Strategy
   5.1. Strategic Positioning
   5.2. Development of strategies and examples
   5.3. Cases for team work

**Lecture notes**
The Slides from the lecture serve as lecture notes and are available as download.

**Literature**
A bibliography will be distributed at the beginning of the lecture.

---

529-0193-00L Renewable Energy Technologies I

**Abstract**
The lectures Renewable Energy Technologies I (529-0193-00L) and Renewable Energy Technologies II (529-0191-01L) can be taken independently from one another.

**Objective**
Scenarios for world energy demand and CO2 emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry), Wind and ocean energy, heat pumps, geothermal energy, energy from waste, CO2 sequestration.

**Prerequisites / notice**
1 excursion per semester, 2 case studies, guest speakers for specific topics

**Lecture notes**
Handouts of the lecture

---

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 101 of 1432
New master students are introduced to the atmospheric and climate research field through keynotes given by the programme's professors.

Lecture notes will be distributed during the course.

The students are exposed to different atmospheric science topics and learn how to take part in scientific discussions.

Fundamentals of chemistry and physics are a prerequisite for this course.

Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.

Only students who fulfill the following criteria are allowed to begin with their master thesis:
a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.

The master thesis is under the supervision of a professor teaching in the module courses of the master programme. Please refer to the web page linked here for instructions and guidelines how to register for the master thesis (http://www.iac.ethz.ch/education/master/curriculum/master_thesis).

</table>
| Content     | - Origin and properties of the atmosphere: structure, large scale dynamics, UV radiation
- Thermodynamics and kinetics of gas phase reactions: enthalpy and free energy of reactions, rate laws, mechanisms of bimolecular and termolecular reactions.
- Tropospheric photochemistry: Photolysis reactions, photochemical G3 formation, role and budget of HOx, dry and wet deposition
- Aerosols and clouds: chemical properties, primary and secondary aerosol sources
- Multiphase chemistry: heterogeneous kinetics, solubility and hygroscopicity, N2O5 chemistry, SO2 oxidation, secondary organic aerosols
- Air quality: role of planetary boundary layer, summer- versus winter-smog, environmental problems, legislation, long-term trends
- Stratospheric chemistry: Chapman cycle, Brewer-Dobson circulation, catalytic ozone destruction cycles, polar ozone hole, Montreal protocol
- Global aspects: global budgets of ozone, methane, CO and NOx, air quality - climate interactions |      |      |       |                    |
| Prerequisites / notice | Basic courses in chemistry and physics are expected |      |      |       |                    |
| 701-0475-AAL| Atmospheric Physics Enrolment only for MSc students who need this course as additional admission requirement. | E-   | 3 credits | 6R    | U. Lohmann         |
| Abstract    | The fundamental background of cloud and precipitation formation (including thermodynamics and aerosol physics) and their relevance for climate are discussed. |      |      |       |                    |
| Objective   | The students can appreciate the processes leading to cloud and precipitation formation and their importance for climate. This lecture is the prerequisite for the MSc lectures cloud microphysics and cloud dynamics. |      |      |       |                    |
| Content     | - Moist processes/thermodynamics; aerosol physics; cloud formation; precipitation processes, storms; importance of aerosols and clouds for climate; measurements of clouds (radar and satellites) |      |      |       |                    |

**Enrolment only for MSc students who need this course as additional admission requirement.**

**Abstract**
This lecture treats the mathematical and computational basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

**Objective**
This lecture treats the mathematical and computational basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

**Content**
Classification of numerical problems, introduction to finite-difference methods, time integration schemes, non-linearity, conservative numerical techniques, an overview of spectral and finite-element methods. Examples and exercises from a diverse cross-section of Environmental Science.

Three tutorials, each two hours in length, are integrated into the lecture. The implementation language is Matlab (previous experience not necessary, a Matlab introduction is provided). Example programs and graphics tools are supplied.

**Lecture notes**
Provided on the webpage of the course: Lecture notes in German, tutorials in English.

**Literature**
List of literature is provided.

**Abstract**
Self study course in Systems Analysis to fulfill requirements for enrollment into the master program. Topics covered include linear box models with one and several variables; non-linear box models with one or several variables; discrete-time models; and continuous models in space and time.

**Objective**
The aim of this course is to develop an understanding of the dynamical behavior of environmental systems and how this behavior can be captured and understood using mathematical concepts.

**Lecture notes**
For English Speaking students:

**Content**
Selected mathematical topics are presented for later use in more specialised lectures. Part of the topics were already discussed in the lectures Mathematics I-III. Here, they should be shortly recapitulated and most importantly applied to practical problems. If necessary, new mathematical concepts and methods will be introduced in order to solve challenging and inspiring problems from practice.

**Objective**
The aim of this lecture is to prepare the students for the more specialised lectures. They should become more familiar with the mathematical background, the mathematical concepts and most of all with their application and interpretation.

**Content**
Practical examples from the following areas will be discussed: ordinary differential equations; eigenvalue problems from linear algebra; systems of linear and nonlinear differential equations; partial differential equations (diffusion, transport, waves).

Abstract
The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

Abstract
This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)"

Objective
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

</tbody>
</table>

Abstract
Enrolment only possible with Teaching Diploma or DC matriculation.

Objective
At the end of the seminar, participants will be in a position to
- describe the scientific fundamentals of test theory and test structure,
- evaluate examples of scientifically-developed tests in their application context.
- if necessary, critically question the performance assessment that they employ in practice and professionalise it further.

Content
Die konkreten Inhalte des Seminars ergeben sich aufgrund der Präferenzen der Teilnehmenden und der daraus abgeleiteten Themenübersicht für Vorträge und Seminararbeiten.

<table>
<thead>

<th>Prerequisites / notice</th>
</tr>
</thead>
</table>

Content
Die konkreten Inhalte des Seminars ergeben sich aufgrund der Präferenzen der Teilnehmenden und der daraus abgeleiteten Themenübersicht für Vorträge und Seminararbeiten. Im Rahmen der Startveranstaltung wird eine Liste mit möglichen Themen abgegeben und erläutert. Schwerpunkte der Themenvorschläge sind:
- Testentwicklung
- Gütekriterien von Tests
- Aufgabenkonstruktion
- Datenauswertung
- Rasch-Modell
- Internationale Vergleichstests
- Zulassungstests

Lecture notes
Im Verlaufe des Semesters werden einzelne Unterlagen in den Veranstaltungen abgegeben. Dazu gehören auch die Handouts der verschiedenen, studentischen Vorträge.

Literature
Als Grundlagenerarbeit werden folgende Werke empfohlen:
- Weitere Literatur wird in der Lehrveranstaltung genannt.

Prerequisites / notice
Die Leistungsanforderungen richten sich im Umfang nach der Zahl zu erwerbender ECTS-Punkte, wobei 1 ECTS-Punkt einem Zeitaufwand von ca. 30 Arbeitsstunden entspricht. ETHZ-Studierende können im Rahmen dieser Veranstaltung 3 ECTS-Punkte erwerben. Dazu sind folgende Leistungen zu erbringen:
- Präsenz und aktive mündliche Mitarbeit in der Lehrveranstaltung (MA)
- Pflichtlektüre entsprechend der Angaben in der Lehrveranstaltung
- Referat (RE)
- Schreiben einer schriftlichen Arbeit

Weitere Angaben zu den Leistungsanforderungen werden im Rahmen der Startveranstaltung abgegeben und erläutert.

Abstract
This lecture is only apt for students who intend to enrol in the programs "Teaching Diploma" or "Teaching Certificate". It is about learning in childhood and adolescence.

Objective
Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.
**Coping with Psychosocial Demands of Teaching (EW4)**

Enrolment possible with Teaching Diploma matriculation, except for students of Sport Teaching Diploma, who complete the sport-specific course unit EW4.

**Abstract**

Students learn and practice techniques and skills for coping with psychosocial demands of teaching.

1. They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).
2. They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions; crisis intervention).
3. They know stress coping strategies to prevent burnout (e.g., psychosocial support) and are familiar with relevant institutions.

**Content**

Major themes:
- Counseling and counseling techniques
- Conflict management and mediation
- Classroom management
- Supporting students in a psychological crisis
- Preventing stress and burnout

**Literature**

**Prerequisites / notice**

This lecture is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

---

**Support and Diagnosis of Knowledge Acquisition Processes (EW3)**

Enrolment only possible with matriculation in Teaching Diploma, except for students of Sport Teaching Diploma, who complete the sport-specific course unit EW3.

**Prerequisites:** successful participation in 851-0240-00L "Human Learning (EW1)".

**Abstract**

In this seminar students learn advanced techniques to support and to diagnose knowledge acquisition processes in school.

The main goals are:
1. You have a deep understanding about the cognitive mechanisms of knowledge acquisition.
2. You have a basic understanding about psychological test theory and can appropriately administer tests.
3. You know various techniques of formative assessment and can apply these to uncover students’ misconceptions.

**Prerequisites / notice**

Für eine reibungslose Semesterplanung wird um persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

---

**Designing Educational Environments in Physical Education (EW2 Sport)**

**Abstract**

Students learn principles of teaching beyond classroom and regular PE-Lessons:
- Planning and organizing camps and events
- Teaching the "Ergänzungsfach Sport"
- Long-term-curricula in PE

As a practical part students design the Outdoor event in EW4 of the following term

**Objective**

Students know
- How to plan events and camps
- To assess curricula critically and to use them properly
- How to combine theoretical and practical issues in the ‘Ergänzungsfach’

**Content**

1. LV Semestereinführung
2. LV Planung Outdoor-Weekend
3. LV Auswertung Outdoor-Event
4. LV Planung Event
5. LV Event-Präsentationen / Schlussveranstaltung

**Prerequisites / notice**

EW2 is compulsory requirement for EW4 Sport

---

**Effective Learning Environments (EW 5)**

This is a mandatory course for students of the teacher’s diploma for secondary schools, who have not completed
the course 851-0238-01L "Unterstützung und Diagnose von Wissenswirksamkeitsprozessen" (EW 3) until the end of spring semester 2014 (except for students of Sport Teaching Diploma, who have completed the sport-specific course units EW2-4).

The successful completion of ALL modules relevant for the teacher's diploma is required for participation in this course.

Abstract
The students have to read the book "Lernwirksam unterrichten" from Felten/Stern and they have to answer the questions addressed on http://www.ifvl.ethz.ch/education/ew5. In individual or small-group sessions, Elsbeth Stern and the students will discuss how insights from learning research can inform classroom practice.

Objective
The focus of all classes on educational psychology is on scientific insights which help to reflect on instructional learning. In order to become professionals, teachers have to better understand students' behavior and achievement and thereby become aware of their scope of classroom practice. Students get a final opportunity to ask questions about psychological learning research.

Literature
Buch "Lernwirksam unterrichten" (Felten/Stern)

Prerequisites / notice
Detailed information: http://www.ifvl.ethz.ch/education/ew5

851-0242-07L Human Intelligence

W 1 credit 1S E. Stern, P. Edelsbrunner, B. Rütsche

Entrollment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Number of participants limited to 30.

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Abstract
The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

851-0242-09L Student Research Projects: Practical Research on Learning and Instruction

The successful completion of both course no. 851-0240-06L "Menschliches Lernen (EW 1)" and course no. 851-0238-01L "Unterstützung und Diagnose von Wissenswirksamkeitsprozessen (EW 3)" is a necessary prerequisite for this course.

Abstract
In teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturers in this course. Basic conceptual and methodological issues are the topic of a series of plenary meetings; however, the major part of the work is done in small-group meetings with the advising researcher, and in self-directed research projects.

Objective
The course is targeted at advanced students who have taken an interest in gathering practical research experience in the field of Learning & Instruction. In teams of two, students conduct their own research projects (planning, conducting, analyzing, interpreting, and presenting research); thus, the course requires a high amount of self-directed working. Students are personally advised, and supported in their research project, by one of the researchers serving as lecturers in this course. During the first half the semester, relevant methodological knowledge and skills are practiced during plenary meetings and in students' independent reading (e.g. generating and testing research questions, designing experiments, and analyzing data in the field of Learning and Instruction)

Learning goals include:
- Participants can illustrate and explain basic methods and concepts for research in the fields of Learning and Instruction, e.g. with the help of practical examples.
- Participants can generate testable research questions for a topic relevant in the fields of Learning and Instruction.
- Participants can design and conduct a study that is relevant for answering their research question.
- Participants can summarize and evaluate the main results from a study in the field of learning and Instruction, with regard to the research question being asked.

851-0242-06L Cognitively Activating Instructions in MINT Subjects •

W 2 credits 2S R. Schumacher

Entrollment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Number of participants limited to 30.

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Abstract
This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

Objective
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction
- Understanding the research question being asked.

Prerequisites / notice
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

851-0242-08L Research Methods in Educational Science

W 1 credit 1S P. Edelsbrunner, B. Rütsche, E. Stern, E. Ziegler

Number of participants limited to 30.

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".
Vocational Schools as Sites of Teaching and Learning
T. Bernauer, P. Greutmann, E. Hafen

This seminar will begin with a review of the literature on the teaching and learning of nature of science and scientific inquiry. It focuses on the development of adequate and functional understandings of nature of science and scientific inquiry.

Objective
- Understand research methods used in the empirical educational sciences
- Understand pedagogically relevant findings from the empirical educational sciences

851-0250-05L Introduction to "Nature of Science" and "Scientific Inquiry"
Enrolment only possible with matriculation in Teaching Diploma (excluding Teaching Diploma Sport).

Objective
Student teachers will develop an understanding of the concepts of nature of science and scientific inquiry. They will design a variety of instructional materials for teaching students about these concepts.

Number of participants limited to 20.

851-0240-15L Current Research on MINT Learning
Enrolment only possible with matriculation in Teaching Diploma (excluding Teaching Diploma Sport).

Objective
Participants are expositorically introduced to different research methods used in research on learning and instruction and learn to weigh advantages and disadvantages of these approaches.

851-0250-05L Introduction to "Nature of Science" and "Scientific Inquiry"
Enrolment only possible with matriculation in Teaching Diploma (excluding Teaching Diploma Sport).

Objective
Student teachers will develop an understanding of the concepts of nature of science and scientific inquiry. They will design a variety of instructional materials for teaching students about these concepts.

Number of participants limited to 20.

851-0594-00L International Environmental Politics
Particularly suitable for students of D-ITET, D-USYS

Objective
This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

Content
This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 4 ECTS credit points. The workload is around 120 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

Lecture notes
Slides and reading material will be made available at www.ib.ethz.ch (teaching, materials, then menu on the left side of the screen). They are password protected. Use your Nethz username and password to access the material.

Literature
See www.ib.ethz.ch (teaching, materials)

Prerequisites / notice
Students from ETH will receive 4 ECTS credit points if they attend classes regularly and obtain a grade of 4.0 or higher for the written exam in the final week of the semester. Students who obtain a grade of less than 4.0 for the end-of-semester test will have a second chance in the first week of the following semester. The rules of the game are defined in detail on the course syllabus. Students who do not participate in the end of semester test will not have access to the repeat exam unless they submit compelling and documented reasons for why they were unable to participate in the first test. Except for language dictionaries, no additional materials and no laptops and mobile phones are allowed during the exam.

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

The workload for this course is approx. 120 hours (all inclusive).
Simultaneous enrolment in course "Lehr- und Lernort Berufsfachschule II: Förderung und Unterstützung von Berufslernenden" (UZH Module Code: 098GyZ03) is compulsory.

Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
"The Vocational Schools as Sites of Teaching and Learning - Teaching Structure" sets out and discusses how to implement the specifications in the framework curriculum. This module is aimed at teachers in high schools awarding vocational school-leaving certificates (Berufsmatura) and all types of vocational schools. It also covers the link established with the company as a learning location.

Objective
- Formulating learning objectives at different levels, and implementing and monitoring these.
- Steering tuition in terms of content and method to fit in with the objectives.
- Formulating examination questions and assignments on the basis of the learning objectives set out in the curriculum and the teaching given.
- Selectively deploying different examination types and procedures/structuring selected learning contents logically in terms of the subject matter and learning process (from the concrete to the abstract, from the simple to the complex) and implementing these with different didactic visual aids.

Content
In the seminar, the work of the teacher in vocational schools and the framework curriculum is analyzed and the teaching material is discussed.

851-0237-02L Vocational Schools as Sites of Teaching and Learning W I: Providing Encouragement & Support (UZH) 3 credits 2S University lecturers

Enrolment only possible with Teaching Diploma matriculation.

Simultaneous enrolment in course "Lehr- und Lernort Berufsfachschule I: Unterrichtsgestaltung" (UZH Module Code: 098GyZ01) is compulsory.

Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
The module "vocational schools as sites of teaching and learning: providing encouragement and support for apprentices" aims to provide teachers at VET and professional baccalaureate institutions with ways of dealing with learners problems, particularly in connection with their being fed up with school, with job-seeking, school-to-work transition, or continuing education.

Objective
- The special situation of the apprentices in their double burden of work and school.
- The special situation of the school guidance and educational process.
- Mobbing in school.
- The special situation of the curriculum and learning process (from concrete to abstract, from simple to complex) and implementing these with different didactic visual aids.

Content
- Positioning the vocational schools as sites of teaching and learning: providing encouragement and support for apprentices.
- Formulating learning objectives at different levels, and implementing and monitoring these.
- Steering tuition in terms of content and method to fit in with the objectives.
- Formulating examination questions and assignments on the basis of the learning objectives set out in the curriculum and the teaching given.
- Selectively deploying different examination types and procedures/structuring selected learning contents logically in terms of the subject matter and learning process (from the concrete to the abstract, from the simple to the complex) and implementing these with different didactic visual aids.

Introduction to Test Theory and Test Construction in Educational Contexts (University of Zürich)  

851-0240-03L

This course is not offered at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: 200u809x

Enrolment only possible with Teaching Diploma or DC matriculation.

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
In this seminar, students establish the scientific fundamentals of performance measurement and educational diagnostics and study them on the basis of different current issues.

Objective
At the end of the seminar, participants will be in a position to
- describe the scientific fundamentals of test theory and test structure.
- evaluate examples of scientifically-developed tests in their application context.
- if necessary, critically question the performance assessment that they employ in practice and professionalise it still further.

Content
The lecture explores various strands in philosophy of science in a critical way, focusing on the notion of rationality in science, especially
- accountabilities of science.

Prerequisites / notice
- 2V

Lecture notes
Im Verlaufe des Semesters werden einzelne Unterlagen in den Veranstaltungen abgegeben. Dazu gehören auch die Handouts der verschiedenen, studentischen Vorträge.

Literature
Als Grundlagenliteratur werden folgende Werke empfohlen:
- Roth, J. (2004), Lehrbuch Testtheorie - Testkonstruktion (2. Aufl.), Bern: Huber
- Weitere Literatur wird in der Lehrveranstaltung genannt.

Social Psychology  

227-0802-01L

Objective
The aim of the lecture is to impart a well-founded scientific understanding of social influence processes in individuals, groups, organizations, and social settings.

Content
The participants should develop competencies in the structuring of communication, interaction, and management processes.

Im Einzelnen sollen die Teilnehmerinnen und Teilnehmer lernen:
- an den Beispielen von Kaufverhalten oder ökologischem Verhalten zu beschreiben, wie Normen und Einstellungen Einfluss auf das Verhalten nehmen,
- Die Subjektivität und die Fehlerquellen sozialer Wahrnehmung verstehen,
- Prinzipien der Psychologie der Kommunikation zu nutzen für eine Verbesserung der Kommunikation in Studium und Beruf,
- Merkmale und Strukturen von Gruppen zu identifizieren und mit geeigneten Methoden zu analysieren,
- Die Grundlagen von Konformität und Gehorsam gegenüber Autoritäten zu erkennen,
- Gruppenphänomene wie soziales Faulenzen, Risiko- und Konservativismus-Schub und Gruppendenken entgegenzuwirken,
- Führungsstile zu unterscheiden lernen,
- Techniken zur Moderation von interagierenden Gruppen kennen zu lernen.

Philosophy of Science  

701-0701-00L

Objective
Students learn to engage with problems in the philosophy of science and to relate them to natural and environmental sciences, thus developing their skills in critical thinking about science and its use. They know the most important positions in philosophy of science and the objections they face. They can identify, structure and discuss issues raised by the use of science in society.

Content
1. Core differences between classical Greek and modern conceptions of science.
2. Classic positions in the philosophy of science in the 20th century: logical empiricism and critical rationalism (Popper); the analysis of scientific concepts and explanations.
3. Objectives to logical empiricism and critical rationalism, and further developments: What is the difference between the natural sciences, the social sciences and the arts and humanities? What is progress in science (Kuhn, Fleck, Feyerabend)? Is scientific knowledge relativistic? What is the role of experiments and computer simulations?
4. Issues raised by the use of science in society: The relation between basic and applied research; inter- and transdisciplinarity; ethics and accountability of science.

Lecture notes
A reader will be available for students.

Our society faces a serious ecological crisis. Of what historical dimension is this crisis? How have human societies already in earlier times changed their environment, and, consequently, perhaps also ours? What were the main ecological challenges for societies and how did they change over time? And how did societies adapt to changing environmental conditions?

Improved ability to assess current problems from a historical perspective and to critically interrogate one’s own standpoint.

Uekötter, Frank (Ed.) 2010. The turning points of environmental history, Pittsburgh: University of Pittsburgh Press.

Students are asked to write an exam during the second last session (11.12.2015).

---

Philosophy of Science: Exercises

The exercises in philosophy of science serve to develop skills in critical thinking by discussing seminal texts about the rationality of science. Topics discussed include the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

In the teaching given at high-school level I (the first three years of the full-length high school, or the first year of the reduced-length high school), central contents of geometry, arithmetic and algebra, and also written mathematical problems are explained.

The exercises in philosophy of science serve to develop skills in critical thinking by discussing seminal texts about the rationality of science. Topics discussed include the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

The exercises in philosophy of science serve to develop skills in critical thinking by discussing seminal texts about the rationality of science. Topics discussed include the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

For preparing a structure and a summary of one of the texts, students are asked to write an exam during the second last session (11.12.2015).

Students are asked to write an exam during the second last session (11.12.2015).

### Abstract

**Colloquium in Structural Engineering**

Professors from national and international universities, technical experts from the industry as well as research associates of the institute of structural engineering (IBK) are invited to present recent research results and specific projects from the practice. This colloquium is addressed to members of universities, practicing engineers and interested persons in general.

**Colloquia in Geotechnics**

The Institute for Geotechnical Engineering invites distinguished speakers from research and practice, nationally and internationally. The colloquia are directed towards staff and students from Universities as well as engineers and scientists working in industry. Details can be obtained from www.igt.ethz.ch by following Events & Public Events. Some colloquia are available via webcast.

### Objective

**Colloquium in Structural Engineering**

Learn about recent research results in structural engineering.

**Colloquia in Geotechnics**

Learn about recent research results in geotechnics.

| 651-0032-00L | Geology and Petrography               | O    | 4     | 2V+1U | C. A. Heinrich, S. Löw, K. Rauchenstein |

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 114 of 1432
This course gives an overview of the basic concepts of geology and petrography and shows some links to the application of these concepts. The course consists of lectures and exercises in groups. The lectures cover all aspects of the dynamic earth, from the history of the earth, to the formation of rocks, mountains, and oceans, and the degradation processes shaping the uppermost earth's crust.

Content:

Lecture notes:
- Übungen zum Gesteinsbestimmen und Lesen von geologischen, tektonischen und geotechnischen Karten, einfache Konstruktionen.

Literature:
- Press, F.; Siever, R.: Allgemeine Geologie, Spektrum Akademischer Verlag, Heidelberg
- Lecturers: H. Peter

851-0703-03L Introduction to Law for Civil Engineering
- Type: Lecture notes
- Objective: Introduction to fundamental questions of public and private law which serves as a foundation for more advanced law classes.
- Content:
  1. Public Law
     - Constitutional law: sources of law, organization of the state, fundamental rights. Administrative law: administrative decisions, organization of the administration, enforcement of administrative decisions, procedural law, basics of police, environmental and zoning law.

  2. Private Law

Further information is available at: http://www.hertig.ethz.ch/courses.html

851-0709-00L Introduction to Civil Law
- Type: Lecture notes
- Content:
  - Le cours de droit civil porte notamment sur le droit des obligations (droit des contrats et responsabilité civile) et sur les droits réels (propriété, gages et servitudes). De plus, il est donné un bref aperçu du droit de la procédure et de l'exécution forcée.

Prerequisites / notice:

- Les examens peuvent se faire en français ou en italien.
- Examen au 1er propédeutique; convient pour travail de semestre.
- Les examens peuvent se faire en français ou en italien.
- Examen au 1er propédeutique; convient pour travail de semestre.

**Abstract**

We will model and solve scientific problems with partial differential equations. Differential equations which are important in applications will be classified and solved. Elliptic, parabolic and hyperbolic differential equations will be treated. The following mathematical tools will be introduced: Laplace and Fourier transforms, Fourier series, separation of variables, methods of characteristics.

**Objective**

Learning to model scientific problems using partial differential equations and developing a good command of the mathematical methods that can be applied to them. Knowing the formulation of important problems in science and engineering with a view toward civil engineering (when possible). Understanding the properties of the different types of partial differential equations arising in science and in engineering.

**Content**

Classification of partial differential equations

Study of the Heat equation general diffusion/parabolic problems using the following tools:
- Separation of variables
- Fourier series
- Fourier transform
- Laplace transform

Study of the wave equation and general hyperbolic problems using similar tools and the method of characteristics.

**Lecture notes**

Study of the Laplace equation and general elliptic problems using similar tools and generalizations of Fourier series.

**Literature**

Accompanying material will be posted on the course website throughout the semester.

We will loosely follow the following books:

- Stanley J. Farlow - Partial Differential Equations for Scientists and Engineers (a Dover reprint and can be bought for less than 20 CHF)
- Chapters 11 and 12 of E. Kreyszig, Advanced Engineering Mathematics.

Two good sources in German are:

- Norbert Hungerbühler, "Einführung in die partiellen Differentialgleichungen"

**Prerequisites / notice**

Analysis I and II, in particular, knowing how to solve ordinary differential equations is an important prerequisite.

**Examination Block 2**

In place of the German course 851-0703-01 Grundzüge des Rechts für Baurwissenschaften students can take the French course 851-0709-00 Droit civil.
The course explores the fundamental principles of Geomechanics and Geotechnical Engineering, with the following objectives:

2. Linear oscillations - 1 degree of freedom: force and kinematic excitation, state space, damped and undamped free oscillations, Lehr's damping, phase space portraits, eigenvalue plots, harmonic excitation, amplitude and phase responses, power consumption, beat frequencies, resonance.

3. Linear oscillation - 1 degrees of freedom: MDGKN system, representation in configuration and state space, eigenvalues, eigenvectors, higher order eigenvectors, undamped and damped systems, Rayleigh damping, modal decoupling.

4. Wave equation: String under tension, longitudinal dynamics of rods, torsional vibrations of circular cylindrical rods, boundary conditions in space and time, canonical transformation, normal form of the wave equation, d'Alembert solution, characteristics, left and right waves, reflection at free and restrained ends, standing waves and oscillations.

Lecture notes

Literature
Als Zusatzliteratur wird empfohlen: Mechanik 3, Dynamik, M.B. Sayir, Eigenverlag (CHF 32.-)

101-0113-00L Theory of Structures I
- Introduction, statically determinate beams and frames, stresses and deformations, application of the principle of virtual work, statically indeterminate beams and frames (force method).
- Objective: Understanding the response of elastic beam and frame structures
- Ability to correctly apply the equilibrium conditions
- Ability to determine elastic deformations
- Ability to apply the force (flexibility) method for statically indeterminate structures

Content
- Introduction
- Reactions, internal forces and moments
- Arches and cables
- Trusses
- Influence lines
- Stresses and deformations
- Principle of virtual work
- Flexure and axial force, shear, torsion
- Deflections, work equation
- Statically indeterminate systems

Lecture notes

Literature

Bachelor Studies (Programme Regulations 2010)
5. Semester
Compulsory Courses 5. Semester
Examination Block 1

Number Title
151-0505-00L Mechanics III for Civil Engineers
- Only for Civil Engineering BSc, Programme Regulations 2010.

Abstract
Contents: basic concepts: planar dynamics with (principle of) linear and angular momentum, moment of inertia, kinetic energy. - linear vibration systems: (higher-order) eigenvectors, modal decoupling. - wave equation: normal form, characteristics, reflection.

Objective
This lecture gives the student a well-founded basic education in the technical theory of oscillations. The focus of the lecture lies - in addition to directly applicable methods - in the methodical introduction to the theory of vibrations. This should enable the student to work independently in the praxis-oriented area of oscillation analysis and to study further at a high level. The material used in the lectures is mathematically oriented and strictly causally structured and makes use of vector and matrix calculus. Particular importance is given to demanding and practice-oriented exercises.

Content

2. Linear oscillations - 1 degree of freedom: force and kinematic excitation, state space, damped and undamped free oscillations, Lehr's damping, phase space portraits, eigenvalue plots, harmonic excitation, amplitude and phase responses, power consumption, beat frequencies, resonance.

3. Linear oscillation - 1 degrees of freedom: MDGKN system, representation in configuration and state space, eigenvalues, eigenvectors, higher order eigenvectors, undamped and damped systems, Rayleigh damping, modal decoupling.

4. Wave equation: String under tension, longitudinal dynamics of rods, torsional vibrations of circular cylindrical rods, boundary conditions in space and time, canonical transformation, normal form of the wave equation, d'Alembert solution, characteristics, left and right waves, reflection at free and restrained ends, standing waves and oscillations.

Remarks
- Only for Civil Engineering BSc, Programme Regulations 2010.
- The course includes practical examples and exercises done by the students to enhance their knowledge.

Examination Block 3

Number Title
101-0315-00L Geotechnical Engineering

Abstract
The course explores the fundamental principles of Geomechanics and Geotechnical Engineering, with the following objectives:

- Recognition of the basic consequences of the ground construction;
- Understanding of the important fundamental concepts of Soil mechanics and Geotechnical Engineering;
- Independent analysis of the basic geotechnical problems.

Objective
The course explores the fundamental principles of Geomechanics and Geotechnical Engineering, with the following objectives:

- Recognition of the basic consequences of the ground construction;
- Understanding of the important fundamental concepts of Soil mechanics and Geotechnical Engineering;
- Independent analysis of the basic geotechnical problems.

Content
Overview of stability problems; Bearing capacity of shallow and deep foundations; Soil-foundation interaction; Analysis and design of shallow and deep foundations; Earth pressure on retaining structures; Analysis and design of retaining walls; Excavations: dewatering, analysis and design; Safety considerations.

Lecture notes
Examples
Exercises

Literature
### 101-0415-01L  
**Railway Infrastructures (Transportation II)**

**Objective:**
Teaches the basic principles of public transport network and topology design, geometrical design, dimensioning and construction as well as the maintenance of rail infrastructures. Teaches students to recognize the interactions between the infrastructure design and the production processes. Provides the background for Masters degree study.

**Content:**
1. Fundamentals: Infrastructures of public transport systems; interaction between track and vehicles; passengers and goods as infrastructure users; management and financing of networks; railway standards and norms.
2. Infrastructure planning: Planning processes and decision levels in network development and infrastructure planning, planning of railway tracks and rail topologies; planning of the passenger parts of stations.
3. Infrastructure design: Fundamentals of the layout of a line: track geometry; switches and crossings; design of station platforms.
4. Construction of railway infrastructures: Assembly and evolution of the railway track; elements of the railway track; dimensioning of the track; track stability.
5. Approval and beginning service on complex infrastructure facilities: Definitions and limitations; fundamentals of the legal situation; test and approval processes; processes of putting railway systems into operation.
6. Maintenance of railway infrastructures: Fundamentals of infrastructure maintenance; kinds of deprevations; supervision methods; steps of infrastructure maintenance; estimation of maintenance need; methods to minimize maintenance costs.

**Lecture notes**
Autographie on plate girders, trusses, load introduction and redirection, steel concrete composite elements. Copies of presentations.

**Literature**
- Stahlbaukalender, Ernst & Sohn, Berlin

**Prerequisites / notice**
The content of steel structures I is a prerequisite.

---

### 101-0515-00L  
**Project Management**

**Objective:**
To introduce the methods and tools of project management. To impart knowledge in the areas of project organisation and structure, project planning, resource management, project controlling and on team leadership and team work.

**Content:**
- From strategic planning to implementation (Project phases, goals, constraints, and feasibility)
- Project leadership (Leadership, Teams)
- Project organization (Structure)
- Project planning (Schedule, cost and resource planning)
- Project controlling
- Risk and Quality Management
- Project completion

**Lecture notes**
The transparencies will be available for download from the website at least one week before each class. Copies of all necessary documents will be distributed at appropriate times.

---

### 101-0325-01L  
**Rock Mechanics**

**Objective:**
Introduction to the principles of rock mechanics. Fundamentals of engineering of structures built on rock.

**Content:**
Grundphänomene und Problemstellungen des Felsbaus über Tage und des Untertagbaus im Fels; Felsstruktur; Erfassung des Trennflächengefüges und der mechanischen Eigenschaften der Trennflächen; felshydraulische Grundlagen; Einfluss des Wassers auf das Kräftepiel; Verformungs- und Festigkeitseigenschaften von Gestein; Stabilität von Felbschössungen und Felbsfundationen; Feldversuche und Feldmessungen.

**Lecture notes**
Autographie

**Literature**

**Objective:**
Students know the theoretical basis and the detailing of struetural steel elements. They understand how to cope with local load introduction and redirection. They know the basics of design, detailing and dimensioning of steel structures for buildings, respecting aspects of safety, architecture, use, durability and flexibility etc.

**Content:**
After having attended Steel structures I and II students are able to design, detail and dimension the structure of common steel buildings.

**Lecture notes**
Autography on plate girders, trusses, load introduction and redirection, steel concrete composite elements. Copies of presentations.

**Literature**

**Prerequisites / notice**
The content of steel structures I and "Theory of Structures II".

**Abstract**
Introduction into the basic and practical knowledge of important building materials and testing methods.

**Objective**
Introduction into the basic and practical knowledge of important building materials and testing methods.

**Content**
- Introduction of material testing equipment, with various examples of experiments on metals (tensile behaviour, hardness, bending and impact loading).
- Theoretical background and practical aspects of concrete technology: mixture design, casting and setting; determination of mechanical properties.
- Properties of bricks and mortar: individual materials and the composite brickwork. Parameters like strength, Young's modulus, water absorption and thermal conductivity are determined.
- Understanding the characteristic properties of wood: anisotropy, hygroscopic behaviour, shrinkage and swelling, and effect of size on strength. Introduction to test-methods for wood and wood-products.
- Introduction into the basics of scanning electron microscopy: practical exercises with the Environmental Scanning Electron Microscope (ESEM).
- Introduction to fundamentals of Finite Element Methods and their application in examples.
- Introduction to durability of building materials and building structures: assessment of potentials for detecting and locating corrosion of steel reinforcement in concrete.

**Lecture notes**
For each topic a script will be provided, that can be downloaded under www.ifb.ethz.ch/education

### Bachelor Thesis

**Abstract**
The Bachelor Programme concludes with the Bachelor Thesis. This project is supervised by a professor. Writing up the Bachelor Thesis encourages students to show independence and to produce structured work.

**Objective**
Encourages students to show independence, to produce scientifically structured work and to apply engineering working methods.

**Content**
The contents base upon the fundamentals of the Bachelor Programme. Students can choose from different subjects and tasks. The thesis consists of both a written report and an oral presentation.

### Electives

**Bachelor's Thesis**
The entire course programs of ETH Zurich and the University of Zurich are open to the students to individual selection.

**Abstract**
Introduction to computer aided design and drafting in 2D and 3D with examples from structural engineering

**Objective**
Having followed the course, students are able to a develop a 2D-structure (formwork drawing) and they know the principle of a reinforcement module. They have also got an introduction to a 3D program (reinforcement in 3D). They are therefore better prepared for:
- the bachelor thesis in the 6th semester,
- an eventual internship between bachelor and master course,
- the master thesis.
Above all they practice spatial sense and acquire contextual knowledge as future superiors of draftsmen and designers.

**Lecture notes**
CAD für Bauingenieure

**Prerequisites / notice**
Spezialbewilligung der Dozierenden notwendig.
Für Studierende im 5. Semester während 10 Wochen gemäss speziellem Programm; Arbeit ausschliesslich am eigenen Laptop. Die rechtzeitige Installation der Software ist Bedingung für die Teilnahme. Eine Anleitung zur Installation wird ausgegeben.

**Abstract**

Procurement of consistent procedures to solve typical problems of civil engineering. Consolidation of the knowledge of the bachelor courses; integration of bachelors of other universities. Practice of the holistic approach of conceptual design, parallel and iterative operations on varying levels of detailing. Integration of different fields of knowledge and experiences.

**Objective**

Procurement of consistent procedures to solve typical problems of civil engineering. Consolidation of the knowledge of the bachelor courses; integration of bachelors of other universities. Practice of the holistic approach of conceptual design, parallel and iterative operations on varying levels of detailing. Integration of different fields of knowledge and experiences.

**Content**

- Basic tools: Literature research, quotations
- Technical report and presentations
- Basics of graphical representation
- Elements of the design process:
  - Service criteria and respective agreement
  - Design requirements and design boundary conditions
  - Design alternatives
  - Preliminary dimensioning
  - Cost effectiveness
  - Optimization
  - Detailing
- Exemplary consolidations:
  - Geotechnical basics of retaining walls
  - Conceptual design and shaping of retaining walls
  - Drainage of structures
  - Case study conceptual bridge design
- Implementation with a planning tutorial:
  - Presentation of the objects
  - Survey and inventory
  - Design options
  - Intermediate review
  - Final presentation

</table>

**Abstract**

This course provides an introduction to:

- how to model the changes in infrastructure objects over time,
- how to monitor these changes and assess the benefits of monitoring,
- how to intervene to improve infrastructure performance and assess the benefits of interventions, and
- how to model the changes in stakeholders interests over time.

**Objective**

To provide the basic information and tools to be used to make decisions with respect to existing infrastructure.

**Content**

- Deterioration
  - manifest and latent processes,
  - modeling
- Monitoring
  - non-destructive and destructive techniques,
  - evaluation of benefits of monitoring
- Intervention
  - types of intervention,
  - evaluation of benefits of intervention
- Benefits
  - modeling of stakeholder benefits over time

**Lecture notes**

All necessary materials (e.g. transparencies and hand-outs) will be handed out at the beginning of each class.

**Literature**

Appropriate reading material will be assigned when necessary.

This course will provide a comprehensive overview and understanding of the techniques, processes, tools and terminology to manage the Project Triangle (time, cost, quality) and to organize, analyze, control and report a complex project from Pre-Tender stage to Contract signature and Notice to Proceed. This is part 1 of a 3 part course, see notice below.

Upon successful completion of this course students will have the understanding of the Project Management duties and responsibilities from the Pre-Tender stage of a project to Contract Execution.

Scenarios for world energy demand and CO2 emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry), heat pumps, geothermal-energy, energy from waste. CO2 sequestration and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry), heat pumps, geothermal-energy, energy from waste. CO2 sequestration.

| 101-0357-00L | Theoretical and Experimental Soil Mechanics | W+   | 6    | 4G    | R. Herzog, S. M. Springman |
| Abstract     | The number of participants is limited to 30 due to the existing laboratory equipment! Students with major in Geotechnical Engineering have priority. Registrations will be accepted in the order they are received. |      |      |        |                      |
| Objective    | Extend knowledge of theoretical approaches that can be used to describe soil behaviour to enable students to carry out more advanced geotechnical design and to plan the appropriate laboratory tests to obtain relevant parameters for coupled plasticity models of soil behaviour. A further goal is to give students the wherewithal to be able to select an appropriate constitutive model and set up insitu stress conditions in preparation for subsequent numerical modelling (e.g. with finite elements). |      |      |        |                      |
| Content      | Overview of soil behaviour Discussion of general gaps between basic theory and soil response Stress paths in practice & in laboratory tests Explanation of typical applications: reality, modelling, laboratory tests with transfer of results to the practical examples Consolidation theory and typical applications in practice Triaxial & direct shear tests: consolidation & shear, drained & undrained response Plasticity theory & Critical State Soil Mechanics, Cam Clay Application of plasticity theory |      |      |        |                      |
| Lecture notes | Printed script with web support             |      |      |        |                      |
| Literature   | http://geotip.igt.ethz.ch/                  |      |      |        |                      |
| Prerequisites / notice | Lectures will be conducted as Problem Based Learning within the framework of a case history Virtual laboratory in support of 'hands-on' experience of selected laboratory tests |      |      |        |                      |

Pre-requisites: Basic knowledge in soil mechanics as well as knowledge of advanced mechanics Laboratory equipment will be available for 60 students. First priority goes to those registered for the geotechnics specialty in the Masters, 2nd year students then first year students, doctoral students qualifying officially for their PhD status and then 'first come, first served'.

| 101-0307-00L | Design and Construction in Geotechnical Engineering | W     | 4    | 3G    | A. Thielen, P. A. Mayor |
| Abstract     | This lecture deals with the practical application of the knowledge gained in the fundamental lectures from the Bachelor degree. The basics of planning and design of geotechnical structures will be taught for the main topics geotechnical engineers are faced to in practice. |      |      |        |                      |
| Objective    | Transfer of the fundamental knowledge taught in the Bachelor degree to practical application. Ability to plan and design geotechnical structures based on the state of the art. |      |      |        |                      |
| Content      | Introduction to Swisscode SIA Foundations and settlements Pile foundations Excavations Slopes Soil nailing Reinforced geosystems Ground improvement River levees |      |      |        |                      |
| Lecture notes | Script in the form of chapters and powerpoint overheads with web support (http://geotip.igt.ethz.ch) |      |      |        |                      |
| Literature   | relevant literature will be stated during the lectures |      |      |        |                      |

<td>Structural Reliability and Risk Analysis</td>
<td>W</td>
<td>3</td>
<td>2</td>
<td>B. Sudret</td>
</tr>
<tr>
<td></td>
<td>Abstract</td>
<td></td>
<td></td>
<td></td>
<td>Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.</td>
</tr>
<tr>
<td></td>
<td>Objective</td>
<td></td>
<td></td>
<td></td>
<td>The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. After this course the students will have refreshed their knowledge of probability theory and statistics to model uncertainties in view of engineering applications. They will be able to analyze the reliability of a structure and to use risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.</td>
</tr>
</tbody>
</table>
Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. When designing new structures and systems, the design codes such as SIA or Euro-code usually provide a framework that guarantees safety and reliability. However the level of safety is not quantified explicitly, which does not allow the analyst to properly choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FORM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and pre-post risk assessment methods are presented. Bayesian networks are introduced as a generic numerical tool for solving such problems. The course also includes a tutorial using a software dedicated to real world structural reliability analysis.

The lecture's target is the knowledge of the physical basics and technical components of relevant systems for an efficient and sustainable construction.

Energy- and Climate Systems I
A. Schütler
J. Carmeliet

1. Introduction
2. Thermal systems
3. Ventilation
4. Daylight and artificial lighting

The lecture contains concepts, physics and components of building technologies for the efficient and sustainable energy supply and climatisation of buildings and their interaction with architecture and urban design. Using calculations, students learn to acquire relevant numbers and assess the performance of solutions.

The lecture's target is the knowledge of the physical basics and technical components of relevant systems for an efficient and sustainable climatisation and maintenance of buildings and their interdependency with the architectonic design and construction. By learning rough calculation methods, determination of relevant dimensions and identification of important parameters become possible. Hence, adequate approaches for the own design can be chosen, reviewed quantitatively and qualitatively and set in with a synergistic effect.

This is a course on structural dynamics, an extension of structural analysis for loads that involve significant inertial forces and vibratory response of structures. Dynamic responses of elastic and inelastic single-degree-of-freedom, continuous-mass and multiple-degree-of-freedom structural systems subjected to harmonic, periodic, pulse, impulse, and random excitation are discussed. Theoretical background and engineering guidelines for practical solutions to vibration problems in flexible structures caused by humans, machinery, wind and explosions are presented. Laboratory demonstrations of single- and multi-degree-of-freedom system dynamic response and use of viscous and tuned-mass dampers are conducted.

The electronic copies of the learning material will be uploaded to Ilias and available through myStudies. The learning material includes: the lecture presentations, additional reading material, and exercise problems and solutions.

Knowledge of the fundamentals in structural analysis, and in structural design of reinforced concrete, steel and/or wood structures is mandatory. Working knowledge of matrix algebra and ordinary differential equations is required. Familiarity with Matlab and with structural analysis computer software is desirable.

The electronic copies of the learning material will be uploaded to Ilias and available through myStudies. The learning material includes: the lecture presentations, additional reading material, and exercise problems and solutions.

Students will develop a basic knowledge of all stages of the public transport planning process from market demand to service planning;

1. Fundamentals of system and network planning: Mobility and transport systems; public transport systems; customer needs versus
2. Lamina and Laminate Theory
3. Power Point Printouts
4. References to technical literature will be included in the course script. An additional list of literature will be given during the course.
5. At the end of the course, you shall be able to
   1) Design advanced FRP composites for your structures,
   2) To consult owners and clients with necessary testing and SHM techniques for FRP structures,
   3) Continue your education as a PhD student in this field.

**Fibre Composite Materials in Structural Engineering**

**Abstract**
1) Lamina and Laminate Theory
2) FRP Manufacturing and Testing Methods
3) Design and Application of Externally Bonded Reinforcement to Concrete, Timber, Masonry, and metallic Structures
4) FRP Reinforced Concrete, All FRP Structures
5) Measurement Techniques and Structural Health Monitoring

**Objective**
At the end of the course, you shall be able to

1) Design advanced FRP composites for your structures,
2) To consult owners and clients with necessary testing and SHM techniques for FRP structures,
3) Continue your education as a PhD student in this field.

**Content**
Fibre Reinforced Polymer (FRP) composites are increasingly being used in civil infrastructure applications, such as reinforcing rods, tendons and FRP profiles as well as wraps for seismic upgrading of columns and repair of deteriorated structures. The objective of this course is to provide new generation of engineering students with an overall awareness of the application and design of FRP reinforcing materials for internal and external strengthening (repair) of reinforced concrete structures. The FRP strengthening of other structures such as metallic, timber and masonry will also be considered. The objective of this course is to provide new generation of engineering students with an overall awareness of the application and design of FRP reinforcing materials for internal and external strengthening (repair) of reinforced concrete structures. The FRP strengthening of other structures such as metallic, timber and masonry will also be considered. **Abstract**
Public transport in the context of the transport systems; customer needs in the transport market; service planning processes for regular public transport services; long distance, regional and urban public transport service strategies; access to public transport and the last mile

**Objective**
Students will develop a basic knowledge of all stages of the public transport planning process from market demand to service planning; they will understand the most relevant planning methods and will be able to use them

**Content**
1) Fundamentals of system and network planning: Mobility and transport systems; public transport systems; customer needs versus supply characteristics of regular services. (2) System and network planning; generic planning process; demarcation, analysis of the situation, setting of targets; design of public transport services; evaluation and optimization; system planning. (3) Public transport services: long distance service offers; suburban and urban service offers; regional and local service offers; access to public transport and the last mile.

**Lecture notes**
A script in German will be provided for the course. The slides are made available.

**Literature**
References to technical literature will be included in the course script. An additional list of literature will be given during the course.

**Prerequisites / notice**
No remarks.

**Abstract**
Fundamentals of traffic flow theory and operations.

**Objective**
The objective of this course is to fully understand the fundamentals of traffic flow theory in order to effectively manage traffic operations. By the end of this course students should be able to apply basic techniques to model different aspects of urban and inter-urban traffic performance, including congestion.

**Content**
Introduction to fundamentals of traffic flow theory and operations. Includes understanding of traffic data collection and processing techniques, as well as data analysis, and traffic modeling.

**Lecture notes**
The lecture notes and additional handouts will be provided during the lectures.
Knowledge of methods and algorithms commonly used in transport planning

Additional literature recommendations will be provided during the lectures. Verkehr III - Road Transport Systems 6th Sem. BSc (101-0415-00L)

Special permission from the instructor can be requested if the student has not taken Verkehr III

101-0417-00L Transport Planning Methods W 6 credits 4G K. W. Axhausen

Abstract
The course provides the necessary knowledge to develop models supporting the solution of given planning problems. This is done by dividing the forecasting problem into sub-problems.
The course is composed of a lecture part, providing the theoretical knowledge, and a applied part, in which students develop their own models.

Objective
- Knowledge of methods and algorithms commonly used in transport planning
- Ability to independently develop a transport model able to solve/answer the given problem/questions
- Understanding of algorithms and their implementations commonly used in transport planning

Content
The course provides the necessary knowledge to develop models supporting the solution of given planning problems. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with the forecasting problem it is first divided into sub-problems. Then, these are solved using various algorithms like iterative proportional fitting, shortest path algorithms and the method of successive averages.

The course is composed of a lecture part, providing the theoretical knowledge, and a applied part, in which students create their own models. This part takes place in form of a tutorial and consists in the development of a computer program. The programming part is closely guided and particularly suited for students with little programming experience.

Lecture notes
The slides of the lecture are provided electronically.

Literature

401-0647-00L Introduction to Mathematical Optimization W 5 credits 2V+1U R. Zenklusen

Abstract
Introduction to basic techniques and problems of mathematical optimization.

Objective
The goal is to get a good understanding of some of the most important mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems.

Content
Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, network flows, knapsack problem, ...).

Lecture notes
Information about relevant literature will be given in the lecture.

Prerequisites / notice
This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics and more.

103-0317-00L Sustainable Spatial Development I W 3 credits 2G B. Scholl

Abstract
The lectures impart important knowledge for solving spatial relevant conflicts and problems. Case studies will be used to demonstrate the implementation in practice.

Objective
Spatial development deals with the development and the design of our living space. To meet the expectations, the interests and the plans of the different actors, it is needed a planning approach considering the overview of both the actual and future situation.

The concept of sustainable development in spatial planning leads necessarily to an efficient management of the resources, especially regarding the resource land. The basics of this important discipline will be the subject of this lecture, which is therefore organised in three parts:
- Inner development
- Integrated spatial and infrastructure development
- Cross-border issues in spatial development

Content
Tasks of Spatial Planning and development
Issues of local and supra-local interest
Recurring changes, impacts and key figures
Formal and informal instruments and procedures in spatial planning
Spatial design - Ideas about the future
Reasoning and assessing the situation in spatial planning
Spatial planning as a sequence of decisions and interventions
Process and procedures management
Focus issues - Inner development before external development
Focus issues - Cross-border tasks
Focus Issues - Integrated spatial and infrastructure development

Lecture notes
Further information and the documents for the lecture can be found on the homepage of the Chair of Spatial Development.

101-0499-00L Basics in Air Transport W 4 credits 3G P. Wild

Abstract
The course explains main principles of air transport in general and elaborates on simple interdisciplinary topics.

Since working on broad topics like aerodynamics, manufacturers, airport operation, business aviation, business models etc. the students get a good overview in air transportation.

Objective
Understand and explain basics, principles and contexts in the broader air transport industry.

Lay the foundation of working in or with the air transport industry.

### Content

Properties of porous media.
Exercises: Groundwater use, porosity, grain size analysis.

Flow properties, Darcy's law, filter.
Exercises: Darcy's law.

Analytical solutions, confined aquifers, steady-state flow.
Exercises: Head isolines.

Use of superposition principles, transient flow, free surface flow.
Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems I.
Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems II.
Exercises: Finite difference formulations to flow problems.

Transport processes.
Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems I.
Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems II.
Exercises: Analytical solutions to transport problems.

Path lines, groundwater protection.
Exercises: Analytical solutions to transport problems.

Groundwater remediation, groundwater management.
Exercises: Groundwater remediation.

### Prerequisites / notice

Strongly recommended:
Hydrology, Hydraulics I and Hydraulic Engineering

The voluntary and unmarked exercise bases on field data, which are collected by the students on a river in nature. Besides the collection of fundamentals and field data, the exercise comprehends the calculation of the stage-discharge relationship, of the critical discharges at the onset of bed load transport and bed erosion and of the annual sediment load in a given river reach.
Objective

Based on the bachelor courses Materials I-III, current, fundamental, and important issues of specific building materials are addressed. Next to aspects of material production, usage and properties, their interaction with the environment e.g. by durability and environmental impact are addressed. This course is intended to simplify the further selection of courses.

Content

The lecture is segmented into 13 important problems, namely:
1. Materials, Structures, and Sustainability
2. Granular matter: (DEM)
3. Fracture mechanics and size effects in concrete
4. Cyclic failure of asphalt (Fatigue)
5. Mechanics and failure of fiber reinforcements materials
6. Wood: from the tree to the beam (multi scale approaches)
7. Transport and degradation in porous building materials
8. Rheology
9. Plasticity
10. Foam (e.g. polymers)
11. Gluing and coating (surfaces)
12. Asbestos, nano particles and hazardous substances
13. Biomimetics in Constructions

Lecture notes

download from www.ifb.ethz.ch/education

Literature

Prerequisites / notice

The lecture will be given in english.

402-0809-01L
Introduction to Computational Physics (for Civil Engineers)

W 4 credits 2V+1U H. J. Herrmann

Abstract

This course offers an introduction to computer simulation methods for physics problems and their implementation on PCs and super computers: classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell's equation), Monte Carlo simulations, percolation, phase transitions, Electrodymanik and statistischen Mechanik sowie interdisziplinären Anwendungen werden die wichtigsten objektorientierten Programmiermethoden für numerische Simulationen (überwiegend in C++) erläutert. Daneben wird eine Einführung in die Programmierung von Vektorsupercomputern und parallelen Rechnern, sowie ein Überblick über vorhandene Softwarebibliotheken für numerische Simulationen geboten.

Prerequisites / notice

Lecture and exercise lessons in english

101-0537-01L
Wood and Wood Composites

W 3 credits 2G A. Frangi, I. Burgert, G. Fink, M. Fontana, R. Steiger

Abstract

Objective

Knowledge of characteristic properties of wood as a anisotropic and porous material and their consideration in structural timber design. Knowledge about history, ecology, structure of timber, drying, material properties, influence of moisture and creep, durability and grading. Knowledge about material properties and field of applications of solid timber, glued laminated timber and wood composites. Design of timber in fire.

Content

Lecture notes

Power Point slides. Further literature.

Literature

Prerequisites / notice

Die Vorlesung ist mit einer halbtägigen Exkursion verbunden.
Abstract

Moisture transport and related degradation processes in building and civil engineering materials and structures; concepts of poromechanics and multiscale analysis; analysis of damage cases.

Objective

- Basic knowledge of moisture transport and related degradation processes in building and civil engineering materials and structures
- Introduction to concepts of poromechanics and multiscale analysis
- Application of knowledge by analysis of damage cases

Content

1. Introduction
Moorise damage: problem statement
Durability

2. Moisture Transport
Description of moisture transport
Determination of moisture transport properties
Hysteresis
Transport in cracked materials
Damage and moisture transport in cracked media

3. Poromechanics
Moisture and mechanics: poro-elasticity
Poro-elasticity and salt crystallisation
Poro-elasticity and damage
Case studies

4. Multiscale analysis
Problem statement
Multiscale transport model
Multiscale coupled transport - damage model

An Introduction to Sustainable Development in the Built Environment

This course was offered as "Sustainable Construction" until HS14.

Objective
At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

Content
The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development
- Case Study 1: Sustainable construction, the role of construction industry (national/international)
- Case Study 2: Cities, forms of settlements
- Case Study 3: Material resources, scenarios, energy, construction materials, urban metabolism
- Case Study 4: Buildings, heating/cooling, consumers, prosumers and other stakeholder, cooperations
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Economics for sustainable construction
- Method 3: Construction, flexibility, modularity
- Synthesis 1: Climate Change mitigation and adaptation in cities
- Synthesis 2: Transition to sustainable development

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.
### Railway Construction and Maintenance

**ECTS**: 4

**Lecture**: Deepen the knowledge on selected topics of underground construction.

**Objective**

The lecture gives a deeper insight into track geometry, the interaction between track and vehicles as well as in construction and dimensioning of the track. Methods for the diagnosis of the state of the track and its forcast are shown. State-of-the-art maintenance strategies and technologies are presented.

**Content**

Track geometry including calculation and measuring as well as related data systems; interaction between track and vehicles, vehicle dynamics, stress; track construction including special features of railway bridges and tunnels; track diagnostics and forcast; track maintenance and related methods.

**Lecture notes**

The slides will be made available.

**Literature**

A list with related technical literature will be handed out.

**Prerequisites / notice**

The lecture Railway Infrastructures (Transportation II) is recommended.

**Abstract**
In this course selected famous geotechnical failures are investigated with the following purpose: (a) to deepen understanding of the geotechnical risks and possible solutions; (b) to practice design and analysis methods; (c) to learn the techniques for investigation of failures; (d) to learn the techniques for mitigation of the failure damage.

**Objective**
In this course selected famous geotechnical failures are investigated with the following purpose: (a) to deepen understanding of the geotechnical risks and possible solutions; (b) to practice design and analysis methods; (c) to learn the techniques for investigation of failures; (d) to learn the techniques for mitigation of the failure damage.

**Content**
- Failure of shallow and deep foundations
- Failure due to the creeping landslides
- Failure due to excessive settlements
- Failure due to the leaning instability
- Failure due to tunnelling
- Excavation failure

**Prerequisites / notice**
Prerequisite: Basic knowledge in Geotechnical Engineering (Course content of "Grundbau" or similar lecture).

**Method of Finite Elements II**

**W** 3 credits 2G E. Chatzi

**Abstract**

Basic theoretical and procedural concepts of the method of finite elements (FE) for the analysis of nonlinear & dynamic systems are introduced. Kinematic and material nonlinear effects and the dynamic analysis of structures in terms of modal and time domain analysis are described. The course is complemented by Homework Sessions using computing tools and FE software such as MATLAB,ABAQUS & ANSYS.

**Objective**

Basic theoretical and procedural concepts of the method of finite elements (FE) for the analysis of nonlinear & dynamic systems are introduced. Kinematic and material nonlinear effects and the dynamic analysis of structures in terms of modal and time domain analysis are described. The course is complemented by Homework Sessions using computing tools and FE software such as MATLAB,ABAQUS & ANSYS.

**Content**

Introduction to finite element nonlinear analysis in structural engineering. Formulation and solution of nonlinear problems. Nonlinear constitutive relations. Dynamic finite element analysis. Solution of eigen value problems. Practical application of the finite element nonlinear and/or dynamic analysis

**Problem solution using MATLAB, ABAQUS and ANSYS**

Useful Reading:

**101-0169-00L**

**Timber Structures II**

**W** 3 credits 2G A. Frangi, R. Jockwer, R. Steiger

**Prerequisite:** Timber Structures I (101-0168-00L)

**Abstract**

Basic knowledge of structural timber design including material behaviour especially anisotropy, moisture and long duration effects and their consideration in structural analysis and detailing. Design, detailing and structural analysis of timber roof structures, buildings and bridges.

**Objective**

Comprehension and application of basic knowledge of structural timber design including material behaviour especially anisotropy, moisture and long duration effects and their consideration in structural analysis and detailing. Design, detailing and structural analysis of timber roof structures, buildings and bridges.

**Content**

Field of application of timber structures; Timber as building material (wood structure, physical and mechanical properties of wood and wood-based products); Durability; Principles of design and dimensioning; Connections (dowels, nails, screws, glued connections); Timber components and assemblies (mechanically jointed beams, trusses); Design and detailing of timber roof structures, buildings and bridges.

**Lecture notes**

Autography Timber Structures

Copies of lecture slides

**Literature**

Timber design tables HBT 1, Lignum (2012)

Swiss Standard SIA 265 (2012)

Swiss Standard SIA 265/1 (2009)

**Prerequisites / notice**

Timber Structures I

**101-0189-00L**

**Seismic Design of Structures II**

**W** 3 credits 2G B. Stojadinovic

**Abstract**

The following advanced topics will be covered: 1) behavior and non-linear response of structural systems under earthquake excitation; 2) seismic behavior and design of moment frame, braced frame, shear wall and masonry structures; 3) fundamentals of seismic isolation; and 4) assessment and retrofit of existing buildings. These topics are discussed in terms of performance-based seismic design.

**Objective**

After successfully completing this course the students will be able to:

1. Use the knowledge of nonlinear dynamic response of structures to interpret the design code provisions and apply them in seismic design structural systems.
2. Explain the seismic behavior of moment frame, braced frame and shear wall structural systems and successfully design such systems to achieve the performance objectives stipulated by the design codes.
3. Determine the performance of structures under earthquake loading using modern performance assessment methods and analysis tools.

**Content**

This course completes the series of two courses on seismic design of structures at ETHZ. Building on the material covered in Seismic Design of Structures I, the following advanced topics will be covered in this course: 1) behavior and non-linear response of structural systems under earthquake excitation; 2) seismic behavior and design of moment frame, braced frame and shear wall structures; 3) fundamentals of seismic isolation; and 4) assessment and retrofit of existing buildings. These topics will be discussed from the standpoint of performance-based design.

**Lecture notes**

The electronic copies of the learning material will be uploaded to ILIAS and available through myStudies. The learning material includes the lecture presentations, additional reading, and exercise problems and solutions.

**Literature**

Earthquake Engineering: From Engineering Seismology to Performance-Based Engineering, Yusof Borzorgnia and Vitelmo Bertero, Eds., CRC Press, 2004

**Prerequisites / notice**

ETH Seismic Design of Structures I course, or equivalent. Students are expected to understand the seismological nature of earthquakes, to characterize the ground motion excitation, to analyze the response of elastic single- and multiple-degree-of-freedom systems to earthquake excitation, to use the concept of response and design spectrum, to compute the equivalent seismic loads on simple structures, and to perform code-based seismic design of simple structures. Familiarly with structural analysis software, such as SAP2000, and general-purpose numerical analysis software, such as Matlab, is expected.

101-0439-00L **Introduction to Economic Policy - A Case Study Approach with Cost Benefit Analysis in Transport** **W** **6 credits** **4G** K. W. Axhausen, R. Schubert

**Abstract**

The course presents cost benefit analysis and related evaluation methods in transport and introduces the survey methods used to derive the monetary values of non-market goods.

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 135 of 1432
101-0469-00L Road Safety

Abstract
The collection and the methods of statistical and geographical analysis of road accidents are important fundamentals of this course. Safety Aspects in design of urban roads are discussed and measures for improving the safety situation are presented. Procedures of infrastructure safety management for administrations and police are another topic.

Objective
Importing knowledge about road safety and the event of accident, presenting possibilities to increase road safety

Content
Accident origin, collection of road accidents, statistical (descriptive and multivariate, accident prediction models) and geographical analysis of road accidents, risk analysis and rehabilitation measures, road safety instruments for infrastructure with focus on road safety audit, Swiss and international transport policy

Literature

Further literature: will be presented during the course

101-0419-00L Railway Construction and Maintenance

Abstract
Track geometry including calculation and measuring as well as related data systems; interaction between track and vehicles, vehicle dynamics, stress; track construction including special features of railway bridges and tunnels; track diagnostics and forecast; track maintenance and related methods

Objective
The lecture gives a deeper insight into track geometry, the interaction between track and vehicles as well as in construction and dimensioning of the track. Methods for the diagnosis of the state of the track and its forecast are shown. State-of-the-art maintenance strategies and technologies are presented.

Content
Track geometry including calculation and measuring as well as related data systems; interaction between track and vehicles, vehicle dynamics, stress; track construction including special features of railway bridges and tunnels; track diagnostics and forecast; track maintenance and related methods

Literature
A list with related technical literature will be handed out.

Lecture notes
The slides will be made available.

Prerequisites / notice
The lecture Railway Infrastructures (Transportation II) is recommended.

101-0479-00L Safety and Reliability of Railway Systems

Abstract
Railway safety policies and safety concepts, command and control technologies for railways, optimization systems, European Train Control System, reliability availability maintainability safety (RAMS) of railway systems.

Objective
The students comprehend the main principles of safety, reliability and optimization for railway systems and understand the basic concepts of command and control technologies for railways.

Content
Railway safety strategies
- Safety in public transport
- Safety relevant characteristic of railway transport
- Safety requirements for railway transport
- Safety concepts

Command and control technologies for railway systems
- protective functions
- ensure the sequence/spacing of trains
- ensure route protection
- ensure level crossing protection
- technical realization for protective functions
- European Train Control System

- operational command/control systems
- dispatching
- operational control systems
- concepts of optimization

RAMS for railway systems
- accident investigation methods
- RAMS standards for railways
- risk analysis and hazard control
- RAMS methods
- design principles for availability and safety
- maintenance strategies
- Life Cycle Costs (LCC)
- Human Factor
- safety in long railway tunnels

Lecture notes
The slides will be provided in German.

Literature
References will be included in the lecture notes. An additional list of literature will be given during the course.

Prerequisites / notice
some of the tutorials will be held at the IVTs Railway Operation Laboratory. The lecture Systems Dimensioning and Capacity is recommended.

101-0449-00L Management, Marketing, Quality

Abstract
Transport and administrative policy, international and national regulation, business management of public transport companies, marketing, advertising and pricing; quality management
The participants know the interdependencies between the assessment of a situation, decision making, knowledge and language. They

All necessary materials (e.g. transparencies and hand-outs) will be handed out at the beginning of each class.

This course provides an introduction to:

- Transport and administrative policy: Goals of the state related to public transports, governmental activities in public transport, regulation.
- Business management in public transport enterprises: goals of public transport companies, goals of the business management, management of public transport on the different management levels, business organization.
- Marketing, advertising and pricing: Fundamentals and goals; marketing strategies and concepts in public transports; marketing tools; putting marketing into action.
- Quality control: Quality in transport systems; goals of quality management; structuring quality control measures; collecting quality data in an operating service; use of quality control systems for service optimization.

Course notes will be provided in German. Slides will be made available.

Appropriate reading material will be assigned when necessary.

Upon completion of the course students will have the fundamental knowledge required

- to provide the basic information and tools to be used to make decisions with respect to existing infrastructure
- to determine the nature of a decision dilemma and maximes, how to deal with it. Especially they learn that the requirement of information for a decision depends upon the preferences of the deciding acteur. They are also familiar with difficulties and pitfalls within these contexts and know what can be done against it.
- to identify and model the processes used in organizations to manage infrastructure
- to establish benchmarks that can be used to measure the performance of organizations that manage infrastructure, and
- to evaluate organizations that manage infrastructure

Lectures, Systems and Network Planning as well as Systems Dimensioning and Capacity recommended.

</tbody>
</table>
The objective of this course is to conduct a realistic traffic engineering project from beginning to end. During the process, students will also familiarize themselves with microscopic traffic simulation, and will use the simulation software for modeling and analyzing the traffic operations in reality. The emphasis is not only on building the simulation model, but also on how to evaluate results. The final goal is to make valid and concrete engineering proposals based on the simulation model.

Content

In this course the students will complete a traffic engineering project with microscopic traffic simulator VISSIM. An emphasis will be on traffic signals at intersections.

Specific tasks will include:
1) Building a model with the simulator VISSIM in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/ extending the model to improve the traffic performance.

Lecture notes

The lecture notes and additional handouts will be provided before the lectures.

Prerequisites / notice

There are no pre-requisites for this course. The course Transport Simulation (101-0438-00 G) and previous experience with VISSIM is helpful but not mandatory. In addition, simultaneously taking the course Traffic Engineering (101-0437-00 G) is encouraged.

Major in Hydraulic Engineering and Water Resources Management

Number Title Type ECTS Hours Lecturers
101-0249-00L Selected Topics on Hydraulic Engineering W 3 credits 2S R. Boes, I. Albayrak

Abstract

The lecture focuses on selected topics in hydraulic engineering, water management and aquatic ecology relating to hydropower and flood protection projects.

Objective

to deepen knowledge on special aspects in hydraulic engineering and to understand the procedures and the planning sequence of hydropower projects.

Content

Different selected topics in hydraulic engineering will be focused on, e.g. dam safety, possible problems at reservoirs like sedimentation or natural hazards by impulse waves, the hydraulics of river flows, spillways and intake structures at dams and weirs, hydropower and ecology like fish-ecological aspects at low-head hydropower plants and eco-hydraulics like flow-vegetation interaction. Another focus will be put on typical approaches and procedures in the planning process of hydropower projects.

Lecture notes

Lecture notes/handouts will be available on line.

Prerequisites / notice

External speakers will present current topics and projects in Switzerland and abroad.

101-0269-00L Numerical Modelling in Fluvial Hydraulics and River Engineering W 3 credits 2G D. F. Vetsch, A. Siviglia

Abstract

The basics of numerical modelling of fluvial hydraulics and river engineering problems are presented. The governing equations for flow and sediment transport in open channels and corresponding numerical solution strategies are introduced. The theoretical parts are discussed by examples.

Objective

Get to know possibilities and limitations of numerical modelling in fluvial hydraulics and river engineering.

Content

- Governing equations and modelling approaches
- Initial and boundary conditions
- Simulation process and grid generation
- Numerical methods: basics, accuracy and stability
- Examples of numerical schemes, 1D and 2D models

Lecture notes

Slides of lecture are available for download as PDF. Supplementary material will be provided during lecture.

Prerequisites / notice

Relevant books and citations will be mentioned.

101-0289-00L Applied Glaciology W 3 credits 2G M. Funk, A. Bauder

Abstract

We will explain the fundamentals of physics of glaciers which are necessary for treating applied problems. We will go into climate-glacier interactions, flow of glaciers, lake ice and hydrology of glaciers.

Objective

To understand the fundamental physical processes in glaciology.
To learn some basic numerical modelling techniques for glacier flow.
To identify glaciological hazards and to learn some assessment and mitigation possibilities.
Content
Basics in physical glaciology
Dynamics of glaciers: deformation of glacier ice, role of water in glacier motion, reaction of glaciers to climate changes, glacier calving, surges
Ice falls, ice avalanches
Glacier floods
Lake ice and bearing capacity

Lecture notes
Handouts are available

Literature
Relevante Literatur wird während der Vorlesung angegeben.

Prerequisites / notice
Für aktuelle Fallbeispiele werden risikobasierte Massnahmen bei glaziologischen Naturgefahren diskutiert.

Voraussetzungen: Es werden Grundkenntnisse in Mechanik und Physik vorausgesetzt.

Data: 06.10.2017 12:56 Autumn Semester 2015
The course offers an overview of relevant practical issues and present technological challenges for glass and natural stones in constructions. Students gain a good knowledge of the basics of glasses and natural stones, their potential as engineering materials and learn to apply them in the design of civil engineering constructions and to evaluate concepts.

Objective
Glass is increasingly used in constructions to ease the construction process, as functional insulation barrier, even for structural applications of impressive size. While everyone has experienced the innovation potential of glass in the last decade, products from natural stone suffer from an unjustified traditional image that often originates from a lack of understanding of the material and its combination with other materials. Culturally important structures often are made from natural stone and their conservation demands an understanding of their deterioration mechanisms, the concepts of which can be applied to other civil engineering materials. Designers and engineers need the knowledge to reconcile materials and system behavior with the entire processing, handling, integration and life time in mind.

In this module students are provided with a broad fundamental as well as practice-oriented education on glass and natural stone in civil engineering applications. Present and future construction and building concepts demand for such materials with optimized properties. Based on the fundamentals from the Bachelor course in materials by the end of this module, you should be able to:

- recognize and choose specific applications from the broad overview you were provided with,
- relate processing technologies to typical products and building applications and recognize (and explain typical damage related to wrong material choice or application,
- explain the nature of glassy and crystalline materials and interpret their physical behavior against this background,
- explain the major deterioration mechanisms in natural stone and how this relates to durability,
- analyze material combinations and appraise their application in future products as well as integration in existing constructions,
- summarize with appropriate guidance publications on a related topic in an oral presentation and short report.

Content
Lecture 1: An introduction to science and engineering of glass and natural stone in construction (FW/TW)
Lecture 2: Glass chemistry including historical development of glass composition, use of raw materials, melts, chemical stability and corrosion. (FW)
Lecture 3: Geology and mineralogy of stones used in construction. Formation processes, chemistry, crystal structure. (TW)
Lecture 4: Microscopic models for glassy materials. Physics of glass transition. From microscopic physical models to thermodynamics, rheology and mechanics of glassy materials. (FW)
Lecture 5: Stone properties and behavior: microstructure, density, porosity, mechanical properties (TW)
Lecture 6: Glass physics: Optical properties (transmission, reflection, emission, refraction, polarization and birefringence, testing methods); Mechanical properties (density, thermal, mechanical, electric properties, glass testing) (FW)
Lecture 7: Stone properties and durability: transport, moisture and thermal cycling (TW)
Lecture 8: Forming and processing of glass: (plate and molded glass, drawing, slumping, profiling etc.; Processing: Cutting, mechanical processing, tempering, gluing, bending, laminating of glass Surface treatments: coating, sputtering, enameling, printing, etching, chemical pre-stressing.) (FW)
Lecture 9: Durability: Salt crystallization, freezing, biodeterioration (TW)
Lecture 10: Glass products for civil engineering applications: (Molded glasses, fiber glass, foam glass, plate glass); construction glass (insulation glass, structural glass, protective glass, intelligent glass, codes); (FW)
Lecture 11: Conservation: Consolidation, cleaning, and other treatments (TW). Practical aspects (guest lecturer)
Lecture 12: Glass in constructions. (modelling, application and regulation, typical damage in glass) (FW)
Lecture 13: Student presentations; exam questions (FW/TW)

Literature
Werkstoffe II (download via the IFB homepage). Rest will be handed out in the lectures

Prerequisites / notice
Werkstoffe I/II of the bachelor studies or equivalent introductory materials lecture.
Objective
Understand the mechanism of deterioration of RC structures, in particular reinforcement corrosion.

Know the relevant parameters affecting durability of reinforced concrete, in particular cover depth, concrete quality, moisture, and the ways to control durability.

Understand the current approaches for design for durability (exposure classes, prescriptive) and be aware of their limitations

Know the future performance-based models for durability design and the difficulties in defining input parameters (such as critical chloride content).

Know and understand different ways to improve durability of RC structures (e.g. stainless steel reinforcement)

Know the particular problems with post-tensioned structures and ways to overcome them (electrically isolated tendons).

Know and understand the non-destructive methods for inspection and condition assessment (especially half-cell potential mapping) and be aware of the limitations

Know and understand repair methods such as conventional repair, electrochemical methods (in particular cathodic protection)

Be aware of differences in performance of the new blended cements (especially CEM II with limestone) respect to the traditional Portland cement and the possible future problems for durability.

Content
Reinforced concrete combines the good compressive strength of concrete with the high tensile strength of steel and has proven to be successful in terms of structural performance and durability. However, there are instances of premature failure of reinforced concrete and prestressed concrete components due to corrosion of the reinforcing steel with very high economic implications of such damage. This course focuses on the chloride and carbonation induced corrosion of steel in concrete, presenting transport mechanisms and electrochemical concepts. The main emphasis lies on design and execution aspects related to durability of new and existing structures.

New methods and materials for preventative measures, condition assessment and repair techniques are discussed. The course is a point of reference for engineers and materials scientists involved in research and practice of corrosion protection, rehabilitation and maintenance of reinforced concrete structures and components.

Content of the course in detail:

Lecture 1
Administrative issues, literature, what do students expect to learn? Introduction (economic relevance of durability, transition from building to maintenance), Fundamentals of corrosion and durability / Passivity and pitting corrosion.

Lecture 2
Reinforced concrete / Corrosion protection / Degradation mechanism corrosion (chlorides/carbonation) / electrochemical mechanism / controlling parameters / cracks and spalling on surface, danger of localized corrosion.

Lecture 3
Other degradation mechanisms: sulphate attack, ASR, frost attack
Various examples, frequency of occurrence of individual deterioration mechanisms.

Lecture 4
Service life: initiation stage & propagation stage. Durability design: prescriptive approach, constructive detailing, importance of moisture for almost all degradation mechanisms. Performance based approach, simple diffusion approach for chloride ingress, Critical chloride content (influencing parameters).

Lecture 5
Stainless steel as reinforcing steel for concrete / different types of stainless steels / mechanical properties / corrosion resistance, passivity / coupling with black reinforcing steel / examples of application / life-cycle-costs.

Lecture 6
Inspection and condition assessment I: visual inspection / destructive testing (chloride profiles, carbonation depth, thin section analysis, etc.)

Lectures 7
Inspection and condition assessment II: non-destructive testing (potential mapping, cover depth measurement, resistivity measurement). Potential mapping: measurement principle / effect of carbonated cover zone / effect of moisture / examples.

Lecture 8
Post-tensioned structures / problem with existing structures: no NDT method / approach for protection (multiple barrier) / new systems with polymer ducts / electrically isolated tendons / fib guidelines / Swiss guideline / Monitoring techniques / Applications.

Lecture 9
Repair methods I: conventional repair / coatings / inhibitors / limitations.

Lecture 10
Repair methods II: electrochemical repair methods (ECR, ER, CP) / principles / electrochemical chloride removal (theory and examples) / electrochemical realkalization (theory and examples) / when can these methods be applied? / cost aspects.

Lecture 11
Repair methods III: cathodic protection (theory, technical solutions, anode systems, etc and examples). Monitoring of CP.

Lecture 12
New cements, issue of CO2 reduction. Effects of fly ash, slag, limestone on workability, diffusion coefficient, resistivity, pH (including a discussion of the pozzolanic reaction and its consequences with respect to pH buffering Portlandite reserve). Discuss products on the Swiss market.

Lecture 13
Summary of most important points of this course given by the students. Open discussion about durability design, use of new cements, new materials and repair methods. Expected consequences for practice? Course evaluation and time for asking questions.

Lecture notes
The course is based on the book
Slides of the lectures will be distributed in advance
Special hand outs and reprints for particular topics will be distributed

Literature

Prerequisites / notice
Students are encouraged to actively participate during the lectures. Students are expected to work on all the exercises (four). For one exercise a detailed written solution of the exercise has to be delivered (after the discussion).

Students should have passed the exams on Werkstoffe I and II.
### 101-0689-00L  
**Bituminous Materials**  
- **W**: 3 credits  
- **G**: 2G  
- **M**: Partl  

**Abstract**  
Introduction into special aspects of the mechanical and chemo-physical properties as well as the structure and application of bituminous materials for road and waterproofing application considering also new R&D trends

**Objective**  
Introduction into special aspects of the mechanical and chemo-physical properties as well as the structure and application of bituminous materials for road and waterproofing application considering also new R&D trends

**Content**  
Basics of mechanical behavior: Viscosity, rheological models, viscoelasticity, time-temperature superposition, fatigue, viscoplasticity.  
Bituminous binders: Tar-related issues, bitumen, natural asphalt, polymer modified bitumen, technological tests, mechanical-physical properties, binder classification, bitumen emulsions, foam bitumen  
Asphalt pavements: material structure and concepts, production, mixture testing and characterization, mixture types, recycling  
Waterproofing membranes: tack-coats, structure of polymer modified waterproofing membranes, production, typical tests, system-related properties, construction and application

**Lecture notes**  
Script, handed out during lecture

**Prerequisites / notice**  
The lecture comprises two written exercises and one literature exercise with short presentation that are requested to be done.

### 101-0689-00L  
**Shrinkage and Cracking of Concrete: Mechanisms and Impact on Durability**  
- **W**: 3 credits  
- **G**: 2V  
- **P**: Lura  

**Abstract**  
Concrete is generally viewed as a durable construction material. However, the long-term performance of a concrete structure can be greatly compromised by early-age cracking. This course will explain how shrinkage of concrete leads to cracking and how control of shrinkage allows increasing the expected durability of a concrete structure.

**Objective**  
This course will begin with a brief introduction about hydration and microstructure development in cement paste and concrete. The students will learn the main causes of cracking at early ages, namely plastic, drying, thermal and autogenous shrinkage, with special emphasis on the driving mechanisms. The importance of concrete curing, especially in the first few days after casting, will be explained. Building on the knowledge of the driving forces of shrinkage, the way of action of shrinkage-reducing admixtures will be clarified and different applications illustrated. As an extension of external curing, the students will become familiar with internal water curing by means of saturated lightweight aggregate and superabsorbent polymer.

Most concrete members are restrained by adjacent structures. When shrinkage is restrained, cracks may develop. The students will learn how to apply different criteria for assessing concrete cracking and how to retrieve the mechanical properties of the concrete, especially stiffness and creep, relevant for the calculations.

In addition to macroscopic cracks, microcracking may occur in the cement paste due to inner restraint offered by the aggregates. Both macroscopic cracks and diffuse microcracking within a concrete may facilitate the ingress of harmful substances (e.g. chloride and sulfate ions) into the concrete; these may react with the concrete or with the reinforcement and create further deterioration. The students will acquire an understanding of the mechanisms of transport through cracked concrete, with special focus on experimental evidence and on techniques able to visualize the transport process and follow it in time.

As a final outcome of the course, the students will be able to estimate the impact of cracking on the expected durability of concrete structures and to implement different types of measures to reduce the extent of cracking.

**Content**  
Concrete is generally viewed as a long-lasting construction material. However, the durability of a concrete structure can be jeopardized by shrinkage-induced cracking. In addition to being unsightly, cracks have the potential to act as weak planes for further distress or as conduits for accelerated ingress of aggressive agents that may reduce durability.

Advances in concrete technology over the past decades have led to the practical use of concrete with a low water to binder ratio and with different types of mineral and organic admixtures. Another recent development is self-compacting concrete, which avoids concrete vibration and reduces labor during placing. Unfortunately, these concretes are especially prone to early-age cracking. This course will explain how shrinkage of concrete leads to cracking and how control of early-age cracking can improve durability. Proper curing becomes in this case the key to achieve better performance in various environmental and load conditions.

Specific topics covered by the course:
- Hydration and microstructure development
- Plastic shrinkage
- Development of mechanical properties
- Thermal deformation
- Autogenous deformation
- Drying shrinkage
- Curing
- Shrinkage-reducing admixtures
- Internal curing: saturated lightweight aggregate and superabsorbent polymer
- Fracture and microcracking
- Transport in cracked concrete
- Impact of cracking on concrete durability

**Lecture notes**  
For each lecture, lecture notes will be provided. In addition, one or two research papers for each lecture will be indicated as supportive information.

The students will be also provided with a DVD containing the teaching material of a previous course on the same topic, including 16 hours of filmed lectures.

**Literature**  
Copies of one to two research papers relevant to the topic of each lecture will be provided to the students as supportive information.

**Prerequisites / notice**  
A basic knowledge of concrete technology is preferable.

### 151-0353-00L  
**Mechanics of Composite Materials**  
- **W**: 4 credits  
- **G**: 2V+1U  
- **G**: Kress  

**Abstract**  
The course Mechanics of Composite Materials is dedicated to modeling problems following from the complex mechanical behavior of these anisotropic material structures. Modeling of continuous fibre reinforced composites. Participants will be able to design parts for the mechanical, automotive and aerospace industry.

**Objective**  
Understanding of the mechanical properties of fiber reinforced composites with regard to analysis and design of lightweight structures for mechanical, transportation and aerospace applications.

**Content**  
1. Introduction and Elastic Anisotropy  
2. Laminate Theory  
3. Thick-Walled Laminates and Interlaminar Stresses  
4. Edge Effects at Multidirectional Laminates  
5. Micromechanics  
6. Failure Hypotheses and Damage Prediction  
7. Fatigue Response  
8. Joining and Bonding Techniques  
9. Sandwich Designs

**Lecture notes**  
Manuscript and handouts in printed form and as PDF-files: [http://www.structures.ethz.ch/education/master/intro/compulsory/mechanics](http://www.structures.ethz.ch/education/master/intro/compulsory/mechanics)

**Literature**  
The lecture material is covered by the script and further literature is referenced in there.

### 151-0833-00L  
**Principles of Nonlinear Finite-Element-Methods**  
- **W**: 5 credits  
- **G**: 2V+2U  
- **G**: Manipulo, B. Berisha

Data: 06.10.2017 12:56  
Autumn Semester 2015  
Page 142 of 1432
Abstract
Most problems in engineering are of nonlinear nature. The nonlinearities are caused basically due to the nonlinear material behavior, contact conditions and instability of structures. The principles of the nonlinear Finite-Element-Method (FEM) will be introduced in the scope of this lecture for treating such problems.

Objective
The goal of the lecture is to provide the students with the fundamentals of the non linear Finite Element Method (FEM). The lecture focuses on the principles of the nonlinear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Methods are simulations of:
- Crash
- Collapse of structures
- Materials in Biomechanics
- General forming processes

Content
Special attention will be paid to the modeling of the nonlinear material behavior, thermo-mechanical processes and processes with large plastic deformations. The ability to independently create a virtual model which describes the complex nonlinear systems will be acquired through accompanying exercises. These will include the Matlab programming of important model components such as constitutive equations:
- Fundamentals of continuum mechanics to characterize large plastic deformations
- Elasto-plastic material models
- Updated-Lagrange (UL), Euler and combined Euler-Lagrange (ALE) approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- Modeling of crack propagation
- Introduction of advanced FE-Methods

Prerequisites / notice
If we will have a large number of students, two dates for the exercises will be offered.

</tr>
<tr>
<td>Abstract</td>
<td>In line with the approach of P.L. Nervi's book, our study is based on factors that, outlined by him, are still today all the more relevant as a lesson for architecturally and structurally justified buildings. We will observe selected buildings both of our time and of the past for their space, architecture and construction, understand them and interpret them according to universal values of design.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>&quot;Costruire correttamente&quot; (Constructing Correctly), the 1955 book published by Pier Luigi Nervi, covers crucial factors for building that, outlined by him, are still today all the more relevant as a lesson for architecturally and structurally justified buildings. His thoughts represent valuable criteria and indispensable tools for observation and carrying out investigations of the built environment. Lessons learned from this can enrich the design work of today's and tomorrow's architects. All of these (see abstract) i.e. analyses, observances, hypotheses, groupings and cross-comparisons, will help the students in their careers to find their own strategies and approaches to design and to be aware of them. And so, according to the advice of Pier Luigi Nervi : &quot;...At every stage of his training, the future architect should be constantly and methodically guided to search for essential elements in each problem, be it large or small. The study of the architectural works of the past should consist in the critical examination of their functional and structural solutions and of the relation between these and form, in order to show that form is a consequence and not a determinant of functional and structural needs.&quot; [P.L. Nervi: Costruire correttamente, Milano 1955; English version titled &quot;Structures&quot;, 1956, p.28].</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The main thread of this course, that runs over two semesters (*), are buildings of all ages that could be categorised under notions such as « most viewed », « most technically daring », « most unknown », « most discussed » or « most worthy of discussion », and carry instructive aspects of the teachings of Pier Luigi Nervi (&quot;costruire correttamente&quot;). In the lecture, these buildings will be investigated on-the-spot, described from the designers' point-of-view and will be commented on with reference to any redesign resulting from the interplay of architectural and structural concepts. Harmonies and discords will be discovered. Occasionally there will be guest lectures. These people, who were directly involved with a certain building, will portray the emergence and development of the project. In this sense, the course is also intended for civil / structural engineering students and presents a possible bridge between the two prospective project partners - architect and engineer.</td>
<td></td>
<td></td>
<td></td>
<td></td>

| Abstract     | This summer school will function as an inter-disciplinary think-tank, exploring the requisites for sustainable urban development in Barranquilla through the lens of architecture, engineering, and environmental sciences. You will be challenged to work in an intensive cross-cultural setting and develop solutions in a complex, real-life context with local practitioners and stakeholders. |

Autumn Semester 2015
Objective
You will receive full support on-site from Universidad del Norte and ETH tutors from your discipline. In developing the scenarios you will work side by side with young professionals with a grounded knowledge of the field, and be joined by a wide variety of local stakeholders.

The program will combine site visits, expert lectures and workshops to allow you to develop the following skills:

- The capacity to work to address urban challenges in an inter-disciplinary team
- Apply Scenario Analysis technique to structure and integrate knowledge from various fields
- Cross cultural understanding and skills in an international collaboration
- Mechanisms to collaborate and communicate with practitioners and stakeholders

Understanding of integrated and sustainable urban development

Ability to use stakeholder participation to solve real world problems

Content
Mid-sized cities in Latin America are growing at unprecedented rates. The next decade will be decisive in terms of demographic and economic growth, creating a time window to respond to unprecedented demands on resources, such as land, water and energy.

Are these boomtowns doomed to follow the fate of megacities or will they successfully avoid the pitfalls of rapid urban development? This program is part of a three-year ambitious collaboration with the Inter American Development Bank's Emerging and Sustainable Cities Initiative and the Swiss Ministry for Economic Cooperation (SECO). It will influence decision makers and engage with real issues.

ETH is teaming up with the leading Universidad del Norte in Colombia to focus on Barranquilla, a rapidly growing city of 1.2 million inhabitants on the Atlantic coast of Colombia. Following a period of decline, vast sums of foreign investment are now flowing into this port city, with the potential to reverse current inequalities and spark more sustainable development.

In a team, you will produce alternative urban scenarios for the redevelopment of Barranquillas Central Market. You will contribute your expertise and unpack the realities of sustainable development in a tropical climate. How can knowledge from the ETH be combined with leading Colombian research and translated to a Latin American context? Through debate, controversy and collaboration it is expected you produce scenarios that integrate your different disciplines and question the preconceptions of sustainable urban development.

This immersive summer school will be structured in three interlocking modules:

1. In the first module you will investigate the central market and gain a strong understanding of the social, environmental and built context in Barranquilla. You will employ and combine your varied disciplinary methodologies to gain insight into the sustainability challenges facing the city and the redevelopment of the avenue.

2. In the second module, you will develop a series of scenarios for the central market in Barranquilla, proposing alternatives for its sustainable future. You will build on research from the first module, and explore the potential of your ideas with local stakeholders and professionals from your field. You will document these scenarios using creative and varied representational methods.

3. In the final module you will pitch your scenarios to decision makers. During this high-level event you will measure their preferences, debate the associated trade-offs, and provide a series of orientations for those planning the future of Barranquilla.

Who should apply?
Enthusiastic students currently enrolled in a masters program in ETH Zurich and Universidad del Norte, Barranquilla Colombia. A balanced group of 12 ETH master students from the D-ARCH, D-USYS and D-BAUG departments will be selected. They will be joined by 12 Colombian students from our partner university in Barranquilla, Universidad del Norte.

Applicants should have a strong interest in sustainable urban development and trans disciplinary collaborative research. They should be able to demonstrate their academic strength, motivation, interest and expertise. Knowledge of Spanish is welcomed but not obligatory.

ETH participants will be charged a fee of 300 CHF to cover local activities, travel and accommodation.

Students will be responsible for organising visa, health insurance, and transportation to and from Barranquilla. Flights to Barranquilla from Zurich cost approximately 1700 CHF. Additional travel grants are available for ETH students.

Applications can be submitted including curriculum vitae, portfolio where relevant and letter of motivation as portable document format (pdf) by May 30th, 17:00 CET to hertzogl@usys.ethz.ch

Notification for admission June 1st.

Compulsory Electives in Humanities, Social and Political Sciences

Recommended GESS compulsory elective courses (Type B) for D-BAUG.

Only students who fulfill the following criteria are allowed to begin with their master thesis:

1. successful completion of the bachelor programme;
2. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract
The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 16 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

Objective
To work independently and to produce a scientifically structured work.
Content
The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

**Abstract**
The master thesis accompanion seminar with ethical discussions, obtaining research plans, literature searches, critical discussion of original publications, and obtaining possible solutions when confronted with experimental problems.

**Objective**
The seminar helps during the master thesis in order to enable a successful completion of the thesis.

**Prerequisites / notice**
Findet nach Vereinbarung statt.

**Abstract**
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modulated transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

**Objective**
To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modulated transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

**Content**
- X-ray imaging
  - Computed tomography
  - Single photon emission tomography
  - Positron emission tomography
  - Magnetic resonance imaging
  - Ultrasound/Doppler imaging

**Abstract**
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

**Objective**
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

**Content**

**Lecture notes**
Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino

**Literature**

**Abstract**
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: INI415

Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mbiologtaet_en.html

**Objective**
This course focuses on basic aspects of central nervous system physiology, including perception, motor control and cognitive functions.

**Content**
Main emphasis sensory systems, with complements on motor and cognitive functions.

**Prerequisites / notice**
"Principles of Neural Science", Kandel, Schwartz, and Jessel

### Work Design and Organizational Change

Good work design is crucial for individual and company effectiveness and a core element to be considered in organizational change. Meaning of work, organization-technology interaction, and uncertainty management are discussed with respect to work design and sustainable organizational change. As course project, students learn and apply a method for analyzing and designing work in business settings.
Objective
- Know effects of work design on competence, motivation, and well-being
- Understand links between design of individual jobs and work processes
- Know basic processes involved in systematic organizational change
- Understand the interaction between organization and technology and its impact on organizational change
- Understand relevance of work design for company performance and strategy
- Know and apply methods for analyzing and designing work

Content
- Work design: From Adam Smith to job crafting
- Effects of work design on performance and well-being
- Approaches to analyzing and designing work
- Modes of organizational change and change methods
- Balancing stability and flexibility in organizations as design criterion
- The organization-technology interaction and its impact on work design and organizational change
- Example Flexible working arrangements
- Strategic choices for work design

Literature
A list of required readings will be provided at the beginning of the course.

Prerequisites / notice
The course includes the completion of a course project to be conducted in groups of four students. The project entails applying a particular method for analyzing and designing work processes and is carried out by means of interviews and observations in companies chosen by the students.

363-0790-00L Technology Entrepreneurship

W 2 credits 2V U. Claesson, P. Baschera, F. Hacklin

Abstract
Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

Objective
This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures.

Prerequisites / notice
Students are required to have successfully completed the course "Neural control of movement and motor learning" and to have basic knowledge of applied statistics. Self-study material will be available at the beginning of the course and statistical knowledge will be tested (central element) in the second course week (open book). Passing this test is a requirement for continuing the course. Students will be required to write essays, give presentations and participate in discussions on a regular basis. Assessment will be made on the basis of the complete aforementioned practical work.

376-0221-00L Contemporary Problems of Neural Control of Movement

For MSc Major "Human Movement Science and Sport" only.

W 2 credits 2S N. Wenderoth

Number of participants limited to 20.

Abstract
Students read, present and discuss seminal papers in the field of Neural Control of Movement and Motor Learning.

Objective
The goal of this course is to nurture and develop independent thinking which is a vital component of personal and professional development. Students will critically evaluate academic papers, present logical arguments, source reliable information and design thought experiments to solve problems relevant to the neural control of behavior.

Prerequisites / notice
Students are selected on the basis of an application form and an essay. The prerequisite is a course in Neuroscience or Motor Control.

376-0225-00L Physical Activities and Health

W 3 credits 2V E. de de Bruin

Abstract
This course introduces/explores the complex relationship between physical activity, sedentary behavior and health. It will discuss the evolution of current physical activity recommendations. It will examine the current evidence base that has informed physical activity recommendations and that identified physical activity as a key modifiable lifestyle behavior contributing to disease and mortality.

Objective
On completion of this course students will be able to demonstrate:
1. knowledge of and critical awareness of the role of physical activity and sedentary behavior in the maintenance of health and the aetiology, prevention and treatment of disease.
2. thorough knowledge and critical awareness of current recommendations for physical activity, and current prevalence and trends of physical activity and associated diseases
3. awareness of current national and international physical activity policies and how these impact on global challenges

Content
Introduction to Physical Activity for Health, including sedentary behavior
- Physical activity epidemiology: concepts, principles and approaches
- Physical activity and all cause morbidity and mortality
- Physical activity and chronic disease; Coronary heart disease, diabetes, bone health, cancer and obesity
- Physical activity and brain health
- Physical activity and sedentary behavior recommendations
- Population prevalence of physical activity and sedentary behavior
- Physical activity policies
- Physical activity assessment

Literature
Core texts for this course are:

Selecting journal articles from relevant journals such as Journal of Physical Activity and Health and Journal of Aging and Physical Activity

Prerequisites / notice
From the BSc-course the following book is recommended: ‘Essentials of strength training and conditioning’ T. Baechle, R. Earle (3rd Edition)

376-1033-00L History of Sports

W 2 credits 2V M. Gisler

Abstract
Comprehension for development and changes of sports from the ancient world to the presence. Description of sports in services of national idea, from education and health promotion from the middle of the 18th century till this day.

Objective
Understanding for the development and adaptation of sports from the ancient world to present times.

Content

Lecture notes
Ein Skript für die aktuelle Veranstaltung wird abgegeben.

Literature

376-1107-00L Sport Pedagogy

W 2 credits 2V D. Seiler Hubler

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 148 of 1432
Central aspects of Sport related pedagogy will be handled in these lectures. These aspects cover, amongst others, the subject and tasks of Sport related pedagogy. Furthermore, the general and sports relevant foundations of Sport related pedagogy will be covered.

To gain basic knowledge of sports pedagogy and to recognize starting points for applied sports pedagogical intervention in schools.

Inhaltliche Schwerpunkte der Vorlesung sind:
- Einführung in die Sportpädagogik
- Bedeutung des Sports im Kindes- und Jugendalter
- Leistungssport im Kindes- und Jugendalter
- Pädagogische Perspektiven des Sportunterrichts in der Schule
- Ein zeitgemäßer Schulsport
- Bewegungskulturelle Bildung: Bewegungserziehung, Spielerziehung

Unterrichtsmaterialien zu den einzelnen Veranstaltungen werden den Studierenden zur Verfügung gestellt.

Number of participants limited to 30.

Analysis of posture: Development of the functionally correct posture
Perception, measurement

Analysis of posture: Development of the functionally correct posture
Perception, measurement

Perception of the own posture
Analysis of the own posture
Status of the posture standing
Own training program
Neutral liability on the
Back injuries - healthy back
Tension / Stability
Tone regulation
- sensomotorial activity (treats the capacity to feel the own movements, transfer from theory into practice of programming and modifying neuromotoric movements)
- Torso stability 1, 2
Relaxation:
Work-life - Balance
Mental training
Ideas for relaxation (also for kids)
Stress regulation
Massage (introduction in Massage technics)

Students are given insight into different work areas of sport psychology. In order to understand what «sport psychology» is, it is necessary to explain the essence and tasks of sport psychology and what it relates to, and to work out an underlying basis for key topics, such as cognition and emotions. Students' expertise is furthered by presenting and providing more in-depth treatment of additional topics of sport psychology. Selected intervention forms are intended to provide insight into applied sport psychology and ensure that mental processes and their impact in sport can be recognised. Case studies and practical exercises (e.g. objective training) are intended to prompt students to reflect to a greater extent on the forms in which sport psychology can be applied in their practice of sports and to integrate these in their teaching.

Main Topics
- Introduction to sport psychology
- Cognitions in sports; mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

The lectures deal with the current changes in society and sport and provide an overview of the many different problems and perspectives of sport sociology.

The lectures set out to:
- present the different dimensions, functions and interrelationships of present-day sport
- provide an introduction to the central theories and models of (sport) sociology
- show how far sport reflects society and how it changes and becomes more differentiated in the process
- take current examples from newspapers, magazines and television to highlight the sociological view of sport.

Sport and social change: developments and trends

The economy and the media: dependencies, consequences, scandals
Social inequalities and distinctions; gender differences and group behavior
Conflicts and politics: sports organizations, doping, violence

Selected materials for the lecture are available under www.LSSFB.ch --> Lehre

Completion of the musculoskeletal system concerning deterioration, overload and regeneration of the musculoskeletal system are an important basis for an ergonomic working environment. The following topics are covered: Muscle fatigue during the 8-hour day, use of the computer mouse, backaches, Tendinitis, nerve compression, epidemiology, prevention, rehabilitation, laws, measuring procedures.
Objective
Goal of the course is the activation of physiological and patho-physiological insights for the understanding of loads of the musculoskeletal system during work. Prevention and rehabilitation of work related musculoskeletal disease will be discussed with the help of a bio-psycho-social model. Furthermore, evidence based methods for a healthy work design will be presented.

Content
Insights of human movement sciences concerning wear, overtraining and regeneration of the musculoskeletal system form an important base for an ergonomic work design. The following topics will be covered: Muscle fatigue in an 8-hours-day, mouse appliance, back pain, insertion tendinitis, nerve compression, epidemiology, prevention, rehabilitation, laws, and measurement methods.

Lecture notes
Skript und Folien auf NETZ als PDF-Datei zur Verfügung

Prerequisites / notice
- To develop basics for a differentiate analyses of sports (model)
- To develop competencies of training with youth and talents
- To develop the basics of talent training in theory and practice
- To observe athletes in case studies, make judgments and conclusion

-To develop the basics of talent training in theory and practice
Further information will be given in the individual lectures and are mentioned on OLAT.

- The course covers the development of the nervous system (NS) with a focus on: sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.
- The main focus is on the structure, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

- The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

- The course covers the structure, plasticity and regeneration of the adult nervous system (NS) with focus on: sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.
- The main focus is on the structure, plasticity and regeneration of the NS: biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

- The combining of training and coaching as in the example of sport analysis, which has an effect on youth training and athlete development
- The course is the activation of physiological and patho-physiological insights for the understanding of loads of the musculoskeletal system during work. Prevention and rehabilitation of work related musculoskeletal disease will be discussed with the help of a bio-psycho-social model. Furthermore, evidence based methods for a healthy work design will be presented.

- The main focus is on the structure, plasticity and regeneration of the NS: Early development of the NS, cellular processes, nerve fiber growth, building of synapses and neuronal networks.

- UZH students: Lecture notes will be provided on OLAT: https://www.olat.uzh.ch/olat/dmz/

- The course is the activation of physiological and patho-physiological insights for the understanding of loads of the musculoskeletal system during work. Prevention and rehabilitation of work related musculoskeletal disease will be discussed with the help of a bio-psycho-social model. Furthermore, evidence based methods for a healthy work design will be presented.

- The course is the activation of physiological and patho-physiological insights for the understanding of loads of the musculoskeletal system during work. ### 376-1717-00L Practical Basics in Sports and Exercise Therapy

- **W**: 2 credits
- **2V**: B. Spörr Kälín, B. S. Wirth Gasser

**Objective**: The members are able to transform the knowledge from the previous courses in practical situations of Sports and Exercise Therapy. They learn basic aspects to design therapy lessons.

**Content**: Communication/conversation with patients

**Prerequisites / notice**: The courses “Introduction in Sports and Exercise Therapy” and has been completed successfully.

### 376-1720-00L Application of MATLAB in the Human Movement Sciences

- **W**: 2 credits
- **2G**: R. van de Langenberg

**Objective**: Students will learn to import, process and graphically present experimental data using the MATLAB computing environment. Both the data and the methods of analysis will be typical for experiments in Human Movement Science (i.e. kinematics, kinetics and electromyography).

**Content**: Drawbacks of Excel; Possibilities in MATLAB; Import of several data formats; Plot of one and more signals; Removing of an offset and filtering of data based on self-written functions; Normalisation and parametrisation of data; Reliability; Interpolation, Differentiation and Integration in MATLAB.

**Prerequisites / notice**: A Laptop with MATLAB installed (v2009 or higher) and wireless internet access is mandatory. Two students can share a laptop if necessary. A MATLAB student version can be obtained at Stud-IDES for free.

### 376-1722-00L Spinal Cord Injury and Exercise

- **W**: 2 credits
- **2V**: C. Perret

**Objective**: Knowledge of the pathophysiology and the concomitant complications of a spinal cord injury and the consequences for physical exercise and trainability during rehabilitation as well as in recreational and elite sport.

**Content**: The following issues will be discussed: Epidemiology and etiology of spinal cord injury; complications and consequences of spinal cord injury; trainability/exercise physiology and spinal cord injury; history and organisation of wheelchair sports; elite sport and spinal cord injury psychology.

**Prerequisites / notice**: Voraussetzung: Vorlesung Anatomie/Physiologie besucht!

### 376-1177-00L Human Factors I

- **W**: 2 credits
- **2V**: M. Menozzi Jäckli, R. Boutellier, R. Huang, M. Siegrist

**Objective**: Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

**Content**: Physiological, physical, and cognitive factors in sensation and perception

- Body spaces and functional anthropometry
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

### 376-1179-00L Applications of Cybernetics in Ergonomics

- **W**: 1 credit
- **1U**: M. Menozzi Jäckli, Y.Y. Hedinger Huang, R. Huang

**Objective**: To learn and practice cybernetics principles in interface designs and product development.

**Abstract**: Cybernetics systems have been studied and applied in various research fields, such as applications in the ergonomics domain. Research interests include the man-machine interaction (MMI) topic which involving the performance in multi-model interactions, quantification in gestalt principles in product development; or the information processing matter.
### 376-1716-00L Basics of Exercise Therapy

**Number of participants limited to 30.**

**W** 2 credits 2V K. Marschall

**Abstract**
Basics of Exercise Therapy:
A: diagnostic, anamnesis, diagnostic of movement and function, assessments in exercise therapy, diagnostic of experience and behavior in relation to movement
B: biological-medical basics
biomechane (joints), pathophysiological Basics (internal, orthopedic and psychological diseases.
C: didactic knowledge, Reha-didactic

**Objective**
Students learn the assessments to plan an exercise-therapy-treatment. They are able to use them. They're able to integrate biological and medical basics. They are able to prepare a therapy-session.

**Content**
Grundlagen der Diagnostik, Anamnese,
Bewegungsdiagnostik, Funktionsdiagnostik
Sport- und Bewegungstherapeutische Testverfahren
Motorische Basisdiagnostik
Diagnostik bewegungsbezogenen Erlebens und Verhaltens
Biologisch-medizinische Grundlagen
Biomechanik (v.a. Gelenke), Pathophysiologische Grundlagen, Modelle der Methodik und Didaktik, Lektionsplanung

**Literature**
- Handouts can be downloaded.
- Schüle / Huber: Grundlagen der Sporttherapie, Deutscher Ärzteverlag, Köln 2012
- Deimel et al.: Neue aktive Wege in Prävention und Rehabilitation, Deutscher Ärzteverlag, Köln 2007

**Prerequisites / notice**
90% of the lectures students must be present.

### 376-2017-00L Biomechanics of Sports Injuries and Rehabilitation

**W** 3 credits 2V K.U. Schmitt, J. Goldhahn

**Abstract**
This lectures introduces the basic principles of injury mechanics and rehabilitation focussing on sports injuries.

**Objective**
Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the basic mechanisms and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

**Content**
This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented. Furthermore possibilities to prevent injuries are discussed. Thereby the lecture focuses on sports injuries.

**Literature**
- Schmitt K-U, Niederer P., M. Muser, Walz F.: "Trauma Biomechanics - Accidental Injury in traffic and sports", Springer Verlag

**Prerequisites / notice**
A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

### 752-6001-00L Introduction to Nutritional Science

**W** 3 credits 2V M. B. Zimmermann, C. Wolfrum

**Abstract**
The course introduces basic concepts of micro- and macronutrient nutrition. Micronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fat and carbohydrates. Special attention is given to nutrient digestion, bioavailability, metabolism and excretion with some focus on energy metabolism.

**Objective**
To introduce the students to the both macro- and micronutrients in relation to food and metabolism.

**Content**
The course is divided into two parts. The lectures on micronutrients are given by Prof. Zimmermann and the lectures on macronutrients are given by Prof. Wolfrum. Prof. Zimmermann discusses the micronutrients, including fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. Prof. Wolfrum introduces basic nutritional and aspects of proteins, fats, carbohydrates and energy metabolism.

The nutrients are described in relation to digestion, absorption and metabolism. Special aspects of homeostasis and homeorhesis are emphasized.

**Literature**
- Elmada I & Leitzmann C: Ernährung des Menschen
  - IUTB Ulmer, Stuttgart, 4. überarb. Ausgabe 2004
  - Garrow JS and James WPT: Human Nutrition and Dietetics
  - Churchill Livingstone, Edinburgh, 11th rev. ed. 2005

### 752-6101-00L Nutrition and Chronic Disease (HS)

**W** 3 credits 2V M. B. Zimmermann

**Abstract**
To have the student gain understanding of the links between the diet and the etology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

**Objective**
To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

**Content**
The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, cancer, obesity etc.

**Literature**
To be provided by the individual lecturers, at their discretion.

**Prerequisites / notice**
No compulsory prerequisites, but prior completion of Human Nutrition I + II (Humanernährung I+II) is strongly advised.

### 752-6105-00L Epidemiology and Prevention

**W** 3 credits 2V M. Eichholzer

**Abstract**
The module Epidemiology and prevention gives a brief introduction to epidemiology with the aim to enable students to judge the scientific evidence on dietary habits and health. The importance of nutrition in the prevention of chronic diseases such as type 2 diabetes, cardiovascular diseases, cancer, obesity etc. is presented.
Students are able to evaluate the scientific evidence on the effects of diet on human health. They should be able to describe the role of nutritional factors in the prevention of chronic diseases and to assess the nutritional status of a population (Switzerland taken as an example). The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition examples.

The module Epidemiology and prevention gives an introduction to epidemiology with the aim to enable students to judge the scientific evidence on dietary habits and health. The importance of nutrition in the prevention of chronic diseases such as type 2 diabetes, cardiovascular diseases, cancer, obesity etc. is presented. Switzerland taken as an example, the health risks associated with our nutritional habits will be evaluated. Finally, examples of preventive measures addressing individuals but also our society in relation to the obesity epidemic and other threats to health are discussed.

The course introduces basic concepts of the interaction between nutrition and exercise and cognitive performance. Students should obtain practical experience of 3 month length in possible job environments. The selected places (internal or external) enable them to communicate adequately in specific situations.

The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

Language: English

It is strongly recommended to attend the lectures. The lecture (including the handouts) is not designed for distance education.

The lectures "Leadership I" (WS) and "Leadership II" (SS) have been designed as a two-semester lecture series, but may also be followed independently of one another or in reverse order. "Leadership I" covers the following fields: leadership basics, leadership theories and leadership styles, the concept of leadership responsibility and the role of communication in practical leadership.

The aim of this lecture is to give students an introductory overview of relevant topics regarding leadership research and practice, thus enabling them to gain a deeper understanding of the leadership phenomenon. Students should understand different concepts of leadership in the complex interaction between individuals, groups, organisation, context and situation. They should be informed about the evolution of the understanding of mankind in relation to working processes and its impact on organizations and the understanding of leadership theory in the past 100 years. They should grasp the concept of leadership responsibility (leadership ethics) and be able to derive consequences for leadership in practical situations. They should recognize the fundamental importance of communication in leadership situations and receive input which enables them to communicate adequately in specific situations.

The 1-hour written exam will take place during the last lecture in the semester.

Practical Training

The students should obtain practical experience of 3 month length in possible job environments. The selected places (internal or external) should be as close as possible by the major exercise in movement and training doctrines.

Master Thesis

Only students who fulfill the following criteria are allowed to begin with their master thesis:

a. successful completion of the bachelor programme;

b. fulfilling of any additional requirements necessary to gain admission to the master programme.

The course builds on basic nutrition and biochemistry knowledge to address exercise and performance related aspects of nutrition. General knowledge about nutrition, human biology, physiology and biochemistry is a prerequisite for this course. The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

Language: English

It is strongly recommended to attend the lectures. The lecture (including the handouts) is not designed for distance education.

The course introduces basic concepts of the interaction between nutrition and exercise and cognitive performance. The students should obtain practical experience of 3 month length in possible job environments. The selected places (internal or external) should be as close as possible by the major exercise in movement and training doctrines.

The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

Language: English

It is strongly recommended to attend the lectures. The lecture (including the handouts) is not designed for distance education.
The student shall apply his basic knowledge in a practical scientific study. He/she will be confronted with the requirements of scientific working. He/she must master this requirements.

The master thesis can only be started after the Bachelor Degree was obtained and the Vertiefungsleiter has approved the study.

**Abstract**
Measurement and modeling of the human movement during daily activities and in a clinical environment.

**Objective**
The students are able to analyse the human movement from a technical point of view, to process the data and perform modeling with a focus towards clinical application.

**Content**
This course includes ethical considerations, measurement techniques, clinical testing, accessing movement data and anaylsis as well as modeling with regards to human movement.

**Abstract**
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

**Objective**
To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function, modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.
### Content
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

### Literature
Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011

### Prerequisites / Notice
Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

### 227-0386-00L Biomedical Engineering

| Objective | Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined. |
| Lecture notes | Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino |

### 227-0447-00L Image Analysis and Computer Vision

| Objective | Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises. |
| Content | The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed. |
| Lecture notes | Lecture notes and handouts |

### 227-1051-00L Introduction to Systems Neuroscience

| Objective | This course focuses on basic aspects of central nervous system physiology, including perception, motor control and cognitive functions. |
| Content | To understand the basic concepts underlying perceptual, motor and cognitive functions. |
| Lecture notes | None |

### 363-0790-00L Technology Entrepreneurship

| Objective | Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding. |
| Content | This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture. |
| Lecture notes | Lecture slides and case material |

### 376-1219-00L Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions

| Objective | This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases. |
| Content | See course website |

### Data: 06.10.2017 12:56 Autumn Semester 2015 Page 155 of 1432
Abstract
Rehab. Engineering is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

Content
Introduction, problem definition, overview
- Rehabilitation of visual function
  - Anatomy and physiology of the visual sense
  - Technical aids (glasses, sensor substitution)
  - Retina and cortex implants
- Rehabilitation of hearing function
  - Anatomy and physiology of the auditory sense
  - Hearing aids
  - Cochlea Implants
- Rehabilitation and use of kinesthetic and tactile function
  - Anatomy and physiology of the kinesthetic and tactile sense
  - Tactile/haptic displays for motion therapy (incl. electrical stimulation)
  - Role of displays in motor learning
- Rehabilitation of vestibular function
  - Anatomy and physiology of the vestibular sense
  - Rehabilitation strategies and devices (e.g. BrainPort)
- Rehabilitation of vegetative Functions
  - Cardiac Pacemaker
  - Phrenic stimulation, artificial breathing aids
  - Bladder stimulation, artificial sphincter
  - Deep brain stimulation for patients with Parkinson, epilepsy, depression
  - Brain-Computer Interfaces

<td></td>
<td></td>
<td>Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed. In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.</td>

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 157 of 1432
Abstract
Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

Objective
Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

Content
Bioinformatics I will cover the following topics:

From genes to databases and information
BLAST searches
Prediction of gene function and regulation
RNA structure prediction
Gene expression analysis using microarrays
Protein sequence and structure databases
WWW for bioinformatics
Protein sequence comparisons
Proteomics and de novo protein sequencing
Protein structure prediction
Cellular and protein interaction networks
Molecular dynamics simulation

Abstract
The master thesis accompanying seminar. Participants present new scientific publications and landmark-papers in form of a short oral presentation and a poster. Furthermore, results of the Master Thesis are presented in a 30-min oral presentation. Critical discussion of scientific and conceptual aspects are trained intensively.

Objective
Critical analysis and discussion, as well as presentation of scientific literature and own results.

Content
Participants present new scientific publications and landmark-papers in form of a short oral presentation and in form of a poster. Furthermore, results of the Master Thesis are presented in a 30-min oral presentation. Thus, the most common types of scientific presentations as well as critical discussion of scientific and conceptual aspects are trained intensively.

Literature
Unterlagen werden in moodle zur Verfügung gestellt.

Prerequisites / notice
Successful completion of Seminar I is required before the start of Seminar II.

**Abstract**
Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

**Objective**
This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

**Content**
See course website

**Lecture notes**
Lecture slides and case material

**Prerequisites / notice**
The course includes the completion of a course project to be conducted in groups of four students. The project entails applying a particular method for analyzing and designing work processes and is carried out by means of interviews and observations in companies chosen by the students.

### 376-0130-00L Laboratory Course in Exercise Physiology

**Abstract**
Conduct physical performance tests and measurements that are typically used to assess performance of athletes and/or patients and that deepen the understanding of physiological processes in response to physical exertion.

**Objective**
Gain hands-on experience in exercise physiology and consolidate knowledge on physiological adaptations to different types and degrees of physical activity and climatic influences. Learn fundamental assessment techniques of the muscular system, the cardio-respiratory system and of whole-body performance, learn scientifically correct data analysis and interpretation of results. Insight into today's Sports Medicine.

**Content**
Laboratory course:
- various exercise tests assessing human performance and assessments of physiological responses to activity (examples are VO2max-test, Conconi-Tests, Determination of anaerobic threshold, Cooper-Test, 1-repetition maximum test, lactate minimum test), dynamometry, mechanography, body composition etc.). Insight into measurements in Sports Medicine.

**Lecture notes**
Tutorial on Laboratory Experiments in Exercise Physiology (Editor: Exercise Physiology Lab)

**Literature**
Schmidt/Lang/Heckmann: Physiologie des Menschen, Springer-Verlag, Heidelberg

**Prerequisites / notice**
Anatomy and physiology classes and lab course in physiology successfully completed (BWS students please contact C. M. Spengler)

Desirable:
Exercise Physiology Lecture (concomitantly or passed; is selection criterion in case of more applications than lab spaces)

### 376-0221-00L Contemporary Problems of Neural Control of Movement

**For MSc Major "Human Movement Science and Sport" only.**

<table>

<tr>
<th>Credit Type</th>
<th>Credits</th>
<th>Semester</th>
</tr>
</thead>
<tbody>
<tr>
<td>W</td>
<td>2</td>
<td></td>
</tr>
</tbody>
</table>

**Abstract**
Students read, present and discuss seminal papers in the field of Neural Control of Movement and Motor Learning.

**Objective**
The goal of this course is to nurture and develop independent thinking which is a vital component of personal and professional development. Students will critically evaluate academic papers, present logical arguments, source reliable information and design thought experiments to solve problems relevant to the neural control of behavior.

**Prerequisites / notice**
Students are required to have successfully completed the course "Neural control of movement and motor learning" and to have basic knowledge of applied statistics. Self-study material will be available at the beginning of the course and statistical knowledge will be tested (central element) in the second course week (open book). Passing this test is a requirement for continuing the course. Students will be required to write essays, give presentations and participate in discussions on a regular basis. Assessment will be made on the basis of the complete aforementioned practical work.

### 376-0225-00L Physical Activities and Health

</tr>
</tbody>
</table>

**Abstract**
This course introduces/explores the complex relationship between physical activity, sedentary behavior and health. It will discuss the evolution of current physical activity recommendations. It will examine the current evidence base that has informed physical activity recommendations and that identified physical activity as a key modifiable lifestyle behavior contributing to disease and mortality.

**Objective**
On completion of this course students will be able to demonstrate:
1. knowledge of and critical awareness of the role of physical activity and sedentary behavior in the maintenance of health and the aetiology, prevention and treatment of disease.
2. thorough knowledge and critical awareness of current recommendations for physical activity, and current prevalence and trends of physical activity and associated diseases
3. awareness of current national and international physical activity policies and how these impact on global challenges

**Content**
- Introduction to Physical Activity for Health, including sedentary behavior
- Physical activity epidemiology; concepts principles and approaches
- Physical activity and all cause morbidity and mortality
- Physical activity and chronic disease; Coronary heart disease, diabetes, bone health, cancer and obesity
- Physical activity and brain health
- Physical activity and sedentary behavior recommendations
- Population prevalence of physical activity and sedentary behavior
- Physical activity policies
- Physical activity assessment
Central aspects of sport related pedagogy will be handled in these lectures. These aspects cover, amongst others, the subject and tasks of sport related pedagogy. Furthermore, the general and sports relevant foundations of Sport related pedagogy will be covered.

Core texts for this course are:

Students are given insight into different work areas of sport psychology. In order to understand what «sport psychology» is, it is necessary to explain the essence and tasks of sport psychology and what it relates to, and to work out an underlying basis for key topics, such as cognition and emotions. Students’ expertise is furthered by presenting and providing more in-depth treatment of additional topics of sport psychology. Selected intervention forms are intended to provide insight into applied sport psychology and ensure that mental processes and their impact in sport can be recognised. Case studies and practical exercises (e.g. objective training) are intended to prompt students to reflect to a greater extent on the forms in which sport psychology can be applied in their practice of sports and to integrate these in their teaching.

Core texts for this course are:
- Selective journal articles from relevant journals such as Journal of Physical Activity and Health and Journal of Aging and Physical Activity.

Consolidated findings of movement sciences concerning deterioration, overload and regeneration of the musculoskeletal system are an important basis for an ergonomic working environment. The following topics are covered: Muscle fatigue during the 8-hour day, use of the computer mouse, backaches, Tendinitis, nerve compression, epidemiology, prevention, rehabilitation, laws, measuring procedures.

A detailed program with additional references will be delivered at the beginning of the lecture.
### Content
Insights of human movement sciences concerning wear, overstraining and regeneration of the musculoskeletal system form an important base for an ergonomic work design. The following topics will be covered: Muscle fatigue in an 8-hours-day, mouse appliance, back pain, insertion tendinitis, nerve compression, epidemiology, prevention, rehabilitation, laws, and measurement methods.

### 376-1177-00L Human Factors I

<table>
<thead>
<tr>
<th>W</th>
<th>2 credits</th>
<th>2V</th>
<th>M. Menozzi Jäckli, R. Bouitetell, R. Huang, M. Siegrist</th>
</tr>
</thead>
</table>

**Abstract**
Every day humans interact with various systems. Strategies of interaction, individual needs, physical & mental abilities, and system properties are important factors in controlling the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction & overall performance.

**Objective**
The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

**Content**
- Physiological, physical, and cognitive factors in sensation and perception
- Body spaces and functional anthropometry
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

**Literature**

### 376-1179-00L Applications of Cybernetics in Ergonomics

<table>
<thead>
<tr>
<th>W</th>
<th>1 credit</th>
<th>1U</th>
<th>M. Menozzi Jäckli, Y.Y. Hedinger Huang, R. Huang</th>
</tr>
</thead>
</table>

**Abstract**
Cybernetics systems have been studied and applied in various research fields, such as applications in the ergonomics domain. Research interests include the man-machine interaction (MMI) topic which involves the performance in multi-model interactions, quantification in gestalt principles in product development; or the information processing matter.

**Objective**
To learn and practice cybernetics principles in interface designs and product development.

**Content**
- Fitt's law applied in manipulation tasks
- Hick-Hyman law applied in design of the driver assistance systems - Vigilance applied in quality inspection
- Accommodationvergence crosslink function
- Cross-link models in neurobiology- the oculomotor control system
- Human information processing in optimization of production lines

**Literature**

### 376-1305-00L Development of the Nervous System

<table>
<thead>
<tr>
<th>W</th>
<th>3 credits</th>
<th>2V</th>
<th>E. Stoelckl, further lecturers</th>
</tr>
</thead>
</table>

**Abstract**
The course covers the development of the nervous system (NS) with a focus on neurogenesis and migration, axon growth, synapse formation, mol. & cell. mechanisms, and diseases of the developing NS.

**Objective**
The aim is to give a deepened insight on the normal development, of the nervous system based on molecular, cellular and biochemical approaches.

**Content**
The main focus is on the development of the NS: Early development of the NS, cellular processes, nerve fiber growth, building of synapses and neuronal networks.

**Lecture notes**
Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz as BIO344

**Literature**
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

**Prerequisites / notice**
Auxiliary tools:
None. Bring something to write and your student ID

### 376-1305-01L Structure, Plasticity and Repair of the Nervous System

<table>
<thead>
<tr>
<th>W</th>
<th>3 credits</th>
<th>2V</th>
<th>M. E. Schwab, L. Fili, K. A. Martin, further lecturers</th>
</tr>
</thead>
</table>

**Abstract**
The course covers the structure, plasticity and regeneration of the adult nervous system (NS) with focus on: sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.

**Objective**
The aim is to give a deepened insight into the structure, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

**Content**
The main focus is on the structure, plasticity and regeneration of the NS: biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

**Lecture notes**
ETH students: Lecture notes will be provided on Moodle https://moodle.app2.let.ethz.ch/course/view.php?id=694
Password will be provided at the beginning of the lecture.

UZH students: Lecture notes will be provided on OLAT: https://www.olat.uzh.ch/olat/dmz/

**Literature**
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle / OLAT.

**Prerequisites / notice**
Repetitionsprüfung 15. Juni 2016, HG E 26.1, 9-10.30h

### 376-1665-00L Training and Coaching I

<table>
<thead>
<tr>
<th>W</th>
<th>3 credits</th>
<th>2G</th>
<th>O. Buholzer</th>
</tr>
</thead>
</table>

**Abstract**
The combining of training and coaching as in the example of sport analysis, which has an effect on youth training and athlete development

**Objective**
- To develop for a differentiates analyses of sports (model)
- To develop a profile of requirements for specific sports
- To develop competencies of training with youth and talents
- To develop the basics of talent training in theory and practice
- To observe athletes in case studies, make judgments and conclusion
Das Modell der Sportartenanalyse
- Die Relevanz der einzelnen Leistungsfaktoren
- Das Modell der Wettkampfanalyse
- Folgerungen für das Training und Coaching in der Sportart
- Folgerungen für das Nachwuchstraining
- Folgerungen für die Athletenauswahl, Athletenbeobachtung und -betreuung
- Das Nachwuchs- und Talenttraining (Sichtung, Selektion, Förderung)
- Projekte aus der Praxis (Talent- und Nachwuchstraining)
- Praxisinput zum Thema Koordination, motorische Grundbedürfnisse, Kraft und Gesundheit
- Praxisbeispiele erarbeiten und planen
- Konkrete Athletenbeobachtung

Lecture notes
- Die Skript- (Lektionsunterlagen) werden im Rahmen des Semesters abgeben und auf Homepage veröffentlicht.

Literature
- Struktur sportlicher Leistung (Modellansatz von Gundlach; (Trainingswissenschaften S. 45 - 49; Stehler/Konzag/Döbler)
- Leistungsdiagnostische Verfahren, Stiehler (Konzag/Döbler)
- Training fundiert erklärt, Handbuch der Trainingslehre, Ingold Verlag 2006
- Das sportliche Talent, W. Joch, Meyer&Meyer Verlag, 2002
- Das neue Konditionstraining, Grosser/Starischka/Zimmermann, blv 2002

Prerequisites / notice
- Für die Kreditvergabe sind die vorgeschriebenen Semesterarbeiten und die Präsenz zwingend. Die Benotung erfolgt durch eine schriftliche Arbeit.
- Planung
- Die Planungsunterlagen werden zu Semesterbeginn abgegebenen, sind provisorisch und können vom Dozenten geändert werden. Die Praxislektionen werden jeweils am Mittwoch von 13.00 - 15.00 abgehalten. Die Termine werden in Absprache festgelegt.
- Die Semesterarbeit ist 4 Wochen nach Semesterbeginn abzugeben.

376-1716-00L Basics of Exercise Therapy

<table>
<thead>
<tr>
<th>Number of participants limited to 30.</th>
</tr>
</thead>
</table>

Abstract
- Basics of Exercise Therapy
  - A: diagnostic, anamnesis, diagnostic of movement and function, assessments in exercise therapy, diagnostic of experience and behavior in relation to movement
  - B: biological-medical basics
  - biomechanic (joints), pathophysiological Basics (internal, orthopedic and psychological deseases).
  - C: didactic knowledge, Reha-didactic

Objective
- Students learn the assessments to plan an exercise-therapy-treatment.
- They are able to use them. They're able to integrate biological and medical basics.
- They are able to preparate a therapy-session

Content
- Grundlagen der Diagnostik, Anamnese, Bewegungsdiagnostik, Funktionsdiagnostik
- Sport- und Bewegungstherapeutische Testverfahren
- Motorische Basisdiagnostik
- Diagnostik bewegungsbezogenen Erlebens und Verhaltens
- Biologisch-medicinische Grundlagen
- Biomechanik (v.a. Gelenke), Pathophysiologische Grundlagen, Modelle der Methodik und Didaktik, Lektionsplanung

Literature
- Schüle / Huber: Grundlagen der Sporttherapie, Deutscher Ärzteverlag, Köln 2012
- Deimel et al.: Neue aktive Wege in Prävention und Rehabilitation, Deutscher Ärzteverlag, Köln 2007

Lecture notes
- skript will be on lern-platform

Prerequisites / notice
- The courses "Introduction in Sports and Exercise Therapy" and has been completed successfully.

90% of the lections students must be present.

376-1717-00L Practical Basics in Sports and Exercise Therapy

<table>
<thead>
<tr>
<th>Number of participants limited to 30.</th>
</tr>
</thead>
</table>

Abstract
- Impart knowledge of practical basics of Sports and Exercise Therapy
- The members are able to transform the knowledge from the previous courses in practical situations of Sports and Exercise Therapy. They learn basic aspects to design therapy lessons.

Objective
- communication/conversation with patients
- psychoregulation: relaxation
- anatomy in vivo

Content
- Grundlagen der Diagnostik, Anamnese, Bewegungsdiagnostik, Funktionsdiagnostik
- Sport- und Bewegungstherapeutische Testverfahren
- Motorische Basisdiagnostik
- Diagnostik bewegungsbezogenen Erlebens und Verhaltens
- Biologisch-medicinische Grundlagen
- Biomechanik (v.a. Gelenke), Pathophysiologische Grundlagen, Modelle der Methodik und Didaktik, Lektionsplanung

Literature
- Schiele / Huber: Grundlagen der Sporttherapie, Deutscher Ärzteverlag, Köln 2012
- Deimel et al.: Neue aktive Wege in Prävention und Rehabilitation, Deutscher Ärzteverlag, Köln 2007

Lecture notes
- skript will be on lern-platform

Prerequisites / notice
- The courses "Introduction in Sports and Exercise Therapy" and has been completed successfully.

90% of the lections students must be present.

376-1720-00L Application of MATLAB in the Human Movement Sciences

Abstract
- Students will learn to import, process and graphically present experimental data using the MATLAB computing environment. Both the data and the methods of analysis will be typical for experiments in Human Movement Science (i.e. kinematics, kinetics and electromyography).

Objective
- Students will acquire the ability to independently load, plot, and process kinematic, kinetic and electromyographical data using the MATLAB computing environment.
### Spinal Cord Injury and Exercise

**Code:** 752-6105-00L  
**Credits:** 2  
**Semester:** Autumn Semester 2015

**Objective:**
Knowledge of the pathophysiology and the concomitant complications of a spinal cord injury and the consequences for physical exercise and training during rehabilitation as well as in recreational and elite sport.

**Content:**
The following issues will be discussed: Epidemiology and etiology of spinal cord injury; complications and consequences of spinal cord injury; trainability/exercise physiology and spinal cord injury; history and organisation of wheelchair sports; elite sport and spinal cord injury.

**Prerequisites / Literature:**
Voraussetzung: Vorlesung Anatomie/Physiologie besucht!

**Prerequisites / Literature:**

#### Biomechanics of Sports Injuries and Rehabilitation

**Code:** 752-6001-00L  
**Credits:** 3  
**Semester:** Autumn Semester 2015

**Objective:**
This course introduces basic concepts of micro- and macronutrient nutrition. Micronutrients include fat-soluble and water-soluble vitamins, minerals and trace elements. Special attention is given to nutrient digestion, bioavailability, metabolism and excretion with some focus on energy metabolism.

**Content:**
The course is divided into two parts. The lectures on micronutrients are given by Prof. Zimmermann and the lectures on macronutrients are given by Prof. Wolfrum. Prof. Zimmermann discusses the micronutrients, including fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. Prof. Wolfrum introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism.

**Prerequisites / Literature:**
There is no script. Powerpoint presentations will be made available.

**Prerequisites / Literature:**

#### Nutrition and Chronic Disease (HS)

**Code:** 752-6101-00L  
**Credits:** 3  
**Semester:** Autumn Semester 2015

**Objective:**
To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

**Content:**
The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

**Prerequisites / Literature:**
To be provided by the individual lecturers, at their discretion.

**Prerequisites / Literature:**

#### Epidemiology and Prevention

**Code:** 752-6105-00L  
**Credits:** 3  
**Semester:** Autumn Semester 2015

**Objective:**
To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

**Content:**
The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

**Prerequisites / Literature:**
To be provided by the individual lecturers, at their discretion.

**Prerequisites / Literature:**
The module Epidemiology and prevention provides a brief introduction to epidemiology with the aim to enable students to judge the scientific evidence on dietary habits and health. The importance of nutrition in the prevention of chronic diseases such as type 2 diabetes, cardiovascular diseases, cancer, obesity etc. is presented.

**Objective**
- Students are able to evaluate the scientific evidence on the effects of diet on human health
- to describe the role of nutritional factors in the prevention of chronic diseases
- to assess the nutritional status of a population (Switzerland taken as an example)
- to put forward preventive measures addressing individuals but also our society in relation to the obesity epidemic

**Content**
The module Epidemiology and prevention provides a brief introduction to epidemiology with the aim to enable students to judge the scientific evidence on dietary habits and health. The importance of nutrition in the prevention of chronic diseases such as type 2 diabetes, cardiovascular diseases, cancer, obesity etc. is presented. Switzerland taken as an example, the health risks associated with our nutritional habits will be evaluated. Finally, examples of preventive measures addressing individuals but also the society in relation to the obesity epidemic and other threats to health are discussed.

---

**752-6151-00L Public Health Concepts**

**Abstract**
The module “public health concepts” offers an introduction to key principles of public health. Students get acquainted with the concepts and methods of epidemiology. Students also learn to use epidemiological data for prevention and health promotion purposes. Public health concepts and intervention strategies are presented, using examples from infectious and chronic diseases.

**Objective**
- to interpret the results of epidemiological studies
- to critically assess scientific literature
- to know the definition, dimensions and determinants of health
- to plan public health interventions and health promotion projects

**Content**
Concepts of descriptive and analytical epidemiology, study designs, measures of effect, confounding and bias, screening, surveillance, definition of health and health promotion, health dimensions and health determinants, prevention strategies, public health interventions, public health action cycle, epidemiology and prevention of infectious and chronic diseases (HIV, Tuberculosis, Obesity, Public health nutrition).

**Lecture notes / Prerequisites / notice**
Handouts are provided to students in the classroom.

**Language of the course**
English

---

**752-6403-00L Nutrition and Performance**

**Abstract**
The course introduces basic concepts of the interaction between nutrition and exercise and cognitive performance.

**Objective**
To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.

**Content**
The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition examples.

**Lecture notes / Literature / Prerequisites / notice**
Lecture slides and required handouts will be available on the ETH website.

**Language**
English

It is strongly recommended to attend the lectures. The lecture (including the handouts) is not designed for distance education.

---

**853-0033-00L Leadership I**

**Abstract**
The lectures "Leadership I" (WS) and "Leadership II" (SS) have been designed as a two-semester lecture series, but may also be followed independently of one another or in reverse order. "Leadership I" covers the following fields: leadership basics, leadership theories and leadership styles, the concept of leadership responsibility and the role of communication in practical leadership.

**Objective**
The aim of this lecture is to give students an introductory overview of relevant topics regarding leadership research and practice, thus enabling them to gain a deeper understanding of the leadership phenomenon. Students should understand different concepts of leadership in the complex interaction between individuals, groups, organization, context and situation. They should be informed about the evolution of the understanding of mankind in relation to working processes and its impact on organizations and the understanding of leadership theory in the past 100 years. They should grasp the concept of leadership responsibility (leadership ethics) and be able to derive consequences for leadership in practical situations. They should recognize the fundamental importance of communication in leadership situations and receive input which enables them to communicate adequately in specific situations.

**Prerequisites / notice**
The 1-hour written exam will take place during the last lecture in the semester.

---

**151-0104-00L Uncertainty Quantification for Engineering & Life Sciences**

**Abstract**
Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

**Objective**
The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

**Content**
Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

**Lecture notes / Literature / Prerequisites / notice**
The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

**Language**
English
### Practical Training

**Abstract**

3-months practical experience with topics from the major exercise physiology.

**Objective**

The students should obtain practical experience of 3 month length in possible job environments. The selected places (internal or external) should be as close as possible by the major exercise physiology.

**Content**

The content of the practica is determined by the supervisor together with the student.

**Prerequisites / notice**

Practica can be combined with the master thesis. In such a case, it can only be started after the Bachelor Degree was obtained and the Vertiefungsleiter has approved the study.

### Master Thesis

**Abstract**

6-months research study with topics from the major exercise physiology.

**Objective**

The student shall apply his basic knowledge in a practical scientific study. He/she will be confronted with the requirements of scientific working. He/she must master this requirements.

**Content**

The content of the master thesis is determined by the supervisor together with the student. The thesis can begin only after the approval Vertiefungsleiter.

**Prerequisites / notice**

The master thesis can only be started after the Bachelor Degree was obtained and the Vertiefungsleiter has approved the study.

| 701-0265-00L    | Ecology and Evolution                                                 | Z Dr | 2     | 2S    | E. Postma, J. Jokela                                                      |
| **Abstract**    | A course dedicated to the reading and discussion of the relevant literature. The actual list of theme papers will be proposed anew for every year. Students then choose a topic and prepare themselves for a general discussion with their colleagues and peers. In the process, current and controversial topics will be discussed and studied. |      |       |       |                                                                           |
| **Objective**   | To become proficient in reading scientific literature, to understand how to look at publications, to understand them and to be able to put them in context. The course also trains the skills needed for the presentation of scientific contributions and the ability to put things into a broader context. Training in how to participate in a scientific discussion, how to make an argument and how to listen to arguments of others. |      |       |       |                                                                           |
| **Content**     | All topics focus on themes from ecology and evolution, notably so on studies on adaptation of organisms, their evolutionary history, or on questions of current methodology. |      |       |       |                                                                           |
| **Lecture notes** | none                                                                  |      |       |       |                                                                           |
| **Literature**  | The actual content, i.e. the theme papers, will be determined and allocated to the participants at the start of the course each year. Takes place at Uni Irchel. Please refer to notes on board or ask secretary Mrs. Rita Jenny (Rita.Jenny@env.etzh.ch). |      |       |       |                                                                           |
| **Requirements** | Knowledge of ecology and evolution, e.g., lectures during basic and advanced study period. The course is meant for advanced and PhD students. |      |       |       |                                                                           |
| 760-2211-00L    | Colloquium Agricultural Science                                       | Z Dr | 0     | 2K    | E. Frossard, N. Buchmann, W. Gruissem, M. Kreuzer, O. Voinnet, A. Walter, S. C. Zeeman |
| 151-0927-00L    | Rate-Controlled Separations in Fine Chemistry                         | Z Dr | 4     | 3G    | M. Mazzotti                                                               |
| **Abstract**    | The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology. |      |       |       |                                                                           |
The class covers separation techniques that are central in the purification and downstream processing of chemicals and bio-
pharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Liquid-liquid extraction; 2) Adsorption and
chromatography; 3) Membrane processes; 4) Crystallization and precipitation.

The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern
life science processes in particular, fine chemistry and biotechnology.

This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical
sciences.

The main goal of this course is to enhance the student's ability to:

- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.
- recognize and identify ethical issues and conflicts,
- apply ethical decision-making frameworks and strategies.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international,
governmental, institutional and professional level.

The last third of the course is dedicated to an introduction into generalized linear regression models: this includes logistic regression for
binary response variables, Poisson regression for count data, cumulative logit models for ordered, and multinomial regression for
categorical response variables.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-
3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have
not registered for the examination of the other course unit.

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for
which an introduction will be held.

I. Ethics & the Process of Ethical Inquiry
---------------------------------------
Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues... Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)
----------------------------------------------------------
Integrity in Research & Research Misconduct
- What is “integrity” in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 R’s (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks;
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access;
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health, will present a paper. Presentations will be made available after the seminars.

ZüKoSt: Seminar on Applied Statistics

Several research groups from University, ETH, Basel, Bern and Konstanz meet once per month and present their work related to DNA-repair, recombination, replication, and cancer.

Objective: Discussion of current topics in DNA-repair, recombination, replication, and cancer.

Content: Discussion of current topics in DNA-repair, recombination, replication, and cancer.

Prerequisites / notice: The lecture requires an active participation of the students. All students will participate in individual or group work focussing on specific subject of the lecture. Students will have ample time for preparation during lecture time.

551-0530-00L  Repair, Recombination, Replication  Z  0 credits  1K  J. Jirincy

Abstract: Several research groups from University, ETH, Basel, Bern and Konstanz meet once per month and present their work related to DNA-repair, recombination, replication, and cancer.

Objective: Discussion of current topics in DNA-repair, recombination, replication, and cancer.

Content: Discussion of current topics in DNA-repair, recombination, replication, and cancer.

Prerequisites / notice: The lecture requires an active participation of the students. All students will participate in individual or group work focussing on specific subject of the lecture. Students will have ample time for preparation during lecture time.

551-1109-00L  Seminars in Microbiology  Z Dr  0 credits  2K  M. Aebi, H.M. Fischer, W.D. Hardt, J. Piel, J. Vorholt-Zambelli

Abstract: Seminars by invited speakers covering selected microbiology themes.

Objective: Discussion of selected microbiology themes presented by invited speakers.

401-0620-00L  Statistical Consulting  Z Dr  0 credits  0.1K  M. Kalisch, L. Meier

Abstract: The Statistical Consulting service is open for all members of ETH, including students, and partly also to other persons.

Objective: Advice for analyzing data by statistical methods.

Content: Students and researchers can get advice for analyzing scientific data, often for a thesis. We highly recommend to contact the consulting service when planning a project, not only towards the end of analyzing the resulting data!

Prerequisites / notice: This is not a course, but a consulting service. There are no exams nor credits.

Contact: beratung@stat.math.ethz.ch . Tel. 044 632 2223. See also http://stat.ethz.ch/consulting

Requirements: Knowledge of the basic concepts of statistics is desirable.

551-0512-00L  Current Topics in Molecular and Cellular Neurobiology  Z Dr  2 credits  1S  U. Suter

Abstract: The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Objective: The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

Content: You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Lecture notes: Presentations will be made available after the seminars.

Literature: We cover a range of themes related to development and neurobiology. Before starting your preparations, check with Jorge Pereira (jorge.pereira@biol.ethz.ch), who helps you with finding an appropriate paper.

Prerequisites / notice: You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

551-0737-00L  Experimental Ecology: Evolution and Ecology  Z Dr  2 credits  2K  S. Bonhoeffer

Abstract: Interaction seminar. Student-mediated presentations, guest and discussions on current themes in ecology, evolutionary and population biology.

Objective: Getting familiar with scientific arguments and discussions. Overview of current research topics. Making contacts with fellow students in other groups.

Content: Scientific talks and discussions on changing subjects.

Lecture notes: None

Literature: None
### Current Immunological Research in Zürich

**Abstract**

This monthly meeting is a platform for Zurich-based immunology research groups to present and discuss their ongoing research projects. At each meeting three PhD students or Postdocs from the participating research groups present an ongoing research project in a 30 min seminar followed by a plenary discussion.

**Objective**

The aim of this monthly meeting is to provide further education for master and doctoral students as well as Postdocs in diverse topics of immunology and to give an insight in the related research. Furthermore, this platform fosters the establishment of science- and technology-based interactions between the participating research groups.

**Content**

Presentation and discussion of current research projects carried out by various immunology-oriented research groups in Zurich.

**Lecture notes**

none

---

### Electron Cryomicroscopy Seminar

**Abstract**

Intergroup seminar for scientists and students interested in electron cryomicroscopy

**Objective**

The goal of the seminar is to provide an exchange forum for anyone interested in electron cryomicroscopy (tomography and single particle).

The first ~10 minutes are used for exchange on instrument status and technical issues, followed by a ~30 min presentation and discussion of a specific project.

The seminar can also be used to discuss current literature and report from conferences.

**Prerequisites / notice**

Presented project data are confidential. Sign-up for seminar announcements by emailing pilhofer@biol.ethz.ch.

---

European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Mathematics I is an introduction to one- and multidimensional calculus and linear algebra emphasizing on applications.

Students understand mathematics as a language for modeling and as a tool for solving practical problems in natural sciences. Students can analyze models, describe solutions qualitatively or calculate them explicitly if need be. They can solve examples as well as their practical applications manually and using computer algebra systems.

Abstract

Objective

Content

## Eindimensionale diskrete Entwicklungen ##
- linear, exponentiell, begrenzt, logistisch
- Fixpunkte, diskrete Veränderungsrate
- Folgen und Grenzwerte

## Funktionen in einer Variablen ##
- Reproduktion, Fixpunkte,
- Periodizität,
- Stetigkeit

## Differentialrechnung (I) ##
- Veränderungsrate/-geschwindigkeit
- Differentialquotient und Ableitungsfunktion
- Anwendungen der Ableitungsfunktion

## Integralrechnung (I) ##
- Stammfunktion
- Integrationstechniken

## Gewöhnliche Differentialgleichungen (I) ##
- Qualitative Beschreibung an Beispielen:
  - Beschränkt, Logistisch, Gompertz
  - Stationäre Lösungen
  - Lineare DGL 1. Ordnung
  - Trennung der Variablen

## Lineare Algebra ##
- Erste Arithmetische Aspekte
- Matrizenrechnung
- Eigenwerte / -vektoren
- Quadratische LGS und Determinante

Lecture notes

In Ergänzung zu den Vorlesungskapiteln der Lehrveranstaltungen fassen wir wichtige Sachverhalte, Formeln und weitere Ausführungen jeweils in einem Vademecum zusammen. Die pdfs finden Sie unter Lernmaterial > Dokumente.

Dabei gilt:

* Die Skripte ersetzen nicht die Vorlesung und/oder die Übungen!
* Ohne den Besuch der Lehrveranstaltungen verlieren die Ausführungen ihren Mehrwert.
* Details entwickeln wir in den Vorlesungen und den Übungen, um die hier bestehenden Lücken zu schliessen.
* Prüfungsrelevant ist, was wir in der Vorlesung und in den Übungen behandeln.

## Foundations of Computer Science ##

**4 credits**

**522-0532-00L**

**Abstract**

Students learn to apply selected concepts and tools from computer science for working on interdisciplinary projects.

The following topics are covered: modeling and simulations, introduction to programming, visualizing multi-dimensional data, introduction matrices, managing data with lists and tables and with relational databases, universal methods for algorithm design.

**Objective**

The students learn to:
- understand the role of computer science in science,
- to control computer and automate processes of problem solving by programming,
- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data,
- know universal methods for algorithm design.

**Content**

1. The role of computer science in science
2. Introduction to Programming with Python
3. Modeling and simulations
4. Introduction to Matrices with Matlab
5. Visualizing multidimensional data
6. Data management with lists and tables
7. Data management with a relational database
8. Universal methods for algorithm design

**Lecture notes**

All materials for the lecture are available at www.gdi.ethz.ch

**Prerequisites / notice**

This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

---

## Fundamentals of Biology IA ##

**5 credits**

**551-0105-00L**

**Abstract**

The course provides an introduction to the basics of molecular- and cell biology and genetics.

**Objective**

Introduction to modern biology and to principal biological concepts.

**Content**

1. Basic principles of Evolution.
2. Chemistry of Life: Water; Carbon and molecular diversity; biomolecules
3. The cell; structure; membrane structure and function, cell cycle
4. Metabolism: Respiration; Photosynthesis; Fermentation
5. Inheritance: meiosis and sexual reproduction; Mendelian genetics, chromosomal basis of inheritance, molecular basis of inheritance, from gene to protein, regulation of gene expression; genomes and their evolution

**Lecture notes**

None.

**Literature**

The text-book "Biology" (Campbell, Reece) (10th edition) is the basis of the course.

The structure of the course is largely identical with that of the text-book.

**Prerequisites / notice**

Certain sections of the text-book must be studied by self-instruction.

---

## General Chemistry (for Biology/Pharmacy/HST) ##

**4 credits**

**522-1001-01L**

**Abstract**

The lecture deals with a number of basic chemistry concepts. These include (amongst others) chemical reactions, energy transfer during chemical reactions, properties of ionic and covalent bonds, Lewis structures, properties of solutions, kinetics, thermodynamics, acid-base equilibria, electrochemistry and properties of metal complexes.

**Objective**

The course is designed to provide an understanding of the basic principles and concepts of general and inorganic chemistry.

**Content**

The lecture deals with a number of basic chemistry concepts. These include (amongst others) chemical reactions, energy transfer during chemical reactions, properties of ionic and covalent bonds, Lewis structures, properties of solutions, kinetics, thermodynamics, acid-base equilibria, electrochemistry and properties of metal complexes.

## Organic Chemistry I (for students of Biology, Pharmaceutical Sci., and Health Sci. & Tech.) ##

**4 credits**

**529-1011-00L**

**Abstract**

Fundamentals of Organic Chemistry: molecular structure, Bonding and functional groups; nomenclature; resonance and aromaticity; stereochemistry; conformation; bond strength; organic acids and bases; basic reaction thermodynamics and kinetics; reactive intermediates: carbanions, carbenium ions and radicals.

**Abstract**

Introduction to the practical work in a chemistry laboratory. The most important manipulations and techniques are treated, as well as the most fundamental chemical reaction types.

**Objective**

- Knowledge of the basic chemical laboratory methods.
- Basic knowledge of the scientific approach in experimenting.
- Observation and interpretation of real-world chemical processes.
- Keeping of a reliable laboratory journal.

**Content**

- Simple chemical methods and calculations.
- Separation techniques.
- Simple physical measurements.
- Ionic solids (salts).
- Acid/Base chemistry, buffers.
- Redox reactions.
- Metal complexes.
- Titration methods.
- Introduction to qualitative analysis.

**Lecture notes**

Course manual (is handed out to the students at the begin of the lessons). Language: German, English upon request.

**Literature**

**Prerequisites / notice**

This practical course causes costs for materials and chemicals. The costs are charged to the students at the end of semester.

**Abstract**

The goal of this course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

**Objective**

The goal of this course is to provide students with a wide general understanding cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

**Content**

The focus is animal cells and the development of multicellular organisms with a clear emphasis on the molecular basis of cellular structures and phenomena. The topics include biological membranes, the cytoskeleton, protein sorting, energy metabolism, cell cycle and division, viruses, extracellular matrix, cell signaling, embryonic development and cancer research.

**Lecture notes**

The lectures are presented in the Powerpoint format. These are available on the WEB for ETH students over the netzh (Moodle). Some lectures are available on the ETH WEB site in a live format (Livestream) at the above WEB site.

Vertiefung von Statistikmethoden. Nach dem detailierten Fundament aus Statistik I liegt nun der Fokus auf konzeptueller Breite und

Topics likely to be covered in this course include research methods in evolutionary biology, adaptation, evolution of sex, evolutionary

This course provides an introduction to Biochemistry / Molecular Biology with some emphasis on chemical and biophysical aspects.

Topics include the structure-function relationship of proteins / nucleic acids, protein folding, enzymatic catalysis, cellular pathways involved in bioenergetics and the biosynthesis and breakdown of amino acids, glycols, nucleotides, fatty acids and phospholipids, and steroids. There will also be a discussion of DNA replication and repair, transcription, and translation.

The course provides an introduction to Biochemistry / Molecular Biology with some emphasis on chemical and biophysical aspects. The course provides an introduction to Biochemistry / Molecular Biology with some emphasis on chemical and biophysical aspects.

This course introduces important questions about the evolutionary processes involved in the generation and maintenance of biological diversity across all domains of life and how evolutionary science investigates these questions.

The course provides an introduction to Biochemistry / Molecular Biology with some emphasis on chemical and biophysical aspects.

Some of the lectures are given in the English language. Certain sections of the text-book must be studied by self-instruction.

Analytical part: basic operations for the separation of mixtures of organic compounds (recrystallization, distillation, extraction, none; hand-outs will be prepared before the lectures.

Practical Course Organic Chemistry (for Students of
Lecture: Body plans, characteristics, diversity and phylogenetic position of the main groups of Protozoa, Invertebrates, and Vertebrates, with a special focus on Arthropods and Vertebrates (including vertebrate fauna of Switzerland).

Practical: Macroscopic and microscopic study of selected Protozoa, Invertebrates (especially insects) and Vertebrates: morphology and anatomy; behaviour, mainly locomotion, feeding, and reproduction.

Lecture notes
A script for the course will be sold in the lecture, and additional material will be handed out (particularly in the practical).

Literature
No further literature required, the script contains suggestions for further reading.

551-0227-00L
Mycology

Objective
Understanding the fungal life form.
Knowledge of the specific properties of the fungal cell
Knowledge of the different reproductive cycles in all fungal phyla
Knowledge of the different nutritional modes of the fungi; correlation with habitat and ecology
Knowledge of the application of fungi in food production and biotechnology

Content
The lecture focuses on the following topics within Mycology:
1. The fungal lifestyle
2. Differentiation processes of the Mycelium
3. Reproductive cycles and systematic grouping of fungi
4. Ecology of the fungi
5. Use of fungi

Lecture notes
none; hand-outs will be prepared before the lectures

Literature
none

Cellular and Molecular Biology

Number Title Type ECTS Hours Lecturers
701-0245-00L Introduction to Evolutionary Biology O 2 credits 2V G. Velicer, S. Wielgoss

Objective
This course introduces important questions about the evolutionary processes involved in the generation and maintenance of biological diversity across all domains of life and how evolutionary science investigates these questions.

Content
This course introduces important questions about the evolutionary processes involved in the generation and maintenance of biological diversity across all domains of life and how evolutionary science investigates these questions. The topics covered range from different forms of selection, phylogenetic analysis, population genetics, life history theory, the evolution of sex, social evolution to human evolution. These topics are important for the understanding of a number of evolutionary problems in the basic and applied sciences.

Literature
Textbook: Evolutionary Analysis
Scott Freeman and Jon Herron

Prerequisites /

529-0229-00L Practical Course Organic Chemistry (for Students of Biology and Pharmaceutical Sciences)

Objective
Learn the basic techniques for the preparation and purification of organic compounds.
Learn to take accurate notes of the experiments.
Deepen the understanding of reaction mechanisms.

Content
Analytical part: basic operations for the separation of mixtures of organic compounds (recrystallization, distillation, extraction, chromatography).
Synthetic part (main part): at least 8 synthetic steps (one- or two-step syntheses).
Introduction to database searches (Reaxys, SciFinder).

Lecture notes
Document will be handed out at the beginning of the course.

Literature
1) P. Wörfel, M. Bitzer, U. Claus, H. Felber, M. Hübel, B. Vollenweider, Laborpraxis (Bd. 1: Einführung, allgemeine Methoden; Bd. 2: Messmethoden; Bd. 3: Trennungsmethoden; Bd. 4: Analytische Methoden), Birkhäuser Verlag.

Prerequisites /

Biology and Pharmaceutical Sciences).

As a prerequisite, all participants need to pass the “Safety Test HCI Chemie_V2 English” (see https://moodle-app2.let.ethz.ch). A printout of the certificate generated by the system needs to be presented to the teaching assistants prior to starting lab work.

This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UniZH Irchel.

**551-0311-00L Molecular Life of Plants**  
W 6 credits 4V  
W. Gruissem, A. Rodriguez-Villalon, C. Sánchez-Rodríguez, O. Voinnet, S. C. Zeeman

**Abstract**  
The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates phylogeny and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.

**Objective**  
The new course "Molecular Life of Plants" reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels.

The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.

**Content**  
The course "Molecular Life of Plants" will cover the following topics in a developmental context:

- Plant genome organization
- Seed anatomy
- Food reserves and mobilization
- Seedling emergence
- Heterotrophic to autotrophic growth
- Chlorophyll biosynthesis, photoreceptors
- Integration of metabolism
- Hormones
- Cell cycle
- Cell differentiation and expansion
- Environmental interactions
- Environmental interactions
- Flower development and fertilization
- Embryo and seed development
- Fruit development
- Senescence

**551-0313-00L Microbiology (Part I)**  
W 3 credits 2V  
J. Piel, M. Pilhofer

**Abstract**  
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Objective**  
This concept class will be based on common concepts (Grundlagen der Biologie II, Teil Mikrobiologie) and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Content**  
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Lecture notes**  
Updated handouts will be provided during the class.

**Literature**  
Current literature references will be provided during the lectures.

**Prerequisites / notice**  
English  
The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

**551-0319-00L Cellular Biochemistry (Part I)**  
W 3 credits 2V  
U. Kutay, C. M. Azzalin, B. Kornmann, M. Peter

**Abstract**  
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

**Objective**  
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

**Content**  
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

**Lecture notes**  
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

**Literature**  
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**Prerequisites / notice**  
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.
### Food Microbiology I

**W 3 credits 2V**

**M. Loessner**

For students of the study programme Biology BSc the course can only be selected as 4th concept course.

**Abstract**

This lecture is the first part of a one-year course. It offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

**Objective**

The lecture offers insights into the basics, practical consequences and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts, molds and protozoa in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

The focus of this first part of the lecture will be on the organisms, but also on the factors which determine spoilage and foodborne disease.

**Content**

1. History of Food Microbiology
   1.1. Short synopsis of foodborne microorganisms
   1.2. Spoilage of Foods
   1.3. Foodborne Disease
   1.4. Food Preservation
   1.5. VIPs of Food Microbiology
2. Overview of Microorganisms in Foods
   2.1. Origin of foodborne Microorganisms
   2.2. Bacteria
   2.3. Yeasts
   2.4. Molds
3. Microbial Spoilage of Foods
   3.1. Intrinsic and Extrinsic Parameters
   3.2. Meats, Seafoods, Eggs
   3.3. Milk and Milk Products
   3.4. Vegetable and Fruit Products
   3.5. Miscellaneous (baked goods, nuts, spices, ready-to-eat products)
   3.6. Drinks and Canned Foods
4. Foodborne Disease
   4.1. Significance and Transmission of Foodborne pathogens
   4.2. Staphylococcus aureus
   4.3. Gram-positive Sporeformers (Bacillus & Clostridium)
   4.4. Listeria monocytogenes
   4.5. Salmonella, Shigella, Escherichia coli
   4.6. Vibrio, Yersinia, Campylobacter
   4.7. Brucella, Mycobacterium, Aeromonas, Plesiomonas
   4.8. Parasites
   4.9. Viruses and Bacteriophages
   4.10. Mycotoxins
   4.11. Bioactive Amines
   4.12. Miscellaneous (Antibiotic-resistant Bacteria, Biofilms)

**Lecture notes**

Electronic copies of the presentation slides (PDF) will be made available for download.

**Literature**

Recommendations will be given in the first lecture.

---

### Immunology I

**W 3 credits 2V**

**A. Oxenius, M. Kopf**

**Abstract**

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

**Objective**

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

**Content**

- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

**Lecture notes**

Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien".

**Literature**

**Prerequisites / notice**

Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung".

---

### Introduction to Bioinformatics: Concepts and Applications

**W 6 credits 4G**

**W. Gruissem, K. Bärenfaller, A. Caflisch, G. Capitani, J. Fütterer, M. Robinson, A. Wagner**

**Abstract**

Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.
Objective
Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

Content
Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

376-1305-10L Neurobiology W 6 credits 4V M. E. Schwab, E. Stoeckli, L. Filli, K. A. Martin, further lecturers

Abstract
Development of the nervous system (NS); the adult NS, plasticity and regeneration, sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, diseases of the NS.

Objective
Overview of normal development, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

Content
Development: Early development of the nervous system, cellular level, nerve fiber growth, building of neuronal networks; biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

Lecture notes
Structure, Plasticity and Repair of the Nervous System (376-1305-01L); Lecture notes will be provided on Moodle https://moodle-app2.let.ethz.ch/course/view.php?id=694 Password will be provided at the beginning of the lecture.

Literature
Development of the Nervous System (376-1305-00L); Lecture notes will be provided on OLAT https://www.olat.uzh.ch/olat/dmz/

701-1415-00L Population Biology W 3 credits 2V

Abstract
This course provides an understanding of the basic concepts of population biology. It presents models regarding the dynamics and evolution of populations, and experimental designs for investigating population biology hypotheses (e.g., population growth, species interactions, epidemiology, metapopulations, life history evolution, local adaptation, evolution of sex, and coevolution).

Objective
Students are able to:
- describe and apply population biology models (e.g. growth, species interactions)
- describe and apply epidemiological models
- to substantiate evolutionary concepts (e.g., life history evolution, coevolution, evolution of sex) using population biology arguments and provide examples
- to propose population biology experiments

Content
Population growth, population regulation, predator-prey interactions, host-pathogen interactions, competition, metapopulations, life history evolution, local adaptation, mating systems, sexual selection, coevolution.

Lecture notes
Handouts of lectures

Literature

376-0205-00L Molecular Disease Mechanisms I W 6 credits 4V C. Wolfrum, C. Ciaudo, M. Ristow, M. Stoffel, A. Wutz, M. Zenobi-Wong

Abstract
The mechanisms of disease development will be studied. Main topics will be: Genetic regulation of disease development with a focus on monogenic and polygenic forms. In addition the methods used in elucidating genetic components in disease progression will be discussed. Ageing and development associated disease progression including the underlying molecular mechanisms.

Objective
To understand the mechanisms governing disease development with a special emphasis on genetic and ageing associated components to understand the mechanisms governing disease development with a special emphasis on genetic and ageing associated components.

701-0323-00L Plant Ecology W 3 credits 2V S. Gässewell, J. Levine

Abstract
This class focuses on ecological processes involved with plant life, mechanisms of plant adaptation, plant-animal and plant-soil interactions, plant strategies and implications for the structure and function of plant communities. The discussion of original research examples familiarises students with research questions and methods; they learn to evaluate results and interpretations.

Objective
Students will be able to:
- propose methods to study ecological processes involved with plant life, and how these processes depend on internal and external factors;
- analyse benefits and costs of plant adaptations;
- explain plant strategies with relevant traits and trade-offs;
- explain and predict the assembly of plant communities;
- explain implications of plant strategies for animals, microbes and ecosystem functions;
- evaluate studies in plant ecology regarding research questions, assumptions, methods, as well as the reliability and relevance of results.
Lectures will particularly focus on the contribution of biotechnology towards crop improvement, with examples from our own work on crops. Students will use lists of genes obtained in real experiments and learn how to obtain gene-centered information from literature and databases. They will use tools for gene function prediction and visualization of protein-protein interaction networks. The work will lead to a more meaningful annotation of co-detected genes and generate a hypothesis about their functional relationship.

**Prerequisites**

- General knowledge of plant functioning (Biologie I-II)
- General ecological concepts (Biologie III)
- Overview of plant taxonomy and vegetation types (Biologie IV)

**Course Information**

**Lectures and handouts** will be available electronically at the beginning of the semester.

**Handouts and further reading** will be available electronically at the beginning of the semester.

**Knowledge of characteristics, life style and ecological significance of major fungal and fungal-like groups. Become acquainted with**

**Exposure to the biology, systematics and ecology of the important fungal groups.**

**The participants will study primarily fungal materials**

**Following topics will be covered:**

- General ecological concepts (Biologie III)

**The course covers multidisciplinary aspects of plant molecular biology and green biotechnology. The participants will acquire theoretical and practical introduction on diverse topics, including, generation and molecular characterization of transgenic plants; allele mining from genetic resources and on strategies to improve plants against biotic & abiotic stresses and for their nutritional value.**

**Lectures and handouts** are normally in German, but we shall switch to English on request. Non German-speaking students who intend to attend the course should contact S. Güsewell before the start of the semester to ask for the change in language.

**Course Information**

**Lectures and handouts** are normally in German, but we shall switch to English on request. Non German-speaking students who intend to attend the course should contact S. Güsewell before the start of the semester to ask for the change in language.

- General ecological concepts (Biologie III)
Research laboratory class in small groups. Research projects on current topics in cellular microbiology and bacterial pathogenesis are provided at the beginning of the course.

The students learn to describe the principles and molecular mechanisms of cell polarity, using different model systems as examples:

- Animal cells during epithelial and neuronal differentiation
- Fungi during morphogenesis and aging.

Based on lectures, literature reading, discussions, presentations and practical lab work the students will be able to compare experimental strategies in different model systems, and to develop open questions in the field of cell polarity. Students will also know about the mechanisms and consequences of asymmetric cell division such as those performed by stem cells and asymmetric protein functions during morphogenesis and aging.

During this Block-Course, the students will learn to:

1. describe and compare the principles and molecular mechanisms of cell polarity in fungi and animal cells,
2. apply, evaluate and compare experimental strategies in the different model systems, and
3. select the best model system to answer a particular question.

Students - in groups of 2 or max 3 - will be integrated into a research project connected to the subject of the course, within one of the participating research groups.

Lectures and technical notes will be given and informal discussions held to provide you with the theoretical background.

There will be optional papers to be read before the course start. They serve as framework orientation for the practical parts of this block course and will be made accessible to you shortly before the course starts on the relevant Moodle site.

The course aims at introducing principles of synthetic biology related to metabolic engineering. The main focus is on practical work and will be done exclusively using a computer. Students will work independently but with close supervision by experienced scientists.

Daily discussions of the work will ensure progress. The computer work will be accompanied by lectures on theoretical and practical aspects of databases, gene networks and the project context of the gene lists that will be analyzed. Students will present their results and hypotheses at the end of the block course.

551-0347-00L  
Molecular Mechanisms of Cell Growth and Polarity  
Number of participants limited to 15.

Abstract  
Introduction to the principles and molecular mechanisms of cell polarity, using animal cells and fungi as model systems.

Objective  
The students learn to describe the principles and molecular mechanisms of cell polarity, using different model systems as examples:

- Animal cells during epithelial and neuronal differentiation
- Fungi during morphogenesis and aging.

Content  
During this Block-Course, the students will learn to:

1. describe and compare the principles and molecular mechanisms of cell polarity in fungi and animal cells,
2. apply, evaluate and compare experimental strategies in the different model systems, and
3. select the best model system to answer a particular question.

Number of participants limited to 6.

Lecture notes  
None

Literature  
Documentation and recommended literature (review articles) will be provided during the course.

551-1129-00L  
Engineering Bacterial Metabolism  
Number of participants limited to 6.

Abstract  
This laboratory course has a focus on current research topics related to metabolic engineering / synthetic biology. Projects will be conducted in small groups.

Objective  
The course aims at introducing principles of synthetic biology related to metabolic engineering. The main focus is on practical work and will familiarize with complementary approaches, in particular genetic, biochemical and analytical approaches. Scientific presentation of results.

Content  
The projects will involve the selection of enzymes and pathways for integration into foreign host metabolism and testing of their activity. Experimental work applied during the course will comprise e.g. creation of synthetic operons, cloning work, transformation, enzyme activity tests, dynamic 13C labeling experiments. The course will be linked to ongoing research projects in the laboratory.

Number of participants limited to 10.

Lecture notes  
None

Literature  
The course is not taught by a particular book, but recommended literature (review articles and selected primary literature) will be provided during the course.

551-0916-00L  
Learning and Teaching Biology  
Number of participants limited to 20

Abstract  
This course represents an introduction to recent research into student learning on the conceptual foundations of modern biology, together with pedagogical methods associated with effective instruction and its valuation. Students will be involved in active research into deepened activities of selected topics of fungi from forests.

Objective  
The course will be linked to ongoing research projects in the laboratory.

Content  
The course is not taught by a particular book, but recommended literature (review articles and selected primary literature) will be provided during the course.

Number of participants limited to 10.

Lecture notes  
None

Literature  
The course is not taught by a particular book, but recommended literature (review articles and selected primary literature) will be provided during the course.

See the introductory video to the course here: http://youtu.be/GFJuNncSsdE

Block Courses in 2nd Quarter of the Semester

From 8.10.2015, 08:00 hr to 30.10.2015, 17:00 hr

Number  
551-0345-00L  
Mechanisms of Bacterial Pathogenesis  
Number of participants limited to 8

Abstract  
Research laboratory class in small groups. Research projects on current topics in cellular microbiology and bacterial pathogenesis are assigned to each student.

Objective  
Introduction to a current topic in cellular microbiology and/or molecular genetics of a bacterial pathogen. Experimental work in the research lab and introduction to the current techniques. Work with the current research literature in bacterial pathogenesis. Writing of a research protocol.

Requirement for obtaining the credit points: oral presentation of the research project and evaluation of the research protocol.

Number of participants limited to 10.

Lecture notes  
None

Literature  
Literature will be selected with reference to the assigned research project.

551-0421-00L  
Biology and Ecology of Fungi in Forests  
Number of participants limited to 10.

Abstract  
Introduction of the biological and ecological basics of fungi in forests. Focusing on mycorrhizal, saprobic, and pathogenic fungi and their functional relevance in the forest ecosystems. To get to know current methodological research approaches on the basis of selected examples with practical works in forest and lab as well as excursions and lectures.

Objective  
Knowledge of the fungi of forest and its ecological significance. Knowing of current methodological research approaches. Self-reliant and deepened activities of selected topics of fungi from forests.
Unterlagen zum Kurs werden abgegeben. W. Kovacs
Introduction of the biological and ecological basics of fungi in forests. Focusing on mycorrhizal, saprobic, and pathogenic fungi and their functional relevance in the forest ecosystems. To get to know current methodological research approaches on the basis of selected examples with practical works in forest and lab as well as excursions and lectures.

Prerequisites notice
Der Blockkurs findet an der Eidg. Forschungsanstalt WSL in Birmensdorf statt. Der Wald vor der Haustüre des Institutes macht diesen Kurs besonders praxisnah.

Erreichbarkeit mit Tram 14 bis Triemli, danach PTT-Bus 220 oder 350 bis Birmensdorf Sternen/WSL, oder mit 59 bis Birmensdorf SBB und mit PTT-Bus eine Station in Richtung Zürich bis Birmensdorf/WSL.

**Block Courses in 3rd Quarter of the Semester**
From 3.11.2015 13:00 hr to 25.11.2015, 17:00 hr

Methods in Cellular Biochemistry

The class deals with a specifically designed and genuine research project. We intend to carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. By working in parallel, teams of 2 participants each will generate a variety of different variants of a chorismate mutase. Individual enzyme catalysts will be purified and subsequently characterized using several different spectroscopic methods. The detailed chemical-physical analyses include determination of the enzymes’ kinetic parameters, their molecular mass, and the integrity of the protein structure. The results obtained from the individual evolution experiments will be compared and discussed at the end of the class in a final seminar. We expect that during this lab course we will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalyst.

**Lecture notes**
A script will be distributed to the participants on the first day of the course.

**Literature**
General literature to "Directed Evolution" and chorismate mutases, e.g.:

Further literature will be indicated in the distributed script.

**Prerequisites / notice**
This laboratory course will involve experiments that require a tight schedule and (sometimes) long working days. The maximum number of participants for the laboratory class is limited, but surplus applicants may contact P. Kast directly to have their names added to a waiting list. A valid registration is considered a commitment for attendance of the entire course, as involved material orders and experimental preparations are necessary and, once the class has started, the flow of the experiments must not be interrupted by individual absences. In case of an emergency, please immediately notify P. Kast. For more information, see also http://www.protein.ethz.ch/kast/praktikum.html

**Abstract**
During the block course in the fall semester, we will carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. The class with its very dense program consists of the practical course itself and an integrated series of seminar/lecture sessions.

**Objective**
All technologies used for the experiments will be explained to the students in theory and in practice with the goal that they will be able to independently apply them for the course project and in future research endeavors. After the course, an individual report about the results obtained has to be prepared.

**Content**
The class deals with a specifically designed and genuine research project. We intend to carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. By working in parallel, teams of 2 participants each will generate a variety of different variants of a chorismate mutase. Individual enzyme catalysts will be purified and subsequently characterized using several different spectroscopic methods. The detailed chemical-physical analyses include determination of the enzymes’ kinetic parameters, their molecular mass, and the integrity of the protein structure. The results obtained from the individual evolution experiments will be compared and discussed at the end of the class in a final seminar. We expect that during this lab course we will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalyst.

**Lecture notes**
A script will be distributed to the participants on the first day of the course.

**Literature**
General literature to "Directed Evolution" and chorismate mutases, e.g.:

Further literature will be indicated in the distributed script.

**Prerequisites / notice**
This laboratory course will involve experiments that require a tight schedule and (sometimes) long working days. The maximum number of participants for the laboratory class is limited, but surplus applicants may contact P. Kast directly to have their names added to a waiting list. A valid registration is considered a commitment for attendance of the entire course, as involved material orders and experimental preparations are necessary and, once the class has started, the flow of the experiments must not be interrupted by individual absences. In case of an emergency, please immediately notify P. Kast. For more information, see also http://www.protein.ethz.ch/kast/praktikum.html

**Abstract**
Students will learn about biochemical approaches to analyze cellular functions. The course consists of practical projects in small groups, lectures and literature discussions. The course concludes with the presentation of results at a poster session.

**Objective**
Students will learn to design, carry out and assess experiments using current biochemical and cell biological strategies to analyze cellular functions in a wide range of model systems. In particular they will learn novel imaging techniques along with biochemical approaches to understand fundamental cellular pathways. Furthermore, they will learn to assess strengths and limitations of the different approaches and be able to discuss their validity for the analysis of cellular functions.

**Literature**
Documentation and recommended literature (review articles and selected primary literature) will be provided during the course.

**Prerequisites / notice**
This course will be taught in French.

**Abstract**
Introduction to the physiological and biochemical action of insulin signaling and its role in the fasted/feeding response and in obesity and diabetes.

**Objective**
The students will obtain an overview about the current topics of research in insulin signaling and how it impacts on growth, metabolism and cell differentiation. They will learn to design experiments and use techniques necessary to analyze different aspects of insulin signaling, including physiological actions in whole animals as well as in tissue culture. Through lectures and literature seminars, they will learn about the open questions of insulin signaling research and discuss approaches to address these questions experimentally.

In practical lab projects the students will perform physiological in vivo studies as well as biochemical experiments. Finally, they will learn how to present and discuss their data. Student assessment is a graded semester performance based on individual performance in the laboratory, a written exam and the lab data presentation.

**Abstract**
Teaching of basic experimental knowledge for detection and identification of foodborne pathogens. Practical experiments were accompanied by theoretical introductions. Students become acquainted with classical and state-of-the-art molecular techniques for the rapid detection of foodborne pathogens and experiments in dependence on current research topics of the Laboratory of Food Microbiology.

**Objective**
Introduction of methods and techniques of food microbiology

**Content**
Teaching of basic experimental knowledge for detection and identification of foodborne pathogens by applying state-of-the-art techniques as well as modern molecular techniques for the rapid identification of relevant foodborne pathogens.

**Lecture notes**
Handouts were provided at the start of the course

Parallels Between Tissue Repair and Cancer

The recommended literature, including reviews and primary research articles, will be provided during the course.

U. Auf dem Keller,
6 credits

Bryophytes: Basic knowledge on the morphology, ecology, biogeography and endangerment of byrophytes; knowledge of common

During the course students will become familiar with methods for the collection and analysis of plant-derived volatile organic compounds and explore the role of these compounds in mediating plant-insect interactions.

The students will obtain an overview about the diversity of current RNA-research. They will learn to design experiments and use techniques necessary to analyze different aspects of RNA biology. Through lectures and literature seminars, they will learn about the burning questions of RNA research and discuss approaches to address these questions experimentally. In practical lab projects the students will work in one of the participating laboratories. Finally, they will learn how to present and discuss their data in an appropriate manner.

Student assessment is a graded semester performance based on individual performance in the laboratory, the written exam and the poster presentation.

Requirements: First and second year courses in Botany and Evolution.

Complex Carbohydrates - the Fourth Pillar of Life

Number of participants limited to 2 and maximum 8.

Abstract

In vitro & in vivo experiments will introduce current research on the biosynthesis, structure & function of protein-bound glycans in different pro- and eukaryotic microorganisms.

Objective

Participants are familiar with the biosynthesis, structure and function of N-glycans in microorganisms and with the methods for their analysis.

Content

* Topics: biosynthesis of asparagine-linked glycans in pro- and eukaryotes; structure of glycans in different organisms; methods to analyse the structure of glycans; function of glycans in protein quality control
* Introductory lectures
* Seminar with presentation and discussion of recent publications
* Experiments that exemplify the current research done in the group

Plant Volatiles in Plant Insect Interactions

Number of participants limited to 16.

Abstract

During the course students will become familiar with methods for the collection and analysis of plant-derived volatile organic compounds and explore the role of these compounds in mediating plant-insect interactions.

Objective

The course will cover six main topics that will be connected throughout the experimental phase:
1) Plant volatile biosynthesis and classification
2) Insect olfactory physiology
3) Volatile-mediated plant-herbivore interactions
4) Volatile-mediated multitrophic interactions
5) Manipulation of plant volatile emission by vector-borne disease agents
6) Methods for volatile collection and analysis

The lab practical will be performed in a system consisting of the cabbage butterfly Pieris brassicae, its host plant Brassica oleracea (Brussels sprouts), and the parasitoid wasp Cotesia glomerata (natural enemy of P. brassicae).

Students will collect volatiles from herbivore-damaged and undamaged plants and learn how to identify and quantify these compounds through gas chromatography coupled with mass spectrometry and flame ionization detection (GC-MS-FID). Afterwards, they will be able to compare volatile emissions from herbivore-damaged and undamaged plants and identify important volatile compounds associated with herbivory. Finally, students will evaluate the effect of herbivore-induced volatile compounds on the behavior of the herbivore (P. brassicae) and its natural enemy (C. glomerata), using different behavioral assays, including Y-tube olfactometers and wind tunnels.

Lecture notes

No script

Literature

The recommended literature, including reviews and primary research articles, will be provided during the course.

Autumn Semester 2015

Page 185 of 1432
The aims of the block course are that students

All organisms have to control their growth in accordance with environmental conditions. This course focuses on the analysis of growth regulation in the model organisms yeast and Drosophila. The participants will perform experiments in small teams to study insulin/TOR signaling as a key regulator of cellular growth. A particular focus will be the discussion of current research.

The aims of the block course are that students

(I) understand the function and evolution of insulin/TOR signaling

(II) learn how genetic approaches in different organisms contribute to the understanding of human diseases such as cancer

(III) will get familiarized with reading and discussing research articles

(IV) get a first exposure to current research.

Lecture notes

Literature

Original research articles will be discussed during the course.

551-1403-00L Imaging Bacterial Cells in a Native State by Electron Cryotomography

The goal is to acquire the techniques to image bacteria by electron cryotomography, resolving their structure in a native state, in 3D, and to macromolecular resolution. In a small group, students will perform wet lab experiments, data collection with stat-of-the-art equipment, data processing and analyses. The key method and its application in bacterial cell biology will be introduced by lectures

Cryotomography

Number of participants limited to 3.

Objective

Students will acquire the skills to cultivate bacteria, plunge-freeze samples for cryotomography, collect data using an electron cryomicroscope, process raw data, analyze tomograms, perform subtomogram averaging, model structures of interest, and generate movies for visualization.

https://www.mol.biol.ethz.ch/groups/pilhofer_group/

Block Courses in the 1st Half of the Semester

From 15.9.2015, 13:00 hr to 30.10.2015, 17:00 Uhr.

551-1037-00L Growth Control: Insights from Yeast and Flies

This course aims at the understanding of the cellular and molecular mechanisms underlying tissue repair processes in response to different insults. The focus will be on repair of the skin and the liver. In addition, we will highlight the parallels and differences between tissue repair and cancer. Experimental approaches include biochemical studies, molecular and cellular studies using cultured cell lines and primary cultures, as well as analysis of murine and human tissues.

The course combines practical work with lectures, discussions, project preparations and presentations.

siehe Lernmaterialien.

551-1404-00L Limnoecology (incl. two Practical Courses)

This course combines Limnology (the study of inland waters in its broad sense) with Ecological and Evolutionary concepts. It deals with rivers, groundwater, wetlands and lakes.

This course contains a lecture part, an experimental part, two determination courses (aquatic invertebrates and algae) as well as excursions.

Objective

During this course you will get an overview of the world's typical continental aquatic ecosystems. After this course you will be able to know the most important aquatic species groups (macroinvertebrates, microinvertebrates and cryptogames) in Switzerland and the most important identification traits.

Content

The course contains a lecture part, an experimental part, two determination courses (aquatic invertebrates and algae) and field excursions.

Lecture:

The lecture part covers ecology and evolution of aquatic organisms in lentic and lotic waters. Topics include: Adaptations, distribution patterns, biotic interactions, and conceptual paradigms in freshwater ecosystems. Important aspects regarding ecosystem metabolism and habitat properties of freshwaters. Applied case studies and experiments testing ecological and evolutionary processes in freshwaters.

Practical part:

The practical part includes an Excursion to the river Sense (Saturday 26th of September 2015):

On this excursion you will get to know and experience a natural river system. Further you will conduct in a team your own field research project.

Further the practical part contains two excursions to a lake (Greifensee) and a river (Töss). Additional you will perform in small groups an independent experiment in a research group at Eawag.

The taxonomic part will cover macroinvertebrates (e.g. Crustacean, aquatic insects), microinvertebrates and algae. The goal is to get to know the most common aquatic taxa in Switzerland, to identify them with commonly used identification literature, and to get an idea how these organisms are used in research and practice. (language: German, translation of the most important things during the course possible)

Lecture notes

Course notes and power point presentations provided during the course.

Prerequisites / notice

The maximal participating number of biology students is 14. The course includes a mandatory field trip to the Sense River floodplain. It will take place Saturday 26th of September.

Block Courses during Semester Break

551-1143-00L Analysis of Human T and B Cell Responses to Infectious Agents

Students actively participate in ongoing research projects on the analysis of human T and B cell response to pathogens and vaccines. They will be tutored in small groups by doctoral students and postdocs. In a lecture series, the theoretical background for the projects will be provided and the students will have the opportunity to present their projects and discuss recent publications.

Objective

To learn current methodologies in human immunology through experimental work in the lab. To learn current concepts through lectures and discussion of original papers. Requirement for obtaining the credit points: oral presentation of the research project in a ppt format.
Protein Folding, Assembly and Degradation  
Number of participants limited to 7.

Abstract  
Students will carry out defined research projects related to the current research topics of the groups of Prof. Glockshuber and Prof. Weber-Ban. The topics include mechanistic studies on the assembly of adhesive pili from pathogenic bacteria, disulfide bond formation in the bacterial periplasm, ATP-dependent chaperone-protease complexes and formation of amyloid deposits in Alzheimer's disease.

Objective  
The course should enable the students to understand and apply biophysical methods, in particular kinetic and spectroscopic methods, to unravel the mechanism of complex reactions of biological macromolecules and assemblies in a quantitative manner.

Content  
The students will be tutored in their experimental work by doctoral or postdoctoral students from the Glockshuber or Weber-Ban group. In addition, the course includes specific lectures that provide the theoretical background for the experimental work, as well as exercises on the numeric evaluation of biophysical data, and literature work.

Participation in one of the following projects will be possible:

Projects of the Glockshuber group:
- Purification, biophysical characterization and structure determination of enzymes required for disulfide bond formation in the periplasm of Gram-negative bacteria.
- Identification of intermediates in the aggregation of the human Abeta peptide

Experimental work on these projects involves
- Molecular cloning, recombinant protein production in E. coli and protein purification
- Protein crystallization
- Thermodynamic and kinetic characterization of conformational changes in proteins and protein-ligand interactions by fluorescence and circular dichroism spectroscopy
- Analysis of rapid reactions by stopped-flow fluorescence
- Negative-stain electron microscopy
- Light scattering

Projects of the Weber-Ban group:
- Generation and purification of site-directed variants of the E. coli ClpA/P protease and chaperone-proteasome complexes from other organisms, their biophysical characterization, including rapid kinetics by stopped-flow methods, ATPase activity measurement, negative-stain electron microscopy and light scattering

Lecture notes  
No script

Literature  
Literature related to the individual projects will be provided on the first day of the course.

Prerequisites / notice  
Attendance of the concept course “Biomolecular Structure and Mechanism I: Protein Structure and Function” (551-0307-00L) in the autumn semester is highly recommended for acquiring the theoretical background to this block course.

---

Genomic and Genetic Methods in Cell and Developmental Biology  
Number of participants limited to 11.

Abstract  
This course aims to provide students with a comprehensive overview of mammalian developmental biology and stem cell systems both on the theoretical as well as the experimental level. Centering the course on genetic and genomic methods engages the students in contemporary research and prepares for future studies in the course of semester and master projects.

Objective  
- Understanding mammalian development
- Introduction to stem cell systems
- Working with cultured cells
- Translational aspects of mammalian cell biology

Content  
The course will consist of a series of lectures, essay assignments, project development and discussion workshops, and 2 and a half week of lab work with different mammalian cell systems embedded in real life research projects. At the end of the course students will take an exam consisting of questions on the topic of the lectures and workshops. It is expected that students will be able to apply the knowledge to concrete problems.

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Abstract
This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

Objective
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Abstract
The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Abstract
Literature from the learning sciences is critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and two further meetings will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

Objective
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

The successful completion of both course no. 851-0242-06L "Menschliches Lernen (EW 1)" and course no. 851-0242-07L "Unterstützung und Diagnose von Wissenserwerbsprozessen (EW 3)" is a necessary prerequisite for this course.

Abstract
In teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturers in this course. Basic conceptual and methodological issues are the topic of a series of plenary meetings; however, the major part of the work is done in small-group meetings with the advising researcher, and in self-directed research projects.

Objective
The course is targeted at advanced students who have taken an interest in gathering practical research experience in the field of Learning & Instruction. In teams of two, students conduct their own research projects (planning, conducting, analyzing, interpreting, and presenting research); thus, the course requires a high amount of self-directed working. Students are personally advised, and supported in their research project, by one of the researchers serving as lecturers in this course. During the first half the semester, relevant methodological knowledge and skills are practiced during plenary meetings and in students’ independent reading (e.g. generating and testing research questions, designing experiments, and analyzing data in the field of Learning and Instruction)

Learning goals include:
- Participants can illustrate and explain basic methods and concepts for research in the fields of Learning and Instruction, e.g. with the help of practical examples.
- Participants can generate testable research questions for a topic relevant in the fields of Learning and Instruction.
- Participants can design and conduct a study that is relevant for answering their research question.
- Participants can summarize and evaluate the main results from a study in the field of learning and Instruction, with regard to the research question being asked.
### Subject Didactics in Biology

**Abstract**
In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

**Objective**
- The objective is for the students:
  - to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle.
  - to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

**Content**
- Themenwahl nach Vereinbarung.
  - Reflexion über Themen aus allen biologiespezifischen Bereichen des Unterrichts.

**Lecture notes**
Eine kurze Anleitung zur mentorierten Arbeit in Fachdidaktik wird zur Verfügung gestellt.

**Literature**
Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

**Prerequisites**
Beginn nach Absprache jederzeit möglich, jedoch erst nach Abschluss der Fachdidaktik I und II und nach der Absolvierung allfälliger fachwissenschaftlicher Voraussetzungen.

Die Arbeit sollte vor Beginn des Unterrichtspraktikums abgeschlossen werden.

Allfällige fachwissenschaftliche Auflagen müssen alle erfüllt sein, bevor mit der Mentorierten Arbeit begonnen werden kann.

ECTS
Title
Lecturers
26A
Type
Students conduct a series of "classical" biological school experiments and therefore gain practice and experience in this area.

Unterlagen für den Unterricht werden online mit Hilfe der e-learning Platform OLAT abgegeben.

E. Hafen

Literatur und Literaturhinweise werden mit der e-learning Platform OLAT abgegeben.

Specialist aspects of biology are covered from the angle of imparting these to pupils, their historical development, and their significance for the individual and society.

After successfully completing the module, students should be in a position:

- to call up more in-depth specialist knowledge of biology, covering a wide range of topics, and to impart this to others.
- to explain biological concepts and principles, as well as the way they fit together.
- to analyse controversial topics and to give factual explanations for these.
- to conduct more in-depth work on a research topic and to compile a tuition unit based on this topic
- to prepare tuition units involving complex learning matter at a high specialist level which are suitably tailored to the recipients, and to teach these in a manner conducive to learning.

Demanding biological topics are dealt with under consideration of the special needs of persons involved in teaching. The module comprises the parts:

Data: 06.10.2017 12:56   Autumn Semester 2015   Page 192 of 1432
This Course lasts for two semesters. It can be started in autumn or in spring. Booking is only required once.

Performance Assessment:
Performance is assessed during the course of the entire modul, with a final test. Active participation in the colloquia and group seminars is required. The thesis report and an oral presentation have to be completed.

The Specialized Biology Course with an Educational Focus (12 CP) can be acknowledged, in agreement with the advisor of the respective elective major, as one of the two obligatory research projects (each 15 CP). In such a case, additional 3 CP must be obtained in another course.

In case of overbooking of the course, students enrolled in the Teaching Diploma in Biology will have priority for registration.

The course is organized jointly with the University of Zurich (Fachbereich Biologie) and is held at the Life Science Zurich Learning Center of the ETH Zurich and the University of Zurich.

---

**Abstract**
This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

**Objective**
The main goal of this course is to enhance the student's ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.
I. Ethics & the Process of Ethical Inquiry

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not ...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

Integrity in Research & Research Misconduct
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 Rs (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

701-0015-00L Seminar on Transdisciplinary Research for Sustainable Development

Abstract
The seminar is designed for students and researchers (MA, PhD, PostDoc) who use inter- and transdisciplinary elements in their projects. It addresses the challenges of this research: How to integrate disciplines? How (and in what role) to include societal actors? How to bring results to fruition? We discuss these questions based on case studies and theories and on the participant's projects.

Objective
The participants understand the specific challenges of inter- and transdisciplinary research in general and in the context of sustainable development in particular. They know methods and concepts to address these challenges and apply them to their research projects.
The course deals with the concepts and methodologies for the analysis and assessment of sustainable development. A special focus is on improvements in environmental quality and sustainable management of natural resources. Students will learn to produce a research-based paper on a project they work on during the course.

The course is structured as follows:

- (1) Theories and concepts of inter- and transdisciplinary research
- (2) The specific challenges of inter- and transdisciplinary research
- (3) Involving stakeholders
- (4) Collaborating disciplines
- (5) Exploration of tools and methods
- (6) Analysing participants' projects to improve inter- and transdisciplinary elements

Environmental Governance

Objective
To understand how an environmental problem may (or not) become a policy and explain political processes, using basic concepts and techniques from political science.

Content
Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of 'environmental governance' and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Literature

Sustainability Assessment

Objective
At the end of the course students should:

Know:
- core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

Content
The course is structured as follows:

- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;
- Tradeoffs in selected examples.

Learning and Teaching Biology

Abstract
The block course will only take place with a minimum of 10 participants.

Objective
Provides an overview on student's learning and shows ways to make the classroom experience more engaging and effective for students. Students will learn to produce a research-based paper on a project they work on during the course.
In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in

**Abstract**

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

- The main adaptations and the critical steps of phylogeny are presented.
- The genetic, phenetic and cultural diversity of modern human populations as the result of evolutionary processes.
- Recognize similarities and differences in the behavior and the cognitive lines from humans and animals, in particular monkeys.
- The main adaptations and the critical steps of phylogeny are presented.
- The genetic, phenetic and cultural diversity of modern human populations as the result of evolutionary processes.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

**Course Units for Additional Admission Requirements**

**Abstract**

Genetics, fossil remains, comparative anatomy and behavioral research prove the affiliation of humans to primates. This mammalian order represents variations of a single theme.

The main adaptations and the critical steps of phylogeny are presented.

**Objective**

- Upon successfully completing of the module the students can:
  - interpret the main features of primates and especially of fossil hominids in the evolutionary and functional context;
  - explain the genetic, phenetic and cultural diversity of modern human populations as the result of evolutionary processes;
  - recognize similarities and differences in the behavior and the cognitive lines from humans and animals, in particular monkeys;
  - explain why cultural evolution occurs only in humans;
  - discuss the question “What are human beings?” from an evolutionary biological perspective.

**Prerequisites / notice**

- No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.
- UZH Module Code: BIO133
- Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

**Abstract**

Basic knowledge of the anatomy and physiology of tissues, of the embryonal and postnatal development, of the basic terminology of pathology, the neuro-muscular system, the cardiovascular system and the respiratory system.

**Objective**

Basic knowledge of human anatomy and physiology and basics of clinical pathophysiology.
Content

Short overview of human anatomy, physiology and general pathology.

Anatomy and Physiology I (fall term):
Basics of cytology, histology, embryology, general pathology; nervous system, muscles, cardiovascular system, respiratory system, digestive system, kidney and urinary tract, endocrine system, skin, thermoregulation, sensory organs, male and female reproductive system, pregnancy and child birth.

Anatomy and Physiology II (spring term):

Abstract
The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

Objective
The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

Content
Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.
Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher's fundamental theorem.
Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation.

Literature

Prerequisites / notice
There will be 5 optional extra sessions for the population genetics part (following lectures 2-6) for computer simulations, designed to help understand the course material.

Abstract
This class focuses on ecological processes involved with plant life, mechanisms of plant adaptation, plant-animal and plant-soil interactions, plant strategies and implications for the structure and function of plant communities. The discussion of original research examples familiarises students with research questions and methods; they learn to evaluate results and interpretations.

Objective
Students will be able to:
- propose methods to study ecological processes involved with plant life, and how these processes depend on internal and external factors;
- analyse benefits and costs of plant adaptations;
- explain plant strategies with relevant traits and trade-offs;
- explain and predict the assembly of plant communities;
- explain implications of plant strategies for animals, microbes and ecosystem functions;
- evaluate studies in plant ecology regarding research questions, assumptions, methods, as well as the reliability and relevance of results.

Content
Plants represent the matrix of natural communities. The structure and dynamics of plant populations drives the function of ecosystems. This course presents essential processes and plant traits involved with plant life. We focus on research questions that have been of special interest to plant ecologists as well as current topical questions. We use original research examples to discuss how ecological questions are studied and how results are interpreted.
- Growth: what determines the production of a plant?
- Nutrients: consumption or recycling; opposite strategies and feedbacks on soils;
- Clonality: collaboration and division of labour in plants;
- Plasticity: benefits and costs of plant intelligence;
- Flowering and pollination: how expensive is sex?
- Seed types, dispersal, seed banks and germination: strategies and trade-offs in the persistence of plant populations;
- Development and structure of plant populations;
- Stress, disturbance and competition as drivers of different plant strategies;
- Herbivory: plant-animal feedbacks and functioning of grazing ecosystems
- Fire: impacts on plants, vegetation and ecosystems.
- Plant functional types and rules in the assembly of plant communities.

Abstract
The focus is on the potential to assess strategies and tactics of pest management, taking into account the demands from the economy, the environment and the society. Significant agricultural approaches will be explained using practical examples, including prevention using natural resources, surveillance and forecasting, resistance management, as well as product registration, incl. ecotoxicology.

Objective
The students gain a good understanding of fundamental aspects of pest management in agroecosystems. They will have the ability to assess options for action in view of requirements from the economy, the ecology and the society. Further, they will learn to perform searches on relevant issues in pest management, and to critically evaluate case studies.

Abstract
In this research seminar we will critically discuss current topics in Ecological Genetics using publications from the leading scientific journals in this field.

Objective
It is our aim that participants gain insight into the current research topics and knowledge available in Ecological Genetics and learn to critically assess and appreciate scientific publications in this field.

Literature
will be distributed
Knowledge of agro-ecosystems and urban ecosystems; their origin, ecosystem services, mechanisms and importance for the maintenance of biodiversity.

Objective
Knowledge of alpine environments worldwide and their ecology

Content
The online course ALPECOLe provides a global overview of the complex ecosystems of mountain regions, and of their great diversity of habitats and organisms. The course is strongly interdisciplinary and the various approaches are designed to help understand the past, present and future of mountain ecosystems.

Objectives
- 5 lessons on abiotic factors: geology, soils and their forming processes, climate, and disturbance factors
- 12 lessons on plants: diversity, patterns and processes, treelines, water & nutrients, carbon cycle, atmospheric influences, sexual and asexual reproduction, and one specific lesson on aquatic environments
- 5 lessons on animals: habitats and adaptations, origin of species, food ecology and impact of domestic livestock
- 3 lessons on landscape evolution: quaternary paleoenvironments, methods like radiocarbon dating, pollen records, dendrochronology, stable isotopes, and historical data
- 1 lesson on global change

Students can also follow a virtual walk through alpine areas where context-based information on alpine environments can be accessed. Moreover, all major alpine areas of the world can be selected on a map and then informative pictures of those landscapes and faunistic and floristic inhabitants will be shown.

Online exercises and tests allow to test the learned matter.

Additionally to the online lessons, three supplementary papers will be read and discussed during the tutorials.

Prerequisites / notice
Online course
Course language is English

Associated literature
- Montgomery et al. (2006): Introduction to Linear Regression Analysis
- Fox (2008): Applied Regression Analysis and GLMs
- Draper & Smith (1998): Applied Regression Analysis
- Faraway (2006): Extending the Linear Model with R
- Montgomery et al. (2006): Linear Models with R

Classified learning outcomes
- Knowledge of alpine environments worldwide and their ecology
- Ability to plan and analyze efficient experiments in the fields of natural sciences
- Practical experience in planning and analyzing single factor experiments, block designs, full factorial and fractional designs, crossover and Latin square designs, split-plot and strip-plot designs, random effects and mixed effects models

Assessment
- Project work
- Online exercises and tests

Predefined learning outcomes
- Knowledge of alpine environments worldwide and their ecology
- Ability to plan and analyze efficient experiments in the fields of natural sciences
- Practical experience in planning and analyzing single factor experiments, block designs, full factorial and fractional designs, crossover and Latin square designs, split-plot and strip-plot designs, random effects and mixed effects models

Online course
Course language is English

Associated literature
- Provided to students through ILIAS
- Selected required readings (peer reviewed literature, selected book chapters). Optional recommended readings with additional information.
It is not essential to borrow/buy the following books. We will continuously provide extracts and other literature during the course.

A. J. Papritz
At the end of the course...

D. Schröter
Using R for Data Analysis and Graphics (Part I)

This course provides the ecological systems' knowledge needed to question applied solutions to current environmental issues. Our central aim is to balance participants' respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

The course is structured around four larger topical areas: (1) Integrated Water Management -- Green infrastructure (land management options) as an alternative to engineered solutions (e.g. large reservoirs) in flood and drought management; (2) Fire dynamics, the water cycle and biodiversity -- The surprising dynamics of species life cycles and populations in arid landscapes; (3) Rewilding, e.g. re-introducing apex predators (e.g. wolves), or large ungulates (e.g. bisons) in protected areas -- A nature conservation trend with counterintuitive effects; (4) Coupling of aquatic and terrestrial systems: carbon, nitrogen and phosphorus transfers of global importance on landscape scale.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetic;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course aims to facilitate this by providing a basic introduction to R. The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regressions" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

The students will be able to use the software R efficiently for data analysis.

401-6215-00L
Using R for Data Analysis and Graphics (Part I)

The course covers the first part of an introduction to the statistical software R for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

The students will be able to use the software R for simple data analysis.

The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetic;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical interface RStudio: www.rstudio.org.

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

The course resources will be provided via the Moodle web learning platform. Please login (with your ETH (or other University) username+password) at https://moodle-app2.etih.ch/enrol/users.php?id=1145

Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

401-6217-00L
Using R for Data Analysis and Graphics (Part II)

The course provides the second part an introduction to the statistical software R for scientists. Topics are data generation and selection, graphical functions, important statistical functions, types of objects, models, programming and writing functions.

Note: This part builds on "Using R... (Part I)", but can be taken independently if the basics of R are already known.

The students will be able to use the software R efficiently for data analysis.

Preparations / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

Preparations / notice
Note: This part builds on "Using R... (Part I)", but can be taken independently if the basics of R are already known.

Preparations / notice
The course resources will be provided via the Moodle web learning platform. Please login (with your ETH (or other University) username+password) at https://moodle-app2.etih.ch/enrol/users.php?id=1145

Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 201 of 1432
Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. The course aims to facilitate this by providing a basic introduction to R.

Part II of the course builds on part I and covers the following additional topics:
- Elements of the R language: control structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of vectors, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tayloring R: options;
- Extending basic R: packages

The course resources will be provided via the Moodle web learning platform Please login (with your ETH (or other University) username+password) at https://moodle-app2.let.ethz.ch/enrol/users.php?id=1145
Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

Lecture topics and tentative schedule

Week 1 No Lecture: First day of autumn semester

Week 2 The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nematode attack strategies and types of damage.

Week 5 Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6 Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7 Pisatin and pisatin demethylase. Local and systemic acquired resistance, signal molecules.

Week 8 Pathogen effects on food quality and safety.

Week 9 Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 10 Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11 Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELISA, PCR, rDNA and rep-PCR.

Week 12 Strategies for minimizing disease risks: principles of disease control and management.

Week 13 Disease control strategies: economic thresholds, physical control methods.

Week 14 Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

Lecture notes
Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

The aim of the course is to provide up-to-date knowledge on how we can obtain an understanding of the evolution and population dynamics of organisms based on their genetic sequencing data, employing key concepts from molecular evolution, phylogenetics and phylodynamics. Throughout the course, we tie the models and methods closely with applications, mainly in the field of epidemiology and evolution.
Objective
 Attendees will learn what information is contained in genetic sequencing data and how this information is extracted from the sequencing data. The main concepts introduced are:
* models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics
* stochastic processes
Attendees will apply these concepts to a number of applications yielding biological insight into:
* epidemiology
* pathogen evolution
* macroevolution of species

Content
 The course consists of three parts. We first introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Second, we employ these evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades.

Lecture notes
 Slides of the lecture will be available online.

Literature
 The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice
 Basic knowledge in linear algebra, analysis, and statistics.

---

### Analysis of Ecological Data

<table>

<tr>
<td>701-1419-00L</td>
<td>Analysis of Ecological Data</td>
<td>W</td>
<td>2</td>
<td>2G</td>
<td>S. Güsewell</td>
</tr>
</tbody>
</table>

Abstract
 This class provides students with an overview of techniques for data analysis used in modern ecological research, as well as practical experience in running these analyses with R and interpreting the results. Topics include linear models, generalized linear models, mixed models, model selection and randomization methods.

Objective
 Students will be able to:
- describe the aims and principles of important techniques for the analysis of ecological data
- choose appropriate techniques for given problems and types of data
- evaluate assumptions and limitations
- implement the analyses in R
- represent the relevant results in graphs, tables and text
- interpret and evaluate the results in ecological terms

Content
- Linear models for experimental and observational studies
- Model selection
- Introduction to likelihood inference and Bayesian statistics
- Analysis of counts and proportions (generalised linear models)
- Models for non-linear relationships
- Grouping and correlation structures (mixed models)
- Randomisation methods

Lecture notes
 Lecture notes and additional reading will be available electronically a few days before the course

Literature
 Suggested books for additional reading (available electronically)

Prerequisites / notice
 Time schedule
The course takes place over a period of nine days from Thursday 14.01 to Friday 22.01, with classes on 14, 15, 18, 19 and 20.01. and an exam on 22.01.

Prerequisites
- Basic statistical training (e.g. Mathematik IV in D-USYS): Data distributions, descriptive statistics, hypothesis testing, linear regression, analysis of variance
- Basic experience in data handling and data analysis in R

Individual preparation
Students without the required knowledge are asked to contact the lecturer before Christmas for support with individual preparation.

### Elective Concept Courses

<table>

Abstract
 Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.
Overview of normal development, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics approaches through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

---

### Compulsory Concept Courses

#### 376-1305-10L: Development of the Nervous System (376-1305-00L)

- **Abstract**:
  Development of the nervous system (NS); the adult NS, plasticity and regeneration, sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, diseases of the NS.

- **Objective**: Overview of normal development, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

- **Content**: Development: Early development of the nervous system, cellular level, nerve fiber growth, building of neuronal networks; biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

- **Lecture notes**: Structure, Plasticity and Repair of the Nervous System (376-1305-01L): Lecture notes will be provided on Moodle https://moodle-app2.let.ethz.ch/course/view.php?id=694. Password will be provided at the beginning of the lecture.

- **Literature**: The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures.

#### 376-1305-03L: Immunology I (551-0317-00L)

- **Abstract**: Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

---

### Elective Major: Neurosciences

### Elective Compulsory Concept Courses

See D-BIOL Master Studies Guide

---

**Data: 06.10.2017 12:56**

**Autumn Semester 2015**

**Page 204 of 1432**
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. They will learn to explain the relevance of particular signaling pathways for cellular pathologies such as cancer.

Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung".

**Objective**

Introduction to structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

**Content**

- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histocompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

**Literature**

Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

**Prerequisites / notice**

Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung".

**Abstract**

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective**

This course focuses on the concepts of classical and modern genetics and genomics.

**Content**

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**

Scripts and additional material will be provided during the semester.

**Prerequisites / notice**

This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UniZH Irchel.

**Abstract**

Concepts in Modern Genetics

---

**Abstract**

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective**

This course focuses on the concepts of classical and modern genetics and genomics.

**Content**

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

**Literature**

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**Prerequisites / notice**

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

---

**Abstract**

Cellular Biochemistry (Part I)

---

**Abstract**

Cellular Biochemistry (Part I) focuses on the structural and functional aspects of the immune system. The course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood and biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

---

**Abstract**

Neuroinformatics - Colloquia

---

**Abstract**

The colloquium in Neuroinformatics is a series of lectures given by invited experts. The lecture topics reflect the current themes in neurobiology and neuromorphic engineering that are relevant for our Institute.
Objective
The goal of these talks is to provide insight into recent research results. The talks are not meant for the general public, but really aimed at specialists in the field.

Content
The topics depend heavily on the invited speakers, and thus change from week to week.

227-1047-00L

- **Consciousness: From Philosophy to Neuroscience**
  - **W 3 credits 2V**
  - D. Kiper, A. Gamma
  
  This seminar reviews the philosophical and phenomenological as well as the neurobiological aspects of consciousness. The subjective features of consciousness are explored, and modern research into its neural substrate, particularly in the visual domain, is explained. Emphasis is placed on students developing their own thinking through a discussion-centered course structure.

  **Objective**
  The course's goal is to give an overview of the contemporary state of consciousness research, with emphasis on the contributions brought by modern cognitive neuroscience. We aim to clarify concepts, explain their philosophical and scientific backgrounds, and to present experimental protocols that shed light on a variety of consciousness related issues.

  **Content**
  The course includes discussions of scientific as well as philosophical articles. We review current schools of thought, models of consciousness, and proposals for the neural correlate of consciousness (NCC).

  **Literature**
  None

  **Prerequisites / notice**
  We display articles pertaining to the issues we cover in the class on the course's webpage.

  Since we are all experts on consciousness, we expect active participation and discussions!

---

227-1051-00L

- **Introduction to Systems Neuroscience**
  - **W 6 credits 2V+1U**
  - D. Kiper
  
  This lecture uses the concepts from dynamical systems (Course: “Computable Chaos in Dynamical Systems”) for the description of salient phenomena in complex examples from population dynamics, neuroinformatics and system biology. A particular focus is on the concept of limit cycle solutions and their coupling.

  **Abstract**
  This course focuses on basic aspects of central nervous system physiology, including perception, motor control and cognitive functions.

  **Objective**
  To understand the basic concepts underlying perceptual, motor and cognitive functions.

  **Lecture notes**
  None

  **Literature**

  "Principles of Neural Science", Kandel, Schwartz, and Jessel

---

227-1035-00L

- **Dynamical Systems in Biology**
  - **W 6 credits 2V+1U**
  - R. Stoop

  This course focuses on basic aspects of central nervous system physiology, including perception, motor control and cognitive functions.

  **Objective**
  Main emphasis sensory systems, with complements on motor and cognitive functions.

  **Literature**
  None

---

376-1414-00L

- **Current Topics in Brain Research**
  - **W 1 credit 1.5K**
  - M. E. Schwab, F. Helmchen, S. Jessberger, I. Mansuy, further lecturers

  This seminar reviews the philosophical and phenomenological as well as the neurobiological aspects of consciousness. The subjective features of consciousness are explored, and modern research into its neural substrate, particularly in the visual domain, is explained. Emphasis is placed on students developing their own thinking through a discussion-centered course structure.

  **Objective**
  To exchange scientific knowledge and data and to promote communication and collaborations among researchers.

  **Content**
  For students: Critical discussion of current research. Students aiming at getting a credit point for this colloquium choose one topic and write a critical essay on the presented research topic.

  **Literature**
  no handout

---

227-1045-00L

- **Readings in Neuroinformatics**
  - **W 3 credits 1S**
  - G. Indiveri, M. Cook, D. Kiper

  Thirteen major areas of research have been selected, which cover the key concepts that have led to our current ideas of how the nervous system is built and functions. We will read both original papers and explore the conceptual the links between them and discuss the ‘sociology’ of science, the pursuit of basic science questions over a century of research.

  **Objective**
  It is a commonplace that scientists rarely cite literature that is older than 10 years and when they do, they usually cite one paper that serves as the representative for a larger body of work that has long since been incorporated anonymously in textbooks. Worse than that, many authors have not even read the papers they cite in their own publications. This course, Foundations of Neuroscience is one antidote.

  Thirteen major areas of research have been selected, which cover the key concepts that have led to our current ideas of how the nervous system is built and functions. Unusually, we will explore these areas of research by reading the original publications, instead of reading someone elses digested summary from a textbook or review. By doing this, we will learn how the discoveries were made, what instrumentation was used, how the scientists interpreted their own findings, and how their work, often over many decades and linked together, generated findings from many different scientists, generate the current views of mechanism and structure of the nervous system.

  To give one concrete example, in 1890 Roy and Sherrington showed that there was a neural activity-dependent regulation of blood flow in the brain. One hundred years later, Ogawa discovered that they could use Nuclear Magnetic Resonance (NMR) to measure a blood oxygen-level dependent (BOLD) signal, which they showed was neural activity-dependent. This discovery led to the development of human functional Magnetic Resonance Imaging (fMRI), which has revolutionized neuropsychology and neuropsychiatry. We will read both these original papers and explore the conceptual the links between them and discuss the sociology of science, which in this case, the pursuit of basic science questions over a century of research, led to an explosion in applications. We will also explore the personalities of the scientists and the context in which they made their seminal discoveries. Each week the course members will be given original papers to read for homework, they will have to write a short abstract for each paper. We will then meet weekly with the course leader (KACM) and an assistant for an hour-or-so long interactive seminar. An intimate knowledge of the papers will be assumed so that the discussion does not center simply on an explication of the contents of the papers. Assessment will in the form of a written exam in which the students will be given a paper and asked to write a short abstract of the contents.
Content

It is a commonplace that scientists rarely cite literature that is older than 10 years and when they do, they usually cite one paper that serves as the representative for a larger body of work that has long since been incorporated anonymously in textbooks. Worse than that many authors have not even read the papers they cite in their own publications. This course, Foundations of Neuroscience is one antidote.

Thirteen major areas of research have been selected, which cover the key concepts that have led to our current ideas of how the nervous system is built and functions. Unusually, we will explore these areas of research by reading the original publications, instead of reading someone else's digested summary from a textbook or review. By doing this, we will learn how the discoveries were made, what instrumentation was used, how the scientists interpreted their own findings, and how their work, often over many decades and by many different scientists, linked together to generate the current view of mechanism and structure. This discovery led to the development of human functional Magnetic Resonance Imaging (fMRI), which has revolutionized neuropsychology and neuropsychiatry. We will read both these original papers and explore the conceptual links between them and discuss the sociology of science, which in this case, the pursuit of basic science questions over a century of research, led to an explosion in applications. Each week the course members will be given between 2 and 4 papers to read for homework and we will then meet weekly for an hour long interactive seminar. An intimate knowledge of the papers will be assumed so that the discussion does not center simply on an explication of the contents of the papers. Assessment will be done continuously as the individual students are asked to explain a figure, technique, or concept.

551-1145-00L
Viral and non-Viral Vectors for Human Gene-Therapy - from Pathogens to Safe Medical Applications
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.
ECTS: 2 credits
University lecturers

Abstract
Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Objective
Knowledge of viral and non-viral vector systems.
Knowledge of application in human diseases.
Knowledge of limiting factors.

636-0017-00L
Molecular Evolution, Phylogenetics and Phyldynamics
ECTS: 3G
T. Stadler

Abstract
The aim of the course is to provide up-to-date knowledge on how we can obtain an understanding of the evolution and population dynamics of organisms based on their genetic sequencing data, employing key concepts from molecular evolution, phylogenetics and phyldynamics. Throughout the course, we tie the models and methods closely with applications, mainly in the field of epidemiology and evolution.

Objective
Attendees will learn what information is contained in genetic sequencing data and how this information is extracted from the sequencing data. The main concepts introduced are:
- models in molecular evolution
- phylogenetic & phyldynamic inference
- maximum likelihood and Bayesian statistics
- stochastic processes

Attendees will apply these concepts to a number of applications yielding biological insight into:
- epidemiology
- pathogen evolution
- macroevolution of species

Content
The course consists of three parts. We first introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Second, we employ these evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamics processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets.

Lecture notes
Slides of the lecture will be available online.

Literature
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics.

551-1409-00L
RNA Biology Lecture Series II: Non-coding RNAs: Biology and Therapeutics
ECTS: 2V
J. Hall, M. Stoffel, O. Voinnet, further lecturers

Abstract
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

Objective
The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

Content
Micro RNAs: computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; tRNA biology.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

Objective
This course focuses on the concepts and modern genetics and genomics.

Content
This full-year course (551-0309-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Current literature references will be provided during the lectures.

The lecture “Grundlagen der Biologie II: Mikrobiologie” is the basis for this advanced lecture.

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 208 of 1432
We cover a range of themes related to development and neurobiology. Before starting your preparations, check with Jorge Pereira (jorge.pereira@biol.ethz.ch), who helps you with finding an appropriate paper.

The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Presentations will be made available after the presentations.

Objectives

- T cell function and dysfunction in acute and chronic viral infections
- Cells expressing Pattern Recognition Receptors and their downstream signals
- Evolution of the "Danger" concept
- Dendritic cells
- Co-stimulation (signals 1-3)
- Overview of cytokines and their effector function
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.

You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Lecture notes

Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien".

Prerequisites

All participants are expected to be familiar with the immunological concepts discussed in Immunology I and II, which are taught in the previous semesters.

Literature

Documents of the lectures are available for download at:

https://moodle-app2.let.ethz.ch/course/view.php?id=998

| Abstract   | This course provides a detailed understanding of
- development of T and B cells
- the dynamics of a immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies
Key experimental results will be shown to help understanding how immunological text book knowledge has evolved. |
| Objective  | Obtain a detailed understanding of
- the development, activation, and differentiation of different types of T cells and their effectormechanisms during immune responses,
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- Optimization of B cell responses by intelligent design of new vaccines
Content  | o Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
o NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections
| Literature | Documents of the lectures are available for download at: https://moodle-app2.let.ethz.ch/course/view.php?id=998 |
| 551-0512-00L | Current Topics in Molecular and Cellular Neurobiology | W    | 2 credits | 1S   | U. Suter                          |
| Abstract   | The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature. |
| Objective  | The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking. |
| Content    | You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance. |
| Literature | Presentations will be made available after the seminars. |
| Prerequisites / notice | You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%). |
| 551-1103-00L | Microbial Biochemistry                      | W    | 4 credits | 2V   | J. Vorholt-Zambelli, T. J. Erb, J. Piel |
| Abstract   | The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Emphasis is on processes that are specific to bacteria and archaea and that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest. |
| Objective  | The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. |

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 209 of 1432
Content

Important biochemical processes specific to bacteria and archaea will be presented that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest. Emphasis is on concepts of energy generation and assimilation.

List of topics:
- Eating sugars and letting them in
- Challenging: Aromatics, xenobiotics, and oil
- Complex: (Ligno-)Cellulose and in demand for bioenergy
- Living on a diet and the anaerobic prokaryotic provocation
- Of climate relevance: The microbial C1 cycle
- What are AMO and Anammox?
- 20 amino acids: the making of
- Extending the genetic code
- The 21st and 22nd amino acid
- Some exotic biochemistry: nucleotides, cofactors
- Ancient biochemistry? iron-sulfur clusters, polymers
- Secondary metabolites: playground of evolution

A script will be provided during the course.

Lecture notes

handouts

Literature

Introduction to Glycobiology; M.E. Taylor, K. Drickamer, Oxford University Press, 2003

Structure and linkages; analytical approaches; N-linked protein glycosylation (ER, Golgi); glycan-assisted protein folding and quality control; O-linked protein glycosylation; glucosaminoglycans; glycolipids; prokaryotic glycosylation pathways; lectins; glycans and infectious disease

Prerequisites / notice

The course will be in English. It will include the preparation of short essays (marked) about defined topics in Glycobiology.

551-1105-00L Glycobiology W 4 credits 2V M. Aebi, T. Hennet

Abstract

Structural principles, nomenclature and different classes of glycosylation. The different pathways of N- and O-linked protein glycosylation and glycolipid biosynthesis in prokaryotes and eukaryotes are discussed. Specific glycan binding proteins and their role in deciphering the glycan code are presented. The role of glycans in infectious diseases, antigen mimicry and autoimmunity are discussed.

Objective

Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glycobiology, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

Content

Structure and linkages; analytical approaches; N-linked protein glycosylation (ER, Golgi); glycan-assisted protein folding and quality control; O-linked protein glycosylation; glucosaminoglycans; glycolipids; prokaryotic glycosylation pathways; lectins; glycans and infectious disease

551-1117-00L Cutting Edge Topics: Immunology and Infection Biology W 2 credits 1S A. Oxenius, B. Becher, C. Halin Winter, M. Kopf, S. R. Leibundgut, C. Münz, A. Trkola, M. van den Broek

Abstract

Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.

Objective

Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.

Content

Immunology and infection biology.

The specific topics are variable and depend each semester on the list of invited experts.

551-1153-00L Systems Biology of Metabolism W 4 credits 2V U. Sauer, N. Zamboni, M. Zampieri

Number of participants limited to 15.

Abstract

Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective

Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content

The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes

Script and original publications will be supplied during the course.

Prerequisites / notice

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

551-1171-00L Immunology: from Milestones to Current Topics W 4 credits 2S B. Ludewig, M. Kopf, A. Oxenius, University lecturers

Number of participants limited to 15.

Abstract

Milestones in Immunology: on old concepts and modern experiments

Objective

The course will cover six grand topics in immunology (B cells, innate immunity, antigen presentation, tumor immunity, thymus and T cells, cytotoxic T cells and NK cells) and for each grand topic four hours will be allocated. During the first double hour, historical milestone papers will be presented by the supervisor providing an overview on the development of the conceptual framework and critical technological advances. The students will also prepare themselves for this double lecture by reading the historical milestone papers and contributing to the discussion. In the following lecture up to four students will present each a recent high impact research paper which emerged from the landmark achievements of the previously discussed milestone concepts.

Content

Milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells and NK cells, and tumor immunology.

Lecture notes

Original and review articles will be distributed by the lecturer.

Literature

Literaturunterlagen werden vor Beginn des Kurses auf folgender website zugänglich sein: Moodle Course https://moodle-app2.let.ethz.ch/course/view.php?id=1002

551-1303-00L Current Research Topics in Cellular Biochemistry W 4 credits 2S V. Panse, C. M. Azzalin, V. Korkhov, R. Kröschwieski, P. Picotti, A. E. Smith, F. van Drogen

Number of participants limited to 15.

Abstract

Introduction, presentation, evaluation, critical discussion and written analysis of recent scientific articles in the research area of cellular biochemistry.

Objective

The goal of the course is to train students in critical analysis of current research. Analysis by individual students will be assessed in oral and written form. The students will be able to introduce, present, evaluate, critically discuss and write about recent scientific articles in the research area of cellular biochemistry.
The course is composed of seminar lectures on specific topics, followed by discussions of scientific papers relevant to these topics. The
students will work in small groups under the supervision of a tutor. Each group prepares and presents a lecture, and leads a critical
discussion of the selected articles. While being exposed to advanced research in cellular biochemistry, the students practice the critical
reading of scientific literature, the evaluation of experimental approaches, and the interpretation of results.

The course will be taught in English.

Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  No Lecture: First day of autumn semester

Week 2  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nematode attack strategies and types of damage.

Week 5  Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6  Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, proformed chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7  Pisatin and pisatin demethylase. Local and systemic acquired resistance, signal molecules.

Week 8  Pathogen effects on food quality and safety.

Week 9  Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 10  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11  Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELISA, PCR, rDNA and rep-PCR.

Week 12  Strategies for minimizing disease risks: principles of disease control and management.

Week 13  Disease control strategies: economic thresholds, physical control methods.

Week 14  Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

Lecture notes

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

551-1145-00L  Viral and non-Viral Vectors for Human Gene-Therapy - from Pathogens to Safe Medical Applications

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: BIO708

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract

Basic aspects of virology, the viral mechanisms for transfer of genetic material into cells, different vector-systems and target cells, animal models, specific applications for inborn diseases of the immune system and of metabolism, adverse effects, and new developments of vector systems will be taught.

Objective

Knowledge of important viral and non-viral vector systems.

Knowledge of application in human diseases.

Knowledge of limiting factors.

636-0017-00L  Molecular Evolution, Phylogenetics and Phylodynamics

The aim of the course is to provide up-to-date knowledge on how we can obtain an understanding of the evolution and population dynamics of organisms based on their genetic sequencing data, employing key concepts from molecular evolution, phylogenetics and phylodynamics. Throughout the course, we tie the models and methods closely with applications, mainly in the field of epidemiology and evolution.

Abstract

Attendees will learn what information is contained in genetic sequencing data and how this information is extracted from the sequencing data. The main concepts introduced are:
* models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics
* stochastic processes

Attendees will apply these concepts to a number of applications yielding biological insight into:
* epidemiology
* pathogen evolution
* macroevolution of species

Objective

Content

The course consists of three parts. We first introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Second, we employ these evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades.

Lecture notes

Slides of the lecture will be available online.
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

**Prerequisites / notice**
Basic knowledge in linear algebra, analysis, and statistics.

**Abstract**
Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods.

**Objective**
Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods. Students will engage in discussion and critical analyses of relevant papers and present their evaluations in a seminar setting.

**Abstract**
This is the first part of a one-year course. It offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

**Objective**
The lecture offers insights into the basics, practical consequences and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts, molds and protozoa in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

**Content**
1. History of Food Microbiology
   1.1. Short synopsis of foodborne microorganisms
   1.2. Spoilage of Foods
   1.3. Foodborne Disease
   1.4. Food Preservation
   1.5. VIP's of Food Microbiology
2. Overview of Microorganisms in Foods
   2.1. Origin of foodborne Microorganisms
   2.2. Bacteria
   2.3. Yeasts
   2.4. Molds
3. Microbial Spoilage of Foods
   3.1. Intrinsic and Extrinsic Parameters
   3.2. Meats, Seafoods, Eggs
   3.3. Milk and Milk Products
   3.4. Vegetable and Fruit Products
   3.5. Miscellaneous (baked goods, nuts, spices, ready-to-eat products)
   3.6. Drinks and Canned Foods
4. Foodborne Disease
   4.1. Significance and Transmission of Foodborne pathogens
   4.2. Staphylococcus aureus
   4.3. Gram-positive Sporeformers (Bacillus & Clostridium)
   4.4. Listeria monocytogenes
   4.5. Salmonella, Shigella, Escherichia coli
   4.6. Vibrio, Yersinia, Campylobacter
   4.7. Brucella, Mycobacterium, Aeromonas, Plesiomonas
   4.8. Parasites
   4.9. Viruses and Bacteriophages
   4.10. Mycotoxins
   4.11. Bioactive Amines
   4.12. Miscellaneous (Antibiotic-resistant Bacteria, Biofilms)

**Literature**
Electronic copies of the presentation slides (PDF) will be made available for download.

**Lecture notes**
Recommendations will be given in the first lecture.
Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

### 701-2413-00L  Evolutionary Genetics

| W | 6 credits | 4V | T. Städler, A. Widmer, P. C. Brunner, M. C. Fischer, A. Guggisberg |

**Abstract**
The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

**Objective**
The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

**Content**
- Population genetics: Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.
- Quantitative genetics: Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossing effects on fitness; Fisher's fundamental theorem.
- Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation

### 551-0311-00L  Molecular Life of Plants

| W | 6 credits | 4V | W. Gruissem, A. Rodríguez-Villalon, C. Sánchez-Rodríguez, O. Voinnet, S. C. Zeeman |

**Abstract**
The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates physiology and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.

**Objective**
The new course "Molecular Life of Plants" reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels.

The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.

**Content**
The course "Molecular Life of Plants" will cover the following topics in a developmental context:

- Plant genome organization
- Seed anatomy
- Food reserves and mobilization
- Seedling emergence
- Heterotrophic to autotrophic growth
- Chlorophyll biosynthesis, photoreceptors
- Integration of metabolism
- Hormones
- Cell cycle
- Cell differentiation and expansion
- Environmental interactions: abiotic
- Environmental interactions: biotic
- Flower development and fertilization
- Embryo and seed development
- Fruit development
- Senescence

### 551-0307-00L  Biomolecular Structure and Mechanism I: Protein Structure and Function

| W | 3 credits | 2V | R. Glockshuber, K. Locher, E. Weber-Ban |

**Abstract**
Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAI, current topics in protein biophysics and structural biology.

**Objective**
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanayltics.

**Lecture notes**
Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.
Current topics: References will be given during the lectures.

551-0309-00L Concepts in Modern Genetics

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.

Prerequisites / notice
This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hönggerberg, and on Tuesday morning at UniZH Irchel.

551-0319-00L Cellular Biochemistry (Part I)

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterization of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

529-0731-00L Nucleic Acids and Carbohydrates

Abstract
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Objective
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Literature
Mainly based on recent original literature, a detailed list will be distributed during the first lecture

Patient: Cellular Biochemistry (Part I)

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterization of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Autumn Semester 2015

Data: 06.10.2017 12:56

Page 215 of 1432
### Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I)

This course focuses on the concepts of classical and modern genetics and genomics. Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

#### Prerequisites

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

#### Content

- Introduction into structural and functional aspects of the immune system.
- Basic knowledge of the mechanisms and the regulation of an immune response.

#### Lecture notes

Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien".

#### Literature

#### Prerequisites / notice

Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung".

---

### Neurobiology

Development of the nervous system (NS); the adult NS, plasticity and regeneration, sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, diseases of the NS.

#### Objective

Overview of normal development, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

#### Content

- Development: Early development of the nervous system, cellular level, nerve fiber growth, building of neuronal networks; biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

Active participation in the discussions is a prerequisite for this course.

529-0733-00L Enzymes W 7 credits 3G D. Hilvert

Abstract
Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Objective
Overview of enzymes, enzyme-catalyzed reactions and metabolic processes.

Content
Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Lecture notes
A script will not be handed out.

Literature
General:

In addition, citations from the original literature relevant to the individual lectures will be assigned weekly.

551-1409-00L RNA Biology Lecture Series II: Non-coding RNAs: Biology and Therapeutics W 4 credits 2V J. Hall, M. Stoffel, O. Voinnet, further lecturers

Abstract
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

Objective
The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

Content
Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; nuclear acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; tRNA biology.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

551-0571-00L Current Research Topics in Cellular Biochemistry W 4 credits 2S V. Panse, C. M. Azzalin, V. Korkhov, R. Kroschewski, P. Picotti, A. E. Smith, F. van Drogen

Abstract
Introduction, presentation, evaluation, critical discussion and written analysis of recent scientific articles in the research area of cellular biochemistry.

Objective
The goal of the course is to train students in critical analysis of current research. Analysis by individual students will be assessed in oral and written form. The students will be able to introduce, present, evaluate, critically discuss and write about recent scientific articles in the research area of cellular biochemistry.

Content
The course is composed of seminar lectures on specific topics, followed by discussions of scientific papers relevant to these topics. The students will work in small groups under the supervision of a tutor. Each group prepares and presents a lecture, and leads a critical discussion of the selected articles. While being exposed to advanced research in cellular biochemistry, the students practice the critical reading of scientific literature, the evaluation of experimental approaches, and the interpretation of results.

Literature
The relevant references to primary literature, the evaluation and review articles will be provided during the course.

551-0572-00L Current Topics in Molecular and Cellular Neurobiology W 2 credits 1S U. Suter

Abstract
The course will be taught in English.
Abstract

The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Objective

The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

Content

You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Lecture notes

Presentations will be made available after the seminars.

Literature

We cover a range of themes related to development and neurobiology. Before starting your preparations, check with Jorge Pereira (jorge.pereira@biol.ethz.ch), who helps you with finding an appropriate paper.

Prerequisites / notice

You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

**Objective**

- **752-4009-00L**: To provide an understanding of the mechanisms of foodborne pathogens and the associated risks.
- **752-6101-00L**: To equip students with knowledge on nutrition and the prevention of chronic diseases.
- **636-0507-00L**: To introduce students to the complexities of synthetic biology and its implementation.
- **376-0300-00L**: To provide a comprehensive understanding of translational science.
- **551-1145-00L**: To familiarize students with the development and application of viral and non-viral vectors in human gene therapy.

**Content**

- **752-4009-00L**: Focuses on molecular biology of foodborne pathogens, including Listeria, Vibrio, Campylobacter, etc., and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus).
- **752-6101-00L**: Covers the impact of food and food ingredients on health and disease prevention.
- **636-0507-00L**: Introduces advanced topics in synthetic biology and genetic circuit design.
- **376-0300-00L**: Discusses translational science and its role in healthcare.
- **551-1145-00L**: Explores viral and non-viral vectors in the context of human gene therapy.

**Prerequisites/Literature**

- **752-4009-00L**: No compulsory prerequisites, but prior completion of Human Nutrition I + II is strongly advised.
- **752-6101-00L**: Lectures (2 hours) will be held as a single session of approximately 60 minutes (10:15 until 11:15 h), with no break.
- **636-0507-00L**: No prerequisites, recommended background in biology and engineering.
- **376-0300-00L**: Discussion of project planning, ethics application, and interdisciplinary communication.
- **551-1145-00L**: No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signalling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration. The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions. Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

The course will be taught in English. The students will work in small groups under the supervision of a tutor. Each group prepares and presents a lecture, and leads a critical discussion of the selected articles. While being exposed to advanced research in cellular biochemistry, the students practice the critical reading of scientific literature, the evaluation of experimental approaches, and the interpretation of results.

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signalling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytokoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.
**Concepts of Modern Genetics**

**Abstract**

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective / Content**

This course focuses on the concepts of classical and modern genetics and genomics.

**Lecture notes**

A script will not be handed out.

**Literature**

Introduction to Glycobiology; M.E.Taylor, K.Drickamer, Oxford University Press, 2003

**Literature**

**Notice**

The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Emphasis is on processes that are specific to bacteria and archaea and that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest.

The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Important biochemical processes specific to bacteria and archaea will be presented that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest. Emphasis is on concepts of energy generation and assimilation.

**List of topics:**

- Eating sugars and letting them in
- Challenging: Aromatics, xenobiotics, and oil
- Complex: (Ligno-)Cellulose and in demand for bioenergy
- Living on a diet and the anaerobic provocations of climate relevance: The microbial C1 cycle
- What are AMO and Anammox? 20 amino acids: the making of
- Extending the genetic code
- The 21st and 22nd amino acid
- Some exotic biochemistry: nucleotides, cofactors
- Ancient biochemistry? Iron-sulfur clusters, polymers
- Secondary metabolites: playground of evolution

**Lecture notes**

A script will be provided during the course.

**Number of participants limited to 15.**
Separations in Biotechnology and Bioprocess

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes
Script and original publications will be supplied during the course.

Prerequisites / notice
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

636-0001-00L

Separations in Biotechnology and Bioprocess

W 6 credits

Economy

Abstract
Separations play an integral part of any biotechnological process. This course aims at enabling students specifically with a chemistry/biology background to select & roughly design suitable separation processes for typical biotechnological products such as monoclonal antibodies, antibiotics, and fine chemicals and at providing a basic set of purification operations & judge on process economy.

Objective
Students should be able to select for a given biotechnological product a suitable set of purification operations and judge on process economy.

Content
Introduction membrane operations adsorption and chromatography crystallization overall process economics

Lecture notes
Handouts during course

636-0007-00L

Computational Systems Biology

W 6 credits

3V+2U

J. Stelling

Abstract
Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

Objective
The aim of this course is to provide an introductory overview of computational methods for the modeling, simulation and analysis of biological networks.

Content
Biological systems have witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

Literature

401-0649-00L

Applied Statistical Regression

W 5 credits

2V+1U

M. Dettling

Abstract
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life.

Objective
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content
The course starts with the basics of linear regression modeling, and then proceeds to parameter estimation, tests and confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, categorical input variables, shrinkage and general modeling strategies.

The last third of the course is dedicated to an introduction into generalized linear regression models: this includes logistic regression for binary response variables, Poisson regression for count data, cumulative logit models for ordered, and multinomial regression for categorical response variables.

Lecture notes
A script will be available.

Literature
Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

636-0003-00L

Biological Engineering and Biotechnology

W 6 credits

3V

M. Fussenegger

Abstract
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Objective
1. Insight Into The Mammalian Cell Cycle. Cycling, The Balance Between Proliferation and Cancer - Implications For Biopharmaceutical Manufacturing.
2. The Licence To Kill. Apoptosis Regulatory Networks - Engineering Survival Pathways To Increase Robustness of Production Cell Lines.
5. From Target To Market. An Antibody's Journey From Cell Culture to Development of Biological Weapons?
8. IP Management - Food Technology, Protecting Your Knowledge For Business.

Lecture notes
Handouts during the course.

The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence. The course emphasizes work at the cellular, subcellular and molecular levels.

The course reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Where traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels.

The goal of “Molecular Life of Plants” is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.
Content

The course "Molecular Life of Plants" will cover the following topics in a developmental context:

- Plant genome organization
- Seed anatomy
- Food reserves and mobilization
- Seedling emergence
- Heterotrophic to autotrophic growth
- Chlorophyll biosynthesis, photoreceptors
- Integration of metabolism
- Hormones
- Cell cycle
- Cell differentiation and expansion
- Environmental interactions
- Flower development and fertilization
- Embryo and seed development
- Fruit development
- Senescence

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course. To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

**Abstract**

Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

**Objective**

Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

**Content**

Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

| 701-2413-00L | Evolutionary Genetics | W | 6 credits | 4V | T. Städler, A. Widmer, P. C. Brunner, M. C. Fischer, A. Guggisberg |

**Abstract**

The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

**Objective**

The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

**Content**

Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.

Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crosses; effects on fitness; Fisher's fundamental theorem.

Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation.

**Lecture notes**

Handouts

**Literature**

There will be 5 optional extra sessions for the population genetics part (following lectures 2-6) for computer simulations, designed to help understand the course material.

**Abstract**

The focus is on the potential to assess strategies and tactics of pest management, taking into account the demands from the economy, the environment and the society. Significant agricultural approaches will be explained using practical examples, including prevention using natural resources, surveillance and forecasting, resistance management, as well as product registration, incl. ecotoxicology.

**Objective**

The students gain a good understanding of fundamental aspects of pest management in agroecosystems. They will have the ability to assess options for action in view of requirements from the economy, the ecology and the society. Further, they will learn to perform searches on relevant issues in pest management, and to critically evaluate case studies.

| 551-1105-00L | Glycobiology | W | 4 credits | 2V | M. Aebi, T. Hennek |

**Abstract**

Structural principles, nomenclature and different classes of glycosylation. The different pathways of N- and O-linked protein glycosylation and glycolipid biosynthesis in prokaryotes and eukaryotes are discussed. Specific glycan binding proteins and their role in deciphering the glycan code are presented. The role of glycans in infectious diseases, antigen mimicry and autoimmunity are discussed.

**Objective**

Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glycomics, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

**Content**

Structure and linkages; analytical approaches; N-linked protein glycosylation (ER, Golgi); glycan-assisted protein folding and quality control; O-linked protein glycosylation; glucosaminoglycans; glycolipids; prokaryotic glycosylation pathways; lectins; glycans and infectious disease.

The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics.

**Plant Pathology I**  
**Insect Ecology**  
2 credits  
Insect Ecology  
U. Sauer  
This is an introductory course in insect ecology. Students will learn about the ways in which insects interact with and adapt to their abiotic & biotic environments and their roles in diverse ecosystems. The course will entail lectures, outside readings, and critical analysis of contemporary literature.

**Objective**  
Students completing this course should become familiar with the application of ecological principles to the study of insects, as well as major areas of inquiry in this field. Highlighted topics will include insect behavior, chemical and sensory ecology, physiological responses to biotic and abiotic stressors, plant-insect interactions, community and food-web dynamics, and disease ecology. The course will emphasize insect evolution and adaptation in the context of specific interactions with other organisms and the abiotic environment. Examples from the literature incorporated into lectures will highlight the methods used to study insect ecology.

**Preparatory reading**  
Selected required readings (peer reviewed literature, selected book chapters). Optional recommended readings with additional information.

**Prerequisites**  
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

**551-1103-00L**  
**Microbial Biochemistry**  
W  
4 credits  
J. Vorholt-Zambelli, T. J. Erb, J. Piel  
The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Emphasis is on processes that are specific to bacteria and archaea and that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest.

**Abstract**  
The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Important biochemical processes specific to bacteria and archaea will be presented that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest. Emphasis is on concepts of energy generation and assimilation.

**Objective**  
Students completing this course should become familiar with the application of ecological principles to the study of insects, as well as major areas of inquiry in this field. Highlighted topics will include insect behavior, chemical and sensory ecology, physiological responses to biotic and abiotic stressors, plant-insect interactions, community and food-web dynamics, and disease ecology. The course will emphasize insect evolution and adaptation in the context of specific interactions with other organisms and the abiotic environment. Examples from the literature incorporated into lectures will highlight the methods used to study insect ecology.

**Preparatory reading**  
Selected required readings (peer reviewed literature, selected book chapters). Optional recommended readings with additional information.

**Prerequisites**  
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

**551-1153-00L**  
**Systems Biology of Metabolism**  
W  
4 credits  
U. Sauer, N. Zamboni, M. Zampieri  
Number of participants limited to 15.

**Abstract**  
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

**Objective**  
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

**Prerequisites**  
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

**571-4504-00L**  
**Plant Pathology I**  
W  
2 credits  
F. Talas, B. McDonald, J. Palma Guerrero, A. Sanchez Vallet  
Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

**Objective**  
Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  No Lecture: First day of autumn semester

Week 2  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nematode attack strategies and types of damage.

Week 5  Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6  Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7  Pisatin and pisatin demethylase. Local and systemic acquired resistance, signal molecules.

Week 8  Pathogen effects on food quality and safety.

Week 9  Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 10  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11  Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELisa, PCR, rDNA and rep-PCR.

Week 12  Strategies for minimizing disease risks: principles of disease control and management.

Week 13  Disease control strategies: economic thresholds, physical control methods.

Week 14  Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

Lecture notes

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

Microbiology (Part I)  
Basics:
Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

This course focuses on the concepts of classical and modern genetics and genomics. The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Scripts and additional material will be provided during the semester.

This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoengerberg, and on Tuesday morning at UniZH Irchel.

Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background, the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

### Literature

**551-0309-00L**  
**Concepts in Modern Genetics**  
W 6 credits 4V  
Objective
This course focuses on the concepts of classical and modern genetics and genomics. The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**551-0313-00L**  
**Microbiology (Part I)**  
W 3 credits 2V  
Objective
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content
This concept class will be based on common concepts (Grundlagen der Biologie IIB, Teil Mikrobiologie) and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**551-0319-00L**  
**Cellular Biochemistry (Part I)**  
W 3 credits 2V  
Objective
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

**551-1295-00L**  
**Introduction to Bioinformatics: Concepts and Applications**  
W 6 credits 4G  
Objective
Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.
Content

Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing

**Abstract**
Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

**Objective**
The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

**Content**
Biological knowledge is an asset but not a prerequisite. The course provides students with different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

**Abstract**
The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Emphasis is on processes that are specific to bacteria and archaea and that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest.

**Objective**
The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms.

### Literature
- Molecular dynamics and simulation
- Computational Systems Biology
- Computational Biology
- Microbial Biochemistry
Important biochemical processes specific to bacteria and archaea will be presented that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest. Emphasis is on concepts of energy generation and assimilation.

List of topics:
- Eating sugars and letting them in
- Challenging: Aromatics, xenobiotics, and oil
- Complex: (Ligno)-Cellulose and in demand for bioenergy
- Living on a diet and the anaerobic provocations
- Of climate relevance: The microbial C1 cycle
- What are AMO and Anammox?
- 20 amino acids: the making of
- Extending the genetic code
- The 21st and 22nd amino acid
- Some exotic biochemistry: nucleotides, cofactors
- Ancient biochemistry? Iron-sulfur clusters, polymers

Secondary metabolites: playground of evolution

A script will be provided during the course.

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: BIO336
Mind the enrolment deadlines at UZH: [http://www.uzh.ch/studies/application/mobilitaet_en.html](http://www.uzh.ch/studies/application/mobilitaet_en.html)

By the end of this module, each student should be able to:
- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.

Key skills:
- By the end of this module, each student should be able to:
  - present and discuss a relevant evolutionary topic in an oral presentation
  - select and integrate key concepts in animal evolution from primary literature
  - participate in discussions on topics presented by others

Handouts during course
Evolutionary dynamics is concerned with the mathematical principles according to which life has evolved. This course offers an introduction to mathematical modeling of evolution, including deterministic and stochastic models.

The goal of this course is to understand and to appreciate mathematical models and computational methods that provide insight into the evolutionary process.

Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the context of different biological systems, focusing on sexual processes. Viruses and cancer cells provide the most prominent examples of such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies equation, evolution of HIV, evolutionary game theory, birth-death processes, evolutionary stability, evolutionary graph theory, somatic evolution of cancer, stochastic tunneling, cell differentiation, hematopoietic tumor stem cells, genetic progression of cancer and the speed of adaptation, diffusion theory, fitness landscapes, neutral networks, branching processes, evolutionary escape, and epistasis.

No. 

Prerequisites / notice

Prerequisites: Basic mathematics (linear algebra, calculus, probability)

CURRENT TOPICS: References will be given during the lectures.

- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.
- Creighton, T.E., Proteins, Freeman, (1993)

Current topics: References will be given during the lectures.

### Elective Major: Structural Biology and Biophysics

### Compulsory Concept Courses

**Number** | **Title** | **Type** | **ECTS** | **Hours** | **Lecturers**
--- | --- | --- | --- | --- | ---
551-0307-00L | Biomolecular Structure and Mechanism I: Protein Structure and Function | D-BIOL BSc students are obliged to take part I and part II (next semester) as a two-semester course | O | 3 credits | 2V
R. Glockshuber, K. Locher, E. Weber-Ban

**Abstract**

Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

**Objective**

Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytics.

**Lecture notes / Literature**

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

**Prerequisites / notice**

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

**Number** | **Title** | **Type** | **ECTS** | **Hours** | **Lecturers**
--- | --- | --- | --- | --- | ---
551-0319-00L | Cellular Biochemistry (Part I) | W | 3 credits | 2V | U. Kutay, C. M. Azzalin, B. Kommann, M. Peter

**Abstract**

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

**Objective**

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

**Content**

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes. Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

**Lecture notes / Literature**

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**Prerequisites / notice**

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

---

### Elective Major: Structural Biology and Biophysics

#### Compulsory Concept Courses

**Number** | **Title** | **Type** | **ECTS** | **Lecturers**
--- | --- | --- | --- | ---
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis. This concept class will be based on common concepts (Grundlagen der Biologie IIB, Teil Mikrobiologie) and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

### Content
*Prerequisites / notice*
- The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

### 551-1295-00L Introduction to Bioinformatics: Concepts and Applications

- **Abstract**: Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.
- **Objective**: Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

### Content
- Bioinformatics I will cover the following topics:
  - From genes to databases and information
  - BLAST searches
  - Prediction of gene function and regulation
  - RNA structure prediction
  - Gene expression analysis using microarrays
  - Protein sequence and structure databases
  - WWW for bioinformatics
  - Protein sequence comparisons
  - Proteomics and de novo protein sequencing
  - Protein structure prediction
  - Cellular and protein interaction networks
  - Molecular dynamics simulation

### 551-0309-00L Concepts in Modern Genetics

- **Abstract**: Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.
- **Objective**: This course focuses on the concepts of classical and modern genetics and genomics.
- **Content**: The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

### Lectures
- Scripts and additional material will be provided during the semester.

### Prerequisites / notice
- This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UniZH Irchel.

### Elective Compulsory Master Courses

#### 529-0733-00L Enzymes

- **Abstract**: Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.
- **Objective**: Overview of enzymes, enzyme-catalyzed reactions and metabolic processes.
- **Content**: Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.
- **Lecture notes**: A script will not be handed out.

In addition, citations from the original literature relevant to the individual lectures will be assigned weekly.

#### 551-1105-00L Glycobiology

- **Abstract**: Structural principles, nomenclature and different classes of glycosylation. The different pathways of N- and O-linked protein glycosylation and glycolipid biosynthesis in prokaryotes and eukaryotes are discussed. Specific glycan binding proteins and their role in deciphering the glycan code are presented. The role of glycans in infectious diseases, antigen mimicry and autoimmunity are discussed.
- **Objective**: Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glycobiology, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

---

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 236 of 1432
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. A script will be provided during the course.

The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Emphasis is on processes that are specific to bacteria and archaea and that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest.

**Abstract**

**Prerequisites**

Solid knowledge in biochemistry strongly recommended

**Literature**

J. Vorholt-Zambelli, T. J. Erb, J. Piel

**Course Code**

551-1103-00L

**Content**

Microbial Biochemistry

**Objective**

To understand current research strategies in protein science. Proteins have become an object of intense study in modern science, ranging from their use as therapeutics to elucidating their structure and function in the cell. Moreover, it is now possible to engineer and evolve tailor-made proteins, opening up many new areas of science. This course will attempt to cover the frontiers and remaining challenges, emphasizing the biochemical foundations of the various approaches.

**Prerequisites / notice**

A script will be provided during the course.

**Literature**

Molecular models, Force fields, Spatial boundary conditions, Calculation of Coulomb forces, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.

**Course Code**

529-0004-00L

**Objective**

Introduction to computer simulation of (bio)molecular systems, development of skills to carry out and interpret computer simulations of biomolecular systems.

**Content**

Molecular models, Force fields, Spatial boundary conditions, Calculation of Coulomb forces, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.

**Literature**

Available (copies of powerpoint slides distributed before each lecture)

See: www.csms.ethz.ch/education/CSCBP
The course starts with the basics of linear regression modeling, and then proceeds to parameter estimation, tests and confidence intervals.

This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

4 credits

The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:

- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc.; simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

Lecture notes
A script will be available.

Literature
Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

401-6215-00L Using R for Data Analysis and Graphics (Part I) W 1 credit 1G A. J. Papritz, C. B. Schwierz

Abstract
The course provides the first part an introduction to the statistical software R for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

Objective
The students will be able to use the software R for simple data analysis.

Content
The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:

- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc.; simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

Lecture notes
An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

Prerequisites / notice
The course resources will be provided via the Moodle web learning platform

Literature
Montgomery et al. (2006): Introduction to Linear Regression Analysis
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs

529-0041-00L Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics W 6 credits 3G R. Zenobi, M. Badertscher, B. Hattendorf, P. Martinez-Lozano Sinues

Abstract
Modern mass spectrometry, hyphenated analytical methods, speciation, methods of surface analysis, chemometrics.

Objective
Comprehensive knowledge about the analytical methods introduced in this course, and their applications.

Content
Coupling of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation.

Modern mass spectrometry: Time of flight and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods.

Methods of surface analysis (ESCA, Auger, SIMS, raster microscopy methods).

Employment of computer science for processing data in chemical analysis (chemometrics).

Lecture notes
lecture notes will be available in the lecture at production cost.

Literature
information about relevant literature will be available in the lecture & in the lecture notes.

Prerequisites / notice
Exercises are an integral part of the lecture.

Prerequisites:
529-0051-00 "Analytische Chemie I (3. Semester)"
529-0058-00 "Analytische Chemie II (4. Semester)"
(or equivalent)

551-1409-00L RNA Biology Lecture Series II: Non-coding RNAs: W 4 credits 2V J. Hall, M. Stoffel, O. Voinnet, further lecturers

Abstract
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

Objective
The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

Content
Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; tRNA biology.

Prerequisites / notice

Basics knowledge of cell and molecular biology.

Elective Major: Biological Chemistry

Compulsory Concept Courses

Abstract
Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies

Objective
Overview of enzymes, enzyme-catalyzed reactions and metabolic processes.

Content
Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Lecture notes
A script will not be handed out.

Literature
General:

In addition, citations from the original literature relevant to the individual lectures will be assigned weekly.

Abstract
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic product from target to market.

Objective
1. Insight Into The Mammalian Cell Cycle. Cycling, The Balance Between Proliferation and Cancer - Implications For Biopharmaceutical Manufacturing.
2. The Licence To Kill. Apoptosis Regulatory Networks - Engineering of Survival Pathways To Increase Robustness of Production Cell Lines.
5. From Target To Market. An Antibody's Journey From Cell Culture to The Clinics.
6. Biology and Malign Applications. Do Life Sciences Enable the Development of Biological Weapons?
7. Functional Food. Enjoy your Meal!

Abstract
Advanced Modern Methods and Strategies in Synthesis

Objective
Knowledge of modern methods in asymmetric stereocentre, enantioselective catalysis, and organic reaction mechanisms.

Content
Current trends in methods for and approaches to synthesis of complex natural products, pharmaceuticals, and biological molecules; fragment coupling and protecting group strategies; chemical ligation and biomolecules synthesis; enantioselective catalysis including ligand design and optimization; cross coupling reactions from preactivated precursors; C-H activation and oxidation chemistry; building block synthesis with chiral auxiliaries and reagents; new concepts in asymmetric catalysis. Analysis of key primarily literature including identification of trends, key precendents, and emerging topics will be emphasized.

Lecture notes
will be provided in class and online

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 239 of 1432
529-0233-00L  Organic Synthesis: Methods and Strategies  W  7 credits  3G  E. M. Carreira

**Abstract**
The complex relation between structural analysis, methods leading to desired transformations, and insight into reaction mechanisms is exemplified. Relations between retrosynthetic analysis of target structures, synthetic methods and their combination in a synthetic strategy.

**Objective**
Extension and deepening of the knowledge in organic synthesis.

**Content**

**Literature**

**Prerequisites / notice**
OC I-IV

---

529-0243-00L  Reactive Intermediates  W  7 credits  3G  P. Chen

**Abstract**
Advanced physical organic chemistry. Methods for the elucidation of reaction mechanisms. Reactive intermediates. Thermochemistry: isotope labeling; cross-over experiments; kinetic isotope effects; thermodynamics-kinetics correlations; solution and ion pairs; radical reactions; electron transfer; spectroscopic methods.

**Objective**
Methods for the elucidation of organic reaction mechanisms.

**Content**

**Lecture notes**
A printed script is handed out in the course. This material is also available for download from the web page of the course (as pdf files).

**Literature**
Additional reading and original publications are cited in the lectures.

**Prerequisites / notice**
Required level: Courses in organic and physical chemistry of the first and second year.

---

551-1409-00L  RNA Biology Lecture Series II: Non-coding RNAs: Biology and Therapeutics  W  4 credits  2V  J. Hall, M. Stoffel, O. Voinnet, further lecturers

</tbody>
</table>
Objective

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes. Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Abstract

This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

Objective

The main goal of this course is to enhance the student’s ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.
I. Ethics & the Process of Ethical Inquiry
---------------------------------------

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)
----------------------------------------------------------

Integrity in Research & Research Misconduct
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 Rs (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks;
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Research Projects (for all Master Majors)
Number Title Type ECTS Hours Lecturers
551-1801-00L Research Project I O 15 credits 34A Lecturers

Research projects, with themes from the chosen scientific fields of interest, are intended to familiarise candidates with scientific procedures and operational methodologies through supervised participation in current research work.

Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.
Abstract

Research projects, with themes from the chosen scientific fields of interest, are intended to familiarise candidates with scientific procedures and operational methodologies through supervised participation in current research work.

Compulsory Electives in Humanities, Social and Political Sciences

Recommended GESS compulsory elective courses (Type B) for D-BIOL.

**Abstract**

Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course students are expected to submit assignments. The course concludes with an end-of-semester examination.

**Objective**

The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

**Content**

Main topics of the course include:

- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number fluids
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

**Lecture notes**

The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

**Prerequisites / notice**

The lecture will be taught in English.

**Abstract**

From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles. Intermolecular forces, their macroscopic manifestations, and ways to control such interactions. Self-assembly and directed assembly of 2D and 3D structures. Special emphasis on the emerging field of molecular electronic devices.

**Objective**

Familiarize students with basic science and engineering principles governing the nano domain.

**Content**

The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics that are traditionally taught separately.

Special emphasis is placed on the emerging field of molecular electronic devices, their working principles, applications, and how they may be assembled.

Topics are treated in 2 blocks:

(I) From Quantum to Continuum

From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale

Intermolecular forces, their macroscopic manifestations, and ways to control such interactions. Self-assembly and directed assembly of 2D and 3D structures.

**Literature**

**Prerequisites / notice**

Course format:

Lectures and Mini-Review presentations: Thursday 10-13, ML F 36

Homework: Mini-Reviews

Students select a paper (list distributed in class) and expand the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper.

**Abstract**

Students are introduced to the basics of micromachining and silicon process technology and will learn about the fabrication of Microsystems and devices by a sequence of defined processing steps (process flow).

**Objective**

Students are introduced to the basics of micromachining and silicon process technology and will understand the fabrication of microsystems devices by the combination of unit process steps (process flow).

**Content**

- Introduction to Microsystems technology (MST) and micro electro mechanical systems (MEMS)
- Basic silicon technologies: Thermal oxidation, photolithography and etching, diffusion and ion implantation, thin film deposition.
- Specific microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical and thermal properties, piezoelectric and piezoresistive materials.
- Selected microsystems: Mechanical sensors and actuators, microresonators, thermal sensors and actuators, system integration and encapsulation.

<td>Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed. In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.</td>

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metals to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells. As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the prepartion of medical implants and the determination of tissue's anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

227-1037-00L  Introduction to Neuroinformatics  W  6 credits  2V+1U  K. A. Martin, M. Cook, V. Mante, M. Pfister

Abstract
The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

Objective
Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, math, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

Content
This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

Recommended Elective Courses
These courses are particularly recommended for the Bioelectronics track. Please consult your track advisor if you wish to select other subjects.

Number  Title  Type  ECTS  Hours  Lecturers
227-0166-00L  Analog Integrated Circuits  W  6 credits  2V+2U  Q. Huang

Abstract
This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies. Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

Objective
The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

Content
Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc; Amplifiers: differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; Stability; Comparators; Second-order effects in analog circuits such as mismatch, noise and offset; A/D and D/A converters; Introduction to switched capacitor circuits.

The exercise sessions aim to reinforce the lecture material by well guided step-by-step design tasks. The circuit simulator SPECTRE is used to facilitate the tasks. There is also an experimental session on op-amp measurements.

Literature
Handouts of presented slides. No script but an accompanying textbook is recommended.

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 246 of 1432
Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content
The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Line and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Lecture notes
Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.

The course language is English.

227-0468-00L Analog Signal Processing and Filtering

Objective
This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers.

Content
At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during the whole term to analyze circuits and understand how signals propagate through them. The theory and CMOS implementation of active Filters is then discussed in detail using the example of Gm-C filters and active-RC filters. The ideal and nonideal behaviour of opamps, current conveyors, and inductor simulators follows. The link to the practical design of circuits and systems is done with an overview over different quality measures and figures of merit used in scientific literature and datasheets. Finally, an introduction to discrete-time and mixed-domain filters and circuits is given, including sensor read-out amplifiers, correlated double sampling, and chopping, and an introduction to sigma-delta A/D and D/A conversion on a system level.

Lecture notes
The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

Prerequisites
Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

227-0981-00L Cross-Disciplinary Research and Development in Medicine and Engineering

Objective
Cross-disciplinary collaboration between engineers and medical doctors is indispensable for innovation in health care. This course will bring together engineering students from ETH Zurich and medical students from the University of Zurich to experience the rewards and challenges of such interdisciplinary work in a project based learning environment.

Content
After a general introduction to interdisciplinary communication and detailed background on the collaborative project, the engineering students will receive tailored lectures on the anatomy and physiology of the relevant system. They will then team up with medical students who have received a basic introduction to engineering methodology to collaborate on said project. In the process, they will be coached both by lecturers from ETH Zurich and the University of Zurich, receiving lectures customized to the project. The course will end with each team presenting their solution to a cross-disciplinary audience.

Prerequisites
Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.

Lecture notes
Handouts and relevant literature will be provided.

227-1033-00L Neuromorphic Engineering I

Objective
Understanding of the characteristics of neuromorphic circuit elements.
Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

**Content**

- **Objective**: Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability 1) to select appropriate software, 2) to apply it for solving given problems, 3) to validate the results, 4) to interactively improve the models until sufficiently accurate results are obtained.

- **Content**: Since the fabrication and characterization of micro- and nanostructures is difficult, expensive, and time-consuming, numerical modelling drastically reduced the design process. Although many commercial software packages are available, it is important to know the drawbacks and difficulties of the numerical methods behind them and to be able to validate the results obtained with such packages.

**Literature**

- Lecture notes and references therein.

**Prerequisites / notice**

- Particular: The course is highly recommended for those who intend to take the spring semester course ‘Neuromorphic Engineering II’, that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Objective

Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within manmade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

Content

Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

Lecture notes

All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

376-1219-00L Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions

Abstract

Rehab. Engineering is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective

Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

Content

Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces
This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built with the help of micro/nanotechnology. The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having a background in the life sciences. The course should familiarize the students with the techniques used in micro/nanotechnology and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and medical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard-disk drive heads, and in turn provides a route to performing chemistry and biology in an ultra-fast and high-efficiency manner.

**Prerequisites / notice**

Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich
- Students of other departments, faculties, courses are also welcome

**Introductory Books:**

**Selected Journal Articles and Web Links:**

**Abstract**

This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard-disk technology for biosensing and scanning microfluidics for analyzing tissue sections are just a few examples of the covered topics.

**Objective**

The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having a background in the life sciences. The course should familiarize the students with the techniques used in micro/nanotechnology and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and medical applications. The second objective is to have life students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

**Content**

Mostly formal lectures (2 x 45 min), with a 2 hour visit and introduction to cleanroom and micro/nanotechnology instruments, last 3 sessions would be dedicated to the presentation and evaluation of projects by students (3 students per team).

**Prerequisites / notice**

Nanotech center and lab visit at IBM would be mandatory, as well as attending the student project presentations.

**Data:** 06.10.2017 12:56

**Autumn Semester 2015**

Page 250 of 1432
Objective

In the course students will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis. A design workshop will allow students to develop new microscale flow processes by appreciating the dominant physics at the microscale. The application of these basic ideas will primarily focus on biological problems and will include a treatment of diagnostic devices for use at the point-of-care, advanced functional material synthesis, DNA analysis, proteomics and cell-based assays. Lectures, assignments and the design workshop will acquaint students with the state-of-the-art in applied microfluidics.

Content

Specific topics in the course include, but not limited to:

1. Theoretical Concepts
   - Features of mass and thermal transport on the microscale
   - Key scaling laws
2. Microfluidic Device Manufacture
   - Conventional lithographic processing of rigid materials
   - Soft lithographic processing of plastics and polymers
   - Mass fabrication of polymeric devices
3. Unit operations and functional components
   - Analytical separations (electrophoresis and chromatography)
   - Chemical and biological synthesis
   - Sample pre-treatment (filtration, SPE, pre-concentration)
   - Molecular detection
4. Design Workshop
   - Design of microfluidic architectures for PCR, distillation & mixing
5. Contemporary Applications in Biological Analysis
   - Microarrays
   - Cellular analyses (single cells, enzymatic assays, cell sorting)
   - Proteomics
6. System integration
   - Applications in radiochemistry, diagnostics and high-throughput experimentation

Lecture notes

Lecture handouts, background literature, problem sheets and notes will be provided electronically.

Abstract

Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Objective

1. Insight Into The Mammalian Cell Cycle. Cycling, The Balance Between Proliferation and Cancer - Implications For Biopharmaceutical Manufacturing.
2. The Licence To Kill. Apoptosis Regulatory Networks - Engineering of Survival Pathways To Increase Robustness of Production Cell Lines.
5. From Target To Market. An Antibody's Journey From Cell Culture to Development of Biological Weapons?
9. 6.    System integration
   - Physical work
   - Respiratory system
   - Immune system and lymphoid organs
   - Musculoskeletal system, Muscle contraction
   - Blood, Blood vessels
   - Immune system and lymphoid organs
   - Heart
   - Cardiovascular system
   - Respiratory system
   - Acid-Base-Homeostasis
   - Physical work

Lecture notes

Handouts during the course.

Editorial note: This document contains information about academic courses and programs, including course descriptions, objectives, and prerequisites. It is structured to be easily absorbed by students and instructors alike. The material is presented in a clear and concise manner, allowing for easy navigation through the various sections. The courses cover a wide range of topics, from basic techniques in cell and molecular biology to advanced concepts in image formation, perception, and analysis. The focus is on providing students with a comprehensive understanding of the field, along with practical exposure to laboratory techniques. The document also highlights the interdisciplinary nature of biomedical engineering, with courses that integrate biology, physics, and engineering principles.
### Methods & Models for fMRI Data Analysis

#### Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

#### Content
Synchronous-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

<td>Abstract</td>
<td>Physical modelling plays an important role in the analysis and design of new structures, especially for micro and nano devices where fabrication and measurement are difficult. After the fundamentals of electromagnetics, mechanics, and thermodynamics, an introduction to the main concepts and most widely used codes for physical modelling is given and commercial codes are applied.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Objective**

Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability 1) to select appropriate software, 2) to apply it for solving given problems, 3) to validate the results, 4) to interactively improve the models until sufficiently accurate results are obtained.
**Content**

Since the fabrication and characterization of micro- and nanostructures is difficult, expensive, and time-consuming, numerical modelling drastically reduced the design process. Although many commercial software packages are available, it is important to know the drawbacks and difficulties of the numerical methods behind them and to be able to validate the results obtained with such packages. First, an introduction to the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics is given. This is important for understanding the problems to be analyzed and for validating results obtained from software packages. After this, the main concepts of numerical methods and of the most widely used codes for physical modelling are outlined and compared, which is essential for the adequate selection of software for solving given problems. After this, prominent commercial software packages are applied to various types of problems, ranging from electrodymanics to multiphysics. For becoming able to select appropriate software and to validate the results obtained, different commercial software packages will be used and compared during the exercises in form of small projects.

**151-0105-00L** Quantitative Flow Visualization

**Abstract**

The course provides an introduction to digital image analysis in modern flow diagnostics. Different techniques which are discussed include image velocimetry, laser induced fluorescence, liquid crystal thermography and interferometry. The physical foundations and measurement configurations are explained. Image analysis algorithms are presented in detail and programmed during the exercises.

**Objective**

Understanding of hardware and software requirements and solutions.

**Content**

- Fundamentals of optics, flow visualization and electronic image acquisition.
- Frequently used image processing techniques (filtering, correlation processing, FFTs, color space transformations).
- Image Velocimetry (tracking, pattern matching, Doppler imaging).
- Surface pressure and temperature measurements (fluorescent paints, liquid crystal imaging, infrared thermography).
- Laser induced fluorescence. (Digital) Schlieren techniques, phase contrast imaging, interferometry, phase unwrapping.
- Wall shear and heat transfer measurements.
- Pattern recognition and feature extraction, proper orthogonal decomposition.

**Lecture notes**

available

**Prerequisites / notice**

Prerequisites: Fluidodynamics I, Numerical Mathematics, programming skills.

Language: German on request.

**375-1279-00L** Virtual Reality in Medicine

**Abstract**

Virtual Reality has the potential to support medical training and therapy. This lecture will derive the technical principles of multi-modal (audiospatial, haptic, tactile etc.) input devices, displays and rendering techniques. Examples are presented in the fields of surgical training, intra-operative augmentation, and rehabilitation. The lecture is accompanied by practical courses and excursions.

**Objective**

Provide theoretical and practical knowledge of new principles and applications of multi-modal simulation and interface technologies in medical education, therapy, and rehabilitation.

**Content**

- Virtual Reality has the potential to provide descriptive and practical information for medical training and therapy while relieving the patient and/or the physician. Multi-modal interactions between the user and the virtual environment facilitate the generation of high-fidelity sensory impressions, by using not only visual and auditory modalities, but also kinesthetic, tactile, and even olfactory feedback. On the basis of the existing physiological constraints, this lecture will derive the technical requirements and principles of multi-modal input devices, displays, and rendering techniques. Several examples are presented that are currently being developed or already applied for surgical training, intra-operative augmentation, and rehabilitation. The lecture will be accompanied by several practical courses on graphical and haptic display devices as well as excursions to facilities equipped with large-scale VR equipment.

**Literature**

**Prerequisites / notice**

The course language is English.

Basic experience in Information Technology and Computer Science will be of advantage.

More details will be announced in the lecture.

**151-0605-00L** Nanosystems

**Abstract**

From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles. Intermolecular forces, their macroscopic manifestations, and ways to control such interactions. Self-assembly and directed assembly of 2D and 3D structures. Special emphasis on the emerging field of molecular electronic devices.

**Objective**

Familiarize students with basic science and engineering principles governing the nano domain.

**Content**

- The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics that are traditionally taught separately.
- Special emphasis is placed on the emerging field of molecular electronic devices, their working principles, applications, and how they may be assembled.

Topics are treated in 2 blocks:

(I) From Quantum to Continuum

From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale

Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.

Self-assembly and directed assembly of 2D and 3D structures.

Prerequisites / notice

Course format:
Lectures and Mini-Review presentations: Thursday 10-13, ML F 36

Homework: Mini-Reviews
Students select a paper (list distributed in class) and expand the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper.

252-0543-01L

Computer Graphics

Abstract
This course covers some of the fundamental concepts of computer graphics, namely 3D object representations and generation of photorealistic images from digital representations of 3D scenes.

Objective
At the end of the course the students will be able to build a rendering system. The students will study the basic principles of rendering and image synthesis techniques, covering topics such as lightfields and depth-image based rendering.

Content
This course covers fundamental concepts of modern computer graphics. Students will learn about 3D object representations and the details of how to generate photorealistic images from digital representations of 3D scenes. Starting with an introduction to 3D shape modeling and representation, texture mapping and ray-tracing, we will move on to acceleration structures, the physics of light transport, appearance modeling and global illumination principles and algorithms. We will end with an overview of modern image-based image synthesis techniques.

Lecture notes
no

Prerequisites / notice
Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++, Visual Computing course recommended. The programming language will be in C++. This will not be taught in the class.

402-0674-00L

Physics in Medical Research: From Atoms to Cells

Abstract
Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epidermal growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple monolayers to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

Objective
The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

227-1033-00L

Neuromorphic Engineering I

Abstract
This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Objective
Understanding the characteristics of neuromorphic circuit elements.

Content
Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on the properties of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characteristics of neuromorphic circuits, from elementary devices to systems.

Literature
S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

Prerequisites / notice
Particular: The course is highly recommended for those who intend to take the spring semester course 'Neuromorphic Engineering II', that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

227-1037-00L

Introduction to Neuroinformatics

Abstract
This course covers some of the fundamental concepts of computer graphics, namely 3D object representations and generation of photorealistic images from digital representations of 3D scenes.

Objective
At the end of the course the students will be able to build a rendering system. The students will study the basic principles of rendering and image synthesis techniques, covering topics such as lightfields and depth-image based rendering.

Content
This course covers fundamental concepts of modern computer graphics. Students will learn about 3D object representations and the details of how to generate photorealistic images from digital representations of 3D scenes. Starting with an introduction to 3D shape modeling and representation, texture mapping and ray-tracing, we will move on to acceleration structures, the physics of light transport, appearance modeling and global illumination principles and algorithms. We will end with an overview of modern image-based image synthesis techniques.

Lecture notes
no

Prerequisites / notice
Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++, Visual Computing course recommended. The programming language will be in C++. This will not be taught in the class.
Abstract
The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

Objective
Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

Content
This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

This course offers an introduction into the structure and function of the human body, and how these are interlinked with one another. Focusing on physiology, the visualization of anatomy is supported by 3D-animation, Computed Tomography and Magnetic Resonance imaging.

Abstract
This course offers an introduction into the structure and function of the human body, and how these are interlinked with one another. Anatomical nomenclature, axes, planes, and orientations, as well as musculoskeletal, neurological, circulatory, respiratory, immune, lymphoid, cardiovascular, and acid-base systems will be discussed. The human body is the starting point for understanding clinical relevance and medical terminology used in medical and research.

Objective
To understand basic principles and structure of the human body in consideration of the clinical relevance and the medical terminology used in medical work and research.

Content
- The human body: nomenclature, axes, planes, orientations
- Musculoskeletal system, Muscle contraction
- Blood, Blood vessels
- Immune system and lymphoid organs
- Heart
- Cardiovascular system
- Respiratory system
- Acid-Base-Homeostasis
- Physical work

Abstract
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

Objective
To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

Content
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

227-0447-00L Image Analysis and Computer Vision W 6 credits 3V+1U G. Székely, O. Göksel, L. Van Gool

Abstract
Light and perception. Digital image formation. Image enhancement and feature extraction. Unitary transformations. Color and texture, Image segmentation and deformable shape matching. Motion extraction and tracking. 3D data extraction. Invariant features. Specific object recognition and object class recognition.

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.
The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Lecture notes
Course material Script, computer demonstrations, exercises and problem solutions
Prerequisites / notice
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.
The course language is English.

227-0965-00L Micro and Nano-Tomography of Biological Tissues
W 4 credits 3G W. Stampapani, K. S. Mader
Abstract
The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.
Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.
Content
Synchrontron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrontron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrontron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.
Lecture notes
Available online

376-1651-00L Clinical and Movement Biomechanics
W 4 credits 3G S. Lorenzetti, R. List, N. Singh
Abstract
Measurement and modeling of the human movement during daily activities and in a clinical environment.
Objective
The students are able to analyse the human movement from a technical point of view, to process the data and perform modelling with a focus towards clinical application.
Content
This course includes ethical considerations, measurement techniques, clinical testing, accessing movement data and anyis as well as modeling with regards to human movement.

376-1985-00L Trauma Biomechanics
W 4 credits 2V+1U K.U. Schmitt, M. H. Muser
Abstract
Trauma biomechanics in an interdisciplinary research field investigating the biomechanics of injuries and related subjects such as prevention. The lecture provides an introduction to the basic principles of trauma biomechanics.
Objective
Introduction to the basic principles of trauma biomechanics.
Content
This lecture serves as an introduction to the field of trauma biomechanics. Emphasis is placed on the interdisciplinary nature of impact biomechanics, which uses the combination of fundamental engineering principles and advanced medical technologies to develop injury prevention measures. Topics include: accident statistics and accident reconstruction, biomechanical response of the human to impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations using multi-body and finite element modelling techniques, aspects of passive safety of vehicles (focusing on restraint systems and vehicle compatibility). Real world examples mainly from automobile safety are used to augment lecture material.
Lecture notes
Available via homepage.

Prerequisites:
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.
The course language is English.

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 258 of 1432
The lecture deals with constitutive models that are relevant for design and calculation of structures. These include anisotropic linear elasticity, linear viscoelasticity, plasticity, viscoplasticity. Homogenization theories and laminate theory are presented. Theoretical models are complemented by examples of engineering applications and experiments.

Objective
Basic theories for solving continuum mechanics problems of engineering applications, with particular attention to material models.

Content

Microrobotics

Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course students are expected to submit assignments. The course concludes with an end-of-semester examination.

Objective
The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content
Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes
The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

Prerequisites / notice
The lecture will be taught in English.

151-0605-00L

Nanosystems

From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles. Intermolecular forces, their macroscopic manifestations, and ways to control such interactions. Special emphasis is placed on the emerging field of molecular electronic devices. Self-assembly and directed assembly of 2D and 3D structures.

Objective
Familiarize students with basic science and engineering principles governing the nano domain.

Content
The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics that are traditionally taught separately. Special emphasis is placed on the emerging field of molecular electronic devices, their working principles, applications, and how they may be assembled.

Topics are treated in 2 blocks:

(I) From Quantum to Continuum
- From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale
- Intermolecular forces, their macroscopic manifestations, and ways to control such interactions. Self-assembly and directed assembly of 2D and 3D structures.

Literature

Prerequisites / notice
The lecture will be taught in English.

Course format:
Lectures and Mini-Review presentations: Thursday 10-13, ML F 36
Homework: Mini-Reviews. Students select a paper (list distributed in class) and expand the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper.

227-2037-00L

Physical Modelling and Simulation

Physical modelling plays an important role in the analysis and design of new structures, especially for micro and nano devices where fabrication and measurement are difficult. After the fundamentals of electromagnetics, mechanics, and thermodynamics, an introduction to the main concepts and most widely used codes for physical modelling is given and commercial codes are applied.

Objective
Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability 1) to select appropriate software, 2) to apply it for solving given problems, 3) to validate the results, 4) to interactively improve the models until sufficiently accurate results are obtained.
Since the fabrication and characterization of micro- and nanostructures is difficult, expensive, and time-consuming, numerical modelling drastically reduced the design process. Although many commercial software packages are available, it is important to know the drawbacks and difficulties of the numerical methods behind them and to be able to validate the results obtained with such packages. First, an introduction to the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics is given. This is important for understanding the problems to be analyzed and for validating results obtained from software packages. After this, the main concepts of numerical methods and of the most widely used codes for physical modelling are outlined and compared, which is essential for the adequate selection of software for solving given problems. After this, prominent commercial software packages are applied to various types of problems, ranging from electrodynamics to multiphysics. For becoming able to select appropriate software and to validate the results obtained, different commercial software packages will be used and compared during the exercises in form of small projects.

### Content

**Introduction to Finite Elements and Sparse Linear Systems**

**System Solving**

The finite element (FE) method is the method of choice for (approximately) solving partial differential equations on complicated domains. In the first third of the lecture, we give an introduction to the method. The rest of the lecture will be devoted to methods for solving the large sparse linear systems of equation that a typical for the FE method. We will consider direct and iterative methods.

**Objective**

Students will know the most important direct and iterative solvers for sparse linear systems. They will be able to determine which solver to choose in particular situations.

**Content**

I. **THE FINITE ELEMENT METHOD**

1. Introduction, model problems.
2. 1D problems. Piecewise polynomials in 1D.
3. 2D problems. Triangulations. Piecewise polynomials in 2D.
5. Implementation aspects.

II. **DIRECT SOLUTION METHODS**

6. LU and Cholesky decomposition.
7. Sparse matrices.

III. **ITERATIVE SOLUTION METHODS**

9. Stationary iterative methods, preconditioning.
11. Incomplete factorization preconditioning.
12. Multigrid preconditioning.
13. Non-symmetric problems (GMRES, BiCGstab).

**Literature**

**Prerequisites / notice**

Prerequisites: Linear Algebra, Analysis, Computational Science.

The exercises are made with Matlab.

### 376-1103-00L

**Frontiers in Nanotechnology**

**Abstract**

Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.

**Objective**

Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to prove their nano-chemistry, nano-mechanics and other properties within manmade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

**Content**

Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.
Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions

W  3 credits  2V  R. Riener, R. Gassert, L. Marchal Crespo

Abstract
Rehab. Engineering is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

Content
Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces
Virtual Reality in Medicine

Introductory Books:

Selected Journal Articles and Web Links:

VideoTact, ForeThought Development, LLC. http://my.execpc.com/?dwysocki/videotac.html

Prerequisites / notice

Target Group:

- Students of higher semesters and PhD students of D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich

Students of other departments, faculties, courses are also welcome

376-1279-00L Virtual Reality in Medicine  n  W  3 credits  2V  R. Rienier, M. Harders

Virtual Reality has the potential to support medical training and therapy. This lecture will derive the technical principles of multi-modal (audiovisual, haptic, tactile etc.) input devices, displays and rendering techniques. Examples are presented in the fields of surgical training, intra-operative augmentation, and rehabilitation. The lecture is accompanied by practical courses and excursions.

Target Group:

- Students of higher semesters and PhD students of D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Movement Science and Sport
- Robotics, Systems and Control Master
- Medical Faculty, University of Zurich

Students of other departments, faculties, courses are also welcome!

Literature

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 262 of 1432
This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented.

P. Manser

This lecture introduces the basic principles of injury mechanics and rehabilitation focusing on sports injuries.

Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a current topic in biomechanics presented by speakers from academia and industry.

K. Maniura

Handouts can be downloaded.

W

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having a background in the life sciences. The course should familiarize the students with the techniques used in micro/nanotechnology and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and medical applications. The second objective is to have life students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

B. Helgason

A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

Prerequisites / notice

Lecture notes

G

A Laptop with MATLAB installed (v2009 or higher) and wireless internet access is mandatory. Two students can share a laptop if necessary. A MATLAB student version can be obtained at Stud-IDES for free.

376-1974-00L

Colloquium in Biomechanics

W

2 credits

2K

Current topics in biomechanics presented by speakers from academia and industry.

Getting insight into actual areas and problems of biomechanics.

376-2017-00L

Biomechanics of Sports Injuries and Rehabilitation

W

3 credits

2V

K.U. Schmitt, J. Goldhahn

This lecture introduces the basic principles of injury mechanics and rehabilitation focusing on sports injuries.

Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

Lecture notes

A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

Prerequisites / notice

402-0341-00L

Medical Physics I

W

6 credits

2V+1U

P. Manser

Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

Data: 06.10.2017 12:56
Autumn Semester 2015
Page 263 of 1432
The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

A script will be provided.

**Physics in Medical Research: From Atoms to Cells**

<table>
<thead>
<tr>
<th>Content</th>
<th>Objective</th>
</tr>
</thead>
</table>
| Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells. The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes. High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.
| The lecture is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour. As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced. The course deals with simple quantitative and graphical as well as more complex methods of biostatistics. Contents: Descriptive statistics, probability theory and design of experiments, testing hypotheses, confidence intervals, correlation, simple and multiple linear regression, analysis of variance, logistic regression, survival analysis (Kaplan-Meier curves and Cox-regression). Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body. Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function. 3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented. Visiting clinical research in a leading university hospital will show the usefulness of the lecture series. |

<td>Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks. In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science. Although &quot;Introduction to Bioinformatics I&quot; will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course &quot;Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms&quot; that will be offered in the following semester. Bioinformatics I will cover the following topics:</td>

**Introduction to Medical Physics**

The purpose of this course is to impart basic knowledge in radiobiology in order to handle ionizing radiation and to provide a basis for predicting the radiation risk.

**Radiobiology**

The purpose of this course is to impart basic knowledge in radiobiology in order to handle ionizing radiation and to provide a basis for predicting the radiation risk.

**Physics in Medical Research: From Atoms to Cells**

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitelial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

---

**Recommended Elective Courses**

These courses are particularly recommended for the Medical Physics track. Please consult your track advisor if you wish to select other subjects.

Data: 06.10.2017 12:56

Autumn Semester 2015
The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content
The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Lecture notes
Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice
Prerequisites:
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.

The course language is English.

227-0945-00L | Cell and Molecular Biology for Engineers I |

This course is part I of a two-semester course.
Abstract
The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

Objective
After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

Content
Lectures will include the following topics: DNA, chromosomes, RNA, protein, genetics, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer, development and stem cells.

In addition, three journal clubs will be held, where one/two publications will be discussed. For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication. These written documents will be graded, and count as 25% for the final grade.

Lecture notes
Scripts of all lectures will be available.

Literature

Molecular Bioengineering
Track Core Courses
During the Master program, a minimum of 12 CP must be obtained from track core courses.

Objective

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body.

465-0953-00L

Biosciences W 2 credits 2V+1U

Abstract

The course deals with simple quantitative and graphical as well as more complex methods of biostatistics. Contents: Descriptive statistics, probability theory and design of experiments, testing hypotheses, confidence intervals, correlation, simple and multiple linear regression analysis, analysis of variance, logistic regression, survival analysis (Kaplan-Meier curves and Cox-regression).

551-0103-00L

Objective

The goal of this course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Content

The focus is animal cells and the development of multicellular organisms with a clear emphasis on the molecular basis of cellular structures and phenomena. The topics include biological membranes, the cytoskeleton, protein sorting, energy metabolism, cell cycle and division, viruses, extracellular matrix, cell signaling, embryonic development and cancer research.

Lecture notes

The lectures are presented in the Powerpoint format. These are available on the WEB for ETH students over the netzh (Moodle). Some lectures are available on the ETH WEB site in a live format (Livestream) at the above WEB site.

Literature

Prerequisites / notice

Some of the lectures are given in the English language. Certain sections of the text-book must be studied by self-instruction.

551-1295-00L

Abstract

Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

Objective

Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.
Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and...
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

Biominalization is a multidisciplinary field. Topics dealing with biology, molecular and cell biology, solid state physics, mineralogy, crystallography, organic and physical chemistry, biochemistry, dentistry, oceanography, geology, etc. are addressed. The course covers definition and general concepts of biominalization (BM)/types of biominerals and their function / crystal nucleation and growth / biological induction of BM / control of crystal morphology, habit, shape and orientation by organisms / strategies of compartmentalization / the interface between biomolecules (peptides, polysaccharides) and the mineral phases / modern experimental methods for studying BM phenomena / inter-, intra, extra- and epidermal BM / organic templates and matrices for BM / structure of bone, teeth (vertebrates and invertebrates) and mollusk shells / calcification / solidification in diatoms, radiolarians and plants / calcium and iron storage / impact of BM on lithosphere and atmosphere / evolution / taxonomy of organisms.

1. Introduction and overview
2. Biominerals and their functions
3. Chemical control of biominalization
4. Control of morphology: Organic templates and additives
5. Modern methods of investigation of BM
6. BM in matrices: bone and nacre
7. Vertebrate teeth
8. Invertebrate teeth
9. BM within vesicles: calcite of coccoliths
10. Silica
11. Iron storage and mineralization

Lecture notes
Script with more than 600 pages with many illustrations will be distributed free of charge.

Literature
3) P. M. Dove, J. J. DeYoreo, S. Weiner (Eds.) Biominalization, Reviews in Mineralogy & Geochemistry Vol. 54, 2003

Prerequisites
No special requirements are needed for attending. Basic knowledge in chemistry and cell biology is expected.

376-1622-00L Practical Methods in Tissue Engineering W 5 credits 4P K. Würzt-Kozak, M. Zenobi-Wong

Objective
Teach MSc students the necessary skills for doing research in the fields of tissue engineering and regenerative medicine.

Abstract
Practical exercises and demonstrations on topics including sterilized cell culture, light microscopy and histology, protein and gene expression analysis, and viability assays are covered. The advantages of 3D cell cultures will be discussed and practical work on manufacturing and evaluating hydrogels and scaffolds for tissue engineering will be performed in small groups. In addition to practical lab work, the course will teach skills in data acquisition/analysis.

Lecture notes
A script will be provided.

402-0341-00L Medical Physics I W 6 credits 2V+1U P. Manser

Abstract
Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

Objective
Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

Content
The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the linear clinical accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

Lecture notes
A script will be provided.

535-0423-00L Drug Delivery and Drug Targeting W 2 credits 2V J.C. Leroux, D. Brambilla

Abstract
The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.

Objective
The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.

Content
The course covers the following topics: drug targeting and delivery principles, radiopharmaceuticals, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, delivery of active agents in tissue engineering, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices and novel trends in transdermal and nasal drug delivery.

Lecture notes
Selected lecture notes, documents and supporting material will be directly provided or may be downloaded using http://www.galenik.ethz.ch/teaching/drug_del_drug_targ

The website also displays additional information on peroral delivery systems, transdermal systems and systems for alternative routes (nasal, pulmonary) of delivery. These fields are covered in detail in the course Galenische Pharmazie II (Galenical Pharmacy II).

Literature

Further references will be provided in the course.

636-0507-00L Synthetic Biology II W 4 credits 4A S. Panke, Y. Benenson, J. Stelling

Abstract
7 months biological design project, during which the students are required to give presentations on advanced topics in synthetic biology (specifically genetic circuit design) and then select their own biological system to design. The system is subsequently modeled, analyzed, and experimentally implemented. Results are presented at an international student competition at the MIT (Cambridge).

Objective
The students are supposed to acquire a deep understanding of the process of biological design including model representation of a biological system, its thorough analysis, and the subsequent experimental implementation of the system and the related problems.

Content
Presentations on advanced synthetic biology topics (e.g. genetic circuit design), project selection, modeling of selected biological system, design space exploration, sensitivity analysis, conversion into DNA sequence, (DNA synthesis external) implementation and analysis of design, summary of results in form of scientific presentation and poster, presentation of results at the iGEM international student competition (www.igem.org).
The final presentation of the project is typically at the MIT (Cambridge, US). Other competing schools include regularly Imperial College, Cambridge University, Harvard University, UC Berkeley, Princeton University, CalTech, etc.

This project takes place between end of Spring Semester and beginning of Autumn Semester. Registration in April.

Please note that the number of ECTS credits and the actual work load are disconnected.

**Abstract**
The course introduces concepts of bioinformatics starting from first principles: DNA sequence alignment, phylogenetic tree inference, genome annotation, protein structure and function prediction. Key methods and algorithms are covered, including dynamic programming, Markov and Hidden Markov models, and molecular dynamics simulations. Practical applications and limitations are discussed.

**Objective**
The course aims at introducing the fundamental concepts and methods of bioinformatics. Emphasis is given to a deep understanding of the methods' foundations and limitations to enable critical evaluations and applications of bioinformatics tools in areas such as biotechnology and systems biology.

**Content**
Lecture topics:
1. Background: DNA, proteins, databases
2. Sequence alignments, dynamic programming
3. Evolutionary processes, Markov models, phylogenetic trees
4. Genome characteristics, Hidden Markov models, genome annotation
5. Protein structure and function, molecular modeling
6. Outlook: genomics and proteomics

**Lecture notes**
Course material will be made available at: http://www.csb.ethz.ch

**Abstract**
Basic concepts and mathematical tools to explore biochemical reaction kinetics and biological network dynamics.

**Objective**
The aim of the course is to provide an introductory overview of mathematical and computational methods to analyse biological network dynamics.

**Content**
1. Introduction to Mathematical Modeling
2. Introduction to Biochemical Reaction Modeling
3. Model Analysis: Phase Plane
4. Model Analysis: Linear Stability Analysis
5. Model Analysis: Bifurcation Analysis
6. Regulatory Feedback: Switches
7. Regulatory Feedback: Adaptation
8. Regulatory Feedback: Oscillations and Delay Equations
9. Receptor Signaling and Signaling Cascades
10. Network Properties: Sensitivity and Robustness
11. Introduction to Parameter Estimation

**Literature**

**Abstract**
Introduction into the field of microbial biotechnology, covering possible products, fermentation and downstream technology.

**Objective**
The student should be able to identify opportunities for microbial bioprocesses and to go through basic and advanced design procedures for microbial bioprocesses.

**Content**
Students will obtain a thorough overview over microbial biotech products and the elements of bioprocess design: cellular growth and its modelling; mass transfer in fermentation; bioreaction engineering; bioreactors; downstream processing

**Abstract**
Students are introduced to the basics of semiconductors, microelectronics, microtechnology, and silicon process technology. They will get to know the fabrication of silicon-based microdevices and -systems by a sequence of defined batch processing steps as well as dedicated microfabrication processes.

**Objective**
Students are introduced to the basics of semiconductors, microelectronics, microtechnology, and silicon process technology. They will get to know the different fabrication methods for various microdevices and systems.

**Content**
Introduction to semiconductors, microelectronics, microtechnology, and micro electro mechanical systems (MEMS)

- Fundamentals of semiconductors
- Basics of microelectronics: transistor and diode.
- Silicon processing and fabrication steps
- Silicon crystal structure and manufacturing
- Thermal oxidation
- Doping via diffusion and ion implantation
- Photolithography
- Thin film deposition: dielectrics and metals
- Wet etching & bulk micromachining
- Dry etching & surface micromachining
- Microelectronics processing and fabrication sequence
- Packaging

**Lecture notes**
Handouts in English
626-0003-00L Molecular Biology W+ 6 credits 3G R. Paro

Abstract
This lecture course gives an in-depth view into molecular mechanisms controlling basic biological processes, ranging from genetic regulatory networks, the internal functional organization of a cell to the signaling events controlling cells in their social context. In the tutorials methods and techniques used in molecular biology to solve problems in biotechnology and medicine are reviewed.

Objective
The goal is to achieve a high level knowledge of basic biological processes, to learn the methodology to tackle questions in molecular biology and to interpret experimental molecular data. Emphasis is given to cellular processes amenable to studies in systems and synthetic biology.

Content
The molecular biology of basic biological processes of a cell will be presented from the inside-out; in the nucleus the structure and function of the genetic material will be introduced, the compartmentalization of the cytoplasm and its ensuing specialization will be presented and the physiological activities of cellular populations through their signaling and interactions will be analyzed.

The course will be emphasize the logic of experimental design, the application of relevant methodology and equipment and of data analysis.

The following chapters will be discussed:

1. Chromosomes and Genomes
2. Control of gene expression
3. From gene sequence to biopharmaceuticals
4. Membrane structure and function
5. Intracellular compartments and protein sorting
6. Mechanisms of cell communication
7. The cytoskeleton, cell junctions and extracellular matrix
8. Cell cycle control
9. Development and apoptosis
10. Cancer
11. Tissue renewal and stem cells
12. Project planning and implementation

The tutorials are focused on state-of-the-art methods and techniques of molecular biology. Students are trained how to prepare an oral scientific presentation.

Lecture notes
The Powerpoint presentations of the lectures as well as other course material relevant for an active participation will be made available online.

Literature

Abstract
Interdisciplinary Biotechnology Seminar

Objective
To provide a common frame of reference for all novel biotechnology students who have come to Basel.

Content
An overview of the scope of the 3rd year Biotechnology BSc.

Lecture notes
Hands out during the course.

Prerequisites / notice
Block course (Tuesday afternoon to Friday evening) at the beginning of the fall semester.

626-0010-00L Nanomachines of the Cell (Part I): Principles W+ 6 credits 2V+1U D. J. Müller

Abstract
Molecular biotechnology students will combine basic knowledge in molecular cell biology, biochemistry, proteomics, biophysics, bioinformatics, bionanotechnology and engineering to learn how the nanomachines of the cell works and to use this knowledge to address future molecular biotechnological and bionanotechnological questions. Particularly it will be addressed how biomolecular units can be char

Objective
Gain of an interdisciplinary research and development competence, which qualifies for scientific work (master's or doctoral thesis) as well as for work in the research and development department of a biotechnological company. The module is of general use in nano- and biotechnological courses of study focusing modern biomolecular technologies.
What are nanomachines of the cell? Understanding the cell as a complex factory. Are there engineering principles of the cell and if so what can we learn? Introducing new ways to understand and to apply engineering principles of cellular nanomachines in biotechnology and nanotechnology.

Designing molecular compounds that stabilize specific proteins. Designing molecular compounds that lead to protein destabilization, misfolding and denaturation.

Energy currencies of the cell. Energy conversion. Storable and transient forms of energy. Nature created a variety of light-driven ion pumps. How can we use this pumps, how can we modify them to our purpose? Employing light-driven ion pumps in biotechnology. Employing light-driven proton pumps adsorbing different wavelengths to boost the membrane gradient. How to create a synthetic membrane that allows no diffusion of ions. Transforming a proton into a chloride pump. Tuning the adsorption spectra of a light-driven ion pump. Engineering proton pumps as safety standards for credit cards and ID cards. Engineering proton pumps for holographic devices. Native and artificial light-activated ion channels. Engineering light-activated channels for their use in neuroscience: Optogenetics. ATP synthases convert transient into storiable energies. Experimental approaches to explore the nanoscopic rotary machinery of single ATP synthase. Are there ways to engineer and to exchange the building blocks of the ATP synthase? Ways to change to gear of ATP synthases and to 'tune' its fuel consumption. Engineering an artificial vesicular system to convert light into ion gradients to synthesize ATP. Engineering ATP synthases as nanopropellers to move vesicles. Engineering a light-frequency tuned proton pumps to control the speed of nanopropelled vesicles. Engineering light-driven ion pumps to power the synthetic ATP propellers and to steer vesicles. Engineering and employing ATP synthases as molecular mixing devices.

Principles of signal transduction. The family of G-protein coupled receptors (GPCRs). Structure and function of GPCRs. Engineering (and other) possibilities to manipulate the functional state of GPCRs.

Lecturenotes Literature

Hand out will be given to students at lecture.

Alberts et al: Molecular Biology of the cell
Molecular Virology, Modrov et al.; ISBN: 3-6274-1086-X, Spectrum Verlag, Heidelberg

Prerequisites / notice

The module is composed of 3 SWS (3 hours/week): 2-hour lecture, 1-hour seminar. For the seminar, students prepare oral presentations on specific in-depth subjects with under the guidance of the lecturer.

Optofluidics for Biological System Analysis

Systems Biology aims integrating data at various levels to realize predictive models of biological phenomena and to control biological systems via external stimuli. Combination of optics and microfluidics (hence optofluidics) provides a new platform for high-throughput quantitative analysis of biological systems such as molecules, organelles, cells and tissue, and allow performing complex experime
Abstract

Content

626-0513-00L Scientific Calculation  W  6 credits  3G  external organisers

626-0011-00L Linear Algebra with Applications to Systems Biology  W+  6 credits  3G  M. H. Khammash

Abstract

The course presents concepts and tools from linear algebra and linear programming together with applications to systems biology. The course builds on freshman courses Mathematical Foundations: Mathematical Analysis I and II.

Objective

To give the student a solid background in the theory and applications of linear algebra and linear programming with particular emphasis and motivating examples from systems biology.

Content

Matrices and inverses; LU factorization; subspaces; null space; independence; basis; dimension; rank; orthogonality and projections; eigenvalues and eigenvectors; diagonalization; positive definite matrices; SVD; linear programs; application to metabolic reaction networks will be integrated throughout the course.

Literature

Introduction to Linear Algebra, Fourth Edition, William Strang
Linear and nonlinear programming, David Leunberger

Laboratory Courses

The laboratory courses will be offered in spring semester only.

Compulsory Electives in Humanities, Social and Political Sciences

The Compulsory Electives in Humanities, Social and Political Sciences can be attended at the University of Basel (Faculty of Humanities as well as Faculty of Business and Economics) and/or at the University of Zürich.

| 636-0011-00L | Introduction to Biological Computers  | W+   | 6    | 3G    | Y. Benenson |
| Prerequisites: Synthetic Biology I (636-0002-00 L). Basic knowledge of molecular biology is assumed. |      |      |       |       |
Abstract

Biological computers are man-made biological networks that interrogate and control biological hosts—cells and organisms—in which they operate. Their key features, inspired by computer science, are programmability, modularity and versatility. The course will show how to rationally design, implement and test biological computers using molecular engineering, DNA nanothechnology and synthetic biology.

Objective

The course has the following objectives:

* Familiarize students with parallels between theories in computer science and engineering and information-processing in live cells and organisms

* Introduce basic theories of computation

* Introduce approaches to creating novel biological computing systems in non-living environment and in living cells including bacteria, yeast and mammalian/human cells.

The covered approaches will include
- Nucleic acids engineering
- DNA and RNA nanotechnology
- Synthetic biology and gene circuit engineering
- High-throughput genome engineering and gene circuit assembly

* Equip the students with computer-aided design (CAD) tools for biocomputing circuit engineering. A number of tutorials will introduce MATLAB SimBiology toolbox for circuit design and simulations

* Foster creativity, research and communication skills through semester-long "Design challenge" assignment in the broad field of biological computing and biological circuit engineering.
Lecture 1. Introduction: what is molecular computation (part I)?

* What is computing in general?
* What is computing in the biological context (examples from development, chemotaxis and gene regulation)
* The difference between natural computing and engineered biocomputing systems

Lecture 2: What is molecular computation (part II) + State machines

1st hour

* Detailed definition of an engineered biocomputing system
* Basics of characterization
* Design challenge presentation

2nd hour

* Theories of computation: state machines (finite automata and Turing machines)

Lecture 3: Additional models of computation

* Logic circuits
* Analog circuits
* RAM machines

Basic approaches to computer science notions relevant to molecular computation. (i) State machines; (ii) Boolean networks; (iii) analog computing; (iv) distributed computing. Design Challenge presentation.

Lecture 4. Classical DNA computing

* Adleman experiment
* Maximal clique problem
* SAT problem

Lecture 5: Molecular State machines through self-assembly

* Tiling implementation of state machine
* DNA-based tiling system
* DNA/RNA origami as a spin-off of self-assembling state machines

Lecture 6: Molecular State machines that use DNA-encoded tapes

* Early theoretical work
* Tape extension system
* DNA and enzyme-based finite automata for diagnostic applications

Lecture 7: Introduction to cell-based logic and analog circuits

* Computing with (bio)chemical reaction networks
* Turing computation with ultrasensitivity and cooperativity
* Specific examples

Lecture 8: Transcriptional circuits I

* Introducing transcription-based circuits
* General features and considerations
* Guidelines for large circuit construction

Lecture 9: Transcriptional circuits II

* Large-scale distributed logic circuits in bacteria
* Toward large-scale circuits in mammalian cells

Lecture 10: RNA circuits I

* General principles of RNA-centered circuit design
* Riboswitches and sRNA regulation in bacteria
* Riboswitches in yeast and mammalian cells
* General approach to RNAi-based computing

Lecture 11: RNA circuits II

* RNAi logic circuits
* RNAi-based cell type classifiers
* Hybrid transcriptional/posttranscriptional approaches

Lecture 12: In vitro DNA-based logic circuits

* DNAzyme circuits playing tic-tac-toe against human opponents
* DNA brain

Lecture 13: Advanced topics

* Engineered cellular memory
* Counting and sequential logic
* The role of evolution
* Fail-safe design principles
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Objective

The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Content

The class covers separation techniques that are central in the purification and downstream processing of chemicals and biopharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Liquid-liquid extraction; 2) Adsorption and chromatography; 3) Membrane processes; 4) Crystallization and precipitation.

Lecture notes

Handouts during the class.
This course focuses on the analysis of innovation as a pervasive process that cut across organizational and functional boundaries. It looks at the sources of innovation, at the tools and techniques that organizations deploy to routinely innovate, and the strategic implications of technical change.

Objective
This course intends to enable all students to:
- understand the core concepts necessary to analyze how innovation happens
- master the most common methods and tools organizations deploy to innovate
- develop the ability to critically evaluate the innovation process, and act upon the main obstacles to innovation

Content
This course looks at technology and innovation management as a process. Continuously, organizations are faced with a fundamental decision: they have to allocate resources between well-known tasks that reliably generate positive results; or explore new ways of doing things, new technologies, products and services. The latter is a high risk choice. Its rewards can be high, but the chances of success is small.

How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, guest speakers, simulations and group work.

Lecture notes
Slides will be available on the TIMGROUP website.

Literature
Readings will be available on the TIMGROUP website.

Prerequisites / notice
No specific background in economics or management is required.

<tr>
<td>Abstract</td>
<td>Microfluidics describes the behaviour, control and manipulation of fluids that are geometrically constrained within sub-microliter environments. The use of microfluidic devices offers an opportunity to control physical and chemical processes with unrivalled precision, and in turn provides a route to performing chemistry and biology in an ultra-fast and high-efficiency manner.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>In the course students will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis. A design workshop will allow students to develop new microscale flow processes by appreciating the dominant physics at the microscale. The application of these basic ideas will primarily focus on biological problems and will include a treatment of diagnostic devices for use at the point-of-care, advanced functional material synthesis, DNA analysis, proteomics and cell-based assays. Lectures, assignments and the design workshop will acquaint students with the state-of-the-art in applied microfluidics.</td>
<td></td>
<td></td>
<td></td>

Handouts provided during the classes and references therin.
### Content

Specific topics in the course include, but not limited to:

1. Theoretical Concepts
   - Features of mass and thermal transport on the microscale
   - Key scaling laws
2. Microfluidic Device Manufacture
3. Conventional lithographic processing of rigid materials
4. Soft lithographic processing of plastics and polymers
5. Mass fabrication of polymeric devices
6. Unit operations and functional components
7. Analytical separations (electrophoresis and chromatography)
8. Chemical and biological synthesis
9. Sample pre-treatment (filtration, SPE, pre-concentration)
10. Molecular detection
11. Design Workshop
12. Design of microfluidic architectures for PCR, distillation & mixing

### Lecture notes

Lecture handouts, background literature, problem sheets and notes will be provided electronically.

Further references will be provided in the course.
The focus of this first part of the lecture will be on the organisms, but also on the factors which determine spoilage and foodborne disease. The course can only be selected as 4th concept course. For students of the study programme Biology BSc the course is intended as an introduction to the fundamentals of food microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms. Results are presented at an international student competition at the MIT (Cambridge).
1. History of Food Microbiology
2. Short synopsis of foodborne microorganisms
3. Spolilage of Foods
4. Foodborne Disease
5. Food Preservation
6. VIP's of Food Microbiology
7. Overview of Microorganisms in Foods
8. Origin of foodborne Microorganisms
9. Bacteria
10. Yeasts
11. Molds
12. Microbial Spolilage of Foods
13. Intrinsic and Extrinsic Parameters
14. Meat, Seafoods, Eggs
15. Milk and Milk Products
16. Vegetable and Fruit Products
17. Miscellaneous (baked goods, nuts, spices, ready-to-eat products)
18. Drinks and Canned Foods
19. Foodborne Disease
20. Significance and Transmission of Foodborne pathogens
21. Staphylococcus aureus
22. Gram-positive Sporeformers (Bacillus & Clostridium)
23. Listeria monocytogenes
24. Salmonella, Shigella, Escherichia coli
25. Vibrio, Yersinia, Campylobacter
26. Brucella, Mycobacterium, Aeromonas, Plesiomonas
27. Parasites
28. Viruses and Bacteriophages
29. Mycotoxins
30. Bioactive Amines
31. Miscellaneous (Antibiotic-resistant Bacteria, Biofilms)

Lecture notes
Electronic copies of the presentation slides (PDF) will be made available for download.

<td>An Introduction to Probability Theory and Stochastic Processes with Applications to Biology</td>
<td>W</td>
<td>4</td>
<td>3G</td>
<td>A. Gupta</td>
</tr>
<tr>
<td>Abstract</td>
<td>Biology is becoming increasingly quantitative and mathematical modeling is now an integral part of biological research. In many biological processes, ranging from gene-expression to evolution, randomness plays an important role that can only be understood using stochastic models. This course will provide the students with a theoretical foundation for developing such stochastic models and analyzing reading based on their research interests.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The aim of this course is to introduce certain topics in Probability Theory and Stochastic Processes that have been specifically selected with an eye on biological applications. This course will teach students the tools and techniques for modeling and analyzing random phenomena. Throughout the course, several biological applications will be discussed and students will be encouraged to do additional reading based on their research interests.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The first half of the course will cover the basics of Probability Theory while the second half will delve into the theory of Stochastic Processes. Below is the list of topics that will be covered in the course.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>1. The mathematical representation of random phenomena: The probability space, properties of the probability measure, Independence of events, Conditional probability and Bayes formula, applications to parameter inference.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>3. Convergence of Random Variables: Modes of convergence, Laws of large numbers, the central limit theorem, the law of the iterated logarithm, Applications to the analysis of cell population data.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>7. Introduction to the theory of Martingales: Basic definitions, Martingale differences and Doob's inequalities, Martingale Convergence Theorem, Crossings and convergence, Stopping times and the optional sampling theorem, Applications to the analysis of stochastic biochemical reaction networks.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Prerequisites / notice</td>
<td>The course will involve a healthy balance between mathematical rigor (theorem proving) and biological applications. Students are expected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.</td>
<td></td>
<td></td>

<td>636-0017-00L</td>
<td>Molecular Evolution, Phylogenetics and Phylodynamics</td>
<td>W</td>
<td>4</td>
<td>3G</td>
<td>T. Stadler</td>
</tr>
<tr>
<td>Abstract</td>
<td>The aim of the course is to provide up-to-date knowledge on how we can obtain an understanding of the evolution and population dynamics of organisms based on their genetic sequencing data, employing key concepts from molecular evolution, phylogenetics and phylodynamics. Throughout the course, we tie the models and methods closely with applications, mainly in the field of epidemiology and evolution.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Objective
Attendees will learn what information is contained in genetic sequencing data and how this information is extracted from the sequencing data. The main concepts introduced are:
* models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics
* stochastic processes
Attendees will apply these concepts to a number of applications yielding biological insight into:
* epidemiology
* pathogen evolution
* macroevolution of species

Content
The course consists of three parts. We first introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Second, we employ these evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades.

Lecture notes
Slides of the lecture will be available online.

Literature
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics.

<tr>
<td>Content</td>
<td>This course uses compilers as example to expose modern software development techniques. The course introduces the students to the fundamentals of compiler construction. Students will implement a simple yet complete compiler for an object-oriented programming language for a realistic target machine. Students will learn the use of appropriate tools (parser generators): the implementation language is Java. Throughout the course, students learn to apply their knowledge of theory (automata, grammars, stack machines, program transformation) and well-known programming techniques (module definitions, design patterns, frameworks, software reuse) in a software project. Specific topics: Compiler organization. Lexical analysis. Top-down parsing via recursive descent, table-driven parsers, bottom-up parsing. Symbol tables, semantic checking. Code generation for a simple RISC machine: expression evaluation, straight line code, conditionals, loops, procedure calls, simple register allocation techniques. Storage allocation on the stack, parameter passing, runtime storage management, heaps. Special topics as time permits: introduction to global dataflow and its application to register allocation, instruction scheduling.</td>

Abstract
Course that focuses on an in-depth understanding of object-oriented programming and compares designs of object-oriented programming languages. Topics include different flavors of type systems, inheritance models, encapsulation in the presence of aliasing, object and class initialization, program correctness, reflection

Objective
After this course, students will:
- Have a deep understanding of advanced concepts of object-oriented programming and their support through various language features.
- Be able to understand language concepts on a semantic level and be able to compare and evaluate language designs.
- Be able to learn new languages more rapidly.
- Be aware of many subtle problems of object-oriented programming and know how to avoid them.

Content
The main goal of this course is to convey a deep understanding of the key concepts of sequential object-oriented programming and their support in different programming languages. This is achieved by studying how important challenges are addressed through language features and programming idioms. In particular, the course discusses alternative language designs by contrasting solutions in languages such as C++, C#, Eiffel, Java, Python, and Scala. The course also introduces novel ideas from research languages that may influence the design of future mainstream languages.

The topics discussed in the course include among others:
- The pros and cons of different flavors of type systems (for instance, static vs. dynamic typing, nominal vs. structural, syntactic vs. behavioral typing)
- The key problems of single and multiple inheritance and how different languages address them
- Generic type systems, in particular, Java generics, C# generics, and C++ templates
- The situations in which object-oriented programming does not provide encapsulation, and how to avoid them
- The pitfalls of object initialization, exemplified by a research type system that prevents null pointer dereferencing
- How to maintain the consistency of data structures

Literature
Will be announced in the lecture.

Prerequisites / notice
Mastering at least one object-oriented programming language (this course will NOT provide an introduction to object-oriented programming); programming experience

Abstract
This course surveys some of the main approaches to software verification, including axiomatic semantics, abstract interpretation, model checking, and testing.

Objective
After successfully taking this course, students will have a theoretical and practical understanding of:
- The principles behind fundamental software verification techniques, including Hoare-style axiomatic semantics, abstract interpretation, model checking, and testing.
- Application of the principles to the construction of verification tools, in particular program provers.
- Research challenges in these areas.

Content
The idea of software verification has been around for decades, but only recently have the techniques become mature enough to be implemented and be applicable in practice. Progress has been made possible by the convergence of different techniques, originally developed in isolation.

This course embraces this diversity of approaches, by surveying some of the main ideas, techniques, and results in software verification. These include in particular:

- Axiomatic semantics, which provides a foundation of program correctness proofs by supplying a rigorous semantics of programs.
- Abstract interpretation, which provides a general framework to express and design static techniques for program analysis.
- Model checking, which provides efficient techniques for the exhaustive exploration of state-based models of programs and reactive systems.
- Testing, which provides the counterpart to exhaustive techniques by defining dynamic analyses to detect programming mistakes and correct them.

To demonstrate some of the techniques in practice, the course will offer a practical project requiring the application of verification tools to illustrative examples.
Axiomatic semantics:

Abstract interpretation:

| Introduction to information retrieval with a focus on text documents and images. Main topics comprise extraction of characteristic features from documents, index structures, retrieval models, search algorithms, benchmarking, and feedback mechanisms. Searching the web, images and XML collections demonstrate recent applications of information retrieval and their implementation.

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 292 of 1432
The course examines how traditional information system architectures and technologies have been adapted to support various forms of mobile and personal information systems. Topics to be covered include: databases of mobile objects; context-aware services; opportunistic information sharing; ambient information; pervasive display systems.

Objectives
Students will be introduced to a variety of novel information services and architectures developed for mobile environments in order to gain insight into the requirements and processes involved in designing and developing such systems and learning to think beyond traditional information systems.

Content
Advances in mobile devices and communication technologies have led to a rapid increase in demands for various forms of mobile information systems where the users, the applications and the databases themselves may be mobile. Based on both lectures and breakout sessions, this course examines the impact of the different forms of mobility and collaboration that systems require nowadays and how these influence the design of systems, at the database, the application and the user interface level. For example, traditional data management techniques have to be adapted to meet the requirements of such systems and cope with new connection, access and synchronisation issues. As mobile devices have increasingly become integrated into the users’ lives and are expected to support a range of activities in different environments, applications should be context-aware, adapting functionality, information delivery and the user interfaces to the current environment and task. Various forms of software and hardware sensors may be used to determine the current context, raising interesting issues for discussion. Finally, user mobility, and the varying and intermittent connectivity that it implies, gives rise to new forms of dynamic collaboration that require lightweight, but flexible, mechanisms for information synchronisation and consistency maintenance. Here, the interplay of mobile, personal and social context will receive special attention.

252-0417-00L Randomized Algorithms and Probabilistic Methods

Abstract
Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks

Objective
After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.

Content
Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas.

Literature

252-0437-00L Distributed Algorithms

Abstract
Models of distributed computations, time space diagrams, virtual time, logical clocks and causality, wave algorithms, parallel and distributed graph traversals, consistent snapshots, mutual exclusion, election and symmetry breaking, distributed termination detection, garbage collection in distributed systems, monitoring distributed systems, global predicates.

Objective
Become acquainted with models and algorithms for distributed systems.

Content
Verteilte Algorithmen sind Verfahren, die dadurch charakterisiert sind, dass mehrere autonome Prozesse gleichzeitig Teile eines gemeinsamen Problems in kooperativer Weise bearbeiten und der dabei erforderliche Informationsaustausch ausschliesslich über Nachrichten erfolgt. Derartige Algorithmen kommen im Rahmen verteilter Systeme zum Einsatz, bei denen kein gemeinsamer Speicher existiert und die Übertragungsgeschwindigkeit von Nachrichten i.a. nicht vernachlässigt werden kann. Da dabei kein Prozess eine aktuelle konsistente Sicht des globalen Zustands besitzt, führt dies zu interessanten Problemen. Im einzelnen werden u.a. folgende Themen behandelt:
- Modelle verteilter Berechnungen; Raum-Zeit Diagramme; Virtuelle Zeit; Logische Uhren und Kausalität; Wellengrenzalgorithmen; Verteilte parallele Graphtraversierungen; Berechnung konsistenter Schnappschlüsse; Wechselseitiger Ausschluss; Elektion und Symmetriebrechung; Verteilte Terminierungen; Garbage-Collection in verteilten Systemen; Beobachten verteilter Systeme; Berechnung globaler Prädikate.

252-0463-00L Security Engineering

Abstract
Subject of the class are engineering techniques for developing secure systems. We examine concepts, methods and tools, applied within the different activities of the SW development process to improve security of the system. Topics: security requirements & risk analysis, system modeling & model-based development methods, implementation-level security, and evaluation criteria for secure systems

Objective
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include
- security requirements & risk analysis,
- system modeling and model-based development methods,
- implementation-level security, and
- evaluation criteria for the development of secure systems
Data engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class

2. Requirements Engineering: Security Requirements and some Analysis
   - overview: functional and non-functional requirements
   - use cases, misuse cases, sequence diagrams
   - safety and security
   - FMEA, FTA, attack trees

3. Modeling in the design activities
   - structure, behavior, and data flow
   - class diagrams, statecharts

4. Model-driven security for access control (design)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience

5. Model-driven security (Part II)
   - Continuation of above topics

6. Security patterns (design and implementation)

7. Implementation-level security
   - buffer overflows
   - Input checking
   - Injection attacks

8. Testing
   - overview
   - model-based testing
   - testing security properties

9. Risk analysis and management 1 (project management)
   - "risk": assets, threats, vulnerabilities, risk
   - risk assessment: quantitative and qualitative
   - safeguards
   - generic risk analysis procedure
   - The OCTAVE approach

10. Risk analysis: IT baseline protection
    - Overview
    - Example

11. Evaluation criteria
    - CMM
    - systems security engineering CMM
    - common criteria

12. Guest lecture
    - TBA

Literature

- Further relevant books and journal/conference articles will be announced in the lecture.

Prerequisites / notice

Prerequisite: Class on Information Security

252-0523-00L  Computational Biology  W  6 credits  3V+2U  G. H. Gonnet

Abstract

Study of computational techniques, algorithms and data structures used to solve problems in computational biology. Topics: basic biology, string alignment, phylogeny (distance, character, parsimony), molecular evolution, multiple sequence alignment, probabilistic and statistical models, Markov models, microarrays, dynamic programming, maximum likelihood and specialized DNA and protein analysis.

Objective

Familiarize the students with the basic concepts of molecular biology and the models and algorithms used to understand, classify and predict behaviour of living organism. This course is at the most basic level, where the main issues, mostly of molecular sequences, are studied.

Content

This course lies in the intersection between Computer Science and Molecular Biology. The main purpose is to study computational techniques, algorithms and data structures which are usually applied to solve problems in Molecular Biology and Biochemistry. The following topics are likely to be covered: Introduction, mathematical models of evolution, protein and DNA sequence alignment and its meaning, phylogenetic tree construction, multiple sequence alignments, secondary structure prediction, molecular dynamics, threading, role of bioinformatics in drug design, etc. From the computer science point of view we concentrate our attention in practical solutions for the above problems. Biological knowledge is an asset but not a prerequisite.

252-0527-00L  Probabilistic Graphical Models for Image Analysis  W  4 credits  3G

Abstract

2015 Autumn Semester
Abstract

This course will focus on the algorithms for inference and learning with statistical models. We use a framework called probabilistic graphical models which include Bayesian Networks and Markov Random Fields.

We will use examples from traditional vision problems such as image registration and image segmentation, as well as recent problems such as object recognition.

Objective

Students will be introduced to probabilistic graphical models and will learn how to apply them to problems in image analysis and understanding. The focus will be to study various algorithms for inference and parameter learning.

Literature

Will be announced during the lecture.

Content
The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a particularly well-suited model for the behaviour and interaction of such selfish users and programs. Classical game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

Outline:
- Introduction to classical game theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- The cost difference between an optimum under central control and an equilibrium under selfish agents, known as the "price of anarchy".
- Auction-like mechanisms and algorithms that "direct" the actions of selfish agents into a certain desired equilibrium situation.
- Selected current research topics of Algorithmic Game Theory, such as Web-Search Based Keyword Auctions, or Information Cascading in Social Networks

Lecture notes
No lecture notes.

Literature
"Game Theory and Strategy", Philip D. Straffin, The Mathematical Association of America, 5th printing, 2004

Prerequisites / notice
Several copies of both books are available in the Computer Science library.

Audience: Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.

Requirements: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.

252-1411-00L Security of Wireless Networks W 5 credits 2V+1U+1A S. Capkun
Abstract
Core Elements: Wireless communication channel, Wireless network architectures and protocols, Attacks on wireless networks, Protection techniques.
Objective
After this course, the students should be able to: describe and classify security goals and attacks in wireless networks; describe security architectures of the following wireless systems and networks: 802.11, GSM/UMTS, RFID, ad hoc/sensor networks; reason about security protocols for wireless network; implement mechanisms to secure 802.11 networks.
Content

252-1414-00L System Security W 5 credits 2V+2U S. Capkun, A. Perrig
Abstract
The first part of the lecture covers individual system's aspects starting with tamperproof or tamperresistant hardware in general over operating system related security mechanisms to application software systems, such as host based intrusion detection systems. In the second part, the focus is on system design and methodologies for large projects.
Objective
In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.
Content
The first part of the lecture covers individual system's aspects starting with tamperproof or tamperresistant hardware in general over operating system related security mechanisms to application software systems such as host based intrusion detection systems. The main topics covered are: tamper resistant hardware, CPU support for security, protection mechanisms in the kernel, file system security (permissions / ACLs / network filesystem issues), IPC Security, mechanisms in more modern OS, such as Capabilities and Zones, Libraries and Software tools for security assurance, etc.

In the second part, the focus is on system design and methodologies for large projects. The main question answered is how to get a large secure system. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security (java...), logging and auditing (BSM audit, dtrace, ...), cryptographic support, TCG, secure file systems, dos/windows/ windowsXP security issues.

Along the lectures, model cases will be elaborated and evaluated in the exercises.

252-1425-00L Geometry: Combinatorics and Algorithms W 6 credits 2V+2U+1A B. Gärtner, M. Hoffmann, E. Welzl
Abstract
Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them algorithmically. The lecture addresses theoretical foundations concerning geometric structures. Central objects of interest are triangulations. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?)
Objective
The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area and in various application domains.
Content
Planar and geometric graphs, embeddings and their representation (Whitney's Theorem, canonical orderings, DCEL), polygon triangulations and the art gallery theorem, convexity in R^d, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chan's Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction), Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.

Lecture notes
yes

Literature

Prerequisites / notice
Prerequisites: The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH.

Outlook: In the following spring semester there is a seminar "Geometry: Combinatorics and Algorithms* that builds on this course. There are ample possibilities for Semester-, Bachelor- and Master Thesis projects in the area.

252-3610-00L Smart Energy W 3 credits 2G F. Mattern, V. Tiefenbeck
Abstract
The lecture covers the role of ICT for sustainable energy usage. Concepts of the emerging smart grid are outlined and approaches to motivate sustainable consumer choices are explained. The lecture combines technologies from ubiquitous computing and traditional ICT with insights from socio-psychological concepts and illustrates them with examples from actual applications.

</table>
Objective
Students are aware of current threats that Internet services and networked devices face and can explain appropriate countermeasures.
Students know fundamental network security concepts.
Students have an in-depth understanding of important security technologies.
Students know how to configure a real firewall and know some penetration testing tools from their own experience.

Content
Risk management and the vulnerability lifecycle of software and networked services are discussed. Threats like denial of service, spam, worms, and viruses are studied in-depth. Fundamental security related concepts like identity, availability, authentication and secure channels are introduced. State of the art technologies like secure shell, network and transport layer security, intrusion detection and prevention systems, cross-site scripting, secure implementation techniques and more for securing the Internet and web applications are presented. Several case studies illustrate the dark side of the Internet and explain how to protect against current threats. A hands-on computer lab that accompanies the lecture gives a deep dive on firewalls, penetration testing and intrusion detection.

This lecture is intended for students with an interest in securing Internet services and networked devices. Students are assumed to have knowledge in networking as taught in the Communication Networks lecture. This lecture and the exam are held in English.

Prerequisites / notice
Due to recent changes in the Swiss law, ETH requires each student of this course to sign a written declaration that he/she will not use the information given in this for illegal purposes. This declaration will have to be signed and submitted no later than at the beginning of the second lesson.

263-5001-00L
Introduction to Finite Elements and Sparse Linear System Solving

Abstract
The finite element (FE) method is the method of choice for (approximately) solving partial differential equations on complicated domains. In the first third of the lecture, we give an introduction to the method. The rest of the lecture will be devoted to methods for solving the large sparse linear systems of equation that a typical for the FE method. We will consider direct and iterative methods.

Objective
Students will know the most important direct and iterative solvers for sparse linear systems. They will be able to determine which solver to choose in particular situations.

Content

I. THE FINITE ELEMENT METHOD

(1) Introduction, model problems.
(2) 1D problems. Piecewise polynomials in 1D.
(3) 2D problems. Triangulations. Piecewise polynomials in 2D.
(4) Variational formulations. Galerkin finite element method.
(5) Implementation aspects.

II. DIRECT SOLUTION METHODS

(6) LU and Cholesky decomposition.
(7) Sparse matrices.
(8) Fill-reducing orderings.

III. ITERATIVE SOLUTION METHODS

(9) Stationary iterative methods, preconditioning.
(10) Preconditioned conjugate gradient method (PCG).
(11) Incomplete factorization preconditioning.
(12) Multigrid preconditioning.
(13) Nonsymmetric problems (GMRES, BiCGstab).
(14) Indefinite problems (SYMMLQ, MINRES).

Literature

Prerequisites / notice
Prerequisites: Linear Algebra, Analysis, Computational Science. The exercises are made with Matlab.

263-5150-00L
Scientific Databases

Abstract
Scientific databases share many aspects with classical DBs, but have additional specific aspects. We will review Relational DBs, Object Oriented DBs, Knowledge DBs, textual DBs and the Semantic Web. All these topics will be studied from the point of view of the scientific applications (Bioinformatics, Physics, Chemistry, Health, Engineering) A toy SDB will be used for exercises.

Objective
The goals of this course are to:
(a) Familiarize the students with how existing DBs can be used for scientific applications.
(b) Recognize the areas where SciDBs differ and require additional features compared to classical DBs.
(c) Be able to understand more easily SciDBs, improve existing ones or design/create new ones.
(d) Familiarize the students with at least two examples of SciDBs.
Content

1)  - Introduction, Statement of the problem, course structure, exercises, why Scientific DBs (SDBs) do not fit exactly the classical DB area. Efficiency issues and how they differ from classical DB.

2)  - Relational DB used for scientific data, pros/cons. Introduction to RDB, limitations of the model, basics of SQL, handling of metadata, examples of scientific use of RDBs.

3)  - Object Oriented DB. Rich/structured objects are very appealing in SDB. OODB primitives and environments. OODB searching, Space and access time efficiency of OODBs.

4)  - Knowledge bases, key-value stores, ontologies, workflow-based architectures. WASA.

5)  - MapReduce / Hadoop

6)  - Storing and sharing mathematical objects, Open Math, its relation with OODB and Knowledge bases. Also the problem of chemical formula representation.

7)  - SGML and XML, human-readable databases, genomic databases. Advantages of human-readable databases (the huge initial success of genomic databases).

8)  - Semantic web, Resource Description Framework (RDF) triples, SparQL. An example of very flexible database for knowledge storage. Goals of the Semantic Web, discussion about its future.

9)  - An ideal scenario (and the design of a toy system with most of the desired features for exploration and exercises).

11)  - Functional testing, Verifiers, Consistency, Short-circuit testing, Recovery and Automatic recovery, Backup (incremental) methods.

12)  - Performance and space issues, various uses of compression, concurrence control. Hardware issues, clusters, Cloud computing, Crowd-sourcing.

13)  - Guest speaker: Ioannis Xenarios (UniProtKB/Swiss-Prot).

Literature

Several papers and online articles will be made available. There is no single textbook for this course. A significant amount of material will be delivered in the lectures making lecture attendance highly recommended.

263-5200-00L Data Mining: Learning from Large Data Sets

Abstract

Many scientific and commercial applications require insights from massive, high-dimensional data sets. This courses introduces principled, state-of-the-art techniques from statistics, algorithms and discrete and convex optimization for learning from such large data sets. The course both covers theoretical foundations and practical applications.

Objective

Many scientific and commercial applications require us to obtain insights from massive, high-dimensional data sets. In this graduate-level course, we will study principled, state-of-the-art techniques from statistics, algorithms and discrete and convex optimization for learning from such large data sets. The course will both cover theoretical foundations and practical applications.

Content

Topics covered:
- Dealing with large data (Data centers; Map-Reduce/Hadoop; Amazon Mechanical Turk)
- Fast nearest neighbor methods (Shingling, locality sensitive hashing)
- Online learning (Online optimization and regret minimization, online convex programming, applications to large-scale Support Vector Machines)
- Multi-armed bandits (exploration-exploitation tradeoffs, applications to online advertising and relevance feedback)
- Active learning (uncertainty sampling, pool-based methods, label complexity)
- Dimension reduction (random projections, nonlinear methods)
- Data streams (Sketches, coresets, applications to online clustering)
- Recommender systems

Prerequisites / notice

Prerequisites: Solid basic knowledge in statistics, algorithms and programming. Background in machine learning is helpful but not required.

263-5210-00L Probabilistic Artificial Intelligence

Abstract

This course introduces core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as sensor networks, robotics, and the Internet.

Objective

How can we build systems that perform well in uncertain environments and unforeseen situations? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as sensor networks, robotics, and the Internet. The course is designed for upper-level undergraduate and graduate students.

Content

Topics covered:
- Search (BFS, DFS, A*), constraint satisfaction and optimization
- Tutorial in logic (propositional, first-order)
- Probability
- Bayesian Networks (models, exact and approximate inference, learning) - Temporal models (Hidden Markov Models, Dynamic Bayesian Networks)
- Reinforcement learning
- Combining logic and probability

Prerequisites / notice

Solid basic knowledge in statistics, algorithms and programming
The course will teach fundamental concepts of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in engineering and life sciences. Expansions will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multi-core architectures.

Content

Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modeling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Literature

1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Prerequisites / notice

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

151-0104-00L Uncertainty Quantification for Engineering & Life Sciences

Number of participants limited to 60.

Abstract

Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective

The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multi-core architectures.

Content

Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modeling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Literature

1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Prerequisites / notice

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

227-0778-00L Hardware/Software Codesign

W 6 credits 2V+2U L. Thiele

Abstract

The course provides advanced knowledge in the design of complex computer systems, in particular embedded systems. Models and methods are discussed that are fundamental for systems that consist of software and hardware components.

Objective

The course provides advanced knowledge in the design of complex computer systems, in particular embedded systems. Models and methods are discussed that are fundamental for systems that consist of software and hardware components.

Content

The course covers the following subjects: (a) Models for describing hardware and software components (specification), (b) Hardware-Software Interfaces (instruction set, hardware and software components, reconfigurable computing, heterogeneous computer architectures, System-on-Chip), (c) Application specific instruction sets, code generation and retargetable compilation, (d) Performance analysis and experimentation techniques, (e) System design (hardware-software partitioning and design space exploration), (d)

Literature

Material for exercises, copies of transparencies.

Prerequisites / notice

Prerequisites for the course is a basic knowledge in the following areas: computer architecture, digital design, software design, embedded systems.

401-0647-00L Introduction to Mathematical Optimization

W 5 credits 2V+1U R. Zenklusen

Abstract

Introduction to basic techniques and problems of mathematical optimization.

Objective

The goal is to get a good understanding of some of the most important mathematical optimization techniques used to linear programs and basic combinatorial optimization problems.

Content

Topics covered in this course include:

- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, network flows, knapsack problem, ...).

Literature

Information about relevant literature will be given in the lecture.

Prerequisites / notice

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics and more.

636-0007-00L Computational Systems Biology

W 6 credits 3V+2U J. Stelling

Abstract

Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

Objective

The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation, and analysis of biological networks. Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation, and analysis of biological networks. We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The seminar “Advanced Topics in Machine Learning” familiarizes students with recent developments in pattern recognition and machine learning. Original articles have to be presented and critically reviewed. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar presentation is to summarize the essential ideas of the paper in sufficient depth while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.</td>

</table>
The aim of this seminar is to introduce students to recent research results in the area of programming languages and software engineering. To accomplish that, students will study and present research papers in the area as well as participate in paper discussions. The papers will span topics in both theory and practice, including papers on program verification, program analysis, testing, programming language design, and development tools.

The publications to be presented will be announced on the seminar home page at least one week before the first session.

**Prerequisites / notice**
Organizational note: the seminar will meet only when there is a scheduled presentation. Please consult the seminar’s home page for information.

**263-4200-00L**  
**Seminar SAT**  
W 2 credits 2S  
E. Welzl

**Objective**  
Goal of this seminar is to study and present, in continuation of the course "Boolean Satisfiability-Combinatorics and Algorithms", research papers from the literature.

**Literature**  
A list of papers for presentations will be distributed at the beginning of the seminar.

**263-4203-00L**  
**Geometry: Combinatorics and Algorithms**  
W 2 credits 2S  
B. Gärtner, E. Welzl

**Objective**  
Each student is expected to read, understand, and elaborate on a selected research paper. To this end, (s)he should give a 45-min. presentation about the paper. The process includes:

* getting an overview of the related literature;
* understanding and working out the background/motivation:
  why and where are the questions addressed relevant?
* understanding the contents of the paper in all details;
* selecting parts suitable for the presentation;
* presenting the selected parts in such a way that an audience with some basic background in geometry and graph theory can easily understand and appreciate it.

**Prerequisites / notice**  
To attend the seminar, some basic knowledge in (discrete and computational) geometry and graphs and algorithms is required. Thus, previous participation in some of the courses "Graphs and Algorithms", "Computational Geometry", "Geometric Graphs: Combinatorics & Algorithms", or similar courses is strongly encouraged. It is also possible to take this seminar in parallel to the lecture "Computational Geometry".

**Abstract**
Principles and phenomena around radioactivity.

**Objective**
Knowledge of the most important phenomena in relation with radioactivity. Knowledge of the principles of radiation protection. Ability to judge dangerous situations in handling radioactive materials, geopolitically as well as locally at one's own working place.

**Content**
Structure and properties of atomic nuclei, mathematical description of the radioactive decay, decay types, interaction of radiation with matter, detectors for ionizing radiation, radiation protection, principles of isotope separation, nuclear power plants, major nuclear accidents.

Additional topics may be suggested by the students.

**Lecture notes**
A script is available free of charge.

**Abstract**
Fragrance Chemistry: A journey into the molecular world of scents from the chemical secrets behind Chanel N°5 to structure-odor relationships, industrial processes, and total synthesis of terpenoids. Each subunit is centered on one odorant family and highlights a certain class of chemical reactions, illustrated by prominent perfumery examples.

**Objective**
After completion of this lecture module the students know all the major perfumery materials of the important odor families with their academic and industrial syntheses, their olfactory properties, their usage, their historic perspective, and today’s economic importance. The students can approximate the conformational space of odorants and especially macrocycles on the basis of simple rules, and know how olfactophore models are used. The latter enables them to further their education in perfumery at specialized universities such as the ISIPCA in Versailles; yet, the student also knows about the links of Fragrance Chemistry with Pharmaceutical Chemistry and the Specialty Chemicals business in general.

## Examples of partial differential equations
- Classification of PDEs
- Superposition principle

## One-dimensional wave equation
- D'Alembert's formula
- Duhamel's principle

## Fourier series
- Representation of piecewise continuous functions via Fourier series
- Examples and applications

## Separation of variables
- Resolution of wave and heat equation
- Homogeneous and inhomogeneous boundary conditions, Dirichlet and Neumann boundary conditions

## Laplace equation
- Resolution of the Laplace equation on rectangle, disk and annulus
- Poisson formula
- Mean value theorem and maximum principle

## Fourier transform
- Derivation and Definition
- Inverse Fourier transformation and inversion formula
- Interpretation and properties of the Fourier transform

## Laplace transform
- Definition, motivation and properties
- Inverse Laplace transform of rational functions
- Application to ordinary differential equations

### Lecture notes
There are available some Lecture Notes in English and also in German of the Professor. These can be found following the links provided under the tab 'Lernmaterialien'.

### Literature
2) Y. Pinchover and J. Rubinstein, An Introduction to Partial Differential Equations, Cambridge University Press
3) E. Kreyszig, Advanced Engineering Mathematics, John Wiley & Sons (only Chapters 1,2,6,11)

### Prerequisites / notice
It is required a minimal background of: 1) multivariable functions (Riemann integrals in two or three variables, change of variables in the integrals through the Jacobian, partial derivatives, differentiability, Jacobian) 2) numerical and functional sequences and series, basic knowledge of ordinary differential equations.

**Abstract**
Introduction to the experimental methods of Inorganic Chemistry

**Objective**
The teaching laboratory offers an insight into different aspects of Inorganic Chemistry, including solid state chemistry, organometallic chemistry, kinetics, etc. The synthesis, characterization and analysis of inorganic compound are a main topic. Emphasis is given to scientific writing (experiment reports).

**Content**
Inorganic chemistry part: Synthesis and analysis of elemento-organic compounds, metal complexes, and organometallic compounds. Introduction to Schlenk techniques, solid state synthesis, and kinetics. Introduction in the chemistry library: literature data banks and collections of spectra.

Organic synthesis with organometallic compounds and catalysts: Experiments in the framework of a selected specialised project. Possible projects: Rh catalysed asymmetric hydrogenation of enamides, Mn-catalysed epoxidation of olefins, Cu catalysed Diels-Alder reactions, synthesis of organo-boron compounds and Pd catalysed coupling with halides, Ru catalysed transfer hydrogenation.

**Lecture notes**
A manual is distributed in the teaching laboratory.

**Prerequisites**
- Practical Course General Chemistry (1. Semester, 529-0011-04)
- Practical Course Inorg. and Org. Chemistry I (2. Sem., 529-0230)
- Attendance of Course Inorg. Chemistry 1 (3. Sem., 529-0121)

If necessary, access priority will be settled according to the results of the first-year examinations.

Physical Chemistry IV: Magnetic Resonance

ECTS

Type

Hours

ECTS

B. H. Meier, M. Ernst, G. Jeschke, R. Riek

Abstract

Theoretical foundations of magnetic resonance (NMR,EPR) and selected applications.

Objective

Introduction to magnetic resonance in isotropic and anisotropic phase.

Content

The course gives an introduction to magnetic resonance spectroscopy (NMR and EPR) in liquid, liquid crystalline and solid phase. It starts from a classical description in the framework of the Bloch equations. The implications of chemical exchange are studied and two-dimensional exchange spectroscopy is introduced. An introduction to Fourier spectroscopy in one and two dimensions is given and simple ‘pulse trickery’ is described. A quantum-mechanical description of magnetic resonance experiments is introduced and the spin Hamiltonian is derived. The chemical shift term as well as the scalar, dipolar and quadrupolar terms are discussed. The product-operator formalism is introduced and various experiments are described, e.g. polarization transfer. Applications in chemistry, biology, physics and medicine, e.g. determination of 3D molecular structure of dissolved molecules, determination of the structure of paramagnetic compounds and imaging (MRI) are presented.

Abstract

Laboratory experiments to acquire a profound knowledge of spectroscopical methods and techniques in chemistry. Evaluation and visualization of measurement data. Writing lab reports.

Objective

Laboratory experiments to acquire a profound knowledge of spectroscopical methods and techniques in chemistry. Evaluation and visualization of measurement data. Writing lab reports.

Content

Laboratory experiments: UV/VIS spectroscopy, luminescence spectroscopy, FT infrared spectroscopy, dye laser, light diffraction and refraction, laser ablation inductively coupled plasma mass spectrometry (LA-ICP-MS), FT nuclear magnetic resonance spectroscopy (NMR), electron paramagnetic resonance spectroscopy (EPR), atomic force microscopy (AFM), Fourier transform methods.

Lecture notes

Detailed documents to each experiment will be handed out.

Prerequisites / notice

529-0141-00L

Physical Methods for Inorganic Chemistry

W

6 credits

3G

D. Günther, J. Koch, R. Verel, M. D. Wörle

Abstract

Introduction into the important methods for structural analysis (solid state NMR), crystal structure analysis and surface analysis techniques and their applications.

Objective

Knowledge in solid state NMR, crystal structure analysis and surface analytical techniques relevant for inorganic materials

Content

This lecture course consists of three parts 1) Solid state NMR 2) Surface and direct solid analysis 3) Crystal structure analysis. Most important fundamentals of the individual methods will be presented and details will be explained on most relevant inorganic applications

Lecture notes

Will be given during the lectures

529-0441-00L

Signal Processing

W

6 credits

3G

G. Jeschke, M. Yulikov

Abstract

Introduction of the basics of signal processing in spectroscopy. Fourier transformation, linear response theory, stochastic signals, digital data processing, Fourier spectroscopy.

Objective

Basics of signal processing in spectroscopy

Content

Lecture notes

Script available

Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics

W

6 credits

3G

R. Zenobi, M. Badertscher, B. Hattendorf, P. Martinez-Lozano Sinues

Abstract

Modern mass spectrometry, hyphenated analytical methods, speciation, methods of surface analysis, chemometrics.

Objective

Comprehensive knowledge about the analytical methods introduced in this course, and their applications.

Content

Coupling of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: Time of flight and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Methods of surface analysis (ESCA, Auger, SIMS, raster microscopy methods). Employment of computer science for processing data in chemical analysis (chemometrics).

Lecture notes

lecture notes will be available in the lecture at production cost.

Literature

Information about relevant literature will be available in the lecture & in the lecture notes.

Abstract
Chain-growth polymerizations (anionic, cationic, Ziegler/Natta, ROMP, radical, NMP, ATRP, RAFT), mechanistic details including how to render a polymerization "living", recent developments, and important examples.

Objective
The students should gain an overview of important polymerization procedures, learn how to deal with chemical structures and reactivities, and be able to suggest reasonable synthetic pathways to a given polymer structure. Aspects like achievable molar masses in dependence of the method used and structure perfection play a role throughout.

Content

I. Anionic polymerization
1. General
2. Living polymerization
3. Group transfer polymerization (GTP)
4. Some recent developments

II. Cationic polymerization
1. General
2. Some applications (macromonomer and telechelics)

III. Ziegler/Natta- and metallocene polymerization
1. General
2. Mechanism
3. Some applications

IV. Ring-opening metathesis polymerization
1. Comments on history
2. Monomers, catalysts, polymer structures
3. Mechanism, direct NMR monitoring
4. Termination
5. Examples

V. Controlled radical polymerization
1. Nitroxide mediated polymerization (NMP)
2. Atom transfer radical polymerization (ATRP)
3. Reversible addition fragmentation chain transfer polymerization (RAFT)

For step-growth procedures and other topics (dendrimers, bottle-brushes, macrocycles, polyrotaxanes, topochemical polymerizations etc.) see Advanced Polymer Synthesis

Abstract
Production and use of chemicals also introduces them into the environment. This course introduces chemistry students to environmental chemistry, ecotoxicology and trace analysis.
Partitioning behavior and reactions of organic pollutants in the environment. Biodegradation, bioavailability and bioaccumulation. Ecotoxicological effects at the molecular level. Aspects of chemical trace analysis.

Objective
Goals:
* The students develop an understanding of the processes that govern the fate and effects of chemicals in the environment.
* The students know a number of methods for estimating the fate and effect of environmental pollutants. They recognize the relevant processes affecting a given compound and know how to use appropriate estimation methods for their quantification.
Content

Part I: Fate of Chemicals in the Environment:
Relevant environmental compartments and how chemicals reach the environment.
Partitioning in the environment:
- Meaning of vapor pressure, water solubility and air-water partition coefficient for environmental behavior
- Octanol-water partition coefficient as surrogate for partitioning into biological systems
- Influence of temperature and pH on partitioning
- Global distribution of semi-volatile chemicals
- Molecular interactions that govern partitioning
- Sorption to natural surfaces, partitioning into natural organic matter
Chemical and photochemical transformation reactions
Microbial transformation processes in the environment

Part II: Effects of chemicals in the environment
Biological test systems for assessing ecotoxicological effects
Endpoints of toxicity assessment:
- Acute and chronic toxicity, effects on reproduction
- Dose-response modeling
Bioavailability and bioaccumulation:
- Bioconcentration, biomagnification, food chain accumulation
- Active and passive uptake mechanisms
Molecular mechanisms of toxicity in cells:
- Baseline toxicity
- Specific toxicity (Examples: Inhibition of photosynthesis, neurotoxicity, including AchEsterase, ion channels etc.)
- Oxidative stress
- Genotoxicity

Part III: Specific aspects of trace analysis in the environment (soil, water, air)
Planning of analytical strategy and sampling
Enrichment procedures
Separation and detection
Quantification, screening for unknowns

Lecture notes
Copies of the slides and some articles are distributed

Literature

701-1233-00L

Abstract

Objective
The lecture gives an overview on the manifold reactions which occur in the gas phase, in stratospheric aerosol droplets and in polar cloud particles. The focus is on the chemistry of stratospheric ozone and its influence through natural and anthropogenic effects. Especially the intercontinental air traffic and the ozone depletion caused by FCKW CFC in the mid-latitude and the polar regions as well as coupling with the greenhouse effect.

Content
Short presentation of thermodynamical and kinetic basics of chemical reactions: bi- and thermo rmolecular reactions, photo-dissociation. Introduction to the chemical family concept: active species, their source gases and reservoir gases. Detailed treatment of the pure oxygen family (odd oxygen) according to the Chapman chemistry. Radical reactions of the oxygen species with nitric oxide, active halogens (chlorine and bromine) and odd hydrogen. Ozone depletion cycles. Methane depletion and ozone production in the lower stratosphere (photo-smog reactions). Heterogeneous chemistry on the background aerosol and its significance for heavy air traffic. Chemistry and dynamics of the ozone hole: Formation of polar stratospheric clouds and chlorine activation.

Lecture notes
Documents are provided in the contact hours.

Literature

Prerequisites / notice
Prerequisites: Basics in physical chemistry are required and an overview equivalent to the bachelor course in atmospheric chemistry (lecture 701-0471-01) is expected.

701-1233-00 V starts in the first week of the semester. The exercises 701-1233-00 U will start only in the 2nd week of the semester.

Compulsory Electives in Humanities, Social and Political Sciences

**ECTS**

European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
The course is targeted at advanced students who have taken an interest in gathering practical research experience in the field of Learning Research Methods in Educational Science.

In teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturers in this course. Basic conceptual and methodological issues are the topic of a series of plenary meetings; however, the major part of the work is done in small-group meetings with the advising researcher, and in self-directed research projects.

The successful completion of both course no. 851-0240-00L "Menschliches Lernen (EW 1)" and course no. 851-0238-01L "Unterstützung und Diagnose von Wissenserwerbsprozessen (EW 3)" is a necessary prerequisite for this course.

In teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturers in this course. The course is targeted at advanced students who have taken an interest in gathering practical research experience in the field of Learning & Instruction. In teams of two, students conduct their own research projects (planning, conducting, analyzing, interpreting, and presenting research); thus, the course requires a high amount of self-directed working. Students are personally advised, and supported in their research project, by one of the researchers serving as lecturers in this course. During the first half the semester, relevant methodological knowledge and skills are practiced during plenary meetings and in students’ independent reading (e.g. generating and testing research questions, designing experiments, and analyzing data in the field of Learning and Instruction).

Learning goals include:
- Participants can illustrate and explain basic methods and concepts for research in the fields of Learning and Instruction, e.g. with the help of practical examples.
- Participants can generate testable research questions for a topic relevant in the fields of Learning and Instruction.
- Participants can design and conduct a study that is relevant for answering their research question.
- Participants can summarize and evaluate the main results from a study in the field of learning and instruction, with regard to the research question being asked.

For a reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.
529-0950-00L

Subject Didactics Chemistry

Simultaneous enrolment in Introductory Internship Chemistry - course 529-0968-00L - is compulsory.

Abstract

Implementing findings from research into teaching and learning for chemistry lessons and coverage of subject-specific teaching and learning specialities.

Objective

- Among other things, students are put in a position where they can
  - divide up the subject matter into contents that can be learned by heart or accessed intellectually, and communicate these contents.
  - break down technically complex contents to the right level for a class and still present these in a stringent, error-free manner in their simplified form.
  - establish which subject matter can be presented with which teaching techniques and methods that have been recognised as efficient in teaching terms, and adapt these tools to the learning content in question.
  - plan school experiments, incorporate them in lessons, perform them in accordance with all the rules of the art, and also evaluate them in a beneficial manner.
  - assess pupils’ prior knowledge, clarify it in greater detail and take it into account for planning lessons.
  - design a sequential curriculum suitable for the levels in question and put it into practice.
  - reliably identify stumbling blocks in the contents and get round these.

Content

Schwerpunkte im ersten Studiensemester bilden die folgenden Themen:

- Auswahl gymnasiumsrelevanter Lerninhalte
- Modellbegriff in den Naturwissenschaften, insbesondere der Chemie
- Sprache und Fachsprache im Chemieunterricht
- Wechselwirkung zwischen Beobachtungen in der realen Welt und Deutungsversuchen auf der Modell-Ebene
- Interdisciplinarität mit Biologie, Mathematik und Physik
- Lehrplanung und -beurteilung im Theorie- und Laborunterricht
- Atommodelle und chemische Bindung
- Mathematische Beschreibung chemischer Systeme (z.B. Stoichiometrie und Gleichgewichtssysteme)
- Auswahl, Konzeption, Einbettung, Vorbereitung, Durchführung, Nachbereitung und Auswertung von Demonstrations- und Schüler-Experimenten

Lecture notes

Literature

Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

Prerequisites / notice

Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

ECTS

4 credits
Professional Training in Chemistry

Important: You can only enrol in the courses of this category if you have not more than 12 CP left for possible additional requirements.

| 529-0964-00L   | Teaching Internship Chemistry                   | O    | 8    | 17P   | A. Baertsch |
|                | Simultaneous enrolment in Subject Didactics Chemistry I |
| Abstract       | The teaching practice takes in 50 lessons: 30 are taught by the students, and the students sit in on 20 lessons. The teaching practice lasts 4-6 weeks. It gives students the opportunity to implement the contents of their specialist-subject, educational science and subject-didactics training in the classroom. Students also conduct work assignments in parallel to their teaching practice. |
| Objective      | - Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching. |
|                | - They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils. |
|                | - They acquire the skills of the teaching trade. |
|                | - They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution. |
|                | - They learn to assess pupils’ work. |
|                | - Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance. |
| Literature     | Wird von der Praktikumslehrperson bestimmt.     |      |      |       |           |
| Prerequisites  | Findet in der Regel am Schluss der Ausbildung, vor Ablageung der Prüfungslektionen statt. |

| 529-0965-00L   | Teaching Internship Chemistry II                | W    | 4    | 9P    |           |
|                | Teaching Internship for students upgrading TC to Teaching Diploma |
| Abstract       | This is a supplement to the Teaching Internship required to obtain a “Lehrdipolm” in the corresponding subject. It is aimed at enlarging the already acquired teaching experience. Students observe 10 lessons and teach 15 lessons independently. |
| Objective      | Die Studierenden können die Bedeutung von Unterrichtsthemen in ihrem Fach unter verschiedenen Blickwinkeln einschätzen. Sie kennen und beherrschen das unterrichtliche Handwerk. Sie können ein gegebenes Unterrichtsthema für eine Gruppe von Lernenden fachlich und didaktisch korrekt strukturieren und in eine adäquate Lernumgebung umsetzen. Es gelingt ihnen, die Balance zwischen Anleitung und Offenheit zu finden, sodass die Lernenden sowohl über den nötigen Freiraum wie über ausreichend Orientierung verfügen, um aktiv und effektiv flexibel nutzbare (Fach-)Wissen zu erwerben. |

| 529-0955-00L   | Professional Exercises: Experiments in Teaching Chemistry | O    | 2    | 4V    | A. Baertsch |
| Abstract       | This course unit introduces students to the technique of conducting experiments in chemistry lessons. It covers didactic, technical, safety-related and presentation aspects. |

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 316 of 1432
Schwerpunkte im ersten Studiensemester bilden die folgenden Themen:
- Theoretische Einführung.
- Merkmale für das sichere Experimentieren.
- Erstellen und Überarbeiten von Experimentieraufschriften.
- Vorfahrungen von Experimenten.
- Experimentierkurs mit praktischen Übungen für die Studierenden.
- Leistungserhebung und -beurteilung im Experimentalunterricht.
- Sensibilisierung für die Wichtigkeit des Experiments im Chemie-Unterricht.
- Aufbau einer persönlichen Experimente-Bibliothek.
- Befähigung zu eindrücklichem Experimentieren.
- Einhaltung aller einschlägigen Sicherheitsbestimmungen.

Die Studierenden erfahren das Lektionsthema in der Regel eine Woche vor dem Prüfungstermin. Von der zuständigen Lehrperson erhalten sie Informationen über den Wissensstand der zu unterrichtenden Klasse und können sie vor dem Prüfungstermin besuchen. Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie bis am Vortag um 12 Uhr den beiden Prüfungsexperten ein.

Will mark the conclusion of the teacher training program in Chemistry.

Simultaneous enrolment in "Examination Lesson II Chemistry" (529-0968-02L) is compulsory.

In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

On the basis of a specified topic, the candidate shows that they are in a position
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Die Studierenden erfahren das Lektionsthema in der Regel eine Woche vor dem Prüfungstermin. Von der zuständigen Lehrperson erhalten sie Informationen über den Wissensstand der zu unterrichtenden Klasse und können sie vor dem Prüfungstermin besuchen. Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie bis am Vortag um 12 Uhr den beiden Prüfungsexperten ein.

Die gehaltene Lektion wird kriteriumsbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltene Lektion im Rahmen eines kurzen Kolloquiums.

Nach Abschluss der Übrigen Ausbildung.

Ausgewählte Artikel aus der Primärliteratur werden vorgestellt, kommentiert und zur Lektüre empfohlen.

Students are accustomed to scientific work and they get to know one specific research field.

In this course, participants acquire extended and more in-depth knowledge of selected chemistry topics. The selection is based to a large extent on the partial aspects of chemistry that are typically taught at high school. By gaining a broader understanding, teachers are put in a position where they can comprehend the topics that are to be taught in a wider and, to some extent, unconventional context and critically process these in respect of their teachability and learnability. At the same time, interrelationships between the classical sub-disciplines of chemistry are highlighted, along with the unique features of chemistry as one of the central natural sciences.

### Content

#### of the four modules:
1. The language of chemistry; Concepts, formulas, aesthetics, and philosophical aspects
2. Chirality and stereochemistry: Selected aspects, origin of biomolecular chirality, inorganic chemistry
3. Cosmochemistry
4. Chemistry of the atmosphere

### Lecture notes

### Abstract

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

### Objective

- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
- To try out different options for specialist further training in their profession.

Advanced Modern Methods and Strategies in Synthesis

### Objective

Knowledge of modern methods in asymmetric stereocontrol, enantioselective catalysis, and organic reaction mechanisms.
Content

Current trends in methods for and approaches to synthesis of complex natural products, pharmaceuticals, and biological molecules; fragment coupling and protecting group strategies; chemical ligation and biomolecules synthesis; enantioselective catalysis including ligand design and optimization; cross coupling reactions from preactivated precursors; C-H activation and oxidation chemistry; building block synthesis with chiral auxiliaries and reagents; new concepts in asymmetric catalysis. Analysis of key primarily literature including identification of trends, key precedents, and emerging topics will be emphasized.

W

The aim of the course is to familiarize the students with the basic concepts of high-resolution solid-state NMR. Starting from
This course provides an introduction to the interaction of light with nano- and microparticles followed by an overview of applications of current interest. Examples range from nanoparticles for medical applications and sensing to the role of the interaction of solar radiation with aerosol particles and cloud droplets for the climate.

The students will be introduced to the basic concepts of the interaction of light with nano- and microparticles. The combination of basic concepts with different applications will enable students to apply their knowledge to new problems in various fields where nanoscale objects play a role.

Light interacts surprisingly differently with small particles than with bulk or with gas phase materials. The first part of the course provides a basic but rigorous introduction into the interaction of light with nano- and microparticles. The emphasis is on the classical treatment of absorption and scattering of light by small particles. The strengths and limits of this conventional approach will be discussed. The second part of the course is devoted to a broad range of applications. Here topics include: Plasmon resonances in metallic systems, metallic dielectric nanoparticles for medical applications, the use of lasers for optical trapping and characterization of single particles, vibrational excitons in dielectric nanoparticles, interaction of light with aerosol particles and cloud droplets for remote sensing applications and climate predictions, characterization of ultratine aerosol particles by photoemission using velocity map imaging.

A manuscript will be distributed to the participants of the course.

Basis for the understanding of this lecture are the courses Allgemeine Chemie 1&2, Anorganische Chemie 1: Übergangsmetallchemie (Dozent Mezzetti).

Applications: References will be provided during the course.
The course is for advanced students and covers selected topics from magnetic resonance spectroscopy. This year, the lecture will introduce and discuss the theoretical foundation of high-resolution solid-state NMR under magic-angle spinning.

Abstract
Scenarios for world energy demand and CO₂ emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry). Wind and ocean energy, heat pumps, geothermal energy, energy from waste. CO₂ sequestration.

Objective
Scenarios for the development of world primary energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO₂ emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

Abstract
Advanced X-ray crystal structure analysis

Objective
To gain a deeper understanding of crystal structure determination principles and practice by X-ray diffraction and the evaluation of results.

Content
Review of principles of diffraction and instrumentation, unit cells, lattices, and symmetry. Inorganic structural chemistry: sphere packings, ionic crystals, covalent networks, intermetallic compounds. Overview of powder diffraction and application of crystal chemistry for structure analysis of polycrystalline phases. Working safely with X-rays, crystal growth, selection and mounting, data collection strategies, data reduction, corrections for absorption, extinction and Lp, advanced structure solution theory and techniques: Patterson function, heavy atom technique, Fourier methods, direct methods. Structure modeling and refinement, disorder, twinning, false symmetry, interpretation of anisotropic shift parameters. Determination of absolute configuration, interpretation of results and scope of chemically useful information, validation and publication of results, critical evaluation of published crystal structures.

Lecture notes
Information and exercise sheets will be distributed in loose form.

**Abstract**

Advanced, but fundamental topics central to the understanding of theory in chemistry and for solving actual chemical problems with a computer. Examples are:

- Operators derived from principles of relativistic quantum mechanics
- Relativistic effects + methods of relativistic quantum chemistry
- Open-shell molecules + spin-density functional theory
- New electron-correlation theories

**Objective**

- The aim of the course is to provide an in-depth knowledge of theory and method development in theoretical chemistry. It will be shown that this is necessary in order to be able to solve actual chemical problems on a computer with quantum chemical methods.

The relativistic re-derivation of all concepts known from (nonrelativistic) quantum mechanics and quantum-chemistry lectures will finally explain the form of all operators in the molecular Hamiltonian - usually postulated rather than deduced. From this, we derive operators needed for the description of complex systems (like those required by magnetic resonance spectroscopy). Implications of other assumptions in standard non-relativistic quantum chemistry shall be analyzed and understood, too. Examples are the Born-Oppenheimer approximation and the expansion of the electromagnetic wave function in a set of pre-defined many-electron basis functions (Slater determinants). Overcoming these concepts, which are so natural to the theory of chemistry, will provide deeper insights into many-particle quantum mechanics. Also re-deriving the workhorse of quantum chemistry, namely density functional theory, with an expanded view on open-shell electronic structures (radicals, transition-metal complexes) will contribute to this endeavor. It will be shown how these insights allow us to make more accurate predictions in chemistry in practice - at the frontier of research in theoretical chemistry.

**Content**

1. Introductory lecture: basics of quantum mechanics and quantum chemistry
2. Einstein's special theory of relativity and the (classical) electromagnetic interaction of two charged particles
3. Klein-Gordon and Dirac equation; the Dirac hydrogen atom
4. Numerical methods based on the Dirac-Fock-Coulomb Hamiltonian, two-component and scalar relativistic Hamiltonians
5. Response theory and molecular properties, derivation of property operators, Breit-Pauli-Hamiltonian
6. Relativistic effects in chemistry and the emergence of spin
7. Spin in density functional theory
8. New electron-correlation theories: Tensor network and matrix product states, the density matrix renormalization group
9. Quantum chemistry without the Born-Oppenheimer approximation

**Lecture notes**

A set of detailed lecture notes will be provided, which will cover the whole course.

**Literature**

Abstract
A comprehensive understanding of the interaction of electrons with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

Objective
A comprehensive understanding of the interaction of electrons with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

Content
This course provides a general introduction into electron microscopy of organic and inorganic materials. In the first part, the basics of transmission- and scanning electron microscopy are presented. The second part includes the most important aspects of specimen preparation, imaging and image processing. In the third part, recent applications in materials science, solid state physics, structural biology, structural geology and structural chemistry will be reported.

Abstract
Toxicokinetic and toxicodynamic aspects of xenobiotic interactions with cellular structures and mechanisms. Toxic responses at the level of organs (immune-, neuro-, reproductive and genotoxicity) and organisms. Introduction into developmental toxicology and ecotoxicology.

Objective
Understanding of the impact of chemicals on biological systems; evaluation of the effects from different biomedical perspectives.

Content
Explanation of important interactions between xenobiotic chemicals and cellular structures such as membranes, enzymes, and nucleic acids. Relevance of intake, distribution, excretion, and biochemical transformation processes. Relevance of mixtures. Explanation of important modes of toxic action such as immunotoxicity, neurotoxicity, reproduction toxicity, genotoxicity based on examples of certain xenobiotics and their effects on important organs.

Analytical Chemistry I
16P
This class conducts and supports experiments for a specifically designed genuine research project. We will carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. The relevant technologies will be taught to the students, such as the preparation of competent cells, production and isolation of DNA fragments, transformation of gene libraries, and DNA sequencing. The course participants will generate a variety of different variants of a chorismate mutase. Individual enzyme catalysts will be purified and subsequently characterized using several different spectroscopic methods. The detailed chemical-physical analyses include determination of the enzymes' kinetic parameters, their molecular mass, and the integrity of the protein structure. The students will present the results obtained from their individual evolution experiments at the end of the semester. We expect that during this lab course we will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalyst.

Further information to registration and work hours:
www.protein.ethz.ch/kast/praktikum.html

During this semester course, methodologies will be taught for biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. All technologies used for the experiments will be explained to the students in practice with the goal that they will be able to independently apply them for the course project and in future research endeavors. After the course, an individual report about the results obtained has to be prepared.

After the course, an individual report about the results obtained has to be prepared.

Limited number of participants.

Before online enrolment, it is mandatory to sign up directly with P. Kast, no later than 2 weeks prior to start of autumn semester.

Further information to registration and work hours:
www.protein.ethz.ch/kast/praktikum.html

All technologies used for the experiments will be explained to the students in practice with the goal that they will be able to independently apply them for the course project and in future research endeavors. After the course, an individual report about the results obtained has to be prepared.

The necessary documents and protocols will be distributed to the participants during the course.

General literature to "Directed Evolution" and chorismate mutases, e.g.:

Further literature will be indicated in the distributed script.

- This laboratory course will involve experiments that require a tight schedule and (sometimes) long (!) working days.
- The projects of this course are tightly linked to the ones of the Biology BSc course "Biological Chemistry B: New Enzymes from Directed Evolution Experiments", which takes place as a block course during the month of November. There will be joint lectures for the participants of both courses during that time. The teaching language is English.
- The number of participants for the laboratory class is limited. It is mandatory to sign up for the course directly with P. Kast at the latest 2 weeks prior to the start of the fall semester. A valid registration is considered a commitment for attendance of the entire semester course, as involved material orders and experimental preparations are necessary and, once the class has started, the flow of the experiments must not be interrupted by individual absences. In case of an emergency, please immediately notify P. Kast.
- For more information, see also http://www.protein.ethz.ch/kast/praktikum.html or contact P. Kast directly (HCI F 333, Tel. 044 632 29 08, kast@org.chem.ethz.ch).

Content
Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:
- Mass spectrometry: ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.
- UV/VIS spectroscopy: Basics, interpretation of electron spectra. Circular dichroism (CD) and optical rotation dispersion (ORD).

Lecture notes
Script will be for the production price

Literature
- M. Hesse, H. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5. überarbeitete Auflage, Thieme, Stuttgart, 1995

Prerequisites / notice
Exercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounds" (4th semester) is recommended.

529-0122-AAL Inorganic Chemistry II
Enrollment only for MSc students who need this course as additional requirement.

Abstract
The lecture is based on Inorganic Chemistry I and addresses an enhanced understanding of the symmetry aspects of chemical bonding of molecules and translation polymers, i.e. crystal structures.

Objective
The lecture is based on Inorganic Chemistry I and addresses an enhanced understanding of the symmetry aspects of chemical bonding of molecules and translation polymers.

Content
Symmetry aspects of chemical bonding, point groups and representations for the deduction of molecular orbitals, energy assessment for molecules and solids, Sanderson formalism, derivation and understanding of bond structures, densities of states, overlap populations, crystal symmetry, basic crystal structures and corresponding properties, visual representations of crystal structures.

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 327 of 1432
The aim of the course is to provide the tools needed for the understanding of the fundamental processes and the design of the industrial
Polymerization Reaction and Colloid Engineering

Abstract
Microfluidics describes the behaviour, control and manipulation of fluids that are geometrically constrained within sub-microliter environments. The use of microfluidic devices offers an opportunity to control physical and chemical processes with unrivalled precision, and in turn provides a route to performing chemistry and biology in an ultra-fast and high-efficiency manner.

Objective
In the course students will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis. A design workshop will allow students to develop new microscale flow processes by appreciating the dominant physics at the microscale. The application of these basic ideas will primarily focus on biological problems and will include a treatment of diagnostic devices for use at the point-of-care, advanced functional material synthesis, DNA analysis, proteomics and cell-based assays. Lectures, assignments and the design workshop will acquaint students with the state-of-the-art in applied microfluidics.

Content
Specific topics in the course include, but not limited to:

1. Theoretical Concepts
   - Features of mass and thermal transport on the microscale
   - Key scaling laws
2. Microfluidic Device Manufacture
   - Conventional lithographic processing of rigid materials
   - Soft lithographic processing of plastics and polymers
   - Mass fabrication of polymeric devices
3. Unit operations and functional components
   - Analytical separations (electrophoresis and chromatography)
   - Chemical and biological synthesis
   - Sample pre-treatment (filtration, SPE, pre-concentration)
   - Molecular detection
4. Design Workshop
   - Design of microfluidic architectures for PCR, distillation & mixing
5. Contemporary Applications in Biological Analysis
   - Microarrays
   - Cellular analyses (single cells, enzymatic assays, cell sorting)
   - Proteomics
6. System integration
   - Applications in radiochemistry, diagnostics and high-throughput experimentation

Lecture notes
Lecture handouts, background literature, problem sheets and notes will be provided electronically.

Polymers

Number  Title  Type  ECTS  Hours  Lecturers
529-0837-00L  Biomicrofluidic Engineering  W+  7 credits  3G  A. de Melo

Abstract

Objective
Introduce the students to the design of polymerization reactors for the production of polymers with molecular characteristics suitably tuned for specific applications. This includes the post-treatment of polymer latexes and the analysis of their colloidal behavior.

Content
The aim of the course is to provide the tools needed for the understanding of the fundamental processes and the design of the industrial units involved in the production of polymeric materials and in the post-treatment of polymer colloids. In particular, the following topics are discussed: Physico-chemical characterization of polymers and description of the polymerization processes. Kinetics of free-radical polymerization and use of population balance models. Production of homo- and co-polymers with controlled characteristics in terms of molecular weight distribution and chain composition distribution. Living polymerizations. Design of polymerization reactors and the thermal runaway problem. Kinetics and control of emulsion polymerization. The radical segregation problem. Surfactants and colloidal stability. Aggregation kinetics and aggregate structure in conditions of diffusion and reaction limited aggregation. The role of shear conditions on aggregation and breakage kinetics and on the aggregate structure. Modeling and design of colloid aggregation processes.

Lecture notes
Skripts are available on the 'Polymerization Reaction and Colloid Engineering' web page of the Morbidelli-group, vide the given link for details.

Literature

Chemical Product Design

Number  Title  Type  ECTS  Hours  Lecturers
529-0837-00L  Polymeric Materials  W+  7 credits  3G  W. J. Stark

Abstract
The 'Chemical Product Design' course teaches students quantitative concepts to analyze, select and transform theoretical concepts from chemistry and engineering into valuable real-world products. Basic chemistry and chemical engineering knowledge is required (Diffusion, Thermodynamics, Kinetics, ..).

Objective
This course starts with analyzing existing chemical needs and unmet technical challenges. We then develop the skills to critically analyze a specific chemical idea for a product, to rapidly test feasibility or chance for success and to eventually realize its manufacturing. The chemical engineering basics are then used to assess performance of products or devices with non-traditional functions based on dynamic properties (e.g. responsive building materials; personal medical diagnostics on paper strips). The course teaches the interface between laboratory and market with a specific focus on evaluating the chemical value of a given process or compound, and the necessary steps to pursue the resulting project within an entrepreneurial environment. We therefore extend the questions of process design ('how do we make something?') to the question of 'what should we make?'
Content

Part A: The 'Chemical Product Design' course starts with discussing questions along, 'What is a chemical product, and why do people pay for it? How does a given compound in a specific setting provide a service?' We then learn how to translate new, often ill-defined wishes or ideas into quantifiable specifications.

Part B: Thermodynamic and kinetic data allow sharp selection criteria for successful products. We learn how to deal with insufficient data and development of robust case models to evaluate their technical and financial constraints. How can parameters of a running process in one industry be scaled into another industry? Can dimensionless engineering numbers be applied beyond traditional chemical processes?

Part C: Manufacturing of commodity products, devices and molecular products: Chemical reactors, separation and detection or isolation units as part of a toolbox. Planning of manufacturing and decisions based on hard data. Providing quantitative answers on potential value generated.

Students are expected to actively develop chemical products along the course. Contributions will be made individually, or in small groups, where a larger topic is studied.

**Abstract**

This course encompasses the theoretical principles of chemical process simulation, as well as its practical application in process analysis and optimization. The techniques for simulating stationary and dynamic processes are presented, and illustrated with case studies. Commercial software packages are presented as a key engineering tool for solving process flowsheeting and simulation problems. Students are expected to actively develop chemical products along the course. Contributions will be made individually, or in small groups, where a larger topic is studied.

**Objective**

This course aims to develop the competency of chemical engineers in process flowsheeting and simulation. Specifically, students will develop the following skills:
- Deep understanding of chemical engineering fundamentals: the acquisition of new concepts and the application of previous knowledge in the area of chemical process systems and their mechanisms are crucial to intelligently simulate and evaluate processes.
- Modeling of general chemical processes and systems: students have to be able to identify the boundaries of the system to be studied and develop the set of relevant mathematical relations, which describe the process behavior.
- Mathematical reasoning and computational skills: the familiarization with mathematical algorithms and computational tools is essential to be capable of achieving rapid and reliable solutions to simulation and optimization problems. Hence, students will learn the mathematical principles necessary for process simulation and optimization, as well as the structure and application of process simulation software. Thus, they will be able develop criteria to correctly use commercial software packages and critically evaluate their results.

**Content**

Overview of process simulation and flowsheeting
- Definition and fundamentals
- Classification: stationary (steady-state) versus dynamic (transient state) systems
- Fields of application
- Case studies

Process modeling
- Modeling strategies of process systems
- Mass conservation
- Species balance
- Energy conservation
- Momentum balance
- Multiphase-systems: equilibrium & non-equilibrium models
- Process system model

Process simulation
- Process specification
- Introduction to process specification
- Classification of mathematical models: AMS, DOE, DAE, PDE
- Model validation
- Software tools
- Solution methods for process flowsheeting
- Simultaneous methods
- Sequential methods
- Dynamic simulation
- Numerical solution: explicit and implicit methods
- Continuous-discrete simulation: handling of discontinuities

Process optimization and analysis
- Classification of optimization problems
- Linear programming
- Non-linear programming
- Dynamic programming
- Optimization methods in process flowsheeting
- Sequential methods
- Simultaneous methods

Commercial software for simulation: Aspen Plus
- Thermodynamic property methods
- Reaction and reactors
- Separation / columns
- Convergence & debugging

**Literature**

An exemplary literature list is provided below:

**Prerequisites / notice**

A basic understanding of material and energy balances, thermodynamic property methods and typical unit operations (e.g., reactors, flash separations, distillation/absorption columns etc.) is required.
529-0643-00L Process Design and Development W+ 7 credits 3G G. Storti

Abstract
The course is focused on the design of Chemical Processes, with emphasis on the preliminary stage of the design approach, where process creation and quick selection among many alternatives are important. The main concepts behind more detailed process design and process simulation are also examined in the last part of the course.

Objective
The course is focused on the design of Chemical Processes, with emphasis on the preliminary stage of the design approach, where process creation and quick selection among many alternatives are important. The main concepts behind more detailed process design and process simulation are also examined in the last part of the course.

Content

Preliminary process evaluation: simplified material and energy balances (linear balances), degrees of freedom, short-cut models, flowsheet solution algorithms.

Process economic evaluation: equipment sizing and costing, time value of money, cash flow calculations.

Detailed Process Design: unit operation models, flowsheet solution algorithms (different iterative methods, inside-out method), sequencing of nonideal distillation columns, networks of chemical reactors.

Abstract
Applied Fluid Dynamics
The methods of fluid dynamics play an important role in the description of a chain of events, involving the release, spreading and dilution of dangerous fluids in the environment.

Objective
Generally applicable methods in fluid dynamics and gas dynamics are illustrated and practiced using selected current examples.

Content
Tunnel ventilation systems and strategies are studied, which must meet severe requirements during normal operation and in emergency situations (tunnel fires etc.).

### Abstract
Contents
- Laminar and turbulent flows, instability and origin of turbulence - Statistical description: averaging, turbulent energy, dissipation, closure problem - Scalings. Homogeneous isotropic turbulence, correlations, Fourier representation, energy spectrum - Free turbulence: wake, jet, mixing layer - Wall turbulence: Channel and boundary layer - Computation and modelling of turbulent flows

### Objective
Basic physical phenomena of turbulent flows, quantitative and statistical description, basic and averaged equations, principles of turbulent flow computation and elements of turbulence modelling

### Content
- Properties of laminar, transitional and turbulent flows.
- Origin and control of turbulence. Instability and transition.
- Statistical description, averaging, equations for mean and fluctuating quantities, closure problem.
- Scalings, homogeneous isotropic turbulence, energy spectrum.
- Turbulent free shear flows. Jet, wake, mixing layer.
- Wall-bounded turbulent flows.
- Turbulent flow computation and modeling.

### Abstract
Study of computational techniques, algorithms and data structures used to solve problems in computational biology. Topics: basic biology, string alignment, phylogeny (distance, character, parsimony), molecular evolution, multiple sequence alignment, probabilistic and statistical models, Markov models, microarrays, dynamic programming, maximum likelihood and specialized DNA and protein analysis.

### Objective
Familiarize the students with the basic concepts of molecular biology and the models and algorithms used to understand, classify and predict behaviour of living organism. This course is at the most basic level, where the main issues, mostly of molecular sequences, are studied.

### Content
This course lies in the intersection between Computer Science and Molecular Biology. The main purpose is to study computational techniques, algorithms and data structures which are usually applied to solve problems in Molecular Biology and Biochemistry. The following topics are likely to be covered: introduction, mathematical models of evolution, protein and DNA sequence alignment and its meaning, phylogenetic tree construction, multiple sequence alignments, molecular dynamics, threading, role of bioinformatics in drug design, etc. From the computer science point of view we concentrate our attention in practical solutions for the above problems. Biological knowledge is an asset but not a prerequisite.

## 529-0611-00L  Characterization of Catalysts and Surfaces

<table>
<thead>
<tr>
<th>W</th>
<th>7 credits</th>
<th>3G</th>
<th>J. A. van Bokhoven, D. Ferri</th>
</tr>
</thead>
</table>

### Abstract
Basic aspects of surface science. Understanding of principles of most important experimental methods used in research concerned with surface science, material science and catalysis.

### Objective
Methods which are covered embrace: Gas adsorption and surface area analysis, IR-Spectroscopy, X-ray diffraction, X-ray photoelectron spectroscopy, X-ray absorption, solid state NMR, Electron Microscopy and others.

## 529-0615-00L  Polymerization Reaction and Colloid Engineering

<table>

### Abstract

### Objective
Introduce the students to the design of polymerization reactors for the production of polymers with molecular characteristics suitably tuned for specific applications. This includes the post-treatment of polymer latexes and the analysis of their colloidal behavior.

### Content
The aim of the course is to provide the tools needed for the understanding of the fundamental processes and the design of the industrial units involved in the production of polymeric materials and in the post-treatment of polymer colloids. In particular, the following topics are discussed: Physico-chemical characterization of polymers and description of the polymerization processes. Kinetics of free-radical polymerization and use of population balance models. Production of homo- and co-polymers with controlled characteristics in terms of molecular weight distribution and chain composition distribution. Living polymerizations. Design of polymerization reactors and the thermal runaway problem. Kinetics and control of emulsion polymerization. The radical segregation problem. Surfactants and colloidal stability. Aggregation kinetics and aggregate structure in conditions of diffusion and reaction limited aggregation. The role of shear conditions on aggregation and breakage kinetics and on the aggregate structure. Modeling and design of colloid aggregation processes.

### Literature
The 'Chemical Product Design' course teaches students quantitative concepts to analyze, select and transform theoretical concepts from chemistry and engineering into valuable real-world products. Basic chemistry and chemical engineering knowledge is required (Diffusion, Thermodynamics, Kinetics, ...).

This course starts with analyzing existing chemical needs and unmet technical challenges. We then develop the following skills:

- Deep understanding of chemical engineering fundamentals: the acquisition of new concepts and the application of previous knowledge in the area of chemical process systems and their mechanisms are crucial to intelligently simulate and evaluate processes.
- Modeling of general chemical processes and systems: students have to be able to identify the boundaries of the system to be studied and develop the set of relevant mathematical relations, which describe the process behavior.
- Mathematical reasoning and computational skills: the familiarization with mathematical algorithms and computational tools is essential to be capable of achieving rapid and reliable solutions to simulation and optimization problems. Hence, students will learn the mathematical principles necessary for process simulation and optimization, as well as the structure and application of process simulation software. Thus, they will be able to develop criteria to correctly use commercial software packages and critically evaluate their results.

A basic understanding of material and energy balances, thermodynamic property methods and typical unit operations (e.g., reactors, flash separations, distillation/absorption columns etc.) is required.

Objective
This course aims to develop the competency of chemical engineers in process flowsheeting and simulation. Specifically, students will develop the following skills:

- Definition and fundamentals
- Classification: stationary (steady-state) versus dynamic (transient state) systems
- Fields of application
- Case studies

Prerequisites:
- Basic chemistry and chemical engineering knowledge (Diffusion, Thermodynamics, Kinetics, ...).

Literature
An exemplary literature list is provided below:

Content
Overview of process simulation and flowsheeting
- Process specification
- Introduction to process specification
- Classification of mathematical models: AMS, DOE, DAE, PDE

Prerequisites / notice
A basic understanding of material and energy balances, thermodynamic property methods and typical unit operations (e.g., reactors, flash separations, distillation/absorption columns etc.) is required.
Part A: The 'Chemical Product Design' course starts with discussing questions along, 'What is a chemical product, and why do people pay for it? How does a given compound in a specific setting provide a service?' We then learn how to translate new, often ill-defined wishes or ideas into quantifiable specifications.

Part B: Thermodynamic and kinetic data allow sharp selection criteria for successful products. We learn how to deal with insufficient data and development of robust case models to evaluate their technical and financial constraints. How can parameters of a running process in one industry be scaled into another industry? Can dimensionless engineering numbers be applied beyond traditional chemical processes?

Part C: Manufacturing of commodity products, devices and molecular products: Chemical reactors, separation and detection or isolation units as part of a toolbox. Planning of manufacturing and decisions based on hard data. Providing quantitative answers on potential value generated.

Students are expected to actively develop chemical products along the course. Contributions will be made individually, or in small groups, where a larger topic is studied.

**529-0643-00L Process Design and Development**

**Abstract**
The course is focused on the design of Chemical Processes, with emphasis on the preliminary stage of the design approach, where process creation and quick selection among many alternatives are important. The main concepts behind more detailed process design and process simulation are also examined in the last part of the course.

**Objective**
The course is focused on the design of Chemical Processes, with emphasis on the preliminary stage of the design approach, where process creation and quick selection among many alternatives are important. The main concepts behind more detailed process design and process simulation are also examined in the last part of the course.

**Content**

**Lecture notes**
no script

**Literature**

**Prerequisites / notice**
Prerequisite: Thermal Unit Operations

**529-0617-00L Catalysis Engineering**

**Abstract**
The purpose of the "Catalysis Engineering" course is to provide students with tools that enable the optimal design of catalytic materials and reactor engineering concepts favoring more sustainable manufacturing processes within the chemical industry.

**Objective**
The course aims at illustrating, from conception to implementation, the design of sustainable catalytic processes by integration of the microlevel (catalyst), mesolevel (reactor), and macrolevel (process). The word "sustainable" implies intensified processes with an improved exploitation of raw materials, wider use of renewable feedstocks, reduction of energy consumption, and minimized environmental impact. By the use of modern case studies of industrial relevance, aspects of catalyst preparation and characterization, kinetics, mass and heat transport, and deactivation are discussed. Emphasis is put on understanding the interaction among these basic elements in order to select the optimal catalytic process. Since no textbooks covering this area are available at this time and the intention of this course is unique, the lectures will be based on own texts and journal articles. During the course, there will be specific topics addressed by industrial contributors.

**Content**
The following general aspects:
- Catalyst preparation and characterization
- Kinetics
- Mass and heat transport
- Selectivity
- Deactivation

will be demonstrated for modern catalytic materials and processes of industrial relevance such as:
- Chlorine recycling
- N2O abatement
- Chemoselective hydrogenations
- Hierarchical zeolite catalysts
- Syngas conversion
- Biomass to chemicals and fuels

**Lecture notes**
The course material is based on an own script, journal articles, and slides.

**Prerequisites / notice**
It is assumed that students selecting this course are familiar with general concepts of catalysis, reactor design, and transport phenomena.

**529-0837-00L Biomicrofluidic Engineering**

**Abstract**
Biomicrofluidics describes the behaviour, control and manipulation of fluids that are geometrically constrained within sub-microliter environments. The use of microfluidic devices offers an opportunity to control physical and chemical processes with unrivalled precision, and in turn provides a route to performing chemistry and biology in an ultra-fast and high-efficiency manner.

**Objective**
In the course students will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis. A design workshop will allow students to develop new microscale flow processes by appreciating the dominant physics at the microscale. The application of these basic ideas will primarily focus on biological problems and will include a treatment of diagnostic devices for use at the point-of-care, advanced functional material synthesis, DNA analysis, proteomics and cell-based assays. Lectures, assignments and the design workshop will acquaint students with the state-of-the-art in applied microfluidics.
Towards the end of the course the students will understand the basics of electrochemistry and will be able to describe and calculate.

C. A. Baumel,

Historic development and applications of electrochemistry. Electrochemical cells: electrodes, electrolyte, charge transfer, material flux,

Electrochemistry

Risk Assessment of Chemicals

7 credits

Specific topics in the course include, but not limited to:

1. Theoretical Concepts
   Features of mass and thermal transport on the microscale
   Key scaling laws

2. Microfluidic Device Manufacture
   Conventional lithographic processing of rigid materials
   Soft lithographic processing of plastics and polymers
   Mass fabrication of polymeric devices

3. Unit operations and functional components
   Analytical separations (electrophoresis and chromatography)
   Chemical and biological synthesis
   Sample pre-treatment (filtration, SPE, pre-concentration)
   Molecular detection

4. Design Workshop
   Design of microfluidic architectures for PCR, distillation & mixing

5. Contemporary Applications in Biological Analysis
   Microarrays
   Cellular analyses (single cells, enzymatic assays, cell sorting)
   Proteomics

6. System integration
   Applications in radiochemistry, diagnostics and high-throughput experimentation

Lecture notes
Lecture handouts, background literature, problem sheets and notes will be provided electronically.

529-0047-00L Risk Assessment of Chemicals W 7 credits 6A C. Bogdal, C. A. Baumel, K. Hungerbühler

Abstract
Projects on chemical assessment with the focus on the analysis and assessment of basic substance data for selected chemical classes; analysis and modelling of technical processes; characterisation of environmental and health risks. Risk assessment on the basis of quality and protection goals. Estimation of model and parameter uncertainty. Precaution and safety measures.

Objective
Project thesis (report) on chemicals assessment; time frame totals ca. 80 hours.

Content
Projects on chemical assessment with the focus on the following aspects:
   * Analysis and assessment of basic substance data for selected chemical classes: physical chemical properties, environmental behaviour (distribution, persistence), human and eco-toxicity (biochemical metabolism, effect mechanisms), safety.
   * Analysis and modelling of technical processes determining chemical release into the environment, e.g., chemicals applications.
   * Characterisation of environmental and health risks on the basis of exposure and effect models, QSARs from environmental chemistry, toxicology and methods of risk analysis.
   * Risk assessment on the basis of quality and safety goals. Estimation of the model and data uncertainty.
   * Demonstration of possibilities and limits of precaution and safety measures (technical, organisational, concerning personnel) including effectiveness and efficiency.

Project teaching; time frame totals ca. 80 hours.

Lecture notes
See recommended literature.

Literature

Prerequisites / notice
Co-operation with chemical companies.

529-0745-00L General and Environmental Toxicology W 7 credits 3V M. Arand, H. Nägeli, B. B. Stieger, I. Werner

Abstract
Toxicokinetic and toxicodynamic aspects of xenobiotic interactions with cellular structures and mechanisms. Toxic responses at the level of organs (immunne-, neuro-, reproductive and genotoxicity) and organisms. Introduction into developmental toxicology and ecotoxicology.

Objective
Understanding of the impact of chemicals on biological systems; evaluation of the effects from different biomedical perspectives.

Content
Explanation of important interactions between xenobiotic chemicals and cellular structures such as membranes, enzymes, and nucleic acids. Relevance of intake, distribution, excretion, and biochemical transformation processes. Relevance of mixtures. Explanation of important modes of toxic action such as immuno toxicity, neurotoxicity, reproduction toxicity, genotoxicity based on examples of certain xenobiotics and their effects on important organs.

Lecture notes
Course material will be handed out as the lectures progress

Literature
Textbooks of pharmacology and toxicology (cf. list in course material)

Prerequisites / notice
Educational basis: basic chemistry, biology and biochemistry

529-0659-00L Electrochemistry W 6 credits 3G P. Novák

Abstract

Electroanalytical techniques. Applications: electrolysis, galvanotechnics, batteries; electrosynthesis, sensors, corrosion.

Objective
Towards the end of the course the students will understand the basics of electrochemistry and will be able to describe and calculate electrochemistry-related matters in industrial processes and products.

Content
Historic development and applications of electrochemistry. Electrochemical cells: electrodes, electrolyte, charge transfer, material flux, electrochemical conversion. Electrolytes: structure of solutions, conductivity, transfer number, solid and polymer electrolytes, transport processes in the electrolyte (diffusion, migration, convection, limiting current density). Cell voltage, electrode potential, potential series.

529-0193-00L Renewable Energy Technologies I W 4 credits 3G A. Wokaun, A. Steinfeld

The lectures Renewable Energy Technologies I (529-0193-00L) and Renewable Energy Technologies II (529-0191-01L) can be taken independently from one another.

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 334 of 1432
The class consists of three parts:

- **Literatur**

  - Computational Systems Biology
  - Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

- **Objective**

  - The class consists of three parts:
    1. Introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and (vi) stochastic simulation methods.

- **Content**

  - Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
  - The concept of biocompatibility.
  - Introduction to methodology used in biomaterials research and application.

- **Prerequisites / notice**

  - Fundamentals of chemistry and physics are a prerequisite for this course.
  - Handsouts during the course.

**Abstract**

Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

**Objective**

1. Insight Into The Mammalian Cell Cycle. Cycling, The Balance Between Proliferation and Cancer - Implications For Biopharmaceutical Manufacturing
2. The Licence To Kill. Apoptosis Regulatory Networks - Engineering of Survival Pathways To Increase Robustness of Production Cell Lines
3. Everything Under Control I. Regulated Transgene Expression in Mammalian Cells - Facts and Future
4. Secretion Engineering. The Traffic Jam getting out of the Cell
5. From Target To Market. An Antibody's Journey From Cell Culture to the Clinics
6. Development of Biological Weapons?
7. Functional Food. Enjoy your Meal?
8. Industrial Genomics. Getting a Systems View on Nutrition and Health - An Industrial Perspective
9. IP Management - Food Technology. Protecting Your Knowledge For Business
10. Biopharmaceutical Manufacturing I. Introduction to Process Development
11. Biopharmaceutical Manufacturing II. Up-stream Development
12. Biopharmaceutical Manufacturing III. Downstream Development
13. Biopharmaceutical Manufacturing IV. Pharma Development

**Prerequisites**

Fundamentals of chemistry and physics are a prerequisite for this course.

**Handsouts**

Lecture notes distribution during the course.
Lecturers
Topics that will be covered include: Uncertainty quantification under Case Studies in Process Design. Teams of two students will conduct four or five experiments from the following areas: reactor stability, characterization of multiphase flows, and high-resolution imaging and spectroscopy.

Hours
The same chemical process will be investigated as in part I and II of the case study course. This process will be depicted in one (or several) simulation programs. A cost calculation will be implemented considering investment and operating cost. Afterwards sensitivity analyses and optimizations are conducted considering technical and in particular economic criteria.

Nano-Optics
- Physics I+II

Chemical Engineering Laboratory II
- Electrochemistry
- Molecular spectroscopy, light forces and optical trapping, photonic bandgap materials, and theoretical methods in nano-optics.

**Abstract**

The goal of this course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

**Objective**

The goal of this course is to provide students with a wide general understanding cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

**Content**

The focus is animal cells and the development of multicellular organisms with a clear emphasis on the molecular basis of cellular structures and phenomena. The topics include biological membranes, the cytoskeleton, protein sorting, energy metabolism, cell cycle and division, viruses, extracellular matrix, cell signaling, embryonic development and cancer research.

**Abstract**

The lecture course Biology II is a basic introductory course into biology for students who need to pass this course for admission to their MSc curriculum.

**Objective**

The objective of the lecture course Biology II is the understanding of form, function, and development of animals and of the basic underlying mechanisms.

**Content**

The following numbers of chapters refer to the text-book “Biology” (Campbell & Reece, 7th edition, 2005) on which the course is based. Chapters 1-4 are a basic prerequisite. The sections “Structure of the Cell” (Chapters 5-10, 12, 17) and “General Genetics” (Chapters 13-16, 18, 46) are covered by the lecture Biology I.

1. Genomes, DNA Technology, Genetic Basis of Development
   - Chapter 19: Eukaryotic Genomes: Organization, Regulation, and Evolution
   - Chapter 20: DNA Technology and Genomics
   - Chapter 21: The Genetic Basis of Development
2. Form, Function, and Development of Animals I
   - Chapter 40: Basic Principles of Animal Form and Function
   - Chapter 41: Animal Nutrition
   - Chapter 44: Osmoregulation and Excretion
   - Chapter 47: Animal Development
3. Form, Function, and Development of Animals II
   - Chapter 42: Circulation and Gas Exchange
   - Chapter 43: The Immune System
   - Chapter 45: Hormones and the Endocrine System
   - Chapter 48: Nervous Systems
   - Chapter 49: Sensory and Motor Mechanisms

**Literature**

The following text-book is the basis for the courses Biology I and II:

Prerequisites / notice

529-0051-AAL Analytical Chemistry I

Enrolment only for MSc students who need this course as additional requirement.

Abstract
Introduction into the most important spectroscopical methods and their applications to gain structural information.

Objective
Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications

Content
Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:
- Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.
- UV/VIS spectroscopy: Basics, interpretation of electron spectra. Circular dichroism (CD) and optical rotation dispersion (ORD).

Lecture notes
Script will be for the production price

Literature
- M. Hesse, H. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5. überarbeitete Auflage, Thieme, Stuttgart, 1995

Prerequisites / notice
Exercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounds" (4th semester) is recommended.

551-0013-AAL Biochemistry

Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
The lecture is a basic introductory course on the molecular principles of biology for students who need to pass this course for admission to their MSc curriculum.

Objective
The goal of this course is to give the students a basic understanding of the molecules that build a cell and make it function, and the basic principles of metabolism and molecular genetics

Content
The course content is based on the following chapters of the textbook Biochemistry (Berg, Tymoczko, Stryer, 7th edition, 2012, Freeman & Co, New York)

- Chapter 1: The molecular design of life
- Chapter 2: Protein composition and structure
- Chapter 3: Exploring proteins and proteomes
- Chapter 4: DNA, RNA and the flow of information
- Chapter 5: Exploring Genes and Genomes
- Chapter 7: Hemoglobin
- Chapter 8: Enzymes and the basic concepts of catalysis
- Chapter 11: Carbohydrates
- Chapter 12: Lipids and cell membranes
- Chapter 15: Metabolism: Basic concepts and design

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 339 of 1432
Introduction to the binding theory in complexes of the transition metals. Interpretation of structure, bonding, and spectroscopic properties.

Can be bought at the HCI-shop

See: www.csms.ethz.ch/education/InfoI

Qualitative analysis (simple cation and anion separation process, determination of cations and anions), acid-base-equilibria (strengths of acids and bases, pH- and pKa-values, titrations, buffer systems, Kjeldahl determination), precipitation equilibria (gravimetry, potentiometry, conductivity, oxidation state and redox behaviour (syntheses), redox-titrations, galvanic elements), metal complexes (syntheses of complexes, ligand exchange reactions, complexometric titration)

For more information: www.csms.ethz.ch/education/InfoI

Objective

Discuss fundamentals of computer architecture, languages, algorithms and programming with an eye to their application in the area of chemistry, biology and material science.

Content

Minimal introduction to UNIX, Data representation and processing, algorithms and programming in C++, Errors, programming guidelines, efficiency, computer architecture, algorithms for sorting and searching, databases, numerical algorithms, types of algorithms, simulation, data communication & networks, chemical structures, operating systems, programming languages, software engineering.

Lecture notes

Available (in English), distributed at first lecture

Literature

See: www.csms.ethz.ch/education/InfoI

Prerequisites / notice

Since the exercises on the computer do convey and test essentially different skills as those being conveyed during the lectures and tested at the written exam, the results of the exercises are taken into account when evaluating the results of the exam.

For more information about the lecture: www.csms.ethz.ch/education/InfoI

**Laboratory Courses**

**529-0011-04L**

**Practical Course General Chemistry**

Latest online enrolment is one week before the beginning of the semester.

Information about the practical course will be given on the first day.

Qualitative analysis (determination of cations and anions), acid-base-equilibria (pH- values, titrations, buffer), precipitation equilibria (gravimetry, potentiometry, conductivity), redoxreactions (syntheses, redox-titrations, galvanic elements), metal complexes (syntheses, complexometric titration)

Objective

Qualitative analysis (simple cation and anion separation process, determination of cations and anions), acid-base-equilibria (strengths of acids and bases, pH- and pKa-values, titrations, buffer systems, Kjeldahl determination), precipitation equilibria (gravimetry, potentiometry, conductivity, oxidation state and redox behaviour (syntheses), redox-titrations, galvanic elements), metal complexes (syntheses of complexes, ligand exchange reactions, complexometric titration)

Content

The general aim for the students of the practical course in general chemistry is an introduction in the scientific work and to get familiar with simple experimental procedures in a chemical laboratory. In general, first experiences with the principal reaction behaviour of a variety of different substances will be made. The chemical characteristics of these will be elucidated by a series of quantitative experiments alongside with the corresponding qualitative analyses. In order to get an overview of classes of substances as well as some general phenomena in chemistry suitable experiments have been chosen. In the second part of the practical course, i.e. physical chemistry, the behaviour of substances in their states of aggregation as well as changes of selected physical values will be recorded and discussed.

Lecture notes

http://www.gruetzmacher.ethz.ch/education/labcourses

Prerequisites / notice

Compulsory: online enrolment latest one week prior to the start of the semester

3. Semester

**Compulsory Subjects Examination Block I**

**529-0121-00L**

**Inorganic Chemistry I**

Introduction to the binding theory in complexes of the transition metals. Interpretation of structure, bonding, and spectroscopic properties. General synthetic strategies.

Content

The chemical bond (overview). Symmetry and group theory. The chemical bond of coordination compounds (Valence Bond Theory, Crystal Field Theory, Molecular Orbital Theory (sigma- and pi-bonding), pi-Acceptor ligands (CO, NO, olefins, dioxygen, dihydrogen, phosphines and phosphites). Electronic spectra of coordination compounds (Tanabe-Sugano diagrams). Coordination numbers and isomers in complexes. Dynamic phenomena (stereochemical nonrigidity). Complexes and kinetics.

Lecture notes

Can be bought at the HCI-shop

Literature

**529-0221-00L**

**Organic Chemistry I**

Chemical reactivity and classes of compounds. Eliminations, fragmentations, chemistry of aldehydes and ketones (hydrates, acetals, imines, enamines, nucleophilic addition of organometallic compounds, reactions with phosphorus and sulfur ylides; reactions of enolates as nucleophiles) and of carboxylic acid derivatives. Aldol reactions.

Objective

Acquisition of a basic repertoire of synthetic methods including important reactions of aldehydes, ketones, carboxylic acids and carboxylic acid derivatives, as well as eliminations and fragmentations. Particular emphasis is placed on the understanding of reaction mechanisms and the correlation between structure and reactivity. A deeper understanding of the concepts presented during the lecture is reached by solving the problems handed out each time and discussed one week later in the exercise class.

Content

Chemical reactivity and classes of compounds. Eliminations, fragmentations, chemistry of aldehydes and ketones (hydrates, acetals, imines, enamines, nucleophilic addition of organometallic compounds, reactions with phosphorus and sulfur ylides; reactions of enolates as nucleophiles) and of carboxylic acid derivatives. Aldol reactions.

## Examples of partial differential equations
- Classification of PDEs
- Superposition principle

## One-dimensional wave equation
- D'Alembert's formula
- Duhamel's principle

## Fourier series
- Representation of piecewise continuous functions via Fourier series
- Examples and applications

## Separation of variables
- Resolution of wave and heat equation
- Homogeneous and inhomogeneous boundary conditions, Dirichlet and Neumann boundary conditions

## Laplace equation
- Resolution of the Laplace equation on rectangle, disk and annulus
- Poisson formula
- Mean value theorem and maximum principle

## Fourier transform
- Derivation and Definition
- Inverse Fourier transformation and inversion formula
- Interpretation and properties of the Fourier transform
- Resolution of the heat equation

## Laplace transform
- Definition, motivation and properties
- Inverse Laplace transform of rational functions
- Application to ordinary differential equations

Lecture notes
There are available some Lecture Notes in English and also in German of the Professor. These can be found following the links provided under the tab 'Lernmaterialien'.

Literature
2) Y. Pinchover and J. Rubinstein, An Introduction to Partial Differential Equations, Cambridge University Press
3) E. Kreyszig, Advanced Engineering Mathematics, John Wiley & Sons (only Chapters 1,2,6,11)

Prerequisites / notice
It is required a minimal background of: 1) multivariable functions (Riemann integrals in two or three variables, change of variables in the integrals through the Jacobian, partial derivatives, differentiability, Jacobian) 2) numerical and functional sequences and series, basic knowledge of ordinary differential equations.

Abstract
Introduction to the experimental methods of Inorganic Chemistry

Objective
The teaching laboratory offers an insight into different aspects of Inorganic Chemistry, including solid state chemistry, organometallic chemistry, kinetics, etc.. The synthesis, characterization and analysis of inorganic compound are a main topic. Emphasis is given to scientific writing (experiment reports).

Content
Inorganic chemistry part: Synthesis and analysis of elemento-organic compounds, metal complexes, and organometallic compounds. Introduction to Schlenk techniques, solid state synthesis, and kinetics. Introduction in the chemistry library: literature data banks and collections of spectra.

Organic synthesis with organometallic compounds and catalysts: Experiments in the framework of a selected specialised project. Possible projects: Rh catalysed asymmetric hydrogenation of enamides, Mn-catalysed epoxidation of olefins, Cu catalysed Diels-Alder reactions, synthesis of organo-boron compounds and Pd catalysed coupling with halides, Ru catalysed transfer hydrogenation.

Lecture notes
A manual is distributed in the teaching laboratory.

Prerequisites / notice
Prerequisites:
- Practical Course General Chemistry (1. Semester, 529-0011-04)
- Practical Course Inorg. and Org. Chemistry I (2. Sem., 529-0230)
- Attendance of Course Inorg. Chemistry 1 (3. Sem., 529-0121)

If necessary, access priority will be settled according to the results of the first-year examinations.

Abstract
This course teaches the fundamentals of thermodynamics applied to the description of real mixtures in the presence of physicochemical equilibria, including methods to quantitatively estimate them. While giving insights into the meaning and properties of main thermodynamic quantities, the course keeps primary focus on application to real chemical engineering problems.

Objective
The objective of the course is twofold. First, to teach the methods to calculate the volumetric and thermodynamic properties of mixtures in the presence of physicochemical equilibria. In particular, students are supposed to acquire the knowledge on which thermodynamic properties have to be estimated to carry out such calculation, on which data which need to be gathered and estimated, on the methods, the relative assumption and approximations. Second, the course is intended to give the students a sufficient theoretical insight on the thermodynamic properties, which will be used for future applications and studies.
Heat Transport and Fluid Dynamics

This course teaches the basics and the methods for the description and for the quantitative treatment of heat transfer and fluid flow with emphasis on physico-chemical processes. During the lectures, theoretical aspects will be discussed and will be linked to application by the discussion of a comprehensive study case, including the methods for its solution. Detailed exercises will be given (and discussed later) to the students, to let them familiarize with the main methods discussed during the lectures.

In the last part of the course, the chemical equilibria are discussed, with particular focus on the calculation of mass and energy balances for multicomponent systems (mixtures), also in the presence of physical equilibria.

During the lectures, theoreetical aspects will be discussed and will be linked to application by the discussion of a comprehensive study case, including the methods for its solution. Detailed exercises will be given (and discussed later) to the students, to let them familiarize with the main methods discussed during the lectures.

Prerequisites / notice
Knowledge in chemical thermodynamics required

Lecture notes
No script will be available. Support material consists of PowerPoint presentations, which will be available in PDF format online.

Literature
Books on this subject can be mostly found under the title: 'Chemical Engineering Thermodynamics', 'Thermodynamics for Chemical Engineers', or 'Chemical Process Principles'. A selection:

Acquisition of material properties and data:

- "Chemistry Data Series", ed. by J. Gmeihling, U. Onken, Dechema, Frankfurt
- "TRC Thermodynamic Tables", Thermodynamic Research Center, College Station USA
- "Zahlenwerte und Funktionen aus Naturwissenschaften und Technik", Landolt-Börnstein, Band IV, Teile 4, Bandteil a.

Prerequisites / notice
Knowledge in chemical thermodynamics required

Abstract
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

Objective
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

Content
Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; dilution in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Reynolds- and Chilton-Colburn analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogenous and heterogenous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogenous reaction. Applications.

Literature

Prerequisites / notice
Three tests are offered for practicing the course material. Participation is voluntary.

Provide to the students a complete methodology for the analysis and design of homogeneous reactors

The lectures for Discovering Management are designed to broaden the participant's understanding of the principles of entrepreneurial management, emphasizing the interdependence of various specialties in the development and management of a firm. For this reason, the lectures are structured on the basis of a coherent business model and will be presented by the respective area specialists at D-MTEC. The lectures broaden the view and the understanding of technology by interlinking it with society. Corporate sustainability, for example, introduces economic, ecological and social issues that are relevant to all engineering disciplines. Practical examples stimulate the students to assess these issues and be aware of their responsibilities as engineers. Technology and innovation management, to mention a second example, focuses on the interplay of technical and organizational change, and how these often neglected interactions explain why many new technologies are never used. It fosters the students' ability to see the business and social consequences of their ‘technical’ decisions. Critical skills will be trained by the case study exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of the decision maker, as they learn more about the specific case and identify the challenge they are faced with. Students will be presented real case scenarios by industry guests from established corporations and will have to critically analyze specific issues. The case study exercise will provide an insight into the context of a managerial problem-solving and enhance the participant's appreciation for the complex tasks companies deal with.

Discovering Management attempts to overcome the limitations of traditional teaching curricula of management in technical universities, which often merely focus on transferring specific skills to students, e.g. planning or forecasting. In response to the new challenges for entrepreneurial decision-making, students will be offered the opportunity to actively engage in an advanced business game simulation; a business game that establishes a link between business management theory and business management in practice. The simulation presents a realistic model of a company and provides participants with the opportunity to quickly gain the lasting effects of practical experience in a risk-free environment. All this provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyze the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities.

No prior knowledge of business or economics is required to successfully complete this course.

**Abstract**

The focus of part I of the case study course lies on the literature-based comparison of chemical process alternatives. Based on this compilation and selected quantitative as well as qualitative measures a process assessment and comparison is conducted and the most promising process alternative is chosen for further evaluation, and a basic flow sheet and mass and energy balances are generated.

**Objective**

- to obtain knowledge about different databases and sources of information
- application of the knowledge obtained in lectures
- problem-oriented problem solving (application of different methods to the same subject)
- team work
- report writing and presentation techniques

The focus of part I of the case study course lies on the literature-based comparison of chemical process alternatives. For this purpose relevant substance data (i.e. physico-chemical, toxicological, safety, and environmental data) as well as information about synthesis routes and technical implementations (i.e. on reaction kinetics; possible separation operations; economic, safety, and environmental aspects) are collected from the literature. Based on this compilation and selected quantitative as well as qualitative measures a process assessment and comparison is conducted and the most promising process alternative is chosen for further evaluation. For this alternative a basic flowsheet and mass and energy balances are generated.

**Content**

In groups of two, students will conduct selected experiments in the following areas: thermodynamics and phase equilibria including electrochemistry, transport phenomena, kinetics and selectivity of complex reactions, characterisation of ideal and real reactors.

**Objective**

Introduction to various tools of chemical engineering techniques with reference to the running lectures.

**Content**

In groups of two, students will conduct selected experiments in the following areas: thermodynamics and phase equilibria including electrochemistry, transport phenomena, kinetics and selectivity of complex reactions, characterisation of ideal and real reactors.

This course provides an introduction to Security Studies by examining the major theoretical approaches to the study of international security. It familiarizes students with general research design problems such as defining research questions, analyzing causality, and designing single and comparative case studies. It then introduces them to basic issues in small-n research. Students acquire an understanding of the specific challenges and design problems in qualitative analysis. Finally, students are introduced to exemplary methods of data collection. By the end of the course, students should be able to use the principal methods of data collection used by political scientists, have a critical understanding of the advantages and disadvantages of the methods, and should be able to reflect on and discuss the methods in light of research questions of their interest.

Objectives:
1. After this course, students should be able to assemble a dataset, prepare descriptive statistics, develop and test hypotheses, and present their results in a high-quality presentation or paper.
2. Students will be expected to contribute to such discussions and present short position papers. Most importantly, students will also be expected to engage in continuous independent study.
3. The seminar is an opportunity to explore in depth particular issues and to engage in discussions in a small group. Students will be expected to present their findings in a high-quality presentation or paper.

Methods I: Research Design, Qualitative Methods, and Data Collection

Abstract
The seminar covers basic issues of research design, small-n research, and data collection. It deals with issues of causality, conceptualization, case study design and QCA. Data collection includes interviews, surveys, and text analysis.

Objective
This MACIS core seminar covers basic issues of research design, small-n research, and data collection. It familiarizes students with general research design problems such as defining research questions, analyzing causality, and designing single and comparative case studies. It then introduces them to basic issues in small-n research. Students acquire an understanding of the specific challenges and design problems in qualitative analysis. Finally, students are introduced to exemplary methods of data collection. By the end of the course, students should be able to use the principal methods of data collection used by political scientists, have a critical understanding of the advantages and disadvantages of the methods, and should be able to reflect on and discuss the methods in light of research questions of their interest.

Democracy

Abstract
The seminar focuses on seminal books and articles as well as brand new analyses on topical issues of democratic theory and practice. Students gain an overview of the relevant theories of democracy and democratic governance, and they will be able to critically engage with challenges to democracy stemming from globalization and international institutions.

Objective
At the end of the seminar, students are familiar with the relevant theoretical and empirical literature on democracy and democratization in national and international contexts. They are able to reflect on contemporary challenges to democracy, in particular those stemming from the internationalization of politics.

Content

Political Violence

Abstract
This course offers an introduction to political violence in domestic and international politics. The course covers explanations of interstate wars, theories of civil and ethnic wars and regional conflict. Other topics include new threats, including transnational terrorist networks and other non-state actors, and the relationship between conflict and nation-building and democratization processes.

Objective
This course offers an introduction to political violence in domestic and international politics. Electives

Number Title Type ECTS Hours Lecturers
857-0003-00L Contemporary Security Studies W 4 credits 2S M. Dunn, Cavelty, J. Hagmann

Abstract
This course provides an introduction to Security Studies by examining the major theoretical approaches to the study of international relations as well as several core conceptual areas of study. Each section features a review of the main theoretical works in the field and an examination of important empirical cases.

Objective
The aim of the course is to promote a critical engagement with a wide range of empirical, historical, and theoretical literature in Security Studies and by applying this theoretical material to contemporary developments in world politics. By the end of the course, students should be able to understand the competing contemporary definitions and theories of security and to formulate academically informed opinions about contemporary security issues and policy.

Content
This course draws upon a variety of theoretical perspectives in security studies to analyze the complex ways in which the world order has been threatened during and after the Cold War. To this end, the first part of the course concentrates on traditional approaches to security, while the second part provides students with an overview of approaches that have broadened and deepened the concept of security: away from military concerns to include economic, societal, and environmental sectors, and away from the state towards notions of global and human security.

Lecture notes
The seminar is an opportunity to explore in depth particular issues and to engage in discussions in a small group. Students will be expected to contribute to such discussions and present short position papers. Most importantly, students will also be expected to engage in continuous independent study.

Literature
All texts will be available online.

Prerequisites / notice
Class will only take place with a minimum of 5 students and is limited to approx. 15 participants. MACIS students are given priority.

851-0594-00L International Environmental Politics

Abstract
This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

Objective
The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.

Course materials:
All texts will be available online.

Prerequisites / notice
Particularly suitable for students of D-ITET, D-USYS
Content

This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation, various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 4 ECTS credit points. The workload is around 120 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

Lecture notes

Slides and reading material will be made available at www.ib.ethz.ch (teaching, materials, then menu on the left side of the screen). They are password protected. Use your Netzh username and password to access the material.

Literature

See www.ib.ethz.ch (teaching, materials).

Prerequisites / notice

Students from ETH will receive 4 ECTS credit points if they attend classes regularly and obtain a grade of 4.0 or higher for the written exam in the final week of the semester. Students who obtain a grade of less than 4.0 for the end-of-semester test will have a second chance in the first week of the following semester. The rules of the game are defined in detail on the course syllabus. Students who do not participate in the end of semester test will not have access to the repeat exam unless they submit compelling and documented reasons for why they were unable to participate in the first test. Except for language dictionaries, no additional materials and no laptops and mobile phones are allowed during the exam.

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

The workload for this course is approx. 120 hours (all inclusive).

Abstract

A three-day visit to international organizations in Geneva - e.g., the World Trade Organization, the World Health Organization and the International Committee of the Red Cross. Teams of 2-3 students prepare a 2-3 page background reading for the group on a specific international organization and lead the discussion with representatives of that organization during the visit.

Objective

Become familiar with the work and challenges of international organizations based in Geneva.

Content

A three-day visit to international organizations in Geneva - e.g., the World Trade Organization, the World Health Organization and the International Committee of the Red Cross. Democratic Representation in Theory and Practice

4 credits

2S

W

Abstract

This course discusses normative and empirical models of democracy, and compares the actual behavior of the main actors in a democratic system to that which is required by the different models. The course also looks at why democracies often produce sub-optimal outcomes when dealing with certain issues, such as budget deficits and environmental externalities.

Objective

- Discuss the differences between various normative models of democratic representation
- Discuss how the normative models relate to empirical studies on the topic
- Discuss when, why, and in what sense, democratic representation fails or works well
- Discuss the strengths and weaknesses of current empirical research
- Identify needs for further research

857-0075-00L

Development and Current Issues of European Integration

4 credits

2S

W

Abstract

How have the EU’s powers developed until now and what are the problems facing the Union today? In this course, we will discuss the development of European integration. Furthermore, the course will address key issues such as the EU's democratic deficit, the consequences from enlargement to Central and Eastern Europe, the prospects for future entrants and the Euro-crisis.

Objective

Since its start in the fifties, the European Union has evolved into an ever more important multilevel system of integration in terms of decision-making competences and scope of policy. How have the EU’s powers developed until now and what are the problems facing the Union today? To address these questions, the course is divided into two parts. The first part discusses the development of European integration in terms of the functioning of the EU institutions and the policy-making process (i.e. agenda-setting, decision-making and implementation). In the second part of the course, we analyze the problems confronting Europe during the process of European integration, as well as current issues associated with the EU’s expansion of powers and membership. For example, key questions include: Is there a “democratic deficit” in the EU in terms of responsiveness to public opinion? To what extent does the existing EU institutional structure allow for representation? How can we explain patterns of “differentiated integration” across policy areas and countries? What are the consequences from the EU’s enlargement on the “new” Central and Eastern European member states and the prospects for future entrants? We will conclude with a discussion about the Euro-crisis.

Political Islam: Islamist Movements in Arab MENA States (University of Zurich)

6 credits

2S

W

Abstract

The winds of change that swept over the Middle East and North Africa have transformed the political landscape in an unexpected manner. This seminar will look closely at the concept of political Islam and at the ideologies and programs of some of these parties and groups. It will also investigate the consequences of their participation on citizenship rights and the democratization process.
1. Examine the concept of political Islam and at the ideologies and programs of some of these parties and groups.
2. Examine some of these movements within the contexts of different countries
3. Investigate the consequences of their participation on citizenship rights and the democratization process.

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 349 of 1432
Objective
Public policies result from decision-making processes that take place within formal institutions of the state (parliament, government, public administration, courts). That is, policies are shaped by the characteristics of decision-making processes and the characteristics of public institutions and related actors (e.g., interest groups). In this course, students acquire the contextual knowledge for analyzing public policies. They learn why and how public policies and laws are developed, designed, and implemented at national and international levels. The course is organized in three modules. The first module (Stefan Bechtold) examines basic concepts and the role of law, law-making, and law enforcement in modern societies. The second module (Thomas Bernauer) deals with the functioning of legislatures, governments, and interest groups. The third module (Frank Schimmelfennig) focuses on the European Union and international organisations.

Content
Schedule:
W1: (no class because of ISTP cornerstone course)
W2: Bechtold, Bernauer: Introduction
W3: Bechtold: Why do we need laws and why do people and other actors (e.g., firms) usually obey the law?
W4: Bechtold: How is the law enforced, and when do laws fail to influence the behavior of individuals and other actors (e.g., firms)?
W5: Bechtold: Courts as policy-makers
W6: Bernauer: How are parliaments (legislatures) elected, how do they work, and how do their characteristics and processes affect policy-making?
W7: Bernauer: Why do forms of government differ and how does this affect policy-making? Why and in what respect are public administrations efficient/effective, and why sometimes not?
W8: Bernauer: How do interest groups and social movements affect policy-making?
W9: Schimmelfennig: Governance beyond the state: why and how states create international institutions.
W10: Schimmelfennig: International organizations and regimes: case studies of global governance.
W11: Schimmelfennig: Governance in the European Union: policy-making and policy enforcement.
W12: Schimmelfennig: The international diffusion of policies: how states learn from each other.
W13: study week, Q&A meeting
W14: End of semester test
End of January: deadline for review essay

Lecture notes
Reading materials will be distributed to the students before the semester starts.

Prerequisites / notice
This is a Master level course. The course is capped at 25 students, with ISTP Master students having priority.

Permission to begin master thesis is required to take part in Colloquium.

Abstract
In this colloquium, students enrolled in the MACIS program first present and discuss research design and methods issues concerning their prospective MA theses. Towards the end of the semester they present preliminary findings from their MA thesis work.

Objective
It is the goal of the colloquium to help students with the initial steps of writing their master theses. During the colloquium, they will develop a relevant research question and hypotheses and select appropriate methods and data.

Only students who fulfill the following criteria are allowed to begin with their master thesis:

- a. successful completion of the bachelor programme;
- b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract
The Master Thesis is an independent piece of research on an issue in comparative and international politics. It combines theory, methods, and empirical work.

Objective
The Thesis should demonstrate the students’ ability to conduct independent research on the basis of the theoretical and methodological knowledge acquired during the MA program.

</tbody>
</table>
1) - Introduction, Statement of the problem, course structure, exercises, why Scientific DBs (SDBs) do not fit exactly the classical DB area. Hierarchy: File systems, data bases, knowledge bases and variations. Efficiency issues and how they differ from classical DB.

2) - Relational DB used for scientific data, pros/cons Introduction to RDB, limitations of the model, basics of SQL, handling of metadata, examples of scientific use of RDBs.

3) - Object Oriented DB. Rich/structured objects are very appealing in SDB. OODB primitives and environments. OODB searching. Space and access time efficiency of OODBs.

4) - Knowledge bases, key-value stores, ontologies, workflow-based architectures. WASA.

5) - MapReduce / Hadoop

6) - Storing and sharing mathematical objects, Open Math, its relation with OODB and Knowledge bases. Also the problem of chemical formula representation.

7) - SGML and XML, human-readable databases, genomic databases. Advantages of human-readable databases (the huge initial success of genomic databases).

8) - Semantic web, Resource Description Framework (RDF) triples, SparQL. An example of very flexible database for knowledge storage. Goals of the Semantic Web, discussion about its future.

9) - An ideal scenario (and the design of a toy system with most of the desired features for exploration and exercises).

11) - Functional testing, Verifiers, Consistency, Short-circuit testing. Recovery and Automatic recovery, Backup (incremental) methods.

12) - Performance and space issues, various uses of compression, concurrency control. Hardware issues, clusters, Cloud computing, Crowd-sourcing.

13) - Guest speaker: Ioannis Xenarios (UniProtKB/Swiss-Prot).

Literature

Several papers and online articles will be made available. There is no single textbook for this course.

A significant amount of material will be delivered in the lectures making lecture attendance highly recommended.

401-6282-00L Statistical Analysis of High-Throughput Genomic and Transcriptomic Data (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: STA426

Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract

A range of topics will be covered, including basic molecular biology, genomics technologies and in particular, a wide range of statistical and computational methods that have been used in the analysis of DNA microarray and high throughput sequencing experiments.

Objective

-Understand the fundamental "scientific process" in the field of Statistical Bioinformatics

-Be equipped with the skills/tools to preprocess genomic data (Unix, Bioconductor, mapping, etc.) and ensure reproducible research (Sweave)

-Have a general knowledge of the types of data and biological applications encountered with microarray and sequencing data

-Have the general knowledge of the range of statistical methods that get used with microarray and sequencing data

-Gain the ability to apply statistical methods/knowledge/software to a collaborative biological project

-Gain the ability to critically assess the statistical bioinformatics literature

-Writing a coherent summary of a bioinformatics problem and its solution in statistical terms

Content

Lectures will include: microarray preprocessing; normalization; exploratory data analysis techniques such as clustering, PCA and multidimensional scaling; Controlling error rates of statistical tests (FPR versus FDR versus FWER); limma (linear models for microarray analysis); mapping algorithms (for RNA/ChIP-seq); RNA-seq quantification; statistical analyses for differential count data; isoform switching; epigenomics data including DNA methylation; gene set analyses; classification

Lecture notes

Lecture notes, published manuscripts

Prerequisites / notice

Prerequisites: Basic knowledge of the programming language R, sufficient knowledge in statistics

Former course title: Statistical Methods for the Analysis of Microarray and Short-Read Sequencing Data

551-0307-00L Biomolecular Structure and Mechanism I: Protein Structure and Function

D-BIOL BSc students are obliged to take part I and part II (next semester) as a two-semester course

Abstract

Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

Objective

Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytics.

Lecture notes

Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Creighton, T. E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.
- Berg, Tymoczko, Stryer: Biochemistry (5th edition), Freeman (2001);

Current topics: References will be given during the lectures.

### 636-0007-00L

**Computational Systems Biology**

**W** 6 credits 3V+2U  J. Stelling

**Abstract**

Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity, reduction, stability, identification).

**Objective**

The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

**Content**

Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes and, subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

**Literature**

### 636-0009-00L

**Evolutionary Dynamics**

**W** 5 credits 2V+1U  N. Beerenwinkel

**Abstract**

Evolutionary dynamics is concerned with the mathematical principles according to which life has evolved. This course offers an introduction to mathematical modeling of evolution, including deterministic and stochastic models.

**Objective**

The goal of this course is to understand and to appreciate mathematical models and computational methods that provide insight into the evolutionary process.

**Content**

Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the context of different biological systems, focusing on asexual populations. Viruses and cancer cells provide the most prominent examples of such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies equation, evolution of HIV, evolutionary game theory, birth-death processes, evolutionary theory, stochastic evolution of cancer, stochastic tunneling, cell differentiation, hematopoietic tumor stem cells, genetic progression of cancer and the speed of adaptation, diffusion theory, fitness landscapes, neutral networks, branch processes, evolutionary escape, and epistasis.

**Lecture notes**

No.

**Literature**

**Prerequisites / notice**

Prerequisites: Basic mathematics (linear algebra, calculus, probability)

### 636-0017-00L

**Molecular Evolution, Phylogenetics and Phyloinformatics**

**W** 4 credits 3G  T. Stadler

**Abstract**

The aim of the course is to provide up-to-date knowledge on how we can obtain an understanding of the evolution and population dynamics of organisms based on their genetic sequencing data, employing key concepts from molecular evolution, phylogenetics and phyloinformatics. Throughout the course, we tie the models and methods closely with applications, mainly in the field of epidemiology and evolution.

**Objective**

Attendees will learn what information is contained in genetic sequencing data and how this information is extracted from the sequencing data. The main concepts introduced are:

- models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics
- stochastic processes

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

**Content**

The course consists of three parts. We first introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Second, we employ these evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer geneologies and phylogenies. We finally introduce the field of phyloinformatics.

The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades.

**Lecture notes**

Slides of the lecture will be available online.

**Literature**

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

**Prerequisites / notice**

Basic knowledge in linear algebra, analysis, and statistics.

<tr>
<td><strong>Content</strong></td>
<td>Neuronomorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. <td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enrichtments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.</td>
<td></td>
<td></td>
<td></td>

### 535-0810-00L Gene Technology

**Abstract**
The aim of the lecture course is to provide a solid overview of the science and issues in gene technology and genome science. 

**Topics:**
- Antibody phage technology
- Protein modification technology
- Genome projects, genome sequencing, transcriptomics, proteomics, and SNP technology
- The course is suited for advanced undergraduate and early graduate students in pharmaceutical sciences or related fields.

**Objective**
The course will provide a solid overview of the science and issues in gene technology and genome science.

**Content**
1. Antibody phage technology
   - The antibody molecule
   - V genes, CDRs, basics of antibody engineering
   - Principles of phage display
   - Phagemid and phage vectors
   - Antibody libraries
   - Phage display selection methodologies
   - Other phage libraries (peptides, globular proteins, enzymes)
   - Alternative screening/selection methodologies
   - DNA-encoded chemical libraries

2. Proteins: chemical modification and detection of biomolecular interactions
   - Homo- and hetero-dimerization of proteins
   - Chemical modifications of proteins
   - Radioactive labeling of proteins
   - Kinetic association and dissociation constants
   - Affinity constant: definition and its experimental measurement

3. Genomics: Applications to Human Biology
   - Protein cloning and expression
   - Functional Genomics
   - Sequencing genomes and novel sequencing methods
   - Genetic disorders: discovery and pharmaceutical implications
   - Transcriptomics
   - Proteomics
   - Principles of Cancer
   - Principles of Vaccine Development
   - Principles of Gene Therapy

4. Pharmaceuticals: Focus on Discovery
   - Chemical Libraries
   - Protein Therapeutics
   - Consideration on pharmacokinetics and half-life extension

**Lecture notes**
- Skript "Gene Technology" by Prof. Dario Neri
- Updated handouts will be provided during the class.
- Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.
- In addition, citations from the original literature relevant to the individual lectures will be assigned weekly.

### 551-0307-00L Biomolecular Structure and Mechanism I: Protein Structure and Function

**Abstract**
Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

**Objective**
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytics.

**Lecture notes**
Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

**Literature**
- Creighton, T.E., Proteins, Freeman, (1993)
- Biological Principles of Cancer
- Principles of Vaccine Development
- Principles of Gene Therapy

**Current topics: Reference will be given during the lectures.**

### 551-0309-00L Concepts in Modern Genetics

**Abstract**
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective**
This course focuses on the concepts of classical and modern genetics and genomics.

**Content**
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**
Scripts and additional material will be provided during the semester.

### 551-0313-00L Microbiology (Part I)

**Abstract**
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Objective**
This concept class will be based on common concepts (Grundlagen der Biologie IIb, Teil Mikrobiologie) and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Content**
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

</table>

**Abstract**

Concepts to cope with: a) what can be accomplished in a fully automated fashion (algorithmically solvable) b) How to measure the inherent difficulty of tasks (problems) c) What is randomness and how can it be useful? d) What is nondeterminism and what role does it play in CS? e) How to represent infinite objects by finite automata and grammars?

**Objective**

Learning the basic concepts of computer science along their historical development.

**Content**

- alphabets, words, languages, measuring the information content of words, representation of algorithmic tasks
- finite automata, regular and context-free grammars
- Turing machines and computability
- complexity theory and NP-completeness
- design of algorithms for hard problems

**Lecture notes**

The lecture is covered in detail by the textbook "Theoretical Computer Science".

**Abstract**

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

**Objective**

Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensible to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.

**Prerequisites**

- During the semester, two non-obligatory test exams will be offered.
Content

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:
- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non-parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

Lecture notes

No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice

Solid basic knowledge in analysis, statistics and numerical methods for CSE. Experience in programming for solving the project tasks.

401-0663-00L Numerical Methods for CSE W 7 credits 4V+2U R. Hiptmair

Abstract

The course gives an introduction into fundamental techniques and algorithms of numerical mathematics which play a central role in numerical simulations in science and technology. The courses focuses on fundamental ideas and algorithmic aspects of numerical methods. The exercises involve actual implementation of numerical methods.

Objective

* Knowledge of the fundamental algorithms in numerical mathematics
* Knowledge of the essential terms in numerical mathematics and the techniques used for the analysis of numerical algorithms
* Ability to choose the appropriate numerical method for concrete problems
* Ability to interpret numerical results
* Ability to implement numerical algorithms efficiently

Content

1. Direct Methods for linear systems of equations
2. Interpolation
3. Iterative Methods for non-linear systems of equations
4. Krylov methods for linear systems of equations
5. Eigensolvers
6. Least Squares Techniques
7. Filtering Algorithms
8. Approximation of Functions
9. Numerical Quadrature
10. Clustering Techniques
11. Single Step Methods for ODEs
12. Stiff Integrators
13. Structure Preserving Integrators

Lecture notes

Lecture slides will be made available to participants.

Literature

151-0104-00L Uncertainty Quantification for Engineering & Life Sciences W 4 credits 3G J. Beck, P. Koumoutsakos

Number of participants limited to 60.

Abstract

Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective

The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content

Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Lecture notes

The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Literature

1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes
3. Class Notes

Abstract

Flexible, short research project (lab rotation) with an emphasis on experimental biology.
Objective
The course provides a practical overview of an experimental biology research area, applying concepts taught in the General and Core courses, and preparing for further specialization through the Master thesis.

Abstract
Flexible, short research project within the field of computational biology/bioinformatics.

Objective
The course provides a practical overview of a bioinformatics research area, applying concepts taught in the General and Core courses, and preparing for further specialization through the Master thesis.

Content
Students learn to transfer and apply their knowledge by working independently in the laboratory or on projects. By applying knowledge acquired from the core and advanced courses, and the Methods of Computer Science course, students gain insight into different research areas.

► Compulsory Electives in Humanities, Social and Political Sciences

Objective
The Master Thesis is the result of an independent scientific research and/or constructive development project in the chosen area of specialization.

Objective
The Master thesis concludes the Master programme. By writing up the Master thesis, students show their ability to independently produce a coherent and scientific piece of work.

Content
The program concludes with a Master thesis of 6 months duration that includes a written report and an oral presentation. The topic of the thesis can be chosen according to the student's interests in the field of computational biology & bioinformatics.

Abstract
This course is about fundamental algorithm design paradigms (such as induction, divide-and-conquer, backtracking, dynamic programming), classic algorithmic problems (such as sorting and searching), and data structures (such as lists, hashing, search trees). The connection between algorithms and data structures is explained for geometric and graph problems.

Objective
An understanding of the design and analysis of fundamental algorithms and data structures.

Content
The course covers fundamental data types, expressions and statements, (Limits of) computer arithmetic, control statements, functions, arrays, structural types and pointers. The part on object orientation deals with classes, inheritance and polymorphy, simple dynamic data types are introduced as examples.

In general, the concepts provided in the course are motivated and illustrated with algorithms and applications.

406-0603-AAL Stochastics (Probability and Statistics) E- 4 credits 9R M. Kalisch
Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

Objective
The objective of this course is to build a solid foundation in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

</tbody>
</table>

**Abstract**
The 4 hour lecture covers the basics of writing & presenting a scientific text. The focus will be on the structure and elements of a scientific text and not on the language. Citation rules, good practice of scientific writing and an overview on software tools will be part of the training. The lecture will be thought on two afternoons. Some exercises will be built into the lecture.

**Objective**
Knowledge on structure and content of a scientific text. The course further is arranged to stimulate a discussion on how to properly write a legible scientific text versus writing an interesting novel. We will further discuss the practice of properly citing and critically reflect on recent plagiarism allegations.

**Content**

* Topic 1: Structure of a Scientific Text (The Title, the author list, the abstract, State-of-the Art, the “in this paper” paragraph, the scientific part, the summary, Equations, Figures).

* Topic 2: Power Point Presentations.

* Topic 3: Citation Rules and Citation Software.

* Topic 4: Guidelines for Research Integrity.

**Literature**

ETH “Citation Etiquette”, see www.plagiate.ethz.ch.

**Prerequisites / notice**
Students should already have a Bachelor degree and plan to do either a semester project or a master thesis in the immediate future.

**Abstract**
The Diploma of Advanced Studies finishes with a 3-months diploma thesis which is directed by a professor of the department ITET. Students prove their ability to conduct independent scientific research on a specific research problem, using skills and knowledge acquired during the program. The thesis includes a written report and an oral presentation.

**Objective**

### Pharmacology and Toxicology I

**Number:** 535-0521-00L  
**Title:** Pharmacology and Toxicology I  
**Type:** W  
**ECTS:** 2 credits  
**Hours:** 2V  
**Lecturers:** U. Quitterer

**Abstract**  
The two-semester lecture course will provide a detailed understanding of the fundamentals of drug action and the mechanisms of action and therapeutic use of the important classes of drugs. The lectures are intended for students of pharmaceutical sciences.

**Objective**  
The lectures will provide a comprehensive survey of pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects.

**Content**  
Topics include disease-relevant macroscopic, microscopic, pathobiochemical and functional disturbances of specific organs and organ systems. The lectures integrate disease pathology with mechanisms of drug action, usage, metabolism, pharmacokinetics, side effects, toxicity, contraindications and dosage of relevant drug classes. Basic principles of clinical pharmacology and pharmacotherapy will be covered.

**Lecture notes**  
Für jede Vorlesung wird ein Skript abgegeben, das eine Zusammenfassung mit den wichtigsten Stichpunkten beinhaltet.

### Clinical Microbiology

**Number:** 535-0165-00L  
**Title:** Clinical Microbiology  
**Type:** W  
**ECTS:** 1 credit  
**Hours:** 1V  
**Lecturers:** K. Lucke

**Abstract**  
Thorough knowledge of major pathogens involved in infectious diseases; principles of laboratory diagnosis of pathogenic bacteria and fungi.

**Objective**  
Thorough knowledge of all major pathogens involved in infectious diseases; principles of laboratory diagnosis of pathogenic bacteria and fungi.

**Content**  
Basics and principles of clinical microbiology:
- host-pathogen interaction
- symptoms and diagnosis of major bacterial pathogens
- therapeutic regimens commonly used against bacterial disease
- major aspects of medical mycology, virology and parasitology
- epidemiology

**Literature**

### Gene Technology

**Number:** 535-0810-00L  
**Title:** Gene Technology  
**Type:** W  
**ECTS:** 2 credits  
**Hours:** 2G  
**Lecturers:** D. Neri

**Abstract**  
The aim of the lecture course is to provide a solid overview of the science and issues in gene technology and genome science.  
Topics: Antibody phage technology, protein modification technology, genome projects, genome sequencing, transcriptomics, proteomics and SNP technology. The course is suited for advanced undergraduate and early graduate students in pharmaceutical sciences or related fields.

**Objective**  
The course will provide a solid overview of the science and issues in gene technology and genome science.
## Content

1. **Antibody phage technology**
   - The antibody molecule
   - V genes, CDRs, basics of antibody engineering
   - Principles of phage display
   - Phagemid and phage vectors
   - Antibody libraries
   - Phage display selection methodologies
   - Other phage libraries (peptides, globular proteins, enzymes)
   - Alternative screening/selection methodologies
   - DNA-encoded chemical libraries

2. **Proteins: chemical modification and detection of biomolecular interactions**
   - Homo- and hetero-dimerization of proteins
   - Chemical modifications of proteins
   - Radioactive labeling of proteins
   - Kinetic association and dissociation constants
   - Affinity constant: definition and its experimental measurement

3. **Genomics: Applications to Human Biology**
   - Protein cloning and expression
   - Functional Genomics
   - Sequencing genomes and novel sequencing methods
   - Genetic disorders: discovery and pharmaceutical implications
   - Transcriptomics
   - Proteomics
   - Principles of Cancer
   - Principles of Vaccine Development
   - Principles of Gene Therapy

4. **Pharmaceuticals: Focus on Discovery**
   - Chemical Libraries
   - Protein Therapeutics
   - Consideration on pharmacokinetics and half-life extension

---

### Lecture notes

**J.C. Leroux, B. A. Gander**

**Abstract**
Principles and technologies for the manufacturing of dosage forms and drug delivery systems. Knowledge of pharm. excipients, materials, containers, liquid and semi-solid dosage forms, their production, function, quality and application. Comprehension of molecular interactions in solution and colloidal systems. Comprehension of interfacial phenomena and stabilization measures in disperse dosage forms.

**Objective**
Knowledge of the most important pharmaceutical excipients, materials, containers, liquid and semi-solid dosage forms, of their production, function, quality, stability and application. Comprehension of the molecular interactions in solution and colloidal systems. Comprehension of interfacial phenomena and stabilization measures in disperse dosage forms.

**Content**
Introduction and overview of important fundamentals, principles and technologies for the development and manufacturing of dosage forms and drug delivery systems. Overview of the most important pharmaceutical excipients and polymers, their structure, properties and processing; importance of materials properties for containers. Pharmaceutical solvents, fundamentals of solubility and solubilization of drugs. Water treatment processes, sterilization techniques and quality requirements of pharmaceutical water. Parenteral dosage forms and liquid ophthalmics. Surfactants, micelle formation and colloidal systems. Liquid suspensions and emulsions. Stabilization measures in dosage forms.

**535-0250-00L**  
**Biotransformation of Drugs and Xenobiotics**  
**W 1 credit 1V**  
**S.D. Krämer**

**Abstract**
Knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.

**Objective**
Goals: knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.

**Content**
Major reactions of biotransformation. Major enzymes and reaction partners involved in the biotransformation of drugs and xenobiotics. Toxic reactions of metabolites. Factors which affect the biotransformation.

**Lecture notes**
Biotransformation of drugs and xenobiotics
Students have a thorough knowledge of all clinical pictures and their symptoms regarding outpatient treatment. They know the main groups of indications encountered in outpatient treatment. Outlining of therapeutic strategies and patterns with regard to suitable distinction between pharmaceutical self-medication and the need for medical treatment. Detailed coverage of the pharmacotherapy of all mechanisms of action, contraindication, therapeutic patterns, side effects, interactions.

Pharmacoepidemiology and Drug Safety

Abstract
Introduction of principles of pharmacoepidemiology and epidemiology in addressing drug related questions in the population and of epidemiologic perspectives for health care management.

In parallel appropriate tools to critique pharmacoepidemiologic studies in medical literature will be given and applied.

Objective
To familiarize participants with the principles of pharmacoepidemiology and epidemiology in addressing drug related questions with concern to the use, effects and risks of medicinal products in a large population.

To introduce participants to fundamental statistical, economic and epidemiologic concepts and methods.

To provide the appropriate tools to critique pharmacoepidemiologic studies in the literature and to critically read and understand papers in the medical literature which relate to drug benefits, risks, and costs.

To address controversial topics in drug use and benefit-risk assessment, and to critically appraise the outcome of drug therapy.

To equip participants with skills to facilitate further studies in these areas.

Content
The contribution of epidemiology to the study of drug uses, effects and risks:
- Pharmacoepidemiology study methodologies, concepts and strategies,
- Detection and identification of unintended drug effects (pharmacovigilance),
- Quantifying unintended effects and drug interactions,
- Bias and confounding by indication,
- Drug utilization

Pharmacoepidemiology and outcome assessment of drug therapy.

Meta-analysis in pharmacoepidemiology.

Lecture notes
This course will be a combination of formal lectures, group discussions and self-directed project work. Course material will be taught through seminars, case studies and group projects. Reading material and scripts will be given for each week.

Literature
A reading list pertinent to the course will be provided during the course.

Methodological referen

Therapeutic Proteins

Abstract
In this course, various topics related to the development, GMP production and application of therapeutic proteins will be discussed. Furthermore, students will expand their training in pharmaceutical immunology and will be introduced to the basic concepts of pharmaceutical product quality management.

Objective
Students know and understand:
- basic mechanisms and regulation of the immune response
- the pathogenic mechanisms of the most important immune-mediated disorders
- the most frequently used expression systems for the production of therapeutic proteins
- the use of protein engineering tools for modifying different features of therapeutic proteins
- the mechanism of action of selected therapeutic proteins and their application
- basic concepts in the GMP production of therapeutic proteins

Content
The course consists of two parts:

In a first part, students will complete their training of pharmaceutical immunology (Chapter 13 - 16 Immunobiology VIII textbook). This part particularly focuses on the pathogenic mechanisms of immune-mediated diseases. Deepened knowledge of immunology will be relevant for understanding the mechanism of action of many therapeutic proteins, as well as for understanding one major concern related to the use of protein-based drugs, namely, immunogenicity.

The second part focuses on topics related to the development and application of therapeutic proteins, such as protein expression, protein engineering, reducing immunogenicity, and GMP production of therapeutic proteins. Furthermore, selected examples of approved therapeutic proteins will be discussed.

Lecture notes
Handouts to the lectures will be available for downloading under http://www.pharma.ethz.ch/scripts/index

Literature
- Chapters 13-16 of the Immunobiology VIII book (Janeway et al.)
- Lecture Handouts
- Paper References provided in the Scripts
- EMEA Dossier for Humira

Abstract
Overview of the most important clinical pictures: symptoms, recognition, differentiation, pharmacotherapy for the most important general and special medical indications. Groups of pharmaceutical compounds, active pharmaceutical ingredients, proprietary medicinal products: mechanisms of action, contraindication, therapeutic patterns, side effects, interactions.

Objective
Students have a thorough knowledge of all clinical pictures and their symptoms regarding outpatient treatment. They know the main groups of indications including active pharmaceutical self-medication and ingredients, mechanisms of action, pharmacokinetics, pharmadynamics and dosage. They are also able to identify the relevant side effects and interactions.

Content
Pathophysiology of selected clinical pictures and their main symptoms and clinical parameters. Recognition of alarm symptoms and distinction between pharmaceutical self-medication and the need for medical treatment. Detailed coverage of the pharmacotherapy of all fields of indication encountered in outpatient treatment. Outlining of therapeutic stratagems in outpatient treatment. Discussion of the most important mechanisms of action, contraindications, side effects and interactions.

Pharmaceutical Manufacturing in Small Quantities

Abstract
Hands-on course in pharmaceutical manufacturing in the pharmacy according to "GMP regulations for small quantities" defined in the pharmaceups: Design and practical approach in compounding of formulas using the most important dosage forms including their risks and quality assurance.
Objective
Students are able to manufacture, to package, to quality-control and document pharmaceutical compounding on their own, "lege artis" and according to GMP regulations, using the appropriate techniques. They know the most important properties of active ingredients and excipients frequently used. They achieve the necessary knowledge including the relevant literature and other sources of information, as well as the legal requirements regarding pharmaceutical manufacturing in small quantities.

Content
To impart knowledge about the principal techniques and processes in the manufacturing of pharmaceuticals in small quantities (formulas), focusing on the design, manufacturing, quality assurance and risk based self-appraisal including the patient specific dispensing. During the practical training periods: by means of pharmaceutical relevant examples the design, the planning, the manufacturing including the correct use of the equipment, the in-process control, the packaging and the quality assurance are practiced for various dosage forms and recipes. Quality assurance and control are mainly risk adapted considering as well hygiene regulations according to current pharmaceutical practice. The participants will thus improve their general GMP knowledge and skills.

<tr>
<td>Content</td>
<td>Students know the most important concepts and methods of pharmaceutical care of patients with regard to OTC and Rx-only drugs as well as the essential concepts and methods of public health, prevention and health care. They master the basic rules concerning the pharmaceutical triage and their implications. For the clinical pictures covered during the course, they are able to make therapeutic plans or accompany and optimize doctor’s orders. Students show an adequate understanding of the rights and duties of pharmacists as medical personnel regarding medical care and service within the framework of the Swiss health care system. They are capable of handling important medical products and instructing patients about their use. Students have the necessary basic skills and applications of first aid and emergency medicine. They know the essence, chances and limits with reference to additional assortments, therapeutic options like phytotherapy, complementary medicine, veterinary pharmacy and non-medical methods of healing. Students have the essential knowledge of legal aspects and regulations concerning pharmacists and know the basics of business administration.</td>

<td><strong>PhD Colloquium Theory of Information Technology for Architects</strong></td>
<td>W</td>
<td>2</td>
<td>2K</td>
<td>L. Hovestadt</td>
</tr>
<tr>
<td><strong>Abstract</strong></td>
<td>Information technology plays an increasingly important role in research. To meet this challenging development, it is not only important to acquire respective skills, but also to consider and understand information technology in what sets it apart from other gaitstas of technics (like mechanics, dynamics, or thermodynamics).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>The starting point for this colloquium is to comprehend computing not in terms of skills, but as a literacy which we can experience today. Like in the case of writing as well, computing cannot exhaustively be reduced to either logics, grammar, arithmetics, or analytics. Rather, computation, if comprehended as a literacy, relates to any of the established categories of learning and raises questions of an architectonic kind. This colloquium draws from the principal richness of cultural forms of knowing and learning and thematizes approaches to formulate a theoretical stance on information technology for architects which is driven by and resting on the actual reality of computability today. In this, it is complementary to those theory courses on technology offered by the historical disciplines at ETH.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Prerequisites / notice</strong></td>
<td>To benefit from this course, you should have a practical affinity to technics, as well as an abstract interest in information technology in its comprehensive cultural context.</td>
<td></td>
<td></td>

The programme revolves around the so-far untapped resource desert sand and the question of how to activate its potential as an
alternative building material. The E4D winter school will be composed of 30 master and doctoral students of different disciplines related to
development, urban design and landscape design and city's relation to society.

The colloquium of the ZGW focuses on present developments, debates and perspectives in the field of history of knowledge. On the
second and fourth date there will be public events in the Cabaret Voltaire. Check the program on www.zgw.ethz.ch

Knowledge has become one of the existential conditions of modern societies and it increasingly determines their dynamics. Therefore, it is
gaining more and more relevant to develop a differentiated analysis of the epistemic, social and cultural constraints of the production,
circulation and the decay of knowledge. In addition, the colloquium asks after the cultural and ethical resonances of knowledge not only
within science but also in relation to art, literature, technology, everyday life, and so on.

Prerequisites / notice
Short notice about program changes are possible and will be communicated through the ZGW newsletter. Please register with
www.zgw.ethz.ch/de/newsletter.html

Credit points can be gained by regular attending and by writing an essay. In addition to the five colloquia there will be a deepening seminar
on offer (lector K. Espahangizi).

Free childcare available.

064-0017-15L
NSL Doctoral Colloquium: Methods in Urban and Landscape Studies •
Course data: Time and place will follow in due time.

Advanced PhD candidates of urban studies, urban and landscape design and urban sociology report about their experiences and insights
in the concrete application of methods utilized for their research and scientific publications. Discussion of ongoing individual work, 
methodological questions, critical perspectives on urban and landscape design and city's relation to society.

The seminar seeks to provide participants with a differentiated knowledge of methods in the field of the urbanism. Furthermore, it provides
a platform to exchange contemporary urban research experiences across disciplinary boundaries, drawing from different geographies of
knowledge production. Possible meta-themes include modes of data assessment in urban studies, ways of progressing from hypothesis to
synthesis, and research by design as method.

The format of HS15 will provide an overarching methodological meta-theme, to be defined prior to the event. One external guest critic will be
invited. In this case, each presentation will conclude with a discussion round, providing sufficiently detailed feedback for every doctoral
candidate.

The seminar is joint-organized by the chairs of Prof. Kees Christiaanse, Prof. Dr. Christian Schmid, Prof. Dr. Marc Angélil and Prof. Hubert
Klumpner as one full-day event in the academic semester.

The will comprise different formats, alternating with the responsible chair.

Participants in both cases will be expected to submit single-page abstracts of their papers in advance and to make a presentation of app.
20 minutes at the colloquium. The discussion rounds will be moderated by the organizing professor and the invited guests.

Enrolment on agreement with the lecturer only.

051-0827-15L
Sand: an (in)finite Resource? - Engineering for Development (E4D) Winter School
Number of participants limited.

The programme revolves around the so-far untapped resource desert sand and the question of how to activate its potential as an
alternative building material. The E4D winter school will be composed of 30 master and doctoral students of different disciplines related to

Desert sand on the other hand is presently unsuitable to the construction industry: Gradual wind erosion polishes the sand particles into
round and even forms and therefore reduces their friction capacity; desert sand is simply too fine and spherical in shape to act as a high-
friction aggregate in a concrete matrix.

Desert sand is the most used raw material for the production of goods on our planet. It is found in concrete, glass, computers, detergents and
even toothpaste. But sand is a finite resource: what took millions of years to come into being through erosion and sedimentation, man is
acquired knowledge will be tested and applied. The students will attend workshops along three lines of investigation that could mobilise
the topic from ETH Zurich and from other academic institutions. They will be joined by faculty members and external experts.

The E4D winter school aims to develop an integrated vision to a global challenge of today's construction industry: the non-usability of
desert sand. The programme of the E4D Winter School aims at developing alternative methods to activate the so-far unusable resource of
desert sand for the construction industry. Lead by different experts from around the world, students will not only learn the theoretic
background of this resource but experiment with current and future technologies to transform desert sand. In workshop experiments the
acquired knowledge will be tested and applied. The students will attend workshops along three lines of investigation that could mobilise
desert sand for construction and other applications: (i) bio-cementation, (ii) sintering and (iii) 3D printing.

Sand is the most used raw material for the production of goods on our planet. It is found in concrete, glass, computers, detergents and
even toothpaste. But sand is a finite resource: what took millions of years to come into being through erosion and sedimentation, man is
mining at rivers and ocean coasts in a so-far unknown speed. Sand is the megastar of the industrial and digital era - our culture is literally
built upon this resource. But sand is not equal to sand: The construction industry requires grain sizes and rough shapes that are only found
in river beds, lakes and the oceans. Over the turn of millions of years, mountains gradually eroded into gravel, sand and dust. Eventually,
rainfalls carry these particles through existing watercourses to the sea. Sand is mostly composed of quartz, a mineral form of silicon
dioxide. It is one of the most abundant materials on the earth surface and also one of the strongest. These properties make it valuable to
various industries.

Desert sand on the other hand is presently unsuitable to the construction industry: Gradual wind erosion polishes the sand particles into
round and even forms and therefore reduces their friction capacity; desert sand is simply too fine and spherical in shape to act as a high-
friction aggregate in a concrete matrix.

Taking place from 9 to 28 January 2016 at the TU Berlin Campus in El-Gouna, Egypt).

Costs: CHF 500, including board and accommodation. All participants are responsible for organising and financing their own domestic or
international travel to El Gouna.

The Engineering for Development (E4D) Winter School 2016 will invite 30 master and doctoral students from different disciplines related to
the topic of the winterschool. Applicants will be selected based on their academic record and previous work experiences.

Applicants must send a one-page CV and one-page letter of motivation in PDF format stating their interest, to Mrs. Patricia Heuberger,
patricia.heuberger@sl.ethz.ch
Deadline: 30 September 2015
Notification: 20 October 2015

**Abstract**
A seminar on current topic in life cycle assessment. In the fall of 2015, the focus is on assessment of complex systems. We will look a number of topics, including input/output tables, optimization, and linking LCA with physical or economic models.

**Objective**
To improve ones understanding of life cycle assessment, and the broader issues in modeling, improving, and understanding sustainability assessments.

**Content**
The first hour of class is an interactive student presentation with discussion and class participation; each student is expected to present once, either alone or with one other student. The second half of class is devoted to a practical exercise of the concepts introduced and examined in the first half.

**Literature**
Everyone is expected to read one or two scientific articles or manuscripts each week, to be provided by the instructor.

**Prerequisites / notice**
Students should be familiar with either life cycle assessment, environmental science, or economic modeling. This seminar is intended to be primarily for Ph.D. students.

<tr>
<td>Abstract</td>
<td>A course dedicated to the reading and discussion of the relevant literature. The actual list of theme papers will be proposed anew for every year. Students then choose a topic and prepare themselves for a general discussion with their colleagues and peers. In the process, current and controversial topics will be discussed and studied. To become proficient in reading scientific literature, to understand how to look at publications, to understand them and to be able to put them in context. The course also trains the skills needed for the presentation of scientific contributions and the ability to put things into a broader context. Training in how to participate in a scientific discussion, how to make an argument and how to listen to arguments of others. All topics focus on themes from ecology and evolution, notably so on studies on adaptation of organisms, their evolutionary history, or on questions of current methodology. The actual content, i.e. the theme papers, will be determined and allocated to the participants at the start of the course each year. Takes place at Uni Irchel. Please refer to notes on board or ask secretary Mrs. Rita Jenny (<a href="mailto:Rita.Jenny@env.etzh.ch">Rita.Jenny@env.etzh.ch</a>).</td>

Abstract
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life.

Objective
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content
The course starts with the basics of linear regression modeling, and then proceeds to parameter estimation, tests and confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, categorical input variables, shrinkage and general modeling strategies.

The last third of the course is dedicated to an introduction into generalized linear regression models: this includes logistic regression for binary response variables, Poisson regression for count data, cumulative logit models for ordered, and multinomial regression for categorical response variables.

Lecture notes
A script will be available.

Literature
Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.
I. Ethics & the Process of Ethical Inquiry

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not…;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues…; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

Integrity in Research & Research Misconduct
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 Rs (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks;
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 373 of 1432
Abstract
This monthly meeting is a platform for Zurich-based immunology research groups to present and discuss their ongoing research projects. At each meeting three PhD students or Postdocs from the participating research groups present an ongoing research project in a 30 min seminar followed by a plenary discussion.

Objective
The aim of this monthly meeting is to provide further education for master and doctoral students as well as Postdocs in diverse topics of immunology and to give an insight in the related research. Furthermore, this platform fosters the establishment of science- and technology-based interactions between the participating research groups.

Content
Presentation and discussion of current research projects carried out by various immunology-oriented research groups in Zurich.

Lecture notes
none

551-1409-00L RNA Biology Lecture Series II: Non-coding RNAs: W 4 credits 2V J. Hall, M. Stoffel, O. Voinnet, further lecturers

Abstract
This course covers aspects of RNA biology related to the functions of non-coding RNAs as well as their use as drugs to treat diseases.

Objective
The students should get familiar with the wide array of roles, which non-coding RNAs play in cellular functions.

Content
Micro RNAs; computational approaches to miRNAs; micro RNA function in metabolism; viruses and viral RNAs; nucleic acid-based drugs; ncRNA-mediated genome regulation; epigenetic programming of genome remodelling in ciliates; telomerase and telomeres; tRNA biology.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

**Abstract**
This seminar will feature invited lectures about recent advances and developments in systems biology, including topics from biology, bioengineering, and computational biology.

**Objective**
To provide an overview of current systems biology research.

**Content**
The final list of topics will be available at http://www.bsse.ethz.ch/education/.

</tr>
<tr>
<td>Abstract</td>
<td>The lecture provides a journey into the molecular world of scents from the chemical secrets behind Chanel N°5 to structure-odor relationships, industrial processes, and total synthesis of terpenoids. Each subunit is centered on one odorant family and highlights a certain class of chemical reactions, illustrated by prominent perfumery examples.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>After completion of this lecture module the students know all the major perfumery materials of the important odor families with their academic and industrial syntheses, their olfactory properties, their usage, their historic perspective, and today's economic importance. The students can explain the significance of important building blocks and industrial transformations, and can estimate how attractive chemical processes are on large scale. They can retrosynthetically plan academic and industrial syntheses of fragrant compounds and terpenoids, and the acquired knowledge on structure-odor relationships enables them to predict and design new odorants. The students can approximate the conformational space of odorants and especially macrocycles on the basis of simple rules, and know how olfactophore models are used. The students understand and can explain the molecular mechanism of smell, the biosynthesis of terpenes, and the basics of perfumery composition. The latter enables them to further their education in perfumery at specialized Universities such as the ISIPCA in Versailles; yet, the student also knows about the links of Fragrance Chemistry with Pharmaceutical Chemistry and the Specialty Chemicals business in general.</td>
<td></td>
<td></td>
<td></td>
<td></td>

Objective: Students are expected to attend all seminars in one academic year, and should register at the beginning of each seminar. Additionally they must deliver a two page written report at the end of the year describing the topics covered, main conclusions, and interrelationships between the different themes.

Content: The ICB seminar series covers the umbrella of diverse research activities encompassed within the institute, including catalysis, functional materials, polymer engineering, separations, microfluidics, process design, and systems engineering. This series was founded with the aim of promoting cross-disciplinary scientific discourse and interaction with other distinguished groups working worldwide, and is targeted at individuals who have made outstanding contributions within their fields. Each year, around 7 distinguished scientists and technologists will be invited to speak on topics of current interest in Chemical and Biochemical Engineering. PhD students are particularly encouraged to attend in order to broaden their perception and enrich their scientific horizons.

151-1049-00L Seminar in Fundamentals of Process Engineering
Only for master and doctoral students of Process and Chemical Engineering.

Abstract: This seminar covers actual subjects from the specific research areas of the laboratory of transport processes and reactions.

Objective: Scientific discussion on actual research topics

Content: The contents are announced through the group's webpage.

Lecture notes: No textbook

<td>529-0195-00L</td>
<td>Scientific Information Retrieval &amp; Management in Life Sciences and Chemistry</td>
<td>W</td>
<td>1</td>
<td>1V</td>
<td>O. Renn</td>
</tr>
<tr>
<td>Abstract</td>
<td>Students will learn how to effectively retrieve, critically judge, analyze and manage published scientific information - important skill sets in chemistry and life sciences where scientists need to deal with vast amounts of information. The course, being based on practical examples, also covers scientific writing &amp; communication and state-of-the-art technologies for analysis such as text mining.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Ability to select appropriate, subject-specific databases or tools for a given specific scientific question based on a sound understanding on how a tool or database has been developed and maintained; thus building the personal capacity of doing research effectively and efficiently by integrating scientific information into the research process when needed. Ability to communicate own scientific results using additional distribution channels. Ability to easily write-up the Ph.D. thesis or first paper.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The course has been primarily designed for Ph.D. students, also for the Life Science Zurich Graduate School, but is also open to Master students. In a series of 13 lectures, which always include practical examples (for some lectures an own notebook is required), the use of scientific information is taught not in a database-centric view but corresponding to the steps through which scientific research is conducted - including the dissemination of scientific results. This is particularly interesting for students who are about to write-up their first paper or thesis. Students will learn about the different types of information resources and tools, get an insight into the numerous databases and tools that exist and how those are built and maintained, enabling them to critically judge the value and trustworthy of a information resource. Additionally, they will learn how to communicate their own scientific results properly, using also additional measures that are reflected by alternative metrics.

The following topics are covered:
1. The World of Scientific Publishing
2. Searching and Retrieving Scientific Information Using Search Engines and Using Literature Databases
3. Searching and Retrieving Scientific Information Using Subject-specific Databases in Chemistry
4. Searching and Retrieving Scientific Information Using Subject-Specific Databases in Life Sciences
5. Tools for Managing the Retrieved Scientific Information
7. Patents
8. Text(Literature) and Data Mining
9. Communicating & Analyzing the Impact of (Your) Science
10. Scientific Writing & Good Scientific Practice

Lecture notes
The slide deck and supplementary materials will be made available in the teaching document repository (ILIAS) after each lecture.

Literature
Additional literature and reference are provided in the course material.

PhD students learn how to present and discuss their own research questions, methods, results and problems. PhD students get familiar

PhD students interested in empirical development economics will present their ongoing work, with a particular focus on the methods (to be) used and challenges faced. Participants are expected to read the drafts/papers/presentations beforehand and give constructive feedback to the PhD student presenting.

The workshop and lecture series will present a mix of speakers who represent the wide range of current social science research methods.

The students shall acquire the following competences:
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall be familiar with the issues of corporate compliance, i.e.: the system to ascertain that all legal and ethical rules are observed.
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

A comprehensive script will be made available online on the moodle platform.

This series is a joint project by ETH Zurich and the University of Zurich. It provides an overview of interdisciplinary research on intellectual property, innovation, antitrust and technology policy research. They should also have an overview of current topics of international research in these areas.

The workshop and lecture series will present a mix of speakers who represent the wide range of current social science research methods.

Particularly suitable for students of D-ITET

The Role of Intellectual Property in Daily Routine: A Practical Introduction

This colloquium is an essential part of the postgraduate programme "History of Knowledge" dealing with the history of modern knowledge systems in a broad sense. In the analysis of the various systems of knowledge the programme seeks to combine approaches from the fields of Philosophy, History of Science and Technology as well as Social, Economic and Cultural History.

Abstract

The aim of this course is to enable students at ETH Zurich to recognize which rights may protect their creations, and which rights may be infringed as a result of their activities. Students should learn to assess the risks and opportunities of intellectual property rights in the development and marketing of new products. To put them in this position, they need to know the prerequisites and scope of protection afforded by the various intellectual property rights as well as the practical difficulties involved in the enforcement of intellectual property rights. This knowledge is imparted based on current rulings and cases.

Objective

Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thickets).

Content

Prerequisites: solid mathematical skills.

Literature

Texts by Locke, Nozick, Christman, Otsuka, Rasmussen, Schneider, Stirner, Fichte and Forschner. Founding of property right in self-ownership (Locke), revival of this concept in Nozick and his egalitarian critics. Critique of the concept of self-ownership related to property in one's body. Looking back to the personal self-relatedness that comes up again in Intellectual Property and in modern personal rights.

851-0585-15L Complexity and Global Systems Science

Prerequisites: solid mathematical skills.
Particularly suitable for students of D-ITET

Abstract

This course discusses complex techno-socio-economic systems, their counter-intuitive behaviors, and how their theoretical understanding empowers us to solve some long-standing problems that are currently bothering the world.

Objective

Participants should learn to get an overview of the state of the art in the field, to present it in a well understandable way to an interdisciplinary scientific audience, to develop models for open problems, to analyze them, and to defend their results in response to critical questions. In essence, participants should improve their scientific skills and learn to think scientifically about complex dynamical systems.

Content

This course starts with a discussion of the typical and often counter-intuitive features of complex dynamical systems such as self-organization, emergence, (sudden) phase transitions at "tipping points", multi-stability, systemic instability, deterministic chaos, and turbulence. It then discusses phenomena in networked systems such as feedback, side and cascade effects, and the problem of radical uncertainty. The course progresses by demonstrating the relevance of these properties for understanding societal and, at times, global-scale problems such as traffic jams, crowd disasters, breakdowns of cooperation, crime, conflict, social unrests, political revolutions, bubbles and crashes in financial markets, epidemic spreading, and/or "tragedies of the commons" such as environmental exploitation, overfishing, or climate change. Based on this understanding, the course points to possible ways of mitigating technosocio-economic-environmental problems, and what data science may contribute to their solution.

Prerequisites / notice

Mathematical skills can be helpful

851-0550-01L Colloquium Postgraduate Programme "History of Knowledge"

Only for doctoral students of Graduate Center "History of Knowledge"

Abstract

The colloquium is an essential part of the postgraduate programme "history of knowledge" dealing with the history of modern knowledge systems in a broad sense. In the analysis of the various systems of knowledge the programme seeks to combine approaches from the fields of Philosophy, History of Science and Technology as well as Social, Economic and Cultural History.

Objective

The objective of the colloquium is to train the participants in the history of knowledge, to give an insight into different methodological perspectives of all disciplines involved, to practice presentations and develop an understanding of specific problems of interdisciplinary cooperation.

851-0240-16L Current Research on MINT Learning

Objective

This colloquium focuses on the presentation of research projects conducted by the professorships participating in the competence center EducETH which concern learning in the STEM subjects. STEM stands for science, technology, engineering, and mathematics. Doctoral students and postdoctoral researchers will present their current projects and theoretical and methodological aspects will be discussed.

Content

Particularly suitable for students of D-ITET, D-MAVT, D-MATL

Prerequisites: solid mathematical skills.

851-0738-00L Intellectual Property: Introduction

Particularly suitable for students of D-ITET, D-MAVT, D-MATL

Abstract

The course provides an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights). Aspects of competition law are treated insofar as they are relevant for the protection of intellectual creations and source designations. The legal principles are developed based on current cases.

Objective

The aim of this course is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thickets).
In recent years, knowledge about intellectual property has become increasingly important for engineers. In both production and distribution as well as in research and development, engineers are increasingly being confronted with questions concerning the patenting of inventions and the utilisation of patent information. With up to 80% of publicly-available technical information being stored in patents only, it is of great importance for engineers to know the basics of the patent system and to be in a position to be able to extract relevant information from the flood of patent information available. This relates to daily work in industry as well as in research, where protecting inventions has gained in importance.

Patents are also an important source of information - from competitors and potential cooperation partners to the development of markets and the risk of coming into conflict with third party IP rights. Respectively, a knowledge of patents has also become a key qualification at a company’s strategic level.

The seminar is customised to the needs of engineers. Participants will become familiar with practice-relevant aspects of intellectual property with the emphasis being placed on patents. Participants will be able to use the acquired knowledge in the protection and commercialisation of their own inventions.

The topics covered will include:
- The importance of innovation in industrialised countries and high-tech sectors
- The protection of inventions and the safeguarding of commercial implementation - the role and importance of intellectual property
- Patents as a source of technical and business information
- Practical aspects of intellectual property for day-to-day research work, for the formation of start-ups and at the workplace.

The seminar contains practical exercises on the use and research of patent information. Basic knowledge on how to read and evaluate patent documents, as well as how to use publicly available patent databases in order to obtain the required patent information will also be provided.

For students of chemistry-related degree programs, the lecture ‘Protecting inventions in chemistry’ will be offered, which is coordinated to the needs of students in these degree programs.

<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Objective</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>By the end of the lecture, students should be familiar with essential positions in the scientific and philosophical treatment of questions relating the mind to the brain. It should also become clear that some of the most relevant problems in current neurosciences have a long history.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Content</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>According to a myth, the ancient Greek philosopher Democrit dissected animals, because he was in search of the seat of the soul. Current neuroscientists use neuroimaging techniques like functional magnetic-resonance-tomography in order to localize cognitive and emotional qualities in the brain. Between these two dates lies a history of 2500 years, in which the relationship between the mind and the brain has been defined in various ways. Starting with ancient and medieval theories, the lecture will have its focus on modern theories from the nineteenth century onward. I will discuss essential issues in the history of the neurosciences such as localization theories, the neuron doctrine, reflex theory, theories of emotions, neuropsychometrics and the importance of visualizing the brain and its parts, but I will also include works of art and literature.</td>

</tbody>
</table>
Abstract This seminar introduces theory and methods in human-computer interaction and usability. Cognitive Science provides a theoretical framework for designing user interfaces as well as a range of methods for assessing usability (user testing, cognitive walkthrough, GOMS). The seminar will provide an opportunity to experience some of the methods in applied group projects.

Objective This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability. Presentations will cover basics of human-computer interaction and selected topics like mobile interaction, adaptive systems, human error and attention. A focus of the seminar will be on getting to know evaluation techniques in HCI. Students form work groups that first familiarize themselves with at least one usability evaluation method (e.g. user testing, GOMS, task analysis, heuristic evaluation, questionnaires or Cognitive Walkthrough). They will then apply the methods to a human-computer interaction setting (e.g. an existing software or hardware interface) and present the method as well as their procedure and results to the plenary. Active participation is vital for the success of the seminar, and students are expected to contribute to presentations of foundational themes, methods and results of their chosen group project. In order to obtain course credit a written essay / report will be required (details to be specified in the introductory session of the course).

851-0252-02L Introduction to Cognitive Science
Number of participants limited to 70.
Particularly suitable for students of D-ITET

3 credits 2V C. Hölscher, L. Konieczny, T. Thrash

Abstract The lectures provide an overview of the foundations of cognitive science and investigate processes of human cognition, especially perception, learning, memory and reasoning. This includes a comparison of cognitive processes in humans and technical systems, especially with respect to knowledge acquisition, knowledge representation and usage in information processing tasks.

Objective Cognitive Science views human cognition as information processing and provides an inter-disciplinary integration of approaches from cognitive psychology, informatics (e.g., artificial intelligence), neuroscience and anthropology among others. The lectures provide an overview of basic mechanisms of human information processing and various application domains. A focus will be on matters of knowledge acquisition, representation and usage in humans and machines. Models of human perception, reasoning, memory and learning are presented and students will learn about experimental methods of investigating and understanding human cognitive processes and representation structures.

851-0252-03L Cognition in Architecture - Designing Orientation and Navigation for Building Users
Particularly suitable for students of D-ARCH

3 credits 2S V. Schinazi, B. Emo Nax, C. Hölscher

Abstract How can behavioral and cognitive science inform architecture? This project-oriented seminar investigates contributions of cognitive science to architectural design with an emphasis on orientation and navigation in complex buildings and urban settings. It includes theories on spatial memory and decision-making as well as hands-on observations of behavior in real and virtual reality.

Objective Taking the perspectives of building users (occupants and visitors) is vital for a human-centered design approach. Students will learn about relevant theory and methods in cognitive science and environmental psychology that can be used to understand human behavior in built environments. The foundations of environmental psychology and human spatial cognition will be introduced. A focus of the seminar will be on how people perceive their surroundings, how they orient in a building, how they remember the environment and how they find their way from A to B. Students will also learn about a range of methods including real-world observation, virtual reality experiments, eye-tracking and behavior simulation for design. Students will reflect on the roles of designers and other stakeholders with respect to human-centered design and an evidence-based design perspective. The seminar is geared towards a mix of students from architecture / planning, engineering, computer science and behavioral science as well as students interested in the relation between design and cognition.

Architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".

851-0585-04L Lecture with Computer Exercises: Modelling and Simulating Social Systems with MATLAB
Particularly suitable for students of D-MAVT, D-INFK, D-ITET, D-MTEC, D-PHYS.

3 credits 2S D. Helbing, S. Ballelli, O. Woolley

Abstract This course introduces the basic functionalities and features of the mathematical software package MATLAB, such as the simple operations with matrices and vectors, differential equations, statistical tools, the graphical representation of data in various forms, and video animations of spatio-temporal data. With this knowledge, students are expected to implement themselves in MATLAB, models of various social processes and systems, including agent-based models, e.g. models of interactive decision making, group dynamics, human crowds, or game-theoretical models.

Objective Part of this course will consist of supervised programming exercises in a computer pool. Credit points are finally earned for the implementation of a mathematical model from the sociological literature in MATLAB and the documentation in a seminar thesis.

Lecture notes The lecture slides will be presented on the course web page after each lecture.

Further literature, in particular regarding computer models in the social sciences, will be provided in the course.

Prerequisites / notice The number of participants is limited to the size of the available computer teaching room. The MATLAB code related to the seminar thesis should be well enough documented for further use by others and must be handed over to the Chair of Sociology, in particular of Modeling and Simulation, for further free and unrestricted use.

862-0089-00L Advanced Colloquium in Literary Studies
Colloquium is designed for advanced and graduated students.

1 credit 1K A. Kilcher

Abstract The colloquium addresses advanced and graduate students. First, it offers participants the opportunity to present their own research projects (work in progress); and, second, it provides a most fruitful space to discuss methodological, theoretical and systematic complex issues.

Objective The colloquium addresses advanced and graduate students. First, it offers participants the opportunity to present their own research projects (work in progress); and, second, it provides a most fruitful space to discuss methodological, theoretical and systematic complex issues.

851-0252-05L Research Colloquium Cognitive Science
Prerequisite: Participants should be involved in research in the cognitive science group.

1 credit 2K C. Hölscher, V. Schinazi, T. Thrash

Abstract The colloquium provides a forum for researchers and graduate students in cognitive science to present/discuss their ongoing projects as well as jointly discuss current publications in cognitive science and related fields. A subset of the sessions will include invited external visitors presenting their research. Participants of this colloquium are expected to be involved in active research group.

Objective Graduate student train and improve their presentation skills based on their own project ideas, all participants stay informed on current trends in the field and have the opportunity for networking with invited scholars.

851-0738-03L Protecting Inventions in Chemistry

2 credits 2V C. Soltmann
Abstract
The lecture gives students of chemistry-related degree programs an overview of the options to protect inventions and the underlying investments in research and development. The lecture aims to put the participants in a position to be able to use this know-how in the workplace.

Objective
Research and development play an important role in chemistry-related technology sectors, such as inorganic chemistry, pharmacy or food chemistry.

Investments in the development of new substances and active component in these sectors are traditionally secured by patents because publicly known inventions, generally chemical substances, may easily be reproduced by others.

In the last years, the know-how about intellectual property has become increasingly important for chemists and engineers. Both in the production process and in the distribution sector, chemists and engineers are increasingly concerned with questions related to patenting inventions and the use of patent information. As more than three-quarters of all publicly available technical information is reportedly available only in patents, it is more and more important for researchers and engineers to be capable of extracting relevant information from the flood of patents.

Patents are not only a measure to protect investments and inventions in chemistry-related sectors but also an important source of information about competitors and potential cooperation partners, about the development of markets and the risks of infringing others’ patents. Accordingly, the know-how about patents and patent information has also become a key qualification on the strategic level in companies and in the area of research.

The seminar is customised to the needs of chemists and students of related degree programs. Participants will become familiar with practice-relevant aspects of intellectual property with the emphasis being placed on patents. Participants will be able to use the acquired knowledge in the protection and commercialisation of their own inventions.

The topics covered will include:
- The importance of innovation in industrialised countries and high-tech sectors
- The protection of inventions and the safeguarding of commercial implementation - the role and importance of intellectual property
- Patents as a source of technical and business information
- Practical aspects of intellectual property for day-to-day research work, for the formation of start-ups and at the workplace.
- Special aspects of protecting inventions in chemistry-related sectors, including polymorphs and inventions in the field of nanotechnology.

The seminar contains practical exercises on the use and search of patent information in chemistry-related sectors. Basic know-how on how to read and evaluate patent documents, as well as how to use publicly available patent databases in order to obtain the required patent information will also be provided.

Prerequisites / notice
The lecture is coordinated in particular to the needs of the following degree programs: Agricultural science, biotechnology, chemical engineering, chemistry, food science, pharmaceutical sciences.

For engineering and physics students, the lecture 'The Role of Intellectual Property in daily routine: A Practical Introduction' will be offered, which is coordinated to the needs of students in these degree programs.

### 851-0300-94L Combinatorics: History of a Method Between Mathematics and Literature

**Abstract**
Combinatorics is a procedure shared by various disciplines. In mathematics it concerns the calculation of quanta and probabilities, in philosophy the creation of encyclopedic knowledge, in mysticism the achievement of ecstatic experience, in literature, finally, experimental writing. This course investigates these different forms of combinatorics.

**Objective**
- comparative understanding of combinatorics as a transcultural and transdisciplinary procedure to generate knowledge
- combinatorics in theology, mysticism and occultism
- combinatorics in philosophy and the natural sciences
- combinatorics in literature and literary theory

**Content**
Kombinatorik, die Verknüpfung von Elementen, tritt als ein Verfahren in unterschiedlichen Disziplinen und Bereichen des Wissens auf: In der Mathematik, wo man sie zuerst vermutet, ermöglicht sie die Berechnung von Anzahlen und Wahrscheinlichkeiten. Zugleich spielt die Kombinatorik auch eine grosse Rolle in der Philosophie (als ein Verfahren zur Erzeugung eines enzyklopädischen Wissens), in der Mystik (zur Erlangung ekstatischer Erfahrung) und in der Literatur (als ein experimentelles Schreibverfahren). In dem Seminar werden diese vielfältigen Formen und Funktionen von kombinatorischen Verfahren zwischen mathematischer, philosophischer, mystischer und ästhetischer Anwendung verglichen und analysiert.

**Objective**
- Students are familiar with different relations between literature and technology. They can verbalise and analyse central contents.
- Students are familiar with different relations between literature and technology. They can verbalise and analyse central contents.
- to critically consider the concepts of science and knowledge
- to systematically reconstruct and reproduce complex arguments (reading-competences)
- to understand how advances in technology and science are historically rooted in European imperial expansion and are connected to global social inequalities in the postcolonial world.
- to understand the historical plurality of forms of knowledge in different parts of the world as well as entanglements between different forms of knowledge
- to enable students to form an educated opinion and participate in discussions on the global history of science and knowledge

**Publication**
851-0158-00L Living at the Expense of Others. Parasites in the History of Science

**Abstract**
Parasites have a bad reputation. They settle in with other creatures' bodies, they manipulate and deceive them, they live at the expense of others. Such features are not only of biological but also of social, political, and economic importance. The lecture will track the traces of the parasite through the history of biology and medicine and the fields of political economy and cultural theory.

**Objective**
The course provides insight into the complex and intricate history of the parasite and the various definitions of parasitism. In particular, it will make students aware of the fact that there is no single expert discourse on parasites (such as biology or medicine) which is then transferred to the realm of the social and the political. Instead, it will be considered how and why all these aspects are intertwined when people talk about parasites.

**Publication**
851-0101-47L Science in the Twentieth Century: A Global Perspective WEBCLASS

**Abstract**
This course studies the 20th century history of those forms of knowledge framed specifically as science and technology, from a global perspective. It explores how exchanges and relationships between different parts of the world contributed to what is understood as science and "development". In doing so, it considers how the concept of science is entangled with structures of power and domination.

**Objective**
- to critically consider the concepts of science and knowledge
- to understand how advances in technology and science are historically rooted in European imperial expansion and are connected to global social inequalities in the postcolonial world.
- to understand the historical plurality of forms of knowledge in different parts of the world as well as entanglements between different forms of knowledge
- to systematically reconstruct and reproduce complex arguments (reading-competences)
- to understand, compare and analyse differing approaches to the history of science.
- to enable students to form an educated opinion and participate in discussions on the global history of science and knowledge

**Publication**
851-0309-13L "Materialmoränen": Thomas Mann’s Zauberberg from the Point of View of the History of Knowledge

**Abstract**
This seminar is dedicated to Thomas Mann's "Zauberberg", the great Bildungsroman and "Zeitroman" (Mann) from the author's middle period. Mann himself feared that the novel might be intellectually overburdened with contexts and concepts. The seminar will attempt to elucidate these contexts from the point of view of the history of ideas and knowledge and will take into account current research.

**Objective**
- Students familiarize themselves with one of the great novels of the 20th century in the context of a diligent reading accompanied by the lecturer.
- On the basis of the primary text, the seminar establishes several perspectives grounded in cultural history, the history of knowledge and ideas, economic and social history and the history of medicine.

**Publication**
851-0300-95L Writing Between Cultures. German-Jewish Literature and Cultural Knowledge 1822–1933

**Abstract**
German-Jewish literature, which includes famous modern authors from Heine to Kafka, is remarkable because it is a cultural double. This lecture course shows the at once productive and problematic dual, transcultural relationship of its history. The key question is how, in this relationship, cultural knowledge is discussed in theoretical, political and literary terms.
Objective
Overview on the history of German-Jewish literature in Germany and Austria between ca. 1822 and 1933
- Discussion of key text of the most important German-Jewish authors (such as Heine, Börne, Herzl, Kafka, Döblin, Kraus, Roth, Wolfkohl, Lasker-Schüler)
- Analysis of theoretical and cultural reflections in German-Jewish literature, art and culture

Man and Machine
Particularly suitable for students of D-CHAB, D-HEST, D-MAVT, D-MATL

W 3 credits
2G
M. Hampe, D. A. Strassberg

Abstract
The lecture gives an overview about the different Man-Machine-Relations since the 18th century. Different models of machines will be important here: the clockwork, the steam engine and the computer.

Objective
On the one hand models of machines had a heuristic value in research on man, e.g. in Harvey's discovery of blood circulation in the 17th century or in brain research in the 20th century. On the other hand these models were always criticised, sometimes polemically, because they are supposedly not adequate for man.

851-0157-56L
Avantgarde-Life: Utopia of the 'New Man' Between Science and Technology
Particularly suitable for students of D-ARCH, D-HEST, D-MTEC.

W 3 credits
2S
M. Wutz

Abstract
At the beginning of the 20th century, the artistic and social avantgarde movements developed visions of a 'New Man' with new modes of perception and within new forms of social life. The seminar deals with the scientific, technological, artistic, pedagogical, and political designs for a new living.

Objective
The seminar deals with the designs for a new living in the artistic and social avantgarde movements at the beginning of the 20th century. It focuses on the correlation of the contemporary scientific and technological developments and the conceptions of a 'New Man'. The discipline of psychotechnics together with scientific and technological designs of living and working environments formulated visions of new and enhanced ways of human living and perception. In the seminar, we will examine the utopian visions of life in the avantgarde movements. Touching upon the fields of the life sciences, economics, management, progressive education, architecture, and art we will reflect the diverse relations between science, technology, and human living.

851-0300-92L
Institutionalisation of Modernity: "Der Sturm", a German Art & Literary Magazine, Edited by Herwarth Hubermann

W 3 credits
2S
S. S. Leuenberger

Abstract
Based on the contributions published between 1910 and 1932 in "Der Sturm", the seminar gives an overview on the unique diversity of literary and cultural movements in Berlin between the turn of the century and the Weimar Republic. Besides the reading of literary texts, the lecture focuses on the aesthetic, philosophical and political discourses of the epoch.

Objective
The seminar deals with the designs for a new living in the artistic and social avantgarde movements at the beginning of the 20th century. It focuses on the correlation of the contemporary scientific and technological developments and the conceptions of a 'New Man'. The discipline of psychotechnics together with scientific and technological designs of living and working environments formulated visions of new and enhanced ways of human living and perception. In the seminar, we will examine the utopian visions of life in the avantgarde movements. Touching upon the fields of the life sciences, economics, management, progressive education, architecture, and art we will reflect the diverse relations between science, technology, and human living.

851-0125-48L
Wisdom, Certainty, Insecurity
Wisdom is widely - maybe even universally, at all times and everywhere - regarded as one of the highest virtues. But what constitutes wisdom? And is wisdom compatible with uncertainty? Does a wise person have to be certain or can she be uncertain? These and related questions will be discussed in the seminar to gain an understanding of what wisdom, certainty and uncertainty are.

Objective
1. Analysis and discussion of different interpretations of the virtue "wisdom".
3. Discussion of the questions what constitutes wisdom today and whether wisdom is a goal of the good life.
4. Examination of the relevance of wisdom in practical and theoretical contexts.

851-0157-57L
Classics in the History of Science: Approaches, History, Contexts

W 3 credits
2S
N. Guettler, M. Stadler

Abstract
More often than not, classics are known by hearsay; they are quoted, but not read, or re-discovered and re-read selectively, so we can quote them. That holds true for many 'classics' in the history of science, too - texts, that is, which have shaped approaches to, and understandings of, science. The aim of this introductory course is to critically read some of these seminal texts.

Objective
This course is suited for all students with an interest in the history of science and knowledge. Conceived of as an advanced historiographical introduction to the subject, the course is to explore a selection of "classics" in the history of science - some of them well known, others less so. In this course, we shall be as much concerned with the perspectives and the history of science that were advanced in these various texts as we shall be concerned with the historical circumstances, political meanings and wider cultural contexts of these perspectives.

851-0325-01L
Censorship, Caricature and System Criticism: Knowledge of Diversity in the Work of Oskar Panizza
Number of participants limited to 25.

W 3 credits
2S

Abstract
The seminar is dedicated to the texts of scandal author Oskar Panizza. Especially the dogmas and beliefs of the Christian churches caused in this perception the grievances in society. Other the subject regimented categories such as ethnicity and gender are denounced by Panizza and discussed in his writings in many ways.

Objective
- Acquiring cultural scientific aspects and perspectives of literature and literary history: alterity, ethnicity, gender constructions, social differences, religion, etc.
- Critical analysis of recent research positions and research questions
- Training problem oriented circumvention of literature and its social functions in historical contexts
- Developing genre typological and narratological foundations
- Independent balancing and writing of ones own research ideas

Central Questions in Bioethics
Particularly suitable for students of D-BIOL, D-CHAB, D-HEST, D-MATL, D-MAVT

Bioethics deals with the evaluation and regulation of technology based interventions into life. What are valid principles guiding bioethical decision, principles like "Protect the dignity of the living being", or "Respect a person's self-determination"? Besides answering such questions, the social, scientific and political processes linked with biotechnologies should be taken into account.

What Is Knowledge?

The seminar aims at a clarification of the concept of knowledge, as it is built in our experiential relations to the world. An analysis is needed of the difference between knowledge and belief, of the relation between objective and knowledge, and of the role of reasons for having knowledge. Additionally, the legitimacy of different types of knowledge claims should be evaluated.

The Factory of the Origins: Myth and Sciences

In which language has God pronounced «Fiat Lux»? Which discourses have dealt with the origins of religions, nations, languages and «races»? Renan questions if the «destiny» of peoples has ever been driven by racial "instinct". In his Schwarze Hefte (2014-2015), Heidegger speaks about the "metaphysics" of «race». The «origins factory» can be related both to oneself as well as to the others.

Modern Rome in the Film and the Literature

In this course we shall discuss and analyze films and fictional works by modern Italian authors that reflect realities, myths, and dreams about the "Eternal City," Rome. We shall not study classical Rome; rather, the focus will be on a trajectory of works, both written and cinematic, that have settings from the late nineteenth to the late twentieth century.

Sharing. The History of an Attractive Technology

The goal is to explore some of the diverse representations of modern Rome that portray historical, political, subjective, and/or fantastical elements that have interacted over time to produce the palimpsest that is the city of Rome. Films by Fellini, Rossellini, Pasolini, and Bertolucci as well as some films directed by non-Italians will be viewed and explored; fiction by D’Annunzio, Moravia, Pasolini, and Malerba will be read in conjunction with specific films.
Cooperation and fairness in encounters with strangers are puzzling behaviors, since they contradict the law of natural selection. Notwithstanding, daily experience as well as field and laboratory studies, all reveal that humans do cooperate and behave fairly. This lecture series is intended to present the main theoretical approaches in economics and psychology to understanding cooperation and fairness and to review some of the relevant experimental studies. The seminar lectures will focus on three strategic games: the prisoner's dilemma (PD), the ultimatum game (UG) and the Public Goods (PG) game. The theories to be discussed include: classical game theory, reciprocity theories, altruistic punishment, equity, reciprocity and competition (ERC), inequality aversion (IA), as well as a new psychological theory of aspiration levels. The theories' predictions of cooperativeness and fairness in the above mentioned games will be presented and compared using experimental data.

Groups of 2-3 students will write an essay on a topic to be agreed upon during the course meetings. Students will be requested to submit their paper within one month from the last class meeting. The grades will be delivered within two months after the last class meeting.

Literature

Prerequisites / notice

Free childcare available.

Credit points can be gained by regular attending and by writing an essay. In addition to the five colloquia there will be a deepening seminar on offer (lecturer K. Espahangizi).
This will be a seminar on design processes. We will review the body of work directed at understanding design processes from the 1950s to the present time. The students get familiar with different theories of religion and of the relation of religion and modernity in particular. They discuss the conceptual and epistemological implications of these theories and understand the problems of determining religion, especially under modern conditions. They reflect on the differences and even conflicts between different approaches and face their respective ideas about modernity. The course thus also aims to deepen the self-understanding of our modern standpoint in relation both to one's own religious identity and history and to the religion of 'Others'.

The analysis of geospatial data is increasingly important in political science. Many traditional types of data used to understand the historical and cultural aspects of geopolitical phenomena are now being supplemented by novel and complex data, such as social media posts, internet search queries, and geolocated mobile device data. In this course, students learn how to manage, visualize, and analyze spatial data using a variety of software tools and techniques. They will explore how to prepare, run, and interpret basic models for answering research questions.

This will be an introductory course in cognitive neuroscience. We will examine both human neurophysiology and cognitive functioning and explore how the former underwrites the latter. Topics include brain anatomy and development, cellular mechanisms, CNS methodologies, visual perception, object recognition, memory, hemispheric specialization, and complex cognition. Learning objectives and outcomes: the course will have three basic components: (1) the first component will include basics of brain anatomy and development, functional imaging techniques (e.g., fMRI), and computational methods; (2) the second component will overview CNS methodologies, with an emphasis on MRI techniques; (3) the third component will examine the major brain structures and their role in cognitive processes. Requirements: - critical reading of theoretical and literary texts that deal with the tension between scientificity and history.

In addition, recent advances in computing allow for collecting and analyzing novel forms of geocoded information that are of growing importance for understanding political phenomena. This course introduces students to the tools and methods necessary for incorporating geospatial data in their own research projects, and guides participants through the entire workflow of creating, viewing, managing, visualizing, and analyzing geospatial data. Overall, students will learn to manage and view geospatial data in various formats; develop a basic understanding of the problem of cartographic projection; collect, create, manipulate, and combine geospatial data for their own research projects; visualize geospatial data in maps and interactive applications; understand the challenges associated with analyzing geospatial data with statistical tools; prepare, run, and interpret basic spatial econometric models (linear SEM and SAR models).

This is an introductory course in cognitive neuroscience. We will examine both human neurophysiology and cognitive functioning and explore how the latter is underwritten by the former. Topics include brain anatomy and development, cellular mechanisms, and complex cognition. Learning objectives and outcomes: the course will have three basic components: (1) the first component will include basics of brain anatomy and development, functional imaging techniques (e.g., fMRI), and computational methods; (2) the second component will overview CNS methodologies, with an emphasis on MRI techniques; (3) the third component will examine the major brain structures and their role in cognitive processes. Requirements: - critical reading of theoretical and literary texts that deal with the tension between scientificity and history.

Facing the recent return of religion in the public sphere, we discuss concepts of the relation of religion and modernity: the classical theories of secularization and the actual discussion of the post-secular, anthrology of religion, political theoogy, psychoanalytic and postcolonial theories of religion.
Objective
Designing artifacts is a critically important, if not unique, human cognitive activity. While we have engaged in design activity since we have been human, it has only been an object of study for the past 50 years. The initial focus during the 1960s was on "design methodologies," This body of work, motivated by large, technically sophisticated, geographically dispersed projects like the Polaris missile project, sought to develop an analytic, mathematically based, teachable doctrine about the design process that would serve the same role for design as the "scientific method" served for science. During the 1980s interest shifted from a normative approach to a descriptive approach, focusing on the cognitive and computational processes of designers. More recently, several researchers are using neuropsychological methodologies to understand the design process.

Learning objectives: to understand the design process from a normative methodological perspective, and descriptive computational, cognitive, and neural perspectives.

Learning outcomes: By the end of the seminar the student should be familiar with these literatures, should be able to discuss relative strengths and weaknesses, and identify what each has contributed to our ability to design, and to our understanding of the design process itself.

851-0252-07L Recent Debates in Social Networks Research W 2 credits 2S C. Stadtfeld, P. Block
Number of participants limited to 30

Abstract
Social Networks research is a highly interdisciplinary fields. For example, scholars in Sociology, Psychology, Political Sciences, Computer Science, Physics, Mathematics and Statistics contribute to the development of theories and methods. This course aims at understanding, comparing and structuring recent debates in the field of Social Networks.

Objective
Social Networks research is a highly interdisciplinary fields. At the end of this seminar, students will understand and be able to compare different subject-specific approaches to social networks research (e.g., from Sociology, Psychology, Political Sciences, Computer Science, Physics, Mathematics and Statistics). They will be familiar with recent publications in the field of Social Networks and be able to critically participate in a number of recent debates. Amongst others, these debates touch upon the co-evolution of selection and influence mechanisms, appropriateness of statistical models, generic mechanisms and features of social networks, models for the analysis of dynamic networks.

851-0101-49L Concepts and Sources of Global History: Young Researchers’ Colloquium W 1 credit 2K B. Schär, J. Große

Abstract
What distinguishes Global History - conceptually and empirically - from other modes of historical inquiry? This research colloquium provides a collegial and non-competitive forum for young researchers to discuss these questions. We shall examine programmatic texts on Global History and connect them to source materials from our own research projects.

Objective
Participants will acquire an systematic overview of different definitions of and approaches to Global History. They will be able to position their own approach within the field of Global History and gain a clearer understanding on how to examine their source materials.

364-1062-00L Experimental Methods W 1 credit 1V C. Waibel

Abstract
This course introduces PhD students into the principles of experimental methods and outlines how to prepare, conduct and evaluate an experiment.

Objective
This course aims to prepare PhD students for conducting their own experiment.

Content
1. Introduction: What are economic experiments and why to use them?
4. Conducting experiments: Instructions, testing, recruiting, sessions.
5. Measuring techniques: Eliciting beliefs, risk attitudes, social preferences.

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 394 of 1432
Objective

Each student is expected to read, understand, and elaborate on a selected research paper. To this end, (s)he should give a 45-min. presentation about the paper. The process includes

* getting an overview of the related literature;
* understanding and working out the background/motivation: why and where are the questions addressed relevant?
* understanding the contents of the paper in all details;
* selecting parts suitable for the presentation;
* presenting the selected parts in such a way that an audience with some basic background in geometry and graph theory can easily understand and appreciate it.

Prerequisites / notice

To attend the seminar, some basic knowledge in (discrete and computational) geometry and graphs and algorithms is required. Thus, previous participation in some of the courses "Graphs and Algorithms", "Computational Geometry", "Geometric Graphs: Combinatorics & Algorithms", or similar courses is strongly encouraged. It is also possible to take this seminar in parallel to the lecture "Computational Geometry".

263-4200-00L

Seminar SAT

W 2 credits 2S E. Welzl

Objective

Goal of this seminar is to study and present, in continuation of the course "Boolean Satisfiability-Combinatorics and Algorithms", research papers from the literature.

Prerequisites / notice

A list of papers for presentations will be distributed at the beginning of the seminar.

263-2100-00L

Research Topics in Software Engineering

W 2 credits 2S P. Müller

Objective

This seminar is an opportunity to become familiar with current research in software engineering and more generally with the methods and challenges of scientific research.

Content

The aim of this seminar is to introduce students to recent research results in the area of programming languages and software engineering. To accomplish that, students will study and present research papers in the area as well as participate in paper discussions. The papers will span topics in both theory and practice, including papers on program verification, program analysis, testing, programming language design, and development tools.

Prerequisites / notice

The publications to be presented will be announced on the seminar home page at least one week before the first session.

264-5810-00L

Programming Languages Seminar

W 2 credits 2S P. Müller, M. Vechev

Objective

This graduate seminar provides doctoral students in computer science a chance to read and discuss current research papers. Enrollment requires permission of the instructors. Credit units are granted only to active participants.

Content

The seminar will explore different topics from a research perspective.

Prerequisites / notice

Supporting material will be distributed during the seminar. The seminar is open to assistants of the Chair of Programming Methodology and the Software Reliability Lab (Department of Computer Science). Others should contact the instructors.

264-5800-05L

Doctoral Seminar in Visual Computing (HS15)

W 1 credit 1S M. Gross, M. Pollefeys, O. Sorkine Hornung

Objective

Learn about current research results in the area of Visual Computing, practice of scientific presentations.

Content

Current research at the IVC is presented and discussed.

| 227-0389-00L | Advanced Topics in Magnetic Resonance Imaging | W    | 0    | 1V    | K. P. Prüssmann |
| Abstract    | This course is geared towards master and PhD students with a focus on bioimaging. It covers advanced topics in magnetic resonance imaging in biennial rotation, including the electrodynamics of MR signal detection, noise mechanisms, image reconstruction, radiofrequency pulse design, RF pulse trains, as well as advanced contrast mechanisms. |
| Objective   | see above |
| Content     | The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity. |
| Literature  | T.M. Cover and J. Thomas, Elements of Information Theory (second edition) |

| 227-0417-00L | Information Theory I | W    | 6    | 4G    | A. Lapidoth |
| Abstract    | This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity. |
| Objective   | The fundamentals of Information Theory including Shannon’s source coding and channel coding theorems |
| Content     | The entropy rate of a source. Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity |
| Literature  | T.M. Cover and J. Thomas, Elements of Information Theory (second edition) |

| 227-0427-00L | Signal and Information Processing: Modeling, Filtering, Learning | W    | 6    | 4G    | H.A. Loeliger |
| Objective   | The course is an introduction to some basic topics in signal processing, detection/estimation theory, and machine learning.  |
| Content     | Part I - Linear Signal Representation and Approximation: Hilbert spaces, least squares and LMMSE estimation, projection and estimation by linear filtering, learning linear functions and filters, regularization and sparseness, singular-value decomposition and pseudo-inverse, principal-components analysis.  |
| Lecture notes | Lecture notes. |
| Prerequisites / notice | Prerequisites:  |
|            | - local bachelors: course "Discrete-Time and Statistical Signal Processing" (S. Sem.)  |
|            | - others: solid basics in linear algebra and probability theory  |

| 227-0445-00L | Advanced Mathematical Signal Processing | W    | 3    | 3G    | H. G. Feichtinger |
| Block course: Starts on October 8 and ends on November 26, 2015 |
| Thursdays 10-12 and 13-16 |
| Abstract    | Usually Fourier Analysis and Systems Theory emphasize the analogy between the different settings (continuous&discrete, periodic&non-per.). The author proposes a simple approach to generalized functions, based on a Banach space of test functions. The course provides the foundations to Banach Gelfand triples, but also concrete applications in signal processing (time-variant systems, sampling). |
| Objective   | Deeper mathematical understanding of the foundations of signal processing and system theory. The setting of Banach Gelfand Triples allows to provide a framework that allows among others to discuss the relations between different settings (e.g. the generalized Fourier transform of functions on the Euclidean space and corresponding FFT-based routines). |
| Content     | Time-Frequency Analysis and its discretized version, namely Gabor Analysis have required to develop a family of function spaces (the so-called modulation spaces, introduced by Feichtinger in the 80th) which is different from the usual Lebesgue spaces. There is a smallest space (called S_0) and a largest space (namely the dual space), which is a suitable reservoir of generalized functions relevant for the rigorous establishment of basic results in signal processing (sampling theorem, Poisson formula, Fourier inversion, etc.), The course will be centered around the basic properties of the Banach Gelfand triple (S_0.L2.S_0') (also called rigged Hilbert space), its use for signal processing and systems theory applications. In addition to classical questions we will also discuss the fundamental results of time-frequency analysis (Short-time Fourier transform, Gabor frames, Gabor multipliers, best approximation of operators by Gabor multipliers, identification of slowly varying channels using pilot tones, etc.). |
| Lecture notes | There will a script related to the course. In fact, material for a book project on the subject is developed while the course is given. |
| Prerequisites / notice | In principle a good understanding of concepts from linear algebra is sufficient. Of course, basic knowledge about functional analysis (Banach and Hilbert spaces, linear operators and linear functionals) is helpful. We will, however, explain all these concepts as we go along. We will not need background on Lebesgue integration or topological vector spaces (as usually required for the treatment of distributions). |

| 227-0689-00L | System Identification | W    | 4    | 2+1U  | R. Smith |

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 396 of 1432
**Abstract**
Theory and techniques for the identification of dynamic models from experimentally obtained system input-output data.

**Objective**
To provide a series of practical techniques for the development of dynamical models from experimental data, with the emphasis being on the development of models suitable for feedback control design purposes. To provide sufficient theory to enable the practitioner to understand the trade-offs between controller performance and information available for identification.

**Content**

**Literature**

**Prerequisites / notice**
Control systems (227-0216-00L) or equivalent.

**252-0535-00L**

**Objective**
Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensible to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.

**Content**
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous machine learning algorithms on real world data.

**Topics covered in the lecture include:**
- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

**Lecture notes**
No lecture notes, but slides will be made available on the course webpage.

**Prerequisites / notice**
Solid basic knowledge in analysis, statistics and numerical methods for CSE. Experience in programming for solving the project tasks.

| 364-0553-00L  | Innovation in the Digital Space | W    | 1    | 1G    | G. von Krogh |
| Abstract      | The purpose of this course is to review and discuss issues in current theory and research relevant to innovation in the digital space. Through in-depth analysis of published work, doctoral candidates will identify and appraise theoretical and empirical studies, formulate research questions, and improve the positioning of their own research within the academic debate. |
| Objective     | The Internet has a twofold impact on the way individuals and firms innovate. First, firms increasingly draw on digital technology to access and capture innovation-relevant knowledge in their environment. Second, individuals, firms, and other organizations extensively utilize the Internet to create, diffuse, and commercialize new digital products and services. During the past decade, theory and research on innovation in the digital space has flourished and generated extensive insights of relevance to both academia and management practice. This has brought us better understanding of working models, and some fundamental reasons for innovation success or failure. A host of new models and research designs have been created to explore the innovation in the digital space, but these have also brought out many open research questions. We will review some of the existing streams of work, and in the process explore a new research agenda. |
| Content       | Format: The course is organized in one block of 2 days. The course is a combination of pre-readings, presentations by faculty and students, and discussions. The students prepare presentations of papers in order to facilitate analysis and discussion. |
Innovation, openness and search:

364-0559-00L Dynamic Macroeconomics (Doctoral Course) W 3 credits 2V H. Gersbach

Objective
Dynamic models and workhorses in macroeconomics
In this doctoral course, we learn dynamic general equilibrium theory and the basic workhorses in macroeconomics. After the course the participants will be able to speak the Arrow-Debreu and recursive language and apply the frameworks to interesting issues in Growth, Public Finance, Monetary Theory and Banking.

Content
1. Introduction
2. The Arrow-Debreu Approach and Sequential Markets
3. The Neoclassical Growth Model and the Representative Agent Model
4. Mathematical Background
5. Frictions and Banking
   5.1 Overview
   5.2 Banks in Macroeconomic Models
   5.3 Ramsey cum Banks: General Equilibrium with Banks and Outside Equity
6. Overlapping Generations Models and Models with Heterogenous Agents
7. Debates
   7.1 Theory of Piketty
   7.2 High Bank Equity Requirements

364-0556-00L Doctoral Workshop: Astute Modelling W 3 credits 1G H. Gersbach

Prerequisite: Students are expected to attend the course 364-0559-00L "Dynamic Macroeconomics (Doctoral Course)" before registering for this workshop.

Abstract
In this workshop, ongoing research is presented and the criteria and guidelines for astute modelling of economic, political, and social situations are discussed.

Objective
We will learn how to craft models, how to present our own research and improve our analytical skills.

Prerequisites / notice
Students are expected to attend the doctoral course "Macroeconomic Dynamics" before registering for this workshop.

364-0585-01L PhD Course: Applied Econometrics W 2 credits 2S P. Egger

Abstract
In this course, we will address three blocs of selected problems: (i) estimation of fixed and random effects panel data models for single equations and systems of equations; (ii) estimation of models with endogenous treatment effects or sample selection; (iii) estimation of models with interdependent data (so-called spatial models). Students will be able to program estimation routines for such problems in STATA and apply them to data-sets. They will be given a data-set and will have to work out empirical problems in the context of a term paper.
Lecture notes
For panel data analysis, I will rely on the book:

For sample selection and endogenous treatment effect analysis, I will rely on the book:

For spatial econometrics: I will mostly use papers.

I will prepare a script (based on slides), covering all topics.

### 364-0517-00L Urban and Spatial Economics

**Prerequisite:** one semester in microeconomics.

**Objective**
The objective of the course is to provide graduate students with an understanding of the economic factors which give rise to urban spatial structure and the models which have been employed to study these processes. The course aims to help students develop an appreciation for the use of economic models in both positive and normative frameworks. We will assess both the history of thought regarding the role of markets in creating urban development, and we will read about modern theories of externalities and economic factors which induce agglomeration. The final section of the course will focus on transportation problems in urban areas and the use of economic models to assess public policy measures to deal with congestion and associated externalities.

**Content**
Outline of Lectures
- Topic 1: Why do cities exist?
- Topic 2: The Basic Muth-Mills model
- Topic 3: The New Economic Geography
- Topic 4: Business demand for land and Von Thünen's model
- Topic 5: Urban spatial structure
- Topic 6: Land use control
- Topic 7: City size and city growth
- Topic 8: Traffic externalities and congestion
- Topic 9: Public transport

#### Lecture notes
- Cities, agglomeration and spatial equilibrium by E. L. Glaeser, 2008, Oxford University Press.
- The new introduction to geographical economics, Steven Brakman, Harry Garretsen and Charles van Marrewijk, Cambridge.

### 364-0581-00L Microeconomics Seminar (ETH/UZH)

**Objective**
Research Seminar research papers of leading researchers in Microeconomics are presented and discussed

**Content**
Invited Speakers present current research in Microeconomics

### 364-1013-00L Managerial Cognition

**Objective**
The module will seek to provide:
1) Exposure to key theoretical streams in the area.
2) Familiarity with the issues, methods, findings and gaps in the area.
3) Skills in finding insight in the literature.
4) Skills in critiquing the literature, defining research problems and proposing empirical research in this area.

**Content**
- Session 1 - Introduction to the field of managerial cognition
- Session 2 - Methods to study managerial cognition
- Session 3 - Sensemaking, Mindfulness and Attention
Session 1: Introduction
This module aims to introduce major theoretical perspectives on organizational knowledge and to improve the competence of doctoral students. Students should emphasize the following topics in their critique:

- list the weaknesses of the paper (you can use bullet points)
- list the strengths of the paper (you can use bullet points)
- summarize the central framework/ theory that is proposed
- summarize the research problem or question
- Same as for session 1 with particular emphasis on the pros and cons of the method used
- Propose at least one alternative methodology and explain why you think the alternative method(s) would have been better suited

Prerequisites:
- 60 credits in Management at advanced level
- A good background in management

Assignments:
- At the beginning of each session, students must distribute copies of their critique of the assigned reading (please see your names at the end of each reference). The critique should be brief, extending to a maximum of one printed page. The critique is meant to serve as a starting point for the student to lead the class in a discussion of the strengths and weaknesses of the paper. For each session, students should emphasize the following topics in their critique:

  - summarization of the research problem or question
  - summarize the central framework/ theory that is proposed
  - list the strengths of the paper (you can use bullet points)
  - list the weaknesses of the paper (you can use bullet points)

Session 2: Some methods to study managerial cognition

Session 3: Sensemaking, Mindfulness and Attention

BONUS: http://www.wired.com/wired/archive/4.04/weick_pr.html

Session 4: Mindfulness and the Quality of Organizational Attention

Please contact Dr Daniella Laureiro Martinez for more information on this course.
This module aims:
- to provide a basic understanding of key theoretical perspectives on organizational knowledge.
- to provide insights on the research questions, methods, findings and implications of the selected papers.
- to build skills in critically analyzing the literature.
- to identify areas.

Given its prominence in the history of organization science, an impressive variety of theories have evolved that deals with organizational epistemology, the way of knowing in the organization (e.g., Brown & Duguid, 1991; Grant, 1996; Kogut & Zander, 1992; Lave & Wenger, 1991; Nonaka, 1994; Spender, 1996; Tsoukas, 1996; von Krogh et al., 1994). In this module, students will learn about various seminal contributions in the area of organizational knowledge and make connections between theory and empirical research, and identify the ongoing trends and future research directions.

Session 1: Knowledge based view of the firm.
Session 2: Knowledge sharing and transfer
Session 3: Social practice view on knowledge and knowing

Remark: The list might change. Students will be informed about the changes before the first session.

In each session, students will have three assignments:
1) prepare for in-depth discussion of all papers. The students are supposed to read in advance all the papers that will be presented in the sessions.
2) critically review and discuss the assigned papers. Assignments will be done after participants confirm their presence.
3) submit in advance a short critique of the assigned papers - max 2 pages.

- Nonaka, I., 1994; Spender, 1996; Tsoukas, 1996; von Krogh et al., 1994). In this module, students will learn about various seminal contributions in the area of organizational knowledge and make connections between theory and empirical research, and identify the ongoing trends and future research directions.

Risk Center Seminar Series

Number of participants limited to 50.

This course is a mixture between a seminar primarily for PhD and postdoc students and a colloquium involving invited speakers. It consists of presentations and subsequent discussions in the area of modeling complex socio-economic systems and crises. Students and other guests are welcome.

Prerequisites / notice
On each session, students will have two assignments: 1) prepare a summary and critique of at least one of the readings for the day; 2) come prepared to critically discuss all the readings for the day. For the critique, readings will be preassigned in advance of each sessions.

Please contact Prof Stefano Brusoni for further info about this module.

### 364-1013-05L

**Organizational Behavior**

**Registration closed.**

**Abstract**
Organizational behavior concerns the study of individual and group-level processes in organizations like creativity, motivation, decision-making, and leadership. In this module an overview of major research streams and empirical paradigms in organizational behavior is provided.

**Objective**
- to provide an overview of OB research
- to discuss major research streams in OB
- to enable students to relate their own research to concepts and methods used in OB

**Literature**

**Prerequisites / notice**

On each session, students will have two assignments: 1) prepare a summary and critique of at least one of the readings for the day; 2) come prepared to critically discuss all the readings for the day. For the critique, readings will be preassigned in advance of each sessions.

Please contact Prof Stefano Brusoni for further info about this module.

### 364-1013-06L

**Marketing Theory**

The course is taught Florian Wangenheim (ETHZ)

It focuses on the theoretical foundations of marketing and marketing research.

**Objective**
The purpose of the course is to confront students with current theoretical thinking in marketing, and currently used theories for understanding and explaining buyer and customer behavior in response to marketing action.

**Content**
In the first class, current understanding of the marketing literature and marketing thought is discussed. In the following classes, various theories are discussed, particularly in light of their importance for marketing. Economic, psychological and sociological theory will be related to current marketing thought.

**Literature**
The course will be based on some chapters of the books "Advanced Microeconomic Theory" by Jehle and Reny (2011) and "Microeconomic Theory", by Mas-Colell, Whinston and Green (1995), as well as research articles for the most advanced parts.

### 364-1025-00L

**Advanced Microeconomics**

The objective of the course is to provide students with advanced knowledge in some areas of micro economic theory. The course will focus on 1) Individual behavior 2) Collective behavior 3) Choice under uncertainty 4) Intertemporal choice.

**Objective**
The aim is to give to the students the opportunity to review the key results in rational individual behavior, collective models, choice under uncertainty, intertemporal choice, as well as to get some insights on more recent advances in those areas.

The course is therefore designed for students who have some interest for research in economics.

**Content**
The following topics will be addressed:
2) Collective models. Cooperative and non cooperative models of household behavior.
3) Choice under uncertainty. The foundations of expected utility theory. Some insights on other approaches to choice under uncertainty.
4) Intertemporal choice. Dynamic model. Life cycle theory.

**Literature**
The course will be based on some chapters of the books "Advanced Microeconomic Theory" by Jehle and Reny (2011) and "Microeconomic Theory", by Mas-Colell, Whinston and Green (1995), as well as research articles for the most advanced parts.

### 364-1058-00L

**Risk Center Seminar Series**

**Number of participants limited to 50.**

This course is a mixture between a seminar primarily for PhD and postdoc students and a colloquium involving invited speakers. It consists of presentations and subsequent discussions in the area of modeling complex socio-economic systems and crises. Students and other guests are welcome.
Participants should learn to get an overview of the state of the art in the field, to present it in a well understandable way to an interdisciplinary scientific audience, to develop novel mathematical models for open problems, to analyze them with computers, and to defend their results in response to critical questions. In essence, participants should improve their scientific skills and learn to work scientifically on an internationally competitive level.

This course is a mixture between a seminar primarily for PhD and postdoc students and a colloquium involving invited speakers. It consists of presentations and subsequent discussions in the area of modeling complex socio-economic systems and crises. For details of the program see the webpage of the colloquium. Students and other guests are welcome.

There is no script, but a short protocol of the sessions will be sent to all participants who have participated in a particular session. Transparencies of the presentations may be put on the course webpage.

Literature will be provided by the speakers in their respective presentations.

Prerequisites / notice
Participants should have relatively good mathematical skills and some experience of how scientific work is performed.

1 credit

Recommended, not eligible for credits

The aim of the course is to provide a solid background to Ph.D. students in methods of inference for spatial models.

Suitable for doctorate

W, A. Bommier

Books:

Basic Articles:

A reading list with articles for each lecture has been published in ILIAS.

In this seminar series, which is held jointly with Prof. Dr. Woitek and Prof. Dr. Hoffman from the University of Zurich, distinguished international researchers present their current research related to international economic policy. The participating doctoral students are expected to attend the presentations (bi-weekly). Moreover, a critical review has to be prepared for 1 of the papers presented.

On the one hand, participating students are exposed to research at the frontier of international economic policy research. On the other hand, skills such as critical thinking and preparing reviews are learned.

### Abstract

Current advanced research activities in the areas of thermo- and fluid dynamics are presented and discussed, mostly by external speakers. Knowledge of advanced research in the areas of thermo- and fluid dynamics

**Objective**

 Exchange on current internal research projects. Training of presentation skills.

**Content**

Presentations on advanced synthetic biology topics (eg genetic circuit design, adaptation of systems dynamics, analytical concepts, large scale de novo DNA synthesis), project selection, modeling of selected biological system, design space exploration, sensitivity analysis, conversion into DNA sequence, (DNA synthesis external,) implementation and analysis of design, summary of results in form of scientific presentation and poster, presentation of results at the iGEM international student competition (www.igem.org).

**Lecture notes**

Handouts during course

**Prerequisites / notice**

The final presentation of the project is typically at the MIT (Cambridge, US). Other competing schools include regularly Imperial College, Cambridge University, Harvard University, UC Berkeley, Princeton University, CalTech, etc.

This project takes place between end of Spring Semester and beginning of Autumn Semester. Registration in April.

Please note that the number of ECTS credits and the actual work load are disconnected.

**Objective**

Familiarize students with main architectural principles and concepts of embedded control systems.

**Content**

An embedded system is a microprocessor used as a component in another piece of technology, such as cell phones or automobiles. In this intensive two-week block course the students are presented the principles of embedded digital control systems using a haptic device as an example for a mechatronic system. A haptic interface allows for a human to interact with a computer through the sense of touch.

Subjects covered in lectures and practical lab exercises include:
- The application of C-programming on a microprocessor
- Digital I/O and serial communication
- Quadrature decoding for wheel position sensing
- Queued analog-to-digital conversion to interface with the analog world
- Pulse width modulation
- Timer interrupts to create sampling time intervals
- System dynamics and virtual worlds with haptic feedback
- Introduction to rapid prototyping

**Lecture notes**

Lecture notes, lab instructions, supplemental material

**Prerequisites / notice**

This course is restricted to 33 students due to limited lab infrastructure. Interested students please contact Marianne Schmid (E-Mail: schmid@idsc.mavt.ethz.ch)

After your reservation has been confirmed please register online at www.mystudies.ethz.ch.

Detailed information can be found on the course website http://www.idsc.ethz.ch/education/lectures/embedded-control-systems.html

**Objective**

Introduces the fundamentals of Dynamic Programming and Dynamic Programming & Optimal Control.

**Content**

- Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation;
- Deterministic Continuous-Time Optimal Control.

**Literature**

Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

**Objective**

PhD students at ETH Zurich working in the broad area of energy present their research to their colleagues, to their advisors and to the scientific community.

**Content**

PhD students at ETH Zurich working in the broad area of energy present their research to their colleagues, to their advisors and to the scientific community. Every week there are two presentations, each structured as follows: 15 min introduction to the research topic, 15 min presentation of the results, 15 min discussion with the audience.

**Lecture notes**

Slides will be distributed.
Seminar in Fundamentals of Process Engineering
Only for master and doctoral students of Process and Chemical Engineering.

Abstract
This seminar covers actual subjects from the specific research areas of the laboratory of transport processes and reactions.

Objective
Scientific discussion on actual research topics

Content
The contents are announced through the group's webpage.

Lecture notes
No textbook

Leading and Coaching Focus Project Teams (Basic Course)
This course is the first part of a two-semester course.

Abstract
Aim is enhancement of knowledge and competency regarding coaching skills. Participants should be coaches of focus projects. Topics: Overview of the role and mindset of a coach, introduction into coaching methodology, building competencies by doing and exchanging good practices from former focus projects.

Objective
Basic knowledge about role and mindset of a coach; Knowledge and reflection about the classical problems in coaching of a focus project; Development of personal coaching skills; Knowledge and know-how about coaching methods; Reflection and exchange of experiences about personal coaching situations; Inspiration and learning from good cases regarding organizational and team management aspects.

Content
Content of both basic and advanced course (2 semester):
- Basic knowledge about role and mindset of a coach
  - Introduction into coaching: definition & models
  - Role of coaches between examiner and "friend"
  - Knowledge and reflection about the problems in coaching a focus project
  - Knowledge about team development
- Knowledge and reflection about critical phases in the innovation process for an innovation team
- Development of personal coaching competencies, e.g. active listening, asking questions, giving feedback
- Competencies in theoretical models
- Coaching competencies: exercises and reflection
- Knowledge and know-how about coaching methods
- Knowledge about basic coaching methods for technical projects/innovations projects
- Know-how about usage of methods in the coaching process
- Facilitating decisions
- Using and applying coaches opinions and knowledge
- Reflection and exchange of experiences about personal coaching situations
- Self-reflection
- Exchange of experiences in the lecture group
- Good practice on organizational and management aspects
- How to do system and concurrent engineering
- Project planning and replanning
- Facilitating conflict situations
- Discussing sample cases from former teams and actual cases of participants.

Lecture notes
Slides, script and other documents will be distributed via electronically (access only for participants registered to this course).

Prerequisites / notice
Participants (Students, PhD Students, Postdocs) should be part of the coaching team of focus project teams.

Academia Industry Modeling Week

Abstract
Focused research by teams of Master and PhD students as well as post-doctoral fellows on applied problems proposed by industrial partners. Industry representatives and participating faculty coordinate the formulation of the problem and supervise the research teams. Topics can cover all scientific interests and domains represented in the PhD program and in particular their interfaces.

Objective
Team work on industrial problems. Interfacing academia and industry.

Prerequisites / notice
Permission of the PhD advisor and/or instructor.

D-MAVT Distinguished Lecture Series

Abstract
Talks by distinguished lecturers in the Field of Mechanical and Process Engineering, highlighting frontiers in the field of Engineering.

Objective
Become aware of frontiers in the field of Engineering.

Course Catalogue of ETH Zurich

Principles of Nonlinear Finite-Element-Methods
Most problems in engineering are of nonlinear nature. The nonlinearities are caused basically due to the nonlinear material behavior, contact conditions and instability of structures. The principles of the nonlinear Finite-Element-Method (FEM) will be introduced in the scope of this lecture for treating such problems.
Objective
The goal of the lecture is to provide the students with the fundamentals of the non linear Finite Element Method (FEM). The lecture focuses on the principles of the nonlinear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Methods are simulations of:
- Crash
- Collapse of structures
- Materials in Biomechanics (soft materials)
- General forming processes

Special attention will be paid to the modeling of the nonlinear material behavior, thermo-mechanical processes and processes with large plastic deformations. The ability to independently create a virtual model which describes the complex non linear systems will be acquired through accompanying exercises. These will include the Matlab programming of important model components such as constitutive equations

Content
- Fundamentals of continuum mechanics to characterize large plastic deformations
- Elasto-plastic material models
- Updated-Lagrange (UL), Euler and combined Euler-Lagrange (ALE) approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- Modeling of crack propagation
- Introduction of advanced FE-Methods

Lecture notes
yes

Literature

Prerequisites / notice
If we will have a large number of students, two dates for the exercises will be offered.

</tr>
<tr>
<td>Content</td>
<td>In the traditional no arbitrage theory, which goes back to the seminal work of Black, Scholes, and Merton in the late sixties, one of the idealizing assumptions pertains to the absence of transaction costs. In this classical theory one simply assumes that at any moment of time there is one price for the underlying asset at which one may sell or buy. Since these pioneering papers there is quite some literature on the effects which arise if one deviates from this mathematically convenient but practically sometimes misleading assumption of a frictionless market. In the Nachdplomvorlesung I shall review these results and will put emphasis on the asymptotic effects when proportional transaction costs are small, but different from zero. Special focus will be given to a series of recent papers with Christoph Czichowsky on this theory. In the course we shall also encounter some challenging issues in stochastic analysis arising from the problems arising in the theory of portfolio optimization under small transaction costs.</td>

</tr>
<tr>
<td>Content</td>
<td>In the modern era of high-dimensional data, the interface between mathematical statistics and optimization has become an increasingly vibrant area of research. In this course, we provide some vignettes into this interface, including the following topics: (A) Dimensionality reduction via random projection. The naïve idea of projecting high-dimensional data to a randomly chosen low-dimensional space is remarkably effective. We discuss the classical Johnson-Lindenstrauss lemma, as well as various modern variants that provide computationally-efficient embeddings with strong guarantees. (B) When is it possible to quickly obtain approximate solutions of large-scale convex programs? In practice, methods based on randomized projection can work very well, and arguments based on convex analysis and concentration of measure provide a rigorous underpinning to these observations. (C) Optimization problems with some form of nonconvexity arise frequently in statistical settings - for instance, in problems with latent variables, combinatorial constraints, or rank constraints. Nonconvex programs are known to be intractable in a complexity-theoretic sense, but the random ensembles arising in statistics are not adversarially constructed. Under what conditions is it possible to make rigorous guarantees about the behavior of simple iterative algorithms for such problems? We develop some general theory for addressing these questions, exploiting tools from both optimization theory and empirical process theory.</td>

http://www.math.ethz.ch/education/bachelor/lectures/hs2014/math/introlg

### Abstract
This is an introductory course in algebraic topology. The course will cover the following main topics: introduction to homotopy theory, homology and cohomology of spaces.

### Literature

### Prerequisites / notice
- General topology, linear algebra.
- Some knowledge of differential geometry and differential topology is useful but not absolutely necessary.
Prerequisites / notice

Prerequisites:
Mandatory: Probability and measure theory, basic numerical analysis and basics of MATLAB programming.

a) mandatory courses:
Elementary Probability, Probability Theory I.

b) recommended courses:
Stochastic Processes.

401-3651-00L Numerical Methods for Elliptic and Parabolic Partial Differential Equations
Course audience at ETH: 3rd year ETH BSc Mathematics and MSc Mathematics and MSc Applied Mathematics students.
Other ETH-students are advised to attend the course "Numerical Methods for Partial Differential Equations" (401-0674-00L) in the CSE curriculum during the spring semester.

Abstract
This course gives a comprehensive introduction into the numerical treatment of linear and non-linear elliptic boundary value problems, related eigenvalue problems and linear, parabolic evolution problems. Emphasis is on theory and the foundations of numerical methods. Practical exercises include MATLAB implementations of finite element methods.

Objective
Participants of the course should become familiar with
* concepts underlying the discretization of elliptic and parabolic boundary value problems
* analytical techniques for investigating the convergence of numerical methods for the approximate solution of boundary value problems
* methods for the efficient solution of discrete boundary value problems
* implementational aspects of the finite element method

Content
A selection of the following topics will be covered:

* Elliptic boundary value problems
* Galerkin discretization of linear variational problems
* The primal finite element method
* Mixed finite element methods
* Discontinuous Galerkin Methods
* Boundary element methods
* Spectral methods
* Adaptive finite element schemes
* Singularly perturbed problems
* Sparse grids
* Galerkin discretization of elliptic eigenproblems
* Non-linear elliptic boundary value problems
* Discretization of parabolic initial boundary value problems

401-4655-64L Numerical Analysis of High-Dimensional Problems for Uncertainty Quantification
In many applications of mathematics, efficient numerical methods for PDEs on high dimensional state and/or parameter spaces is required. This course provides succinct surveys of recently developed numerical methods, their computer implementation for model problems, and elements of their mathematical analysis for the efficient approximation of high- and infinite-dimensional PDE problems.

Literature
Content

1. Infinite-Dimensional Analysis
   - Probability spaces and measures,
   - Tensor Products,
   - Measures on function spaces,
   - Covariance operators,
   - PCA and KL-expansions,
   - (generalized) polynomial chaos expansions,
   - Kolmogoroff N-widths

2. Examples.
   - Parametric Approximation Problems.
   - Parametric ODEs (biochemical reaction pathways).
   - Parametric PDEs (diffusion problems with random coefficients).
   - PDEs in Parametric Domains (Scattering from random obstacles).

4. Stochastic Galerkin Methods

5. Stochastic Collocation Methods
   - Smolyak's algorithm and its generalizations;
   - sparse, adaptive interpolation algorithms

6. Reduced Basis Methods

7. Monte Carlo Methods

8. Quasi-Monte Carlo Methods

   - Bayesian Inverse Problems
   - Shape Sensitivity Analysis of PDEs.
   - Optimal Control of parametric ODEs and PDEs.
   - Optimization of Parametric ODEs and PDEs.

Literature

Books and Surveys:

2. F. Y. Kuo and Ch. Schwab and I. H. Sloan

4. Ch. Schwab and C. J. Gittelson

Prerequisites / notice

ETH BSc Math or equivalent

and

Num. elliptic and Parabolic PDE
or
Num. hyperbolic PDE
or

ETH Doctoral Studies in applied mathematics or CSE.

Programming:
- MATLAB (for MSc MATH)
- Python and C/C++/MPI programming (MSc CSE).

401-4607-59L Percolation Theory

Abstract
- An introduction to the percolation theory.

Objective
- The objective is to gain familiarity with the methods of the percolation theory and to learn some of its important results.

Content
- Definition of percolation, FKG and BK inequalities, Harris-Kesten Theorem, Menshikov's Theorem, uniqueness of the infinite cluster and possibly Smirnov's Theorem on the conformal invariance of the critical percolation.

Literature
- B. Bollobas, O. Riordan: Percolation, CUP 2006

Prerequisites / notice
- 401-2604-00L Probability and Statistics (mandatory)
- 401-3601-00L Probability Theory (recommended)

401-3611-00L Advanced Topics in Computational Statistics

Abstract
- This lecture covers selected advanced topics in computational statistics, including various classification methods, the EM algorithm, clustering, handling missing data, and graphical modelling.
Objective
Students learn the theoretical foundations of the selected methods, as well as practical skills to apply these methods and to interpret their outcomes.

Content
The course is roughly divided in three parts: (1) Supervised learning via (variations of) nearest neighbor methods, (2) the EM algorithm and clustering, (3) handling missing data and graphical models.

Lecture notes
Lecture notes.

Prerequisites / notice
We assume a solid background in mathematics, an introductory lecture in probability and statistics, and at least one more advanced course in statistics.

Equilibrium Models in Financial Economics
In Mathematical Finance, asset prices are typically assumed to be given exogenously. This leads to tractable models that are well-suited to
study the behaviour of individual agents. However, policy regulations like the introduction of a transaction tax influence the whole market.
To study their impact, one has to turn to models where prices are determined endogenously in equilibrium.

This course provides an introduction to the equilibrium models prevalent in Financial Economics. We will start by studying optimisation
problems for individual investors, and then move towards equilibrium prices, determined so that supply matches demand. The initial focus
will be on conceptual issues in simple one-period models, before moving to more general settings in continuous time.

Prerequisites: probability theory and stochastic processes.

Prerequisites: probability theory and stochastic processes (for which lecture notes are available).

Stochastic Filtering - Theory and Applications
W
6 credits
2V+1U
P. Harms

Filtering is the task of recovering unobserved state variables from noisy observations. This course covers the theoretical foundations of
filtering in various levels of generality, as well as numerics and applications in statistics and finance.

The course starts with linear (Kalman) filtering and progresses to non-linear filtering for semimartingale state and observation processes.
The course also includes numerical methods like Markov chain approximations, Galerkin approximations, and particle filtering, as well as
applications to financial models of, e.g., interest rates or credit risk.

Prerequisites: probability theory, basic stochastic processes, basic statistics.

Note: The former (spring semester 2013) course title of the course unit 401-4926-13L was Filter Theory -- Theory and Applications.

Interest Rate Theory

We introduce and discuss the most important models for interest rate markets. Emphasis will be placed both on theoretical foundations and
on numerical implementation and calibration.

-Gain overview of interest rate markets and the corresponding financial products.

-Understand the various modeling approaches used (short-rate models, Heath-Jarrow-Morton models, LIBOR market models).

-Gain a firm grasp of the underlying theory, and practice numerical implementation of concrete examples.

-Gain overview of interest rate markets and the corresponding financial products.

-Understand the various modeling approaches used (short-rate models, Heath-Jarrow-Morton models, LIBOR market models).

-Gain a firm grasp of the underlying theory, and practice numerical implementation of concrete examples.

-Learn about extensions that have recently become increasingly important: default risk, multiple yield curves, etc.
Interest Rate Modeling in Discrete Time

Abstract
This course gives an introduction to stochastic interest rate modeling in discrete time. Starting from cash flow valuation with state price deflators, we derive the equivalent martingale measures for pricing financial instruments and derivatives of primary assets. The lecture is supplemented by several examples such as the Vasicek model where we also study model calibration.

Objective
The students are familiar with the basic terminology of stochastic interest rate modeling and he is able to transfer his (financial) mathematical knowledge to real world pricing of cash flows and financial instruments.

Content
The following topics are covered:
1) stochastic discounting with state price deflators
2) equivalent martingale measures
3) pricing of cash flows and primary assets
4) pricing of derivatives, e.g. European put options
5) (multi-factor) Vasicek state price deflator model
6) Heath-Jarrow-Morton interest rate modeling framework

<td><strong>Abstract</strong></td>
<td>Terahertz frequency electromagnetic radiation lies at the border between electronics and optics, and as such has many unique properties that make it well-suited to study the electronic, magnetic and structural properties of many materials. The course objective is to give students the ability to identify problems that can be addressed using terahertz frequency radiation and to design (on a conceptual level) a way to implement solutions to these problems. These “problems” include both scientific (in physics, chemistry and biology) and industrial (medicine, pharmaceuticals, security) areas. On the scientific side the applications of THz relate to understanding the electronic, structural and magnetic properties of materials by studying the optical response at low frequencies without the need for physical contact with the sample. The industrial applications tend to be more related imaging (e.g. THz-based airport scanners), but also some spectroscopy is done to identify materials.</td>

</table>
The course covers the foundations of semiconductor nanostructures, e.g., materials, band structures, bandgap engineering and doping, this course presents a comprehensive discussion of optical processes in semiconductors.

At the end of the lecture the student should understand four key phenomena of electron transport in semiconductor nanostructures:

1. Introduction and overview
2. Semiconductor crystals: Fabrication and band structures
3. k-p-theory, effective mass
4. Envelope functions and effective mass approximation, heterostructures and band engineering
5. Fabrication of semiconductor nanostructures
6. Electrostatics and quantum mechanics of semiconductor nanostructures
7. Heterostructures and two-dimensional electron gases
8. Drude Transport
9. Electron transport in quantum point contacts; Landauer-Büttiker description
10. Ballistic transport experiments
11. Interference effects in Aharonov-Bohm rings
12. Electron in a magnetic field, Shubnikov-de Haas effect
13. Integer quantum Hall effect
14. Coulomb blockade and quantum dots

The former title of this course unit was “Fundamental Aspects of Magnetism”. This lecture inspects on the fundamental aspects -- Quantum physics and statistical physics of magnetism. Applications to nanoscale magnetism will be discussed within this fundamental Approach.

In addition to the lecture notes, the following supplementary books can be recommended:

The lecture is suitable for all physics students beyond the bachelor of science degree. Basic knowledge of solid state physics is recommended. Very ambitious students in the third year may be able to follow. The lecture can be chosen as part of the PhD-program. The course is taught in English.
This course gives a survey of current research topics using accelerator-based probes (photons, neutrons, muons) to study problems in condensed matter and biophysics.

The course aims to give students the ability to follow and explain on a conceptual level the ways in which accelerator-based facilities (neutron, photon and muon sources) enable the study of various problems in a wide range of fields, including for example quantum information theory, solid state dynamics in superconductors and low dimensional systems, quantum phase transitions, as well as structural biology.

The course will discuss several current examples of research using accelerator facilities highlighting different technologies and their applications. Specific attention will be given to x-ray spectroscopy and scattering experiments conducted at synchrotrons and x-ray Free Electron Lasers, as well as neutron scattering experiments at spallation sources and muon spin rotation.

6 credits

M. Donegà
Neutrino Physics

Theoretical basis and selected experiments to determine the properties of neutrinos and their interactions (mass, spin, helicity, chirality, oscillations, interactions with leptons and quarks).

The course introduces the theory and phenomenology of the recently discovered Higgs boson. With this course the students will receive a detailed introduction to the physics of the Higgs boson in the Standard Model. They will acquire the necessary theoretical background to understand the main production and decay channels of the Higgs boson at high-energy colliders, and the corresponding experiments.

W 6 credits 2V+1U A. S. Antognini, F. Piegza

Prerequisites: Solid State Physics, Quantum Mechanics

402-0715-00L Low Energy Particle Physics

Low energy particle physics provides complementary information to high energy physics with colliders. In this lecture, we will concentrate on selected experiments, using mainly neutrons and muons, which have significantly improved our understanding of particle physics today.

The course aims to provide an introduction to selected advanced topics in low energy particle physics with neutrons and muons. Low energy particle physics provides complementary information to high energy physics with colliders. At the Large Hadron Collider one directly searches for new particles at energies up to the TeV range. In a complementary way, low energy particle physics indirectly probes the existence of such particles and provides constraints for "new physics", making use of precision and high intensities.

Besides the sensitivity to effects related with new physics (e.g. lepton flavor violation, symmetry violations, CPT tests, search for electric dipole moments, new low mass exchange bosons etc.), low energy physics provides the best test of QED (electron g-2), the best tests of bound-state QED (atomic physics and exotic atoms), precise determinations of fundamental constants, information about the CKM matrix, precise information on the weak and strong force even in the non-perturbative regime etc.

In this lecture, we will concentrate on selected experiments, using mainly neutrons and muons, which have significantly improved our understanding of particle physics today. Starting from a general introduction on high intensity/high precision particle physics and the main characteristics of muons and neutrons and their production, we will then focus on the discussion of fundamental problems and ground-breaking experiments:

- Production and characteristics of muon and neutron beams
- Ultracold neutron production
- Measurement of the neutron lifetime and electric dipole moment
- The neutron in the gravitational field and its electric charge
- Muon and neutron decay correlations
- Lepton flavour violations with muons to search for new physics
- What atomic physics can do for particle physics and vice versa
- Laser experiments at accelerators
- From myonic hydrogen to the proton structure and bound-state QED
- From pionic hydrogen to the strong interaction and effective field theories
- etc.

Golub, Richardson & Lamoreaux: "Ultra-Cold Neutrons"
Rauch & Werner: "Neutron Interferometry"
Carlile & Willis: "Experimental Neutron Scattering"
Byrne: "Neutrons, Nuclei and Matter"
Klapdor-Kleingrothaus: "Non Accelerator Particle Physics"

402-0767-00L Neutrino Physics

Theoretical basis and selected experiments to determine the properties of neutrinos and their interactions (mass, spin, helicity, chirality, oscillations, interactions with leptons and quarks).

Introduction to the physics of neutrinos with special consideration of phenomena connected with neutrino masses.

D.O. Caldwell, Current Aspects of Neutrino Physics, Springer.

402-0883-63L Symmetries in Physics

The course gives an introduction to symmetry groups in physics. It will explain the relevant mathematical background (finite groups, Lie groups and algebras as well as their representations), and illustrate their important role in modern physics.

The course aims to give a self-contained introduction into finite group theory as well as Lie theory from a physicists point of view. Abstract mathematical constructions will be illustrated with examples from physics.

W 6 credits 2V+1U N. Beisert

402-0898-00L The Physics of Electroweak Symmetry Breaking

The aim is to understand the need of physics beyond the Standard Model, the basic techniques of model building in theories BSM and the elements of collider physics required to analyze their phenomenological implications. After an introduction to the SM and alternative theories of electroweak symmetry breaking, we will investigate these issues in the context of models with warped extra dimensions.

After the course the student should have a good knowledge of some of the most relevant theories beyond the Standard Model and have the techniques to understand those theories that have not been surveyed in the course. He or she should be able to compute the constraints on any model of new physics, its successes explaining current experimental data and its main phenomenological implications at colliders.

W 6 credits 2V+1U not available

402-0899-65L Higgs Physics

The former title of this course unit was "The Physics Beyond the Standard Model". If you already got credits for "The Physics Beyond the Standard Model" (402-0898-00L), you cannot get credits for "The Physics of Electroweak Symmetry Breaking" (402-0899-00L).
With this course the students will receive a detailed introduction to the physics of the Higgs boson in the Standard Model. They will acquire the necessary theoretical background to understand the main production and decay channels of the Higgs boson at high-energy colliders, and the corresponding experimental signatures.

**Objective**

Theory part:
- the Standard Model and the mass problem: \( WW \) scattering and the no-lose theorem
- the Higgs mechanism and its implementation in the Standard Model
- radiative corrections and the screening theorem
- theoretical constraints on the Higgs mass; the hierarchy problem
- Higgs production in e+e- collisions
- Higgs production at hadron colliders
- Higgs decays to fermions and vector bosons
- Higgs differential distributions, rapidity distribution, \( pt \) spectrum and jet vetoes
- Higgs properties and beyond the Standard Model perspective

- Outlook: The Higgs sector in weakly coupled and strongly coupled new physics scenarios.

**Experimental part:**
- Introductory material:
  - reminders of detectors/accelerators
  - reminders of statistics: likelihoods, hypothesis testing
  - reminders of multivariate techniques: Neural Networks, Decision Trees
- Main topics:
  - pre-history (pre-LEP)
  - LEP1: measurements at the Z-pole
  - LEP2: towards the limit \( m_H < 114 \text{ GeV} \)
  - TeVatron searches
  - LHC:
    -- main channels overview
    -- dissect on analysis
    -- combine information from all channels
    -- differential measurements
    -- off-shell measurements
  - Future:
    -- pseudo-observables / EFT
    -- Beyond Standard Model

**Content**

- **Hot Topics in Astrophysics**
  - W 4 credits
  - 2V
  - M. Carollo
  - Abstract: The theme we want to discuss this year is: what do we know about the assembly of diffuse baryons into galaxies and stars, from the physics that govern the birth of new stars, out to the dark matter halos onto which baryons are accreted on cosmological timescales. Specifically, we will focus on the following two -- or, time-permitting, three -- Hot Topics in Astrophysics.
  - Objective: The goal of this course is to understand some of the phenomena that stand in the forefront of current research in astrophysics, the physical processes behind them, and how these phenomena are observed by state-of-the-art astronomical facilities. These goals will be achieved by communal discussions, led by the students and chaired by the teachers.

- **Observational Techniques in Astrophysics**
  - W 6 credits
  - 2V+1U
  - K. Schawinski
  - Abstract: The course introduces analysis techniques, the basics of astronomical instruments, real-world observational tools, data reduction strategy and software packages used in astrophysics research. The course will also include discussions of current topics in astrophysics with a focus on active galaxies. The course will include the reduction and analysis of real data from a variety of observatories.
  - Objective: The goal is to acquaint students with the basics of a range of astrophysical observation techniques including the modern software tools needed to analyze data.

- **Statistical Methods in Cosmology and Astrophysics**
  - W 6 credits
  - 2V+1U
  - A. Amara
  - Abstract: Statistical methods play a vital role in modern cosmology and astrophysics studies. This course will give an overview of the statistical principles and tools that are used in these fields. Topics covered will include basic probability theory, Bayesian inference, hypothesis testing, sampling and estimators. Specifically, we will focus on active galaxies. The course will include the reduction and analysis of real data from a variety of observatories.
  - Objective: Develop an understanding of basic probability and statistical theory. Gain practical knowledge of statistical methods commonly used in cosmology and astrophysics.

- **Introductory Course in Neuroscience I**
  - W 2 credits
  - 2V
  - J.M. Fritschy, W. Knecht
  - Abstract: The course gives an introduction to the development and anatomical structure of nervous systems. Furthermore, it discusses the basics of cellular neurophysiology and neuropharmacology. Finally, the nervous system is described on a system level with a particular emphasis on the visual system.
### Content
1) Neuroanatomy I
2) Neuroanatomy II
3) Neurogenesis
4) Axon guidance
5) Action and language development
6) Circadian rhythms
7) Synaptic plasticity
8) Synaptic transmission
9) Neural circuits in vivo
10) Visual pathways and visual processing
11) Somatosensory system
12) Vestibular system
13) Sleep
14) Learning and Memory, mice and human

### Prerequisites / notice
For doctoral students of the Neuroscience Center Zurich (ZNZ).

### 376-1795-00L Advanced Course in Neurobiology I (Functional Anatomy of the Rodent Brain)

- **W** 2 credits 2V
- **J.M. Fritschy, H. U. Zeilhofer**

**Abstract**
The goal of this Advanced Course in Neurobiology is to provide students with a broader knowledge in several important areas of neurobiology. The course consists of four parts: Part I deals with various topics in developmental neurobiology. Part II is devoted to aspects of signal transduction. Part III focuses on synaptic transmission. Part IV gives deeper insights into systems neuroscience.

**Objective**
This credit point course is designed for doctoral students who have successfully completed the Introductory Course in Neuroscience at the Neuroscience Center Zürich. The goal is to provide students with a broader and deeper knowledge in several important areas of neurobiology.

**Prerequisites / notice**

### 402-0620-00L Current Topics in Accelerator Mass Spectrometry and Their Applications

- **E-** 0 credits 1S
- **M. Christl, S. Willett**

**Abstract**
The seminar is aimed at all students who, during their studies, are confronted with age determination methods based on long-living radionuclides found in nature. Basic methodology, the latest developments, and special examples from a wide range of applications will be discussed.

### Doctoral Department of Physics - Key for Type

| W+ | Eligible for credits and recommended | Z | Courses outside the curriculum |
| W  | Eligible for credits                | Dr | Suitable for doctorate        |
| E- | Recommended, not eligible for credits | O  | Compulsory                    |

### Key for Hours

| V | lecture                              |
| G | lecture with exercise                |
| U | exercise                             |
| S | seminar                              |

| P | practical/laboratory course         |
| A | independent project                 |
| D | diploma thesis                      |
| R | revision course / private study      |

### ECTS
European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Observation networks and numerical climate and forecasting models deliver large primary datasets. The use of this data in practice and in research requires specific techniques of statistical data analysis. This lecture introduces a range of frequently used techniques, and enables students to apply them and to properly interpret their results.

Introduction into the theoretical background and the practical application of methods of data analysis in meteorology and climatology.

Topics: exploratory methods, hypothesis tests, analysis of climate trends, measuring the skill of climate and forecasting models, analysis of extreme events, principal component analysis and maximum covariance analysis.

The lecture also provides an introduction into R, a programming language and graphics tool frequently used for data analysis in meteorology and climatology. During hands-on computer exercises the student will become familiar with the practical application of the methods.

Documentation and supporting material include:
- documented view graphs used during the lecture
- exercise sets and solutions
- R-packages with software and example datasets for exercise sessions

All material is made available via the lecture web-page.

Suggested literature:

Prerequisites: Atmosphäre, Mathematik IV: Statistik, Anwendungsnahes Programmieren.

Abstract
Clouds are a fascinating climate phenomenon central to the hydrological cycle and the Earth’s radiation balance. Interactions between cloud particles can result in precipitation, glaciation or evaporation of the cloud depending on its microstructure and microphysical processes. In this course the sought-after topic of ice formation in clouds is studied from a theoretical and empirical perspective.

Objective
Students will gain an appreciation and understanding of the complex processes in clouds and the necessary physical phenomenon that are involved and need to be accounted for in order to study cloud and precipitation formation.

Content
Microstructure of clouds and precipitation, aerosol activation to form cloud droplets, ice crystal nucleation (homogeneous freezing of supercooled aerosol and heterogeneous freezing), precipitation formation

Lecture notes
Powerpoint slides will be made available

Abstract
Dynamics of large-scale atmospheric flow
Dynamic, synoptic Meteorology
Dynamical Meteorology is concerned with the dynamical processes of the earth's atmosphere. The fundamental equations of motion in the atmosphere will be discussed along with the dynamics and interactions of synoptic system - i.e. the low and high pressure systems that determine our weather. The motion of such systems can be understood in terms of quasi-geostrophic theory. The lecture course provides a derivation of the mathematical basis along with some interpretations and applications of the concept.

Objective
Understanding the dynamics of large-scale atmospheric flow

Lecture notes
Dynamics of large-scale atmospheric flow
- Pichler H., Dynamik der Atmosphäre, Bibliographisches Institut, 456 pp. 1997

Abstract
The purpose of this course is to provide fundamental background on the role of land surface processes (vegetation, soil moisture dynamics, land energy and water balances) for the climate system. The course consists of 2 contact hours per week, including 2 computer exercises.

Objective
The students can understand the role of land processes and associated feedbacks for the climate system.

Lecture notes
Powerpoint slides will be made available

Abstract
The lecture will introduce the student to the thematics of solar ultraviolet radiation and its effects on the atmosphere and the biosphere. The lecture will cover the modeling and the measurement of solar ultraviolet radiation. The instruments used for solar radiation measurements will also be introduced.

Objective
The lecture should enable the student to understand the specific problematics related to solar ultraviolet radiation and its interaction with the atmosphere and the biosphere.
1) Einführung in die Problematik  Motivation  
Begriffe (UV-C, UV-B, UV-A,...)  
Einfluss der UV Strahlung auf Biosphäre (Mensch, Tier, Pflanzen)  
Positive und schädliche Effekte  
Wirkungsspektrum, Konzept, Beispiele  
UVIndex:  

2) Geschichtlicher Rückblick  
Rayleigh - Himmelsblau  
1907: Dorno, PMOD  
1970: Bener, PMOD  
1980: Berger, Erythenal sunburn meter  
1990- : State of the Art  

3) Extraterrestrische UV Strahlung  
Spektrum  
Energieverteilung  
Variabilität (Spektral, zeitlich, relativ zu Totalstrahlung)  
Satellitenmessungen, Übersicht  

4) Einfluss der Atmosphäre auf die solare UV Strahlung  
Atmosphärenaufbau  
Beinflussende Parameter (Ozon, Wolken, ...)  
Ozon, Stratosphärisches versus troposphärisches  
Geschichte: Ozondesintegration, Polare Ozonlöcher und Einfluss auf die UV Strahlung  
Wolken  
Aerosole  
Rayleighstreuung  
Trends (Ozon, Wolken, Aerosole)  
Radiation Amplification Factor (RAF)  

5-6) Strahlungsstransfer  
Strahlungsstransfergleichung  
Modellierung, DISORT  
LibRadtran, TUV, FASTRT  
Parameter  
Sensitivitätsstudien  
Vergleiche mit Messungen  
3-D Modellierung (MYSTIC)  
Beer-Lambert Gesetz  

7) Strahlungsmessungen  
Instrumente zur Strahlungsmessung  
Messgrössen: Irradiance (global, direct, diffus), radiance, aktinischer Fluss  
Horizontale und geneigte Flächen  
Generelle Problematica: Freiluftmessungen...  
Qualitätssicherung  

8) Solare UV Strahlungsmessungen  
Problematica: Dynamik, Spektrale Variabilität, Alterung  
Stabilität  
Spezifische Instrumente: Filterradiometer, Spektroradiometer, Dosimetrie  
Übersicht Aufbau und Verwendung  

9-10) Solare UV Strahlungsmessgeräte  
Spektroradiometer, Filterradiometer (Breit und schmalbandig)  
Charakterisierung  
Kalibriermethoden (Im Labor, im Feld)  
Qualitätssicherung, Messkampagnen  

11-12) Auswerteverfahren  
Atmosphärische Parameter aus Strahlungsmessungen  
Ozon, SO2  
Albedo (Effektiv versus Lokal)  
Aerosol Parameter (AOD, SSA, g, Teilchenverteilungen)  
Zusammenspiel Messungen - Modellierung  
Aktinische UV-Strahlungsflüsse und Bestimmung von atmosphärischen Photolysefrequenzen  

13) UV Klimatologie  
Trends  
UV Klimatologie durch Messnetze  
UV Klimatologie durch Satellitenmessungen am Beispiel von TOMS  
Modellierung am Beispiel Meteosat-JRC  
UV Rekonstruktionen  

14) Aktuelle Forschungen  
Internationale Projekte, Stand der Forschung  

---

**Stratospheric Chemistry**  
W 4 credits 2V+1U T. Peter A. Stenke

---

**Abstract**  
Thermodynamical and kinetic basics: bi- and termolecular reactions, photo-dissociation. Chemical family concept. Chapman chemistry. Radical reactions of oxygen species with nitric oxide, active halogens and odd hydrogen. Ozone depletion cycles. Methane depletion and ozone production in the lower stratosphere. Heterogeneous chemistry on background aerosol. Chemistry and dynamics of the ozone hole. The lecture gives an overview on the manifold reactions which occur in the gas phase, in stratospheric aerosol droplets and in polar cloud particles. The focus is on the chemistry of stratospheric ozone and its influence through natural and anthropogenic effects. Especially the intercontinental air traffic and the ozone depletion caused by FCKW CFC in the mid-latitude and the polar regions as well as coupling with the greenhouse effect.
Content

Short presentation of thermodynamical and kinetic basics of chemical reactions: bi- and ter thermo molecular reactions, photo-dissociation. Introduction to the chemical family concept: active species, their source gases and reservoir gases. Detailed treatment of the pure oxygen family (odd oxygen) according to the Chapman chemistry. Radical reactions of the oxygen species with nitric oxide, active halogens (chlorine and bromine) and odd hydrogen. Ozone depletion cycles. Methane depletion and ozone production in the lower stratosphere (photo-smog reactions). Heterogeneous chemistry on the background aerosol and its significance for heavy air traffic. Chemistry and dynamics of the ozone hole: Formation of polar stratospheric clouds and chloride activation.

Lecture notes

Documents are provided in the contact hours.

Literature

Prerequisites / notice

Prerequisites: Basics in physical chemistry are required and an overview equivalent to the bachelor course in atmospheric chemistry (lecture 701-0471-01) is expected.

701-1211-01L Master's Seminar: Atmosphere and Climate 1

W 3 credits 2S

E. M. Fischer, T. Ewen, O. Stebler, M. A. Wüest

Abstract

In this seminar, the process of writing a scientific proposal will be introduced. The essential elements of a proposal, including the peer review process, will be outlined and class exercises will train scientific writing skills. Knowledge exchange between class participants is promoted through the preparation of a master thesis proposal and evaluation of each other's work.

Objective

Training scientific writing skills.

Content

In this seminar, the process of writing a scientific proposal will be introduced. The essential elements of a proposal, including the peer review process, will be outlined and class exercises will train scientific writing skills. Knowledge exchange between class participants is promoted through the preparation of a master thesis proposal and evaluation of each other's work.

Prerequisites / notice

Attendance is mandatory.

651-4095-01L Colloquium Atmosphere and Climate 1

W 1 credit 1K

Abstract

The colloquium is a series of scientific talks by prominent invited speakers assembling interested students and researchers from around Zürich. Students take part of the scientific discussions.

Objective

The students are exposed to different atmospheric science topics and learn how to take part in scientific discussions.

Biogeochemistry and Pollutant Dynamics
