</tbody>
</table>
Objective
Some basic knowledge in physiology is recommended for this course, which revisits important physiological topics, emphasizing their relation to nutrition. The aim is to give the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand. For students with a background in medicine, pharmacy or biology, the course is useful as a review of previously acquired knowledge. Major topics are basic neuroanatomy and neurophysiology, general endocrinology, the physiology of taste and smell; nutrient digestion and absorption; intermediary metabolism and energy homeostasis; and some aspects of cardiovascular physiology and water balance.

766-6205-00L Nutrient Analysis in Foods W+ 3 credits 3U M. B. Zimmermann, V. Galetti
Number of participants limited to 20.

Abstract
In this practical course different meals are prepared and then analyzed in the laboratory. The analyses comprise energy, macronutrients, specific micronutrients as well as polyphenols and phytic acid. Based on the results the nutritional value of each meal is critically evaluated and discussed. The practical work is accompanied by a lecture on the basic principles of analytical chemistry.

Objective
Knowing analytical methods to determine macro- and micronutrient content in foods. Critical evaluation of analytical results and interpretation in relation to nutritional value of meals.

Content
The practical course nutrient analysis in foods includes the preparation and chemical analysis of meals from different types of diets. The content of macronutrients, specific micronutrients and secondary plant components are analyzed using common analytical methods. The analytical results are compared with calculated data from food composition databases and critically evaluated. The nutritional values of the meals in relation to specific chronic diseases are discussed. The practical course is accompanied by a lecture on the basic principles of analytical chemistry.

Lecture notes
A script and lecture slides are handed out before the start.

Prerequisites / notice
Students will work in groups.

Performance is assessed by a short test on course content, results presentation and a short report.

752-6101-00L Nutrition and Chronic Disease (HS) W 3 credits 2V M. B. Zimmermann

Abstract
To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthrits and food allergies.

Objective
To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

Content
The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthrits and food allergies.

Lecture notes
There is no script. Powerpoint presentations will be made available on-line to students.

Literature
To be provided by the individual lecturers, at their discretion.

Prerequisites / notice
No compulsory prerequisites, but prior completion of Human Nutrition I + II (Humanernährung I+II) is strongly advised.

752-6403-00L Nutrition and Performance W+ 2 credits 2V S. Mettler, M. B. Zimmermann

Abstract
The course introduces basic concepts of the interaction between nutrition and exercise and cognitive performance.

Objective
To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.

Content
The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition examples.

Lecture notes
Lecture slides and required handouts will be available on the ETH website.

Literature
Information on further reading will be announced during the lecture. There will be some mandatory as well as voluntary readings.

Prerequisites / notice
General knowledge about nutrition, human biology, physiology and biochemistry is a prerequisite for this course. The course builds on basic nutrition and biochemistry knowledge to address exercise performance and related aspects of nutrition.

The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

Language: English

It is strongly recommended to attend the lectures. The lecture (including the handouts) is not designed for distance education.

### Gene Technology in Foods

- **Introduction and historical background**
- Overview on application in gene technology, the gene transfer potential of bacteria, plants and other organisms and the mostly used methods of genetic modification.
- Students will be required to complete a group project on food products and ingredients with or from functional bacteria. The project will involve information research and analysis followed by an oral presentation and short written report.
- A list of references will be given at the beginning of the course for the different topics presented during this course.

</tbody>
</table>

Abstract

The MAS program “Competency in the Building Process” provides graduates of the program with a thorough understanding of the complexities of a project, instilling them with an increased capacity to assess the consequences of their actions and decisions. Upon successful completion of the studies, graduates are qualified to assume the complex duties of an overall project leader in building projects.

Objective

Over the course of the MAS program, students review and closely examine professional experiences gained so far. The goal of the program is to develop an understanding and form opinions on the present-day building process. The course directs students to draw independent conclusions and set forecasts for design professionals in the building process, creating a basis, in conjunction with group discussions, for independent study.

Content

The Master of Advanced Studies in «Competency in the Building Process» imparts an integral view of the building process. Ever-changing technical and social demands, complex permit processes and increasing pressure to speed up production and completion times have led to the fragmentation and specialization of services and work performed by building process participants. Maintaining an overview of the project are the architects and engineers, who draw from a broad knowledge base as they direct, coordinate and moderate all disciplines involved in the design and construction process.

The MAS program «Competency in the Building Process» is a part-time study for professionally experienced architects and engineers. It provides graduates of the program with a thorough understanding of the complexities of a project, instilling them with an increased capacity to assess the consequences of their actions and decisions. Upon successful completion of the studies, graduates are qualified to assume the complex duties of an overall project leader in building projects.

The first three semesters of the study are comprised of: «Construction Participants», «Services» and «Strategies Interests». Explored in the first semester is communication as it relates to qualifications, acquisition and the organisation chart of the participating client, architects and design and construction professionals. The second semester then turns to the building process as a sequence of activities, placing its focus on basic principles and the services, i.e., the commission for design services, the service model, relevant economic considerations, the overall project leader, coordination of specialty engineers and the project leader. Over the course of the third semester, correlations are then drawn between the topic areas as they relate to the strategies and interests of building industry players. An in-depth look is also taken at the competencies of design professionals. The masters thesis in the fourth and final semester completes the course of study.

MAS in History and Theory of Architecture (GTA)

The MAS-programm in “History and Theory of Architecture” is a two-year half-time course and contains 60 CP. The course starts in the autumn semester.

Attendance of classes supplemented by independent research; practical training periods and excursions; lectures/seminars on one to two days per week, in total 600 ca. contact hours, in addition private study ca. 800 hours (for each in-class day one day of work preparation), two individually tutored seminar papers on chosen subjects (200 hours) and credited Master's thesis (600 hours).

</tbody>
</table>

After successful completion the students achieve 75 Creditpoints.

Abstract
The program aims at enhancing students' understanding of subject matter and methods in the field of research into architectural theory and at assisting them in the critical investigation of the history and theory of architecture.

Objective
The historical and social roots of architecture are an essential aspect of the work of architects. To adapt the past to ones own thinking and knowledge, is a challenge. This will be done in a lively and reflecting process. Anyone faced with this challenge in the practical work will find a quality for his buildings that can't be reached by only considering urbanistic, aesthetic and functional factors.

Based on selected issues, the participants of the MAS-program «Geschichte und Theorie der Architektur» get acquainted with the methods of historic research. Participants will gain a deeper insight into the subjects and methods of architectural historians and will be supported in scientific discourses.

Content
The MAS-program «Geschichte und Theorie der Architektur» includes a weekly four-hour seminar in which the techniques of scientific work (methodology, creating a bibliography, researching, textual criticism, editing) and practicing essential aspects of art and architecture are discussed on the basis of texts and buildings before they are written down in textual form.

Historiographical and methodological aspects as well as training in analyzing and describing architectural phenomena are at the forefront. A major concern is also to improve the ability for writing of texts (encyclopedia articles, short essays, project descriptions, academic papers). Writing is a key instrument not only of disciplinary discourse, but also the public exchange of research.

Depending on the topic of the course, there is a single or multi-day trip, during which the participants talk about the buildings that are visited. In addition, each semester, at least two additional courses of the Institute gta have to be visited.

The course concludes with a diploma thesis written on a subject that is chosen by the students. The concept and writing of this work are intended to be a process that evolves continuously while studying. The thesis can be extended into a dissertation, provided the student has a graduate degree that is acknowledged by the ETH.

MAS in Housing

The course offered within the MAS-program "Housing" is classified in four relevant modules:

- Module 1: social and historical context of housing, housing design and construction.
- Module 2: Housing design, past and present: Typology, biography of usage.
- Module 3: Housing as a contribution of urban design and neighborhood development.
- Module 4: Sustainable development - a new goal in housing design and construction.

Also see separate programmes.

The attendance of the lecture "Housing" of Prof. Eberle in the autumn semester is compulsory. Individual chosen 3-4 further lectures or seminars in the Autumn or Spring Semester have to be attended (6 CP). The modules 3 and 4 are offered in the Spring Semester.

Abstract

Relevant issues about the provision, the design and the construction of housing and quality of living are explored based on an interdisciplinary analysis. The MAS thesis is focused on studying, for example, the interdependence of architectural, social, spatial and urban planning considerations, and shifting demand and usage patterns related to housing.

Objective

Against the backdrop of jointly developed theoretical ideas, the students job-related skills and accomplishments in the fields of drawing up concepts, analysis, interpretation, and conversion as well in oral and written conveying are consolidated and expanded in discussions and in joint work. The course of study does not strive to train generalists. Instead it deals with the formulation of questions and procedures elaborated by the students in a generalistic or interdisciplinary way. This is the decisive factor in the qualitative added value of methods which span over several disciplines.

MAS in Landscape Architecture

The Master of Advanced Studies in Landscape Architecture is a one-year full time postgraduate diploma programme delivered in English. It deals mainly with a scale of landscape that is between that of project design and landscape planning. The focus is on peripheral landscapes and their integration into our cities. In the context of the MAS LA these are discussed and developed in respect to their contemporary functional, ecological and aesthetic potentials. Language: English, contact hours: 600h.

For further information please visit: http://www.girot.arch.ethz.ch/

Courses Offered

The programme is a one-year full time master programme, structured a-round two main poles: a landscape design studio (laboratory), and a theory seminar (oratory). Emphasis within the programme on Landscape Video will also help provide a strong analytical basis in both theory and design. The studies are held during the semester from Tuesday to Friday. The programme will conclude with an individual thesis work.

Abstract
Within the "Master of Advanced Studies in Landscape Architecture" (MAS LA), the use of the latest modeling and visualization possibilities as well as the actual 3D depiction of landscape architecture make up the core emphasis. Here, the focus lies on the integration of CAD/CAM technologies as a design-supporting medium.

Objective
Through an intensive investigation of the latest software and techniques, the students are capable of the following:
- Represent complex design tasks
- Develop spatial perception at different levels of scales
- Handle current problems efficiently and experimentally
- Develop new visualization and communication techniques using new media
- Communicate design ideas professionally

Content
The MAS LA is a one-year (academic) postgraduate diploma programme delivered in English. It is divided into themed modules and a concluding synthesis module. The chosen CAD programs (i.e. Rhino) are particularly appropriate for the visualization of large-scale landscape designs and offer the possibility for export to computer-steered milling machines.

In addition, superior competency enhancement in the area of 3D GIS and the use of photography as a design tool and video as tool for illustration and design round off the goal-oriented program.

Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Companies operating on B2B markets increasingly face global competition and demanding customers. One way out is to customize the company's core offering and to enhance it with additional products and services. However, these "business solutions" are often not as profitable as expected; the underlying business model needs improvement.

In this seminar, the participants analyze their company's business model with regard to its suitability for business solutions. The firm does not have to be a solution provider; the seminar also encourages the students to think about new pathways to increase the competitiveness of the companies they are working for.

The focus of the seminar is on B2B companies. Therefore, the employer of the participants should primarily serve business customers (as opposed to end consumers, e.g. for fast moving consumer goods). Manufacturing and service companies are equally suitable. Students should have a basic understanding of their firm's business model.

Content

Uber, Airbnb, Nest and Jawbone - A wide range of innovative companies exist, which successfully implemented ICT enabled business models and continue to grow at a rapid pace. Examples, illustrating how digitalization, including the "Internet of Things" currently fosters business model innovation across various industries. This course is designed to help students to understand and critically assess such newly emerging (digital) business models.

For the lecture students will get access to one of the leading online teaching platforms (called edX) also offered by other top universities (incl. MIT, Harvard, Berkeley, etc.). Using the edX platform, will allow students to collaborate in online discussions, solve online exercises and present a short educational video as part of a group project.

Key Topics:
Business model innovation; (digital) business model patterns; business value of IT; the concept of integration; transaction cost perspective; network economics perspective; essentials and impact of web 2.0; internet of things, mobile computing, market places, social analytics and big data; IT governance and portfolio management; entrepreneurship in the digital space, etc.

Implementing solutions: project management, critical path method, quality control feedback loop.

Controlling solutions: Vensim software, feedback cycles, control parameters, instabilities, chaos, oscillations and cycles, supply and demand, production functions, investment and consumption

A successful participant of the course is able to:
- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyse the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics

Content

Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical systems dynamics, nonlinear dynamics and macroeconomic modeling.

The course is structured along three main tasks:
1. Finding solutions
2. Implementing solutions
3. Controlling solutions

PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM.

The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture

This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation. What significance do international economic relations have for Switzerland?

This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to every-day economic problems.

This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? What is the best way to protect the environment? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

The course webpage (to be found at http://www.kof.ethz.ch/en/events/teaching/) contains announcements, course information and lecture slides.

We advise you to also buy access to Aplia. This internet platform will support you in learning for this course. To save money, you should buy the book together with Aplia. This is sold as a bundle (ISBN: 9781473715998). Besides this textbook, the slides and lecture notes will cover the content of the lecture and the exam questions.
### Principles of Microeconomics

**Number:** 363-0503-00L  
**Title:** Principles of Microeconomics  
**Type:** W+  
**ECTS:** 3  
**Hours:** 2G  
**Lecturers:** M. Filippini

**Abstract:**  
The course introduces basic principles, problems and approaches of microeconomics.

**Objective:**  
The course includes the following main topics:
- Basic principles of demand and supply, market and state in a modern economy, externalities, cost analysis, consumer behaviour, economies of scale and economies of scope, perfect competition, monopoly, oligopoly, monopolistic competition, mathematical treatment of some basic concepts.

**Lecture notes:**  
Lecture notes, exercises and reference material can be downloaded from Moodle.

**Literature:**  

**Complementary:**  

### Financial Management

**Number:** 363-0711-00L  
**Title:** Accounting for Managers  
**Type:** W+  
**ECTS:** 3  
**Hours:** 2V  
**Lecturers:** J.P. Chardonnens

**Abstract:**  
Overview of financial and managerial accounting  
Accounting for current and fixed assets  
Liabilities and owners equity  
Recording change in balance sheet  
Measuring financial performance  
Managing financial reporting  
Full and variable costing system  
Using accounting information for decision making purposes

**Objective:**  
Understand the different procedures involved in the accounting system  
Record change in financial position  
Measure business income  
Prepare final accounts  
Understand the principles of cost accounting  
Calculate the different product costs  
Make decisions about the acceptance or rejection of a particular product

**Content:**  
Financial Accounting: Balance sheet, income statement, double-entry accounting, journal and ledger, accounting for merchandising activities, value-added tax, adjustments before final accounts, provisions, depreciation, valuation,  
Managerial Accounting: Full costing, variable costing, cost-volume profit, break-even analysis, activity-based costing

**Prerequisites / notice:**  
This course is a prerequisite for the course Financial Management.

### 3. Semester

#### Core Courses

#### Strategy, Technology and Innovation Management

**Number:** 363-0392-00L  
**Title:** Strategic Management  
**Type:** W+  
**ECTS:** 3  
**Hours:** 2G  
**Lecturers:** G. von Krogh

**Abstract:**  
Due to didactic reasons originating from the case based approach, the number of participants is limited to 80.  
Registration through myStudies (first come, first served).  
If you are unable to sign up through myStudies, please contact the course assistant.

**Objective:**  
The course conveys concepts and methods in strategic management, with a focus on competitive strategy. Competitive strategy aims at improving and establishing position of firms within an industry.

**Content:**  
- Introduction to strategy  
- Industry dynamics I: Industry analysis  
- Industry dynamics II: Analysis of technology and innovation  
- The resource-based theory of the firm  
- The knowledge-based theory of the firm

Data: 06.10.2017 12:56  
Autumn Semester 2015  
Page 858 of 1432
The aim for students attending this course is to develop a nuanced understanding of the sustainability challenges facing companies in different sectors and the various strategies companies develop in response. Students will learn how to critique individual corporate sustainability strategies, as well as the more general concepts of corporate sustainability and sustainability leadership.

For participants of the MAS-MTEC program we offer a complementary course Practicing Strategy in which students will apply the concepts of Strategic Management to their real-life contexts and organizations. Please register simultaneously for both courses if you want to take part in this course.

For more information please see:
http://www.smi.ethz.ch/education/practicing-strategy.html

### 365-1059-00L Practicing Strategy

**W+** 1 credit 1S  G. von Krogh, Z. Erden Özkoğ

**Abstract**

This lecture is a special course for MAS students which supplements the Strategic Management course. Participants work on real-life strategy problems in a two-day workshop and apply concepts & methods from the Strategic Management course to develop suitable solutions.

**Objective**

The goal of the course is that participants are able to transfer and use the concepts and methods from the Strategic Management lecture to develop solutions for strategic issues in real-life business contexts.

**Prerequisites / notice**

Successful registration and prior/parallel enrollment in "363-0392-00 G Strategic Management" required (see course catalogue page for details).

### 363-0387-00L Corporate Sustainability

**W+** 3 credits 2G  V. Hoffmann

**Abstract**

We introduce the concept of corporate sustainability; discuss its implications focusing on strategy, technology, and financial markets; and offer e-modules to train relevant critical thinking skills. With this input, students explore the practical challenges of corporate sustainability in a group project, focusing on one of the four sustainability challenges of water, energy, mobility, and food.

**Objective**

- Understand the limits and the potential of corporate sustainability for sustainable development
- Develop critical thinking skills that are useful for corporate sustainability (argumentation, communication, evaluative judgment)
- Be able to recognize and realize opportunities for corporate sustainability in a business environment
- Overview of the grand sustainability challenges of Water, Energy, Mobility, and Food
- Business implications of sustainable development, in particular for corporate strategy, marketing & leadership, technology & innovation, and financial markets.
- Critical thinking skills for corporate sustainability
- In-depth case study of concrete corporate sustainability challenge in the group project phase, such as: How to deal with environmental pressure groups? How to use the strengths of business to solve pressing sustainability problems? How to catalyze radical innovations for sustainability? How to invest money in a sustainable way?

**Lecture notes**

Presentation slides will be distributed prior to lectures.

**Literature**

Literature recommendations will be distributed during the lecture

### 365-1060-00L Case Studies in Corporate Sustainability

**W+** 1 credit 1S  V. Hoffmann

**Prerequisite:** A parallel or previous enrolment for the lecture Corporate Sustainability (363-0387-00) is mandatory.

**Limited number of participants:** a minimum of 10 persons and a maximum of 25 persons.

Please register by 06.10.2015 at the latest via myStudies.

**Abstract**

In this course, we will discuss in detail a selection of case studies of companies from different sectors facing a variety of environmental and social challenges. Through interactive discussions, students will learn to critique the concepts of corporate sustainability and sustainability leadership.

**Objective**

- The aim for students attending this course is to develop a nuanced understanding of the sustainability challenges facing companies in different sectors and the various strategies companies develop in response. Students will learn how to critique individual corporate sustainability strategies, as well as the more general concepts of corporate sustainability and sustainability leadership.
- Corporate sustainability is a complex concept. Although many companies now report on their corporate sustainability actions, few successfully integrate sustainability into their business operations. In this seminar, we will discuss a selection of case studies of companies from different sectors facing a variety of environmental and social challenges. The case studies will allow us to explore from multiple perspectives (e.g. stakeholder, institutional, managerial) why corporate sustainability is so complex, how and why businesses respond in the ways that they do, how existing sustainability strategies could be improved, as well as what it means to be a leader in corporate sustainability. Students will have the opportunity to familiarize themselves with the case study material in detail before each session. The sessions will be interactive, will include small group discussions and will be complementary to the Corporate Sustainability Lecture.

**Literature**

Case study materials including supplementary readings will be provided to participants by email several weeks before the first seminar.

This course can only be attended by those who are currently attending (or have previously attended) the Corporate Sustainability Lecture.
The globalization of the world leads to an increasingly faster pace in business transformation. Enterprises have to adapt faster and even the main reasons for corporate transformation, the relevant management processes to manage corporate transformation, the interdependencies between strategy, processes and information systems, especially how this three levels interrelate, the critical success factors for the successful accomplishment of large scale corporate transformation projects, the main instruments of project, quality and change management and the different types of resulting IT projects.

The goal of the lecture is to understand the main challenges of corporate transformation and to demonstrate the application of a holistic project procedure model for corporate transformation projects with special emphasis on the alignment of business and IT.

The student should understand and be able to explain evidence-based management requires valid empirical research. In this course, students will learn the basics of research design,

The following textbook is mandatory:

S. Wagner

The course offers an introduction to the theory and practice of supply chain management. Students will learn how to develop supply chain strategies and supply chain networks based on firms competitive strategies and marketing priorities.

Effective supply chains ought to be aligned with and support the achievement of the firms corporate, business and product strategies, taking into account future opportunities and risks. This course will familiarize students with modern supply chain management theory and practice to develop and manage supply chains. The topics covered range from fundamental logistics and supply chain concepts (e.g. push vs. pull, postponement) to the development of supply chain strategies, relationships and networks.

Lecture notes

Course material will be available for download from the homepage of the Chair of Logistics Management:

http://www.scm.ethz.ch/teaching/courses.html

The task of designing and managing supply chains requires that managers apply strategic, decision making and leadership skills in a supply chain context. The goal of this course is to develop and practice these skills.

The final course grade will be a weighted average of the following:

Exam (semester end): 70%
Case studies (during the semester): 30%

Students (at least in groups of two) must bring a laptop with MS Excel and the Excel Solver installed to class.

Quantitative and Qualitative Methods

The following textbook is mandatory:

The following textbook is supplementary:

The student should understand and be able to explain evidencing-based management requires valid empirical research. In this course, students will learn the basics of research design, fundamentals of data collection and statistical methods to analyze the data acquired in social science research. Students are expected to apply their knowledge in class discussions and out-of-class assignments.

- Ability to formulate research questions and designing an appropriate study
- Ability to collect and analyze data using a variety of methods
- Ability to critically assess the quality of empirical research in management
- Applied knowledge of empirical methods through out-of-class assignments

1) Introduction to empirical management research
2) Research designs: exploratory, descriptive, experimental
3) Measurement and scaling
4) Data collection and sampling
5) Data analysis methods
6) Reporting and presenting empirical research

Bi-weekly out-of-class assignments and projects on covered subjects
Assignments and projects: This course includes out-of-class assignments and projects to give students some hands-on experience in conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Students will have at least one week to work on each assignment. Students are expected to work on these assignments individually. Duplicate answers will receive no credit and will be subject to a disciplinary review. Assignments will be graded and need to be turned-in on time. Exemplary answers to the assignments will be posted online after the submission date for students to review. Some assignments will also be discussed in class.

Class participation: Class participation is encouraged and can greatly improve students’ learning in this class. Class participation will not be graded; however, it will be considered favorably if a student is between grades. Note, however, that quality is more important than quantity. In this spirit, students are expected to attend class regularly and come to class prepared.

**Abstract**

Relationship between economy and environment, market failure, external effects and public goods, contingent valuation, internalisation of externalities; economics of non-renewable resources, economics of renewable resources, cost-benefit analysis, sustainability, and international aspects of resource and environmental economics.

**Objective**

Understanding of the basic issues and methods in resource and environmental economics; ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

**Topics are:**
- Introduction to resource and environmental economics
- Importance of resource and environmental economics
- Main issues of resource and environmental economics
- Normative basis
- Utilitarianism
- Fairness according to Rawls
- Economic growth and environment
- Externalities in the environmental sphere
- Governmental internalisation of externalities
- Private internalisation of externalities: the Coase theorem
- Free rider problem and public goods
- Types of public policy
- Efficient level of pollution
- Tax vs. permits
- Command and Control Instruments
- Empirical data on non-renewable natural resources
- Optimal price development: the Hotelling-rule
- Effects of exploration and Backstop-technology
- Effects of different types of markets.
- Biological growth function
- Optimal depletion of renewable resources
- Social inefficiency as result of over-use of open-access resources
- Cost-benefit analysis and the environment
- Measuring environmental benefit
- Measuring costs
- Concept of sustainability
- Technological feasibility
- Conflicts sustainability / optimality
- Indicators of sustainability
- Problem of climate change
- Cost and benefit of climate change
- Climate change as international ecological externality
- International climate policy: Kyoto protocol
- Implementation of the Kyoto protocol in Switzerland
- Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

<td>2G</td>
<td>D. Sornette</td>
</tr>
</tbody>
</table>

**Abstract**

I aim to introduce students to the concepts and tools of modern finance and to make them understand the limits of these tools, and the many problems met by the theory in practice. I will put this course in the context of the on-going financial crises in the US, Europe, Japan and China, which provide fantastic opportunities to make the students question the status quo and develop novel solutions.
Objective

The course explains the key concepts and mechanisms of financial economics, their depth and then stresses how and why the theories and models fail and how this is impacting investment strategies and even a global view of citizenship, given the present developing crises in the US since 2007 and in Europe since 2010.

- Development of the concepts and tools to understand these risks and master them.
- Working knowledge of the main concepts and tools in finance (Portfolio theory, asset pricing, options, real options, bonds, interest rates, inflation, exchange rates)
- Strong emphasis on challenging assumptions and developing a systemic understanding of financial markets and their many dimensional risks

Content

1- The Financial Crises: what is really happening? Historical perspective and what can be expected in the next decade(s). Bubbles and crashes. The illusion of the perpetual money machine.

2- Risks in financial markets
- What is risk?
- Measuring risks of financial assets
- Introduction to three different concepts of probability
- History of financial markets, diversification, market risks

3- Introduction to financial risks and its management.
- Relationship between risk and return
- Portfolio theory: the concept of diversification and optimal allocation
- How to price assets: the Capital Asset Pricing Model
- How to price assets: the Arbitrage Pricing Theory, the factor models and beyond

4- Financial markets: role and efficiency
- What is an efficient market?
- Financial markets as valuation engines: exogeneity versus endogeneity (reflexivity)
- Deviations from efficiency, puzzles and anomalies in the financial markets
- Financial bubbles, crashes, systemic instabilities

5- An introduction to Options and derivatives
- Calls, Puts and Shares and other derivatives
- Financial alchemy with options (options are building blocks of any possible cash flow)
- Determination of option value: concept of risk hedging

6- Valuation and using options
- A first simple option valuation model
- The Binomial method for valuing options
- The Black-Scholes model and formula
- Practical examples and implementation
- Realized prices deviate from these theories: volatility smile and real option trading
- How to imperfectly hedge with real markets?

7- Real options
- The value of follow-on investment opportunities
- The timing option
- The abandonment option
- Flexible production
- Conceptual aspects and extensions

8- Government bonds and their valuation
- Relationship between bonds and interest rates
- Real and nominal rates of interest
- Term structure and Yields to maturity
- Explaining the term structure
- Different models of the term structure

9- Managing international risks
- The foreign exchange market
- Relations between exchange rates and interest rates, inflation, and other economic variables
- Hedging currency risks
- Currency speculation
- Exchange risk and international investment decisions

Lecture notes
Lecture slides will be available on the site of the lecture

+ Additional paper reading provided during the lectures

Prerequisites / notice
None

363-0723-00L Corporate Finance W+ 3 credits 2G M. Neuhaus

Abstract
Corporate Finance, investment management, business valuation, value based management & compensation, financial reporting today & in future, financial reporting value chain, reporting on non-financial measures, such as corporate sustainability reporting, mergers & acquisitions, legal aspects, taxes, corporate governance - risk management - internal controls & mgmt. information systems, turnaround.

Objective
Introduction in theory and practical application of Corporate Finance, with a particular focus on financing of operations and transactions, analysed from multiple aspects, including legal and tax.

Content
Corporate Finance, investment management, business valuation, value based management and compensation, financial reporting today and in future, financial reporting value chain, reporting on non-financial measures, such as corporate sustainability reporting, mergers and acquisitions, legal aspects, taxes, corporate governance - risk management - internal controls and management information systems, turnaround.

Abstract
Using uncertainty management by organizations and individuals as conceptual framework, risk management and risk implications of new technologies are treated. Three components of risk management (risk identification/evaluation, risk mitigation, risk communication) and underlying psychological and organizational processes are discussed, using company case studies to promote in-depth understanding.

Objective
- understand basic components of risk management in organizations
  - know and apply methods for risk identification/evaluation, risk mitigation, risk communication
  - know psychological foundations of risk perception, decision-making under risk, and risk communication
  - know organizational principles for managing uncertainty
  - apply theoretical foundations to applied issues such as safety management, regulatory activities, and technology design and implementation in different domains (e.g. transport systems, IT, insurance)

Content
The syllabus includes the following topics:
- Elements of risk management
  - risk identification and evaluation
  - risk mitigation
  - risk communication
- Psychological and organizational concepts relevant in risk management
  - decision-making under uncertainty
  - risk perception
- Resilient organizational processes for managing uncertainty
- Case studies on different elements of risk management (e.g., rule making, training, managing project risks, automation)
- Group projects related to company case studies

Lecture notes
There is no script, but slides will be made available before the lectures.

Lecture notes
There are texts for each of the course topics made available before the lectures.

Prerequisites / notice
The course is restricted to 40 participants who will work closely with the lecturers on case studies prepared by the lecturers on topics relevant in their own companies (Swiss Re, Skyguide, Swisscom).

Abstract
This course will cover how to prepare and deliver your future presentations. You will be more confident presenting yourself. Thanks to the feedback from your colleagues, the trainer and the video you will be able to identify your strengths and weaknesses.

Objective
The participants know the most important elements of a professional presentation, their presentations are more professional and interesting than before, they can structure their presentation for easy delivery and understanding, they can tell what their strengths and areas for improvement are, they will know how to speak of the cuff, they deliver constructive feedback.

Content
The participants know the most important elements of a powerful presentation, structure of prepared presentations, do's and don'ts of a professional presentation, dealing with nervousness, how to work with Power Point, body language (gestures, facial expressions, voice, eye contact), handling of Q&A, speaking of the cuff.

Abstract
Due to didactic considerations, the number of participants for this course is limited to 50.
Please register through myStudies to enroll for the course. Slots are assigned on a first-come first-serve basis (in the order of the registration date on myStudies). We will confirm your registration by e-mail. If you have any inquiries about the course, please contact the course assistant.
This course focuses on the challenges in managing multi-business corporations, and covers topics related to the vertical and horizontal scope of business activities.

Objective
Course Topic and Learning Objectives:
Large- and medium-sized corporations play a central role in the economic activity of most developed and developing countries. Many of these organizations perform multiple business activities in multiple markets. In the face of increasing international competition, globalization, technological development, deregulation, and the emergence of new markets and industries, operating such a portfolio of business activities poses important managerial challenges forcing corporations to continuously re-consider their vertical and horizontal scope and boundaries.

The course Corporate Strategy draws from a wide range of theories and methods to develop an understanding of the conceptual frameworks, debates, and developments concerning decisions associated with the management of multi-business corporations. We will cover the key questions driving a firm's corporate strategy, including:

- In what markets to compete with which businesses?
- Which activities should be performed by the firm and which should be outsourced (i.e. "make" or "buy" decisions)?
- What are the most appropriate approaches to growth and divestiture?
- How do institutional forces impact corporate strategy?

Specifically, we will examine how organizations manage their portfolio of business activities and markets to achieve competitive advantage through vertical integration, cooperative strategies such as strategic alliances and joint ventures, corporate diversification, mergers and acquisitions, diversifications, and globalization/international strategies, and strategic renewal.

Format:
The course is a combination of lectures about concepts/methods, guest lectures, case studies/assignments, and group debates.

Content:
The course homepage can be found at: http://www.smi.ethz.ch/education/courses/corporatestrategy

Having participated in the course Strategic Management by Prof. Georg von Krogh/Dr. Zeynep Erden is an advantage but not a requirement.

Potential of Collaborations

Learning outcomes professional competence
- The students learn and understand the management basics of inter-firm cooperation and organizational networks (business models, incl. risk, communication, etc.)
- realites the value creation potentials of alliances (added value)
- understand underlying theoretical models (Transaction cost theory, principal agent, game theory)
- Identify and understand specific forms of collaboration (Strat. All., JV, Networks, M&A, etc.)
- Apply tools hands on in real companies (in coll. with companies)

Learning outcomes methodological competence
- Writing academic papers
- Developing structured documentation of interviews
- Transferring theory directly into application
- Contributing to the learning journey

Learning outcomes social competence
- Work together with industrial partners
- Improving communication skills as basics for collaboration
- Developing and applying team work skills
- Coping with conflicts resolution in teams

Content:
The constantly increasing complexity of technologies and systems, the increased pressure caused by competition, the need for shortening time-to-market and the thereby implied growing risks force organizations to increasingly focus on core competencies. Collaboration with external partners is a key value creation opportunity for successful ventures. This type of cooperation also has implications on daily management activities. This lecture will provide a better understanding of special requirements needed for management of cooperation issues.

Learning journey:
In an introductory lecture we will give an overview of the theoretical framework and explain the concept of the lecture (Sept. 18, 2014). In weeks 2-5 you will work on a first assignment on six different aspects of the underlying framework: strategy and activities, structure and process, culture and people orientation, interaction and roles, risk and trust, knowledge and learning. This first assignment will give you the basics to participate in the second part (Oct.30-31.2014, 2014) of this seminar. There you will present the results of the first assignment and get additional theoretical input to perform the 2nd assignment. The second assignment will be to analyze real alliance projects in the partner companies. The final lesson will be used as a best practice exchange together with our industrial partners (Dec.18, 2014).

Lecture notes
- Lecture script
- Current course material
- Harvard Case Studies
- Reader with current papers

Literature
A list with recommended publications will be distributed in the lecture.

Additional Books:
HBR Collaborating Effectively ISBN 978-1-4221-6264 4
HBR on Mergers and Acquisitions: ISBN 1-57851-555-6

Prerequisites / notice
The number of students participating in the lecture is limited to 30.
Abstract

The course introduces the students to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies.

Objective

The course includes both lectures and exercises alternately. The goal is to understand the opportunity of user innovation for management and develop strategies to harness the value of user-developed ideas and contributions for firms and other organizations.

The students actively participate in discussions during the lectures and contribute presentations of case studies during the exercises. The combination should allow to compare theory with practical cases from various industries.

The course presents and builds upon recent research and challenges the students to devise innovation strategies that take into account the availability of user expertise, free and public knowledge, and the interaction with communities that span beyond one organization.

Content

This course on user innovation extends courses on knowledge management and innovation as well as marketing. The students are introduced to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies. Theoretical underpinnings taught in the course include models of innovation, the structuration of technology, and an introduction to entrepreneurship.

Grading is based on the final exam, the class presentations (including the slides) as well as class participation.

Prerequisites / notice

-Case study (group work)
-Ability to take successful actions in a technology transfer process either in your own start-up or within a larger organization
-Get familiar with the start-up ecosystem
-Foster entrepreneurial thinking!

Reading assignments: please consult the SMI website:

http://www.timgroup.ethz.ch/education/Courses_at_TIMGROUP

For questions, please contact:

-Contact: Balint Dioszegi, bdioszegi@ethz.ch (D-MTEC)
-In case of non-attendance: Mandatory de-registration until 19.10.15!
-Course registration open until 19.10.15.
-Maximal number of students: 50
-Case study (group work)
-Success story: South Pole Carbon Asset Management - from spin-off to world leader (Thomas Camerata, Co-Founder)
-Student presentations of case study group work (Lesley Spiegel)

Blockday 1 - 27.10.15: Introduction and science push
-Introduction to Technology Transfer (Lesley Spiegel)
-Presentation of the case study group work (Balint Dioszegi)
-From science to market (Dr. Marjan Kraak, ETH Transfer, Head Start-ups)
-Securing intellectual property (Dr. Claudius Dietzsch, Medela)

Blockday 2 - 10.11.15: Start-up ecosystem and market pull
-The start-up ecosystem (Lesley Spiegel)
-Innovation in a mature start-up (Dr. Ekkehard Zwicker, CEO Alstom Inspection Robotics)
-Getting started with your venture: ETH Entrepreneur Club (Presdient ETH Entrepreneur Club)
-Negotiation and conflict management (Prof. Dr. Michael Ambühl)
-Early stage financing models (Erika Puyal, Head Start-up Finance, Zurich Kantonalbank)

Blockday 3 - 24.11.15: Presentation of student case study group work and visit to the Hub and Technopark Zurich
-Student presentations of case study group work (Lesley Spiegel)
-Success story: South Pole Carbon Asset Management - from spin-off to world leader (Thomas Camerata, Co-Founder)
-Visit of the Hub Zurich and presentation of Hub Start-up
-Visit of the Technopark Zurich and presentation of 3 start-ups
-ICT: Rayneer Entertainment (Oliver Füllkiger)
-Foodtech: Eaternity (Judith Ellens)
-Medtech: Ability (Mario Thomman)

Blockday 4 - 10.12.15: Final exam
-Case study (group work)
-Ability (Mario Thomman)
-Visit of the Technopark Zurich and presentation of 3 start-ups
-ICT: Rayneer Entertainment (Oliver Füllkiger)
-Foodtech: Eaternity (Judith Ellens)
-Medtech: Ability (Mario Thomman)

Blockday 5 - 17.12.15: Visit to Technopark Zurich and presentation of 3 start-ups

Blockday 6 - 31.12.15: Christmas break
The objective of this course is to provide students with a practical toolset of techniques, procedures and hints for a successful scientific methodology: Systems Engineering, problem solving process, situation analysis, SWOT, objectives, solution finding, evaluation.

Social science methods for empirical data collection and analysis: how to develop a good research question: methodological awareness and practical considerations, criteria in social research: reliability and validity.

Project Management: tasks plan, milestones, roles, communication Scientific work: research, resources, citation, argumentation Presentation: techniques, procedure, handouts, significance Final report: organization, layout, figures, formal requirements, appendix

Handouts of the presentations / course materials have to be downloaded and printed out before the course (see link above).

Further reading:

The course is intended for students who want to carry out a thesis in industry, in general these are:

(1) MSc-students MTEC or MAVT with master thesis (MA) during the next term and supervised by MTEC, (corresponds to 3rd or 4th semester Master) and
(2) BSc-students MAVT with bachelor thesis (BA) in industry and supervised by MTEC, as well as with full MTEC focus (corresponds to 5th or 6th semester Bachelor) or
(3) MAS MTEC students in 3rd semester for MA during the next term.

Important note: Credits will only be awarded to students according to (1), (2) or (3). Prerequisites for obtaining the credit or "Testat": being present during the whole course (presence list) and prior study of documents provided on the Internet and of the book Züst, R.: Einstieg ins Systems Engineering. 3. Aufl., Verlag Industrielle Organisation, Zürich 2004.

Other students on request (limited places).

Important: the chair coaching your BA/MA defines whether the course is mandatory. Please contact your chair!

Electronic enrollment until 08.09.2015 required. Without electronic enrollment participation in the course can't be confirmed. The course is held "en bloc" at the beginning of the semester.

Date: Friday 11.09.2015 (13:15-17:00), location: HG E33.1 (ETH main building) and Saturday, 12.09.2015 (09:15-17:00), location: HG E33.1 (ETH main building). Participation at both days required (Friday afternoon and Saturday whole day).

The course is held in English; handouts are available in English.

Besonderes (deutsche Version):
Der Kurs richtet sich an Studierende, welche an einer Professur des D-MTEC eine Arbeit in der Wirtschaft schreiben werden. Im Allgemeinen sind dies:

(1) MSc-Studierende MTEC oder MAVT mit Masterarbeit (MA) im kommenden Semester, die vom MTEC betreut wird, (entspricht 3. oder 4. Semester Master) sowie
(2) BSc-Studierende MAVT mit Bachelorarbeit (BA) in der Wirtschaft, die vom MTEC betreut wird, sowie mit vollem MTEC Fokus (entspricht 5. oder 6. Semester Bachelor) oder
(3) MAS MTEC-Studierende im 3. Semester für MA im kommenden Semester.

Andere Studierende auf Anfrage (beschränkte Anzahl Plätze).

Wichtig: die Professur, welche die jeweilige BA/MA betreut, legt fest, ob der Besuch der Veranstaltung obligatorisch ist. Bitte informieren Sie sich dort!

Elektronische Einschreibung bis zum 08.09.2015 notwendig. Ohne elektronische Einschreibung kann Ihre Teilnahme am Kurs nicht bestätigt werden.

Der Kurs wird als Blockkurs zu Beginn des Semesters gehalten.

Termin: Freitag, den 11.09.2015 (13:15-17:00) im HG E33.1 und Samstag, 12.09.2015 (09:15- ca. 17:00) im HG E33.1 (ETH Hauptgebäude). Anwesenheitspflicht an beiden Tagen (Freitagmittags und Samstag ganztags).

Die Veranstaltung wird auf Englisch gehalten; Handouts sind in Englisch verfügbar.
### Technology Ventures

Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding. This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

**Objective**

This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real-life examples and cases.

**Content**

**Prerequisites**

- Prerequisites: The course relies heavily on the concepts and techniques used in basic game theory. Therefore prior knowledge is recommended.

**Abstract**

- Objective: This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real-life examples and cases.

**Content**

- See course website
This lecture will introduce the fundamentals of monetary economics and explain the working and impact of monetary policy.

Entrepreneurial Leadership

Monetary Policy

Will be announced and published ahead of each session.

To convey management behaviour based on practical examples, own experiences and team discussions complemented by short theory sessions (subsidized from the donation for promotion and training in enterprise sciences at the ETHZ).

Based on several core Human Resource Management processes (e.g. recruiting, performance management, reward, training and development), this seminar teaches practical skills in HRM and leadership in teams from a managerial point of view. Using a variety of interactive methods and discussions of real-life situations, it provides a highly practice-oriented approach to dealing with potential HRM- and team-related conflicts at work.

Using a variety of interactive methods and discussions of real-life situations, it provides a highly practice-oriented approach to dealing with potential HRM- and team-related conflicts at work. The course also includes a guest lecture on diversity and gender issues at work.

Limited number of participants: a minimum of 10 persons and a maximum of 26 persons. Please register by 15.10.2015 at the latest via myStudies

Participants are able to cope with potentially difficult HRM-related situations they may encounter as line managers and team leaders. Using a variety of interactive methods and discussions of real-life situations, it provides a highly practice-oriented approach to dealing with potential HRM- and team-related conflicts at work. The course also includes a guest lecture on diversity and gender issues at work.

Participants receive a certificate.

ECTS: 4

Limited number of participants: a minimum of 10 persons and a maximum of 26 persons. Please register by 15.10.2015 at the latest via myStudies

Prerequisites: Prior participation in the lecture "Human Resource Management: Leading Teams” (363-0302-00L) in Spring Semester is recommended.

This seminar provides the most ambitious and best performing master students at MTEC with the challenging opportunity of a real case based project. Participants are expected to conduct in-depth research, to gain insights into the corporate culture, and to understand and apply the management principles of the potential partner. The contents of the seminar cover the areas of market research, development of a project plan, research, and preparation of a project report.

The number of participants is limited. Please send an email to bms@ethz.ch by 03.08.15 for your registration

Week I: 17.08.15 to 21.08.15
Week II: 07.09.15 to 11.09.15

The course will be based on chapters of:

Prerequisites / notice

Please apply for this course via the official website (www.mtec.ethz.ch) and send your application form together with a CV and transcript of records no later than 25.8.2015. Earlier applications will be considered.

Students apply with motivation letter, CV and a transcript of records no later than 25.8.2015. Earlier applications will be considered.

Once your application is confirmed, a registration in the office of Prof. P. Baschera. E-Mail: bms@ethz.ch

Exclusively for MAS MTEC students (first semester).
The online course will be open from 14.09.2015 to 14.02.2016. Within this time, students can proceed through the course at their own convenience. Seat time is about 25 hours.

All MAS MTEC students will receive further information by e-mail on 14.09.2015.

Abstract
This course is a web-based, online, interactive introduction to financial accounting within the context of management requirements. It has been developed by Harvard Business Publishing.

Objective
The online course uses the case study "Global Grocer" to guide the students from company foundation with a simple balance sheet towards more complex balance sheets, income and cash flow statements. This ensures an integrated understanding of company transactions.

Content
1. Introductory Section
   1.1 Terms and Concepts
   1.2 The Balance Sheet
   1.3 Income Statement
   1.4 Accounting Records
   1.5 The Statement of Cash Flows
2. Advanced Section
   2.1 Revenue & Receivables
   2.2 Inventories and Cost of Sales
   2.3 Depreciation and non-current Assets
   2.4 Liabilities and Financing Costs
   2.5 Investment & Investment Income
   2.6 Deferred Taxes and Tax Expense
   2.7 Owner’s Equity

Lecture notes
The Financial Accounting online-course is an ideal complement to the lectures "Accounting for Managers (363-0711-00)" as well as "Financial Management (363-0560-00)" with the purpose to further deepen the student's knowledge of accounting. Parts of the course content are overlapping, however, it is provided in a different context. Not covered in the online course is managerial accounting which is an important topic in the lecture "Accounting for Managers".

Literature
Needles & Powers (2010), Financial Accounting, 11e, South-Western College Pub

Prerequisites / notice
The online course will be open from 14.09.2015 to 14.02.2016. Within this time, students can proceed through the course at their own convenience. Seat time is about 25 hours. The online course should be accessed and activated only if students wish to take and complete it.

No lectures are offered for this course. Specific course topics can be discussed with other course participants, and any questions regarding the course content will be answered by an expert on the learning platform Moodle.

</tr>
<tr>
<td></td>
<td>Objective: This course will provide students with the underlying principles and techniques surrounding Quality Management with an emphasis on the application in manufacturing and services settings. Students will develop a working knowledge of the best practices in Quality and Process Management. Students will learn to view quality from a variety of functional perspectives and in the process, gain a better understanding of the problems associated with improving quality. The course aims to impart knowledge on the quality management process and key quality management activities. Specifically it aims to: Compare and contrast the various tools used in quality management, comprehend the concepts of customer's value, discuss the emerging tendencies toward global competitiveness, understand different perspectives on quality, explore six-sigma management and its tools, demonstrate how to design quality into product and services, describe the importance of developing a strategic plan for Quality Management, and discuss the importance of 'benchmarking' as a means of identifying the choice of markets.</td>

Contemporary Conflict Management

**Abstract**
The course provides students with theoretical background and practical insights in conflict management in the 3 areas international, business and interpersonal (legal) relations. Students are introduced into theoretical concepts related to the research field and real world case studies including examples of international conflicts, WWI, old and new regional conflicts, business and mediation.

**Objective**
- Students will gain
  - knowledge of history of conflict management;
  - comprehension of major ideas in the theory and practice of conflict management, mediation, transformation and resolution;
  - application of theoretical concepts to current conflict situations;
  - evaluation of conflict situations in international relations and business.

**Content**
The following topics will be covered:
- history of international and regional conflicts;
- theoretical concepts of conflict management;
- theoretical models of arms races and conflict escalation;
- case studies in international conflicts, as well as in business.

**Literature**
- Peter Wallensteen (2012): Understanding Conflict Resolution. SAGE, London, UK

Unethical Decision Making: Alternative and Critical Thinking in Management

**Abstract**
This course is about decision making processes in complex situations involving financial, relational and ethical problems. First, it provides fundamental tools for addressing problematic situations. Second, it discusses how stakeholders' ethical expectations and social responsibility issues can be effectively implemented and integrated in organizational systems and strategic planning processes.

**Objective**
- Become familiar with tools and procedures to prevent, identify and resolve corporate fraud and crime in organizations
- Understanding the mutual relationship between financial, relational and ethical drivers in managerial decision making
- Become familiar with tools and procedures to prevent and resolve corporate crises and scandals
- Understanding the opportunities associated with the corporate social responsibility (CSR) movement and how to integrate CSR in organizational and strategic planning
- Create an effective CSR strategic planning process to successfully develop and implement a CSR package
- Understand a variety of strategic CSR planning tools
- Become familiar with creating deep destructive change in pursuit of dual economic and social value
- Fraud and corruption in organizations
- Crisis management
- Personnel problems: Preventing and managing mobbing and sexual harassment
- Global criminal networks

**Content**
Most classes are taught through a series of mini-cases and notes that represent real management decisions.

Some classes are complemented with readings from prominent media resources, guest speakers and experimental exercises.

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 870 of 1432
This course is based on mini-cases that will be distributed during the classes.

Moodle of the course: https://moodle-app2.let.ethz.ch/course/view.php?id=1425

No Pre-course preparation as requirement. This is an interactive course.

<td>2+1U</td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>The course deals with simple quantitative and graphical as well as more complex methods of biostatistics. Contents: Descriptive statistics, probability theory and design of experiments, testing hypotheses, confidence intervals, correlation, simple and multiple linear regression, analysis of variance, logistic regression, survival analysis (Kaplan-Meier curves and Cox-regression).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>This 1-week theory and practical class offers the possibility to enjoy a variety of research and clinical areas in diagnostic and nuclear medicine. It gives insight into practical concepts and techniques that are discussed thoroughly as the class is performed within actual laboratories with real radiation sources.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The course starts with the fundamental physics of radiobiology (from X-ray production to image detectors) and continues with the basic parameters of image quality in radiography (contrast, resolution, noise) and their measurement methods. Specific applications of radiation diagnostic are then considered separately. The physics of fluoroscopy and mammography is presented with emphasis on the type of detectors. Computer tomography starts from mono- to multi-detector row technology and finishes with the dose indicators and the impact of acquisition parameters on patient dose. Nuclear medicine is approached through the production and labeling of radiopharmaceuticals before explaining the aspects related to quality control like the stability of the compounds, nuclear- and radionuclide purity as well as apyrogenicity and sterility. Imaging aspects of nuclear medicine are treated in details for SPECT and PET through the instrumentation, the reconstruction algorithms and the corresponding image quality. Finally, the aspects related to patient dose and radiation protection of the personnel are considered separately for diagnostic radiology and nuclear medicine. The general frameworks of external as well as internal irradiation are presented and practical examples of dose calculations are explained.</td>

**Abstract**

Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

**Objective**

Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

**Content**

The lecture covers the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will be taught. The student should know the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications. A script will be provided.

**Lecture notes**

A script will be provided.

**402-0674-00L**

**Physics in Medical Research: From Atoms to Cells**

W (2 credits) 2V+1U  B. K. R. Müller

**Abstract**

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

**Objective**

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostuctures that could be seen using the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure’s shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue’s anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented. Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

**Physiology and Anatomy for Medical Physicists I**

W 2 credits 2V not available

**Abstract**

Introduction into the functions and structural properties of tissues, organs, systems of organs and the human body as an organism.

**Objective**

Grundlagen in Physiologie und Anatomie des menschlichen Körpers sowie Kenntnisse und korrekte Anwendung der medizinischen Fachsprache

**Content**

"Physiology and Anatomy for Medical Physicists I & II" provides an introduction into the functions and structural properties of tissues, organs, systems of organs and the human body as an organism. The major part of the course is dedicated to the most important systems of organs. Anatomy and physiology are discussed integrated in the thematical order. Each topic is preceded by some comments concerning evolution and/or embryology. The content of the lessons is adapted to engineers and an emphasis is set to medical terminology. In a supplementary part of the course a few topics in applied physiology will be discussed.

---

**465-0953-00L**

**Biostatistics**

W 2 credits 2V+1U

**Abstract**

The course deals with simple quantitative and graphical as well as more complex methods of biostatistics. Contents: Descriptive statistics, probability theory and design of experiments, testing hypotheses, confidence intervals, correlation, simple and multiple linear regression, analysis of variance, logistic regression, survival analysis (Kaplan-Meier curves and Cox-regression).

Abstract
The course is dedicated to introduce MAS students from Medical Physics to the field of radiodiagnostic and nuclear medicine. Dedicated practicals will illustrate the theory with an emphasis on the relationship between dose and image quality as well as the security problems related to the work with radiations.

Objective
This 1-week theory and practical class offers the possibility to enjoy a variety of research and clinical areas in diagnostic and nuclear medicine. It gives insight into practical concepts and techniques that are discussed thoroughly as the class is performed within actual laboratories with real radiation sources.

Content
The course starts with the physical basis of radiography (from X-ray production to image detectors) and continues with the basic parameters of image quality in radiography (contrast, resolution, noise) and their measurement methods. Specific applications of radiation diagnostic are then considered separately.

The physics of fluoroscopy and mammography is presented with emphasis on the type of detectors. Computer tomography starts from mono- to multi-detector row technology and finishes with the dose indicators and the impacts of acquisition parameters on patient dose. Nuclear medicine is approached through the production and labeling of radiopharmaceuticals before explaining the aspects related to quality control like the stability of the compounds, nuclide- and radionuclide purity as well as apyrogenicity and sterility.

Imaging aspects of nuclear medicine are treated in details for SPECT and PET through the instrumentation, the reconstruction algorithms and the corresponding image quality.

Finally, the aspects related to patient dose and radiation protection of the personnel are considered separately for diagnostic radiology and nuclear medicine. The general frameworks of external as well as internal irradiation are presented and practical examples of dose calculations are explained.

551-0307-00L    Biomolecular Structure and Mechanism I: Protein Structure and Function
D-BIOL BSc students are obliged to take part I and part II (next semester) as a two-semester course

Abstract
Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

Objective
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytic.

Lecture notes Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

Literature
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

529-0004-00L    Computer Simulation in Chemistry, Biology and Physics

Abstract
Molecular models, Force fields, Boundary conditions, Electrostatic interactions, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.

Objective
Introduction to computer simulation of (bio)molecular systems, development of skills to carry out and interpret computer simulations of biomolecular systems.

Content
Molecular models, Force fields, Spatial boundary conditions, Calculation of Coulomb forces, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.

Lecture notes Available (copies of powerpoint slides distributed before each lecture)

Literature
See: www.csms.ethz.ch/education/CSCBP

Prerequisites / notice
Since the exercises on the computer do convey and test essentially different skills as those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam.

For more information about the lecture: www.csms.ethz.ch/education/CSCBP

227-0385-10L    Biomedical Imaging
New course. Not to be confounded with 227-0385-00L of fall 2014.

Abstract
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

Objective
To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

Content
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

Lecture notes Lecture notes and handouts

Literature
Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011

Prerequisites / notice
Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

227-0386-00L    Biomedical Engineering

Abstract
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Objective
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
The Seminar Series features invited experts from a wide range of disciplines, who will present their experiences working with water related topics in international settings. The students will be exposed to many different perspectives, and will be asked to apply the information they learn to specific case studies.

The Seminar Series will provide students with background information on the wide range of topics related to water resources. The lectures will challenge the students to evaluate water resources and water resource management in new ways, using tools that have been successfully implemented in real case scenarios. The seminars will include theory, interactive discussions, and the assessment of methodologies. Student participation will be highly encouraged.

The Seminar Series is aimed at offering students the opportunity to learn about water resources in a multi-disciplinary fashion, with a focus on international examples. Selected topics will include: Water & Sanitation, Urban Water Management, Politics & International Water Management, Water Resources & Agriculture, Water Hazards (floods), Water Resources & Ecosystem Services, Integrated Water Resource Management, and Adaptation to Climate Change. For additional details see the course website http://www.ifu.ethz.ch/MAS_SWR/programme/Seminars.

For further information, contact the MAS coordinator, Darcy Molnar (darcy.molnar@ifu.baug.ethz.ch)

- **Water Resources Seminars**
  - **Number**: 118-0101-00L
  - **Title**: Water Resources Seminars
  - **Type**: O
  - **ECTS**: 3 credits
  - **Hours**: 3S
  - **Lecturers**: P. Molnar, P. Burlando, further speakers
  - **Abstract**: The Seminar Series features invited experts from a wide range of disciplines, who will present their experiences working with water related topics in international settings. The students will be exposed to many different perspectives, and will be asked to apply the information they learn to specific case studies.
  - **Objective**: The Seminar Series will provide students with background information on the wide range of topics related to water resources. The lectures will challenge the students to evaluate water resources and water resource management in new ways, using tools that have been successfully implemented in real case scenarios. The seminars will include theory, interactive discussions, and the assessment of methodologies. Student participation will be highly encouraged.
  - **Content**: The Seminar Series is aimed at offering students the opportunity to learn about water resources in a multi-disciplinary fashion, with a focus on international examples. Selected topics will include: Water & Sanitation, Urban Water Management, Politics & International Water Management, Water Resources & Agriculture, Water Hazards (floods), Water Resources & Ecosystem Services, Integrated Water Resource Management, and Adaptation to Climate Change. For additional details see the course website http://www.ifu.ethz.ch/MAS_SWR/programme/Seminars.
  - **Prerequisites / notice**: For further information, contact the MAS coordinator, Darcy Molnar (darcy.molnar@ifu.baug.ethz.ch)

- **Fluvial Systems**
  - **Number**: 102-0287-00L
  - **Title**: Fluvial Systems
  - **Type**: O
  - **ECTS**: 3 credits
  - **Hours**: 2G
  - **Lecturers**: P. Molnar
  - **Abstract**: The course presents an integrated view of the river basin and fluvial system. The fluvial system is viewed in terms of the dynamics in the transfer of water and sediment, the resulting geomorphology of the river network and streams, and finally the basin and river management options for conservation and restoration.
  - **Objective**: The goal of the course is to develop process-understanding of fluvial systems and to introduce the students to appropriate analysis tools. In the first section the estimation of basin sediment supply from upland sheet, rill and gully erosion, and basin sediment yield are discussed. The second section focuses on sediment transport in rivers in general, e.g. basic mechanics of sediment laden flows, bedforms, flow resistance, sediment type and load measurement and estimation, the morphology of rivers. It is illustrated how the river network can be analysed in terms of its connectivity and topological characteristics, Channel stability and channel erosion modelling are discussed. The third section looks at fluvial system management in terms of engineering and nonstructural sediment (e.g. upland and channel erosion protection) and water (e.g. the importance of the natural streamflow regime on riverine ecosystem integrity, river rehabilitation) resource management.
  - **Lecture notes**: There is no script.
  - **Literature**: Study materials (lecture handouts and selected papers) are distributed in class and available on the web.
  - **Prerequisites / notice**: Prerequisites: Hydrology I and Hydrology II (or contact instructor).

- **Hydrology II**
  - **Number**: 102-0223-00L
  - **Title**: Hydrology II
  - **Type**: O
  - **ECTS**: 3 credits
  - **Hours**: 2G
  - **Lecturers**: P. Burlando, S. Fatichi
  - **Abstract**: The course presents advanced hydrological analyses of rainfall-runoff processes. The course is given in English.
  - **Objective**: Tools for hydrological modelling are discussed at the event and continuous scale. The focus is on the description of physical processes and their modelisation with practical examples.
  - **Lecture notes**: Parts of the script for “Hydrology I” are used. Also available are the overhead transparencies used in the lectures. The semester project consists of a two part instruction manual.
  - **Literature**: Additional literature is presented during the course.

- **Numerical Hydraulics**
  - **Number**: 101-0267-01L
  - **Title**: Numerical Hydraulics
  - **Type**: O
  - **ECTS**: 3 credits
  - **Hours**: 2G
  - **Lecturers**: M. Holzner
  - **Abstract**: In the course Numerical Hydraulics the basics of numerical modelling of flows are presented.
  - **Objective**: The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use commercial software in a responsible and critical way.
  - **Content**: The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as an introductory to the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.
  - **Lecture notes**: Given in lecture.
  - **Literature**: Lecture notes, powerpoints shown in the lecture and programs used can be downloaded. They are also available in German.

- **GIS III**
  - **Number**: 103-0237-00L
  - **Title**: GIS III
  - **Type**: O
  - **ECTS**: 5 credits
  - **Hours**: 3G
  - **Lecturers**: P. Kiefer, S. Scheider
  - **Abstract**: The course deals with advanced topics in GIS; GIS project lifecycle, Managing GIS, Legal issues, GIS assets & constraints; Geospatial Web Services; technical basics, architecture, functions, interoperability, standards, mashups, portals, applications; Geostatistics; Sensor Web Enablement; Human-Computer Interaction; Cognitive Issues in GIS.
  - **Objective**: Students will get a detailed overview of advanced GIS Topics. They will go through all steps of setting up a Web-GIS application in the labs and perform other practical tasks relating to Sensor Web Enablement, Human-Computer Interaction, Geostatistics, and Web Processing Services.
  - **Lecture notes**: no script

- **Systems Analysis and Mathematical Modeling in Water Resources**
  - **Number**: 102-0227-00L
  - **Title**: Systems Analysis and Mathematical Modeling in Water Resources
  - **Type**: O
  - **ECTS**: 6 credits
  - **Hours**: 4G
  - **Lecturers**: E. Morgenroth, M. Maurer
  - **Abstract**: The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.
  - **Lecture notes**: Given in lecture.
  - **Literature**: Lecture notes, powerpoints shown in the lecture and programs used can be downloaded. They are also available in German.
Urban Water Management

This course supports the course in Biological Wastewater Treatment (102-0217-00L). It is therefore advantageous to follow both courses simultaneously.

**Abstract**

**Objective**
The goal of this course is to provide the students with an understanding and the tools to develop their own mathematical models, to plan experiments, to evaluate error propagation and to test simple process control strategies in the field of process engineering in urban water management.

**Content**
The course will provide a broad introduction into the fundamentals of modeling water treatment systems. The topics are:
- Introduction into modeling and simulation
- The material balance equations, transport processes, transformation processes (kinetics, stoichiometry, conservation)
- Ideal reactors
- Hydraulic residence time distribution and modeling of real reactors
- Dynamic behavior of reactor systems
- Systems analytical tools: Sensitivity, parameter identification, error propagation, Monte Carlo simulation
- Introduction to process control (PID controller, fuzzy control)

**Lecture notes**
Copies of overheads will be made available.

**Literature**
Handouts.

**Prerequisites / notice**
There will be a required textbook that students need to purchase:

Consolidation of the basic procedures for design and operation of technical networks in water engineering.

The seminar is designed for students and researchers (MA, PhD, PostDoc) who use inter- and transdisciplinary elements in their projects. The seminar is specifically suitable for PhD or PostDoc researchers. It is open to master students (minor "global change and sustainability") who are already included in 102-0307-00.

Course Topics are:
- Sustainable Development and its meaning for Management
- Management Standards for Sustainability (ISO and others)
- Sustainability Opportunities and Innovation
- Organisation and Implementation
- The concept of "Continuous Improvement"
- Environmental Performance Measurement (Concepts, Standards, Methods)
- Life Cycle Costing, Life Cycle Management
- (Sustainable) Supply Chain Management
- Communication of Sustainability Issues

Abstract
How to make sustainability operational - in industry, services and other organizations: You will learn how to integrate sustainability into practice by selecting one or more sustainability-related projects. This seminar is intended for project managers, interested in sustainability-related topics.

Objective
To provide understanding of how sustainability can be made operational in an organisation. To do so, students will understand how to integrate sustainability thinking into the typical current organisational environment and processes, such as planning, implementing and controlling.

Content
We meet for five 3-hour-lectures, with discussions and case studies during course time. Additionally, small case studies in-between courses will be given at most course days.

Course topics are:
- Demand Side Management versus Supply Side Management
- Optimierung von Wasserverteilnetzen
- Druckstöße
- Kalkausfällung, Korrosion von Leitungen
- Hygiene in Verteilsystemen
- Siedlungshydrologie: Niederschlag, Abflussbildung
- Instationäre Strömungen in Kanalisationen
- Stofftransport in der Kanalisation
- Einleitbedingungen bei Regenwetter
- Versickerung von Regenwasser
- Generelle Entwässerungsplanung (GEP)

Lecture notes
Course documentation as well as case study descriptions will be provided during the course via the "Ilias" repository.

Literature
Course documentation is provided during the course via the "Ilias" repository. There are two ways to approach the course's issues:

- c) We will touch upon the hotel sustainable scheme and label "Ibex" see: http://www.e2mc.com/images/stories/e2_bilder/downloads/Umweltfocus_d.pdf (for an english version, pls contact the lecturer at arthurb@ethz.ch)

Prerequisites / notice
If you have specific interests or questions, let me know at arthurb@ethz.ch. Maybe I can include your issues - or I can't :-)

Using R for Data Analysis and Graphics (Part I) W 1 credit 1G A. J. Papritz, C. B. Schwierz

Abstract
The course provides the first part an introduction to the statistical software R for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

Objective
The students will be able to use the software R for simple data analysis.

Content
The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetic;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

Lecture notes
An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

Prerequisites / notice
The course resources will be provided via the Moodle web learning platform Please login (with your ETH (or other University) username+password) at https://moodle-app2.let.ethz.ch/enrol/users.php?id=1145

Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

Quantification and Modeling of the Cryosphere: Dynamic Processes (University of Zurich) W 3 credits 1V University lecturers

Abstract
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.
UZH Module Code: GEO815

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Objective
Overview of the most important earth surface processes and landforms in cold regions (regions with glaciers and intense frost) with emphasis on high-mountain aspects. Discussion of present research challenges.

Content
Knowledge of the most prominent climate-related geomorphological processes and phenomena in high-mountain regions, understanding of primary research challenges.

Lecture notes
Glacial and periglacial geomorphodynamics in high-mountain regions. Ca. 100 pages.

Prerequisites / notice
Basic knowledge about geomorphology and glaciers/permafrost from corresponding courses at ETH/UZH or from the related lecture notes

Abstract
The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. Natural processes, anthropogenic pollution, legislation of groundwater and surface water and of drinking water as well as water treatment will be discussed for industrialized and developing countries.

Objective
The goal of this lecture is to give an overview over the whole path of drinking water from the source to the tap and understand the involved physical, chemical and biological processes which determine the drinking water quality.

Content
The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. The various water resources, particularly groundwater and surface water, are discussed as part of the natural water cycle influenced by anthropogenic activities such as agriculture, industry, urban water systems. Furthermore legislation related to water resources and drinking water will be discussed. The lecture is focused on industrialized countries, but also addresses global water issues and problems in the developing world. Finally unit processes for drinking water treatment (filtration, adsorption, oxidation, disinfection etc.) will be presented and discussed.

Lecture notes
Handouts will be distributed

Analysis of Climate and Weather Data W 3 credits 2G C. Frei

Abstract
Observation networks and numerical climate and forecasting models deliver large primary datasets. The use of this data in practice and in research requires specific techniques of statistical data analysis. This lecture introduces a range of frequently used techniques, and enables students to apply them and to properly interpret their results.

Objective
Observation networks and numerical climate and forecasting models deliver large primary datasets. The use of this data in practice and in research requires specific techniques of statistical data analysis. This lecture introduces a range of frequently used techniques, and enables students to apply them and to properly interpret their results.

Content
Introduction into the theoretical background and the practical application of methods of data analysis in meteorology and climatology.

Topics: exploratory methods, hypothesis tests, analysis of climate trends, measuring the skill of climate and forecasting models, analysis of extreme events, principal component analysis and maximum covariance analysis.

The lecture also provides an introduction into R, a programming language and graphics tool frequently used for data analysis in meteorology and climatology. During hands-on computer exercises the student will become familiar with the practical application of the methods.

Lecture notes
Documentation and supporting material include:
- documented view graphs used during the lecture
- exercise sets and solutions
- R-packages with software and example datasets for exercise sessions

All material is made available via the lecture web-page.

Content

Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional management has frequently resulted in catastrophic failures such as, for example, the collapse of fish stocks and biodiversity loss. These failures have stimulated the development of alternative ecosystem management approaches that emphasize the functionality of human-dominated systems. Inherent to such approaches are system-wide perspectives and a focus on ecological processes and services, multiple scales, and spatial and temporal scales, as well as the need to incorporate diverse stakeholder interests into decision making. Thus, ecosystem management is the science and practice of managing natural resources, biodiversity and ecological processes, to meet multiple demands of society. It can be local, regional or global in scope, and addresses critical issues in developed and developing countries relating to economic and environmental security and sustainability.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

Politics of Environmental Problem Solving in Developing Countries

Abstract
The course focuses on processes and drivers of decision-making on natural resources management issues in developing countries. It gives insights into the relevance of ecological aspects in developing countries. It covers concepts, instruments, processes, and actors in environmental politics at the example of specific environmental challenges of global importance.

Objective
After completion of the module, students will be able to:
- Identify and appraise ecological aspects in development cooperation, development policies and developing countries’ realities
- Analyze the forces, components and processes, which influence the decisions, the implementation and the outcome of ecological measures
- Characterize concepts, instruments and drivers of environmental politics and understand, how policies are shaped, both at national level and in multilateral negotiations
- Study changes (improvements) in environmental politics over time as the result of the interaction of processes and actors, including international development organizations
- Analyze politics and design approaches to influence them, looking among others at governance, social organization, legal issues and institutions

Content
Key issues and basic concepts related to environmental politics are introduced. Then, the course predominantly builds on case studies, providing information on the context, specifying problems and potentials, describing processes, illustrating the change management, discussing experiences and outcomes, successes, and failures. The analysis of the cases elucidates factors for success and pitfalls in terms of processes, key elements and intervention strategies.

Different cases not only deal with different environmental problems, but also focus on different levels and degrees of formalism. This ranges from local interventions with resource user groups as key stakeholders, to country level policies, to multi- and international initiatives and conventions. Linkages and interaction of the different system levels are highlighted. Special emphasis is given to natural resources management.

The cases address the following issues:
- Land use and soil fertility enhancement: From degradation to sustainable use
- Common property resource management (forest and pasture): Collective action and property rights, community-based management
- Ecosystem health (integrated pest management, soil and water conservation)
- Payment for environmental services: Successes in natural resources management
- Climate change and agriculture: Adaptation and mitigation possibilities
- Biodiversity Convention: Implications for conservations and access to genetic resources
- Biodiversity as a means for more secure livelihoods: Agroforestry and intercropping
- The Millennium Development Goals: Interactions between poverty and the environment
- Poverty and natural resources management: Poverty reduction strategies, the view of the poor themselves
- Food security: Policies, causes for insecurity, the role of land grabbing
- Biofuels and food security: Did politics misfire?
- Strategy development at global level: IAASTD and World Development Report 2008
- Trade liberalization and natural resource management: Common pool resources

Lecture notes
Information concerning the case studies and specific issues illustrated therein will be provided during the course (uploaded on Moodle)

Literature

Prerequisites / notice
The performance assessment will consist of an individual essay to be written by each student based on at least five references in addition to the sources provided in the course. Students can choose from a list of topics. Criteria for assessment will be communicated at the beginning of the course.

701-0535-00L
Environmental Soil Physics/Vadose Zone Hydrology

Abstract
The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

Objective
Students are able to
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media,
- quantify driving forces and resulting fluxes of water, solute, and heat in soils.
- apply modern measurement methods and analytical tools for hydrological data collection
- conduct and interpret a limited number of experimental studies
- explain links between physical processes in the vadose-zone and major societal and environmental challenges

2 credits
2G+2U
D, Or

W

Autumn Semester 2015
Content

Weeks 1 to 3: Physical Properties of Soils and Other Porous Media. Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior.

Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity.

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing.

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:

Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.

Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.

Part 2 - Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.

Midterm exam.

Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.

Part 3 - Use of Hydrus model for simulation of unsaturated flow.

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils - Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.

Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:

Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

Biological Processes in the Vadose Zone - An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.

Lecture notes

Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller (available at the beginning of the semester)

http://www.step.ethz.ch/education/active-courses/vadose-zone-hydrology

Literature

Supplemental textbook (not mandatory) - Environmental Soil Physics, by: D. Hillel.

102-0617-00L  Basics and Principles of Radar Remote Sensing for Environmental Applications  W  3 credits  2G  I. Hajnsek

Abstract

The course will provide the basics and principles of Radar Remote Sensing (specifically Synthetic Aperture Radar (SAR)) and its imaging techniques for the use of environmental parameter estimation.

Objective

The course should provide an understanding of SAR techniques and the use of the imaging tools for bio/geophysical parameter estimation. At the end of the course the student has the understanding of:

1. SAR basics and principles,
2. SAR polarimetry,
3. SAR interferometry, and
4. environmental parameter estimation from multi-parametric SAR data.

Content

The course is giving an introduction into SAR techniques, the interpretation of SAR imaging responses and the use of SAR for different environmental applications. The outline of the course is the following:

1. Introduction into SAR basics and principles
2. Introduction into electromagnetic wave theory
3. Introduction into scattering theory and decomposition techniques
4. Introduction into SAR interferometry
5. Introduction into polarmetric SAR interferometry
6. Introduction into bio/geophysical parameter estimation (classification/segmentation, soil moisture estimation, earth quake and volcano monitoring, forest height inversion, wood biomass estimation etc.)

Lecture notes

Handouts for each topic will be provided.

Literature

First readings for the course:

Complete literature listing will be provided during the course.

Prerequisites / notice

This course in combination with 102-0627-00-G: Applied Radar Remote Sensing for Environmental Parameter Estimation is providing a profound basis for independent data analysis. It is recommended to take both courses together.

401-0649-00L  Applied Statistical Regression  W  5 credits  2V+1U  M. Dettling

Abstract

This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life.

Objective

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.
Streams are integrated monitors of the health and functioning of their surrounding landscapes. Students learn how to integrate process knowledge, data, and models to understand how landscapes regulate the fluxes of water, sediment, nutrients, and pollutants in streams, and to anticipate how streams will respond to changes in land use, atmospheric deposition, and climate.

Using a combination of lectures, field exercises, and data analysis, we explore the processes controlling the delivery of water, solutes, and sediment to streams, and how those processes are affected by changes in land cover, land use, and climate. We review the connections between process understanding and predictive modeling in these complex environmental systems. How well can we understand the processes controlling watershed-scale phenomena, and what uncertainties are unavoidable? What are the relative advantages of top-down versus bottom-up approaches? How much can "black box" analyses reveal about what is happening inside the black box? Conversely, can small-scale, micro-mechanistic approaches be successfully "scaled up" to predict whole-watershed behavior? Practical problems to be considered include the effects of land use, atmospheric deposition, and climate on streamflow, water quality, and sediment dynamics, illustrated with data from experimental watersheds in North America, Scandinavia, and Europe.

Using numerical models of fluvial hydraulics, management of the delivery of water, solutes, and sediment to streams, and how those processes are affected by changes in land cover, land use, and climate. We review the connections between process understanding and predictive modeling in these complex environmental systems. How well can we understand the processes controlling watershed-scale phenomena, and what uncertainties are unavoidable? What are the relative advantages of top-down versus bottom-up approaches? How much can "black box" analyses reveal about what is happening inside the black box? Conversely, can small-scale, micro-mechanistic approaches be successfully "scaled up" to predict whole-watershed behavior? Practical problems to be considered include the effects of land use, atmospheric deposition, and climate on streamflow, water quality, and sediment dynamics, illustrated with data from experimental watersheds in North America, Scandinavia, and Europe.

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

701-1644-00L Mountain Forest Hydrology

Abstract
This course presents a process-based view of the hydrology, biogeochemistry, and geomorphology of mountain streams. Students learn how to integrate process knowledge, data, and models to understand how landscapes regulate the fluxes of water, sediment, nutrients, and pollutants in streams, and to anticipate how streams will respond to changes in land use, atmospheric deposition, and climate.

Objective
Students will have a broad understanding of the hydrological, biogeochemical, and geomorphological functioning of mountain catchments. They will practice using data and models to frame and test hypotheses about connections between streams and landscapes.

Content
Streams are integrated monitors of the health and functioning of their surrounding landscapes. Streams integrate the fluxes of water, solutes, and sediment from their contributing catchment area; thus, they reflect the spatially integrated hydrological, ecophysiological, biogeochemical, and geomorphological processes in the surrounding landscape. At a practical level, there is a significant public interest in managing forested upland landscapes to provide a reliable supply of high-quality surface water and to minimize the risk of catastrophic flooding and debris flows, but the scientific background for such management advice is still evolving.

Using a combination of lectures, field exercises, and data analysis, we explore the processes controlling the delivery of water, solutes, and sediment to streams, and how those processes are affected by changes in land cover, land use, and climate. We review the connections between process understanding and predictive modeling in these complex environmental systems. How well can we understand the processes controlling watershed-scale phenomena, and what uncertainties are unavoidable? What are the relative advantages of top-down versus bottom-up approaches? How much can "black box" analyses reveal about what is happening inside the black box? Conversely, can small-scale, micro-mechanistic approaches be successfully "scaled up" to predict whole-watershed behavior? Practical problems to be considered include the effects of land use, atmospheric deposition, and climate on streamflow, water quality, and sediment dynamics, illustrated with data from experimental watersheds in North America, Scandinavia, and Europe.

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

101-0269-00L Numerical Modelling in Fluvial Hydraulics and River Engineering

Abstract
The basics of numerical modelling of fluvial hydraulics and river engineering problems are presented. The governing equations for flow and sediment transport in open channels and corresponding numerical solution strategies are introduced. The theoretical parts are discussed by examples.

Objective
Get to know possibilities and limitations of numerical modelling in fluvial hydraulics and river engineering.

Content
- Governing equations and modelling approaches
- Initial and boundary conditions
- Simulation process and grid generation
- Numerical methods: basics, accuracy and stability
- Examples of numerical schemes, 1D and 2D models

Literature
Slides of lecture are available for download as PDF. Supplementary material will be provided during lecture.

Lecture notes
Relevant books and citations will be mentioned.

Prerequisites / notice
Exercises are based on the simulation software BASEMENT (www.basement.ethz.ch), the open-source GIS Qgis (www.qgis.org) and code examples written in MATLAB. The applications comprise one- and two-dimensional approaches for the modelling of flow and sediment transport.

Abstract
Students propose relevant research topics from their home countries, or from Latin American research projects, around which individual study programmes are devised, and on which they write their thesis. The Master thesis is supervised by scientific staff at ETH and collaborating institutions, and is based on the student's academic or professional experience.

Objective
The Master Thesis research takes place throughout the duration of the MAS Programme (12 months), complemented by Master level coursework and Seminars focusing on Water Resources and Sustainability. Students become familiar with new research techniques, and receive guidance from experts. The topic of the research should address a relevant water resources problem in the student's home country, and is aimed at enhancing collaboration between academics and professionals in Latin America and in Switzerland.

</table>

**Abstract**

The MAS programme is structured around an investigation of transforming urban conditions as they pertain to global phenomena, and the development of practical tools for operating within such domains.

**Objective**

The programme aims at developing a culture of urban research and design that will enable the participant to actively engage in envisioning future urban scenarios. Secondly, a strong emphasis is put on methodology, process design and communication in order to prepare for the interdisciplinary negotiating agenda of the urban designer as future member of professional design offices, academic research teams, public services or communication agencies.

**Content**

Each year, the MAS studio will focus on two specific topics of urban research and two existing sites on which to intervene in the form of two design research studios. The sites are preferably territories under development pressure with existing groups of urban actors to engage with.

**Abstract**
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. The module provides an overview of the principles of management, teaches knowledge about management that is highly complementary to the students’ technical knowledge, and provides a basis for advancing the knowledge of the various subjects offered at D-MTEC.

**Objective**
Discovering Management offers an integrated learning system, which combines in an innovative format a set of lectures, an advanced business game simulation and a set of group exercises involving industry speakers (ranging from leading venture capitalists to executives at established corporations). Unlike more traditional courses, the learning model for Discovering Management involves ‘learning by doing’. While the 13 different lectures, in-class discussions and assigned readings provide the theoretical and conceptual foundations, the experiential learning outcomes result from the interrelated group activities: 1) the interactive case studies and exercises, 2) the business game simulation.

**Content**
The lectures for Discovering Management are designed to broaden the participant's understanding of the principles of entrepreneurial management, emphasizing the interdependence of various specialties in the development and management of a firm. For this reason, the lectures are structured on the basis of a coherent business model and will be presented by the respective area specialists at D-MTEC. The lectures broaden the view and the understanding of technology by interlinking it with society. Corporate sustainability, for example, introduces economic, ecological and social issues that are relevant to all engineering disciplines. Practical examples stimulate the students to assess these issues and be aware of their responsibilities as engineers. Technology and innovation management, to mention a second example, focuses on the interplay of technical and organizational change, and how these often neglected interactions explain why many new technologies are never used. It fosters the students’ ability to see the business and social consequences of their ‘technical’ decisions. Critical skills will be trained by the case study exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of the decision maker, as they learn more about the specific case and identify the challenge they are faced with. Students will be presented real case scenarios by industry guests from established corporations and will have to critically analyze specific issues. The case study exercise will provide an insight into the context of a managerial problem-solving and enhance the participant’s appreciation for the complex tasks companies deal with.

**Prerequisites / notice**
Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Entrepreneurial Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich. No prior knowledge of business or economics is required to successfully complete this course.

**Abstract**
The course introduces the students to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies.

**Objective**
The course includes both lectures and exercises alternately. The goal is to understand the opportunity of user innovation for management and develop strategies to harness the value of user-developed ideas and contributions for firms and other organizations.

The students actively participate in discussions during the lectures and contribute presentations of case studies during the exercises. The combination should allow to compare theory with practical cases from various industries.

The course presents and builds upon recent research and challenges the students to devise innovation strategies that take into account the availability of user expertise, free and public knowledge, and the interaction with communities that span beyond one organization.

Grading is based on the final exam, the class presentations (including the slides) as well as class participation.

---

This course on user innovation extends courses on knowledge management and innovation as well as marketing. The students are introduced to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies. Theoretical underpinnings taught in the course include models of innovation, the structuration of technology, and an introduction to entrepreneurship.

The slides of the lectures are made available and updated continuously through the SMI website:

Relevant literature for the exam includes the slides and the reading assignments. The corresponding papers are either available from the author online or distributed during class.

363-0511-00L Managerial Economics

Not for MSc students belonging to D-MTEC!

Abstract
Managerial Economics applies economic theory and methods to business and economic decision-making. Economic ideas related to optimization, the theory of consumer demand, the theory of the firm, industrial organization and decision making under uncertainty are studied using methods of numerical analysis, statistical estimation, game theory and constrained optimization.

Objective
The objective of the course is to provide undergraduate and graduate students in MAVT with an understanding of the use of economic concepts for firm-level management decisions. The course covers a number of models and methods of analysis which are commonly employed in business decisions. The course covers the economic theory of choice, models of oligopoly and industrial organization, applications of game theory to contract design and agency theory, and the theory of decision making under uncertainty focusing specifically on long-term investment decisions. The course will include three lectures by Professor Volker Hoffman focusing on related case-studies in management.

Literature
Mikroökonomie (Pearson Studium - Economic VWL) Gebundene Ausgabe, August 2013, Robert S. Pindyck, Dr. Daniel L. Rubinfeld.

Prerequisites / notice
The course acquaints students who have previous not studied economics to economic concepts and quantitative methods which can be used to solve management decision problems.

Understand the limits and the potential of corporate sustainability for sustainable development

This course is an introduction to the critical management skills involved in planning, structuring, controlling and leading an organization. We look at organizations as part of an industry context, which is affected by different elements like strategy, structure, culture, tasks, people and outputs. We consider how managerial decisions are made in any one of these domains affect decisions in each of the others.

Selected readings from the book and additional learning materials will be available on the course Moodle: https://moodle-app2.let.ethz.ch/course/view.php?id=1287

All the materials uploaded on Moodle must be considered as required readings.

**Abstract**

This course is an introduction to the critical management skills involved in planning, structuring, controlling and leading an organization.

We develop a ‘systemic’ view of organizations.

We look at organizations as part of an industry context, which is affected by different elements like strategy, structure, culture, tasks, people and outputs.

We consider how managerial decisions are made in any one of these domains affect decisions in each of the others.

and on the Moodle of the course: https://moodle-app2.let.ethz.ch/course/view.php?id=1287

Selected readings from the book and additional learning materials will be available on the course Moodle: https://moodle-app2.let.ethz.ch/course/view.php?id=1287

All the materials uploaded on Moodle must be considered as required readings.
Abstract
The course is designed to convey a profound understanding of marketing's role in modern firms, its interactions and interfaces with other disciplines, its main instruments and recent trends. Particular attention is given to emerging marketing concepts and instruments, and the role of marketing in technology firms.

Objective
After taking the lecture, students should have knowledge on
1) The definition and role of marketing (marketing basics)
2) Creating marketing insights - understanding customer behavior
   - Theoretical concepts in customer behavior (customer behavior)
   - Analytical means to extend knowledge on customer behavior (marketing research)
   - Strategic tools to quantify customer behavior (CLV, CE)
3) Strategic marketing - translating marketing insights into actionable marketing strategies
   - Segmentation, Targeting, and Positioning
   - Attracting customers (marketing mix, 4Ps)
   - Maintaining profitable customer relations (CRM)

Content
The course is designed to convey a profound understanding of marketing's role in modern firms, its interactions and interfaces with other disciplines, its main instruments and recent trends. Particular attention is given to emerging marketing concepts and instruments, and the role of marketing in technology firms.

The lecture features a short tutorial that is held at irregularly spaced intervals throughout the semester (approximately every third week). The tutorial is embedded within the lecture and consists of short sessions of about 30 minutes. It serves to illustrate theoretical and methodological concepts from the lecture by walking students through the analysis of real-world data from the telecommunications industry. The case data will be provided so that students practice and apply the concepts of the lecture on their own. The tutorial is held jointly by a Teaching Assistant (S.N. Brüggenmann) and the professor (Prof. F. v. Wangenheim).

Literature

363-0421-00L Management Information Systems
W+  3 credits  2G  E. Fleisch

Abstract
This lecture provides a theory- and practice-based understanding of how today's information technologies enable new digital business models and disrupt existing markets.

Objective
A. After the lecture, the student is able to evaluate digital business models from different angles, including theory-based views:
   - Definition and classification of business models
   - Digital business model patterns
   - Theoretical frameworks that explain why and how digital business models function
   - Impact of digital business model patterns on P&L and balance sheet

Students know how to measure & evaluate investments into the digital space as
   - a decision maker in an established company (should I invest in project A or B?)
   - an entrepreneur (should I pursue this venture?)
   - an investor (should I invest in start-up xy?)

B. The student knows different tools to design digital business model patterns.

Content
Uber, Airbnb, Nest and Jawbone - A wide range of innovative companies exist, which successfully implemented ICT enabled business models and continue to grow at a rapid pace. Examples, illustrating how digitalization, including the “Internet of Things” currently fosters business model innovation across various industries. This course is designed to help students to understand and critically assess such newly emerging (digital) business models.

For the lecture students will get access to one of the leading online teaching platforms (called edX) also offered by other top universities (incl. MIT, Harvard, Berkeley, etc.). Using the edX platform, will allow students to collaborate in online discussions, solve online exercises, and present a short educational video as part of a group project.

Key Topics:
- Business model innovation (digital) business model patterns; business value of IT; the concept of integration; transaction cost perspective; network economics perspective; essentials and impact of web 2.0; internet of things, mobile computing, market places, social analytics and big data; IT governance and portfolio management; entrepreneurship in the digital space, etc.

363-0445-00L Logistics, Operations and Supply Chain Management I
W+  3 credits  2G  P. Schönsleben, E. Scherer

Abstract
Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Objective
An effective and efficient flow of goods, data, and control in and between companies contributes significantly to the value added for the customer. Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Content
Strategic and tactical concepts in logistics, operations, and supply chain management: Conflicts of objectives and strategies and in the entrepreneurial context; business process analysis and fundamental logistics concepts; the MRP II / ERP concept: business processes and methods; the lean / just-in-time and repetitive manufacturing; concepts for product families and one-of-a-kind production; concepts for the process industry.

Lecture notes
This book also serves as textbook for LOS II (spring term) as well as ERP and SCM software systems (autumn term). In addition powerpoint-handouts and documents for case studies.

Sales at 17.9.15, from 12:45, before and during brakes of the first lecture.

Literature
see "script"

Prerequisites / notice
As for the lecture of the 3rd week (BEMAD, a much-liked Business Engineering and Management Ability Development game), this lecture (of Oct. 1) will follow a specific schedule in specific rooms. The schedule will be presented at Sept. 17 during the 1st lecture.

Due to the big number of students, about half of the students will play this game, instead of Oct. 1, at Friday afternoon, Oct. 2. Please be available. Thank you for your help in this matter.

363-0453-00L Strategic Supply Chain Management
W+  3 credits  2G  S. Wagner

Abstract
The course offers an introduction to the theory and practice of supply chain management. Students will learn how to develop supply chain strategies and supply chain networks based on firms competitive strategies and marketing priorities.

Objective
The task of designing and managing supply chains requires that managers apply strategic, decision making and leadership skills in a supply chain context. The goal of this course is to develop and practice these skills.
Effective supply chains ought to be aligned with and support the achievement of the firm's corporate, business, and product strategies, taking into account future opportunities and risks. This course will familiarize students with modern supply chain management theory and practice to develop and manage supply chains. The topics covered range from fundamental logistics and supply chain concepts (e.g., push vs. pull, postponement) to the development of supply chain strategies, relationships, and networks. Any standard textbook in Operations Research is a useful complement to the course.

**Course material will be available for download from the homepage of the Chair of Logistics Management:**

http://www.scm.ethz.ch/teaching/courses.html

Login will be provided in the first lecture or can be obtained from the Teaching Assistant Dennis Schuler (dschuler@ethz.ch).

The following textbook is mandatory:

The following textbook is supplementary:

**The final course grade will be a weighted average of the following:**

- Exam (semester end): 70%
- Case studies (during the semester): 30%

**Students (at least in groups of two) must bring a laptop with MS Excel and the Excel Solver installed to class.**

### Lecture notes

Course notes will be available for download from the Moodle platform. More details about the first lecture can be found on the Moodle platform.

### Literature

- Pearson Education.
- Pearson Education.

### Prerequisites / notice

- Students (at least in groups of two) must bring a laptop with MS Excel and the Excel Solver installed to class.
This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to everyday economic problems.

Complementary:

363-0537-00L Resource and Environmental Economics W+ 3 credits 2G L. Bretschger, A. Vinogradova

Abstract
Relationship between economy and environment, market failure, external effects and public goods, contingent valuation, internalisation of externalities; economics of non-renewable resources, economics of renewable resources, cost-benefit analysis, sustainability, and international aspects of resource and environmental economics.

Objective
Understanding of the basic issues and methods in resource and environmental economics; ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

Topics are:
Introduction to resource and environmental economics
Importance of resource and environmental economics
Main issues of resource and environment economics
Normative basis
Utilitarianism
Fairness according to Rawls
Economic growth and environment
Externalities in the environmental sphere
Governmental internalisation of externalities
Private internalisation of externalities: the Coase theorem
Free rider problem and public goods
Types of public policy
Efficient level of pollution
Tax vs. permits
Command and Control Instruments
Empirical data on non-renewable natural resources
Optimal price development: the Hotelling-rule
Effects of exploration and Backstop-technology
Effects of different types of markets.
Biological growth function
Optimal depletion of renewable resources
Social inefficiency as result of over-use of open-access resources
Cost-benefit analysis and the environment
Measuring environmental benefit
Measuring costs
Concept of sustainability
Technological feasibility
Conflicts sustainability / optimality
Indicators of sustainability
Problem of climate change
Cost and benefit of climate change
Climate change as international ecological externality
International climate policy: Kyoto protocol
Implementation of the Kyoto protocol in Switzerland

Content
Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

363-0565-00L Principles of Macroeconomics W+ 3 credits 2V J.E. Sturm

Abstract
This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation. What significance do international economic relations have for Switzerland?

Objective
This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to everyday economic problems.

Content
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.
Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? What is the best way to protect the environment? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

Lecture notes
The course webpage (to be found at http://www.kof.ethz.ch/en/events/teaching/) contains announcements, course information and lecture slides.

Literature
The set-up of the course will closely follow the book of

We advise you to also buy access to Aplia. This internet platform will support you in learning for this course. To save money, you should buy the book together with Aplia. This is sold as a bundle (ISBN: 9781473715998).

Besides this textbook, the slides and lecture notes will cover the content of the lecture and the exam questions.

363-0711-00L Accounting for Managers W+ 3 credits 2V J.P. Chardonnens
This course looks at technology and innovation management as a process. Continuously, organizations are faced with a fundamental
hours.

Slides will be available on the TIMGROUP website.

This course focuses on the analysis of innovation as a pervasive process that cuts across organizational and functional boundaries. It looks
at the sources of innovation, at the tools and techniques that organizations deploy to routinely innovate, and the strategic implications of
technical change.

Readings will be available on the TIMGROUP website.

No specific background in economics or management is required.

I aim to introduce students to the concepts and tools of modern finance and to make them understand the limits of these tools, and the
many problems met by the theory in practice. I will put this course in the context of the ongoing financial crises in the US, Europe, Japan
and China, which provide fantastic opportunities to make the students question the status quo and develop novel solutions.

This course is a prerequisite for the course Financial Management.

Abstract
Overview of financial and managerial accounting
Accounting for current and fixed assets
Liabilities and owners equity
Recording change in balance sheet
Measuring financial performance
Managing financial reporting
Full and variable costing system
Using accounting information for decision making purposes

Objective
Understand the different procedures involved in the accounting system
Record change in financial position
Measure business income
Prepare final accounts
Understand the principles of cost accounting
Calculate the different product costs
Make decisions about the acceptance or rejection of a particular product

Content
Financial Accounting: Balance sheet, income statement, double-entry accounting, journal and ledger, accounting for merchandising
activities, value-added tax, adjustments before final accounts, provisions, depreciation, valuation, 
Managerial Accounting: Full costing, variable costing, cost-volume-profit, break-even analysis, activity-based costing

Prerequisites
- Ability to formulate research questions and designing an appropriate study
- Ability to collect and analyze data using a variety of methods
- Ability to critically assess the quality of empirical research in management
- Applied knowledge of empirical methods through out-of-class assignments

Assignments and projects: This course includes out-of-class assignments and projects to give students some hands-on experience in
conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a
research question or the design of a study. Students will have at least one week to work on each assignment. Students are expected to
work on these assignments individually. Duplicate answers will receive no credit and will be subject to a disciplinary review. Assignments
will be graded and need to be turned-in on time. Exemplary answers to the assignments will be posted online after the submission date for
students to review. Some assignments will also be discussed in class.

Class participation: Class participation is encouraged and can greatly improve students' learning in this class. Class participation will not be
graded; however, it will be considered favorably if a student is between grades. Note, however, that quality is more important than quantity.
In this spirit, students are expected to attend class regularly and come to class prepared.

Prerequisites
No specific background in economics or management is required.

ECTS
3 credits
3 credits
3 credits
The course explains the key concepts and mechanisms of financial economics, their depth and then stresses how and why the theories and models fail and how this is impacting investment strategies and even a global view of citizenship, given the present developing crises in the US since 2007 and in Europe since 2010.

- Development of the concepts and tools to understand these risks and master them.
- Working knowledge of the main concepts and tools in finance (Portfolio theory, asset pricing, options, real options, bonds, interest rates, inflation, exchange rates)
- Strong emphasis on challenging assumptions and developing a systemic understanding of financial markets and their many dimensional risks

1. The Financial Crises: what is really happening? Historical perspective and what can be expected in the next decade(s). Bubbles and crashes. The illusion of the perpetual money machine.

2. Risks in financial markets
   - What is risk?
   - Measuring risks of financial assets
   - Introduction to three different concepts of probability
   - History of financial markets, diversification, market risks

3. Introduction to financial risks and its management.
   - Relationship between risk and return
   - Portfolio theory: the concept of diversification and optimal allocation
   - How to price assets: the Capital Asset Pricing Model
   - How to price assets: the Arbitrage Pricing Theory, the factor models and beyond

4. Financial markets: role and efficiency
   - What is an efficient market?
   - Financial markets as valuation engines: exogeneity versus endogeneity (reflexivity)
   - Deviations from efficiency, puzzles and anomalies in the financial markets
   - Financial bubbles, crashes, systemic instabilities

5. An introduction to Options and derivatives
   - Calls, Puts and Shares and other derivatives
   - Financial alchemy with options (options are building blocks of any possible cash flow)
   - Determination of option value; concept of risk hedging

6. Valuation and using options
   - A first simple option valuation model
   - The Binomial method for valuing options
   - The Black-scholes model and formula
   - Practical examples and implementation
   - Realized prices deviate from these theories: volatility smile and real option trading
   - How to imperfectly hedge with real markets?

7. Real options
   - The value of follow-on investment opportunities
   - The timing option
   - The abandonment option
   - Flexible production
   - Conceptual aspects and extensions

8. Government bonds and their valuation
   - Relationship between bonds and interest rates
   - Real and nominal rates of interest
   - Term structure and Yields to maturity
   - Explaining the term structure
   - Different models of the term structure

9. Managing international risks
   - The foreign exchange market
   - Relations between exchange rates and interest rates, inflation, and other economic variables
   - Hedging currency risks
   - Currency speculation
   - Exchange risk and international investment decisions

Good work design is crucial for individual and company effectiveness and a core element to be considered in organizational change. Meaning of work, organization-technology interaction, and uncertainty management are discussed with respect to work design and sustainable organizational change. As course project, students learn and apply a method for analyzing and designing work in business settings.
### Transformation: Corporate Development and IT

**Objective**
- Know effects of work design on competence, motivation, and well-being
- Understand links between design of individual jobs and work processes
- Know basic processes involved in systematic organizational change
- Understand the interaction between organization and technology and its impact on organizational change
- Understand relevance of work design for company performance and strategy
- Know and apply methods for analyzing and designing work

**Content**
- Work design: From Adam Smith to job crafting
- Effects of work design on performance and well-being
- Approaches to analyzing and designing work
- Models of organizational change and change methods
- Balancing stability and flexibility in organizations as design criterion
- The organization-technology interaction and its impact on work design and organizational change
- Example Flexible working arrangements
- Strategic choices for work design

**Literature**
A list of required readings will be provided at the beginning of the course.

**Prerequisites / notice**
The course includes the completion of a course project to be conducted in groups of four students. The project entails applying a particular method for analyzing and designing work processes and is carried out by means of interviews and observations in companies chosen by the students.

**Abstract**
Using uncertainty management by organizations and individuals as conceptual framework, risk management and risk implications of new technologies are treated. Three components of risk management (risk identification/evaluation, risk mitigation, risk communication) and underlying psychological and organizational processes are discussed, using company case studies to promote in-depth understanding.

**Objective**
- understand basic components of risk management in organizations
- know and apply methods for risk identification/evaluation, risk mitigation, risk communication
- know psycholigical and organizational processes for managing uncertainty
- know organizational principles for managing uncertainty
- apply theoretical foundations to applied issues such as safety management, regulatory activities, and technology design and implementation in different domains (e.g. transport systems, IT, insurance)

**Content**
The syllabus includes the following topics:
- Elements of risk management
  - risk identification and evaluation
  - risk mitigation
  - risk communication
- Psychological and organizational concepts relevant in risk management
  - decision-making under uncertainty
  - risk perception
  - resilient organizational processes for managing uncertainty
- Case studies on different elements of risk management (e.g., rule making, training, managing project risks, automation)
- Group projects related to company case studies

**Literature**
There is no script, but slides will be made available before the lectures.

**Prerequisites / notice**
The course is restricted to 40 participants who will work closely with the lecturers on case studies prepared by the lecturers on topics relevant in their own companies (Swiss Re, Skyguide, Swisscom).

**Abstract**
This course focuses on the challenges in managing multi-business corporations, and covers topics related to the vertical and horizontal scope of business activities.

70% of the final grade consists of a final closed-book written exam and 30% of the final grade will consist of individual assignments and group debates.

**Objective**
Course Topic and Learning Objectives:
Large- and medium-sized corporations play a central role in the economic activity of most developed and developing countries. Many of these organizations perform multiple business activities in multiple markets. In the face of increasing international competition, globalization, technological development, deregulation, and the emergence of new markets and industries, operating such a portfolio of business activities poses important managerial challenges forcing corporations to continuously re-consider their vertical and horizontal scope and boundaries.

The course Corporate Strategy draws from a wide range of theories and methods to develop an understanding of the conceptual frameworks, debates, and developments concerning decisions associated with the management of multi-business corporations. We will cover the key questions driving a firm's corporate strategy, including:
- In what markets to compete with which businesses?
- Which activities should be performed by the firm and which should be outsourced (i.e. "make" or "buy" decisions)?
- What are the most appropriate approaches to growth and divestiture?
- How do institutional forces impact corporate strategy?

Specifically, we will examine how organizations manage their portfolio of business activities and markets to achieve competitive advantage through vertical integration, cooperative strategies such as strategic alliances and joint ventures, corporate diversification, mergers and acquisitions, divestitures, and globalization/international strategies, and strategic renewal.

**Format:**
The course is a combination of lectures about concepts/methods, guest lectures, case studies/assignments, and group debates.

**Prerequisites / notice**
The course homepage can be found at: http://www.smi.ethz.ch/education/courses/corporatestrategy

Having participated in the course Strategic Management by Prof. Georg von Krogh/Dr. Zeynep Erden is an advantage but not a requirement.
The lecture treats the main challenges of business transformation and the alignment of corporate development and IT activities. It presents a holistic approach to business transformation projects by introducing an integrated model dealing with three main design areas "strategy", "processes" and "information systems" and applying this model to various case studies.

The goal of the lecture is to understand the main challenges of corporate transformation and to demonstrate the application of a holistic project procedure model for corporate transformation projects with special emphasis on the alignment of business and IT.

The student should understand and be able to explain

- the main reasons for corporate transformation,
- the relevant management processes to manage corporate transformation,
- the interdependencies between strategy, processes and information systems, especially how this three levels interrelate,
- the critical success factors for the successful accomplishment of large scale corporate transformation projects,
- the main instruments of project, quality and change management and the different types of resulting IT projects.

The globalization of the world leads to an increasingly faster pace in business transformation. Enterprises have to adapt faster and even faster to the environmental changes in a global economy to remain competitive and to make sure they stay in business. In todays information age this does not only mean to adapt business strategy and business processes but also to adapt information systems to the new circumstances. The fast adaptation trough large scale corporate transformation projects that change strategy, business processes and information systems is critical to ensure competitiveness for tomorrow. The introduction of new business processes and information systems typically takes years in very complex large scale projects. Many projects fail because of insufficient alignment between decision makers in business and IT. Unclear understanding of the overall project scope, undefined roles and responsibilities, unclear project processes, quality problems and resistance to change are some typical problems found in such projects. The lecture is subdivided into following modules:

- Corporate development introduction and motivation,
- Neoclassical Growth Theory
- Parallelization of corporate development and complexity reduction,
- Planning process and project portfolio management in corporate development,
- Management of large scale projects integration of strategy, processes and information systems,
- Quality management in large scale projects,
- Project management in large scale projects,
- Change management within projects. The lecture is accompanied by four case studies that are used to exemplify the contents of the lecture by applying the concepts to real situations in corporate life.

### Content

Lecture 1: IT potential and IT Strategy, business process change, IT portfolio and IT HR management (with case examples)

- The transparency used in the lectures will be distributed to the participants.

### Objective

Students will not only learn about the tools and frameworks to align business and IT, but also learn how to apply the tools / frameworks to real cases.

### Content

- Lecture 1: IT potential and IT Strategy, business process change, IT portfolio and IT HR management (with case examples)
- Lecture 2: Evaluating IT investment and alignment maturity assessment, Digital Strategy
- Lecture 3: Case Presentations

### Literature

- 363-0427-00L Business-IT Alignment
  - Attending the lectures is imperative to complete the assignments
  - Abstract
    - What, how, and outcomes of Business-IT Alignment. This course will introduce tools for strategically aligning business and IT, managing the alignment process, and evaluating the alignment outcomes.
  - Objective
    - Students will not only learn about the tools and frameworks to align business and IT, but also learn how to apply the tools / frameworks to real cases.
  - Content
    - Lecture 1: IT potential and IT Strategy, business process change, IT portfolio and IT HR management (with case examples)
    - Lecture 2: Evaluating IT investment and alignment maturity assessment, Digital Strategy
    - Lecture 3: Case Presentations

- 363-0562-01L Economics of Innovation and Growth
  - Overview how the world has developed. Understanding the role of innovation for economic growth. Design of policies to foster innovation and growth.
  - Objective
    - The three goals of the lecture. First, understanding how the world has developed over the last centuries and the proximate and fundamental causes of economic growth. Second, understanding and application of the basic models of economic growth. Third, design of policies to foster innovation and growth to reduce the large wealth differences in the world.
  - Content
    - 1. Introduction
      - 2. Neoclassical Growth Theory
      - 3. Innovations and Growth (New Growth Theory)
      - 4. Growth Policy
      - 5. Institutions and Growth
  - Literature
    - The transparencies used in the lectures will be distributed to the participants.
    - Core literature:
    - Additional literature:
The idea of this course is to familiarize students with instrumental variables estimation of linear regression models and the estimation of technology transfer.

Climate change is one of the most pressing issues that governments and the global community have to face. This course outlines the problem of climate change and discusses the economic solutions (both domestic and international) to this problem.

This course has a number of objectives: (i) To outline the problem of climate change (ii) to discuss and compare the theoretical economic solutions to combating climate change (iii) to present existing climate change mitigation actions in an economic context and (iv) to outline possible future climate policy issues.

Economics of pollution, Optimal level of greenhouse gases, International Environmental Agreements, Tradable pollution permit markets, Carbon Taxes, Technological innovation and R&D, The optimal approach to control Climate change, The future of Climate change policy

Required reading: Pernet et al. (2003), Natural Resource and Environmental Economics, Pearson Addison Wesley. Also, Journal articles will be cited

Prerequisites / notice
Prerequisites: The course relies heavily on the concepts and techniques used in basic game theory. Therefore prior knowledge is recommended

The course is offered in 3 block days.

Blockday 1 - 27.10.15: Introduction and science push
- Introduction to Technology Transfer (Lesley Spiegel)
- Presentation of the case study group work (Balint Dioszegi)
- From science to market (Dr. Marian Knaak, ETH Transfer, Head Start-ups)
- Securing intellectual property (Dr. Claudius Dietzsch, Medela)

Blockday 2 - 10.11.15: Start-up ecosystem and market pull
- The start-up ecosystem (Lesley Spiegel)
- Innovation in a mature start-up (Dr. Ekkehard Zwicker, CEO Alstom Inspection Robotics)
- Getting started with your venture: ETH Entrepreneur Club (President ETH Entrepreneur Club)
- Negotiation and conflict management (Prof. Dr. Michael Ambühl)
- Early stage financing models (Erika Puyal, Head Start-up Finance, Zurich Kantonabank)

Blockday 3 - 24.11.15: Presentation of student case study group work and visit to the Hub and Technopark Zurich
- Student presentations of case study group work (Lesley Spiegel)
- Visit of the Hub Zurich and presentation of Hub Start-up
- Visit of the Technopark Zurich and presentation of 3 start-ups

ICT: Rayner Entertainment (Oliver Flückiger)
Foodtech: Eaternity (Judith Ellens)
Medtech: Ability (Mario Thomann)

Number of participants limited to 50.

Goals of technology transfer with focus on spin-off and start-up creation. Start-up ecosystem, business model innovation, intellectual property, early stage financing and negotiation. Visit to Technopark and Hub Zurich. Guest speakers, meetings with start-up founders. Case study group work with real start-ups. Block lecture (3 days) with strong link between theory and practical examples.

- Ability to take successful actions in a technology transfer process either in your own start-up or within a larger organization
- Get familiar with the start-up ecosystem
- Foster entrepreneurial thinking!

Case study group work with real start-ups. Block lecture (3 days) with strong link between theory and practical examples.

Corporate Finance, investment management, business valuation, value based management & compensation, financial reporting today & in future, financial reporting value chain, reporting on non-financial measures, such as corporate sustainability reporting, mergers & acquisitions, legal aspects, taxes, corporate governance - risk management - internal controls & mgmt. information systems, turnaround.

Introduction in theory and practical application of Corporate Finance, with a particular focus on financing of operations and transactions, analysed from multiple aspects, including legal and tax.

Corporate Finance, investment management, business valuation, value based management and compensation, financial reporting today and in future, financial reporting value chain, reporting on non-financial measures, such as corporate sustainability reporting, mergers and acquisitions, legal aspects, taxes, corporate governance - risk management - internal controls and management information systems, turnaround.

Corporate Finance, Investment management, business valuation, value based management and compensation, financial reporting today and in future, financial reporting value chain, reporting on non-financial measures, such as corporate sustainability reporting, mergers and acquisitions, legal aspects, taxes, corporate governance - risk management - internal controls and management information systems, turnaround.

Slides in English will be available for download on the following website: https://ilias-app2.let.ethz.ch/goto.php?target=crs_68585&client_id=ilias_ida

Preference will be given to students with a background in economics, finance or the natural sciences. The course is also recommended for students with an interest in the transfer of technology.

Required reading:

For more information and updates, please visit https://ilias-app2.let.ethz.ch/goto.php?target=crs_68585&client_id=ilias_ida

The course is recommended for active participation and completion of the case study group work, based on real start-ups and presented in class. Strong link between theory and practical examples.

### 363-0445-02L Logistics, Operations, and Supply Chain Management (I (Additional Cases))

**Abstract**
Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

**Objective**
An effective and efficient flow of goods, data, and control in and between companies contributes significantly to the value added for the customer. Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

**Content**
1. Fundamentals of Communication Psychology
2. 2 Communication in Business-Life
3. 3 Fundamentals of Leadership
4. 4 Self-Management and Life Balance
5. 5 Leadership Tools
6. 6 Problem Solving and Decision Making Techniques
7. 7 Performance Coaching
8. 8 Conflict Management
9. 9 Personality
10. 10 Summary-Day, Domino-Examination

**Prerequisites / notice**
Limited number of participants.
Mandatory registration by 3.8.2015 via the administration office of Prof. P. Baschera. E-Mail: bms@ethz.ch

**Lecture notes**
Will be provided as electronic version at www.entrepreneurship.ethz.ch at least one week before the seminar starts

**Special permission from lecturers required**
10 days in two weeks. 09:00-17:00

**Number of participants is limited. Please send an email to bms@ethz.ch by 03.08.15 for your registration**

Week I: 17.08.15 to 21.08.15
Week II: 07.09.15 to 11.09.15

### 363-0622-00L Basic Management Skills

**Abstract**
With the aim of preparing the students to take on managerial responsibility, this 2x5 days-seminar teaches basic and practical management skills.

**Objective**
To convey management behaviour based on practical examples, own experiences and team discussions complemented by short theory sessions (subsidized from the donation for promotion and training in enterprise sciences at the ETHZ).

**Content**
1. Fundamentals of Communication Psychology
2. 2 Communication in Business-Life
3. 3 Fundamentals of Leadership
4. 4 Self-Management and Life Balance
5. 5 Leadership Tools
6. 6 Problem Solving and Decision Making Techniques
7. 7 Performance Coaching
8. 8 Conflict Management
9. 9 Personality
10. 10 Summary-Day, Domino-Examination

**Notice**
Will be provided as electronic version at www.entrepreneurship.ethz.ch at least one week before the seminar starts

**Number of participants is limited. Please send an email to bms@ethz.ch by 03.08.15 for your registration**

Week I: 17.08.15 to 21.08.15
Week II: 07.09.15 to 11.09.15

### 363-0790-00L Technology Entrepreneurship

**Abstract**
Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

**Objective**
This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures.

**Content**
To convey management behaviour based on practical examples, own experiences and team discussions complemented by short theory sessions (subsidized from the donation for promotion and training in enterprise sciences at the ETHZ).

**Notice**
Will be provided as electronic version at www.entrepreneurship.ethz.ch at least one week before the seminar starts

**Number of participants is limited. Please send an email to bms@ethz.ch by 03.08.15 for your registration**

Week I: 17.08.15 to 21.08.15
Week II: 07.09.15 to 11.09.15
Objective

Learning outcomes professional competence
- The students learn and understand the management basics of inter-firm cooperation and organizational networks (business models, incl. risk, communication, etc.)
- Realize the value creation potentials of alliances (added value)
- Understand underlying theoretical models (Transaction cost theory, principal agent, game theory)
- Identify and understand specific forms of collaboration (Strat. All., JV, Networks, M&A, etc.)
- Apply tools hands on in real companies (in collabor. with companies)

Learning outcomes methodological competence
- Writing academic papers
- Developing structured documentation of interviews
- Transferring theory directly into application
- Contributing to the learning journey

Learning outcomes social competence
- Work together with industrial partners
- Improving communication skills as basics for collaboration
- Developing and applying team work skills
- Coping with conflicts resolution in teams

Content

The constantly augmenting complexity of technologies and systems, the increased pressure caused by competition, the need for shortening time-to-market and the thereby implied growing risks force organizations to increasingly focus on core competencies. Collaboration with external partners is a key value creation opportunity for successful ventures. This type of cooperation also has implications on daily management activities. This lecture will provide a better understanding of special requirements needed for management of cooperation issues.

Content:
- Introduction to theory and management of inter-firm collaboration and networks.
- Description of the formation, management and evolution of collaborations and networks.
- Collaborations in marketing, development, manufacturing (e.g. NUMMI).
- Special forms of collaborations: mergers & acquisition (e.g. pre- and post-merger activities, joint venture, strategic alliances (e.g. Doz & Hamel, networks, virtual communities)

Learning journey:

In an introductory lecture we will give an overview of the theoretical framework and explain the concept of the lecture (Sept. 18, 2014). In weeks 2-5 you will work on a first assignment on six different aspects of the underlying framework: strategy and activities, structure and process, culture and people orientation, interaction and roles, risk and trust, knowledge and learning. This first assignment will give you the basics to participate in the second part (Oct.30-31.2014, 2014) of this seminar. There you will present the results of the first assignment and get additional theoretical input to perform the 2nd assignment. The second assignment will be to analyze real alliance projects in the partner companies. The final lesson will be used as a best practice exchange together with our industrial partners (Dec.18, 2014).

Lecture notes

- Lecture script
- Current course material
- Harvard Case Studies
- Reader with current papers

Literature

A list with recommended publications will be distributed in the lecture.

Additional Books:
- HBR Collaborating Effectively ISBN 978-1-4221-6264-4
- HBR on Mergers and Acquisitions: ISBN 1-57851-555-6

Prerequisites / notice

The number of students participating in the lecture is limited to 30.

Abstract

This course is a preparation course for theses in industry: Criteria of scientific work, writing the final report, using research resources at ETH. Using case studies, content of other lectures is discussed with regard to the special challenges during theses: Systems Engineering, Social science methods for empirical data collection and analysis, project management, presentation technique.

Objective

The objective of this course is to provide students with a practical toolset of techniques, procedures and hints for a successful scientific work.

Content

Methodology: Systems Engineering, problem solving process, situation analysis, SWOT, objectives, solution finding, evaluation.

Social science methods for empirical data collection and analysis: how to develop a good research question: methodological awareness and practical considerations, criteria in social research: reliability and validity.

Research Designs and Strategies: qualitative and quantitative research.

Methods for data collection and analysis: observation, interview, questionnaire, document and literature analysis, and combinations.

Project Management: tasks plan, milestones, roles, communication

Scientific work: research, resources, citation, argumentation

Presentation: techniques, procedure, handouts, significance

Final report: organization, layout, figures, formal requirements, appendix

Lecture notes

http://www.timgroup.ethz.ch/education/Courses_at_TIMGROUP

Handouts of the presentations / course materials have to be downloaded and printed out before the course (see link above).
The main aim of this course is to analyse the goals of monetary policy and to review the instruments available to central banks in order to pursue these goals. It will focus on the transmission mechanisms of monetary policy and the differences between monetary policy rules and discretionary policy. It will also make connections between theoretical economic concepts and current real world issues.

The semester project (180 hours) is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

The course is intended for students who want to carry out a thesis in industry, in general these are:

1. MSc-students MTEC or MAVT with master thesis (MA) during the next term and supervised by MTEC, (corresponds to 3rd or 4th semester Master) and
2. BSc-students MAVT with bachelor thesis (BA) in industry and supervised by MTEC, as well as with full MTEC focus (corresponds to 5th or 6th semester Bachelor) or
3. MAS MTEC students in 3rd semester for MA during the next term.

Important note: Credits will only be awarded to students according to (1), (2) or (3). Prerequisites for obtaining the credit or "Testat": being present during the whole course (presence list) and prior study of documents provided on the Internet and of the book Züst, R.: Einstieg ins Systems Engineering. 3. Aufl., Verlag Industrielle Organisation, Zürich 2004.

Other students on request (limited places).

Important: the chair coaching your BA/MA defines whether the course is mandatory. Please contact your chair!

Electronic enrollment until 08.09.2015 required. Without electronic enrollment participation in the course can't be confirmed. The course is held "en bloc" at the beginning of the semester.

Date: Friday 11.09.2015 (13:15-17:00), location: HG E33.1 (ETH main building) and Saturday, 12.09.2015 (09:15-17:00), location: HG E33.1 (ETH main building). Participation at both days required (Friday afternoon and Saturday whole day).

The course is held in English; handouts are available in English.

Literature

Prerequisites / notice

The course is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

363-0881-00L Semester Project Small  
Abstract  
The semester project (90 hours) is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

Objective  
The semester project (90 hours) is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

363-0883-00L Semester Project Large  
Abstract  
The semester project (180 hours) is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

Objective  
The semester project (180 hours) is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

363-1021-00L Monetary Policy  
Abstract  
The main aim of this course is to analyse the goals of monetary policy and to review the instruments available to central banks in order to pursue these goals. It will focus on the transmission mechanisms of monetary policy and the differences between monetary policy rules and discretionary policy. It will also make connections between theoretical economic concepts and current real world issues.
363-1024-00L Economics of Regulation

Abstract: This course focuses on important factors that drive the innovation performance of firms, like innovation capabilities, science-industry interactions, environmental economics, and contract theory. Furthermore, by applying these theories to the regulatory problems, we want to show how one can use microeconomic theories to explain and solve real-life issues.

Objective: - To deliver the understanding about why and when regulations are needed; to make students familiar with common regulatory policies; and to let students know about some very famous cases;

- To make a systematic review of the microeconomic theories that are related to regulation, specifically including game theory, industrial organization, environmental economics, and contract theory. Furthermore, by applying these theories to the regulatory problems, we want to show how one can use microeconomics theories to explain and solve real-life issues.

By the end of the course, students are expected to have enhanced their understandings of the related microeconomic theories, and have strengthened the abilities to explain, to analyze, and to solve regulatory problems.

Content: Topics include:
- Introduction (market efficiency and failure);
- Classical regulatory tools (Price regulations and more);
- Monopoly power and dominance;
- Regulating the utilities (Electricity and energy, Telecommunications, Environmental regulation, Financial regulation);
- Cost-benefit analysis;
- The asymmetric information problem in regulation.

Literature: Lodge, M., M. Cave and R. Baldwin (eds.), The Oxford Handbook of Regulation, Oxford University Press, 2010. (accessible online via the school network)

Prerequisites / notice: Basic knowledge in international economics and a good background in macroeconomics. The course website can be found at: http://www.kof.ethz.ch/en/events/teaching/

**Objective**

We will discuss and develop answers to the following questions:

What do I want to achieve in my life?
Why is it important to define goals?
What decision criteria can I use as a guide?
How do potential career paths look like? What are the possibilities?
How does the life cycle of a career look like? What are the alternatives?
How do I increase my chances of success/reaching my goals?
How did others do it? What kind of advice can experienced captains of industry give?
Why is a periodic check of my goals and my progress necessary?

**Content**

**INTRODUCTION (7.10.2015)**
Awareness building / Overview on the career life cycle / Examples from praxis / Exchange of experiences / Approach for goalsetting / Introduction to the success secrets of a career

**ORIENTATION AND GOAL SETTING (14.10.2015)**
Class discussion of the success secrets of a career / Orientation on career options / Discussion of possible decision criteria / Initial formulation of concrete goals

External guest speaker: Inspiring Start-up Entrepreneur

**CAREER DEVELOPMENT PLANS (21.10.2015)**
Exchange w/representatives of industries / Personal Values & Norms vs Corporate Identity / Work-Life Balance Gender / Diversity / Summary of discussions / Best practice / Modification/Sharpening of goals

External guest speaker: Dr. Alexandre Grêt, CEO, HaslerRail AG

**DETAILING OF INDIVIDUAL CAREER PLANS (28.10.2015)**
Development of detailed individual career plans / Next steps / action plan / Tips & Tricks for careers in organizations and entrepreneurship

External guest speaker: Dr. Alexandre Grêt, CEO, HaslerRail AG

**REVIEW & APPLICATION COUNSELING (04.11.2015)**
Review/check of goals and career plans / Motivation letter / CV / Preparation for interviews

**INTERVIEW TRAINING (11.11.2015)**
External guest speaker: Thomas Vellacott, CEO, WWF Switzerland

**Lecture notes**

In today’s world of everything is possible it becomes an every increasing challenge to find orientation, to define a goal for which it is worth to work for with focus and energy. But this is exactly what is so important in today’s work environment. Only with a definite goal one can decide if the taken path is right, one can develop enough motivation to go beyond the comfort zone. With a definite goal, one increases the chances of success of one’s education and career. The earlier one has defined what he/she wants to achieve, the bigger the effect.

**Prerequisites / notice**

Motivation. Strategic long-term view.

**363-1047-00L Economics of Urban Transportation**

<table>

**Additional material:**

Part 1 to 5: textbook: Small and Verhoef (The economics of urban transportation, 2007).

Part 6: Topics to be covered on research papers/case studies.
Abstract
The course focuses on the establishment of sustainability in firm's supply chains (that is, in their internal operations, in their logistics processes, and in their upstream supply chains). We will consider how supply chains can become more sustainable, as well as the extent to which firms are interested in such a development.

Objective
This course aims to equip students with an in-depth knowledge of the sustainability-related challenges and problems within supply chain management, and suggests some tools for managing these challenges. Equally importantly, the course seeks to capacitate students for understanding and analyzing the tradeoffs and conflicts of target within sustainable supply chain management.

The content of the course is closely linked to the latest research in the field, meaning that the absence of simple solutions will be the rule, rather than the exception. Moreover, the course will be highly interactive, and there will be intensive coursework during the course.

Content
The preliminary course outline is as follows:

Module 1: Motivation for SusSCM
-Sustainable development, sustainability, and corporate social responsibility
-Importance of SusSCM
-Motivation for firms to engage in SusSCM
-Specificity of SusSCM

Module 2: Supply chain sustainability topics and issues in an overview
-Types of issues
-Juxtaposing the three dimensions of the triple-bottom line
-Issue reporting
-Dilemmas for firms

Module 3: Sustainable operations management
-Lean and green
-CO2 avoidance
-Recycling
-Closed-loop SCM

Module 4: Sustainable logistics
-Forward vs. reverse logistics
-Sustainable transportation
-Sustainable warehousing
-Sustainable packaging
-Design of sustainable logistics networks

Module 5: Sustainable purchasing and supply management
-Management of the entire supply base in global sourcing contexts
-Sustainable supplier management processes
-Information processing prerequisites to sustainable supplier management processes
-Sustainability-oriented supply chain risk management

Module 6: Emerging topics in sustainable supply chain management

Wrap-up

Lecture notes
The course material will be available for download from the homepage of the Chair of Logistics Management: http://www.scm.ethz.ch/teaching/Courses. The login will be announced in the first lecture. In addition, we will employ scientific publications and case studies as readings which are provided throughout the course. Supplementary textbooks are listed below in the literature section.

851-0735-09L Workshop & Lecture Series on the Law & Economics of Innovation
W 2 credits 2S S. Bechtold, H. Gersbach, A. Heinemann, G. Hertig

Abstract
This series is a joint project by ETH Zurich and the University of Zurich. It provides an overview of interdisciplinary research on intellectual property, innovation, antitrust and technology policy. Scholars from law, economics, management and related fields give a lecture and/or present their current research. All speakers are internationally well-known experts from Europe, the U.S. and beyond.

Objective
After the workshop and lecture series, participants should be acquainted with interdisciplinary approaches towards intellectual property, innovation, antitrust and technology policy research. They should also have an overview of current topics of international research in these areas.

Content
The workshop and lecture series will present a mix of speakers who represent the wide range of current social science research methods applied to intellectual property, innovation, antitrust policy and technology policy issues. In particular, theoretical models, empirical and experimental research as well as legal research methods will be represented.

Lecture notes
Papers discussed in the workshop and lecture series are posted in advance on the course web page.
In this endeavor you are coached and supported by the faculty. The aim of this module is to introduce students to some key concepts in technology marketing and to familiarize them subsequently with the practical challenges of the industry. This seminar provides the most ambitious and best performing master students at MTEC with the challenging opportunity of a real case study on a current and past managerial problem. The course enables students to apply their knowledge from marketing and other disciplines to real life cases under the supervision of internationally operating partner companies, e.g. PanGas, L’Oréal, Henkel, McKinsey, EDEKA, etc. Marketing Practice

Entrepreneurial Leadership
Limited number of participants.
Students apply with motivation letter, CV and a transcript of records no later than 25.8.2015. Earlier applications welcome. Send application to andreakurat@ethz.ch.
Once your application is confirmed, a registration in myStudies is possible.

Abstract
This seminar provides the most ambitious and best performing master students at MTEC with the challenging opportunity of a real case on strategy, innovation and leadership in close collaboration with the top management of an outstanding company - in 2015: PwC Switzerland.

Objective
In your team, you will work on a specific assignment that flows from the current strategic agenda of the board. While gaining substantial insights into the structure, dynamics and challenges of the advisory and assurance industry, you immerse into the business model and strategic landscape of the corporate partner. You visit their headquarter, conduct interviews with members of the management team, experienced consultants as well as internal and external experts before you discuss your ideas with top executives. To secure impact, it is key that you formulate your recommendations from a deep understanding of the authentic leadership culture of the corporate partner.

Content
In this endeavor you are coached and supported by:
- Gudela Grote, Chair of Work and Organizational Psychology
- Stefano Brusoni, Chair of Technology and Innovation Management
- Claude Siegenthaler, Hosei University / The St.Gallen MBA
- Georg von Krogh, Chair of Strategic Management and Innovation
- Pius Baschera, Chair of Entrepreneurship

Prerequisites / notice
Please apply for this course via the official website (www.mtec.ethz.ch) and send your application form together with a CV and transcript of records to andreakurat@ethz.ch.
Apply no later than August 25, yet early registrations are welcomed.
The number of participants is limited to 18.
ECTS: 4
Participants receive a certificate.

363-1051-00L
Cases in Technology Marketing
Number of participants limited to 20.
Students have to apply for this course by sending a CV and an one-page motivation letter until 14.09.2015 to mgrohmann@ethz.ch. Additionally please enroll via myStudies. Places will be assigned on the basis of your motivation letter.

Abstract
This module is to introduce students to some key concepts in technology marketing and to familiarize them subsequently with the challenges that (marketing) managers face in technology intensive markets by using real life cases. Students will have to "solve" current and past managerial problems and will be enabled to compare their solutions with what has actually been done.

Objective
This module should enable students to deal with the uncertainty related to challenges in technology marketing by introducing them to some key concepts and letting them apply those concepts to real life cases. The competences acquired in this module are meant to go beyond the mere understanding of the study material by improving students' analytical skills and capacity for team work. Furthermore, students will be exposed to decision-making styles and procedures in companies.

Prerequisites / notice
Students have to apply for this course by sending a CV and a one-page motivation letter until 14.09.2015 to mgrohmann@ethz.ch.

363-1055-00L
Marketing Practice
Please send your application documents (Cover Letter, CV, Transcript of Records, Reports) by 15.10.2015 to mgrohmann@ethz.ch.
Once your application has been confirmed, a registration in myStudies is possible.

Abstract
The course enables students to apply their knowledge from marketing and other disciplines to real life cases under the supervision of internationally operating partner companies.

Objective
First, students have to assess and analyse real life problems in order to generate creative solutions.

Secondly, students have to demonstrate that they are both able to apply their knowledge from marketing theory to practice, as well as to communicate their ideas to other students and leading marketing executives.

Content
The Circle of Excellence is a one-year talent program for outstanding students together with the universities of Münster, Cologne and Berlin. It aims at preparing the participants for interesting management tasks within various workshops in collaboration with our internationally operating partner companies, e.g. PanGas, L’Oréal, Henkel, McKinsey, EDEKA, etc.

Please find more information on:
http://www.circle-of-excellence-marketing.de

Prerequisites / notice
Your profile:
- Strong interest in Marketing topics
- Very good academic performance
- Interesting and convincing personality

Students have to organize the remaining phase of their studies in a way that they are able to participate in the workshops.
Design Thinking: Human-Centred Solutions to Real World Challenges

Due to didactic reasons, the number of participants is limited to 30.

All interested students are invited to apply for this course by sending a one-page motivation letter until 07.09.2015 to Florian Rittiner (frittiner@ethz.ch).

Additionally please enroll via mystudies. Places will be assigned after the first lecture on the basis of your motivation letter and commitment for the class.

Abstract
The purpose of this course is to engage students in a multidisciplinary collaboration to tackle real world problems. Following a design thinking approach, students will work in multidisciplinary teams to solve a set of design challenges that are organized as a one-week, a three-week, and a six-week project. The final project will be in collaboration with an external project partner.

Objective
During the course, students will learn about different design thinking methods and tools. This will enable them to:
- Generate deep insights through the systematic observation and interaction of key stakeholders.
- Engage in collaborative ideation with a multidisciplinary (student) team.
- Rapidly prototype and iteratively test ideas and concepts by using various materials and techniques.

Human Factors I

Abstract
Every day humans interact with various systems. Strategies of interaction, individual needs, physical & mental abilities, and system properties are important factors in controlling the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction & overall performance.

Objective
The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

Content
- Physiological, physical, and cognitive factors in sensation and perception
- Body spaces and functional anthropometry
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

Literature

Conference of Disarmament: Simulation of Negotiations

Abstract
The Global Studies Institute (University of Geneva) is organizing a simulation seminar on nuclear disarmament in collaboration with the Chair of Negotiation and Conflict Management (ETH), experts from the United Nations Institute for Disarmament Research and the Geneva Center for Security Policy.

Objective
The simulation is conducted in collaboration with experts and students during a two days seminar at the University of Geneva. Students will have the possibility to participate in simulated diplomatic negotiations and to analyse and assess the negotiation logic behind the situations. They should gain insight in the basic information on disarmament issues and on the functioning of the Conference on Disarmament as well as on negotiation techniques in general.
The simulation project is intended for Master’s or Doctoral students of the Global Studies Institute (GSI) of the University of Geneva, of the ETH and for interested students of the Geneva Centre for Security Policy (GCSP). The simulation will be in French and English and is conducted by Prof. Calmy-Rey, former President of Switzerland.

In the lectures, students will be provided with basic information on disarmament issues and on the functioning of the Conference on Disarmament as well as on negotiation techniques in general. Students will take the role of negotiators in the simulation (including the heads of the delegations), of keeper of the minutes or of observers and analysts. Students will co-develop their mandates for the negotiation and be assisted by experts that are specialized in international negotiations as well as in the topic of disarmament. The negotiation tables will be chaired by former diplomats. Representatives of diplomatic missions in Geneva will play the role of the “Capitals” to which the heads of delegations will have to give account of the ongoing negotiations.

More details on the program, timetable, reading lists and performance assessment will be published here: https://chamilo.unige.ch/home/courses/M165/?id_session=0

The simulation will take place on the 26 and 27 November 2015 at the University of Geneva.

Languages: English and French

Dates/Time/Location (GE = University of Geneva)

22 Sept. | ETH HG D 22 | 10:15-12:00 | Introduction
29 Sept. | GE Uni Mail Salle 1170 | 10:15-12:00 | Introduction to Negotiation Techniques (Dr. Vitalijus Butenko and Dr. Sibylle Zürcher, ETH)
6 Oct. | ETH HG D 16.2 | 10:15-12:00 | Distribution of the roles, composition of the negotiation tables, preparation of mandates for the HA (humanitarian approach)
13 Oct. | ETH HG D 22 | 10:15-12:00 | Preparation of the mandates for the FMCT (Fissile Material Cut-off Treaty)
20 Oct. | GE Uni Mail Salle 1170 | 10:15-12:00 | No session; Students deepen and summarize their mandates on one page (A4)
27 Oct. | GE Uni Mail Salle 1170 | 10:15-12:00 | Discussion of the Mandates I (FMCT)
10 Nov. | GE Uni Mail Salle 1170 | 10:15-12:00 | Discussion of the Mandates II (HA)
17 Nov. | GE Uni Mail Salle 1170 | 10:15-12:00 | Preparation Meeting
26 & 27 Nov. | GE Salles 407 et 408 | 10:00-18:00 | Simulation at Uni Dufour
1 Dec. | GE Uni Mail Salle 1170 | 10:15-12:00 | Discussion of the results

Note:
The participation in the simulation on 26. and 27. November in Geneva is necessary.
The two hours lectures on the 22. September, 6. and 13. October have to be attended in Zürich via conference call (ETH HG D 16.2). The other lectures during the semester can be attended via Skype.

To get the 3 ECTS, students have to participate at the 2 days simulation In Geneva, attend the 3 mandatory lecture parts via conference call an Zürich and write a report of 5 pages at the end of the course.

(Technical note for registration: At this stage all registered students are on the waiting list)

► Supplementary Courses

*The students have to deepen their knowledge in the area(s) of engineering/natural sciences in consultation with the responsible professor (tutor). Core courses and electives of D-MTEC can not be used as supplementary courses.*

Abstract
Only students who fulfill the following criteria are allowed to begin with their master thesis:
* a. successful completion of the bachelor programme;
* b. fulfilling of any additional requirements necessary to gain admission to the master programme;
* c. internship fulfilled

Objective
In the Master thesis students prove their ability to independent, structured and scientific working. The Master thesis is supervised by the tutor and normally deals with a subject contained in the major fields. The research will be performed normally within a private company or at the ETH Zurich.

Abstract
This course for MTEC master’s students will focus on developing and refining students’ English writing skills and their understanding of the requirements and conventions of academic writing.
Objective

The aim of this course is to improve the academic writing skills needed to complete an MSc thesis successfully. The course provides theoretical input, practical writing exercises, and detailed individual feedback organised into one group lecture and four workshops in smaller tutorial groups.

Initially, the lecture provides an overview of the range of demands on academic essay and MSc thesis writers and outlines the academic expectations that students must meet. Our goal is to provide a basis for informed decisions when selecting a thesis topic and supervisor. Guidance is then provided in the workshops on planning the writing process effectively, and individual feedback is provided to enhance writing ability.

The course develops a range of practical and transferrable writing skills. Students can use these skills to improve the overall quality of their MSc theses and to produce their thesis more rapidly and efficiently. The writing skills developed here can be used beyond the MSc, whether students go on to complete a PhD or to produce reports and other documents in industry.

Content

Group lecture:
an introduction to writing an MSc thesis in D-MTEC
selecting topic and supervisor
academic expectations
avoiding plagiarism

Workshop 1:
the writing process
reading, note taking and planning
overview of the thesis structure
building academic vocabulary

Workshop 2:
writing methods sections
embedding figures and tables
structuring sentences and paragraphs
noun phrases and articles

Workshop 3:
introductions; results and discussion sections
analysis v description
writing critically
relative clauses

Workshop 4:
abstracts and conclusions
editing your own text
punctuation, spelling, and grammar

Lecture notes

Notes will be available after registration.

**Data:** 06.10.2017 12:56  
**Autumn Semester 2015**  
**Page 912 of 1432**
- Innovation Process: A Quick Overview
- Stages of the planning and design process
- Requirements for a design and technical implementation
- Choice of materials - Basic principles of a material-specific design
- Manufacturing process - fundamentals of a production-oriented design
- Connections, fuses, seals
- Machine-standard elements
- Storage & guides
- Transmission and its components
- Drives

The idea of machine elements is complemented by case studies and illustrated.

Lecture notes
The lecture slides will be published beforehand on the website of the pd|z.

Prerequisites / notice
For Bachelor studies in Mechanical and Process Engineering, the lecture "Maschinenelemente" (HS) is examined together with "Innovationsprozess" (FS) in the exam "Basisprüfung Maschinenelemente und Innovationsprozess".

529-0010-00L Chemistry O 3 credits 2V+1U A. de Mello, K. Elvira

Abstract
This is a general chemistry course aimed at first year undergraduate students in the Department of Mechanical and Process Engineering (D-MAVT).

Objective
The aims of the course are as follows:
1) To provide a thorough understanding of the basic principles of chemistry and its application.
2) To develop an understanding of the atomic and molecular nature of matter and of the chemical reactions that describe their transformations.
3) To emphasize areas considered most relevant in an engineering context.

Content
Electronic structure of atoms, chemical bonding, molecular shape and bonding theory, gases, thermodynamics, chemical thermodynamics, chemical kinetics, equilibrium, solutions and intermolecular forces, redox and electrochemistry.

Literature
The course is based on "Chemistry the Central Science" by Brown, LeMay, Bursten, Murphy and Woodward. Pearson, 12th Edition (international edition).

Abstract

Objective
The lecture and exercises teach the fundamentals of technical drawing and CAD. After taking the course students will be able to create technical drawings of parts and assemblies as well as read them. Students will also be able to create models of parts and assemblies in a 3D, feature-based CAD system. They will understand the links with simulation, product data management (PDM) and additive manufacturing.

Content
Introduction to Engineering Design

Technical Drawing:
- projections and views
- cuts
- notations
- primitives
- ISO norm elements
- dimensioning
- tolerances
- assemblies
- documentation

CAD:
- CAD basics
- CAD modeling methods
- sketch modeling
- modeling operations
- feature-based modeling
- assemblies
- creating 2D drawings from 3D parts
- links to simulation, e.g. kinematics
- links to model variants and Product Data Management (PDM)
- links to additive manufacturing (3D printing)

Lecture notes
Lecture slides and exercise handouts are available on the course Moodle website: https://moodle-app2.let.ethz.ch/course/index.php?categoryid=56

Literature
In addition to the lecture material the following books are recommended (only in German):

TZ
Technisches Zeichnen: selbstständig lernen und effektiv üben
Susanna Labisch und Christian Weber
2008 Vieweg
eBook (accessible from the ETH domain): http://link.springer.com/book/10.1007/978-3-8348-9451-9/page/1

VSM Normen-Auszugs 2010

Abstract
Introduction to partial differential equations. Differential equations which are important in applications are classified and solved. Elliptic, parabolic and hyperbolic differential equations are treated. The following mathematical tools are introduced: Laplace transforms, Fourier series, separation of variables, methods of characteristics.

Objective
Mathematical treatment of problems in science and engineering. To understand the properties of the different types of partial differential equations.

Content
Laplace Transforms:
- Laplace Transform, Inverse Laplace Transform, Linearity, s-Shifting
- Transforms of Derivatives and Integrals, ODEs
- Unit Step Function, t-Shifting
- Short Impulses, Dirac's Delta Function, Partial Fractions
- Convolution, Integral Equations
- Differentiation and Integration of Transforms

Fourier Series, Integrals and Transforms:
- Fourier Series
- Functions of Any Period \( p=2L \)
- Even and Odd Functions, Half-Range Expansions
- Forced Oscillations
- Approximation by Trigonometric Polynomials
- Fourier Integral
- Fourier Cosine and Sine Transform

Partial Differential Equations:
- Basic Concepts
- Modeling: Vibrating String, Wave Equation
- Solution by separation of variables; use of Fourier series
- D'Alembert Solution of Wave Equation, Characteristics
- Heat Equation: Solution by Fourier Series
- Heat Equation: Solutions by Fourier Integrals and Transforms
- Modeling Membrane: Two Dimensional Wave Equation
- Laplacian in Polar Coordinates; Circular Membrane, Fourier-Bessel Series
- Solution of PDEs by Laplace Transform

Abstract
Kinematics, dynamics and oscillations: Motion of a single particle - Motion of systems of particles - 2D and 3D motion of rigid bodies - Vibrations
Objective
This course provides Bachelor students of mechanical engineering with fundamental knowledge of kinematics and dynamics of mechanical systems. By studying motion of a single particle, systems of particles and rigid bodies, we introduce essential concepts such as work and energy, equations of motion, and forces and torques. Further topics include stability of equilibria and vibrations. Examples presented in the lectures and weekly exercise lessons help students learn basic techniques that are necessary for advanced courses and work on engineering applications.

Content

Lecture notes
Hand-written slides will be downloadable after each lecture.

Literature

Prerequisites / notice
Please log in to moodle (https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php), search for "Dynamics", and join the course there. All exercises sheets, lecture materials etc. will be uploaded there.

151-0303-00L Dimensioning I 0 3 credits 3G P. Hora, K. Wegener

Abstract
Introduction to dimensioning (strength calculation) for static and dynamic loaded components and machine parts. Critical strength and fracture criteria. Analytical methods for the calculation of stresses and strains. Consideration of stress concentrations by notch effects. Strength proof for different machine elements:

Objective
The lecture uses basic strength theory from Mechanics II to size and design typical machine elements as beam structures, axes and shafts, pressure vessels, weldings and screws. The students learn to define both geometry and material of frequently used machine elements. Strength calculations are performed both for static and fatigue operating conditions.

Content
- Theoretical basics of engineering design - Description of ductil and brittle material behavior - Design of machine elements at static loading conditions - Notch effects - Axes and shafts - Fatigue design - Surface pressure - Rotationally symmetric bodies, pressure vessels and cylindrical interference - Dimensioning of permanent and separable joints

Lecture notes
The lecture bases on the books specified under "LITERATUR". The books 1) to 5) can be downloaded as pdf's. Additional documentation and handouts are available as PDFs on our website.

Literature

151-0051-00L Thermodynamics I 0 4 credits 2V+2U D. Poulikakos

Abstract
Introduction to the fundamentals of technical thermodynamics.

Objective
Introduction to the fundamentals of technical thermodynamics.

Content

Lecture notes
available

Literature

151-0591-00L Control Systems I 0 4 credits 2V+2U G. Ochsner, C. Onder

Abstract
Analysis and synthesis of linear systems with one input and one output signal (SISO); transition matrix; stability; controllability; observability; Laplace transform; transfer functions; transient and steady state responses. PID control; dynamic compensators; Nyquist theorem.

Objective
Introduction to main ideas of linear systems analysis and synthesis. Transient and steady-state behavior, system engineering (input/output, static/dynamic behavior, feedback and feedback loops, etc.), introduction of most important tools (solution of linear ODE, Laplace transformation, Nyquist theorem, etc.). Elementary controller synthesis methods.

Content

Lecture notes

Prerequisites / notice
Basic knowledge of (complex) analysis and linear algebra

Examination Block 2

Number Title Type ECTS Hours Lecturers
402-0033-10L Physics I 0 6 credits 4V+2U W. Wegscheider

Abstract
This is a two-semester course introducing students into the foundations of Modern Physics. Topics include electricity and magnetism, light, waves, quantum physics, solid state physics, and semiconductors. Selected topics with important applications in industry will also be considered.
Objective
The lecture is intended to promote critical, scientific thinking. Key concepts of Physics will be acquired, with a focus on technically relevant applications. At the end of the two semesters, students will have a good overview over the topics of classical and modern Physics.

Content
Electric and magnetic fields, current, magnetism, Maxwell's equations, concept of light, classical optics, waves.

Lecture notes
Notes from lectures will be available (in German).

Literature
Friedhelm Kuypers
Physik fuer Ingenieure und Naturwissenschaftler
Paul A. Tipler, Gene Mosca, Michael Basler and Renate Dohmen
Physik fuer Wissenschaftler und Ingenieure
Spektrum Akademischer Verlag, 2009, 1636 Seiten, ca. 80 Euro.

Engineering Tools II
The participation at the Engineering Tools course is mandatory. If you miss any classes, no credit points will be awarded. For exemptions you have to contact the lecturer of the course.

Abstract
Introduction to MATLAB; vectors and matrices; graphics in MATLAB; calculus, differential equations; programming with MATLAB; data analysis and statistics; interpolation and polynomials. Exercises with solutions: using MATLAB commands, technical applications.

Objective
Introduction to numerical calculations with MATLAB.

Content
Introduction to MATLAB; vectors and matrices; graphics in MATLAB; calculus, differential equations; programming with MATLAB; data analysis and statistics; interpolation and polynomials. Exercises with solutions: using MATLAB commands, technical applications.

Lecture notes
Web-based tutorial:
http://www.ivp.ethz.ch/studium/vorlesungen.html

Prerequisites / notice
Der Kurs findet in einem Hörsaal statt und es stehen keine Rechner zur Verfügung. Es wird empfohlen, dass pro zwei Studierenden mindestens ein Laptop mit installiertem Matlab mitgebracht wird.

Installation Matlab:
- es funktionieren alle Versionen
- netzunabhängige Node-Lizenz (z.B. zum Download auf IDES)
- folgende Toolboxes/Features müssen installiert sein: Simulink (wird für RT1 benutzt), Curve Fitting Toolbox, Optimization Toolbox, Symbolic Toolbox, Global Optimization Toolbox

Abstract
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

Objective
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

Data: 06.10.2017 12:56
Autumn Semester 2015
Page 916 of 1432
### Content

Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Reynolds- and Chilton-Colburn analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogenous and heterogeneous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogenous reaction. Applications.

Content
Initial value problems for ODE: review of basic theory for ODEs, Forward and Backward Euler methods, Taylor series methods, Runge-Kutta methods, multi-step methods, predictor-corrector methods, basic stability and consistency analysis, numerical solution of stiff ODEs.

Two-point boundary value problems: Green's function representation of solutions, Maximum principle, finite difference schemes, stability analysis.

Elliptic equations: Laplace's equation in one and two space dimensions, finite element methods, implementation of finite elements, error analysis.

Hyperbolic equations: Linear advection equation, method of characteristics, upwind schemes and their stability. Burgers equation, scalar conservation laws, shocks and rarefactions, Riemann problems, Godunov type schemes, TVD property.

Lecture notes
Script will be provided.

Prerequisites / notice
Chapters of the following book provide supplementary reading and are not meant as course material:

151-3207-00L Lightweight
Abstract
The lecture embraces lightweight materials, construction techniques, design principles and calculation methods for the analysis of the load bearing and failure behavior of lightweight structures.

Objective
The course aims to impart basic principles for the understanding and for the design and dimensioning of modern lightweight constructions in mechanical, automotive and aerospace engineering.

Content
Light metals and fiber reinforced plastics, technologies and construction techniques, frames and truss structures, bending, shear and torsion of open and closed, thin-walled constructions, statically undetermined systems, stability of thin-walled systems.

151-0073-30L Submersible Robot for Underwater Scanning
Abstract
This course is part of a one-year course. The 14 credit points will be awarded at the end of FS2016 with new enrolling for the same Focus-Project in FS2016.

For MAVT BSc and ITET BSc only.

Prerequisites for the focus projects:
- Basis examination successfully passed
- Block 1 and 2 successfully passed

Objective
The various objectives of the Focus Project are:
- Synthesizing and deepening the theoretical knowledge from the basic courses of the 1. - 4. semester
- Team organization, work in teams, increase of interpersonal skills
- Independence, initiative, independent learning of new topic contents
- Problem structuring, solution identification in indistinct problem definitions, searches of information
- System description and simulation
- Presentation methods, writing of a document
- Ability to make decisions, implementation skills
- Workshop and industrial contacts
- Learning and recess of special knowledge
- Control of most modern engineering tools (Matlab, Simulink, CAD, CAE, PDM)
- Convert and experience technical solutions

Prerequisites / notice
This Focus-Project is supervised by the following lecturers:
- Siegwart, R., ASL
- Haas, R., ASL
- Beardsley P., Disney Research Zurich

151-0073-10L Remote Controlled Walking Excavator
Abstract
This course is part of a one-year course. The 14 credit points will be awarded at the end of FS2016 with new enrolling for the same Focus-Project in FS2016.

For MAVT BSc and ITET BSc only.

Prerequisites for the focus projects:
- Basis examination successfully passed
- Block 1 and 2 successfully passed

Objective
Students develop and build a product from A-Z! They work in teams and independently, learn to structure problems, to identify solutions, system analysis and simulations, as well as presentation and documentation techniques. They build the product with access to a machine shop and state of the art engineering tools (Matlab, Simulink, etc).
The various objectives of the Focus Project are:
- Synthesizing and deepening the theoretical knowledge from the basic courses of the 1. - 4. semester
- Team organization, work in teams, increase of interpersonal skills
- Independence, initiative, independent learning of new topic contents
- Problem structuring, solution identification in indistinct problem definitions, searches of information

- Team organization, work in teams, increase of interpersonal skills
- Independence, initiative, independent learning of new topic contents
- Problem structuring, solution identification in indistinct problem definitions, searches of information
- System description and simulation
- Presentation methods, writing of a document
- Ability to make decisions, implementation skills
- Workshop and industrial contacts
- Learning and recess of special knowledge
- Control of most modern engineering tools (Matlab, Simulink, CAD, CAE, PDM)
- Convert and experience technical solutions

---

**Zurich Heart MIAA (Minimal Invasive Aortic Anastomosis)**

This course is part of a one-year course. The 14 credit points will be issued at the end of FS2016 with new enrolling for the same Focus-Project in FS2016.

For MAVT BSc and ITET BSc only.

**Prerequisites for the focus projects:**
- Basis examination successfully passed
- Block 1 and 2 successfully passed

**Abstract**

Students develop and build a product from A-Z! They work in teams and independently, learn to structure problems, to identify solutions, system analysis and simulations, as well as presentation and documentation techniques. They build the product with access to a machine shop and state of the art engineering tools (Matlab, Simulink, etc).

**Objective**

- Synthesizing and deepening the theoretical knowledge from the basic courses of the 1. - 4. semester
- Team organization, work in teams, increase of interpersonal skills
- Independence, initiative, independent learning of new topic contents
- Problem structuring, solution identification in indistinct problem definitions, searches of information
- System description and simulation
- Presentation methods, writing of a document
- Ability to make decisions, implementation skills
- Workshop and industrial contacts
- Learning and recess of special knowledge
- Control of most modern engineering tools (Matlab, Simulink, CAD, CAE, PDM)
- Convert and experience technical solutions

Participants will receive tips, hints and background information from experienced tutors applicable to current projects.

Objective
- Getting aware of all project related aspects (problem understanding, user identification, generation of solution ideas)
- Developing soft skills (presenting, giving and getting feedback, team composition and roles)
- Getting ready to start (motivation, vision, critical thinking, project plan)
- Use of Siemens NX in the corresponding Focus Project

Content
- CAD with Siemens NX
  - 1 day of intensive training (1x8L)
  - 2 separate days of intensive training (2x8L)
- CAE with Siemens NX
  - FreeForm-Modelling, CAE Integration in TeamCenter PDM, Design methodology
  - FreeCAD, Creo Parametric, 3D CAD software

Lecture notes
- Lecture notes and documentation will be electronically available.

Prerequisites / notice
- only for students participating in a Focus Project in the same semester
- not more than 30 students

151-0763-00L Practice Course to Focus Projects on CAD and CAE Based on Siemens NX
Number of participants limited to 30.

Only students for focus projects, 2 up to 3 students per focus project

Abstract
This course provides comprehensive input to ongoing Focus Project teams in the areas of CAD and CAE mit Siemens NX. Other topics can be chosen on top.

Objective
Participants will receive tips, hints and background information from experienced tutors applicable to current projects.

Content
CAD with Siemens NX
- 1 day of intensive training (1x8L)

CAE mit Siemens NX
- 2 separate days of intensive training (2x8L)

Further Topics, free choice (each 1x4L)
- FreeCAD, Creo Parametric, 3D CAD software
- FreeForm-Modelling, CAE Integration in TeamCenter PDM, Design methodology
- FreeCAD, Creo Parametric, 3D CAD software

Lecture notes
Lecture notes and documentation will be electronically available.

Prerequisites / notice
- only for students participating in a Focus Project in the same semester
- not more than 30 students
- use of Siemens NX in the corresponding Focus Project

151-0759-00L Base Camp for Focus Projects
Das Base Camp ist eine intensive Kick Off Veranstaltung für Teilnehmer und Coaches der Fokusprojekte.

Prerequisite: only for students participating in a Focus Project in the same semester

Number of participants limited to 30.

Abstract
The Base Camp is an intense kick-off event for participants and coaches of the Focus Projects. During two days, the teams actively prepare their projects and share their ideas with experienced coaches and other project teams. Based on the individual development goals of the various Focus Projects, the teams work on several design tasks.

Objective
- Getting aware of all project related aspects (problem understanding, user identification, generation of solution ideas)
- Getting ready to start (motivation, vision, critical thinking, project plan)
- Developing soft skills (presenting, giving and getting feedback, team composition and roles)
- Getting different approaches in Product Development (iteration, prototyping, testing, project management)

Content

Prerequisites / notice
Teilnehmer müssen in einem Fokusprojekt eingeschrieben oder Coach eines Fokusprojektes sein

Focus Specialization

Energy, Flows and Processes

Number Title Type ECTS Hours Lecturers
151-0123-00L Experimental Methods for Engineers W 4 credits 2V+2U T. Rösgen, R. S. Abhari, K. Boulouchos, D. J. Norris, H.M. Prasser, A. Steinfield

Abstract
The course presents an overview of measurement tasks in engineering environments. Different concepts for the acquisition and processing of measurement data are introduced. Following an initial in-class introduction, laboratory exercises from different application areas (especially in thermofluidics and process engineering) are attended by students in small groups.

Objective
- Introduction to various aspects of measurement techniques, with particular emphasis on thermo-fluidic applications.
- Understanding of various sensing technologies and analysis procedures.
- Exposure to typical experiments, diagnostics hardware, data acquisition and processing.
- Study of applications in the laboratory.
- Fundamentals of scientific documentation & reporting.

Content
- Introduction to representative measurement techniques in the research areas of the participating institutes (fluid dynamics, energy technology, process engineering).
- Lab reports for all attended experiments have to be submitted by the study groups.
- A final exam evaluates the acquired knowledge individually.

Lecture notes
Presentations, handouts and instructions are provided for each experiment.
Lecture notes are available
Independent studies on a defined field in energy, flows, and processes.

To expound fundamentals in process engineering
Overview of process engineering, reactions, balances and residence time analysis; overview of the thermal separation processes; equilibria

HANDOUTS are EXCLUSIVELY IN GERMAN ONLY, however recommendations for English text books will be provided.

TEACHING LANGUAGE IN CLASS is German OR English (ON DEMAND).

151-0973-00L Fundamentals in Process Engineering

Overview of process engineering, reactions, balances and residence time analysis; overview of the thermal separation processes; equilibria for multiphase systems; introduction into mechanical process engineering and particle technology

151-0971-00L Mass Transfer

This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

151-0109-00L Turbulent Flows

Contents
- Laminar and turbulent flows, instability and origin of turbulence - Statistical description: averaging, turbulent energy, dissipation, closure problem - scalings. Homogeneous isotropic turbulence, correlations, fourier representation, energy spectrum - free turbulence: wake, jet, mixing layer - wall turbulence: channel and boundary layer - Computation and modelling of turbulent flows

151-0135-00L Focused Study: Selected Topics in Research and Application in Energy, Flows and Processes

Abstract
Independent studies on a defined field in energy, flows, and processes.

Literature

ECTS
K. Boulouchos, F. Ernst, Y. M. Wright

Prerequisites / notice
Basic understanding in the following areas:
- fluid mechanics, thermodynamics, heat and mass transfer
- electrical engineering / electronics
- numerical data analysis and processing (e.g. using MATLAB)

151-0293-00L Combustion and Reactive Processes in Energy and Materials Technology

The students should become familiar with the fundamentals and with application examples of chemically reactive processes in energy conversion (combustion engines in particular) as well as the synthesis of new materials.

Objective
The students should become familiar with the fundamentals and with application examples of chemically reactive processes in energy conversion (combustion engines in particular) as well as the synthesis of new materials. The lecture is part of the focus "Energy, Flows & Processes" on the Bachelor level and is recommended as a basis for a future Master in the area of energy. It is also a facultative lecture on Master level in Energy Science and Process Engineering.

Content

Literature

151-0977-00L Reaction Kinetics and Catalysis

Overview of reaction kinetics and catalysis; introduction to homogeneous and heterogeneous reaction mechanisms; reactions of gases, liquids, and solids in the gas phase; introduction to catalysis. The lecture is part of the focus "Energy, Flows & Processes" on the Bachelor level and is recommended as a basis for a future Master in the area of energy. It is also a facultative lecture on Master level in Energy Science and Process Engineering.

Content
Introduction to homogeneous and heterogeneous reaction mechanisms; reactions of gases, liquids, and solids in the gas phase; introduction to catalysis.

Literature

Prerequisites / notice
Basic understanding in the following areas:
- fluid mechanics, thermodynamics, heat and mass transfer
- electrical engineering / electronics
- numerical data analysis and processing (e.g. using MATLAB)

151-0295-00L Turbulent Flows

Focused Study: Selected Topics in Research and Application in Energy, Flows and Processes

Abstract
Independent studies on a defined field in energy, flows, and processes.

Objective
 Independent studies on a defined field in energy, flows, and processes.

Number Title
151-0640-00L Studies on Mechatronics

The following professors can be chosen and please contact the professor directly:
R. D'Andrea, C. Daraio, J. Dual, R. Gassert, C. Onder, C.
Abstract
Overview of Mechatronics topics and study subjects. Identification of minimum 10 pertinent refereed articles or works in the literature in consultation with supervisor or instructor. After 4 weeks, submission of a 2-page proposal outlining the value, state-of-the-art and study plan based on these articles. After feedback on the substance and technical writing by the instructor, project commences.

Objective
The students are familiar with the challenges of the fascinating and interdisciplinary field of Mechatronics and Mikrosystems. They are introduced in the basics of independent non-experimental scientific research and are able to summarize and to present the results efficiently.

Content
The students work independently on a study of selected topics in the field of Mechatronics or Microsystems. They start with a selection of scientific papers to continue literature research. The results (e.g. state-of-the-art, methods) are evaluated with respect to predefined criteria. Then the results are presented in an oral presentation and summarized in a report, which takes the discussion of the presentation into account.

Literature
will be available

Number of participants limited to 26.

Abstract
Signals arise in most engineering applications. They contain information about the behavior of physical systems. Systems respond to signals and produce other signals. In this course, we explore how signals can be represented and manipulated, and their effects on systems. We further explore how we can discover basic system properties by exciting a system with various types of signals.

Objective
Master the basics of signals and systems. Apply this knowledge to problems in the homework assignments and programming exercises.

Content

Lecture notes
Lecture notes available on course website.

Data: 06.10.2017 12:56

Autumn Semester 2015

Page 924 of 1432
Literature

Prerequisites / notice

The registration is limited to 26 students.
There are 4 credit points for this lecture.
The lecture will be held in English.

The students are expected to have basic control knowledge from previous classes.

Microsystems Technology

W 6 credits
4G

C. Hierold, M. Haluska

Abstract

Students are introduced to the basics of micromachining and silicon process technology and will learn about the fabrication of microsystems and -devices by a sequence of defined processing steps (process flow).

Objective

Students are introduced to the basics of micromachining and silicon process technology and will understand the fabrication of microsystem devices by the combination of unit process steps (= process flow).

Content

- Introduction to Microsystems Technology (MST) and Micro Electro Mechanical Systems (MEMS)
- Basic silicon technologies: Thermal oxidation, photolithography, etching, diffusion, and ion implantation, thin film deposition
- Specific Microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical and thermal properties, piezoelectric and piezoresistive materials
- Selected Microsystems: Mechanical sensors and actuators, microresonators, thermal sensors and actuators, system integration and encapsulation

Prerequisites / notice

Lecture notes

Handouts (available online)

- S.M. Sze: Semiconductor Devices, Physics and Technology
- W. Menz, J. Mohr, O. Paul: Microsystem Technology
- G. Kovacs: Micromachined Transducer Sourcebook

Prerequisites: Physics I and II

227-0113-00L

Power Electronics

W 6 credits
4G

J. W. Kolar

Abstract

Fields of application of power electronic systems. Principle of operation of basic pulse-width modulated and line-commutated power electronic converters, analysis of the operating behavior and of the control oriented behavior, converter design. Reduction of effects of line-commutated rectifiers on the mains, electromagnetic compatibility.

Objective

Fields of application of power electronic systems. Principle of operation of basic pulse-width modulated and line-commutated power electronic converters, analysis of the operating behavior and of the control oriented behavior, converter design. Reduction of effects of line-commutated rectifiers on the mains, electromagnetic compatibility.

Content

Prerequisites / notice

Lecture notes and associated exercises including correct answers, simulation program for interactive self-learning including visualization/animation features.

Prerequisites: Basic knowledge of electric circuit analysis and signal theory.

227-0517-00L

Electrical Drive Systems II

W 6 credits
4G

P. Steimer, G. Scheuer, C. A. Stulz

Abstract

...
### Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling

**Objective**
The students establish a deeper understanding in regards of the design of the main components of an electrical drive system. They establish knowledge on the most important interaction with the grid and the machine and their related high dynamic control.

**Content**
- Converter topologies (switch or cell based), multi-pulse diode rectifiers, system aspects of transformer and electrical machines, 3-level inverter with its switching and transfer functions, grid side harmonics, modeling and control of synchronous machines (including permanent magnet machines), control of line-side converters, reflection effects with power cables, winding isolation and bearing stress. Field trip to ABB Semiconductors.

**Prerequisites / notice**
- Skript is sold at the beginning of the lectures or can be downloaded from Ilias
- Skript of lecture; References in skript to related technical publications and books

**Abstract**
The class gives an overview of fundamental concepts in nanoscale engineering. Mobility of small objects, interacting forces, surface tensions and wetting phenomena are some of the physical phenomena investigated. These will be applied to the description of formation and growth of nanoparticles and thin films as well as nanofabrication technologies.

**Objective**
The goal of the lecture is to familiarize the students with the basic phenomena occurring on the nanometer scale, thereby illustrating the links to physics, chemistry, materials science, and biology. A further objective is to demonstrate the development of technologies and processes based on or including nanoscale phenomena.

**Content**
- Nanoparticle building blocks for device fabrication
- Particle size distributions and size selection
- Nanoparticle formation
- Forces between small objects
- Control of nanoparticle properties in the gas-phase
- The electric double layer
- Characterization of nanomaterials
- Microscopes and tools for nanoscale objects
- Thin film formation
- Nanofabrication
- Small "hands-on" research project including project presentations and reporting

**Prerequisites / notice**
- Course "Drive System II" the power semiconductors are repeated. The creation of converters based on the combination of switches/cells and based topologies is explained. Another main focus is on the 3-level inverter with its switching and transfer functions. Further topics are the control of the synchronous machine, of line-side converters and issues with converter-fed machines

Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course students are expected to submit assignments. The course concludes with an end-of-semester examination.

Objective

The objective of this course is to expose students to the fundamentals of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content

Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes

The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

Prerequisites / notice

The lecture will be taught in English.

Focal Study: Selected Topics in Research and Application in Micro- and Nanosystems

Exclusive for D-MAVT Bachelor-students of Focus Specialization "Microsystems and Nanoscale Engineering". Please discuss with your focus coordinator.

Objective

Independent studies on a defined field in micro- and nanosystems.

Content

Fundamentals of Plasmonics
- Basic electromagnetic theory
- Optical properties of metals
- Surface plasmon polaritons on surfaces
- Surface plasmon polariton propagation
- Localized surface plasmons

Applications of Plasmonics
- Waveguides
- Extraordinary optical transmission
- Enhanced spectroscopy
- Sensing
- Metamaterials

Physics I, Physics II

Manufacturing I

Number: 151-0705-00L

Type: O

ECTS: 4 credits

Hours: 2V+2U

Lecturers: K. Wegener, M. Boccadoro,
The course "Machine tool metrolgy" deals with the principal design of machine tools, their spindles and linear axes, with possible assembly as combination of several classes of action like, e.g., joining, handling, fine adjustments, etc. Techniques for joining objects are covered. The study of metal working processes: sheet metal forming, folding die cutting, cold bulk metal forming, ro extrusion, plunging, open die forging, drop forging, milling; active principle; elementary methods to estimate stress and strain; fundamentals of process design; manufacturing limits and machining accuracy; tools and operation; machinery and machine usage. Documents are provided during the course. English handouts available on request.

### 151-0703-00L Operational Simulation of Production Lines

<table>
<thead>
<tr>
<th>Prerequisites / notice</th>
<th>Exercises in the laboratories and with the machine tools of the institute for machine tools and manufacturing (IWF) provide the practical background for this course.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abstract</td>
<td>The student learns the application of the event-driven and computer-based simulation for layout and operational improvement of production facilities by means of practical examples.</td>
</tr>
</tbody>
</table>

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 928 of 1432
Objective
The student learns the right use of (Who? When? How?) of the event-driven and computer-based simulation in the illustration of the operating procedures and the production facilities. Operating simulation in the productions, logistic and scheduling will be shown by means of practical examples. The student should make his first experiences in the use of computer-based simulation.

Content
- Application and application areas of the event-driven simulation
- Exemplary application of a software tool (Technomatrix-Simulation-Software)
- Internal organisation and functionality of simulation tools
- Procedure for application: optimizing, experimental design planning, analysis, data preparation
- Controlling philosophies, emergency concepts, production in sequence, line production, rescheduling
- Application on the facilities projecting

Lecture notes
The knowledge is enhanced by practice-oriented exercises and an excursion. A guest speaker will present a practical example.

Prerequisites / notice
Recommended for all Bachelor-Students in the 5th semester and Master-Students in the 7th semester.

151-0833-00L
Principles of Nonlinear Finite-Element-Methods
W 5 credits 2V+2U N. Manopulo, B. Berisha

151-0573-00L

Fields of application of power electronic systems. Principle of operation of basic pulse-width modulated and line-commutated power electronic converters, analysis of the operating behavior and of the control oriented behavior, converter design. Reduction of effects of line-commutated rectifiers on the mains, electromagnetic compatibility.

Objective
Fields of application of power electronic systems. Principle of operation of basic pulse-width modulated and line-commutated power electronic converters, analysis of the operating behavior and of the control oriented behavior, converter design. Reduction of effects of line-commutated rectifiers on the mains, electromagnetic compatibility.

Content
- Fundamentals of continuum mechanics to characterize large plastic deformations
- Elasto-plastic material models
- Updated-Lagrange (UL), Euler and combined Euler-Lagrange (ALE) approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- Modeling of crack propagation
- Introduction of advanced FE-Methods

Prerequisites / notice
Yes

Literature

If we will have a large number of students, two dates for the exercises will be offered.

Objective
- Crash
- Collapse of structures
- Materials in Biomechanics (soft materials)
- General forming processes

Content
- Fundamentals of continuum mechanics to characterize large plastic deformations
- Elasto-plastic material models
- Updated-Lagrange (UL), Euler and combined Euler-Lagrange (ALE) approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction

Exclusively for D-MAVT Bachelor-students of Focus "Manufacturing Science". Please discuss.
Abstract

With your focus coordinator.

Objective

Independent studies on a defined field in manufacturing and reporting.

151-0723-00L Manufacturing of Electronic Devices

W 4 credits 3G A. Kunz, A. Guber, R.D. Moryson, F. Reichert

Abstract

The lecture follows the value added process sequence of electric and electronic components. It contains: Development of electric and electronic circuits, design of electronic circuits on printed circuit boards as well as in hybrid technology, integrated test technology, planning of production lines, production of highly integrated electronic on a wafer as well as recycling.

Objective

Knowledge about the value added process sequence for electronics manufacturing, planning of electric and electronic product as well as their production, planning of production lines, value added process sequence for photovoltaics.

Content

Nothing works without electronics! Typical products in mechanical engineering such as machine tools, as well as any kind of vehicle contain a significant amount of electric or electronic components of more than 60%. Thus, it is important to master the value added process sequence for electric and electronic components.

The lecture starts with a brief introduction of electronic components and the planning of integrated circuits. Next, an overview will be provided about electronic functional units assembled from these electronic components, on printed circuit boards as well as in hybrid technology. Value added process steps are shown as well as their quality check and their combination for planning a complete manufacturing line. The lecture further describes the manufacturing of integrated circuits, starting from the wafer via the structuring and bonding to the packaging. As an example, the manufacturing of micro-electromechanic and electro-optical systems and actuators is described. Due to similar processes in the electronic production, the value added process sequence for photovoltaics will described too.

The lecture concludes with an excursion to a large manufacturing company. Here, students can see the application and realization of the manufacturing of electric and electronic devices.

Lecture notes

Lecture notes are handed out during the individual lessons (CHF 20.-).

Prerequisites / notice

Help for English speaking students on request.

The lecture is partly given by experts from industry. It is supplemented by an excursion to one of the industry partners.

151-0735-00L Dynamic Behavior of Materials and Structures

W 4 credits 2V+2U D. Mohr

Abstract

Lectures and computer labs concerned with the modeling of the deformation response and failure of engineering materials (metals, polymers and composites) subject to extreme loads during manufacturing, crash, impact and blast events.

Objective

Students will learn to apply, understand and develop computational models of a large spectrum of engineering materials to predict their dynamic deformation response and failure in finite element simulations. Students will become familiar with important dynamic testing techniques to identify material model parameters from experiments. The ultimate goal is to provide the students with the knowledge and skills required to engineer modern multi-material solutions for high performance structures in automotive, aerospace and naval engineering.

Content

Topics include viscoelasticity, temperature and rate dependent plasticity, dynamic brittle and ductile fracture; impulse transfer, impact and wave propagation in solids; computational aspects of material model implementation into hydrocodes; simulation of dynamic failure of structures;

Prerequisites / notice

Various books will be recommended covering the topics discussed in class

Lecture notes

Slides of the lectures, relevant journal papers and users manuals will be provided.

Literature

Biomedical Optics and Lasers.

151-0619-00L Introduction to Biomedical Engineering

W 4 credits 3G R. Müller, P. Christen, J. G. Snedeker, M. Zenobi-Wong

Number

376-0021-00L Introduction to Biomedical Engineering I

W 4 credits 3G R. Müller, P. Christen, J. G. Snedeker, M. Zenobi-Wong

Abstract

Introduction to biomechanics, biomaterials, tissue engineering, medical imaging as well as the history of biomedical engineering.

Objective

Understanding of physical and technical principles in biomechanics, biomaterials, tissue engineering, medical imaging as well as the history of biomedical engineering. Mathematical description and problem solving. Knowledge of biomedical engineering applications in research and clinical practice.

Content

Tissue and Cellular Biomechanics, Molecular Biomechanics and Biopolymers, Computational Biomechanics, Biomaterials, Tissue Engineering, Radiation and Radiographic Imaging, Diagnostic Ultrasound Imaging, Magnetic Resonance Imaging, Biomedical Optics and Lasers.

Lecture notes

Stored on ILIAS.

Literature

Academic Press

151-0519-00L Introduction to Nanoscale Engineering

W 5 credits 2V+3P S. E. Pratsinis, D. J. Norris, C. A. Teleki Harsányi, K. Wegner

Abstract

The class gives an overview of fundamental concepts in nanoscale engineering. Mobility of small objects, interacting forces, surface tensions and wetting phenomena are some of the physical phenomena investigated. These will be applied to the description of formation and growth of nanoparticles and thin films as well as nanofabrication technologies.

Objective

The goal of the lecture is to familiarize the students with the basic phenomena occurring on the nanometer scale, thereby illustrating the links to physics, chemistry, materials science, and biology. A further objective is to demonstrate the development of technologies and processes based on or including nanoscale phenomena.

Content

- Nanoparticle building blocks for device fabrication
- Particle size distributions and size selection
- Nanoparticle formation
- Forces between small objects
- Control of nanoparticle properties in the gas-phase
- The electric double layer
- Characterization of nanomaterials
- Microscopes and tools for nanoscale objects
- Thin film formation
- Nanofabrication
- Small "hands-on" research project including project presentations and reporting

151-0255-00L Energy Conversion and Transport in Biosystems

W 4 credits 2V+1U D. Poulikakos, A. Ferrari

Abstract

Theory and application of thermodynamics and energy conversion in biological systems and biomedicine at the macro scale and the cellular level.
The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual, auditory, and tactile sensing, students will be introduced to the main topics of the course which will focus on human factors in physical human-robot interaction, the basic principles of human-robot interaction, the hardware and software aspects of human-robot systems, and human modeling.

### Main topics of the course include:

- Sensing and actuators: Basic principles of human-robot interaction
- Human-robot interaction: Overview of the field
- Human factors: Psychology and physiology
- Human modeling: Simulation and modeling
- Control systems: Design and implementation
- Human-robot systems: Design and implementation
- Haptic interfaces: Design and implementation
- Virtual environments: Design and implementation
- Human-robot collaboration: Collaboration and communication
- Safety and ethics: Safety and ethics in human-robot interaction
- Applications: Applications in various domains

### Prerequisites

Students are expected to have a basic understanding of control systems, human factors, and computer science.

### Lecture notes

Lecture notes and references will be distributed through the document repository before the lectures.

<tbody>
<tr>
<td>By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and design safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:</td>
<td><a href="http://www.relab.ethz.ch/education/courses/phri.html">http://www.relab.ethz.ch/education/courses/phri.html</a></td>
</tr>
</tbody>
</table>

1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation. |

### Prerequisites

Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (http://eduhaptics.org/index.php/HapticDevices/HapticPaddles), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.

### Literature

Data: 06.10.2017 12:56
Autumn Semester 2015
Page 931 of 1432
The class consists of three parts:

4 credits
Continuum Mechanics 1
Biocompatible Materials
E. Mazza
3G, U. Moser, S. Kozerke
K. Maniura

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

Biocompatible Materials
W 4 credits 3G K. Maniura, J. Möller, M. Zenobi-Wong

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

The class consists of three parts:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed. In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

Handouts provided during the classes and references therin.

Biomedical Imaging
New course. Not to be confused with 227-0385-00L of fall 2014.
W 6 credits 5G S. Kazerke, U. Moser, K. P. Prüssmann, M. Rudin

Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

Handouts provided during the classes and references therein.
Objective
To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

Content
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

Lecture notes
Lecture notes and handouts

Literature
Webb A, Smith N.B. Introduction to Medical Imaging; Physics, Engineering and Clinical Applications; Cambridge University Press 2011

Prerequisites / notice
Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

376-0203-00L Movement and Sport Biomechanics W 4 credits 3G

Abstract
Learning to view the human body as a (bio-) mechanical system. Making the connections between everyday movements and sports activity with injury, discomfort, prevention and rehabilitation.

Objective
Students are able to describe the human body as a mechanical system. They analyse and describe human movement according to the laws of mechanics.

Content
Movement- and sports biomechanics deals with the attributes of the human body and their link to mechanics. The course includes topics such as functional anatomy, biomechanics of daily activities (gait, running, etc.) and looks at movement in sport from a mechanical point of view. Furthermore, simple reflections on the loading analysis of joints in various situations are discussed. Additionally, questions covering the statics and dynamics of rigid bodies, and inverse dynamics, relevant to biomechanics are investigated.

151-0509-00L Microscale Acoustofluidics

Abstract
In this lecture the basics as well as practical aspects (from modelling to design and fabrication) are described from a solid and fluid mechanics perspective with applications to microsystems and lab on a chip devices.

Objective
Understanding acoustophoresis, the design of devices and potential applications

Content
Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microrobotics to surface acoustic wave devices

Abstract
Finding solutions: what is complexity, problem solving cycle.

Objective
A successful participant of the course is able to:
- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyse the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics

Content
Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical systems dynamics, nonlinear dynamics and macroeconomic modeling.

The course is structured along three main tasks:
1. Finding solutions
2. Implementing solutions
3. Controlling solutions

PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Lecture notes
Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM.

Prerequisites / notice
The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture

363-0445-00L Logistics, Operations and Supply Chain Management I

Abstract
Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.
Strategic and tactical concepts in logistics, operations, and supply chain management: Conflicts of objectives and strategies in the process industry.

Lecture notes

This book also serves as textbook for LOS II (spring term) as well as ERP and SCM software systems (autumn term). In addition powerpoint-handouts and documents for case studies.

Prerequisites / notice
As for the lecture of the 3rd week (BEMAD, a much-liked Business Engineering and Management Ability Development game), this lecture (of Oct. 1) will follow a specific schedule in specific rooms. The schedule will be presented at Sept. 17 during the 1st lecture.

Due to the big number of students, about half of the students will play this game, instead of Oct. 1, at Friday afternoon, Oct. 2. Please be available. Thank you for your help in this matter.

<tr>
<td>Objective</td>
<td>This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation? What significance do international economic relations have for Switzerland? This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to every-day economic problems. This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer. Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? What is the best way to protect the environment? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.</td>

<tr>
<td>Abstract</td>
<td>Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. The module provides an overview of the principles of management, teaches knowledge about management that is highly complementary to the students’ technical knowledge, and provides a basis for advancing the knowledge of the various subjects offered at D-MTEC.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Discovering Management offers an integrated learning system, which combines in an innovate format a set of lectures, an advanced business game simulation and a set of group exercises involving industry speakers (ranging from leading venture capitalists to executives at established corporations). Unlike more traditional courses, the learning model for Discovering Management involves 'learning by doing'. While the 13 different lectures, in-class discussions and assigned readings provide the theoretical and conceptual foundations, the experiential learning outcomes result from the interrelated group activities: 1) the interactive case studies and exercises, 2) the business game simulation. By discovering the key aspects of entrepreneurial management, the purpose of the course is to advance students’ understanding of factors driving company success, where success is understood as a broad construct including financial return, employee, customer and supplier satisfaction as well as social and ecological responsibility. Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Entrepreneurial Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich. No prior knowledge of business or economics is required to successfully complete this course.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Content
The lectures for Discovering Management are designed to broaden the participant's understanding of the principles of entrepreneurial management, emphasizing the interdependence of various specialties in the development and management of a firm. For this reason, the lectures are structured on the basis of a coherent business model and will be presented by the respective area specialists at D-MTEC. The lectures broaden the view and the understanding of technology by interlinking it with society. Corporate sustainability, for example, introduces economic, ecological and social issues that are relevant to all engineering disciplines. Practical examples stimulate the students to assess these issues and be aware of their responsibilities as engineers. Technology and innovation management, to mention a second example, focuses on the interplay of technical and organizational change, and how these often neglected interactions explain why many new technologies are never used. It fosters the students' ability to see the business and social consequences of their 'technical' decisions. Critical skills will be trained by the case study exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of the decision maker, as they learn more about the specific case and identify the challenge they are faced with. Students will be presented real case scenarios by industry guests from established corporations and will have to critically analyze specific issues. The case study exercise will provide an insight into the context of a managerial problem-solving and enhance the participant's appreciation for the complex tasks companies deal with. Discovering Management attempts to overcome the limitations of traditional teaching curricula of management in technical universities, which often merely focus on transferring specific skills to students, e.g. planning or forecasting. In response to the new challenges for entrepreneurial decision-making, students will be offered the opportunity to actively engage in an advanced business game simulation; a business game that establishes a link between business management theory and business management in practice. The simulation presents a realistic model of a company and provides participants with the opportunity to quickly gain the lasting effects of practical experience in a risk-free environment. All this provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyze the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities.

Prerequisites / notice
Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Business Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich.

No prior knowledge of business or economics is required to successfully complete this course.

</table>
1. Modelling path dependence and formation of standards
   - Why do clocks go clockwise? Why do people in most nations drive on the right? Why do nearly all computer keyboards have the QWERTY layout, even though it is more inefficient compared to DVORAK? It turns out that many real-world processes are path dependent, i.e. small random events early in their history determine the ultimate end state, even when all end states are equally likely at the beginning. Students will learn how to model such processes, to understand the feedback mechanisms that lead to path dependence. As a case in point, we will study the ‘war’ between the Betamax and the VHS standards.

2. Optimal migration as promoter of cooperation
   - Mechanisms to promote cooperative behaviour is a vibrant research topic in various fields - economics, evolutionary biology and management science to name but a few. Students will be introduced to one such mechanism - migration. They will develop and analyse a macroscopic model to study how the rate of migration affects the long-term cooperation rate in a population.

3. Information transfer
   - Information flow in a social system (e.g. about the location of resources or appearance of a competitor) is an important component of group living. It is well known that ants can achieve remarkable feats in finding an optimal route to a food patch through pheromone trails. The goal of this study case is to model information transfer in such systems by investigating the dynamics of trail formation in ants. The students will learn that complexity in navigating to a food source may nevertheless be explained as a simple dynamical system with one control parameter only.

4. Decisions in social societies
   - In many situations individuals have to decide between two or more options. Such decisions often have a profound impact on the system as a whole, especially regarding group cohesion. Group cohesion is preferred, as individuals can benefit from living in groups, yet it may not be the underlying reason behind individual choices. In this case, students will develop and extend a macroscopic model of an animal social system faced with a decision to choose a new home, and identify the conditions which promote group cohesion versus group splitting.

5. Antigenic variation of HIV
   - One of the characteristic traits of HIV is that a host can be a carrier and a transmitter of the virus without experiencing symptoms for up to 10 years. This case is concerned with finding the mechanism of HIV disease progression. The students will develop a general population-based model for the interaction of an infectious agent with the host immune system. The model is applicable to a variety of infectious agents, ranging from acute lethal infections to chronic illness. Through analysing and simulating the model, the students will understand how the HIV virus interacts with the host and how the mutation rate of the virus is ultimately responsible for this long asymptomatic period.

6. Compartmental models in epidemiology
   - Many diffusive processes in social systems, such as epidemics, can be understood as a result of the interaction between a few groups (compartments) of individuals. The most common example is to divide a population into those who are susceptible (S) to a disease, those who are infected (I), and those who have recovered (R) and are immune, and to model their interactions. These so called SIR models find wide application in studying non-biological diffusive processes, e.g. spread of technological innovations, fads, internet memes etc. In this study case, students will become familiar with the basic components of an SIR model and the conditions under which a disease can cause the outbreak of an epidemic. Students will extend the basic model to investigate more realistic scenarios relevant to e.g. different vaccination strategies.

Objective
Understand the limits and the potential of corporate sustainability for sustainable development

Objective
Develop critical thinking skills that are useful for corporate sustainability (argumentation, communication, evaluative judgment)

Objective
Be able to recognize and realize opportunities for corporate sustainability in a business environment

Objective
Overview of the grand sustainability challenges of Water, Energy, Mobility, and Food

Objective
Business implications of sustainable development, in particular for corporate strategy, marketing & leadership, technology & innovation, and financial markets.

Literature
Presentation slides will be distributed prior to lectures.

Literature
Presentation slides will be distributed prior to lectures.
The task of each team (typically 2-4 students) is the realization of a load-carrying structure with selected materials. The teams are free to choose the materials and the design of their structures. The project is structured as described below:

- Concept development
- Design of the component including FE simulation and stability checks
- Manufacturing and structural testing of a prototype
- Manufacturing and structural testing of an improved component
- Report

The project work is supported by selected teaching units.

Content: Basic theories for structure integrity calculations are presented with focus on strength, stability, fatigue and elasto-plastic structural analysis. Theories and models for one dimensional and planar structures are presented based on energy theorems.

Inhalt:
1. Basic problem of continuum mechanics and energy principles: structural theories, homogenization theories; finite elements; fracture mechanics.
2. Structural theories for planar structures and stability: plane-stress, plane theory, buckling of plates (non-linear plane theory).
3. Strength of material theories and material properties: ductile behaviour, plasticity, von Mises, Tresca, principal stress criterion; brittle behaviour; viscoplastic behaviour, creep resistance.
4. Structural design: fatigue and dynamic structural analysis.

The project is structured as described below:

- Concept development
- Design of the component including FE simulation and stability checks
- Manufacturing and structural testing of a prototype
- Manufacturing and structural testing of an improved component
- Report

The project work is supported by selected teaching units.

Objective: To develop the skills to identify and solve typical problems of the structure mechanics on a real application. Other important aspects are to foster team work and team spirit, to link theoretical knowledge and practice, to gather practical experiences in various fields related to lightweight structures such as design, different CAE-methods and structural testing.

Content: The task of each team (typically 2-4 students) is the realization of a load-carrying structure with selected materials. The teams are free to develop and implement their own ideas. In this context, specified requirements include information about loads, interface to the surrounding structures.

The project work is supported by selected teaching units.

Content
The students are exposed to a variety of topics in the field of Engineering Design. Topics are bundled in three main grand challenges and include an introductory lecture held by one of the responsible Professors and 2-3 invited talks of 45 min. each, addressing specific issues. The success of the course is largely dependant on active involvement of the students. Accordingly, a small group of students (1-3) is asked to introduce and moderate each external talk. The group will therefore gather adequate information about the speaker and topic, read and synthesize relevant documents and scientific papers, prepare questions to motivate the interaction with the audience and summarize, at the end of the lecture, the discussed points and outcome.

Prerequisites / notice
Offered in English and German

<th>K. Shea, P. Ermanni, M. Meboldt</th>
</tr>
</thead>
</table>

**Abstract**
This course introduces students to the exciting world of Engineering Design research, which crosses disciplines and requires a variety of skills. Each student identifies a topic in Engineering Design for further investigation, either based on those proposed or a new, agreed topic.

**Objective**
Students gain their first knowledge of Engineering Design research and carry out their first, independent scientific study. Students learn how to read scientific literature and critically analyze and discuss them, gain hands-on experience in the area and learn how to document their work concisely through a report and short presentation.

**Content**
Students identify 5-10 journal articles, or scientifically equivalent, in consultation with the supervisor and can define a small, related project in the area to gain hands-on experience. In the beginning of the semester, students develop with the supervisor a 2-page proposal outlining the objectives of the study, tasks to be carried out and a brief time plan for the work. Once agreed, the project starts resulting in a report combining the state-of-art literature review and project results, if carried out.

**Prerequisites / notice**
Students take this course in parallel to the Lecture "Grand Challenges in Engineering Design". A general meeting will be held in the beginning of the semester to propose topics for the studies. Topics are carried out individually and can be the pre-study for a Bachelor thesis.

**Mechanics of Nano- and Micro-Materials**

<table>
<thead>
<tr>
<th>W</th>
<th>4 credits</th>
<th>2V+1U</th>
<th>C. Daraio</th>
</tr>
</thead>
</table>

**Abstract**
The course provides an introduction to the mechanics of nano- and micro-materials and devices, in the quasistatic and dynamic domains. It reviews scale effects in materials, surveys available characterization techniques and describes the effects of surfaces and microscale contacts. Recent applications of nano- and micro-materials in engineering systems will be discussed.

**Objective**
Learn the fundamental mechanical properties of nano- and micro-system. Understand the effects of scales on the response of materials. Explore applications and devices exploiting the response of materials at small scales.

**Content**
Follows soon

**Lecture notes**
Slides and notes from the course will be provided.

**Literature**
Relevant articles and reading materials will be provided. Various books will be recommended pertaining to the topics covered.

</table>

**Abstract**
The course covers fundamentals of computational optimization methods in the context of engineering design. It develops skills to formally state and model engineering design tasks as optimization problems and select appropriate methods to solve them.

**Objective**
The lecture and exercises teach the fundamentals of optimization methods in the context of engineering design. After taking the course students will be able to express engineering design problems as formal optimization problems. Students will also be able to select and apply a suitable optimization method given the nature of the optimization model. They will understand the links between simulation, optimization and engineering design in order to design more efficient and performance optimized technical products. The exercises are MATLAB based.

**Abstract**
The lecture embraces lightweight materials, construction techniques, design principles and calculation methods for the analysis of the load bearing and failure behavior of lightweight structures.

**Objective**
The course aims to impart basic principles for the understanding and for the design and dimensioning of modern lightweight constructions in mechanical, automotive and aerospace engineering.

**Content**
Light metals and fiber reinforced plastics, technologies and construction techniques, frames and truss structures, bending, shear and torsion of open and closed, thin-walled constructions, statically undetermined systems, stability of thin-walled systems.

**Lecture notes**

**Dynamic Behavior of Materials and Structures**

<table>
<thead>
<tr>
<th>W</th>
<th>4 credits</th>
<th>2V+2U</th>
<th>D. Mohr</th>
</tr>
</thead>
</table>

**Abstract**
Lectures and computer labs concerned with the modeling of the deformation response and failure of engineering materials (metals, polymers and composites) subject to extreme loadings during manufacturing, crash, impact and blast events.

**Objective**
Students will learn to apply, understand and develop computational models of a large spectrum of engineering materials to predict their dynamic deformation response and failure in finite element simulations. Students will become familiar with important dynamic testing techniques to identify material model parameters from experiments. The ultimate goal is to provide the students with the knowledge and skills required to engineer modern multi-material solutions for high performance structures in automotive, aerospace and naval engineering.

**Content**
Topics include viscoelasticity, temperature and rate dependent plasticity, dynamic brittle and ductile fracture; impulse transfer, impact and wave propagation in solids; computational aspects of material model implementation into hydrocodes; simulation of dynamic failure of structures;

**Lecture notes**
Slides of the lectures, relevant journal papers and users manuals will be provided.

**Literature**
Various books will be recommended covering the topics discussed in class

**Prerequisites / notice**
Course in continuum mechanics (mandatory), finite element method (recommended)

Abstract

Only one course can be chosen per semester.

Objective

Introducing the practical application of measuring- and analysis-methods for determination of transfer functions of mechanical structures. Evaluation and preparation of the measured data for visualisation and interpretation of the dynamic behaviour.

Content

Acquaintance with the acceleration- and force-sensors, measurement of transfer functions of mechanical structures, determination and description of modes of vibration by means of practical examples, introduction into the vibration theory and its fundamental terms, discrete oscillator.

Lecture notes

yes, distribution in the course (CHF 20.-)

Literature

David Ewins, Modal Testing: Theory and Practice

Prerequisites / notice

In the practical part of the course the participants self will make measurements on structures and then analyse them for eigenfrequencies and modes of vibrations.

Number of participants limited to 18.

Abstract

Structural testing is a very broad and interdisciplinary field. Taking into account the limited time, the scope of this tool-course is to provide a general introduction to structural testing, with particular attention to theoretical and practical aspects of strain gage measurements. Furthermore a real engineering case is presented and discussed in small groups.

Objective

Introduction to structural testing. Focus lies in measurements with strain gages. Selected case-studies help the participant to better understanding critical issues and possible solutions.

Content

Working with strain gages preparation of the structure, positioning and application of the strain gages, data-gathering, verification.

Introduction to Structural Testing (Theory)

Number of participants limited to 25.

Abstract

Objective

Modern Fem tools for virtual modeling of forming processes. The course provides following concepts:
- Fundamentals of non linear Finite-Element-Methods (FEM)
- The development of the virtual model
- Material properties
- Tool and contact conditions
- Process evolution
- Introduction to AUTOFORM software
- Independent simulation exercises

Content

The simulation tool AUTOFORM allows the design of metal working manufacturing processes, optimization and additionally the possibility to examine the expected process robustness of fabrication processes. The methods are exemplified and the application of the software is exercised in the scope of this course.

Content

1. Understanding the changing environment
   - Globalization, customer requirements, production systems
   - Six Sigma quality philosophy
   - Lean Manufacturing and TPS (Toyota Production System)

2. Quality management with Six Sigma
   - What is Six Sigma
   - DMAIC problem solving cycle
   - Use of different control charts
   - Evaluate process capability, DPMO, Cp, Cpk, Taguchi
   - Cause-effect diagram
   - Control plan and sustainability, PDCA

3. Introduction to the Lean approach
   - Lean goals and principles
   - A3 project management
   - The 9 types of waste
   - Value add and non value add activities
   - The 8 Lean-Tools, whereof 4
   - 5S workplace organization
   - Value stream mapping (excercise), Little's law
   - Continuous flow vs batch
   - Pull Principles, Kanban, DBR
   - Cell design
   - Linear Programming

4. Lean and Six Sigma in practice
   - How fits Lean and Six Sigma together
   - Continuous Improvement/Kaizen organization
   - Change-Management, risks
   - Inspire deployment approach

Lecture notes

Notes will be distributet.

151-0044-10L Engineering Tool IV/V: Computational Fluid Dynamics W 0.4 credits 1K P. Jenny
(CFD) with OpenFoam
All Engineering Tool courses are for MAVT-Bachelor students only.

Number of participants limited to 40.

Abstract
Participants will learn to use the open source simulation software OpenFOAM on a user level (i.e. to conduct classical CFD studies). We will also introduce the students into programming with OpenFOAM so they will be able to implement additional equations into existing solvers.

Objective
Participants will learn to use the open source simulation software OpenFOAM on a user level (i.e. to conduct classical CFD studies). We will also introduce the students into programming with OpenFOAM so they will be able to implement additional equations into existing solvers.

Content
OpenFOAM is a very professional open-source simulation package which is freely (CHF 0.-) available under the GNU General Public License (GPL). It consists of a vast C++ library, many different applications and additional tools. Although most of the existing applications are flow solvers, OpenFOAM can be used in many different areas, as varied as solid dynamics, electromagnetics or pricing of financial options.

Most users make only use of the included applications. One particular strength of OpenFOAM, however, is that new applications and even extensions of the library can be developed in a rather compact and elegant way.

Literature

Prerequisites / notice
Knowing C++ or at least having some experience in another programming language will be of an advantage but is not strictly required to follow this course.

151-0057-10L Engineering Tool IV/V: Systems Engineering for Project Work W 0.4 credits 1K R. Züst, K. Wegener
All Engineering Tool courses are for MAVT-Bachelor students only.

Number of participants limited to 60.

Abstract
The course is about a methodical basis of systematic project work, with a focus on demanding interdisciplinary problems. The participants will be shown how to use it appropriately and correctly in their projects. This short course is based on the "Systems Engineering" (SE) method, which was developed at the ETH.

Objective
The goals of this compact course are:
- Goal-oriented identification and perception of relevant problem areas and project goal setting.
- Deduction and development of procedures for a promising project, including systematic planning of the project content.
- Development of work packages including efficient methodology
- Simple embedding of the projects in the organization, including relationships with buyers, users and securing project participation.
By looking at specific examples during class you will obtain an overview on composing scientific papers (e.g. bachelor theses, semester theses, master theses) using LaTeX and acquire the most important commands to typeset complex formulas, tables and graphics. Only one course can be chosen per semester.

Abstract

The participants learn about the procedures and tools that are necessary to develop technical products. The focus is on computer-based design and development and the management in an integrated software environment.

Objective

The participants will deepen their existing CAD knowledge and learn new PDM knowledge, so that these may be directly applied and used in the focus project.

- CAD refresh (Modelling, Assembling, Drafting, etc.) and CAD mythology for construction (Top-Down modelling)
- Introduction to the Team Center (Siemens PDM System)
- TeamCenter data flow, in particular the process of creating and managing new Items and Parts, the approval procedure and creating different versions of Parts
- Organisation, working methods, conventions.

Content

1. Nachmittag:
   i. Sketch and features as well as manipulation and optimizing models.
   ii. Assembling
   iii. Drafting.
   iv. Organisation. working methods, conventions.
   - Top down modelling CAD
   i. Introduction to top down modelling and concept modelling
   ii. Case study of top down modelling

2. Nachmittag: Introduction to TC (Team Center)
   - Introduction: Short introduction to PLM (What is the idea of PLM? PLM is more than the pure management of drawings!).
   - Lesson 1 - Team Center Rich Client Interface
   - Lesson 2 - TC data types
   - Lesson 3 - Construction from data in TC
   - Lesson 4 - Searching for and examining data.

3. Nachmittag: TC application
   - Lesson 5 - Unit lists (PSE)
   - Lesson 6 - Cross-referencing
   - Lesson 7 - Data release
   - Lesson 8 - Product data examination

Prerequisites / notice

- at least two students of a Focus-Team should sign in for this course, if teh use of Siemens TeamCenter PLM is given for the Team.
- only for students participating in a Focus Project in the same semester
- not more than 25 students

151-0061-10L Engineering Tool IV/V: Scientific Writing with LaTeX and Vector Graphics

All Engineering Tool courses are for MAVT-Bachelor students only.

Number of participants limited to 40.

Abstract

This course provides insights into the structure and compilation of scientific papers and publications using LaTeX as well as open source software for image editing and the creation of vector graphics. LaTeX is a typesetting tool that separates text format and layout. It is widely used for reports and publications in the scientific domain.

Objective

By looking at specific examples during class you will obtain an overview on composing scientific papers (e.g. bachelor theses, semester theses, master theses) using LaTeX and acquire the most important commands to typeset complex formulas, tables and graphics.
Content
-- layout of scientific reports
-- writing with LaTeX (structure, formatting, formulas, tables, graphics, references, table of contents, hyperlinks, packages) based on a
  template for bachelor/ semester/ master theses.
-- graphic design and illustration using open source software and Matlab
-- including PDF files in the report (project description, data sheets)
-- managing bibliography databases

Literature
http://www.relab.ethz.ch/education/courses/engineering-tools-latex.html

Prerequisites / notice
Particular: The exercises will be done on your personal laptop (at least one laptop per two students). The entire LaTeX package, Inkscape and Gimp
should be installed in advance.

151-0067-10L Engineering Tool IV: Sketching and Visualization of Technical Concepts
All Engineering Tool courses are for MAVT-Bachelor students only.

Number of participants limited to 20.

Abstract
This course is offered by the Design and Technology Lab Zurich. Effective visualizations of ideas are essential to communicate technical
concepts. This course focusses on the basics of a coherent draft design through forms of sketches using various simple techniques.

Objective
Mastering various simple techniques for the visualization of technical ideas.

Content
Basics in: Perspective, line drawing, proportions, implementation of the plan views of perspective

Lecture notes
will be distributed

Literature
It requires no further books

Prerequisites / notice
Max 20 participants

Material: Paper and pens

151-0069-10L Engineering Tool IV: Design Optimization and CAD
All Engineering Tool courses are for MAVT-Bachelor students only.

Number of participants limited to 20.

Abstract
Participants will learn about the Computer-Aided Engineering fundamentals and methods that are necessary for successful design of
modern technical products. The focus will be placed on the simulation-driven design in the context of product development process as well
as on the fundamentals of the design optimization.

Objective
Basic Computer-Aided Engineering (CAE) knowledge and skills will be acquired to enable students to recognize both the advantages and
the limitations of current CAE tools. Examples of how to build feature-based and parametric models for simulation-driven design
automation will be given along with common pitfalls. The CAE environment will be the Siemens NX 8.5 which couples the simulation
modeling (e.g. structural, thermal, flow, motion, and multiphysics) with design optimization and Feature-Based Design (FBD). After taking
the course students should be able to independently create effective feature-based and parametric models to suit the requirements of
simulation-driven design.

Content
1. Computer-Aided Engineering (CAE) methods and tools in context of design process (2 afternoons):
   * CAE in the context of the design process
   * Simulation-driven design
   * Introduction to design optimization
   * Features, parameterization and synchronous modeling technology
   * Basic design optimization examples
   * Introduction to Finite-Element Method (FEM) with basic examples

2. Simulation-Driven Design with application to structural design (1 afternoon):
   * Coupling simulation with structural design optimization and feature based-design
   * Simulation driven design examples (single parts and assemblies)

Lecture notes
Handouts in the lecture

Literature
1. CAD NX:
2. CAE NX:
   Reiner, A. and Peter, B. 2010: Simulationen mit NX Kinematik, FEM, CFD und Datenmanagement Mit zahlreichen Beispielen für NX 7.5,
   Carl Hanser Verlag GmbH & Co. KG, eISBN: 978-3-446-42611-5

Prerequisites / notice
Max. 25 participants

151-0091-10L Engineering Tool IV: Scientific Writing
All Engineering Tool courses are for MAVT-Bachelor students only.

Number of participants limited to 50.

Abstract
Participants acquire scientific writing basics as a core competency to communicate with different audiences. They apply important methods
and tools to refine a scientific question, research and evaluate the necessary information, quote and paraphrase, and to plan the structure
of their own text.

Objective
Students are able to
- derive and structure ideas for a text starting from a scientific question using simple techniques
- find literature sources, check their relevance and completeness, organize them with a suitable tool and cite correctly
- apply a reading technique for summarizing a text
- distinguish plagiarism, quotation and paraphrase in texts using the presented criteria and correctly cite or paraphrase external content
- use and cite information from the Internet correctly
- plan and structure specialized texts that refer to different target groups

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 943 of 1432
KURSPROGRAMM

1. Halbtag: Recherchieren und Lesen
   (1) Auf Vorhandenem aufbauen
   (2) Ideen generieren
   (3) Recherchieren
   (4) Quellen beurteilen

2. Halbtag: Paraphrasieren nicht Plagiarisieren
   (1) Nachmittag, 3 Stunden, 15 min Pause
   (1) Verantwortlich sein: der Wert des eigenständigen Denkens
   (2) Regeln und Anweisungen: was ist ein Plagiat, wie wird es an der ETHZ gehandhabt, Eigenständigkeitserklärung, Prüfwerkzeuge
   (3) Zitieren und Paraphrasieren - so geht's
   (4) Paraphrasieren oder Zitieren?
   (5) Lesen und verstehen
   (6) Vom Umgang mit Quellen und Material aus dem Internet

3. Halbtag: Einen Text strukturieren und generieren
   (1) Verwendung einer Standard-Textstruktur als Vorlage für ein Outline
   (2) Ein Grundgerüst mit Abschnitten erstellen
   (3) Eine Textabschnitt schreiben

LEHRFORMEN
- Inputs: Kurzvorträge
- Übungen: während des Nachmittags selbständig in Moodle anhand von Fallstudien
- Feedback und Diskussion: Lösungen der Studierenden via Moodle an Dozentenbeamer und Besprechen durch die Dozierenden

Zu allen Inhaltsteilen gibt es Übungsteile in Moodle, für die ein Laptop mit funktionierendem Internetanschluss benötigt wird.

Literatur

Prerequisites / notice
Computer für Online-Übungen während der Veranstaltung.

<table>

<th>Engineering Tool V: Computer-Aided Design Methods W</th>
<th>0.4 credits</th>
<th>1K</th>
<th>T. Stankovic, K. Shea</th>
</tr>
</thead>
</table>

Only one course can be chosen per semester. All Engineering Tool courses are for MAVT-Bachelor students only.

Abstract
Participants will learn about the Computer-Aided Design fundamentals and methods that are necessary to model complex technical products. The focus will be placed on feature-based and parametric modelling that is common to all modern CAD tools used in mechanical engineering design.

Objective
CAD knowledge and skills will be further developed to enable students to recognize both the advantages and the limitations of current Computer-Aided Design tools. Examples of how to build feature-based and parametric models including design automation will be given along with common pitfalls. After taking the course students should be able to independently create effective feature-based and parametric models of mechanical parts.

Content
1. CAD Methods and Feature-Based Design (2 afternoons):
   * CAD in the context of the design process
   * Feature types and their relation to mechanical design
   * Strategies for building feature-based assemblies
   * Integration of digital part libraries
   * Common issues and difficulties with feature interaction

2. CAD and Parametric Modeling (1 afternoon):
   * Designing and building parametric models
   * Design automation to create design variants
   * Common issues and difficulties with parametric modelling

Workshop Training

Abstract
Students are required to conduct a workshop training outside ETH Zurich for a minimum duration of five weeks. The students learn how to operate workshop equipment, and acquire first experience in the realization of an engineering project. They summarize the workshop practice in a work and project description.

Objective
The students learn how to operate workshop equipment, and acquire first experience in the realization of an engineering project.

Prerequisites / notice
The minimum duration of the workshop practice is five weeks. The practice may be done prior to the start of the study.

Laboratory Practice

Students attend at least 10 Laboratory Practices during the 4th and 5th semester. 4 of these must be Physics laboratories. All laboratory work is graded "pass" or "fail". After completion of 10 laboratory training units, 2 credit points will be issued.

Please register online at https://www.mavt.ethz.ch/praktika/index.

Abstract
Selected laboratory experiments in physics, mechanical and process engineering. With the Laboratory Training held during the fourth and fifth semester, the students learn how to handle and apply measurement methods and devices. Students are offered a diversified choice of laboratory experiments at least ten of which must be completed. Four of the chosen experiments must be in physics.

Objective
With the Laboratory Training held during the fourth and fifth semester, the students learn how to handle and apply measurement methods and devices.

Potential supervisors for the Bachelor's Thesis:  
- All D-MAVT professors ([https://www.mavt.ethz.ch/the-department/people/professors.html](https://www.mavt.ethz.ch/the-department/people/professors.html))  
- Professors in other departments who are accredited at D-MAVT ([https://www.mavt.ethz.ch/the-department/people/accredited-professors.html](https://www.mavt.ethz.ch/the-department/people/accredited-professors.html))  
- D-MAVT titula professors ([https://www.mavt.ethz.ch/the-department/people/titular-professors.html](https://www.mavt.ethz.ch/the-department/people/titular-professors.html)). For enrollment, please contact the D-MAVT Student Administration.

**Abstract**  
The bachelor's thesis is the culmination of the program. The students develop, enhance, and demonstrate their methodological abilities to independently tackle and solve a given research problem. The thesis furnishes the students with their first major research experience and is a further development of the work done in the basis courses, and usually, the focused study.

**Objective**  
The students develop, enhance and demonstrate their methodological abilities to independently tackle and solve a given research problem.

**Content**  
The topics for the bachelor's thesis are published by the professorship or they can be set in consultation between the professors and the students. Thesis projects in cooperation with the industry are also possible.

**Prerequisites / notice**  
Supervisors should normally be part of the D-MAVT professorship or may be professors accredited by D-MAVT. The bachelor's thesis must be completed within 14 weeks, which is an equivalent half-time workload during a semester.

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The primary objective of this course is that the student develops an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The course consists of three parts: First, we will refresh and deepen the student's knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related aspects of control and flight mechanics. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in robotics. The last part finally covers different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.</td>

## 151-0113-00L Thermodynamics of Novel Energy Conversion

**Abstract**

The course will be given in English: Thermodynamics of novel energy conversion in the framework of this course we will look at a broad spectrum of novel energy conversion processes which are not based on the heat-power-conversion. Especially the production of electrical energy without using mechanical work will be covered.

**Objective**

This course deals with novel energy conversion and storage systems such as fuel cells and micro-fuel cells, batteries, hydrogen production and storage, plasmonics and photovoltaics. The focus of the course is on the physics and basic understanding of those systems as well as their real-world applications.

**Content**

- Thermodynamic overview and exergy analysis;
- Thermodynamics of multi-component-systems (mixtures) and phase equilibrium;
- Electrochemistry;
- Part 2: Novel energy conversion and storage systems:
  - batteries and accumulators;
  - fuel cells and micro fuel cells (fundamentals, fabrication, modelling, and applications);
  - hydrogen production and storage, Fuel reforming;
  - Plasmonics and photovoltaics.

**Lecture notes**

Available (ca. 200 pages in English)

**Prerequisites / notice**

Requirements: successful attendance at lectures "Fluidodynamik I und II", "Thermodynamik I und II"

## 151-0116-00L Introduction to Aircraft and Car Aerodynamics

**Abstract**

This course introduces the principles of aircraft and car aerodynamics. It covers the fundamentals of aerodynamic forces and the behavior of vehicles in different flow conditions.

**Objective**

The objective is to provide a comprehensive understanding of aircraft and car aerodynamics, focusing on the design and performance of vehicles in various environments.

**Content**

- Aerodynamics of Atmosphere:
  - Aerodynamic forces (lift, drag, thrust);
- Aerodynamics of aero vehicles:
  - Aerodynamic forces (lift, drag, thrust);
- Aerodynamics of aero vehicles:
  - Aerodynamic forces (lift, drag, thrust);
- Aerodynamics of aero vehicles:
  - Aerodynamic forces (lift, drag, thrust);

**Lecture notes**

1. Grundlagen der Flugtechnik (Basics of flight science, script in german language);
2. Einführung in die Fahrzeugaerodynamik (Introduction in car aerodynamics, script in german language)

## 151-0235-00L Thermodynamics of Novel Energy Conversion

**Abstract**

This course deals with novel energy conversion and storage systems such as fuel cells and micro-fuel cells, batteries, hydrogen production and storage, plasmonics and photovoltaics. The focus of the course is on the physics and basic understanding of those systems as well as their real-world applications.

**Objective**

This course deals with novel energy conversion and storage systems such as fuel cells and micro-fuel cells, batteries, hydrogen production and storage, plasmonics and photovoltaics. The focus of the course is on the physics and basic understanding of those systems as well as their real-world applications.

**Content**

- Thermodynamic overview and exergy analysis;
- Thermodynamics of multi-component-systems (mixtures) and phase equilibrium;
- Electrochemistry;
- Part 2: Novel energy conversion and storage systems:
  - batteries and accumulators;
  - fuel cells and micro fuel cells (fundamentals, fabrication, modelling, and applications);
  - hydrogen production and storage, Fuel reforming;
  - Plasmonics and photovoltaics.

## 151-0109-00L Turbulent Flows

**Abstract**

This course covers the fundamentals of turbulent flows, with a focus on the measurement and analysis of turbulence in various environments.

**Objective**

The course provides an introduction to digital image analysis in modern flow diagnostics. Different techniques which are discussed include image velocimetry, laser induced fluorescence, liquid crystal thermography and interferometry. The physical foundations and measurement configurations are explained. Image analysis algorithms are presented in detail and programmed during the exercises.

**Content**

- Fundamentals of image analysis; flow visualization and electronic image acquisition;
- Frequently used image processing techniques (filtering, correlation processing, FFTs, color space transforms);
- Image Velocimetry (tracking, pattern matching, Doppler imaging);
- Laser induced fluorescence.

**Lecture notes**

Available (ca. 200 pages in English)

**Prerequisites / notice**

Prerequisites: Fluidodynamics I, Numerical Mathematics, programming skills.

Language: German on request.

## 151-0111-00L Applied Fluid Dynamics

**Abstract**

The methods of fluid dynamics play an important role in the description of a chain of events, involving the release, spreading and dilution of dangerous fluids in the environment. Tunnel ventilation systems and strategies are studied, which must meet severe requirements during normal operation and in emergency situations (tunnel fires etc.).

**Objective**

Generally applicable methods in fluid dynamics and gas dynamics are illustrated and practiced using selected current examples.

**Content**

- Often experts fall back on the methodology of fluid dynamics when involved in the construction of environmentally friendly processing and incineration facilities, as well as when choosing safe transport and storage options for dangerous materials. As a result of accidents, but also in normal operations, dangerous gases and liquids may escape and be transported further by wind or flowing water.
- There are many possible forms that the resulting damage may take, including fire and explosion when flammable substances are mixed. The topics covered include: Emissions of liquids and gases from containers and pipelines, evaporation from pools and vaporization of gases kept under pressure, the spread and dilution of waste gas plumes in the wind, deflagration and detonation of inflammable gases, fireballs in gases held under pressure, pollution and exhaust gases in tunnels (tunnel fires etc.)

**Lecture notes**

Requirements: successful attendance at lectures "Fluidodynamik I und II", "Thermodynamik I und II"
Objective: Basic physical phenomena of turbulent flows, quantitative and statistical description, basic and averaged equations, principles of turbulent flow computation and elements of turbulence modelling.

Lecture notes: Lecture notes are available

151-0163-00L Nuclear Energy Conversion W 4 credits 2V+1U H.M. Prasser

Abstract: Physical fundamentals of the fission reaction and the sustainable chain reaction, thermal design, construction, function and operation of nuclear reactors and power plants, light water reactors and other reactor types, conversion and breeding

Objective: Students get an overview on energy conversion in nuclear power plants, on construction and function of the most important types of nuclear reactors with special emphasis to light water reactors. They obtain the mathematical/physical basis for quantitative assessments concerning most relevant aspects of design, dynamic behaviour as well as material and energy flows.

Content: Nuclear physics of fission and chain reaction. Thermodynamics of nuclear reactors. Design of the reactor core. Introduction into the dynamic behaviour of nuclear reactors. Overview on types of nuclear reactors, difference between thermal reactors and fast breeders. Construction and operation of nuclear power plants with pressurized and boiling water reactors, role and function of the most important safety systems, special features of the energy conversion. Development tendencies of reactor technology.

Lecture notes: Hand-outs will be distributed. Additional literature and information on the website of the lab: https://www.ethz.ch/content/specialinterest/mav/energy-technology/lab-of-nuclear-energy-systems/en/studium/teaching-materials/151-0163-00l-nuclear-energy-conversion.html

Literature: Dieter Smidt: Reaktortechnik, Band 1 und Band 2, G. Braun Karlsruhe, 1971

151-0951-00L Process Design and Safety W 4 credits 2V+1U P. Rudolf von Rohr

Abstract: Process design and safety deals with the fundamentals of process apparatus, plant design and safety.

Objective: The goal of the lecture is to expand design characteristics of systems for process engineering applications.

Content: Fundamentals of plant and apparatus design; materials in the process industries, mechanical design and design rules of main components; pumps and fans; piping and armatures, safety in process industry

Lecture notes: Script is available, english slides will be distributed

636-0001-00L Separations in Biotechnology and Bioprocess Economy W 6 credits 3G S. Panke

Abstract: Separations play an integral part of any biotechnological process. This course aims at enabling students specifically with a chemistry/biology background to select & roughly design suitable separation processes for typical biotechnological products such as monoclonal antibodies, antibiotics, and fine chemicals and at providing a basic set of purification operations & judge on process economy.

Objective: Students should be able to select for a given biotechnological product a suitable set of purification operations and judge on process economy.

Content: Introduction membrane operations, adsorption and chromatography, crystallization, overall process economics

Lecture notes: Handouts during course

151-0927-00L Rate-Controlled Separations in Fine Chemistry W 4 credits 3G M. Mazzotti

Abstract: The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Objective: The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Content: The class covers separation techniques that are central in the purification and downstream processing of chemicals and biopharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Liquid-liquid extraction; 2) Adsorption and chromatography; 3) Membrane processes; 4) Crystallization and precipitation.

Lecture notes: Handouts during the class

Literature: Recommendations for text books will be covered in the class

Prerequisites / notice: Requirements: Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

636-0507-00L Synthetic Biology II W 4 credits 4A S. Panke, Y. Benenson, J. Stelling

Abstract: 7 months long design project, during which the students are required to give presentations on advanced topics in synthetic biology (specifically genetic circuit design) and then select their own biological system to design. The system is subsequently modelled, analyzed, and experimentally implemented. Results are presented at an international student competition at the MIT (Cambridge).

Objective: The students are supposed to acquire a deep understanding of the process of biological design including model representation of a biological system, its thorough analysis, and the subsequent experimental implementation of the system and the related problems.

Content: Presentations on advanced synthetic biology topics (e.g. genetic circuit design, adaptation of systems dynamics, analytical concepts, large scale de novo DNA synthesis), project selection, modeling of selected biological system, design space exploration, sensitivity analysis, conversion into DNA sequence, (DNA synthesis external,) implementation and analysis of design, summary of results in form of scientific presentation and poster, presentation of results at the iGEM international student competition (www.igem.org).

Lecture notes: Handouts during course

Prerequisites / notice: The final presentation of the project is typically at the MIT (Cambridge, US). Other competing schools include regularly Imperial College, Cambridge University, Harvard University, UC Berkeley, Princeton University, CalTech, etc.

This project takes place between end of Spring Semester and beginning of Autumn Semester. Registration in April.

Please note that the number of ECTS credits and the actual work load are disconnected.

151-0933-00L Seminar on Advanced Separation Processes Z 0 credits 1S M. Mazzotti

Abstract: Research seminar for master's students and doctoral students.
Objective

Research seminar for master's students and doctoral students

529-0193-00L Renewable Energy Technologies I W 4 credits 3G A. Wokaun, A. Steinfeld

Abstract

This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

Objective

The lectures Renewable Energy Technologies I (529-0193-00L) and Renewable Energy Technologies II (529-0191-01L) can be taken independently from one another.

Content

Scenarios for world energy demand and CO2 emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass, solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry), Wind and ocean energy, heat pumps, geothermal energy, energy from waste, CO2 sequestration.

Prerequisites / notice

Fundamentals of chemistry and physics are a prerequisite for this course.

Lecture notes

Lecture notes will be distributed during the course.

Literature

227-0950-00L New Enterprises for Engineers W 4 credits 3G R. S. Abhari, A. Gawlikowska

Abstract

New Enterprises for Engineers (NEF) is a research seminar for master's students and doctoral students. The class is practical in nature but emphasizes the basic understanding of the parameters that significantly contribute to the success of a new enterprise. It will be highly interactive with special selected guests from Selected guests from; companies founder, venture capital and business angel, and large corporation executive. Class attendance and active participation is required.

Objective

The class is practical in nature but emphasizes the basic understanding of the parameters that significantly contribute to the success of a new enterprise. The new enterprise could be stand-alone start up or a new business unit for an existing enterprise.

Content

Goals of the course:
- Transforming Needs to Business Enterprises
- Proposal the role of Needs-Driven Opportunities for new technology enterprises
- Explore links between entrepreneurship and engineering; such as problem solving, planning, system analysis, can-do attitude!
- Making it happen- through sales, marketing, planning, staffing, implementation, financing, and growth. Detailed Plans and execution
- Survival (and success) through cash flow management
- Explore the human issues in any new enterprise
- Alignment of interests between providers of value (founders and staff, VCs) and the providers of capital (Angels, VCs, Corporation)
- Transformations of enterprises along growth path
- Extensive class interactions capped with presentation by each (group) student of new enterprise plan

Lecture notes

Please see http://www.NEFE.ethz.ch

Literature

151-0917-00L Mass Transfer W 4 credits 2V+2U R. Büchel, S. E. Pratsinis

Abstract

This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

Objective

This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

Content

Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Reynolds- and Chilton-Colburn analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogenous and heterogeneous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogenous reaction. Applications.

Prerequisites / notice

Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.

151-0709-00L Stochastic Methods for Engineers and Natural Scientists W 4 credits 3G D. W. Meyer-Massetti

Abstract

The course provides an introduction into stochastic methods that are applicable for example for the description and modeling of turbulent and subsurface flows. Moreover, mathematical techniques are presented that are used to quantify uncertainty in various engineering applications.

Objective

The course provides an introduction into stochastic methods that are applicable for example for the description and modeling of turbulent and subsurface flows. Moreover, mathematical techniques are presented that are used to quantify uncertainty in various engineering applications.
Objective
By the end of the course you should be able to mathematically describe random quantities and their effect on physical systems. Moreover, you should be able to develop basic stochastic models of such systems.

Content
- Probability theory, single and multiple random variables, mappings of random variables
- Stochastic differential equations, Ito calculus, PDF evolution equations
- Polynomial chaos and other expansion methods
All topics are illustrated with application examples from engineering.

Lecture notes
Detailed lecture notes will be provided.

Literature
Some textbooks related to the material covered in the course:

151-0911-00L
Introduction to Plasmonics
W 4 credits 2V+1U D. J. Norris

Abstract
This course provides fundamental knowledge of surface plasmon polaritons and discusses their applications in plasmonics.

Objective
Electromagnetic oscillations known as surface plasmon polaritons have many unique properties that are useful across a broad set of applications in biology, chemistry, physics, and optics. The field of plasmonics has arisen to understand the behavior of surface plasmon polaritons and to develop applications in areas such as catalysis, imaging, photovoltaics, and sensing. In particular, metallic nanoparticles and patterned metallic interfaces have been developed to utilize plasmonic resonances. The aim of this course is to provide the basic knowledge to understand and apply the principles of plasmonics. The course will strive to be approachable to students from a diverse set of science and engineering backgrounds.

Content
Fundamentals of Plasmonics
- Basic electromagnetic theory
- Optical properties of metals
- Surface plasmon polaritons on surfaces
- Surface plasmon polariton propagation
- Localized surface plasmons

Applications of Plasmonics
- Waveguides
- Extraordinary optical transmission
- Enhanced spectroscopy
- Sensing
- Metamaterials

Physics I, Physics II

151-0213-00L
Fluid Dynamics with the Lattice Boltzmann Method
W 4 credits 3G I. Karlin

Abstract
The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations.

Objective
Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations.

During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on.

Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course).

The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microflows among others.

Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.
Content

The course builds upon three parts:

I. Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.
II. Theoretical basis of statistical mechanics and kinetic equations.
III. Lattice Boltzmann method for real-world applications.

The content of the course includes:

1. Background: Elements of statistical mechanics and kinetic theory:
   - Particle’s distribution function, Liouville equation, entropy, ensembles; Kinetic theory: Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation;
   - Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

2. Basics of the Lattice Boltzmann Method and Simulations:
   - Minimal kinetic models: lattice Boltzmann method for single-component fluid, discretization of velocity space, time-space discretization, boundary conditions, forcing, thermal models, mixtures.

3. Hands on:
   - Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).

4. Practical issues of LBM for fluid dynamics simulations:
   - Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.

5. Microflow:
   - Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. Advanced lattice Boltzmann methods:
   - Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

7. Introduction to LB models beyond hydrodynamics:
   - Relativistic fluid dynamics; flows with phase transitions.

Lecture notes

Lecture notes on the theoretical parts of the course will be made available.

Selected original and review papers are provided for some of the lectures on advanced topics.

Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided.

Prerequisites / notice

The course addresses mainly graduate students (MSc/Ph D) but BSc students can also attend.

151-0107-20L High Performance Computing for Science and Engineering (HPCSE) I

Abstract
This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering.

Objective
Introduction to HPC for scientists and engineers
Fundamental of:
1. Parallel Computing Architectures
2. MultiCores
3. ManyCores

Content
Programming models and languages:
1. C++ threading (2 weeks)
2. OpenMP (4 weeks)
3. MPI (5 weeks)

Computers and methods:
1. Hardware and architectures
2. Libraries
3. Particles: N-body solvers
4. Fields: PDEs
5. Stochastics: Monte Carlo

Class notes, handouts

151-0182-00L Fundamentals of CFD Methods

Abstract
This course is focused on providing students with the knowledge and understanding required to develop simple computational fluid dynamics (CFD) codes to solve the incompressible Navier-Stokes equations and to critically assess the results produced by CFD codes. As part of the course, students will write their own codes and verify and validate them systematically.

Objective
1. Students know and understand basic numerical methods used in CFD in terms of accuracy and stability.
2. Students have a basic understanding of a typical simple CFD code.
3. Students understand how to assess the numerical and physical accuracy of CFD results.

Content
1. Governing and model equations. Brief review of equations and properties
2. Overview of basic concepts: Overview of discretization process and its consequences
3. Overview of numerical methods: Finite-difference and finite-volume methods
4. Analysis of spatially discrete equations: Consistency, accuracy, stability, convergence of semi-discrete methods
5. Time-integration methods: LMS and RK methods, consistency, accuracy, stability, convergence
6. Analysis of fully discrete equations: Consistency, accuracy, stability, convergence of fully discrete methods
7. Solution of one-dimensional advection equation: Motivation for and consequences of upwinding, Godunov's theorem, TVD methods, DRP methods
8. Solution of two-dimensional advection equation: Dimension-by-dimension methods, dimensional splitting, multidimensional methods
9. Solution of one- and two-dimensional diffusion equations: Implicit methods, ADI methods
10. Solution of one-dimensional advection-diffusion equation: Numerical vs physical viscosity, boundary layers, non-uniform grids
11. Solution of incompressible Navier-Stokes equations: Incompressibility constraint and consequences, fractional-step and pressure-correction methods
12. Solution of incompressible Navier-Stokes equations on unstructured grids

Lecture notes
The course is based mostly on notes developed by the instructor.
Literature

Literature: There is no required textbook. Suggested references are:

Prerequisites / notice

Prior knowledge of fluid dynamics, applied mathematics, basic numerical methods, and programming in Fortran and/or C++ (knowledge of MATLAB is "not" sufficient).

151-0216-00L Wind Energy

Abstract

The objective of this course is to introduce the students to the fundamentals, technologies, modern day application, and economics of wind energy. These subjects are introduced through a discussion of the basic principles of wind energy generation and conversion, and a detailed description of the broad range of relevant technical, economic and environmental topics.

Objective

The objective of this course is to introduce the students to the fundamentals, technologies, modern day application, and economics of wind energy.

Content

This mechanical engineering course focuses on the technical aspects of wind turbines; non-technical issues are not within the scope of this technically oriented course. On completion of this course, the student shall be able to conduct the preliminary aerodynamic and structural design of the wind turbine blades. The student shall also be more aware of the broad context of drivetrains, dynamics and control, electrical systems, and meteorology, relevant to all types of wind turbines.

151-0368-00L Aeroelasticity

Abstract

Introduction to the basics and methods of Aeroelasticity. An overview of the main static and dynamic phenomena arising from the interaction between structural and aerodynamic loads.

Objective

The course will give you a physical basic overview of current-structure phenomena. Furthermore you will get to know the most important phenomena in the statistical and dynamical aeroelastic as well as an introduction to the methods for mathematical descriptions and for the wording of quantitative forecasts.

Content

Literature

151-0104-00L Uncertainty Quantification for Engineering & Life Sciences

Abstract

Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective

The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content

Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Lecture notes

The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Literature

1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes
3. Class Notes

Prerequisites / notice

Fundamentals of Probability, Fundamentals of Computational Modeling

151-0215-00L Introduction to Acoustics, Aeroacoustics and Thermoacoustics

Abstract

This course provides an introduction to Acoustics. The focus will be on phenomena that are relevant for industrial and transport applications in the contexts of noise pollution and mechanical fatigue due to acoustic-structure interactions.

Objective

This course is proposed for Master and PhD students interested in getting knowledge in acoustics. Students will be able to predict sound generation, absorption and propagation using various modeling approaches (analytical, numerical) in configurations that are relevant for practical industrial applications (for example in aeronautics, automotive industry or power plants).

Content

First, orders of magnitudes characterizing sound propagation are reviewed and the constitutive equations for acoustics are derived. Then the different sources (monopole/dipole/quadrupole, punctual, non-compact) are introduced and linked to the noise generated by turbulent flows, coherent vortical structures or fluctuating heat release. The scattering of sound by rigid bodies is given in basic configurations. Analytical, experimental and numerical methods used to analyze sound in ducts and rooms are presented (Green functions, Galerkin expansions, Helmholtz solvers, acoustic field reconstruction, space-state formulation). Modeling strategies to predict self-sustained acoustic oscillations driven by reacting and non-reacting flows are given (system stability, describing function analysis). Finally, guidelines to design active and passive control systems are presented.

Lecture notes

Handouts will be distributed during the class

Literature

Books will be recommended for each chapter

Prerequisites / notice

The use of Matlab and Simulink is required in several lessons which will be announced in advance. The students are expected to bring their own laptop with Matlab installed at these dates.

101-0187-00L Structural Reliability and Risk Analysis

Abstract

Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.

Objective

The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. After this course the students will have refreshed their knowledge of probability theory and statistics to model uncertainties in view of engineering applications. They will be able to analyze the reliability of a structure and to use risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.
Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. When designing new structures and systems, the design codes such as SIA or Euro-codes usually provide a framework that guarantees safety and reliability. However the level of safety is not quantified explicitly, which does not allow the analyst to properly choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FOSM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and pre-post risk assessment methods are presented. Bayesian networks are introduced as a generic numerical tool for solving such problems. The course also includes a tutorial using a software dedicated to real world structural reliability analysis.

<td>Fatigue of materials is playing a key role in light weight structures. All applications are affected that are exposed to oscillating loads. The lecture will present the most important methods for analyzing the fatigue strength under service load conditions. This starts with the conventional assessment of a components endurance limit and ends with the application of the damage tolerance philosophy.</td>
</tr>
<tr>
<td></td>
<td>Objective</td>
<td></td>
<td></td>
<td></td>
<td>Goals of the lecture</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>An introduction to the most important terms and phenomena related to fatigue damages of metallic components will be given and explained by practical examples. Methods for assessment of endurance strength, finite life fatigue strength, crack initiation and crack growth will be discussed. The lecture shall demonstrate how to solve fatigue problems in practice. Examples like the ICE disaster at Eschede or structural problems of the Combino tram demonstrate the significance of this subject. The fatigue behavior of lightweight structures for vehicles and aircrafts has to be considered during the component design process. Designing the static strength of a component alone is not sufficient since fatigue damages of such components may cause extremely high costs. Structural components of modern aircraft like Airbus A380 or A400M are designed with respect to crack growth using the damage tolerance philosophy. Understanding fatigue strength and its phenomena requires broad knowledge of material behavior, services loads, manufacturing effects as well as of analysis and test methods. Fatigue strength is a highly interdisciplinary area of work. For this the most important tools and methods shall be presented.</td>

2.7 Frequency distributions or spectra (Schijve; Chapter 9)
2.8 Impact of spectrum shape
2.9 Design Spectra (Schijve; Chapter 13)

3. MATERIAL
3.1 Fatigue strength overview
3.2 Evaluation of material properties for cyclic loading (Schijve; Chapter 13)
3.3 Fatigue properties (Schijve; Chapter 6)
3.4 Wöhler-Diagram (Schijve; Chapter 6. 7)
3.5 Scatter of fatigue properties (Schijve; Chapter 12)
3.6 Mean stress effect (Schijve; Chapter 6)
3.7 Damage mechanisms & material selection (Schijve; Chapter 2)
3.8 Environmental effects (Schijve; Chapter 16, 17)
3.9 Specific fatigue properties (Schijve; Chapter 6)

4. STRUCTURAL COMPONENT
4.1 Fatigue strength overview
4.2 Notches (Schijve; Chapter 3, 7)
4.3 Residual stresses (Schijve; Chapter 4)
4.4 Size effect
4.5 Surface condition and surface layers (Schijve; Chapter 7, 14)
4.6 Fretting corrosion (Schijve; Chapter 15)
4.7 Summary of fatigue strength improving methods (Schijve; Chapter 14)

5. SAFETY FACTORS (Schijve; Chapter 19)

6. FATIGUE STRENGTH ASSESSMENT
6.1 Fatigue strength overview
6.2 Assessment concepts for fatigue lifetime prediction
6.3 Assessment of the endurance strength
6.4 Finite life fatigue strength assessment using the nominal stress concept (Schijve; Chapter 10)
6.5 Local stress-strain concept (Schijve; Chapter 10)
6.6 Fracture mechanics concept (Schijve; Chapter 5, 8, 11)
6.7 Accuracy of concepts for fatigue lifetime assessment

7. STRUCTURAL INTEGRITY CONCEPTS
7.1 Safe life design (Mirage III, Pressure Vessel)
7.2 Fail safe design (modern aircraft construction)
7.3 Damage tolerance (approach according to US Air Force)
7.4 F/A-18 design philosophy
7.5 Summary

8. EXPERIMENTAL FATIGUE STRENGTH
8.1 In case of interesting current tests laboratory visitation at Empa

Lecture notes
All lecture chapters are on Powerpoint presentations. The chapters will be available as presentation handouts at the first day for a fee of CHF 20.

Literature
Recommended books as supplement to the lecture:
Schijve, Jaap
Fatigue of Structures and Materials

Broek, David
The Practical Use of Fracture Mechanics

Prerequisites / notice
Depending on actual fatigue tests a Laboratory visitation at Empa in Dübendorf may be organized.

151-0353-00L Mechanics of Composite Materials W 4 credits 2V+1U G. Kress

Abstract
The course Mechanics of Composite Materials is dedicated to modeling problems following from the complex mechanical behavior of these anisotropic material structures. and modeling of continuous fibre reinforced composites. Participants will be able to design parts for the mechanical, automotive and aerospace industry.

Objective
Understanding of the mechanical properties of fiber reinforced composites with regard to analysis and design of lightweight structures for mechanical, transportation and aerospace applications.

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 954 of 1432

| Abstract     | Rehab. Engineering is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system. |
| Objective    | Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution. |      |         |         |            |
Content
Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

Prerequisites / notice
Target Group:
- Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich
- Students of other departments, faculties, courses are also welcome

151-0535-00L Optical Methods in Experimental Mechanics W 4 credits 3G E. Hack, R. Brönnimann
The lecture introduces a variety of optical methods to assess the mechanical behaviour of a structure, to determine material parameters, or to validate results from FE analysis. Focus is on camera-based techniques for deformation, strain and stress analysis. Applications and limitations will be thoroughly discussed. The lecture includes two afternoons of hands-on experience at Empa (Dübendorf).

The students are able to describe simple optical set-ups and image formation by using a camera system. They understand the working principle of various camera-based techniques for shape, deformation and strain measurement. Most notably they can explain how the measurand is transformed into an interference signal, a change of polarization or temperature, or a different signal modulation. They know the main application fields of the individual techniques. They are able to choose the most appropriate technique for solving a measurement task and to estimate its expected resolution. Through the hands-on experience the students gain a deeper and sustained understanding of the theoretical content by applying the theoretical foundations to dedicated measurement tasks.

After an introduction into optics and image acquisition the lecture explains how to transform mechanical quantities such as strain, stress or deformation into an image content. Imaging optical measurement techniques for deformation and strain analysis make use of a variety of optical principles:

- Triangulation (Digital Image Correlation, Fringe Projection),
- Interference (Speckle Pattern Interferometry, Shearography),
- Diffraction (Moiré-Interferometry, Fiber Bragg Gratings),
- Birefringence (Photoelasticity)
- Infrared radiation (Thermal Stress Analysis)

In addition, dynamic measurements and vibration analysis are explained in the context of modal analysis or transient events. The calibration of imaging optical methods and their application to the validation of numerical simulations are described.

The content is structured as follows:
1. Imaging methods: an introduction
2. Digital Image Correlation
3. White light moiré methods
4. Interferometry
5. Deformation analysis: Speckle pattern interferometry
6. Strain analysis: Shearography
7. Modal analysis
8. Measurement of transient deformations
9. Stress analysis: Photoelasticity
10. Stress analysis: Thermoelasticity
11. Validation of FEA results and calibration of optical full-field methods
12. Fibre based methods

The lecture includes two afternoons of laboratory experience at Empa, where the student will take the first steps with optical methods. Hands-on experience includes e.g. Digital Image Correlation, Speckle pattern interferometry, Thermal Stress Analysis, Fibre optic sensors, Fringe projection, depending on availability of the equipment and the interest of the students.

Copies of the slides will be made available on-line through ILIAS. A private blog will stimulate the discussion on lecture and exercises.

A good overview on the optical methods is presented in the following text books:

Basic knowledge of optics and interferometry as taught in basic physics courses are advantageous but not compulsory. Every week exercises will be made available. Solving is warmly recommended but voluntary. The two afternoons with hands-on experience, however, are central elements of the lecture.

System Modeling

Abstract

Objective
Introduction to system modeling for control. Analysis and optimization of linear and nonlinear systems. Parameter identification. Case studies.

Content
Introduction to generic system modeling approaches for control-oriented models based on first principles and on experimental data. The working principle of various camera-based techniques for shape, deformation and strain measurement. Most notably they can explain how the measurand is transformed into an interference signal, a change of polarization or temperature, or a different signal modulation. They know the main application fields of the individual techniques. They are able to choose the most appropriate technique for solving a measurement task and to estimate its expected resolution. Through the hands-on experience the students gain a deeper and sustained understanding of the theoretical content by applying the theoretical foundations to dedicated measurement tasks.

Operational Simulation of Production Lines

Abstract
The student learns the application of the event-driven and computer-based simulation for layout and operational improvement of production facilities by means of practical examples.

Objective
The student learns the right use of (Who? When? How?) of the event-driven and computer-based simulation in the illustration of the operating procedures and the production facilities. Operating simulation in the productions, logistic and scheduling will be shown by means of practical examples. The student should make his first experiences in the use of computer-based simulation.

Content
- Application and application areas of the event-driven simulation
- Exemplary application of a software tool (Technomatix-Simulation-Software)
- Internal organisation and functionality of simulation tools
- Procedure for application: optimizing, experimental design planning, analysis, data preparation
- Controlling philosophies, emergency concepts, production in sequence, line production, rescheduling
- Application on the facilities projecting

The knowledge is enhanced by practice-oriented exercises and an excursion. A guest speaker will present a practical example.

Operational Simulation of Production Lines

Abstract
The lecture introduces a variety of optical methods to assess the mechanical behaviour of a structure, to determine material parameters, or to validate results from FE analysis. Focus is on camera-based techniques for deformation, strain and stress analysis. Applications and limitations will be thoroughly discussed. The lecture includes two afternoons of hands-on experience at Empa (Dübendorf).

The students are able to describe simple optical set-ups and image formation by using a camera system. They understand the working principle of various camera-based techniques for shape, deformation and strain measurement. Most notably they can explain how the measurand is transformed into an interference signal, a change of polarization or temperature, or a different signal modulation. They know the main application fields of the individual techniques. They are able to choose the most appropriate technique for solving a measurement task and to estimate its expected resolution. Through the hands-on experience the students gain a deeper and sustained understanding of the theoretical content by applying the theoretical foundations to dedicated measurement tasks.

After an introduction into optics and image acquisition the lecture explains how to transform mechanical quantities such as strain, stress or deformation into an image content. Imaging optical measurement techniques for deformation and strain analysis make use of a variety of optical principles:

- Triangulation (Digital Image Correlation, Fringe Projection),
- Interference (Speckle Pattern Interferometry, Shearography),
- Diffraction (Moiré-Interferometry, Fiber Bragg Gratings),
- Birefringence (Photoelasticity)
- Infrared radiation (Thermal Stress Analysis)

In addition, dynamic measurements and vibration analysis are explained in the context of modal analysis or transient events. The calibration of imaging optical methods and their application to the validation of numerical simulations are described.

The content is structured as follows:
1. Imaging methods: an introduction
2. Digital Image Correlation
3. White light moiré methods
4. Interferometry
5. Deformation analysis: Speckle pattern interferometry
6. Strain analysis: Shearography
7. Modal analysis
8. Measurement of transient deformations
9. Stress analysis: Photoelasticity
10. Stress analysis: Thermoelasticity
11. Validation of FEA results and calibration of optical full-field methods
12. Fibre based methods

The lecture includes two afternoons of laboratory experience at Empa, where the student will take the first steps with optical methods. Hands-on experience includes e.g. Digital Image Correlation, Speckle pattern interferometry, Thermal Stress Analysis, Fibre optic sensors, Fringe projection, depending on availability of the equipment and the interest of the students.

A good overview on the optical methods is presented in the following text books:

Basic knowledge of optics and interferometry as taught in basic physics courses are advantageous but not compulsory. Every week exercises will be made available. Solving is warmly recommended but voluntary. The two afternoons with hands-on experience, however, are central elements of the lecture.

System Modeling

Abstract

Objective
Introduction to system modeling for control. Analysis and optimization of linear and nonlinear systems. Parameter identification. Case studies.

Content
Introduction to generic system modeling approaches for control-oriented models based on first principles and on experimental data. Examples: mechatronic, energy, and process engineering systems. Model scaling, linearization, order reduction, and balancing. Planning of experiments, estimation techniques for "gray-box" models (linear and nonlinear least-squares methods). The exercises are solved in teams. One larger case study is to be solved.

The knowledge is enhanced by practice-oriented exercises and an excursion. A guest speaker will present a practical example.
### 151-0705-00L Manufacturing I

**Objective**
Deepener insight in manufacturing processes: drilling, milling, grinding, honing, lapping, electro erosion and electrochemical machining.

**Content**
- Stability of processes, process chains and process choice.
- Deepened discussion on the machining processes and their optimisation. Outlook for additional areas such as NC-Technique, dynamics of processes and machines, chatter as well as process monitoring.

**Language**
Help for English speaking students on request as well as english translations of slides shown.

**Recommended for**
- Bachelor-Students in the 5th semester and Master-Students in the 7th semester.

---

### 151-0717-00L Mechanical Production: Assembly, Joining and Coating Technology

**Objective**
Understanding of the complexity of the assembly process as well as its meaning as success and cost factor. The assembly with the different aspects of adding, moving, adjusting, controlling parts etc., Adding techniques; soluble and unsolvable connections. Assembly plants. Coating techniques and their tasks, in particular corrosion protection.

**Content**
Assembly as combination of several classes of action like, e.g., joining, handling, fine adjustments, etc. Techniques for joining objects temporarily or permanently. Assembly systems. 
Coating processes and their specific applications, with particular emphasis on corrosion protection.

**Recommended for**
- Focus production engineering.
- Majority of lecturers from the industry.

---

### 151-0719-00L Quality of Machine Tools - Dynamics and Metrology at Micro and Submicro Level

**Objective**
Knowledge of
- principal design of machine tools
- errors of linear and rotational axes and of machine tools,
- influence of errors on the workpiece (error budgeting), with testing of drives and numerical control, as well as with checking the machine tool capability.

**Content**
Metrology for production, machine tool metrology
- basics, like principal machine tool design and machine tool coordinate system
- principal design and errors of linear and rotational axes
- error budgeting, influence of machine errors on the workpiece
- geometric and kinematic testing of machine tools
- reversal measurement techniques, multi-dimensional machine tool metrology
- thermal influences on machine tools and testing these influences
- test uncertainty, simulation
- dynamics of machine systems, dynamic error sources
- machine tool dynamics and the engineering tools modal analysis and finite element method (FEM)
- testing of drives and numerical control
- machine tool capability

**Recommended for**
- Focus production engineering.
- Majority of lecturers from the industry.

---

### 151-0721-00L Production Machines II

**Objective**
Control, closed loop control, processing of geometrical data, main drives, noise, flexibility, rationalization and automation, modern machine concepts, thermal and dynamic behavior

**Content**
Control (PLC, NC), closed loop control, processing of geometrical data, main drives, noise emission, flexibility, rationalization and automation, modern machine concepts like high speed machines, alternative kinematics, ultraprecision machines, thermal and dynamic behavior of machine tools, flexibility, rationalization and automation, practical case studies

**Recommended for**
- English speaking students on request.
- Parts of the lecture are held in english.

---

### 151-0731-00L Forming Technology I - Basic Knowledge

**Objective**
The fundamentals of forming technology are presented to Mechanical, Production and Material Engineers. The content of the lecture is:
- Overview of manufacturing with forming techniques, deformation specific description of material properties and their experimental measurement, material laws, residual stresses, heat balance, tribological aspects of forming processes, workpiece and tool failure.

**Content**
Forming technology represents with its 70% global share in manufactured metal volume with respect to yield and cost, the most important manufacturing process in metal-working industries. Typical applications of forming technology range from the manufacturing of sheet metal components in auto bodies to applications in food and pharma packaging, fabrication of implants in medical technologies and to the fabrication of leads in microelectronic components. This course introduces the fundamentals which are essential to evaluate metal-forming processes and its industrial applications. This includes, together with the acquirements of the most important forming processes, the characterization of plastic behavior and manufacturing.

**Recommended for**
- English speaking students on request.
- Parts of the lecture are held in english.

<td><strong>Principles of Nonlinear Finite-Element-Methods</strong>&lt;br&gt;<strong>Abstract</strong>&lt;br&gt;Most problems in engineering are of nonlinear nature. The nonlinearities are caused basically due to the nonlinear material behavior, contact conditions and instability of structures. The principles of the nonlinear Finite-Element-Method (FEM) will be introduced in the scope of this lecture for treating such problems.&lt;br&gt;&lt;br&gt;<strong>Objective</strong>&lt;br&gt;The goal of the lecture is to provide the students with the fundamentals of the non linear Finite Element Method (FEM). The lecture focuses on the principles of the nonlinear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Methods are simulations of:&lt;br&gt;- Crash&lt;br&gt;- Collapse of structures&lt;br&gt;- Materials in Biomechanics (soft materials)&lt;br&gt;- General forming processes</td>

<td><strong>Image Analysis and Computer Vision</strong>&lt;br&gt;<strong>Abstract</strong>&lt;br&gt;Light and perception. Digital image formation. Image enhancement and feature extraction. Unitary transformations. Color and texture. Image segmentation and deformable shape matching. Motion extraction and tracking. 3D data extraction. Invariant features. Specific object recognition and object class recognition.&lt;br&gt;&lt;br&gt;<strong>Objective</strong>&lt;br&gt;Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.&lt;br&gt;&lt;br&gt;<strong>Content</strong>&lt;br&gt;The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.&lt;br&gt;&lt;br&gt;<strong>Lecture notes</strong>&lt;br&gt;Course material Script, computer demonstrations, exercises and problem solutions&lt;br&gt;&lt;br&gt;<strong>Prerequisites / notice</strong>&lt;br&gt;Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C. The course language is English.</td>

</table>
Basics of fracture mechanics, an engineering discipline that draws upon the principles of applied mechanics and materials science. The course gives the tools to a successful application of fracture mechanics concepts to failure analysis.

Topics covered in the lecture include:

- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA, and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge, and LASSO penalization, non-linear regression, and the bias-variance trade-off
- Non-parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

Lecture notes:
No lecture notes, but slides will be made available on the course webpage.

Lecture notes

Prerequisites:
Solid basic knowledge in analysis, statistics and numerical methods for CSE. Experience in programming for solving the project tasks.

Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++, Visual Computing course recommended.

The programming assignments will be in C++. This will not be taught in the class.

Metals I
Repetition and advancement of dislocation theory. Mechanical properties of metals: hardening mechanisms, high temperature plasticity, alloying effects. Case studies in alloying to illustrate the mechanisms.

Dislocation theory:
Properties of dislocations, motion and kinetics of dislocations, dislocation-dislocation and dislocation-boundary interactions, consequences of partial dislocations, sessile dislocations

Hardening theory:
a. solid solution hardening: case studies in copper-nickel and iron-carbon alloys
b. particle hardening: case studies on aluminium-copper alloys
High temperature plasticity:
thermally activated glide
power-law creep
diffusional creep: Coble, Nabarro-Herring
definition mechanism maps
Case studies in turbine blades
superplastizity
alloying effects

Porter/Easterling, Transformations in Metals and Alloys, Chapman & Hall
Hull/Bacso, Introduction to Dislocations, Butterworth & Heinemann
Courtney, Mechanical Behaviour of Materials, McGraw-Hill

Materials I
Basics of fracture mechanics, an engineering discipline that draws upon the principles of applied mechanics and materials science. The course gives the tools to a successful application of fracture mechanics concepts to failure analysis.

The students should know the possibilities and limitations of the use of standard materials as well as get an idea of new innovative development to prevent failure problems. It is an introduction to the field of fracture mechanics, an engineering discipline that draws upon the principles of applied mechanics and materials science. Cracks and crack-like defects are evaluated with a view to understanding and predicting the cracks' growth tendencies. Such growth may be either stable (relatively slow and safe) or unstable (instantaneous and catastrophic). The course gives the tools to a successful application of fracture mechanics concepts to failure analysis.
Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics?

The Strategic and tactical concepts in logistics, operations, and supply chain management: Conflicts of objectives and strategies and in the finding solutions: what is complexity, problem solving cycle.

A successful participant of the course is able to:

- Understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- Apply the problem solving cycle as a systematic approach to identify problems and their solutions
- Calculate project schedules according to the critical path method
- Analyze the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics
- Predict the rate at which a crack can approach a critical size due to fatigue loads or aggressive environmental conditions
- Determine how large a crack can be in a structure before it leads to catastrophic failure
- Lifetime determination and prediction; failure analysis.

The topics covered are:

- Introduction to Linear Elastic Fracture Mechanics (LEFM): crack tip stress, strain and displacement fields in linear elastic materials (Modes I, II and III); the stress-intensity factor, K; the fracture toughness KIC and their determination; fracture criterion
- Estimates of crack plastic zones in ductile materials
- The compliance method: experimental determination of compliance
- Introduction to fracture mechanics of nonlinear materials: the J-integral; the Jc fracture criterion; Jc testing
- Application of fracture mechanics concepts in the analysis of subcritical crack growth (fatigue, stress corrosion cracking, creep and their combinations)
- Lifetime determination and prediction; failure analysis.

**Logistics, Operations and Supply Chain Management I W 3 credits 2G P. Schönsleben, E. Scherer**

**Abstract**

Students will acquire know-how, from a strategic and tactics viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

**Objective**

An effective and efficient flow of goods, data, and control in and between companies contributes significantly to the value added for the customer. Students will acquire know-how, from a strategic and tactics viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

**Content**

Strategic and tactical concepts in logistics, operations, and supply chain management: Conflicts of objectives and strategies and in the entrepreneurial context; business process analysis and fundamental logistics concepts; the MRP II / ERP concept; business processes and methods; the lean / just-in-time and repetitive manufacturing; concepts for product families and one-of-a-kind production; concepts for the process industry.

**Lecture notes**

This book also serves as textbook for LOS II (spring term) as well as ERP and SCM software systems (autumn term). In addition powerpoint-handouts and documents for case studies.

**Systems Dynamics and Complexity W 3 credits 3G F. Schweitzer, P. Mavrodiev**

**Abstract**

Finding solutions: what is complexity, problem solving cycle.

Implementing solutions: project management, critical path method, quality control feedback loop.

**Objective**

A successful participant of the course is able to:

- Understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- Apply the problem solving cycle as a systematic approach to identify problems and their solutions
- Calculate project schedules according to the critical path method
- Setup and run systems dynamics models by means of the Vensim software
- Identify feedback cycles and reasons for unintended systems behavior
- Analyze the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics
- Predict the rate at which a crack can approach a critical size due to fatigue loads or aggressive environmental conditions
- Determine how large a crack can be in a structure before it leads to catastrophic failure
- Lifetime determination and prediction; failure analysis.

**Lecture notes**

The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.
### Prerequisites / notice
Self-study tasks (discussion exercises, Vensim exercises) are provided as home work. Weekly exercise sessions (45 min) are used to discuss selected solutions. Regular participation in the exercises is an efficient way to understand the concepts relevant for the final exam.

### 351-0555-00L Open- and User Innovation

**Abstract**
The course introduces the students to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies.

**Objective**
The course includes both lectures and exercises alternately. The goal is to understand the opportunity of user innovation for management and develop strategies to harness the value of user-developed ideas and contributions for firms and other organizations. The students actively participate in discussions during the lectures and contribute presentations of case studies during the exercises. The course presents and builds upon recent research and challenges the students to devise innovation strategies that take into account the availability of user expertise, free and public knowledge, and the interaction with communities that span beyond one organization.

**Content**
This course on user innovation extends courses on knowledge management and innovation as well as marketing. The students are introduced to the long-standing tradition of actively involving users of technology and other knowledge-intensive products in the development and production process, and through own cases they develop an entrepreneurial understanding of product development under distributed, user-centered, or open innovation strategies. Theoretical underpinnings taught in the course include models of innovation, the structuration of technology, and an introduction to entrepreneurship.

**Lecture notes**
The slides of the lectures are made available and updated continuously through the SMI website:

**Literature**
Relevant literature for the exam includes the slides and the reading assignments. The corresponding papers are either available from the author online or distributed during class.

**Reading assignments:** please consult the SMI website:

### 363-0711-00L Accounting for Managers

**Abstract**
Overview of financial and managerial accounting
Accounting for current and fixed assets
Liabilities and owners equity
Recording change in balance sheet
Measuring financial performance
Managing financial reporting
Full and variable costing system
Using accounting information for decision making purposes

**Objective**
Understand the different procedures involved in the accounting system
Record change in financial position
Measure business income
Prepare final accounts
Understand the principles of cost accounting
Calculate the different product costs
Make decisions about the acceptance or rejection of a particular product

**Content**
Financial Accounting: Balance sheet, income statement, double-entry accounting, journal and ledger, accounting for merchandising activities, value-added tax, adjustments before final accounts, provisions, depreciation, valuation,

Managerial Accounting: Full costing, variable costing, cost-volume-profit, break-even analysis, activity-based costing

**Prerequisites / notice**
This course is a prerequisite for the course Financial Management.

**Exercises**

### 401-0647-00L Introduction to Mathematical Optimization

**Abstract**
Introduction to basic techniques and problems of mathematical optimization.

**Objective**
The goal is to get a good understanding of some of the most important mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems.

**Content**
Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, network flows, knapsack problem, ...).

**Literature**
Information about relevant literature will be given in the lecture.

**Prerequisites / notice**
This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics and more.

### 401-5640-00L ZüKoSt: Seminar on Applied Statistics

**Abstract**
About 5 talks on applied statistics.

**Objective**
See how statistical methods are applied in practice.

**Content**
There will be about 5 talks on how statistical methods are applied in practice.

**Prerequisites / notice**
This is no lecture. There is no exam and no credit points will be awarded. The current program can be found on the web: http://stat.ethz.ch/events/zukost
Course language is English or German and may depend on the speaker.

### 401-5650-00L Zurich Colloquium in Applied and Computational Mathematics

**Abstract**
Research colloquium

### 151-0917-00L Mass Transfer

**Abstract**
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.
Adaptive materials offer appealing ways to extend the design space of structures by introducing time-variable properties into them. In this lecture, students will be provided with an insight into the properties and physical phenomena that lead to the features of adaptive materials. The study of adaptive materials covers topics that range from chemistry to theoretical mechanics. The aim of this course is to convey knowledge about adaptive materials, their properties and the physical mechanisms that govern their function, so as to develop the skills to deal with this interdisciplinary subject. This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

The objective of this course is to convey knowledge about adaptive materials, their properties and the physical mechanisms that govern their function, so as to develop the skills to deal with this interdisciplinary subject.

This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.
Engineering (HPCSE) I

Abstract
This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering.

Objective
Introduction to HPC for scientists and engineers
Fundamental of:
1. Parallel Computing Architectures
2. MultiCores
3. ManyCores

Content
Programming models and languages:
1. C++ threading (2 weeks)
2. OpenMP (4 weeks)
3. MPI (5 weeks)

Computers and methods:
1. Hardware and architectures
2. Libraries
3. Particles: N-body solvers
4. Fields: PDEs
5. Stochastics: Monte Carlo

Class notes, handouts

Skills for Creativity and Innovation

Abstract
This lecture aims to enhance the knowledge and competency of students regarding their innovation capability. An overview on prerequisites of and different skills for creativity and innovation in individual & team settings is given. The focus of this lecture is clearly on building competencies - not just acquiring knowledge.

Objective
- Basic knowledge about creativity and skills
- Knowledge about individual prerequisites for creativity
- Development of individual skills for creativity
- Knowledge about teams
- Development of team-oriented skills for creativity
- Knowledge and know-how about transfer to idea generation teams

Content
Knowledge about individual prerequisites for creativity:
- Personality, motivation, intelligence

Development of individual skills for creativity:
- Focus on creativity as problem analysis & solving
- Individual skills in theoretical models
- Individual competencies: exercises and reflection

Knowledge about teams:
- Definitions and models
- Roles in innovation processes

Development of team-oriented skills for creativity:
- Idea generation and development in teams
- Cooperation & communication in innovation teams

Knowledge and know-how about transfer to idea generation teams:
- Self-reflection & development planning
- Methods of knowledge transfer

Lecture notes
Slides, script and other documents will be distributed via moodle.ethz.ch

Literature
Please refer to lecture script.

Colloquium on Manufacturing Technology

Abstract
Future training on selected current topics of the manufacturing technology. Per afternoon a selected topic is presented in several lectures, by the majority by experts from the industry. The students prepare a summary of the lectures given and prepare themselves on the basis of these lectures and own information search.

Objective
Continuous further training to current topics of the manufacturing technique. Exchange of experience and knowledge with the industry and other universities.

Content
Selected actual topics on manufacturing methods and tools, machine tools, NC-control and drives, components and measuring methods and devices. Topics are changing every year.

Lecture notes
no Script

Prerequisites / notice
- Students must have participated and passed the courses Manufacturing, Production Machines I and Forming Technology III - Forming Processes.
- Further training with specialized lectures and large participation from the industry.

Language: Help for English speaking students on request.

Aeroelasticity

Abstract
Introduction to the basics and methods of Aeroelasticity. An overview of the main static and dynamic phenomena arising from the interaction between structural and aerodynamic loads.

Objective
The course will give you a physical basic overview of current-structure phenomena. Furthermore you will get to know the most important phenomena in the statistical and dynamical aeroelastic as well as an introduction to the methods for mathematical descriptions and for the wording of quantitative forecasts.
### Human Factors I

**Abstract**
Every day humans interact with various systems. Strategies of interaction, individual needs, physical & mental abilities, and system properties are important factors in controlling the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people’s satisfaction & overall performance.

**Objective**
- Physiological, physical, and cognitive factors in sensation and perception
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

**Content**
- Basic knowledge about role and mindset of a coach;
- Good practices from former focus projects.

**Prerequisites**
Knowledge and reflection about the classical problems in coaching of a focus project; good practices from former focus projects.

**Literature**
- Relevant articles and reading materials will be provided. Various books will be recommended pertaining to the topics covered.

### Mechanics of Nano- and Micro-Materials

**Abstract**
The course provides an introduction to the mechanics of nano- and micro-materials and devices, in the quasistatic and dynamic domains. It reviews scale effects in materials, surveys available characterization techniques and describes the effects of surfaces and microscale contacts. Recent applications of nano- and micro-materials in engineering systems will be discussed.

**Objective**
Learn the fundamental mechanical properties of nano- and micro-system. Understand the effects of scales on the response of materials.

**Content**
- Overview of the role and mind set of a coach as, introduction into coaching methodology, building competencies by doing and exchanging contacts. Recent applications of nano- and micro-materials in engineering systems will be discussed.

### Grand Challenges in Engineering Design

**Abstract**
The course is structured in three main blocks, each of them addressing a specific grand challenge in engineering design. Each block is composed of an introductory lecture and two to three invited talks, considering a good mix between speakers coming from academia and industry. Each talk is introduced and moderated by the students.

**Objective**
The aim of the course is to introduce students to the engineering design research and practice in a multitude of Mechanical Engineering disciplines and convey knowledge from both academia and industry about state of the art methods, tools and processes.

**Content**
The students are exposed to a variety of topics in the field of Engineering Design. Topics are bundled in three main grand challenges and include an introductory lecture held by one of the responsible Professors and 2-3 invited talks of 45 min. each, addressing specific issues.

**Literature**
Slides and notes from the course will be provided. Relevant articles and reading materials will be provided. Various books will be recommended pertaining to the topics covered.

### Leading and Coaching Focus Project Teams (Basic Course)

**Abstract**
This course is the first part of a two-semester course.

The course "Leading and Coaching Focus Project Teams (Basic Course)" for Autumn Semester is examined together with the course "Leading and Coaching Focus Project Teams (Advanced Course)" for Spring Semester with 4 ECTS.

**Objective**
Aim is enhancement of knowledge and competency regarding coaching skills. Participants should be coaches of focus projects. Topics:
- Overview of the role and mind set of a coach as, introduction into coaching methodology, building competencies by doing and exchanging good practices from former focus projects.

- Basic knowledge about role and mindset of a coach;
- Knowledge and reflection of the classical problems in coaching of a focus project;
- Development of personal coaching skills;
- Knowledge and know-how about coaching methods;
- Reflection and exchange of experiences about personal coaching situations;
- Inspiration and learning from good cases regarding organizational and team management aspects.
The lecture provides the students an introduction to modern methods for inequality problems in dynamics. The contents of the lecture are:

- Dynamics of Structure-Variant Systems

Contents:
- Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

- The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Prerequisites / notice:
- The course "Leading and Coaching Focus Project Teams (Basic Course)" (HS) is examined together with "Leading and Coaching Focus Project Teams (Advanced Course)" (FS) in FS with 4 ECTS.

Literature:
- Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Lecture notes:
- Slides, script and other documents will be distributed electronically (access only for participants registered to this course).

Prerequisites:
- Participants (Students, PhD Students, Postdocs) should be part of the coaching team of focus project teams.

Overview:
- The lecture provides the students an introduction to modern methods for inequality problems in dynamics. The contents of the lecture are fitted to frictional contact problems in mechanics, but can be transferred to a large class of inequality problems in technical sciences. The purpose of the lecture is to acquaint the students with a consistent generalization of classical mechanics towards systems with discontinuities, and to make them familiar with inequalities treated as set-valued constitutive laws.

Prerequisites:
- Basic knowledge about role and mindset of a coach

Railway Vehicle Dynamics

W
4 credits
2V+1U
O. Polach

Abstract
After an introduction to the railway vehicle design, the modelling of the contact between wheel and rail, and the building of a simulation model and the fundamentals of the track guiding will be explained. The applications of simulations in the development of railway vehicles will be presented and illustrated on examples.

Objective
Development of the theoretical basics regarding the track guiding and the vehicle running dynamics. Understanding the background of multi-body dynamics simulation tools and their application in the development of railway vehicles.

Content
- Introduction in to railway vehicle technology; Vehicle concepts, bogies, suspension systems, brakes, drives.
- Use of multi-body simulations in the railway vehicle industry. Simulation programmes.
- Vehicle model: Model building, modelling of coil springs, rubber to metal springs, air springs and suspension components with friction.
- Wheel/rail contact: Contact geometry, contact area, normal forces, tangential forces.
- Track models. Modelling of track irregularities.
- Linearization of the contact geometry wheelset-track.
- Fundamentals of track guiding.
- Eigenbehaviour, calculation of eigenvalues.
- Linearised and nonlinear calculation of running stability: Methods and assessment criteria. Influence of vehicle design on the running stability.
- Ride comfort assessment.
- Testing and simulations for the acceptance of running characteristics of railway vehicles. Validation of simulation models for the application in context of vehicle acceptance.

Lecture notes
Script will be provided.

Prerequisites
Fundamentals of mechanics and physics.

Railway Systems I

W
6 credits
4G
M. Meyer

Abstract
Basic characteristics of railway vehicles and their interfaces with the railway infrastructure:
- Transportation tasks and vehicle types
- Running dynamics
- Mechanical part of rail vehicles
- Brakes
- Traction chain and auxiliary supply
- Railway power supply
- Signalling systems
- Traffic control and maintenance

Objective
- Overview of the technical characteristics of railway systems
- Know-how about the design and construction principles of rail vehicles
- Interrelationship between different fields of engineering sciences (mechanics, electro and information technology, transport systems)
- Understanding tasks and opportunities of engineers working in an environment which has strong economical and political boundaries
- Insight into the activities of the railway vehicle industry and railway operators in Switzerland
- Motivation of young engineers to start a career in the railway industry or with railway operators

Content
EST I (Frühjahrsemester) - Begriffen, Grundlagen, Merkmale

1 Einführung:
1.1 Geschichte und Struktur des Bahnsystems
1.2 Fahrdynamik

2 Vollbahnfahrzeuge:
2.1 Mechanik: Kasten, Drehgestelle, Lauftechnik, Adhäsion
2.2 Bremsen
2.3 Traktionsantriebsysteme
2.4 Hilfsbetriebe und Komfortanlagen
2.5 Steuerung und Regelung

3 Infrastruktur:
3.1 Fahrweg
3.2 Bahnstromversorgung
3.3 Sicherungsanlagen

4 Betrieb:
4.1 Interoperabilität, Normen und Zulassung
4.2 RAMS, LCC
4.3 Anwendungsbeispiele

Voraussichtlich ein oder zwei Gastreferate

Geplante Exkursionen:
Betriebszentrale SBB, Zürich Flughafen
Reparatur und Unterhalt, SBB Zürich Altstetten
Fahrzeugfertigung, Stadler Bussnang

Lecture notes
Abgabe der Unterlagen (gegen eine Schutzgebühr) zu Beginn des Semesters. Rechtzeitig eingeschriebene Teilnehmer können die Unterlagen auf Wunsch und gegen eine Zusatzgebühr auch in Farbe beziehen.

Prerequisites
Dozent:
Dr. Markus Meyer, Emkamatik GmbH

Voraussichtlich ein oder zwei Gastvorträge von anderen Referenten.

EST I (Herbstsemester) kann als in sich geschlossene einsemestrige Vorlesung besucht werden. EST II (Frühjahrssemester) dient der weiteren Vertiefung der Fahrzeugtechnik und der Integration in die Bahninfrastruktur.

Microscale Acoustofluidics

W
4 credits
3G
J. Dual

Abstract
In this lecture the basics as well as practical aspects (from modelling to design and fabrication ) are described from a solid and fluid mechanics perspective with applications to microsystems and lab on a chip devices.

Objective
Understanding acoustophoresis, the design of devices and potential applications

Content
Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microrobotics to surface acoustic wave devices
Lecture notes: Dynamic Behavior of Materials and Structures

### Objective

Students will learn to apply, understand and develop computational models of a large spectrum of engineering materials to predict their dynamic deformation response and failure in finite element simulations. Students will become familiar with important dynamic testing techniques to identify material model parameters from experiments. The ultimate goal is to provide the students with the knowledge and skills required to engineer modern multi-material solutions for high performance structures in automotive, aerospace and naval engineering.

### Content

Topics include viscoelasticity, temperature and rate dependent plasticity, dynamic brittle and ductile fracture; impulse transfer, impact and wave propagation in solids; computational aspects of material model implementation into hydrocodes; simulation of dynamic failure of structures.

### Literature

Slides of the lectures, relevant journal papers and users manuals will be provided.

### Prerequisites / notice

Course in continuum mechanics (mandatory), finite element method (recommended)

### Robotics, Systems and Control

<td>Virtual Reality has the potential to support medical training and therapy. This lecture will derive the technical principles of multi-modal (audiovisual, haptic, tactile etc.) input devices, displays and rendering techniques. Examples are presented in the fields of surgical training, intra-operative augmentation, and rehabilitation. The lecture is accompanied by practical courses and excursions. Provide theoretical and practical knowledge of new principles and applications of multi-modal simulation and interface technologies in medical education, therapy, and rehabilitation. Virtual Reality has the potential to provide descriptive and practical information for medical training and therapy while relieving the patient and/or the physician. Multi-modal interactions between the user and the virtual environment facilitate the generation of high-fidelity sensory impressions, by using not only visual and auditory modalities, but also kinesthetic, tactile, and even olfactory feedback. On the basis of the existing physiological constraints, this lecture will derive the technical requirements and principles of multi-modal input devices, displays, and rendering techniques. Several examples are presented that are currently being developed or already applied for surgical training, intra-operative augmentation, and rehabilitation. The lecture will be accompanied by several practical courses on graphical and haptic display devices as well as excursions to facilities equipped with large-scale VR equipment.</td>

### Embedded Control Systems

**J. S. Freudenberg, M. Schmid Daners**

**3G**

**Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions**

**R. Riener, R. Gassert, L. Marchal Crespo**

**Abstract**

Rehab. Engineering is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

**Objective**

Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.
Content

Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

Literature

Introductory Books:

Selected Journal Articles and Web Links:

Prerequisites / notice

Target Group:
Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich
Students of other departments, faculties, courses are also welcome

151-0851-00L Robot Dynamics ■ W 4 credits 2V+1U R. Siegwart, M. Hutter, K. Rudin, T. Staastny
### Objective
The primary objective of this course is that the student deepens an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.

### Content
The course consists of three parts: First, we will refresh and deepen the student’s knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related design and control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in robotics. The last part finally covers different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.

### Literature

### Prerequisites / Notice
The contents of the following ETH Bachelor lectures or equivalent are assumed to be known: Mechanics and Dynamics, Control, Basics in Fluid Dynamics.

### 227-0225-00L Linear System Theory

**Abstract**
The class is intended to provide a comprehensive overview of the theory of linear dynamical systems, their use in control, filtering, and estimation and their applications to areas ranging from avionics to systems biology.

**Objective**
By the end of the class students should be comfortable with the fundamental results in linear system theory and the mathematical tools used to derive them.

**Content**
- Rings, fields and linear spaces, normed linear spaces and inner product spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete time, time varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Controllability and observability, canonical forms, Kalman decomposition. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.
- Realization theory.

**Lecture notes**

**Prerequisites / Notice**
Prerequisites: Control systems (227-0216-00 or equivalent) and sufficient mathematical maturity.

### 227-0920-00L Seminar in Systems and Control

**Abstract**
Current topics in Systems and Control presented mostly by external speakers from academia and industry

**Objective**
see above

### 151-0604-00L Microrobotics

**Abstract**
Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course students are expected to submit assignments. The course concludes with an end-of-semester examination.

**Objective**
The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

**Content**
Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

**Lecture notes**
The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

**Prerequisites / Notice**
The lecture will be taught in English.

### 151-0917-00L Mass Transfer

**Abstract**
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

**Objective**
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

**Content**
Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Reynolds- and Chilton-Colburn analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogenous and heterogenous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogenous reaction. Applications.

**Literature**

**Prerequisites / Notice**
Three tests are offered for practicing the course material. Participation is voluntary.

### 376-1504-00L Physical Human Robot Interaction (pHRI)

**Abstract**
This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.
Objective

The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and design safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the defined design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

Content

This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Students will attend 10 laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (http://edu.haptics.org/index.php/HapticDevices/HapticPaddles), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/vertical coupling, friction, damping, time delays, sampling rate, quantization, etc.), during rendering of different mechanical properties.

Lecture notes

Will be distributed through the document repository before the lectures.

Literature

Prerequisites / notice

Notice:
The registration is limited to 26 students.
There are 4 credit points for this lecture.
The lecture will be held in English.
The students are expected to have basic control knowledge from previous classes.

http://www.relab.ethz.ch/education/courses/phrI.html
Introduction to modeling: Black-box and grey-box models; Parametric and non-parametric models; ARX, ARMAX (etc.) models.

Optimal experimental design, Cramer-Rao bounds, input signal design.

Parametric identification methods. On-line and batch approaches.

Closed-loop identification strategies. Trade-off between controller performance and information available for identification.

Control systems (227-0216-00L) or equivalent.

227-0517-00L Electrical Drive Systems II W 6 credits 4G P. Steimer, G. Scheuer, C. A. Stulz

Abstract: In the course "Drive System II" the power semiconductors are repeated. The creation of converters based on the combination of switches/cells and based topologies is explained. Another main focus is on the 3-level inverter with its switching and transfer functions. Further topics are the control of the synchronous machine, of line-side converters and issues with converter-fed machines.

Objective: The students establish a deeper understanding in regards of the design of the main components of an electrical drive system. They establish knowledge on the most important interaction with the grid and the machine and their related high dynamic control.

Content: Converter topologies (switch or cell based), multi-pulse diode rectifiers, system aspects of transformer and electrical machines, 3-level inverter with its switching and transfer functions, grid side harmonics, modeling and control of synchronous machines (including permanent magnet machines), control of line-side converters, reflection effects with power cables, winding isolation and bearing stress. Field trip to ABB Semiconductors.

151-0107-20L High Performance Computing for Science and Engineering (HPCSE) I

Abstract: This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering.

Objective: Introduction to HPC for scientists and engineers

Fundamental of:
1. Parallel Computing Architectures
2. MultiCores
3. ManyCores

Content: Programming models and languages:
1. C++ threading (2 weeks)
2. OpenMP (4 weeks)
3. MPI (5 weeks)

Computers and methods:
1. Hardware and architectures
2. Libraries
3. Particles: N-body solvers
4. Fields: PDEs
5. Stochastics: Monte Carlo

Lecture notes: Skript is sold at the beginning of the lectures or can be downloaded from Ilias

Prerequisites / notice: Skript of lecture; References in skript to related technical publications and books

151-0655-00L Skills for Creativity and Innovation W 4 credits 3G I. Goeller, C. Kobe, M. Meboldt

Abstract: This lecture aims to enhance the knowledge and competency of students regarding their innovation capability. An overview on prerequisites of and different skills for creativity and innovation in individual & team settings is given. The focus of this lecture is clearly on building competencies - not just acquiring knowledge.

Objective

- Basic knowledge about creativity and skills
- Knowledge about individual prerequisites for creativity
- Development of individual skills for creativity
- Knowledge about teams
- Development of team-oriented skills for creativity
- Knowledge and know-how about transfer to idea generation teams

Content: Basic knowledge about creativity and skills:
- Introduction into creativity & innovation: definitions and models

Knowledge about individual prerequisites for creativity:
- Personality, motivation, intelligence

Development of individual skills for creativity:
- Focus on creativity as problem analysis & solving
- Individual skills in theoretical models
- Individual competencies: exercises and reflection

Knowledge about teams:
- Definitions and models
- Roles in innovation processes

Development of team-oriented skills for creativity:
- Idea generation and development in teams
- Cooperation & communication in innovation teams

Knowledge and know-how about transfer to idea generation teams:
- Self-reflection & development planning
- Methods of knowledge transfer
Uncertainty Quantification for Engineering & Life Sciences

Abstract
Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective
The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content
Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Literature
1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Prerequisites / notice
Fundamentals of Probability, Fundamentals of Computational Modeling

Micro & Nanosystems

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
151-0620-00L | Embedded MEMS Lab | W | 5 | 3P | C. Hierold, S. Blunier, M. Haluska

Abstract
Practical course: Students are introduced to the process steps required for the fabrication of MEMS (Micro Electro Mechanical System) and carry out the fabrication and testing steps in the clean rooms by themselves. Additionally, they learn the requirements for working in clean rooms. Processing and characterization will be documented and analyzed in a final report. Limited access

Objective
Students learn the individual process steps that are required to make a MEMS (Micro Electro Mechanical System). Students carry out the process steps themselves in laboratories and clean rooms. Furthermore, participants become familiar with the special requirements (cleanliness, safety, operation of equipment and handling hazardous chemicals) of working in the clean rooms and laboratories. The entire production, processing, and characterization of the MEMS is documented and evaluated in a final report.

Content
With guidance from a tutor, the individual silicon microsystem process steps that are required for the fabrication of an accelerometer are carried out:
- Photolithography, dry etching, wet etching, sacrificial layer etching, critical point drying, various cleaning procedures
- Packaging and electrical connection of a MEMS device
- Testing and characterization of the MEMS device
- Written documentation and evaluation of the entire production, processing and characterization

Prerequisites / notice
The document containing theory, background and practical course content is distributed at the first meeting of the course. The document provides sufficient information for the participants to successfully participate in the course. Participating students are required to attend all scheduled lectures and meetings of the course.

This master's level course is limited to 15 students per semester for safety and efficiency reasons. If there are more than 15 students registered, we regret to restrict access to this course by the following rules:

Priority 1: master students of the master's program in "Micro and Nanosystems"

Priority 2: master students of the master's program in "Mechanical Engineering" with a specialization in Microsystems and Nanoscale Engineering (MAVT-tutors Profs Darbo, Dual, Hierold, Koumoutsakos, Nelson, Norris, Park, Poulikakos, Pratsinis, Stemmer), who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

Priority 3: master students, who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

Priority 4: all other students (PhD, bachelor, master) with a background in silicon or microsystems process technology.

If there are more students in one of these priority groups than places available, we will decide by drawing lots.

Students will be notified at the first lecture of the course (introductory lecture) as to whether they are able to participate.

The course is offered in autumn and spring semester.
### Seminar on Particle Technology

**Abstract**

The goal of the lecture is to convey a basic knowledge in the area of FV materials as well as their construction and production processes and to empower the students to apply the knowledge gained to address current problems in research and practice.

**Objective**

Students attend and give research presentations for the research they plan to do and at the end of the semester they defend their results and answer questions from research scientists. Familiarize the students with the latest in this field.

**227-0377-00L**

**Physics of Failure and Failure Analysis of Electronic Devices and Equipment**

**Abstract**

Failures have to be avoided by proper design, material selection and manufacturing. Properties, degradation mechanisms, and expected lifetime of materials are introduced and the basics of failure analysis and analysis equipment are presented. Failures will be demonstrated experimentally and the opportunity is offered to perform a failure analysis with advanced equipment in the laboratory.

**Objective**

Introduction to the degradation and failure mechanisms and causes of electronic components, devices and systems as well as to methods and tools of reliability testing, characterization and failure analysis.

---

### Microrobotics

**Abstract**

Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course students are expected to submit assignments. The course concludes with an end-of-semester examination.

**Objective**

The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

**Content**

- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetics
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

**Lecture notes**

The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

**Prerequisites / notice**

The lecture will be taught in English.

---

### Seminar on Micro and Nanosystems

**Abstract**

Scientific presentations from the field of Micro- and Nanosystems

**Objective**

In particular, the seminar addresses students, who are interested in scientific work in the field of Micro- and Nanosystem technologies, or who have started already with it. Respectively, current examples in the research will be discussed.

**Content**

---

Introduction to Plasmonics

Mass Transfer

Electromagnetic oscillations known as surface plasmon polaritons have many unique properties that are useful across a broad set of applications in biology, chemistry, physics, and optics. The field of plasmonics has arisen to understand the behavior of surface plasmon polaritons and to develop applications in areas such as catalysis, imaging, photovoltaics, and sensing. In particular, metallic nanoparticles and patterned metallic interfaces have been developed to utilize plasmonic resonances. The aim of this course is to provide the basic knowledge to understand and apply the principles of plasmonics. The course will strive to be approachable to students from a diverse set of science and engineering backgrounds.

Objective

This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

Content

Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Reynolds- and Chilton-Colburn analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogenous and heterogenous reversible and irreversible reactions; diffusion-controlled reactions, mass transfer and first order heterogenous reaction. Applications.

Literature

Prerequisites / notice

Three tests are offered for practicing the course material. Participation is voluntary.

Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino

227-0447-00L Image Analysis and Computer Vision W 6 credits 3G+1U G. Székely, O. Göksel, L. Van Gool

Abstract

Objective

Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content

The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Lecture notes

Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice

Prerequisites:

Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C. The course language is English.

227-0945-00L Cell and Molecular Biology for Engineers I W 3 credits 3G C. Frei

Abstract

This course is part of a two-semester course. The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

Objective

After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

Content

The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

In addition, three journal clubs will be held, where one/two publications will be discussed. For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication. These written documents will be graded, and count as 25% for the final grade.

Lecture notes

Scripts of all lectures will be available.

Literature

227-0965-00L Micro and Nano-Tomography of Biological Tissues W 4 credits 3G M. Stampanoni, K. S. Mader

Abstract

The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets such as segmentation, morphometry and statistics.

Objective

Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.
Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

376-1219-00L Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions
W 3 credits 2V R. Riener, R. Gassert, L. Marchal Crespo

Abstract
Rehab. Engineering is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

Content
Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces
Virtual Reality has the potential to provide descriptive and practical information for medical training and therapy while relieving the patient. It can offer theoretical and practical knowledge of new principles and applications of multi-modal simulation and interface technologies in Virtual Reality in Medicine.

**Introductory Books:**

**Prerequisites / notice**

- Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich

**Target Group:**

- Students of other departments, faculties, courses are also welcome

**376-1279-00L Virtual Reality in Medicine**

**Abstract**

Virtual Reality has the potential to support medical training and therapy. This lecture will derive the technical principles of multi-modal (audiovisual, haptic, tactile etc.) input devices, displays and rendering techniques. Examples are presented in the fields of surgical training, intra-operative augmentation, and rehabilitation. The lecture is accompanied by practical courses and excursions.

**Objective**

Provide theoretical and practical knowledge of new principles and applications of multi-modal simulation and interface technologies in medical education, therapy, and rehabilitation.

**Content**

Virtual Reality has the potential to provide descriptive and practical information for medical training and therapy while relieving the patient and/or the physician. Multi-modal interactions between the user and the virtual environment facilitate the generation of high-fidelity sensory impressions, by using not only visual and auditory modalities, but also kinesthetic, tactile, and even olfactory feedback. On the basis of the existing physiological constraints, this lecture will derive the technical requirements and principles of multi-modal input devices, displays, and rendering techniques. Several examples are presented that are currently being developed or already applied for surgical training, intra-operative augmentation, and rehabilitation. The lecture will be accompanied by several practical courses on graphical and haptic display devices as well as excursions to facilities equipped with large-scale VR equipment.

**Target Group:**

- Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control Master
- Biomedical Engineering/Movement Science and Sport
- Medical Faculty, University of Zurich

**Students of other departments, faculties, courses are also welcome!**

**Literature**

The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and de- sign safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the defined design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neuropsychology and neurophysiology, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (http://edu.haptics.org/index.php/HapticDevices/HapticPaddles), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.

The lecture will be held in English.

There are 4 credit points for this lecture.

Notice:
Devices and Scenarios, pages 157-162.

The course language is English.
Abstract
Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Objective
The class consists of three parts:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

Content
Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed. In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

402-0341-00L Trauma Biomechanics
Abstract
Trauma biomechanics in an interdisciplinary research field investigating the biomechanics of injuries and related subjects such as prevention. The lecture provides an introduction to the basic principles of trauma biomechanics.

Objective
Introduction to the basic principles of trauma biomechanics.

Content
This lecture serves as an introduction to the field of trauma biomechanics. Emphasis is placed on the interdisciplinary nature of impact biomechanics, which combines the use of fundamental engineering principles and advanced medical technologies to develop injury prevention measures. Topics include: accident statistics and accident reconstruction, biomechanical response of the human to impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations using multi-body and finite element modelling techniques, aspects of passive safety of vehicles (focusing on restraint systems and vehicle compatibility). Real world examples mainly from automobile safety are used to augment lecture material.

551-0319-00L Medical Physics I
Abstract
Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

Objective
Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

Content
The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

Lecture notes
A script will be provided.

Literature

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.
Abstract Cross-disciplinary collaboration between engineers and medical doctors is indispensable for innovation in health care. This course will bring together engineering students from ETH Zurich and medical students from the University of Zurich to experience the rewards and challenges of such interdisciplinary work in a project-based learning environment.

Objective The main goal of this course is to demonstrate the differences in communication between the fields of medicine and engineering. Since such differences become the most evident during actual collaborative work, the course is based on a current project in physiology research that combines medicine and engineering. For the engineering students, the specific aims of the course are to:
- Acquire a working understanding of the anatomy and physiology of the investigated system;
- Identify the engineering challenges in the project and communicate them to the medical students;
- Develop and implement, together with the medical students, solution strategies for the identified challenges;
- Present the found solutions to a cross-disciplinary audience.

Content After a general introduction to interdisciplinary communication and detailed background on the collaborative project, the engineering students will receive tailored lectures on the anatomy and physiology of the relevant system. They will then team up with medical students who have received a basic introduction to engineering methodology to collaborate on said project. In the process, they will be coached both by lecturers from ETH Zurich and the University of Zurich, receiving lectures customized to the project. The course will end with each team presenting their solution to a cross-disciplinary audience.

Lecture notes Handouts and relevant literature will be provided.

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 983 of 1432
Content
- Physiological, physical, and cognitive factors in sensation and perception
- Body spaces and functional anthropometry
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

Literature

Design Thinking: Human-Centred Solutions to Real World Challenges

Due to didactic reasons, the number of participants is limited to 30.

All interested students are invited to apply for this course by sending a one-page motivation letter until 07.09.2015 to Florian Rittiner (frittiner@ethz.ch).

Additionally please enroll via mystudies. Places will be assigned after the first lecture on the basis of your motivation letter and commitment for the class.

Objective
The purpose of this course is to engage students in a multidisciplinary collaboration to tackle real world problems. Following a design thinking approach, students will work in multidisciplinary teams to solve a set of design challenges that are organized as a one-week, a three-week, and a six-week project. The final project will be in collaboration with an external project partner.

Topics that will be covered include:
- Uncertainty quantification under 3G, S. Brusoni, A. Cabello Llamas
- Interaction among consumers, environments, behavior, and tasks
- Rapidly prototype and iteratively test ideas and concepts by using various materials and techniques.

Experimental Ergonomics

Number of participants limited to 15.

You will learn how to apply the scientific discipline of ergonomics for system analysis and product development "in order to optimise human well-being and overall system performance" (www.iea.cc). The course offers the framework of models, concepts, methods and tools of applied ergonomics. Teaching is combined with learning-by-doing and research-based learning.

Objective
Knowledge of:
- Principles and rules of applied ergonomic system and product design.
- Methods and tools of ergonomic analysis and evaluation.
- Practical experiences and hands-on skills in:
  - Conducting a study in system and task analysis.
  - Analysing human-product interactions.
  - Applying ergonomic knowledge for product and system improvements.

Content
- Definition and role of applied ergonomics in engineering and design.
- Framework of ergonomic design and analysis.
- Design principles and rules.
- Methods and tools for system and task analysis.
- Hands-on experience in team work:
  - Experimental study of human-product interaction and usability through eye-tracking
  - Field study of system and task analysis, including on-site visits of complex work stations (Hospital OR/ ICU or Air traffic/Railway Control Rooms)

Prerequisites / notice
Max. number of participants is 15. Experiments and field studies in teams of 2-3 students are obligatory.

Uncertainty Quantification for Engineering & Life Sciences

Number of participants limited to 60.

Abstract
Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective
The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content
Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Prerequisites / notice
Fundamentals of Probability, Fundamentals of Computational Modeling

Engineering Design Optimization

Number of participants limited to 25.

The course covers fundamentals of computational optimization methods in the context of engineering design. It develops skills to formally state and model engineering design tasks as optimization problems and select appropriate methods to solve them.
The main objective of the 12-week internship is to expose master's students to the industrial work environment. During this period, students will learn to apply, understand and develop computational models of a large spectrum of engineering materials to predict their dynamic deformation response and failure in finite element simulations. Students will become familiar with important dynamic testing techniques to identify material model parameters from experiments. The ultimate goal is to provide the students with the knowledge and skills required to engineer modern multi-material solutions for high performance structures in automotive, aerospace and navel engineering.

Lectures and computer labs concerned with the modeling of the deformation response and failure of engineering materials (metals, polymers and composites) subject to extreme loadings during manufacturing, crash, impact and blast events.

Topics include viscoelasticity, temperature and rate dependent plasticity, dynamic brittle and ductile fracture; impulse transfer, impact and wave propagation in solids; computational aspects of material model implementation into hydrocodes; simulation of dynamic failure of structures;

Slides of the lectures, relevant journal papers and users manuals will be provided.

Various books will be recommended covering the topics discussed in class

Course in continuum mechanics (mandatory), finite element method (recommended)

**Multidisciplinary Courses**

The students are free to choose individually from the entire course offer of ETH Zurich, ETH Lausanne and the Universities of Zurich and St. Gallen.

Only students who fulfill the following criteria are allowed to begin with their Master's Thesis:

a. Successful completion of the Bachelor's programme
b. Any additional requirements for admission to the degree programme have been fulfilled
c. Successful completion of the Semester Project and Industrial Internship (the corresponding credits have been acquired)

The subject of the Master's Thesis and the choice of the supervisor (ETH professor/titular professor) are to be approved by the tutor. To choose a titular professor of D-MAVT as a supervisor (https://www.mavt.ethz.ch/the-department/people/titular-professors.html), please contact the D-MAVT Student Administration.

Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.
Objective
The thesis is aimed at enhancing the student’s capability to work independently toward the solution of a theoretical or applied problem.

Abstract
Linear algebra is an indispensable tool of engineering mathematics. The course is an introduction to basic methods and fundamental concepts of linear algebra and its applications to engineering sciences.

Objective
After completion of this course, students are able to recognize linear structures and to apply adequate tools from linear algebra in order to solve corresponding problems from theory and applications. In addition, students have a basic knowledge of the software package Matlab.

Content
- Linear maps, kernel and image, coordinates and matrices, coordinate transformations, norm of a matrix, orthogonal matrices, eigenvalues and eigenvectors, algebraic and geometric multiplicity, eigenbasis, diagonalizable matrices, symmetric matrices, orthonormal basis, condition number, linear differential equations, Jordan decomposition, singular value decomposition, examples in MATLAB, applications.

Reading:

Abstract
Introduction to partial differential equations. Differential equations which are important in applications are classified and solved. Elliptic, parabolic and hyperbolic differential equations are treated. The following mathematical tools are introduced: Laplace transforms, Fourier series, separation of variables, methods of characteristics.

Objective
Mathematical treatment of problems in science and engineering. To understand the properties of the different types of partial differential equations.

Content
- Laplace Transforms:
  - Laplace Transform, Inverse Laplace Transform, Linearity, s-Shifting
  - Transforms of Derivatives and Integrals, ODEs
  - Unit Step Function, t-Shifting
  - Short Impulses, Dirac’s Delta Function, Partial Fractions
  - Convolution, Integral Equations
  - Differentiation and Integration of Transforms
- Fourier Series, Integrals and Transforms:
  - Fourier Series
  - Functions of Any Period p=2L
  - Even and Odd Functions, Half-Range Expansions
  - Forced Oscillations
  - Approximation by Trigonometric Polynomials
  - Fourier Integral
  - Fourier Cosine and Sine Transform
- Partial Differential Equations:
  - Basic Concepts
  - Modeling: Vibrating String, Wave Equation
  - Solution by separation of variables; use of Fourier series
  - D’Alembert Solution of Wave Equation, Characteristics
  - Heat Equation: Solution by Fourier Series
  - Heat Equation: Solutions by Fourier Integrals and Transforms
  - Modeling Membrane: Two Dimensional Wave Equation
  - Laplacian in Polar Coordinates: Circular Membrane, Fourier-Bessel Series
  - Solution of PDEs by Laplace Transform

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 988 of 1432
Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.

**Type**

Teaching Internship including Examination Lessons

**ECTS**

6 credits

**Hours**

13P

**Lecturers**

S. P. Kaufmann, J. Dual

In their mentored work, the students combine and extend their knowledge of didactics of engineering to develop a syllabus.

Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

(1) They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).

(2) They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions).

#### Subject Didactics and Professional Training

| 151-1079-00L | Teaching Internship including Examination Lessons Mechanical and Process Engineering | W    | 6    | 13P   | S. P. Kaufmann, J. Dual | Only for students who enrolled from HS 2011 on into TC. The teaching internship can just be visited if all other courses of TC are completed. Repetition of the teaching internship is excluded even if the examination lessons are to be repeated.

**Abstract**

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

**Objective**

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

**Content**

Die Themen für die beiden Prüfungslektionen am Schluss des Praktikums erfahren die Studierenden in der Regel eine Woche vor dem Prüfungstermin. Sie erarbeiten eine Vorbereitung gemäss Anleitung und reichen sie bis am Vortag um 12 Uhr den beiden Prüfungsexperten (Fachdidaktiker/in, Departementsvertreter/-in) ein. Die gehaltenen Lektionen werden kriteriumsbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltenen Lektionen im Rahmen eines kurzen Kolloquiums.

**Lecture notes**

Dokument: schriftliche Vorbereitung für Prüfungslektionen.

**Literature**

Wird von der Praktikumslehrperson bestimmt. Dieses Unterrichtspraktikum ist für Studierende, die sich ab dem HS 2011 ins DZ eingeschrieben haben. Alle anderen Lehrveranstaltungen des DZ sind erfolgreich abgeschlossen. Findet verbindlich am Schluss der Ausbildung, vor Ablegung der Prüfungslektion statt!

**Prerequisites / notice**

151-1061-00L

Subject Didactics I for D-MAVT and D-ITET

Didactical methods in mechanical and electrical engineering.

- The students can plan, conduct and critically reflect single lessons.
- They orient themselves towards the academic goals and take into account existing knowledge, the professional environment and the ambitions of the students.
- They can apply the basic teaching principles meaningfully in their subject and suitably structure the learning phases.
- They can reduce and present complex technical content such that it is in a form suitable for the students to learn.
- They have considered examples of the common conceptual errors encountered by students.

- Didactic analysis
- Competences and goals
- Preparation and wrap-up of lessons
- Process and structure of a typical lesson
- Teaching techniques (informative introduction to lessons, Advance Organizer, learning assignments, frontal teaching, questions, assignments, feedback)
- Assignments and short tests
- Media and language competence
- Conceptual change, misconceptions,
- Integration of the subcomponents of a lesson.

**Literature**

**Prerequisites / notice**

Voraussetzung: Erziehungswissenschaftliche Lehrveranstaltung schon absolviert oder gleichzeitig.

#### Abstract
Differential and integral calculus for functions of one and several variables; vector analysis; ordinary differential equations of first and of higher order, systems of ordinary differential equations; power series. The mathematical methods are applied in a large number of examples from mechanics, physics and other areas which are basic to engineering.

#### Objective
Introduction to the mathematical foundations of engineering sciences, as far as concerning differential and integral calculus.

#### Prerequisites / notice
Die Übungsaufgaben (inkl. Multiple Choice) sind ein wichtiger Bestandteil der Lehrveranstaltung. Es wird erwartet, dass Sie mindestens 75% der wöchentlichen Serien bearbeiten und zur Korrektur einreichen.

### Examination Block B

#### Abstract
General Chemistry I: Stoichiometry, atoms, molecules, chemical bond and molecular structure, gases, solutions, chemical equilibrium, solubility, acids and bases, thermodynamics, electrochemistry, kinetics.

#### Objective
Introduction to general and inorganic chemistry.

#### Content
1. Stoichiometry: mole, chemical formulas and equations,
2. The atom (atomic properties and periodic system), the chemical bond (ionic oder covalent), Lewis formulas, resonance, electronegativity and polar bonds, VSEPR-model.
3. Ideal gases: Gas laws, kinetic gas theory.
4. Liquids, solutions, concentration.
5. Chemical equilibrium in the gas phase.
8. Thermodynamics: Thermochemistry, enthalpy, entropy, Gibbs energy, Delta G and K, van't Hoff's equation.
9. Electrochemistry: Oxidation number, half-reactions, electrochemical cells, standard potentials and the Nernst equation.

#### Abstract
Introduction into the fundamental relationships between chemical composition, crystal structure, symmetry and physical properties of solids. Emphasis: group-theoretical introduction into symmetry, discussion of the factors governing the formation of crystal structures, structural dependence of physical properties, fundamentals of experimental techniques probing the crystal structure.

#### Objective
Introduction into the fundamental relationships between chemical composition, crystal structure, symmetry and physical properties of solids.
Content

Symmetry and order: lattices, point groups, space groups.

Crystal chemistry: geometrical, physical and chemical factors governing the formation of crystal structures; close sphere packings; typical basic crystal structures; lattice energy; magnetic crystals; quasicrystals.

Structure/property relationships: Example quartz (piezoelectricity); perowskite and derivative structures (ferroelectrics and high-temperature superconductors); magnetic materials.

Materials characterization: diffraction techniques, optical techniques.

Lecture notes

A script of the lecture until 2014 is available. New script: to be decided.

Literature

Prerequisites / notice

Organisation: Two hours of lectures per week accompanied by one hour of exercises.

The course treats the fundamental aspects of Quantum mechanics and Atomic physics.

**Prerequisites:** Physics I.

**Objective**

The goal of this course is to give the students a basic understanding of the molecules that build a cell and make it function, and the basic principles of metabolism and molecular genetics.

**Content**

This lecture consists predominantly of exercises and serves mainly to prepare the students intensively for aspects in materials science, based on the lecture Chemie II. A large number of questions will be provided, which will partially be discussed in the lecture while the other part is devoted to self-study.

**Literature**

- M. Hesse, H. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5. überarbeitete Auflage, Thieme, Stuttgart, 1995

**Prerequisites / notice**

Exercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounds" (4th semester) is recommended.

Script will be for the production price

- M. Hesse, H. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5. überarbeitete Auflage, Thieme, Stuttgart, 1995

Prerequisites

Exercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Institutional analysis of organic compounds" (4th semester) is recommended.

402-0041-00L Physics II O 7 credits 4V+2U D. Pescia

Abstract

The course treats the fundamental aspects of Quantum mechanics and Atomic physics.

Objective

The Vorlesung "Physik II" ist eine Einführung in die Quantenmechanik und Atomphysik. Ziel dieser Vorlesung ist es, die grundlegenden Experimente zu kennen sowie die dazugehörende Theorie zu verstehen und sie in einfachen Problemstellungen zur Anwendung zu bringen.

Content

Die Vorlesung "Physik II" ist eine Einführung in die Quantenmechanik und Atomphysik. Inhalt:

- Eindimensionale Probleme (Teilchen im Kasten, Der Tunneleneffekt, Der QM harmonische Oszillator)
- Bewegung im Zentralfeld
- Der Drehimpulsoperator (Darstellung von Zuständen und Operatoren, Matrixdarstellung des Drehimpulsoperators, Das Stern-Gerlach Experiment: der Spin, Die Addition von Drehimpulsen in der Quantenmechanik)
- Mehr-Teilchen Systeme (Das Energiespektrum des He-Atoms, Angelegte Zustände des Heliumatoms, Das Mendelejewschwe Periodensystem, Spektraltermen)
- Übergang in Folge einer zeitabhängigen, periodischen Störung (Magnetische Resonanz (I. Rabi, Phys. Rev. 51, 652 (1937), Nobel Preis 1944), Verallgemeinerung der Rabi Formel auf Übergänge in Folge einer zeitabhängigen, periodischen Störung)

Lecture notes

Ein Skript wird verteilt.

Prerequisites

Prerequisites: Physics I.

***************************************

2015 Autumn Semester

401-0603-00L Statistics O 4 credits 2V+1U J. Teichmann

Abstract

This class covers the following concepts: random variables, probability, discrete and continuous distributions, joint and conditional probabilities and distributions, the law of large numbers, the central limit theorem, descriptive statistics, statistical inference, inference for normally distributed data, point estimation, and two-sample tests.

Objective

Knowledge of the basic principles of probability and statistics.

Content

Introduction to probability theory, some basic principles from mathematical statistics and basic methods for applied statistics.

Lecture notes

Lecture notes

Literature

Lecture notes

401-0363-10L Analysis III O 3 credits 2V+1U A. Iozzi

Abstract

Introduction to partial differential equations. Differential equations which are important in applications are classified and solved. Elliptic, parabolic and hyperbolic differential equations are treated. The following mathematical tools are introduced: Laplace transforms, Fourier series, separation of variables, methods of characteristics.

Objective

Mathematical treatment of problems in science and engineering. To understand the properties of the different types of partial differential equations.

Content

Laplace Transforms:
- Laplace Transform, Inverse Laplace Transform, Linearity, s-Shifting
- Transforms of Derivatives and Integrals, ODEs
- Unit Step Function, t-Shifting
- Short Impulses, Dirac's Delta Function, Partial Fractions
- Convolution, Integral Equations
- Differentiation and Integration of Transforms
- Fourier Series, Integrals and Transforms:
  - Fourier Series
  - Functions of Any Period p=2L
  - Even and Odd Functions, Half-Range Expansions
  - Forced Oscillations
  - Approximation by Trigonometric Polynomials
  - Fourier Integral
  - Fourier Cosine and Sine Transform

Partial Differential Equations:
- Basic Concepts
- Modeling: Vibrating String, Wave Equation
- Solution by separation of variables; use of Fourier series
- D’Alembert Solution of Wave Equation, Characteristics
- Heat Equation: Solution by Fourier Series
- Heat Equation: Solutions by Fourier Integrals and Transforms
- Modeling Membrane: Two Dimensional Wave Equation
- Laplacian in Polar Coordinates; Circular Membrane, Fourier-Bessel Series
- Solution of PDEs by Laplace Transform
Based on the lecture 'Introduction to Materials Science' this lecture aims to give a detailed understanding of important aspects of materials science.

The basics of the ionic and covalent chemical bonds, the bond energy, the crystalline structure, four important structural ceramics, and the properties of glasses and glass ceramics will be presented for ceramic materials.

Thermodynamics and phase diagrams, crystal interfaces and microstructure, diffusional transformations in solids, and diffusionless transformations will be presented for metallic materials.

For metals see:
- Brevieral Ceramics" published by the "Verband der Keramischen Industrie e.V.", ISBN 3-924158-77-0. partly its contents may be found in the internet @ http://www.keramverband.de/brevier_engl/brevier.htm or on our homepage

Die folgenden Kapitelnummern beziehen sich auf das der Vorlesung zugrundeliegende Lehrbuch "Biology" (Campbell & Rees, 7th edition, 2005)
Kapitel 1-4 des Lehrbuchs werden als Grundwissen vorausgesetzt

1. Aufbau der Zelle
Kapitel 5: Struktur und Funktion biologischer Makromoleküle
Kapitel 6: Eine Tour durch die Zelle
Kapitel 7: Membranstruktur und -funktion
Kapitel 8: Einführung in den Stoffwechsel
Kapitel 9: Zelluläre Atmung und Speicherung chemischer Energie
Kapitel 10: Photosynthese
Kapitel 12: Der Zellzyklus
Kapitel 17: Vom Gen zum Protein

2. Allgemeine Genetik
Kapitel 13: Meiose und Reproduktionszyklen
Kapitel 14: Mendel'sche Genetik
Kapitel 15: Die chromosomale Basis der Vererbung
Kapitel 16: Die molekulare Grundlage der Vererbung
Kapitel 18: Genetik von Bakterien und Viren
Kapitel 46: Tierische Reproduktion

Grundlagen des Stoffwechsels und eines Überblicks über molekulare Genetik

Lecture notes
Der Vorlesungsstoff ist sehr nahe am Lehrbuch gehalten, Skripte werden ggf. durch die Dozenten zur Verfügung gestellt.

Literature
Das folgende Lehrbuch ist Grundlage für die Vorlesungen Biologie I und II:

Abstract
To impart basic knowledge and experimental competence using selected examples from chemistry and physics.

Objective
To impart basic knowledge and experimental competence using selected examples from chemistry and physics.

Content
Chemistry III: Synthesis of PMMA via Transesterification; manufacture of poly(methylmethacrylat) via radical polymerization of methylmethacrylat; 3D-printing. Physics I: Powder diffractionmetry, single crystal radiography, capillary rheometry, viscoelasticity of the polymer melt (or an equivalent exp.), 2 physics Experiment at the EMPA: e.g. X-ray florescence analysis, impedance measurements of batteries, cathode manufacturing for a Li-ion battery or texture measurement; and two further physic experiments at D-Phys (e.g. about "elastic constants" or "Inference and diffraction").

Lecture notes
Notes with information for each experiment (aim of the experiment, theory, experimental procedure, data analysis) can be downloaded from the web (https://praktikum.mat.ethz.ch or http://www.mat.ethz.ch/education/bachelor_degree/lab_courses).

Abstract
This course introduces classical and quantum mechanical concepts for the understanding of material properties from a microscopic point of view. The lectures focus on the static and dynamic properties of crystals, the formation of chemical bonds and electronic bands in molecules, insulators, metals, and semiconductors, and on the thermal and electrical properties that emerge from this analysis.

Objective
Providing physical concepts for the understanding of material properties:
Understanding the electronic properties of solids is at the heart of modern society and technology. The aim of this course is to provide fundamental concepts that allow the student to relate the microscopic structure of matter and the quantum mechanical behavior of electrons to the macroscopic properties of materials. Beyond fundamental curiosity, such level of understanding is required in order to develop and appropriately describe new classes of materials for future technology applications. By the end of the course the student should have developed a semi-quantitative understanding of basic concepts in solid state physics and be able to appreciate the pertinence of different models to the description of specific material properties.
Content

PART I: Structure of solid matter, real and reciprocal space

The crystal lattice, Bravais lattices, primitive cells and unit cells, Wigner-Seitz cell, primitive lattice vectors, lattice with a basis, examples of 3D and 2D lattices.

Fourier transforms and reciprocal space, reciprocal lattice vectors, Brillouin zones

PART II: Dynamics of atoms in crystals

Lattice vibrations and phonons in 1D, phonons in 1D chains with monoatomic basis, phonon in 1D chains with a diatomic basis, optical and acoustic modes, phase and group velocities, phonon dispersion and eigenvectors. Phonons in 2D and 3D.

Quantum mechanical description of lattice waves in solids, the harmonic oscillator, the concept of phonon, phonon statistics, Bose-Einstein distribution, phonon density of states, Debye and Einstein models, thermal energy, heat capacity of solids.

PART III: Electron states and energy bands in molecules and solids

Electronic properties of materials, classical concepts: electrical conductivity, Hall effect, thermoelectric effects. Drude model. Transition to quantum models and review of quantum mechanical concepts.

Introduction to molecular orbital theory and linear combination of atomic orbitals (LCAO). The H2+ molecule, homonuclear and heteronuclear molecules, benzene, sigma and pi bonds, sp3 and sp2 hybridization. From molecules to periodic crystal structures.

The free electron gas: Fermi statistics, Fermi energy and Fermi surface, density of states in k-space and as a function of energy. Inadequacy of the free electron model.

PART IV: Electrical and heat conduction

Dynamics of electrons in energy bands, phase and group velocity, crystal momentum, the effective mass concept, scattering phenomena. The equilibrium and non-equilibrium distribution function for electrons. The Boltzmann equation in the presence of external fields in the relaxation time approximation.

Electrical and thermal conductivities revisited. Electron transport due to electric fields (drift) and concentration gradients (diffusion). Einstein's relations. Transport of heat by electrons, Seebeck effect and thermopower, Peltier effect, thermoelectric cooling, thermoelectric energy conversion.

PART V: Semiconductors: concepts and devices

Lecture notes will be handed out during the lectures

Literature

- H. Ibach, H. Lüth: Solid-State Physics (Springer: 2003), available as eBook from the ETH library, also in German.
- C. Kittel, Introduction to Solid State Physics (Wiley, 2005), also available in German.

Prerequisites / notice

Physics I and II. Knowledge of basic quantum mechanical concepts. The lecture will be given in English. The script will be available in English.

327-0504-00L Materials Characterisation Methods O 3 credits 2V+1U L. Heyderman

Abstract

The lecture course is aimed to qualifying the student to choose the optimum characterization method according to the questions posed.

The main topics are: Thermal Analysis (TD, TG, TM, DTA, DSC), light microscopy, diffraction methods (XRD, NRD, SAD), electron microscopy (TEM, HRTEM, STEM, HAADF-STEM, SEM, ESEM, EFEM, EDX, EELS).

Objective

The lecture course is aimed to qualifying the student to choose the optimum characterization method according to the questions posed.

Content

Introduction into the fundamentals of materials characterization: Thermal Analysis (TD, TG, TM, DTA, DSC), light microscopy, diffraction methods (XRD, NRD, SAD), electron microscopy (TEM, HRTEM, STEM, HAADF-STEM, SEM, ESEM, EFEM, EDX, EELS). The emphasis is on the discussion of the fundamentals of these characterization methods.

Lecture notes

Script is provided.

Literature

327-0508-00L Simulation Techniques in Materials Science O 4 credits 2V+2U C. Ederer

Abstract

Introduction to simulation techniques that are relevant for material science. Simulation methods for continua (finite differences, finite elements), mesoscopic methods (cellular automata, mesoscopic Monte Carlo methods), microscopic methods (Molecular Dynamics, Monte-Carlo simulations, Density Functional Theory).

Objective

Learn techniques which are used in the computer-based study of the physics of materials; Obtain an overview of which simulation techniques are useful for which type of problems; develop the capability to transform problems in materials science into a form suitable for computer studies, including writing the computer program and analyzing the results.

Content

- Modeling and simulation techniques in materials science.
- Simulation methods for continua (finite differences, basic idea of finite elements).
- Mesoscopic methods (Cellular automata, phase-field models, mesoscopic Monte Carlo methods).
- Microscopic methods (Molecular dynamics, Monte-Carlo simulation for many-particle systems, basic idea of density functional theory).

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 999 of 1432
Abstract
Repetition and advancement of dislocation theory. Mechanical properties of metals: hardening mechanisms, high temperature plasticity, alloying effects. Case studies in alloying to illustrate the mechanisms.

Objective
Repetition and advancement of dislocation theory. Mechanical properties of metals: hardening mechanisms, high temperature plasticity, alloying effects. Case studies in alloying to illustrate the mechanisms.

Content
Dislocation theory:
Properties of dislocations, motion and kinetics of dislocations, dislocation-dislocation and dislocation-boundary interactions, consequences of partial dislocations, sessile dislocations

Hardening theory:
a. solid solution hardening: case studies in copper-nickel and iron-carbon alloys
b. particle hardening: case studies on aluminium-copper alloys

High temperature plasticity:
thermally activated glide
power-law creep
diffusional creep: Coble, Nabarro-Herring
deformation mechanism maps
Case studies in turbine blades
superplastizity
alloying effects

Courtney, Mechanical Behaviour of Materials, McGraw-Hill
Content
This course is structured in 3 blocks:
Block (I): Fundamentals of engineering in biological materials
- Biological engineering principles
- Basic building blocks found in biological materials

Block (II): Replicating biological design principles in synthetic materials
- Biological and bio-inspired materials: polymer-reinforced and ceramic-toughened composites
- Lightweight biological and bio-inspired materials
- Functional biological and bio-inspired materials: surfaces, self-healing and adaptive materials

Block (III): Bio-inspired design and systems
- Bio-inspiration in the building environment
- Future developments in bio-inspired materials

Lecture notes
Copies of the slides will be made available for download before each lecture.

Literature
The course is mainly based on the books listed below. Additional references will be provided during the lectures.

Abstract
Acquisition of independent scientific-technical skills; project management; organization and undertaking of experiments; interpretation, scientifically and technically correct project presentation in oral and written form.

Objective
Acquisition of independent scientific/technical skills; project management; organization and conducting of experiments; interpretation and scientifically/technically correct presentation of projects in oral and written form.

Content
Supervision by DMATL research groups
Groups of students (2 or 3 per group) each work on a research project throughout the semester.

Prerequisites / notice
Prerequisite: Successful participation in the "Praktika I - IV" (courses within the material science bachelor study at ETH) or comparable practical lab courses.

Compensatory Courses
Only possible after consultation with the Director of Studies.

Industrial Internship or Project

<td>In this course we study how the properties of solids are determined from the chemistry and arrangement of the constituent atoms, with a focus on materials that are not well described by conventional band theories because their behavior is governed by strong quantum-mechanical interactions. We begin with a review of the successes of band theory in describing many properties of metals, semiconductors and insulators, and we practise building up band structures from atoms and describing the resulting properties. Then we explore classes of systems in which the coupling between the electrons and the lattice is so strong that it drives structural distortions such as Peierls instabilities, John-Teller distortions, and ferroelectric transitions. Next, we move on to strong couplings between electronic charge and spin- and/or orbital- angular momentum, yielding materials with novel magnetic properties. We end with examples of the complete breakdown of single-particle band theory in so-called strongly correlated materials, which comprise for example heavy-fermion materials, frustrated magnets, materials with unusual metal-insulator transitions and the high-temperature superconductors.</td>

</table>
This course attempts to prepare the student for a job as a materials engineer in industry. The gap between fundamental materials science and or equivalent classes from another institution is bridged. The focus lies on the practical application of fundamental knowledge allowing the students to experience application related materials concepts with a strong emphasis on case-study mediated learning.

### Objective

- to learn how to design and create objects as building blocks with a particular shape and a defined recognition pattern, b) to understand the chemistry that allows for the creation of such hard and soft objects within a certain size range, and c) to master the concepts to assemble these objects into hierarchically structured materials.

### Content

Part I is focused on self- and directed assembly methods that can be used to create higher order architectures from those building blocks connecting the microscopic with the macroscopic world. Examples include photonics crystals, nanocrystal solids, colloidal molecules, mesocrystals or particle-based foams and aerogels.

Lecture notes: [http://www.multimat.mat.ethz.ch/education/courses/materials_synthesis](http://www.multimat.mat.ethz.ch/education/courses/materials_synthesis)

Literature: Einführung Materialwissenschaft, in particular atomic structure, chemical bonds and basics of magnetic, electronic and optical properties of materials.

### Course Content

1. **Einführung Materialwissenschaft (327-0103-00L)**
2. **Ceramics I (327-0503-00L)**
3. **Kristallographie (327-0104-00L)**
4. **Methoden der Materialcharakterisierung (327-0504-00L)**
5. **Basic concepts of polymer science, in particular polymer synthesis and polymer characterization**

### Prerequisites / notice

Autumn Semester 2015

Page 1003 of 1432
The aim of this course is to impart knowledge on the underlying principles governing the design of biological materials and on strategies to develop synthetic model systems whose structural organization resembles those of natural materials. More and more, the interest in functional fibre composites is increasing. In beginning, the main focus will be on the production of functional fibres, e.g., for fibre-based sensor and actuator composites with polymers, metals and ceramics. Optical, piezoelectric, shape memory and other fibres for advanced composite applications will be treated in detail. There will be a discussion on fibre classification, fibre production (ceramic and others), adaptive and smart materials, types of sensors and actuators (e.g. made from electro-active poly-mers), and sensor networks with piezoelectric elements (e.g., Active or Macro Fibre Composites) for adaptive material systems or structural health monitoring (SHM) of advanced composite structures.

More and more, the interest in functional fibre composites is increasing. In beginning, the main focus will be on the production of functional fibres, e.g., for fibre-based sensor and actuator composites with polymers, metals and ceramics. Optical, piezoelectric, shape memory and other fibres for advanced composite applications will be treated in detail. There will be a discussion on fibre classification, fibre production (ceramic and others), adaptive and smart materials, types of sensors and actuators (e.g. made from electro-active poly-mers), and sensor networks with piezoelectric elements (e.g., Active or Macro Fibre Composites) for adaptive material systems or structural health monitoring (SHM) of advanced composite structures.

Emphasis will be put on the underlying science of a particular process or effect rather than a detailed description of the technique or equipment.

Manufacturing of actuators driven by electro-active polymers (EAP) and sensors applications of Active Fibre Composites (AFC) will be studied in laboratory classes.

Case studies and examples drawn from structural and functional applications of advanced composite and adaptive material systems will be demonstrated.

Prerequisite:

Durability of Engineering Materials

Abstract

Basis of fracture mechanics, an engineering discipline that draws upon the principles of applied mechanics and materials science. The course gives the tools to a successful application of fracture mechanics concepts to failure analysis.

Objective

The course will comprise a balance of lectures, tutorials, student presentations and laboratory classes. In addition, case study site visits will be made for certain topics to illustrate the industrial application of particular technologies.

Content

Crack-flaws cannot be neglected in engineering analysis. Even microscopic crack flaws can grow over time, ultimately resulting in fractured components. Structures that may have been blindly deemed “safe” could fail disastrously, causing injuries to its users, or the loss of life. Fracture mechanics can be used to:

* Determine how large a crack can be in a structure before it leads to catastrophic failure
* Predict the rate at which a crack can approach a critical size due to fatigue loads or aggressive environmental conditions

The topics covered are

* Introduction to Linear Elastic Fracture Mechanics (LEFM): crack tip stress, strain and displacement fields in linear elastic materials (Modes I, II and III); the stress-intensity factor, K; the fracture toughness KIc and their determination; fracture criterion
* Estimates of crack plastic zones in ductile materials
* The compliance method: experimental determination of compliance
* Introduction to fracture mechanics of nonlinear materials: the J-integral; the JIc fracture criterion; JIc testing
* Application of fracture mechanics concepts in the analysis of subcritical crack growth (fatigue, stress corrosion cracking, creep and their combinations)
* Lifetime determination and prediction; failure analysis.

The course is mainly based on the books listed below. Additional references will be provided during the lectures.

**W. H. Gross**
Electron Microscopy in Material Science

This course is structured in 3 blocks:

**Block (I): Fundamentals of engineering in biological materials**
- Basic building blocks found in biological materials

**Block (II): Replicating biological design principles in synthetic materials**
- Biological and bio-inspired materials: polymer-reinforced and ceramic-toughened composites
- Lightweight biological and bio-inspired materials
- Functional biological and bio-inspired materials: surfaces, self-healing and adaptive materials

**Block (III): Bio-inspired design and systems**
- Bio-inspiration in the building environment
- Future developments in bio-inspired materials

Copies of the slides will be made available for download before each lecture.

**Prerequisites / notice**
Prerequisite: the lecture Electron Microscopy (327-0703-00L) has to be attended with success, maximum number of participants 15, work in groups of 3 people.

**Abstract**
A comprehensive understanding of the interaction of electrons with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

**Objective**
A comprehensive understanding of the interaction of electrons with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

**Content**
This course provides a general introduction into electron microscopy of organic and inorganic materials. In the first part, the basics of transmission- and scanning electron microscopy are presented. The second part includes the most important aspects of specimen preparation, imaging and image processing. In the third part, recent applications in materials science, solid state physics, structural biology, structural geology and structural chemistry will be reported.

**Literature**

**Abstract**
Preparation, characterization and applications of polymeric aggregates formed from amphiphilic block copolymers.

**Objective**
To become acquainted with the principles of the self-assembly of amphiphilic block copolymers into micelles and vesicles and to become acquainted with some of the properties and applications of these aggregates.

**Content**
With selected recent examples on the self-assembly of amphiphilic block copolymers several basic aspects and possible applications will be discussed. The focus will mainly be on micelles and vesicles.

**Literature**

**Abstract**
From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles. Intermolecular forces, their macroscopic manifestations, and ways to control such interactions. Self-assembly and directed assembly of 2D and 3D structures. Special emphasis on the emerging field of molecular electronic devices.

**Objective**
Familiarize students with basic science and engineering principles governing the nano domain.

**Content**
The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics that are traditionally taught separately.

**Topics**
Topics are treated in 2 blocks:

(I) From Quantum to Continuum
From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale
Intermolecular forces, their macroscopic manifestations, and ways to control such interactions. Self-assembly and directed assembly of 2D and 3D structures.
Literature

Prerequisites / notice

Lectures and Mini-Review presentations: Thursday 10-13, ML F 36

Homework: Mini-Reviews

Students select a paper (list distributed in class) and expand the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper.

402-0313-00L

Materials Research Using Synchrotron Radiation

W  6 credits  2V+2P  L. Heyderman, V. Scagnoli

Abstract

The course gives an introduction to the use of synchrotron radiation in materials science. It treats the generation of intense x-ray beams at synchrotron radiation sources and their use for the characterisation of materials properties at different length scales. As part of the course, experiments will be carried out at the Swiss Light Source, Paul Scherrer Institut.

Objective

A comprehensive understanding of the interaction of x-rays with condensed matter and their use in materials analysis; acquiring hands-on experience with the use of synchrotron radiation.

Content

Interaction of x-rays with matter:
- Elastic scattering from bound electron, atom and assemblies of atoms; Compton scattering; principles of diffraction from crystals and scattering from disordered systems; thermal diffuse scattering, small-angle scattering from nanometre-sized objects; X-ray absorption spectroscopy; microscopy; comparison with neutron scattering, where appropriate.

The generation of high-brilliance x-ray beams at synchrotron radiation sources:
- Undulators, wigglers and bending magnets; comparison with conventional lab sources; the future x-ray free electron laser.

Instrumentation:
- Monochromator; diffractometer; detector.

Determination of materials properties:
- Crystal structure; defects and strain fields; structure of surfaces and interfaces; chemical bonding properties.

New methods:
- Coherent x-ray scattering and diffractive imaging.

Lecture notes

A reader and a guide through the experiments at the Swiss Light Source will be made available on the web.

Literature

Prerequisites / notice

Part of the course is in the form of practical work at the Swiss Light Source. During two days (dates to be agreed), the following experiments will be performed: (1) elastic and Compton scattering, (2) liquid scattering and powder diffraction, and (4) X-ray absorption spectroscopy.

402-0809-00L

Introduction to Computational Physics

W  8 credits  2V+2U  H. J. Herrmann

Abstract

This course offers an introduction to computer simulation methods for physics problems and their implementation on PCs and super computers: classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell's equation), Monte Carlo simulations, percolation, phase transitions

Content

Prerequisites / notice

Lecture and exercise lessons in english, exams in German or in English

529-0947-00L

Basic Polymer Synthesis

W  6 credits  3G  A. D. Schlüter

Abstract

Chain-growth polymerizations (anionic, cationic, Ziegler/Natta, ROMP, radical, NMP, ATRP, RAFT), mechanistic details including how to render a polymerization "living", recent developments, and important examples.

Objective

The students should gain an overview of practical polymerization procedures, learn how to deal with chemical structures and reactivities, and be able to suggest reasonable synthetic pathways to a given polymer structure. Aspects like achievable molar masses in dependence of the method used and structure perfection play a role throughout.
Because of their aesthetic nature crystals are termed "flowers of mineral kingdom". The aesthetic aspect is closely related to the symmetry.

An introduction to polarization optics is given before optical properties following from crystal symmetry are discussed. Particular emphasis will be put on magneto-optical properties of crystals. Lasers as prototypical intense light sources will be introduced before advanced topics such as the determination of magnetic structures and interactions by nonlinear magneto-optics are discussed.

The aggregation of crystal-optical phenomena, and on optical properties related to ferroic order.

For step-growth procedures and other topics (dendrimers, bottle-brushes, macrocycles, topochemical polymerizations etc.) see Advanced Polymer Synthesis

Lectures will be given on interfacial tension (4h), protein aggregation in bulk and interfaces (4h), Pickering emulsions (2h), polysaccharides (2h), aggregation of complex mixtures (4h), foams (2h), and the use of light scattering in investigation complex food structures (6h). Most chapters include some hand-ons examples of the gain knowledge to common food products.

The underlying colloidal laws are reflecting the structure of the individual raw material (length scale, character of the interacting forces). Once those concepts are appreciated the aggregation of most food systems falls into recognizable patterns that can be used to modify and structure exiting food or to design new products. The application and use of those concepts are discussed in light of common food production.

PhD students who need recognized credit points are required to pass the written exam.
This course will provide an up-to-date, comprehensive review of the industrial perspective at the interface of biomaterials and drugs. This covers regulatory, clinical, pre-clinical and manufacturing concepts. The presentations are provided in an effort to maximize the interaction of student and lecturer.

- The student will be able to categorize a drug-biomaterial as a "drug" or a "material" from a regulatory perspective and can summarize general regulatory pathways for material/drug development.
- The student will be able to summarize the current concepts and challenges for the industry at the material-drug interface.

The student will actively develop innovative, industrial concepts at the drug-biomaterial interface.

This course will provide an up-to-date comprehensive review of the industrial perspective at the interface of biomaterials and drugs. General concepts related to regulatory affairs or such as cost-conscious planning of manufacturing processes will be covered by interactive case-studies and in close interaction between students and lecturers. The course covers the future at the biomaterial - implant interface - as it is seen by the industry today - and will be reviewed by experienced and long-standing faculty from industry with the aim to provide a balanced, insightful perspective. From that, clinical development concepts, regulatory pathways and real-life case studies will be discussed with the students. Finally the students - working in small groups of 4-5 - will outline a development pathway for an industrial project and present it to the course and in presence of all faculty to receive maximum feedback to their approaches.

The student will become familiar with the major elements required for a successful development and which challenges have to be taken into account to translate an idea into a successful product.

Both literatures will be made available in the course upon request.

In the first part of the lecture the bases are obtained for structural ceramics.

The second part of this lecture gives an introduction to polymers, their composition and properties.

327-0406-AAL Basic Principles of Materials Physics A E- 5 credits 11R A. Gusev
Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
Foundations and applications of equilibrium thermodynamics and statistical mechanics, supplemented by an elementary theory of transport phenomena.

Objective
The course provides a solid working knowledge in thermodynamics (as the appropriate language for treating a variety of problems in materials science) and in statistical mechanics (as a systematic tool to find thermodynamic potentials for specific problems).

Content
Thermodynamics, Statistical Mechanics
1. Introduction
2. Foundations of Thermodynamics
3. Applications of Thermodynamics
4. Foundations of Classical Statistical Mechanics
5. Applications of Classical Statistical Mechanics
6. Elementary Theory of Transport Phenomena

Lecture notes
Ein Leitfaden und ein zusammenfassender Artikel werden auf der oben angegebenen Website zur Lehrveranstaltung zur Verfügung gestellt.

Literature
3. L. E. Reichl, A Modern Course in Statistical Physics (University of Texas Press, Austin, 1980)

327-0407-AAL Basic Principles of Materials Physics B E- 6 credits 13R P. Gambardella
Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
This course introduces classical and quantum mechanical concepts for the understanding of material properties from a microscopic point of view. The lectures focus on the static and dynamic properties of crystals, the formation of chemical bonds and electronic bands in molecules, insulators, metals, and semiconductors, and on the thermal and electrical properties that emerge from this analysis.

Objective
Providing physical concepts for the understanding of materials properties.

Content
PART I: Structure of solid matter, real and reciprocal space
The crystal lattice, Bravais lattices, primitive cells and unit cells, Wigner-Seitz cell, primitive lattice vectors, lattice with a basis, examples of 3D and 2D lattices. Fourier transforms and reciprocal space, reciprocal lattice vectors, Brillouin zones Elastic and inelastic scattering of elementary particles with matter (x-rays, neutrons, electrons). Interaction of x-rays with matter. X-ray diffraction, Bragg condition, atomic scattering factors, scattering length, absorption and refraction.

PART II: Dynamics of atoms in crystals
Lattice vibrations and phonons in 1D, phonons in 1D chains with monoatomic basis, phonon in 1D chains with a diatomic basis, optical and acoustic modes, phase and group velocities, phonon dispersion and eigenvectors. Phonons in 2D and 3D. Quantum mechanical description of lattice waves in solids, the harmonic oscillator, the concept of phonon, phonon statistics, Bose-Einstein distribution, phonon density of states, Debye and Einstein models, thermal energy, heat capacity of solids.

PART III: Electron states and energy bands in molecules and solids

PART IV: Electrical and heat conduction
Dynamics of electrons in energy bands, phase and group velocity, crystal momentum, the effective mass concept, scattering phenomena. The equilibrium and non-equilibrium distribution function for electrons. The Boltzmann equation in the presence of external fields in the relaxation time approximation. Electrical and thermal conductivities revisited. Electron transport due to electric fields (drift) and concentration gradients (diffusion). Einstein's relations. Transport of heat by electrons, Seebeck effect and thermopower, Peltier effect, thermoelectric cooling, thermoelectric energy conversion.

PART V: Semiconductors: concepts and devices

Lecture notes
Ein Leitfaden und ein zusammenfassender Artikel werden auf der oben angegebenen Website zur Lehrveranstaltung zur Verfügung gestellt.
**Literature**
- H. Ibach, H. Lüth: Solid-State Physics (Springer: 2003), available as eBook from the ETH library, also in German.

**Prerequisites / notice**
The lecture will be given in English. The script will be available in English.

### 327-0506-AAL Materials Physics

**Enrolment only for MSc students who need this course as additional admission requirement.**

**Abstract**
Extended concepts of material physics and analytical description of material-physical problems.

**Objective**
Building on the lectures 'Introduction to Materials Science' and 'Materials Science I + II' this lecture aims to give a deepened physical understanding of Materials Science.

**Content**
1. Thermal vacancies and diffusion
2. Nucleation and growth; diffusion-controlled and diffusion-less phase transitions
3. Spinodal decomposition and anharmonic effects
4. Dislocation energy/stacking faults; recovery; recrystallization; solidification

**Lecture notes**
See http://www.metphys.mat.ethz.ch/education/courses/matphysik

**Literature**

### 327-0503-AAL Ceramics I

**Enrolment only for MSc students who need this course as additional admission requirement.**

**Abstract**
The aim is the understanding of the basic principles of ceramic processing.

**Objective**
The aim is the understanding of the basic principles of ceramic processing.

**Content**
Basic chemical processes for powder production.
Liquid-phase synthesis methods.
Sol-Gel processes.
Classical crystallography theory.
Gas phase reactions.
Basics of the colloidal chemistry for suspension preparation and control.
Characterization techniques for powders and colloids.
Shaping techniques for bulk components and thin films.
Sintering processes and microstructural control.

**Lecture notes**
See: https://www.multimat.mat.ethz.ch/education/courses/ceramics1

**Literature**

### 327-0502-AAL Polymers I

**Enrolment only for MSc students who need this course as additional admission requirement.**

**Abstract**
Physical foundations of single polymer molecules and interacting chains.

**Objective**
The course offers a modern approach to the understanding of universal static and dynamic properties of polymers.

**Content**
Polymer Physics:
1. Introduction to Polymer Physics, Random Walks
2. Excluded Volume
3. Structure Factor from Scattering Experiments
4. Persistence
5. Solvent and Temperature Effects
6. Flory Theory
7. Self-consistent field theory
8. Interacting Chains, Phase Separation and Critical Phenomena
9. Rheology
10. Numerical methods in polymer physics, computer experiments

**Lecture notes**
A script can be found at http://www.polyphys.mat.ethz.ch/education/polymer_physics

**Literature**

**Prerequisites / notice**
Computer experiments will use the simple MATLAB programming language and will be made available, if necessary or useful.

### 327-0606-AAL Polymers II

**Enrolment only for MSc students who need this course as additional admission requirement.**

**Abstract**

**Objective**

**Content**

**Lecture notes**

**Literature**
Abstract
Principles of polymer technology

Objective
To obtain an understanding of the engineering aspects of structure and properties of solid polymers. Influence of polymer processing on properties of solid polymers.

Content
1. Crystallization of semi-crystalline polymers
2. Glass transition of amorphous polymers
3. Mechanical properties of solid polymers
4. Examples of polymer processing
5. Laboratory exercises

Lecture notes

W. Kaiser, Kunststoffchemie für Ingenieure (Hanser, München, 2005)

327-0501-AAL  Metals I  E-  3 credits  6R  R. Spolenak

Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
Repetition and advancement of dislocation theory. Mechanical properties of metals: hardening mechanisms, high temperature plasticity, alloying effects. Case studies in alloying to illustrate the mechanisms.

Objective
Repetition and advancement of dislocation theory. Mechanical properties of metals: hardening mechanisms, high temperature plasticity, alloying effects. Case studies in alloying to illustrate the mechanisms.

Content
Dislocation theory:
Properties of dislocations, motion and kinetics of dislocations, dislocation-dislocation and dislocation-boundary interactions, consequences of partial dislocations, sessile dislocations
Hardening theory:
a. solid solution hardening: case studies in copper-nickel and iron-carbon alloys
b. particle hardening: case studies on aluminium-copper alloys
High temperature plasticity:
thermally activated glide
power-law creep
diffusional creep: Coble, Nabarro-Herring
definition mechanism maps
Case studies in turbine blades
superplasticity
alloying effects

Abstract
Introduction to materials selection. Basic knowledge of major metallic materials: aluminium, magnesium, titanium, copper, iron and steel. Selected topics in high temperature materials: nickel and iron-base superalloys, intermetallics and refractory metals.

Objective
Introduction to materials selection. Basic knowledge of major metallic materials: aluminium, magnesium, titanium, copper, iron and steel. Selected topics in high temperature materials: nickel and iron-base superalloys, intermetallics and refractory metals.

Content
This course is divided into five parts:

A. Materials selection
Principles of materials properties maps
Introduction to the 'Materials selector' software package
Case studies

B. Light metals and alloys
Aluminium, magnesium, titanium
Properties and hardening mechanisms
Case studies in technological applications

C. Copper and its alloys

D. Iron and steel
The seven pros for steel
Fine grained steels, heat resistant steels
Steel and corrosion phenomena
Selection and application

E. High temperature alloys
Superalloys: iron, nickel, cobalt
Intermetallics: properties and application

Prerequisites / notice
Prerequisites: Metals I

327-0610-AAL  Advanced Composites  E-  3 credits  6R  F. J. Clemens, A. Winstörf er

Enrolment only for MSc students who need this course as additional admission requirement.
Abstract

Introduction of basic concepts for composites with polymer- metal- and ceramic matrix composites; production and properties of composites reinforced with particles, whiskers, short and long fibres; selection criteria, case histories of applications, recycling, future perspectives, and basic concepts for adaptive and functional composites.

Objective

Gain an insight into the diversity of opportunities to change the properties of composites, learn about the most important applications and processing techniques.

Content

1. Introduction
   1.1 What are advanced composites?
   1.2 What are materials by combination?
   1.3 Are composites an idea of today?
   1.4 Delphi foresight
   1.5 Why composites?
   1.6 References for chapter 1

2. Basic modules
   2.1 Particles
   2.2 Short fibres including whiskers
   2.3 Long fibres
   2.4 Matrix materials
      2.4.1 Polymers
      2.4.2 Metals
      2.4.3 Ceramics and glasses
   2.5 References for chapter 2

3. PMC: Polymer Matrix Composites
   3.1 Historical background
   3.2 Types of PMC-laminates
   3.3 Production, processing and machining operation
   3.4 Mechanics of reinforcement, microstructure, interfaces
   3.5 Failure criteria
   3.6 Fatigue behaviour of a multiply composite
   3.7 Adaptive materials systems
   3.8 References for chapter 3

4. MMC: Metal matrix composites
   4.1 Introduction: Definitions, selection criteria und "design"
   4.2 Types von MMCs - examples und typical properties
   4.3 Mechanical and physical properties of MMCs - basics of design, influencing variables and damage mechanisms
   4.4 Production processes
   4.5 Micro structure / interfaces
   4.6 machining operations for MMC
   4.7 Applications
   4.8 References for chapter 4

5. CMC: Ceramic Matrix Composites
   5.1 Introduction and historical background
   5.2 Modes of reinforcement
   5.3 Production processes
   5.4 Mechanisms of reinforcement
   5.5 Micro structure / interfaces
   5.6 Properties
   5.7 Applications
   5.8 Materials testing and quality assurance
   5.9 References for chapter 5

Lecture notes

The script will be delivered at the begin of the semester.

Literature

The script is including a comprehensive list of references.

Prerequisites / notice

Before each class, students will get a handout. Students will get the power point presentation of each class by e-mail.

The exercises take place in small groups. It is their goal to deepen knowledge gained in the classes.

written end of semester examination

Abstract
Overview of financial and managerial accounting
Accounting for current and fixed assets
Liabilities and owners equity
Recording change in balance sheet
Measuring financial performance
Managing financial reporting
Full and variable costing system
Using accounting information for decision making purposes
Record change in financial position
Measure business income
Prepare final accounts
Understand the principles of cost accounting
Calculate the different product costs
Make decisions about the acceptance or rejection of a particular product
Financial Accounting: Balance sheet, income statement, double-entry accounting, journal and ledger, accounting for merchandising activities, value-added tax, adjustments before final accounts, provisions, depreciation, valuation,
Managerial Accounting: Full costing, variable costing, cost-volume profit, break-even analysis, activity-based costing

Objective
Students are able to identify basic structures of the legal system. They understand selected topics of public and private law and are able to apply the fundamentals in more advanced law classes.

Principles of Law and Practical Training

Students who have attended or will attend the lecture
"Introduction to Law for Civil Engineering and Architecture" or "Introduction to Law" (851-0708-00), cannot register for this course unit.

Particularly suitable for students of D-MAVT, D-MATL

Abstract
This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered.

Objective
Students are able to identify basic structures of the legal system. They understand selected topics of public and private law and are able to apply the fundamentals in more advanced law classes.
Content
Basic concepts of law, sources of law.
Private law: Contract law (particularly contract for work and services), tort law, property law.
Public law: Human rights, administrative law, procurement law, procedural law.
Insights into the law of the EU and into criminal law.

Lecture notes
Jaap Hage, Bram Akkermans (Eds.), Introduction to Law, Cham 2014 (Online Resource ETH Library)

Literature
Further documents will be available online (see https://moodle-app2.let.ethz.ch/course/view.php?id=1596).

## Compulsory Courses

### Examination Block I

In Examination Block I either the course unit 402-2883-00L Physics III or the course unit 402-2203-01L Classical Mechanics must be chosen and registered for an examination. (Students may also enrol for the other of the two course units; within the ETH Bachelor Programme Mathematics, this other course unit cannot be registered for an examination. Knowledge of classical mechanics is presupposed in the spring semester core course 402-0224-00L Theoretical Physics.)
### Core Courses

#### Core Courses: Pure Mathematics

</thead>
<tbody>
<tr>
<td>401-3531-00L</td>
<td>Differential Geometry I</td>
<td>W</td>
<td>10 credits</td>
<td>4V+1U</td>
<td>M. Burger</td>
</tr>
</tbody>
</table>

- **Abstract**: This course is an introduction to differential and riemannian geometry.
- **Objective**: The aim is to lead students from a reasonable knowledge of advanced calculus, basic knowledge of general topology and solid knowledge of linear algebra to fundamental knowledge of differentiable manifolds and their basic tools. Riemannian geometry, some basic Lie theory, and de Rham cohomology will be developed as applications.
- **Literature**: W.Boothby *An introduction to differentiable manifolds and Riemannian geometry*
  
  J.M.Lee *Introduction to smooth manifolds*
  
  M.P. Do Carmo *Riemannian Geometry*
401-3461-00L Functional Analysis I W 10 credits 4V+1U D. A. Salamon

Abstract
Baire category; Banach and Hilbert spaces, bounded linear operators; Three Fundamental Principles: Uniform Boundedness, Open Mapping/Closed Graph, Hahn-Banach; Convexity; Dual Spaces: weak and weak* topologies, Banach-Alaoglu, reflexive spaces; Ergodic Theorem; compact operators and Fredholm theory, Closed Image Theorem; Spectral theory, self-adjoint operators.

Lecture notes
Lecture Notes on “Functional Analysis” by D. A. Salamon

401-3371-00L Dynamical Systems I W 10 credits 4V+1U W. Merry

Abstract
This course is a Part I of a broad introduction to dynamical systems. Topic covered include topological dynamics, symbolic dynamics, ergodic theory, hyperbolic dynamics. In Part II (FS 2016), we will cover low-dimensional dynamics, complex dynamics, measure-theoretic entropy and Hamiltonian dynamics.

Objective
Mastery of the basic methods and principal themes of dynamical systems.

Content
The course introduces the principal themes of modern dynamical systems. Topics covered include:

1. Topological dynamics
   (transitivity, attractors, chaos, structural stability)

2. Symbolic dynamics
   (Perron-Frobenius theorem, zeta functions)

3. Ergodic theory
   (Poincare recurrence theorem, Birkhoff ergodic theorem, existence of invariant measures)

4. Hyperbolic dynamics
   (Grobman-Hartman theorem, Shadowing lemma, Closing lemma and applications)

Literature
The most relevant textbook for this course is
Introduction to Dynamical Systems, Brin and Stuck, CUP, 2002.

Another excellent book (which will be relevant also for Dynamical Systems II) is
Lectures on Dynamical Systems, Zehnder, EMS 2010.

A more advanced textbook which covers everything in both Dynamical Systems I and II (and much more) is

401-3118-09L Modular Forms W 8 credits 3V+1U Ö. Imamoglu

Abstract
This is a introductory course on automorphic forms covering its basic properties with emphasis on connections with number theory.

Objective
The aim of the course is to cover the classical theory of modular forms.

Content

Literature
J.P. Serre, A Course in Arithmetic;
N. Koblitz, Introduction to Elliptic Curves and Modular Forms;
D. Zagier, The 1-2-3 of Modular Forms;
H. Iwaniec, Topics in Classical Automorphic Forms.

401-3001-61L Algebraic Topology I W 8 credits 4G P. Biran

Abstract
This is an introductory course in algebraic topology. The course will cover the following main topics: introduction to homotopy theory, homology and cohomology of spaces.

Literature

Book can be downloaded for free at:
http://www.math.cornell.edu/~hatcher/AT/ATpage.html

See also:
http://www.math.cornell.edu/~hatcher/#anchor1772800

3) E. Spanier, "Algebraic topology", Springer-Verlag

Prerequisites / notice
General topology, linear algebra.

Some knowledge of differential geometry and differential topology is useful but not absolutely necessary.

401-3132-00L Commutative Algebra W 10 credits 4V+1U P. D. Nelson

Abstract
This course is meant to provide an introduction to commutative algebra that equips the student to start studying the basics of algebraic geometry.

Objective
About the course: We shall closely follow the text "Introduction to Commutative Algebra" by M. F. Atiyah and I. G. Macdonald. Wherever possible, there will be extra focus on exercises that lead towards the basics of Algebraic Geometry. Topics include
* Basics about rings, ideals and modules
* Localisation
* Primary decomposition
* Integral dependence and valuations
* Noetherian rings
* Completions
* Basic dimension theory

Literature
References:

Prerequisites / notice
Prerequisites: Algebra I (or a similar introduction to the basic concepts of ring theory).

Core Courses: Pure Mathematics (Mathematics Master)
Core Courses: Applied Mathematics and Further Appl.-Oriented Fields

ECTS 2V

Students learn the theoretical foundations of the selected methods, as well as practical skills to apply these methods and to interpret their outcomes. We will then describe the connection between equidecomposability and valuations and valuation theory. Finally, we will discuss some recent classification results of valuations that are invariant under certain groups of motions.

Prerequisites / notice
Office hours: Thursday 11:00 - 12:00

401-3523-65L
Equidecomposability of Polytopes
2V
L. Parapatits

Abstract
A polygon in the plane can be decomposed into finitely many (convex) pieces and reassembled to form another polygon if and only if they have the same area. Hilbert's third problem asks if the analogous is also true for two polyhedra in space. Whether or not it is possible to define volume without the use of approximation arguments depends on the answer to this question.

Objective
The course will cover classical results on equidecomposability including the Dehn-Sydler theorem, i.e. the solution to Hilbert's third problem. We will then describe the connection between equidecomposability and valuation theory. Finally, we will discuss some recent classification results of valuations that are invariant under certain groups of motions.

Prerequisites / notice
Office hours: Thursday 11:00 - 12:00

401-3057-00L
Finite Geometries I, II
2G
N. Hungerbühler

Abstract
Finite geometries I, II: Finite geometries combine aspects of geometry, discrete mathematics and the algebra of finite fields. In particular, we will construct models of axioms of incidence and investigate closing theorems. Applications include test design in statistics, block design, and the construction of orthogonal Latin squares.

Objective
Finite geometries I, II: Students will be able to construct and analyse models of finite geometries. They are familiar with closing theorems of the axioms of incidence and are able to design statistical tests by using the theory of finite geometries. They are able to construct orthogonal Latin squares and know the basic elements of the theory of block design.

Content
Finite geometries I, II: finite fields, rings of polynomials, finite affine planes, axioms of incidence, Euler's thirty-six officers problem, design of statistical tests, orthogonal Latin squares, transformation of finite planes, closing theorems of Desargues and Pappus-Pascal, hierarchy of closing theorems, finite coordinate planes, division rings, finite projective planes, duality principle, finite Möbius planes, error correcting codes, block design

401-3591-65L
Basic Statistics
Intro to Random Graphs
W 4 credits 2V A. Knowles

Abstract
This is an introductory course on random graphs, covering Erdos-Renyi graphs, inhomogeneous graphs, phase transition phenomena, connectivity, and random walks on random graphs.

Prerequisites / notice
A basic undergraduate course on probability.

401-3627-00L
High-Dimensional Statistics
W 4 credits 2V P. L. Bühlmann

Abstract
"High-Dimensional Statistics" deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed.

Objective
Knowledge of methods and basic theory for high-dimensional statistical inference

Content
Lasso and Group Lasso for high-dimensional linear and generalized linear models; Additive models and many smooth univariate functions; Non-convex loss functions and L1-regularization; Stability selection, multiple testing and construction of p-values; Undirected graphical modeling

Literature

Prerequisites / notice
Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

401-4623-00L
Time Series Analysis
W 6 credits 3G not available

Abstract
Statistical analysis and modeling of observations in temporal order, which exhibit dependence. Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. Implementations in the software R.

Objective
Understanding of the basic models and techniques used in time series analysis and their implementation in the statistical software R.

Content
This course deals with modeling and analysis of variables which change randomly in time. Their essential feature is the dependence between successive observations.

Literature
Not available

Prerequisites / notice
A list of references will be distributed during the course.

401-3511-00L
Advanced Topics in Computational Statistics
W 4 credits 2V M. H. Maathuis, M. Mächler

Abstract
This lecture covers selected advanced topics in computational statistics, including various classification methods, the EM algorithm, clustering, handling missing data, and graphical modelling.

Objective
Students learn the theoretical foundations of the selected methods, as well as practical skills to apply these methods and to interpret their outcomes.

Content
The course is roughly divided in three parts: (1) Supervised learning via (variations of) nearest neighbor methods, (2) the EM algorithm and clustering, (3) handling missing data and graphical models.

Lecture notes
Lecture notes.

Prerequisites / notice
We assume a solid background in mathematics, an introductory lecture in probability and statistics, and at least one more advanced course in statistics.

401-0649-00L
Applied Statistical Regression
W 5 credits 2V+1U M. Dettling

Abstract
Statistical analysis and modeling of observations in temporal order, which exhibit dependence. Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. Implementations in the software R.

Objective
Understanding of the basic models and techniques used in time series analysis and their implementation in the statistical software R.

Content
Applications occur in geophysics, engineering, economics and finance. Topics covered: Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. The models and techniques are illustrated using the statistical software R.

Literature
Not available

Prerequisites / notice
A list of references will be distributed during the course.
We introduce and discuss the most important models for interest rate markets. Emphasis will be placed both on theoretical foundations and the corresponding financial products.

Lecturers
W. Meier - Gain overview of interest rate markets and the corresponding financial products.
M. V. Wüthrich - More advanced topics in interest rate modeling and applications.

Lecture notes
A script will be available.

Literature
Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

401-0625-01L Applied Analysis of Variance and Experimental Design

Abstract
Key concepts of experimental design. Planning and analysis of single factor experiments, block designs, full factorial and fractional designs, split-plot and strip-plot designs. Random effects and mixed effects models.

Objective
Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.

Selection: Financial and Insurance Mathematics

In the Bachelor's programme in Mathematics 401-3913-01L Mathematical Foundations for Finance is eligible as an elective course, but only if 401-3888-00L Introduction to Mathematical Finance isn't recognised for credits (neither in the Bachelor's nor in the Master's programme). For the category assignment take contact with the Study Administration Office (www.math.ethz.ch/studiensekretariat) after having received the credits.

Number Title Type ECTS Hours Lecturers
401-4905-00L Interest Rate Theory W 5 credits 2V+1U L. Meier

Abstract
We introduce and discuss the most important models for interest rate markets. Emphasis will be placed both on theoretical foundations and on numerical implementation and calibration.

Objective
- Gain overview of interest rate markets and the corresponding financial products.
- Understand the various modeling approaches used (short-rate models, Heath-Jarrow-Morton models, LIBOR market models).
- Get a firm grasp of the underlying theory, and practice numerical implementation of concrete examples.
- Learn about extensions that have recently become increasingly important: default risk, multiple yield curves, etc.
- Gain overview of interest rate markets and the corresponding financial products.
- Understand the various modeling approaches used (short-rate models, Heath-Jarrow-Morton models, LIBOR market models).
- Get a firm grasp of the underlying theory, and practice numerical implementation of concrete examples.
- Learn about extensions that have recently become increasingly important: default risk, multiple yield curves, etc.

Literature

Prerequisites / notice
- It is calculated.

Policy: Financial and Insurance Mathematics

401-3953-00L Interest Rate Modeling in Discrete Time

Abstract
This course gives an introduction to stochastic interest rate modeling in discrete time. Starting from cash flow valuation with state price deflators, we derive the equivalent martingale prices for pricing financial instruments and derivatives of primary assets. The lecture is supplemented by several examples such as the Vasicek model where we also study model calibration.

Objective
The students are familiar with the basic terminology of stochastic interest rate modeling and he is able to transfer his (financial) mathematical knowledge to real world pricing of cash flows and financial instruments.

Content
The following topics are covered:
1) stochastic discounting with state price deflators
2) equivalent martingale measures
3) pricing of cash flows and primary assets
4) pricing of derivatives, e.g. European put options
5) (multi-factor) Vasicek state price deflator model
6) Heath-Jarrow-Morton interest rate modeling framework
The classical life insurance model is presented together with the important insurance types (insurance on one and two lives, term and endowment insurance and disability). Besides that the most important terms such as mathematical reserves are introduced and calculated. The profit and loss account and the balance sheet of a life insurance company is explained and illustrated.

Prerequisites: knowledge of probability theory, statistics and applied stochastic processes.

Lecture notes

Abstract
The classical life insurance model is presented together with the important insurance types (insurance on one and two lives, term and endowment insurance and disability). Besides that the most important terms such as mathematical reserves are introduced and calculated. The profit and loss account and the balance sheet of a life insurance company is explained and illustrated.

Objective
The student is familiar with the basics in non-life insurance mathematics and statistics. This includes the basic mathematical models for insurance liability modeling, pricing concepts, stochastic claims reserving models and ruin and solvency considerations.

Content
The following topics are treated:
- Collective Risk Modeling
- Individual Claim Size Modeling
- Approximations for Compound Distributions
- Ruin Theory in Discrete Time
- Premium Calculation Principles
- Tariffication and Generalized Linear Models
- Bayesian Models and Credibility Theory
- Claims Reserving
- Solvency Considerations

Lecture notes
M. V. Wüthrich, Non-Life Insurance: Mathematics & Statistics
http://ssrn.com/abstract=2319328

Prerequisites / notice
The exams ONLY take place during the official ETH examination period.

This course will be held in English and counts towards the diploma of "Aktuar SAV". For the latter, see details under www.actuaries.ch.

Prerequisites: knowledge of probability theory, applied stochastic processes.

Selection: Mathematical Physics, Theoretical Physics

In the Bachelor's programme in Mathematics 402-0265-00L Quantum Mechanics I is eligible as an elective course, but only if 402-0224-00L Theoretical Physics isn't recognized for credits (neither in the Bachelor's nor in the Master's programme). For the category assignment take contact with the Study Administration Office (www.math.ethz.ch/studiensekretariat) after having received the credits.

<td>The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a particularly well-suited model for the behaviour and interaction of such selfish users and programs. Classical game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.</td>

|              | Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks |
|              | After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas. |
|              | Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problem in different areas. |

**Abstract**

Complexity Theory classifies problems according to the difficulty of solving them. In this course, we give an introduction to modern complexity theory. We introduce basic complexity classes (such as \( L, P, \) BPP, PH, NP, AM, PH, \( PSPACE, IP, EXP, \)) and study circuit complexity.

**Objective**

The student learns the fundamentals of Complexity Theory, as well as some of the more recent techniques. He not only understands the basic results and techniques used to prove them, but also has insight in some of the technically more advanced theorems.

**Content**

Complexity Theory classifies problems according to the difficulty of solving them. In this course, we give an introduction to modern complexity theory. We introduce basic complexity classes (such as \( L, P, \) BPP, PH, \( PSPACE, IP, EXP, \)) and study the known relationship to uniform complexity. We study circuit complexity, and its relationship to uniform complexity. We also will study some circuit lower bounds for constant depth circuits, as well as results which explain why it is difficult to improve these results.

| Block course: Starts on October 8 and ends on November 26, 2015 Thursdays 10-12 and 13-16 |

| Abstract | Usually Fourier Analysis and Systems Theory emphasize the analogy between the different settings (continuous&discrete, periodic&non-periodic). The author proposes a simple approach to generalized functions, based on a Banach space of test functions. The course provides the foundations to Banach Gelfand triples, but also concrete applications in signal processing (time-variant systems, sampling). |

| Objective | Deeper mathematical understanding of the foundations of signal processing and system theory. The setting of Banach Gelfand Triples allows to provide a framework that allows among others to discuss the relations between different settings (e.g. the generalized Fourier transform of functions on the Euclidean space and corresponding FFT-based routines). |
There will be a script related to the course. In fact, material for a book project on the subject is developed while the course is given. Astronomy

The Linear Complementarity Problem (LCP) was introduced in mid-1960’s (1965-67) by Lemke and Cottle-Dantzig (also called rigged Hilbert space), its use for signal processing and systems theory applications. In addition to classical questions we will also discuss the fundamental results of time-frequency analysis (Short-time Fourier transform, Gabor frames, Gabor multipliers, best approximation of operators by Gabor multipliers, identification of slowly varying channels using pilot tones, etc.).

Seminars

Early enrollments for seminars in myStudies are encouraged, so that we will recognize need for additional seminars in a timely manner. Some seminars have waiting lists. Nevertheless, register for at most two mathematics seminars. In this case, you express a stronger preference for the seminar for which you register earlier.
The seminar introduces and discusses main theorems around Martin Hairer's regularity structures following the article "Introduction to regularity structures" (Braz Jour Prob Stat 29).

The seminar is suited for Bachelor and Master students. Some knowledge in linear functional analysis and algebra is required.

Seminar SAT

Objectives:
1. To understand the basic concepts of regularity structures.
2. To become familiar with the mathematical tools and techniques used in the study of stochastic partial differential equations.
3. To become familiar with the applications of regularity structures to other areas of mathematics.
4. To develop the ability to read, understand, and present research papers in the field of stochastic partial differential equations.

Content:
- Introduction to regularity structures
- Applications of regularity structures to stochastic partial differential equations
- Recent developments in the field of stochastic partial differential equations

Prerequisites:
- Basic knowledge in probability theory and analysis
- Familiarity with stochastic processes and stochastic calculus

Target audience:
Third year Bachelor students;
Master students who cannot document to have received an adequate training in working scientifically.

Mandatory for all Bachelor and Master students with matriculation in the autumn semester 2014 or later.
Optional for Bachelor and Master students with matriculation until or before the spring semester 2014.

Example: You matriculated in the autumn semester 2013 into the first semester of the Bachelor programme, are now in the third year and plan to matriculate in the autumn semester 2016 into the first semester of the Master programme. In this case, you don't need "Scientific Works in Mathematics" in order to complete the Bachelor degree, but for the Master degree you will need it. In this case, we recommend that you register for "Scientific Works in Mathematics" in the autumn semester 2015 or spring semester 2016.

Directive

Abstract
Das Ziel dieser Vorlesung ist die Vermittlung der grundlegenden Konzepte und Begriffe der Mathematik. Dazu gehören die Sprache der Mathematik (d.h. Aussagenlogik und Prädikatenlogik), Modelle von Axiomensystemen (inkl. Gödelscher Vollständigkeitssatz), Beweismethoden, der Aufbau der Zahlen von den natürlichen Zahlen bis zu den reellen Zahlen, sowie die Axiome der Mengenlehre.

Objective
Das Ziel dieser Vorlesung ist die Vermittlung der grundlegenden Konzepte und Begriffe der Mathematik. Dazu gehören die Sprache der Mathematik (d.h. Aussagenlogik und Prädikatenlogik), Modelle von Axiomensystemen (inkl. Gödelscher Vollständigkeitssatz), Beweismethoden, der Aufbau der Zahlen von den natürlichen Zahlen bis zu den reellen Zahlen, sowie die Axiome der Mengenlehre (auf denen die gesamte Mathematik aufgebaut ist).

Die Vorlesung ist mit Übungen. Über das Semester verteilt finden 8 Übungsstunden statt.

<td>Enrolment only possible with matriculation in Mathematics Teaching Diploma or Mathematics TC at ETH or in Mathematics Teaching Diploma at UZH.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>Students learn about and learn to use findings from empirical research into mathematical didactics and best practice, as well as theoretical approaches to teaching various topics in mathematics. Methodological suggestions are compared and draft tuition concepts discussed.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>On the basis of their understanding of mathematics, of the knowledge acquired from research into teaching/learning and subject teaching, and also of best practice, students who have completed this course will be in a position to draft motivating learning arrangements, with cognitive appeal, which trigger and maintain learning processes. The aim here is to implement a corresponding teaching plan, so that the mathematics tuition that is given has a general-education value, on the one hand, and ensures that pupils acquire the fundamental knowledge necessary for studying at university, on the other hand.</td>

**Finite Geometries II**

Lecturers: M. Akveld, N. Hungerbühler

Type of Course: Max Jeger, *Endliche Geometrien*, ETH Skript 1988

**Title:** Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.

**Thematische Schwerpunkte**

Finite geometries I, II: finite fields, rings of polynomials, finite affine planes, axioms of incidence, Euler's thirty-six officers problem, design of experiments.

Vertiefung der mehrdimensionalen Analysis mit Schwerpunkt in der Anwendung der partiellen Differentialgleichungen, Vertiefung der Linearer Algebra und Einführung in die Systemanalyse.

**Vertiefung der Mehrdimensionalen Analysis mit Schwerpunkt in der Anwendung der partiellen Differentialgleichungen, Vertiefung der Linearer Algebra und Einführung in die Systemanalyse.**

**2V+1U**

**Dokument: schriftliche Vorbereitung für Prüfungslektionen.**

Eine kurze Anleitung zur mentorierten Arbeit in Fachdidaktik wird zur Verfügung gestellt.

**Contents of the lectures Combinatorics I and II: congruence transformation of the plane, symmetry groups of geometric figures, Euler's theorems, permutation groups, cycles, Bézout's lemma, cycle index, Polya's theorems, applications to graph theory and isomers.**

**Literature**

E. W. Farkas: *Vertiefung und Ausbau des Stoffes Mathematik I/II für die Anwendung in der Systemanalyse*. 4A

M. Akveld, K. Barro, L. Halbeisen, M. Huber, N. Hungerbühler: *Teaching Diploma and Teaching Diploma Mathematics as Minor Subject*. 4 credits

M. Huber: *Vertiefung der mehrdimensionalen Analysis mit Schwerpunkt in der Anwendung der partiellen Differentialgleichungen, Vertiefung der Linearer Algebra und Einführung in die Systemanalyse*. 2 credits

**Abstract**

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

**Objective**

The objective is for the students:

- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.

- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

**Content**

Die Gegenstände der mentorierten Arbeit in Fachdidaktik stammen in der Regel aus dem gymnasialen Unterricht.

Lernformen

**Literature**

Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

**Prerequisites / notice**

Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

**Abstract**

Finite geometries II: Finite geometries combine aspects of geometry, discrete mathematics and the algebra of finite fields. In particular, we will construct models of axioms of incidence and investigate closing theorems. Applications include test design in statistics, block design, and the construction of orthogonal Latin squares.

**Objective**

Finite geometries II, I, II: Students will be able to construct and analyse models of finite geometries. They are familiar with closing theorems of Desargues and Pappus-Pascal. They know the basic elements of the theory of block design.

**Content**

Finite geometries I, II: finite fields, rings of polynomials, finite affine planes, axioms of incidence, Euler's thirty-six officers problem, design of experiments, orthogonal Latin squares, transformation of finite planes, closing theorems of Desargues and Pappus-Pascal, hierarchy of closing theorems, finite coordinate planes, division rings, finite projective planes, duality principle, finite Möbius planes, error correcting codes, block design.

**Literature**

Albrecht Beutelspacher: *Einführung in die endliche Geometrie I,II*. Bibliographisches Institut 1983

Margaret Lynn Batten: *Combinatorics of Finite Geometries*. Cambridge University Press

Dembowski: *Finite Geometries.*

**Abstract**

The course Combinatorics II and III is an introduction into the field of enumerative combinatorics.

**Objective**

Upon completion of the course, students are able to classify combinatorial problems and to apply adequate techniques to solve them.

**Content**

Contents of the lectures Combinatorics I and II: congruence transformation of the plane, symmetry groups of geometric figures, Euler's function, Cayley graphs, formal power series, permutation groups, cycles, Bézout's lemma, cycle index, Polya's theorems, applications to graph theory and isomers.

**Abstract**

Vertiefung der mehrdimensionalen Analysis mit Schwerpunkt in der Anwendung der partiellen Differentialgleichungen, Vertiefung der Linearen Algebra und Einführung in die Systemanalyse.

**Objective**

Vertiefung und Ausbau des Stoffes Mathematik I/II für die Anwendung in der Systemanalyse.

Vorlesungen Mathematik III

---

**401-0293-99L Mathematics III (Supplement)**

_Simultaneous enrolment in 'Mathematics III' (401-0293-00L) is compulsory._

**Abstract**

**Objective**

Die Studierenden kennen die wesentlichen Elemente der mathematischen Modellierung. Sie sind in der Lage, Modelle zu erstellen und mathematisch zu diskutieren. Sie können selbständig Unterrichtssequenzen zur Modellierung entwickeln.

**Content**

- Modellbildung

  - Lineare Modelle:

  - Vektorräume, Normalformen.

  - Lösungsraum eines Linearen DGL-Systems

  - Qualitative Aussagen, Nichtlineare Modelle:

  - Stabilität für eine DGL 1. Ordnung, für allgemeine DGL-Systeme

  - Modelle in Raum und Zeit:

  - Partielle DGL,

  - Fourier-Reihe, -Transformation,

  - Laplace-Operator

**401-9985-00L Mentored Work Specialised Courses in the Respective Subject with an Educational Focus Mathematics A**

_Mentored Work Specialised Courses in the Respective Subject with an Educational Focus in Mathematics for TC and Teaching Diploma._

**Abstract**

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

**Objective**

The aim is for the students

- to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.

- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readers.

<td></td>
<td>The course is targeted at advanced students who have taken an interest in gathering practical research experience in the field of Learning &amp; Instruction. In teams of two, students conduct their own research projects (planning, conducting, analyzing, interpreting, and presenting research); thus, the course requires a high amount of self-directed working. Students are personally advised, and supported in their research project, by one of the researchers serving as lecturers in this course. During the first half the semester, relevant methodological knowledge and skills are practiced during plenary meetings and in students’ independent reading (e.g. generating and testing research questions, designing experiments, and analyzing data in the field of Learning and Instruction)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Learning goals include:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can illustrate and explain basic methods and concepts for research in the fields of Learning and Instruction, e.g. with the help of practical examples.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can generate testable research questions for a topic relevant in the fields of Learning and Instruction.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can design and conduct a study that is relevant for answering their research question.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can summarize and evaluate the main results from a study in the field of learning and Instruction, with regard to the research question being asked.</td>

1G

Die Studierenden können die Bedeutung von Unterrichtsthemen in ihrem Fach unter verschiedenen Blickwinkeln einschätzen. Sie kennen

Students learn about and learn to use findings from empirical research into mathematical didactics and best practice, as well as theoretical

approaches to teaching mathematics. Methodological suggestions are compared and draft tuition concepts discussed.

Objective

On the basis of their understanding of mathematics, of the knowledge acquired from research into teaching/learning and subject teaching, and also of best practice, students who have completed this course will be in a position to draft motivating learning arrangements, with cognitive appeal, which trigger and maintain learning processes. The aim here is to implement a corresponding teaching plan, so that the mathematics tuition that is given has a general-education value, on the one hand, and ensures that pupils acquire the fundamental knowledge necessary for studying at university, on the other hand.

Prerequisites / notice

This course is to be chosen jointly with 401-3972-00L.

401-3971-99L

Objective

Right at the start of their training, students acquire initial experience with the observation of teaching, the establishment of concepts for teaching and the implementation of teaching. This early confrontation with the complexity of everything that teaching involves helps students decide whether they wish to and, indeed, ought to, continue with the training. It forms a basis for the subsequent pedagogical and subject-didactics training.

Content

Literature

Wird von der Praktikumslehrperson bestimmt.

401-9988-00L

Objective

The teaching practice takes in 50 lessons: 30 are taught by the students, and the students sit in on 20 lessons. The teaching practice lasts 4-6 weeks. It gives students the opportunity to implement the contents of their specialist-subject, educational science and subject-didactics training in the classroom. Students also conduct work assignments in parallel to their teaching practice.

Prerequisites / notice

This is a supplement to the Teaching Internship required to obtain a Master of Advanced Studies in Secondary and Higher Education in the corresponding subject. It is aimed at enlarging the already acquired teaching experience. Students observe 10 lessons and teach 15 lessons independently.

401-9989-00L

Objective

Die Studierenden können die Bedeutung von Unterrichtsthemen in ihrem Fach unter verschiedenen Blickwinkeln einschätzen. Sie kennen

and beherrschen das unterrichtliche Handwerk. Sie können ein gegebenes Unterrichtsthema für eine Gruppe von Lernenden fachlich und
didaktisch korrekt strukturieren und in eine adäquate Lernumgebung umsetzen. Es gelingt ihnen, die Balance zwischen Anleitung und

Offenheit zu finden, sodass die Lernenden sowohl über den nötigen Freiraum wie über ausreichend Orientierung verfügen, um aktiv und
effektiv flexibel zu handeln (Fach-)Wissen zu erwerben.

Content

Das Aufbaupraktikum richtet sich an Studierende, die bereits das Didaktik-Zertifikat in ihrem Fach erworben haben und nun eine

Aufbauausbildung zum Master of Advanced Studies in Secondary and Higher Education absolvieren. In diesem zusätzlichen Praktikum

sollen die Studierenden vertiefte unterrichtliche Erfahrungen machen. Auf der Grundlage der zusätzlich erworbenen Kenntnisse und mit

Hilfe der ihnen jetzt zu Verfügung stehenden Instrumente analysieren sie verschiedene Aspekte des hospitierten Unterrichts. In dem von

ihnen selbst gestalteten Unterricht nutzten sie beim Entwurf der Lektionen, bei der Durchführung ihrer Arbeit insbesondere die

zusätzlich gewonnenen Erkenntnisse aus der allgemeinen und fachdidaktischen Lehr- und Lernforschung.

401-9991-01L

Objective

On the basis of a specified topic, the candidate shows that they are in a position

- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle

- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Content

Reflexion des Kandidaten/ der Kandidatin über die gehaltene Lektion im Rahmen eines kurzen Kolloquiums.
Lecture notes: Schriftliche Vorbereitung für Prüfungslektionen.
Prerequisites / notice: Nach Abschluss der übrigen Ausbildung.

401-9991-00L Examination Lesson II Mathematics ■ O 1 credit 2P N. Hungerbühler

Abstract: In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

Objective: On the basis of a specified topic, the candidate shows that they are in a position:
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle,
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Die gehaltene Lektion wird kriterienbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltene Lektion im Rahmen eines kurzen Kolloquiums.

Lecture notes: Schriftliche Vorbereitung für Prüfungslektionen.
Prerequisites / notice: Nach Abschluss der übrigen Ausbildung.

Professional Training (Two Subjects in One-Step Procedure)
The programme "Teaching Diploma, Two Subjects in One-Step Procedure" will not be offered anymore since Autumn Semester 2010. Therefore new matriculations are no longer possible. The courses offered below are valid only for students who have registered before.

401-9990-00L Teaching Internship Mathematics ■ Teaching Internship Mathematics for Teaching Diploma in 2 Subjects in One-Step Procedure and Mathematics as Major Subject

Abstract: In the final phase of their training, students have to apply and test the insights, abilities and skills they have acquired. They spend 3-5 weeks in an educational institution, during which time they observe 10 lessons and teach 30 lessons independently. The Teaching Internship is complemented by 10 further observed lessons, which are integrated into the Mentored Work in Subject Didactics.

Objective: Die Studierenden können die Bedeutung von Unterrichtsthemen unter verschiedenen Blickwinkeln einschätzen. Sie haben und beherrschen das unterrichtliche Handwerk. Sie können ein gegebenes Unterrichtsthema für eine Gruppe von Lernenden fachlich und didaktisch korrekt strukturieren und in eine adäquate Lernumgebung umsetzen. Es gelingt ihnen, die Balance zwischen Anleitung und Offenheit zu finden, sodass die Lernenden sowohl über den nötigen Freiraum wie über ausreichend Orientierung verfügen, um aktiv und effektiv flexibel nutzbares (Fach-)Wissen zu erwerben.

401-9991-01L Examination Lesson I Mathematics ■ Simultaneous enrolment in "Examination Lesson II Mathematics" (401-9991-02L) is compulsory.

Abstract: In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

Objective: On the basis of a specified topic, the candidate shows that they are in a position:
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle,
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Die gehaltene Lektion wird kriteriumsbaasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltene Lektion im Rahmen eines kurzen Kolloquiums.

Lecture notes: Dokument: Schriftliche Vorbereitung für Prüfungslektionen.

Abstract
Vertiefung der mehrdimensionalen Analysis mit Schwerpunkt in der Anwendung der partiellen Differentialgleichungen, Vertiefung der Linearen Algebra und Einführung in die Systemanalyse.

Objective
- Modellbildung
- Lineare Modelle: Vektorräume, Normalformen, Lösungsraum eines Linearen DGL-Systems
- Qualitative Aussagen, Nichtlineare Modelle: Stabilität für eine DGL 1. Ordnung, für allgemeine DGL-Systeme
- Modelle in Raum und Zeit: Partielle DGL, Fourier-Reihe, -Transformation, Laplace-Operator

Literature
Mentored Work Specialised Courses in the Respective Subject

The aim is for the students, upon completion of the course, to classify combinatorial problems and to apply adequate techniques to solve them.

Als ergänzende Literatur zur Vorlesung kann ich folgende beiden Bücher empfehlen:

## 401-9931-00L Foundations of Mathematics

**Abstract**

Das Ziel dieser Vorlesung ist die Vermittlung der grundlegenden Konzepte und Beiträge zur Mathematik. Dazu gehören die Sprache der Mathematik (d.h. Aussagenlogik und Prädikatenlogik), Modelle von Axiomensystemen (inkl. Gödel'scher Vollständigkeitssatz), Beweismethoden, der Aufbau der Zahlen von den natürlichen Zahlen bis zu den reellen Zahlen, sowie die Axiome der Mengenlehre.

**Objective**

The aim of this lecture is to teach the fundamental concepts and contributions to mathematics. This includes the language of mathematics (such as propositional and predicate logic), models of axiomatic systems (including Gödel's completeness theorem), proof methods, the construction of numbers from natural numbers to real numbers, as well as the axioms of set theory.

**Content**

- Axioms of set theory.
- From natural numbers to real numbers, as well as the axioms of set theory.

**Literature**

Als ergänzende Literatur zur Vorlesung kann ich folgende beiden Bücher empfehlen:

## 401-9995-00L Mentored Work Specialised Courses in the Respective Subject with an Educational Focus Mathematics A

**Subject**

- Mentored Work Specialised Courses in the Respective Subject with an Educational Focus in Mathematics for TC and Teaching Diploma.

**Abstract**

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

**Objective**

The aim is for the students:

- to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
- to try out different options for specialist further training in their profession.

**Content**

Thematical Schwerpunkte:

Lernformen:

**Lecture notes**

Eine Anleitung zur mentorierten Arbeit in FV wird zur Verfügung gestellt.

**Literature**

Die Literatur ist themenspezifisch. Sie muss je nach Situation selber beschafft werden oder wird zur Verfügung gestellt.

**Prerequisites / notice**

Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

## 401-9996-00L Mentored Work Specialised Courses in the Respective Subject with an Educational Focus Mathematics B

**Subject**

- Mentored Work Specialised Courses in the Respective Subject with an Educational Focus in Mathematics for Teaching Diploma and for students upgrading TC to Teaching Diploma.

**Abstract**

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

**Compulsory Elective Courses**

Further course offerings from the category Educational Science are listed under "Programme: Educational Science for Teaching Diploma and TC".

Teaching Diploma in 2 Subjects: One-Step Procedure:

- a) courses from the category Compulsory Elective Courses of the Minor Subject may also be selected;
- b) courses from the category Specialized Courses in the Respective Subject, either of the Major or the Minor Subject, may also be selected.

**401-3057-00L**  
**Finite Geometries II** W 4 credits 2G N. Hungerbühler

**Abstract**
Finite geometries I, II: Finite geometries combine aspects of geometry, discrete mathematics and the algebra of finite fields. In particular, we will construct models of axioms of incidence and investigate closing theorems. Applications include test design in statistics, block design, and the construction of orthogonal Latin squares.

**Objective**
Finite geometries I, II: Students will be able to construct and analyse models of finite geometries. They are familiar with closing theorems of the axioms of incidence and are able to design statistical tests by using the theory of finite geometries. They are able to construct orthogonal Latin squares and know the basic elements of the theory of block design.

**Content**
Finite geometries I, II: finite fields, rings of polynomials, finite affine planes, axioms of incidence, Euler's thirty-six officers problem, design of statistical tests, orthogonal Latin squares, transformation of finite planes, closing theorems of Desargues and Pappus-Pascal, hierarchy of closing theorems, finite coordinate planes, division rings, finite projective planes, duality principle, finite Möbius planes, error correcting codes, block design

**Literature**
- Max Jeger, Endliche Geometrien, ETH Skript 1988
- Albrecht Beutelspacher: Einführung in die endliche Geometrie I,II. Bibliographisches Institut 1983
- Margaret Lynn Batten: Combinatorics of Finite Geometries. Cambridge University Press
- Dembowski: Finite Geometries.
Objective

The general goal of the course consists in presenting ways to teach fundamentals of computer science, which are closely related to contents and methods of mathematics. After attending the course unit, a mathematics teacher is able to teach selected fundamentals of computer science in mathematics classes.

The students understand the fundamental concepts of computer science in the context of a broad and deep knowledge. Through this understanding, they manage to prepare teaching materials for a successful knowledge transfer and to pass their passion for the subject on to their pupils.

The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners inside a class. Besides holding classes, the students do care about the individual pupil support.

They encourage the autonomy of the learners, manage to work with diverse target groups and to establish a positive learning environment.

The students are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.

They are capable of developing teaching materials that are conducive to learning and are also of best practice. Students who have completed this course will be in a position to draft motivating learning arrangements, with cognitive appeal, which trigger and maintain learning processes. The aim here is to implement a corresponding teaching plan, so that the mathematics tuition that is given has a general-education value, on the one hand, and ensures that pupils acquire the fundamental knowledge necessary for studying at university, on the other hand.

Content

The main topics of the course unit "Computer Science in Secondary School Mathematics" represent a scientific and didactic added value for mathematics classes.

The course covers the didactics of logic, of cryptography, of finite state automata, of computability and of the introduction to programming. The students develop the understanding of fundamental scientific concepts such as algorithm, program, complexity, determinism, computation, automata, verification, testing, security of a cryptosystem and secure communication. They reflect on ways to embed them into a scientifically sound and didactically sustainable mathematics course.

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

Enrolment only possible with matriculation in Mathematics  
Teaching Diploma or Mathematics TC at ETH or in Mathematics Teaching Diploma at UZH. | O    | 4    | 2G   | K. Barro                  |
|          | Abstract                                                              |      |      |      |                           |
|          | Students learn about and learn to use findings from empirical research into mathematical didactics and best practice, as well as theoretical approaches to teaching various topics in mathematics. Methodological suggestions are compared and draft tuition concepts discussed. |      |      |      |                           |
|          | Objective                                                             |      |      |      |                           |
|          | On the basis of their understanding of mathematics, of the knowledge acquired from research into teaching/learning and subject teaching, and also of best practice, students who have completed this course will be in a position to draft motivating learning arrangements, with cognitive appeal, which trigger and maintain learning processes. The aim here is to implement a corresponding teaching plan, so that the mathematics tuition that is given has a general-education value, on the one hand, and ensures that pupils acquire the fundamental knowledge necessary for studying at university, on the other hand. |      |      |      |                           |
| 401-9983-00L | Mentored Work Subject Didactics Mathematics A  
Mentored Work Subject Didactics in Mathematics for TC.  
Teaching Diploma and Teaching Diploma Mathematics as Minor Subject. | O    | 2    | 4A   | M. Akveld, K. Barro, L. Halbeisen, M. Huber, N. Hungerbühler |
|          | Abstract                                                              |      |      |      |                           |
|          | In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle. |      |      |      |                           |
|          | Objective                                                             |      |      |      |                           |
|          | The objective is for the students:  
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.  
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use. |      |      |      |                           |

Abstract

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Objective

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practically find the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content

Anlässlich der Hospitalationen erfährt die Praktikumslehrperson ihre fachlichen, fachdidaktischen und pädagogischen Überlegungen, auf deren Basis sie den Unterricht geplant hat und tautscht sich mit dem/der Studierenden aus. Die von dem/der Studierenden gehaltenen Lektionen werden vor- und nachbesprochen.

Die Themen für die beiden Prüfungslektionen am Schluss des Praktikums erfahren die Studierenden in der Regel eine Woche vor dem Prüfungstermin. Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie bis am Vortrag um 12 Uhr den beiden Prüfungsexperten (Fachdidaktiker/-in, Departementsvertreter/-in) ein. Die gehaltenen Lektionen werden kriteriumsbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltenen Lektionen im Rahmen eines kurzen Kolloquiums.

Lecture notes

Dokument: schriftliche Vorbereitung für Prüfungslektionen.

Literature

Wird von der Praktikumslehrperson bestimmt.

### Mathematical Optimization

**Abstract**
Mathematical treatment of diverse optimization techniques.

**Objective**
Advanced optimization theory and algorithms.

**Content**
1. Linear optimization: The geometry of linear programming, the simplex method for solving linear programming problems, Farkas' Lemma and infeasibility certificates, duality theory of linear programming.
3. Integer optimization: Ties between linear and integer optimization, total unimodularity, complexity theory, cutting plane theory.
4. Combinatorial optimization: Network flow problems, structural results and algorithms for matroids, matchings and, more generally, independence systems.

### (also Bachelor) Core Courses: Pure Mathematics

#### 401-3531-00L Differential Geometry I

*W* 10 credits 4V+1U  M. Burger

**Abstract**
This course is an introduction to differential and riemannian geometry.

**Objective**
The aim is to lead students from a reasonable knowledge of advanced calculus, basic knowledge of general topology and solid knowledge of linear algebra to fundamental knowledge of differentiable manifolds and their basic tools. Riemannian geometry, some basic Lie theory, and de Rham cohomology will be developed as applications.

**Literature**
- W. Boothby "An introduction to differentiable manifolds and Riemannian geometry"
- J.M. Lee "Introduction to smooth manifolds"
- M. P. Do Carmo  "Riemannian Geometry"

#### 401-3461-00L Functional Analysis I

*W* 10 credits 4V+1U  D. A. Salamon

**Abstract**
Baire category; Banach and Hilbert spaces, bounded linear operators; Three Fundamental Principles: Uniform Boundedness, Open Mapping/Closed Graph, Convexity; Dual Spaces: weak and weak* topologies, Banach-Alaoglu, reflexive spaces; Ergodic Theorem; compact operators and Fredholm theory, Closed Image Theorem; Spectral theory, self-adjoint operators.

**Lecture notes**
Lecture Notes on “Functional Analysis” by D.A. Salamon

#### 401-3001-61L Algebraic Topology I

*W* 8 credits 4G  P. Biran

**Abstract**
This is an introductory course in algebraic topology. The course will cover the following main topics: introduction to homotopy theory, homology and cohomology of spaces.

**Literature**

**Prerequisites / notice**
Some knowledge of differential geometry and differential topology is useful but not necessarily absolutely required.

#### 401-3132-00L Commutative Algebra

*W* 10 credits 4V+1U  P. D. Nelson

**Abstract**
This course is meant to provide an introduction to commutative algebra that equips the student to start studying the basics of algebraic geometry.

**Objective**
About the course: We shall closely follow the text "Introduction to Commutative Algebra" by M. F. Atiyah and I. G. Macdonald. Wherever possible, there will be extra focus on exercises that lead towards the basics of Algebraic Geometry. Topics include
- Basics about rings, ideals and modules
- Localisation
- Primary decomposition
- Integral dependence and valuations
- Noetherian rings
- Completions
- Basic dimension theory

**References**

**Prerequisites / notice**
Prerequisites: Algebra I (or a similar introduction to the basic concepts of ring theory).

#### 401-3371-00L Dynamical Systems I

*W* 10 credits 4V+1U  W. Merry

**Abstract**
This course is a Part I of a broad introduction to dynamical systems. Topic covered include topological dynamics, symbolic dynamics, ergodic theory, hyperbolic dynamics. In Part II (FS 2016), we will cover low-dimensional dynamics, complex dynamics, measure-theoretic entropy and Hamiltonian dynamics.

**Objective**
Mastery of the basic methods and principal themes of dynamical systems.
The course introduces the principal themes of modern dynamical systems. Topics covered include:

1. Topological dynamics  
   (transitivity, attractors, chaos, structural stability)

2. Symbolic dynamics  
   (Perron-Frobenius theorem, zeta functions)

3. Ergodic theory  
   (Poincare recurrence theorem, Birkhoff ergodic theorem, existence of invariant measures)

4. Hyperbolic dynamics  
   (Groban-Hartman theorem, Shadowing lemma, Closing lemma and applications)

The most relevant textbook for this course is Introduction to Dynamical Systems, Brin and Stuck, CUP, 2002.

Another excellent book (which will be relevant also for Dynamical Systems II) is Lectures on Dynamical Systems, Zehnder, EMS 2010.

A more advanced textbook which covers everything in both Dynamical Systems I and II (and much more!) is

The material of the basic courses of the first two years of the program at ETH is assumed. Some basic differential geometry and functional analysis would be useful but not essential.

---

**Electives: Pure Mathematics**

**Selection: Algebra, Topology, Discrete Mathematics, Logic**

1. **Topology**
   - Basic concepts: sets, functions, spaces
   - Topological properties
   - Connectedness, compactness

2. **Algebra**
   - Groups, rings, fields
   - Polynomials, vector spaces
   - Linear maps, matrices

3. **Combinatorics**
   - Counting principles
   - Graph theory
   - Ramsey theory

4. **Discrete Mathematics**
   - Logic and proofs
   - Set theory
   - Algorithms and complexity

---

**Prerequisites / notice**

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 1045 of 1432
The goal of the course is to present some results of probabilistic number theory in a unified manner. The main concepts will be presented in parallel with the proof of three main theorems: (1) the Erdős-Kac theorem and its variants concerning the number of prime divisors of integers in various sequences; (2) the distribution of values of the Riemann zeta function, including Selberg's central limit theorem for the Riemann zeta function on the critical line; (3) functional limit theorems for the paths of partial sums of families of exponential sums such as Kloosterman sums.

H. Iwaniec and E. Kowalski: "Analytic number theory", and additional lecture notes will be prepared.

Prerequisites / notice

Prerequisites: Complex analysis, measure and integral; some probability theory is useful but the main concepts needed will be recalled. Some knowledge of number theory is useful but the main results will be summarized.

Elliptic Curves

We will study elliptic curves from different point of view: as varieties, as equations, as quotients. We will then study some properties of algebraic points on an elliptic curve. We will finally describe special subset of the rational points of curves that are embedded in products of elliptic curves.

The first part of the course will be devoted to the general theory of linear representations of finite groups. In the second part we will discuss

-existence of affine and projective quotients
-the Hilbert-Mumford criterion
-construction of the moduli space of elliptic curves
-toric varieties as GIT quotients
-semisimple vector bundles on curves

After a couple of introductory sessions, participants will contribute with talks.

Geometric Invariant Theory (GIT) is concerned with the problem of defining quotients of algebraic varieties by group actions, a crucial step in the construction of moduli spaces. Although some of the ideas go back to Hilbert, it was developed in its present form by Mumford in the 60s.

The course Combinatorics I and II is an introduction into the field of enumerative combinatorics.

Contents of the lectures Combinatorics I and II: congruence transformation of the plane, symmetry groups of geometric figures, Euler's function, Cayley graphs, formal power series, permutation groups, cycles, Bunsdie's lemma, cycle index, Polya's theorems, applications to graph theory and isomers.

The main concepts will be presented in parallel with the proof of three main theorems: (1) the Erdős-Kac theorem and its variants concerning the number of prime divisors of integers in various sequences; (2) the distribution of values of the Riemann zeta function, including Selberg's central limit theorem for the Riemann zeta function on the critical line; (3) functional limit theorems for the paths of partial sums of families of exponential sums such as Kloosterman sums.

J. Silverman "The arithmetic of Elliptic Curves"
J. Silverman "Advanced Topics in the arithmetic of Elliptic Curves"
E. Bombieri & W. Gubler "Heights in Diophantine Geometry"

Algebra and Linear Algebra, Topology, Geometry, some basic Algebraic Geometry.

Equidecomposability of Polytopes

A polygon in the plane can be decomposed into finitely many (convex) pieces and reassembled to form another polygon if and only if they have the same area. Hilbert's third problem asks if the analogous is also true for two polyhedra in space. Whether or not it is possible to define volume without the use of approximation arguments depends on the answer to this question.

The course will cover classical results on equidecomposability including the Dehn-Sydler theorem, i.e. the solution to Hilbert's third problem. We will then describe the connection between equidecomposability and valuation theory. Finally, we will discuss some recent classification results of valuations that are invariant under certain groups of motions.

Office hours: Thursday 11:00 - 12:00
Finite geometries II: Finite geometries combine aspects of geometry, discrete mathematics and the algebra of finite fields. In particular, we will construct models of axioms of incidence and investigate closing theorems. Applications include test design in statistics, block design, and the construction of orthogonal Latin squares.

Objective
Finite geometries I, II: Students will be able to construct and analyse models of finite geometries. They are familiar with closing theorems of the axioms of incidence and are able to design statistical tests by using the theory of finite geometries. They are able to construct orthogonal Latin squares and know the basic elements of the theory of block design.

Content
Finite geometries I, II: finite fields, rings of polynomials, finite affine planes, axioms of incidence, Euler's thirty-six officers problem, design of statistical tests, orthogonal Latin squares, transformation of finite planes, closing theorems of Desargues and Pappus-Pascal, hierarchy of closing theorems, finite coordinate planes, division rings, finite projective planes, duality principle, finite Moebius planes, error correcting codes, block design.

<tr>
<td>Abstract</td>
<td>In this course we will present the classical theory as well as some more recent developments of the calculus of variations of surfaces. We will expose method mixing functional analysis and differential geometry in order to produce and describe global and local minimizers or saddle points to two dimensional Lagrangians. In the first part of the class we shall consider the area functional whose critical points are minimal surfaces and study the so-called Plateau problem. Introduced originally by Lagrange in the 18th century. Then we will move to the systematic study of 2-dimensional conformally invariant Lagrangians and explain how they are all related to a generalized Plateau problem of prescribed mean curvature surfaces into submanifolds. In the last part of the class we will present a theory merging minimal surface theory and conformal invariance. This theory has been introduced in the early 20th century by Wilhelm Blaschke and is presently a very active field of research in geometric analysis due in particular to numerous applications in many fields of sciences such as general relativity, elasticity theory, cell biology etc.</td>

Abstract
Course on numerical approximations of stochastic ordinary differential equations driven by Wiener processes. These equations have several applications, for example in financial option valuation. This course also contains an introduction to random number generation and Monte Carlo methods for random variables.

Objective
The aim of this course is to enable the students to carry out simulations and their mathematical convergence analysis for stochastic models originating from applications such as mathematical finance. For this the course teaches a decent knowledge of the different numerical methods, their underlying ideas, convergence properties and implementation issues.

Content
Generation of random numbers
Monte Carlo methods for the numerical integration of random variables
Stochastic ordinary differential equations (SODEs)
Numerical approximations of SODEs
Multilevel Monte Carlo methods for SODEs
Applications to computational finance: Option valuation

Lecture notes
Lecture Notes will be available.

Mandatory: Probability and measure theory, basic numerical analysis and basics of MATLAB programming.

a) mandatory courses:
Elementary Probability, Probability Theory I.

b) recommended courses:
Stochastic Processes.

401-4655-64L  Numerical Analysis of High-Dimensional Problems for Uncertainty Quantification  

Abstract
In many applications of mathematics, efficient numerical methods for PDEs on high dimensional state and/or parameter spaces is required. This course provides succinct surveys of recently developed numerical methods, their computer implementation for model problems, and elements of their mathematical analysis for the efficient approximation of high- and infinite-dimensional PDE problems.
1. Infinite-Dimensional Analysis
   Probability spaces and measures,
   Tensor Products,
   Measures on function spaces,
   Covariance operators,
   PCA and KL-expansions,
   (generalized) polynomial chaos expansions,
   Kolmogoroff N-widths

2. Examples.
   Parametric Approximation Problems.
   Parametric ODEs (biochemical reaction pathways).
   Parametric PDEs (diffusion problems with random coefficients).
   PDEs in Parametric Domains (Scattering from random obstacles).

4. Stochastic Galerkin Methods

5. Stochastic Collocation Methods
   Smolyak’s algorithm and its generalizations;
   sparse, adaptive interpolation algorithms

6. Reduced Basis Methods

7. Monte Carlo Methods

8. Quasi-Monte Carlo Methods

   Bayesian Inverse Problems
   Shape Sensitivity Analysis of PDEs.
   Optimal Control of parametric ODEs and PDEs.
   Optimization of Parametric ODEs and PDEs.

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 1049 of 1432
Learning the theoretical foundations of selected methods and practical skills to apply these methods and to interpret their outcomes.

Objective
Understand the basic models and techniques used in time series analysis and their implementation in the software R.

Content
This course deals with modeling and analysis of variables which change randomly in time. Their essential feature is the dependence between successive observations.

Applications occur in geophysics, engineering, economics and finance. Topics covered: Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. The models and techniques are illustrated using the statistical software R.

Lecture notes
Not available

Literature
A list of references will be distributed during the course.

Prerequisites / notice
Basic knowledge in probability and statistics

401-3610-00L Advanced Topics in Computational Statistics

Abstract
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life.

Objective
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content
The course starts with the basics of linear regression modeling, and then proceeds to parameter estimation, tests and confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, categorical input variables, shrinkage and general modeling strategies.

The last third of the course is dedicated to an introduction into generalized linear regression models: this includes logistic regression for binary response variables, Poisson regression for count data, cumulative logit models for ordered, and multinomial regression for categorical response variables.

Lecture notes
A script will be available.

Literature
Faraway (2005): Linear Models with R
Faraway (2006): Extended Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

401-0625-01L Applied Analysis of Variance and Experimental Design

Abstract
Key concepts of experimental design. Planning and analysis of single factor experiments, block designs, full factorial and fractional designs, split-plot and strip-plot designs. Random effects and mixed effects models.

Objective
Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.

Stochastic Filtering - Theory and Applications

401-4926-13L

We present an introduction into stochastic portfolio theory following the recent work of Bob Fernholz and Ioannis Karatzas. Stochastic Portfolio theory is based on diffusion models which allow for certain forms of arbitrage related to econometric facts on (ranked) capital distribution curves.

The exams ONLY take place during the official ETH examination period.

To study their impact, one has to turn to models where prices are determined endogenously in equilibrium.

Applications to financial models of, e.g., interest rates or credit risk.

The course also includes numerical methods like Markov chain approximations, Galerkin approximations, and particle filtering, as well as

filtering in various levels of generality, as well as numerics and applications in statistics and finance.

filtering is the task of recovering unobserved state variables from noisy observations. This course covers the theoretical foundations of filtering in various levels of generality, as well as numerics and applications in statistics and finance.

The course starts with linear (Kalman) filtering and progresses to non-linear filtering for semimartingale state and observation processes. The course also includes numerical methods like Markov chain approximations, Galerkin approximations, and particle filtering, as well as applications to financial models of, e.g., interest rates or credit risk.

Prerequisites: knowledge of probability theory, statistics and applied stochastic processes.

Prerequisites: knowledge of probability theory, statistics and applied stochastic processes.

Prerequisites: knowledge of probability theory, statistics and applied stochastic processes.

Prerequisites: knowledge of probability theory and applied stochastic processes.

Prerequisites: knowledge of probability theory and applied stochastic processes.

Content
One might have, more provocatively, entitled the course: How does time end (in, Einstein’s general relativity)? In a word, badly. Not in a whimper, nor in a crunch, but in something much more exotic.

More, technically, what does a generic singular point, restricting time, in solutions to the Einstein gravitational field equations look like?

Special cosmological solutions, such as Freedman’s, do have singularities.

In 1963, Lifshitz and Khalatnikov ‘constructed a class’ of singular solutions and concluded that ‘... the presence of a singularity in time is NOT a necessary property of cosmological models of the general theory of relativity, and that the general case of an arbitrary distribution of matter and gravitational field does not lead to the appearance of a singularity.’

In 1965 Penrose and Hawking formulated and proved ‘incompleteness’ theorems that convinced even Lifshitz and Khalatnikov that singularities in time ARE a necessary property of cosmological models of the general theory of relativity. Penrose and Hawking proved, that under very general, physically reasonable conditions, a spacetime (that is, a solution to the Einstein equations) has a light ray (null geodesic) that suddenly ends (‘incompleteness’) sufficiently far in the past. They adroitly sidestep the problem of defining what a singularity actually is, by saying it is the ‘place’ where their light rays end. The proofs of incompleteness theorems are not hard. That’s good. Unfortunately, they are by their very nature completely non constructive and provide no quantitative information at all about what a ‘singularity’ really looks like.

In 1970, Belinski, Khalatnikov and Lifshitz revisited the work of 1963 and found that Khalatnikov and Lifshitz had missed something and that ‘... we shall show that there exists a general solution which exhibits a physical singularity with respect to time.’ In 1982 they revised the 1970 proposal. Their work culminates in a series of fascinating, but very, very heuristic, statements about the possible existence of a class of singular solutions to the field equations. These heuristic statements are referred to as the ‘BKL Conjectures’.

Next semester, we will rigorously formulate and prove the ‘BKL Conjectures’ for homogeneous spacetimes. That is, we will construct a set of initial data with positive measure which evolve into homogeneous, chaotically singular spacetimes that exhibit all of the BKL phenomenology. Most importantly, there are chaotic oscillations, growing in magnitude, whose distribution is governed by the continued fraction expansion of a parameter appearing in the initial data.

The lectures will be completely self contained. One doesn’t need to know anything about general relativity; the Einstein field equations will be introduced from scratch. We will classify real, three dimensional Lie algebras, introduce tensor analysis and discuss the geometry of homogeneous spacetimes. We will also derive the basic properties of continued fractions and the Gauss map $\phi$ as the beta function of a map $x \mapsto \frac{1}{1-x}$ which itself is the continued fraction expansion of a parameter appearing in the initial data.

Lecture notes
Notice
There will be lecture notes.

Prerequisites / notice
First year analysis and linear algebra are the only prerequisites.

402-0843-00L Quantum Field Theory I
W 10 credits 4V+2U G. Isidori

Abstract
This course discusses the quantisation of fields in order to introduce a coherent formalism for the combination of quantum mechanics and special relativity.

Topics include:
- Relativistic quantum mechanics
- Quantisation of bosonic and fermionic fields
- Interactions in perturbation theory
- Scattering processes and decays
- Radiative corrections

Objective
The goal of this course is to provide a solid introduction to the formalism, the techniques, and important physical applications of quantum field theory. Furthermore it prepares students for the advanced course in quantum field theory (Quantum Field Theory II), and for work on research projects in theoretical physics, particle physics, and condensed-matter physics.

402-0861-00L Statistical Physics
W 10 credits 4V+2U M. Sigrist

Abstract
This lecture covers the concepts of classical and quantum statistical physics, and some aspects of kinetic gas theory. In a more advanced part Bose-Einstein condensation, general mean field theory and critical phenomena will be addressed. Finally also various aspects of linear response theory will be discussed.

Objective
This lecture gives an introduction in the basic concepts and applications of statistical physics for the general use in physics and, in particular, as a preparation for the theoretical solid state physics education.

Content
Basics of phenomenological thermodynamics, three laws of thermodynamics.
Classical statistical physics: microcanonical ensembles, canonical ensembles and grandcanonical ensembles, applications to simple systems.
Quantum statistical physics: single particle, ideal quantum gases, fermions and bosons.
Bose-Einstein condensation: Bogolyubov theory, superfluidity.
Critical phenomena: mean field, series expansions, scaling behavior, universality.
Renormalization group: fixed points, simple models.
Linear response theory: general formulation, response in mean field, sum rules, collective modes, fluctuation dissipation theorem.

402-0830-00L General Relativity
W 10 credits 4V+2U M. Gaberdiel

Abstract
Manifold, Riemannian metric, connection, curvature; Special Relativity; Lorentzian metric; Equivalence principle; Tidal force and spacetime curvature; Energy-momentum tensor, field equations, Newtonian limit; Post-Newtonian approximation; Schwarzschild solution; Mercury’s perihelion precession, light deflection.

Objective
Basic understanding of general relativity, its mathematical foundations, and some of the interesting phenomena it predicts.

Suggested textbooks:
C. Misner, K. Thorne and J. Wheeler: Gravitation
S. Carroll - Spacetime and Geometry: An Introduction to General Relativity
R. Wald - General Relativity
S. Weinberg - Gravitation and Cosmology
N. Straumann - General Relativity with applications to Astrophysics

402-0873-65L Partial Differential Equations of Quantum Physics
W 4 credits 2V I. M. Sigal

Abstract
In this course we cover several fundamental equations of quantum physics: the Schrödinger equation, which lies at the foundation of Quantum Mechanics, the Gross-Pitaevski, Landau-Lifshitz and Hartree and Hartree-Fock equations playing an important role in condensed matter physics, the Ginzburg-Landau equations of superconductivity, and the Yang-Mills equations of particle physics.

| 252-1407-00L | Algorithmic Game Theory                  | W    | 7    | 3V+2U+1A | P. Widmayer |
| **Abstract** | Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory. |
| **Objective** | Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting. |
| **Content** | The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a powerful and versatile framework for understanding and designing algorithms for maximizing good properties of the system while minimizing bad properties. |
| **Lecture notes** | No lecture notes. |
| **Prerequisites / notice** | Prerequisites: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required. |
| **Audience** | Audience: Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic. |
| **Requirements** | Requirements: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required. |

| 252-0417-00L | Randomized Algorithms and Probabilistic Methods | W    | 7    | 3V+2U+1A | A. Steger |
| **Abstract** | Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks. |
| **Objective** | After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas. |
| **Content** | Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas. |
| **Lecture notes** | Yes |

| 252-4050-00L | Complexity Theory                        | W    | 6    | 3V+2U  | T. Holenstein |
| **Abstract** | Complexity Theory classifies problems according to the resources required in order to solve them. In this course, we give an introduction to modern complexity theory. We introduce basic complexity classes (such as L, P, BPP, PH, NP, AM, PH, PSPACE, IP, EXP), and study circuit complexity. |
| **Objective** | The student learns the fundamentals of Complexity Theory, as well as some of the more recent techniques. He not only understands the basic results and techniques used to prove them, but also has insight in some of the technically more advanced theorems. |
| **Content** | Complexity Theory classifies problems according to the difficulty of solving them. In this course, we give an introduction to modern complexity theory. We introduce basic complexity classes (such as L, P, BPP, PH, PSPACE, IP, EXP), and study the known relationship to uniform complexity. We study circuit complexity, and its relationship to uniform complexity. We also will study some circuit lower bounds for constant depth circuits, as well as results which explain why it is difficult to improve these results. |

Abstract
For this Reading Course proactive students make an individual agreement with a lecturer to acquire knowledge through independent literature study.

Prerequisites / notice
In principle a good understanding of concepts from linear algebra is sufficient. Of course, basic knowledge about functional analysis (Banach and Hilbert spaces, linear operators and linear functionals) is helpful. We will, however, explain all these concepts as we go along. We will not need background on Lebesgue integration or topological vector spaces (as usually required for the treatment of distributions).

Only necessary and eligible for the Master degree in Applied Mathematics.
One of the application areas specified must be selected for the category Application Area for the Master degree in Applied Mathematics. At least 8

Abstract
Key features of the surface climate (e.g., the wind and temperature distribution) can be understood by considering how basic physical balances such as the angular momentum and energy balance constrain global atmospheric circulations. This course gives an overview of the physical balances involved and explores some of their implications for maintaining the surface climate.

Objective
Understanding of the basic physical processes involved in maintaining the global circulation of the atmosphere and the surface climate (winds, temperature, precipitation, etc.). Ability to reason how climate may change on long timescales.

Content
Introduction to the physical balances and dynamical mechanisms governing global atmospheric circulations and the surface climate: angular momentum balance and its role in controlling winds; energy balance and its role in controlling temperatures; the hydrologic cycle and its role in controlling humidity and aridity; tracer transport and connections to the surface. The relative importance of mean circulations, transient eddies, and stationary eddies in these balances will be discussed, as will be the dynamics of their generation and maintenance.

The course gives an overview of the dominant processes that govern the surface climate, with a focus on phenomenology and order-of-magnitude physics that is applicable to climates generally, including those of Earth's distant past and of other planets.

Abstract
The aim of the course is to provide up-to-date knowledge on how we can obtain an understanding of the evolution and population dynamics of organisms based on their genetic sequencing data, employing key concepts from molecular evolution, phylogenetics and phylodynamics. Throughout the course, we tie the models and methods closely with applications, mainly in the field of epidemiology and evolution
Attendees will learn what information is contained in genetic sequencing data and how this information is extracted from the sequencing data. The main concepts introduced are:

- models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics
- stochastic processes

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

The course consists of three parts. We first introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Second, we employ these evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades.

Slides of the lecture will be available online.

Basic knowledge in linear algebra, analysis, and statistics.

This course provides an understanding of the basic concepts of population biology. It presents models regarding the dynamics and evolution of populations, and experimental designs for investigating population biology hypotheses (e.g., population growth, species interactions, epidemiology, metapopulations, life history evolution, local adaptation, evolution of sex, and coevolution).

Students are able:
- to describe and apply population biology models (e.g. growth, species interactions)
- to derive and apply epidemiological models
- to investigate evolutionary concepts (e.g., life history evolution, coevolution, evolution of sex) using population biology arguments and provide examples
- to propose population biology experiments

Population growth, population regulation, predator-prey interactions, host-pathogen interactions, competition, metapopulations, life history evolution, local adaptation, mating systems, sexual selection, coevolution.

- to substantiate evolutionary concepts (e.g., life history evolution, coevolution, evolution of sex) using population biology arguments and provide examples
- to describe and apply population biology models (e.g. growth, species interactions)

Handouts of lectures

Recommended:

Computational Electromagnetics

First half of the semester: Introduction to the main methods of numerical optimization with focus on stochastic methods such as genetic algorithms, evolutionary strategies, etc.. Second half of the semester: Each participant implements a selected optimizer and applies it on a problem of practical interest.

Typical optimization problems and their difficulties are outlined. Well-known deterministic search strategies, combinatorial minimization, and evolutionary algorithms are presented and compared. In engineering, optimization problems are often very complex. Therefore, new techniques based on the generalization and combination of known methods are discussed. To illustrate the procedure, various problems of practical interest are presented and solved with different optimization codes.

Physical modelling plays an important role in the analysis and design of new structures, especially for micro and nano devices where fabrication and measurement are difficult. After the fundamentals of electromagnetics, mechanics, and thermodynamics, an introduction to the main concepts and most widely used codes for physical modelling is given and commercial codes are applied.

Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability 1) to select appropriate software, 2) to apply it for solving given problems, 3) to validate the results, 4) to interactively improve the models until sufficiently accurate results are obtained.

Since the fabrication and characterization of micro- and nanostructures is difficult, expensive, and time-consuming, numerical modelling drastically reduced the design process. Although many commercial software packages are available, it is important to know the drawbacks and difficulties of the numerical methods behind them and to be able to validate the results obtained with such packages.

First, an introduction to the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics is given. This is important for understanding the problems to be analyzed and for validating results obtained from software packages. After this, the main concepts of numerical methods and of the most widely used codes for physical modelling are outlined and compared, which is essential for the adequate selection of software for solving given problems. After this, prominent commercial software packages are applied to various types of problems, ranging from electromagnetics to multiphysics. For becoming able to select appropriate software and to validate the results obtained, different commercial software packages will be used and compared during the exercises in form of small projects.

Control and Automation

Introduction to Dynamic Programming and Optimal Control. Covers the fundamental concepts of Dynamic Programming & Optimal Control.

Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

#### Content

- Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

#### Literature

This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? What is the best way to protect the environment? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

Besides this textbook, the slides and lecture notes will cover the content of the lecture and the exam questions.

#### Abstract

The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

#### Objective

Students are able to
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media.
- quantify driving forces and resulting fluxes of water, solute, and heat in soils.
- apply modern measurement methods and analytical tools for hydrological data collection
- conduct and interpret a limited number of experimental studies
- explain links between physical processes in the vadose-zone and major societal and environmental challenges

#### Content

- **Weeks 1 to 3:** Physical Properties of Soils and Other Porous Media
  - Units and dimensions, definitions and basic mass-volume relationships
  - Soil colloids and clay behavior
  - Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water reflectance and water balance.
  - Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics)
  - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity
  - Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing
  - Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:
    - Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.
    - Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.
    - Part 2: Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.
    - Midterm exam
    - Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.
    - Part 3 - Use of Hydrus model for simulation of unsaturated flow
  - Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.
  - Week 12 to 13: Solute Transport in Soils
    - Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.
    - Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.
  - Additional topics:
    - Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.
    - Biological Processes in the Vadose Zone
      - An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange, and challenges for bio- and phytoremediation.

### Financial Engineering (University of Zurich)

**Number**: 401-8905-00L  
**Title**: Financial Engineering (University of Zurich)  
**Type**: W  
**ECTS**: 4.5 credits  
**Hours**: 3G  
**Lecturers**: University lecturers

- **Abstract**: Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html
- **Objective**: Quantitative models for European option pricing (including stochastic volatility and jump models), volatility and variance derivatives, American and exotic options.
- **Content**: After introducing fundamental concepts of mathematical finance including no-arbitrage, portfolio replication and risk-neutral measure, we will present the main models that can be used for pricing and hedging European options e.g. Black-Scholes model, stochastic and jump-diffusion models, and highlight their assumptions and limitations. We will cover several types of derivatives such as European and American options, Barrier options and Variance-Swaps. Basic knowledge in probability theory and stochastic calculus is required. Besides attending class, we strongly encourage students to stay informed on financial matters, especially by reading daily financial newspapers such as the Financial Times or the Wall Street Journal.

**Prerequisites / notice**: Basic knowledge of probability theory and stochastic calculus. Asset Pricing.

### Advanced Corporate Finance I (University of Zurich)

**Number**: 401-8913-00L  
**Title**: Advanced Corporate Finance I (University of Zurich)  
**Type**: W  
**ECTS**: 3 credits  
**Hours**: 2V  
**Lecturers**: University lecturers

- **Abstract**: The course applies the basic concepts of corporate finance learnt in earlier courses to a variety of problems in corporate finance. Examples are valuation, takeovers, the measurement of value created, mergers, capital structure, project finance, and foreign direct investment. These are studied in the context of real cases.

**Prerequisites / notice**: Basic knowledge of probability theory and stochastic calculus. Asset Pricing.

### Image Analysis and Computer Vision

**Number**: 227-0047-00L  
**Title**: Image Analysis and Computer Vision  
**Type**: W  
**ECTS**: 6 credits  
**Hours**: 3V+1U  
**Lecturers**: G. Székely, O. Göksel, L. Van Gool

- **Abstract**: Light and perception. Digital image formation. Image enhancement and feature extraction. Unitary transformations. Color and texture. Image segmentation and deformable shape matching. Motion extraction and tracking. 3D data extraction. Invariant features. Specific object recognition and object class recognition.
- **Objective**: Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.
- **Content**: The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

**Lecture notes**: Course material Script, computer demonstrations, exercises and problem solutions

**Prerequisites / notice**: Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C. The course language is English.

### Information and Communication Technology

**Number**: 227-0042-00L  
**Title**: Signal and Information Processing: Modeling, Filtering, Learning  
**Type**: W  
**ECTS**: 6 credits  
**Hours**: 4G  
**Lecturers**: H.A. Loeliger

- **Abstract**: Fundamentals in signal processing, detection/estimation, and machine learning.
  I. Linear signal representation and approximation: Hilbert spaces, LMMSE estimation, regularization and sparseness.
- **Objective**: The course is an introduction to some basic topics in signal processing, detection/estimation theory, and machine learning.
- **Content**: The course starts with some basic topics in signal processing, detection/estimation theory, and machine learning. The course is divided into three parts:

**Lecture notes**: Lecture notes

**Prerequisites / notice**:  
- local bachelors: course "Discrete-Time and Statistical Signal Processing" (5. Sem.)  
- others: solid basics in linear algebra and probability theory
Discrete-Time and Statistical Signal Processing

**Number**: 227-0101-00L  
**Type**: W  
**ECTS**: 6 credits  
**Hours**: 4G  
**Lecturers**: H.A. Loeliger

**Abstract**
The course introduces some fundamental topics of digital signal processing with a bias towards applications in communications: discrete-time linear filters, equalization, DFT, discrete-time stochastic processes, elements of detection theory and estimation theory, LMMSE estimation and LMMSE filtering, LMS algorithm, Viterbi algorithm.

**Objective**
The course introduces some fundamental topics of digital signal processing with a bias towards applications in communications. The two main themes are "linearly" and "probability". In the first part of the course, we deepen our understanding of discrete-time linear filters. In the second part of the course, we review the basics of probability theory and discrete-time stochastic processes. We then discuss some basic concepts of detection theory and estimation theory, as well as some practical methods including LMMSE estimation and LMMSE filtering, the LMS algorithm, and the Viterbi algorithm.

**Content**
Discrete-time linear systems and the z-transform.  
Discrete time and continuous time: forth and back.  
Digital filters.  
DFT.  
Elements of probability theory.  
Discrete-time stochastic processes.  
Elements of detection theory and estimation theory.  
Linear estimation and filtering.  
Wiener filter.  
LMS algorithm.  
Viterbi algorithm.

**Lecture notes**
Lecture Notes.

Information Theory I

**Number**: 227-0417-00L  
**Type**: W  
**ECTS**: 6 credits  
**Hours**: 4G  
**Lecturers**: A. Lapidoth

**Abstract**
This course covers the basics concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

**Objective**
The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

**Content**
The entropy rate of a source. Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity

**Literature**
T.M. Cover and J. Thomas, Elements of Information Theory (second edition)

**Abstract**
Phenomenological approach to "Transport Phenomena" based on balance equations supplemented by thermodynamic considerations to formulate the undetermined fluxes in the local species mass, momentum, and energy balance equations; fundamentals, applications, and simulations

**Objective**
The teaching goals of this course are on five different levels:
1. Deep understanding of fundamentals: local balance equations, constitutive equations for fluxes, entropy balance, interfaces, idea of dimensionless numbers, ...
2. Ability to use the fundamental concepts in applications
3. Insight into the role of boundary conditions
4. Knowledge of a number of applications
5. Flavor of numerical techniques: finite elements, finite differences, lattice Boltzmann, Brownian dynamics, ...

**Content**
Approach to Transport Phenomena  
Diffusion Equation  
Brownian Dynamics  
Refresher Topics in Equilibrium Thermodynamics  
Balance Equations  
Forces and Fluxes  
Measuring Transport Coefficients  
Pressure-Driven Flows  
Heat Exchangers  
Complex Fluids

**Lecture notes**
A detailed manuscript is provided; this manuscript will be developed into a book entitled "A Modern Course in Transport Phenomena" by David C. Venerus and Hans Christian Öttinger

**Literature**

**Prerequisites / notice**
Complex numbers, Vector analysis (integrability; Gauss' divergence theorem). Laplace and Fourier transforms. Ordinary differential equations (basic ideas). Linear algebra (matrices; functions of matrices; eigenvectors and eigenvalues; eigenfunctions). Probability theory (Gaussian distributions; Poisson distributions; averages; moments; variances; random variables). Numerical mathematics (integration), Equilibrium thermodynamics (Gibbs' fundamental equation; thermodynamic potentials; Legendre transforms). Maxwell equations.

**Abstract**
Advanced, but fundamental topics central to the understanding of theory in chemistry and for solving actual chemical problems with a computer.  
Examples are:  
* Operators derived from principles of relativistic quantum mechanics  
* Relativistic effects + methods of relativistic quantum chemistry  
* Open-shell molecules + spin-density functional theory  
* New electron-correlation theories
Objective

The aim of the course is to provide an in-depth knowledge of theory and method development in theoretical chemistry. It will be shown that this is necessary in order to be able to solve actual chemical problems on a computer with quantum chemical methods.

The relativistic re-derivation of all concepts known from (nonrelativistic) quantum mechanics and quantum chemistry lectures will finally explain the form of all operators in the molecular Hamiltonian - usually postulated rather than deduced. From this, we derive operators needed for molecular spectroscopy (like those required by magnetic resonance spectroscopy). Implications of other assumptions in standard non-relativistic quantum chemistry shall be analyzed and understood, too. Examples are the Born-Oppenheimer approximation and the expansion of the electronic wave function in a set of pre-defined many-electron basis functions (Slater determinants). Overcoming these concepts, which are so natural to the theory of chemistry, will provide deeper insights into many-particle quantum mechanics. Also revisiting the workhorse of quantum chemistry, namely density functional theory, with an emphasis on open-shell electronic structures (radicals, transition-metal complexes) will contribute to this endeavor. It will be shown how these insights allow us to make more accurate predictions in chemistry in practice - at the frontier of research in theoretical chemistry.

Content

1) Introductory lecture: basics of quantum mechanics and quantum chemistry
2) Einstein's special theory of relativity and the (classical) electromagnetic interaction of two charged particles
3) Klein-Gordon and Dirac equation; the Dirac hydrogen atom
4) Numerical methods based on the Dirac-Fock-Coulomb Hamiltonian, two-component and scalar relativistic Hamiltonians
5) Response theory and molecular properties, derivation of property operators, Breit-Pauli-Hamiltonian
6) Relativistic effects in chemistry and the emergence of spin
7) Spin in density functional theory
8) New electron-correlation theories: Tensor network and matrix product states, the density matrix renormalization group
9) Quantum chemistry without the Born-Oppenheimer approximation

A set of detailed lecture notes will be provided, which will cover the whole course.

Literature

Abstract

The course addresses the physical principles of modern semiconductor devices and the foundations of their modeling and numerical simulation. Necessary basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided. Computer simulations of the most important devices and of interesting physical effects supplement the lectures.

Objective

The course aims at understanding the principle physics of modern semiconductor devices, of the foundations in the physical modeling of transport and its numerical simulation. During the course also basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided.

Content

The main topics are: transport models for semiconductor devices (quantum transport, Boltzmann equation, drift-diffusion model, hydrodynamic model), physical characterization of silicon (intrinsic properties, scattering processes), mobility of cold and hot carriers, recombination (Shockley-Read-Hall statistics, Auger recombination), impact ionization, metal-semiconductor contact, metal-insulator-semiconductor structure, and heterojunctions. The exercises are focussed on the theory and the basic understanding of the operation of special devices, as single-electron transistor, resonant tunneling diode, pn-diode, bipolar transistor, MOSFET, and laser. Numerical simulations of such devices are performed with an advanced simulation package (Sentaurus-Synopsys). This enables to understand the physical effects by means of computer experiments.

Abstract

Finding solutions: what is complexity, problem solving cycle.

Implementing solutions: project management, critical path method, quality control feedback loop.

Controlling solutions: Vensim software, feedback cycles, control parameters, instabilities, chaos, oscillations and cycles, supply and demand, production functions, investment and consumption

Objective

A successful participant of the course is able to:

- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyze the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics
This course discusses the quantisation of fields in order to introduce a coherent formalism for the combination of quantum mechanics and
Lecture notes will be provided.
- Manifold, Riemannian metric, connection, curvature; Special Relativity; Lorentzian metric; Equivalence principle; Tidal force and spacetime
- This lecture gives an introduction in the basic concepts and applications of statistical physics for the general use in physics and, in
- The content includes:
- Bose-Einstein condensation: Bogolyubov theory, superfluidity.
- Quantum statistical physics: single particle, ideal quantum gases, fermions and bosons.
- Statistical Physics
- Critical phenomena: mean field, series expansions, scaling behavior, universality.
- Renormalization group: fixed points, simple models.
- Linear response theory; general formulation, response in mean field, sum rules, collective modes, fluctuation dissipation theorem.
- Lecture notes
- Literature
- No specific book is used for the course. Relevant literature will be cited in the course.
- This course discusses the quantisation of fields in order to introduce a coherent formalism for the combination of quantum mechanics and
- Topics include:
- - Relativistic quantum mechanics
- - Quantisation of bosonic and fermionic fields
- - Interactions in perturbation theory
- - Scattering processes and decays
- - Radiative corrections
- The objective of this course is to provide a solid introduction to the formalism, the techniques, and important physical applications of quantum
- The course is structured along three main tasks:
- 1. Finding solutions
- 2. Implementing solutions
- 3. Controlling solutions
- PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in
- Self-study tasks (discussion exercises, Vensim exercises), are provided as home work. Weekly exercise sessions (45 min) are used to
discuss selected solutions. Regular participation in the exercises is an efficient way to understand the concepts relevant for the final exam.
- In the Master's programme in Applied Mathematics 402-0205-00L Quantum Mechanics I is eligible as a course unit in the application area Theoretical
- The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical
- systems dynamics, nonlinear dynamics and macroeconomic modeling.
- Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The
- systems oriented management, as an approach to structure problems and to find solutions.
- The role of quality control as an additional feedback loop and the consequences of small changes are discussed.
- PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of
- subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop
- and the consequences of small changes are discussed.
- PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology
- (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand,
- investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For
- economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a
- systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena,
- such as business cycles and other life cycles.
- Theoretical Physics
- In the Master's programme in Applied Mathematics 402-0205-00L Quantum Mechanics I is eligible as a course unit in the application area Theoretical
- Physics. But only if 402-0224-00L Theoretical Physics wasn't or isn't recognised for credits (neither in the Bachelor's nor in the Master's programme).
- For the category assignment take contact with the Study Administration Office (www.math.ethz.ch/studiensekretariat) after having received the credits.
- Introduction to Computational Physics
- This course offers an introduction to computer simulation methods for physics problems and their implementation on PCs and super
- computers: classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell's equation), Monte Carlo
- simulations, percolation, phase transitions
- Einführung in die rechnergestützte Simulation physikalischer Probleme. Anhand einfacher Modelle aus der klassischen Mechanik,
- Elektrodynamik und statistischen Mechanik sowie interdisziplinären Anwendungen werden die wichtigsten objektorientierten
- Programmiermethoden für numerische Simulationen (überwiegend in C++) erläutert. Daneben wird eine Einführung in die Programmierung
- von Vektorsupercomputern und parallelen Rechnern, sowie ein Überblick über vorhandene Softwarebibliotheken für numerische
- Simulationen geboten.
- Lecture notes
- The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found
- on the Moodle platform. More details during the first lecture.
- The main prerequisites are:
- - General Relativity
- - Manifold, Riemannian metric, connection, curvature; Special Relativity; Lorentzian metric; Equivalence principle; Tidal force and spacetime
- - Energy-momentum tensor, field equations, Newtonian limit; Post-Newtonian approximation; Schwarzschild solution; Mercury's
- perihelion precession, light deflection.

- **Abstract**: We study the combinatorics and the complexity of various subclasses of the linear complementarity problem.
- **Objective**: To understand the importance of linear complementarity as a common generalization of linear programming, bimatrix games and convex quadratic programming.
- **Content**: The Linear Complementarity Problem (LCP) was introduced in mid 1960's (1965-67) by Lemke and Cottle-Dantzig as a common generalization of linear programming, bimatrix game and convex quadratic programming. The problem is NP-hard in general, but there are many subclasses of LCP that are in P (polynomially solvable) or suspected to be in P. The reason for the possible polynomial solvability is that these studied subclasses (e.g. P-matrix LCPs and positive-definite LCPs) can be formulated as a problem which admits a solution that has a succinct certificate for its correctness. Moreover, there are elegant combinatorial abstractions of these subclasses.

In this seminar, we study the most important papers/books, both old and new, in the theory of LCP, and aim at understanding what is crucial lack of knowledge in proving or disproving existing conjectures.

- **Prerequisites / notice**: Basic knowledge of linear programming.

Abstract
Semester Papers help to deepen the students' knowledge of a specific subject area. Students are offered a selection of topics. These papers serve to develop the students' ability for independent mathematical work as well as to enhance skills in presenting mathematical results in writing.

Prerequisites / notice
There are several course units "Semester Paper" that are all equivalent. If, during your studies, you write several semester papers, choose among the different numbers in order to be able to obtain credits again.

401-3750-02L Semester Paper W 8 credits 11A Professors
No direct enrolment to this course unit in myStudies. Please fill in the online application form. Requirements and application form under www.math.ethz.ch/intranet/students/study-administration/theses.html (Afterwards the enrolment will be done by the Study Administration.)

Master Thesis
Number Title Type ECTS Hours Lecturers
401-2000-00L Scientific Works in Mathematics O 0 credits E. Kowalski
Target audience:
Third year Bachelor students;
Master students who cannot document to have received an adequate training in working scientifically.

Mandatory for all Bachelor and Master students with matriculation in the autumn semester 2014 or later. Optional for Bachelor and Master students with matriculation until or before the spring semester 2014.

Example: You matriculated in the autumn semester 2013 into the first semester of the Bachelor programme, are now in the third year and plan to matriculate in the autumn semester 2016 into the first semester of the Master programme. In this case, you don't need "Scientific Works in Mathematics" in order to complete the Bachelor degree, but for the Master degree you will need it. In this case, we recommend that you register for "Scientific Works in Mathematics" in the autumn semester 2015 or spring semester 2016.

Directive

Abstract
Introduction to scientific writing for students with focus on publication standards and ethical issues, especially in the case of citations (references to works of others.)

Objective
Learn the basic standards of scientific works in mathematics.

Content
- Types of mathematical works
- Publication standards in pure and applied mathematics
- Data handling
- Ethical issues
- Citation guidelines

Lecture notes
Moodle of the Mathematics Library: https://moodle-app2.let.ethz.ch/course/view.php?id=519

Prerequisites / notice
This course is completed by the optional course "Recherchieren in der Mathematik" (held in German) by the Mathematics Library. For more details see: http://www.math.ethz.ch/library/services/schulungen

401-4990-00L Master's Thesis O 30 credits 57D Professors
Only students who fulfill the following criteria are allowed to begin with their master's thesis:
a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to
gain admission to the master programme.

No direct enrolment to this course unit in myStudies.
Please fill in the online application form.
Requirements and application form under
www.math.ethz.ch/intranet/students/study-administration/theses.html
( Afterwards the enrolment will be done by the Study Administration. )

Abstract
The master's thesis concludes the study programme. Writing up the master's thesis allows students to independently produce a major piece of work on a mathematical topic. It generally involves consulting the literature, solving any ensuing problems, and putting together the results in writing.

The courses below are only available for MSc students with additional admission requirements.
Content

Basic notions and examples of groups:
Subgroups, Quotient groups and Homomorphisms,
Group actions and applications

Basic notions and examples of rings:
Ring Homomorphisms,
ideals, and quotient rings, rings of fractions
Euclidean domains, Principal ideal domains, Unique factorization
domains

Basic notions and examples of fields:
Field extensions, Algebraic extensions, Classical straight edge and compass constructions

Fundamentals of Galois theory
Representation theory of finite groups and algebras

406-2303-AAL
Complex Analysis
Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
Complex functions of one variable, Cauchy-Riemann equations, Cauchy theorem and integral formula, singularities, residue theorem, index of closed curves, analytic continuation, conformal mappings, Riemann mapping theorem.

Literature
B. Paclka: "An introduction to complex function theory."
R.Remmert: Theory of Complex Functions. Springer Verlag

E.Hille: Analytic Function Theory. AMS Chelsea Publication

406-2284-AAL
Measure and Integration
Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
Introduction to the abstract measure theory and integration, including the following topics: Lebesgue measure and Lebesgue integral, Lp-spaces, convergence theorems, differentiation of measures, product measures (Fubini's theorem), abstract measures, Radon-Nikodym theorem, probabilistic language.

Objective
Basic acquaintance with the theory of measure and integration, in particular, Lebesgue's measure and integral.

Literature
1. Lecture notes by Professor Michael Struwe (http://www.math.ethz.ch/~struwe/Skripten/AnalysisIII-SS2007-18-4-08.pdf)
2. L. Evans and R.F. Gariepy "Measure theory and fine properties of functions"
3. Walter Rudin "Real and complex analysis"
4. R. Bartle The elements of Integration and Lebesgue Measure

Alan Hatcher: Algebraic Topology (Cambridge University Press)
http://www.math.cornell.edu/~hatcher/AT/ATpage.html

Prerequisites / notice
The precise content changes with the examiner. Candidates must therefore contact the examiner in person before studying the material.

406-2604-AAL
Probability and Statistics
Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
Introduction to probability and statistics with many examples, based on chapters from the books "Probability and Random Processes" by G. Grimmett and D. Stirzaker and "Mathematical Statistics and Data Analysis" by J. Rice.

Objective
The goal of this course is to provide an introduction to the basic ideas and concepts from probability theory and mathematical statistics. In addition to a mathematically rigorous treatment, also an intuitive understanding and familiarity with the ideas behind the definitions are emphasized. Measured theory is not used systematically, but it should become clear why and where measure theory is needed.

Content
Probability:
Chapters 1-5 (Probabilities and events, Discrete and continuous random variables, Generating functions) and Sections 7.1-7.5 (Convergence of random variables) from the book "Probability and Random Processes". Most of this material is also covered in Chap. 1-5 of "Mathematical Statistics and Data Analysis", on a slightly easier level.

Statistics:
Sections 8.1 - 8.5 (Estimation of parameters), 9.1 - 9.4 (Testing Hypotheses), 11.1 - 11.3 (Comparing two samples) from "Mathematical Statistics and Data Analysis".
406-3461-AAL  Functional Analysis I  E-  10 credits  21R  D. A. Salamon

Abstract  Baire category; Banach spaces and linear operators; Fundamental theorems: Open Mapping Theorem, Closed Range Theorem, Uniform Boundedness Principle, Hahn-Banach Theorem; Convexity; reflexive spaces; Spectral theory.

Lecture notes  Lecture notes by Professor Michael Struwe (http://www.math.ethz.ch/~struwe/Skripten/FA-I-II-26-8-08.pdf) or Lecture notes by Prof. Einsiedler and Ward (https://dl.dropboxusercontent.com/u/2098511/FAnotes.pdf)

Literature  Numerous texts in English or German

406-3621-AAL  Fundamentals of Mathematical Statistics  E-  10 credits  21R  S. van de Geer

Abstract  The course covers the basics of inferential statistics.

ECTS  European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
In this course, various topics related to the development, GMP production and application of therapeutic proteins will be discussed. Furthermore, students will expand their training in pharmaceutical immunology and will be introduced to the basic concepts of pharmaceutical product quality management.

Students know and understand:
- basic mechanisms and regulation of the immune response
- the pathogenic mechanisms of the most important immune-mediated disorders
- the most frequently used expression systems for the production of therapeutic proteins
- the use of protein engineering tools for modifying different features of therapeutic proteins
- the mechanism of action of selected therapeutic proteins and their application
- basic concepts in the GMP production of therapeutic proteins

The course consists of two parts:

In a first part, students will complete their training in pharmaceutical immunology (Chapter 13 - 16 Immunobiology VIII textbook). This part particularly focuses on the pathogenic mechanisms of immune-mediated diseases. Deepened knowledge of immunology will be relevant for understanding the mechanism of action of many therapeutic proteins, as well as for understanding one major concern related to the use of protein-based drugs, namely, immunogenicity.

The second part focuses on topics related to the development and application of therapeutic proteins, such as protein expression, protein engineering, reducing immunogenicity, and GMP production of therapeutic proteins. Furthermore, selected examples of approved therapeutic proteins will be discussed.

Handouts to the lectures will be available for downloading under http://www.pharma.ethz.ch/scripts/index
- Chapters 13-16 of the Immunobiology VIII book (Janeway et al.)
- Lecture Handouts
- Paper References provided in the Scripts
- EMEA Dossier for Humira

The course advances basic knowledge in pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects of drug therapy in the fields of infectious diseases and cancer. The course also provides an overview of the field of pharmacogenomics, with a special focus on the role of genetic polymorphisms in disease susceptibility, drug response and adverse effects.

Topics include the pharmacology and pharmacotherapy of infectious diseases and cancer. In the field of pharmacogenomics, the course is focused on genetics, genome-wide association studies, genetic disease predisposition, examples of genetic variability of drug metabolism and drug responses, identification of new drug targets, relevance of pharmacogenomics for clinical drug development, and toxicogenomics.

A script is provided for each lecture course. The scripts define important and exam-relevant contents of lectures. Scripts do not replace the lecture notes.

Recommended reading:
The classic textbook in Pharmacology:
- Goodman and Gilman’s The Pharmacological Basis of Therapeutics

  or

  2013; Urban & Fischer (Elsevier, München)

Introduction of principles of pharmacoepidemiology and epidemiology in addressing drug related questions in the population and of epidemiologic perspectives for health care management.

Objectives:
- To familiarize participants with the principles of pharmacoepidemiology and epidemiology in addressing drug related questions with concern to the use, effects and risks of medicinal products in a large population.
- To introduce participants to fundamental statistical, economic and epidemiological concepts and methods.
- To provide the appropriate tools to critique pharmacoepidemiologic studies in the literature and to critically read and understand papers in the medical literature which relate to drug benefits, risks, and costs.
- To address controversial topics in drug use and benefit-risk assessment, and to critically appraise the outcome of drug therapy.
- To equip participants with skills to facilitate further studies in these areas.

The contribution of epidemiology to the study of drug uses, effects and risks:
- Pharmacoepidemiology study methodologies, concepts and strategies
- Detection and identification of unintended drug effects (pharmacovigilance)
- Quantifying unintended effects and drug interactions,
- Bias and confounding by indication,
- Drug utilization

Pharmacoepidemiology and outcome assessment of drug therapy.

Meta-analysis in pharmacoepidemiology.

Pharmacoepidemiology and regulatory decision making in drug safety

This course will be a combination of formal lectures, group discussions and self-directed project work. Course material will be taught through seminars, case studies and group projects. Reading material and scripts will be given for each week.
A reading list pertinent to the course will be provided during the course.

Methodological referen

535-0010-00L Drug Seminars I
6 credit points are awarded after successful presentation in the Seminar Week. - Strictly for students enrolled in the Master programmes Pharmaceutical Sciences or MIPS

Abstract
Drug therapy is nothing less than interference with a highly complex biological system, which is affected by various internal and external factors. A profound understanding of drug effects thus requires a transdisciplinary approach of investigation. The drug seminars provide a platform for the presentation and discussion of these transdisciplinary approaches for the investigation of drug action.

Objective
Drug therapy is nothing less than interference with a highly complex biological system, which is affected by various internal and external factors. A profound understanding of drug effects thus requires a transdisciplinary approach of investigation. The drug seminars provide a platform for the presentation and discussion of these transdisciplinary approaches for the investigation of drug action.

Content
The faculty members of the Institute of Pharmaceutical Sciences offer specific projects from different areas of the pharmaceutical sciences, each of which is elaborated by a small group of students (4-8). Each group is tutored by a faculty member. The objective of this work is to achieve an in-depth understanding of the problem investigated and to present the results of the work to an audience composed of all students participating in the drug seminar and the faculty of the Institute of Pharmaceutical Sciences. Presentations will take place in the framework of a dedicated mini-symposium, which is part of the external seminar week. The possibility exists to invite external experts from industry or the public health sector to participate in the mini-symposium. Students are strongly encouraged to make use of this opportunity and will again be supported in these efforts by the faculty members.

Literature
Further references will be provided in the course.

535-0423-00L Drug Delivery and Drug Targeting
The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.

Objective
The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.

Content
The course covers the following topics: drug targeting and delivery principles, radiopharmaceuticals, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, delivery of active agents in tissue engineering, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices and novel trends in transdermal and nasal drug delivery.

Lecture notes
Selected lecture notes, documents and supporting material will be directly provided or may be downloaded using
http://www.galenik.ethz.ch/teaching/drug_del_drug_targ

The website also displays additional information on peroral delivery systems, transdermal systems and systems for alternative routes (nasal, pulmonary) of delivery. These fields are covered in detail in the course Galenische Pharmazie II (Galenical Pharmacy II).

Literature
Further references will be provided in the course.

535-0137-00L Clinical Chemistry II
Detailed knowledge of particular aspects of clinical chemistry and medical laboratory diagnostics concerning quality control, point-of-care analytics, analytics of kidney stones, tumor markers, diagnosis of HIV and hepatitis, pharmacogenetics, thyroid function, bone metabolism and laboratory diagnosis of hypertension.

Objective
Detailed knowledge on the implementation and interpretation of clinical laboratory diagnostic tests. Competence to interpret selected tests.

Content
Internal and external quality control, point-of-care analytics, analytics of kidney stones, use of tumor marker determinations, diagnosis of HIV and hepatitis, pharmacogenetics, thyroid function, bone metabolism and laboratory diagnosis of hypertension.

Lecture notes
Documentation will be available before the lectures electronically.

Prerequisites / notice
Requirement: basic knowledge in clinical chemistry and laboratory diagnostics

535-0250-00L Biotransformation of Drugs and Xenobiotics
Knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.

Objective
Goals: knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.

Content
Major reactions of biotransformation. Major enzymes and reaction partners involved in the biotransformation of drugs and xenobiotics. Toxic reactions of metabolites. Factors which affect the biotransformation.

Lecture notes
Biotransformation of drugs and xenobiotics

Literature

535-0546-00L Patents
Knowledge in the field of intellectual property, especially of patents and trademarks, with particular emphasis on pharmaceutics. Introduction into intellectual property; prosecution of patent applications; patent information; exploitation and enforcement of patents; peculiarities in pharmaceutics and medicine; social, political and ethical aspects; Trademarks.

Objective
Basic knowledge in the field of industrial property, especially of patents and trademarks, with particular emphasis on the chemical, pharmaceutical and biotech field.
The students will learn how computer simulation generates ideas for drug design and development, understand the theoretical principles of

ECTS Type Hours Lecturers

535-0310-00L Glycobiology in Drug Development W 1 credit 1V V. I. Otto

Abstract
Protein-based drugs constitute around 25% of new approvals and most of them are glycoproteins. Using selected examples the course aims at providing insight into our present knowledge on glycocalyx-activity relationships and the production and analysis of glycoprotein-based drugs.

Objective
- Gaining insight into the glycobiology of therapeutically used glycoproteins. This implies knowing and understanding
- the major types of protein-linked glycans and their biosynthesis
- the most important expression systems for production of recombinant glycoproteins
- methods used to alter or manipulate glycocalyx
- the most prominent clinically used glycoproteins and how glycosylation influences their therapeutic profile.
- Current methods for the qualitative and quantitative characterization of glycoproteins and being able to apply this knowledge in other contexts.

Content
- lecture plan:
  1. Proteins wearing a "sugar dress".
  - Glycans in cell-cell communication and molecular recognition in multicellular organisms
  - Tissue plasminogen activator (t-PA), glucocerebrosidase and the biosynthesis of N-glycans
  - PSGL-1 and the biosynthesis of O-glycans;
  - P-selectin and other lectins
  4. The glycoprotein hormones and the production and analysis of therapeutic glycoproteins
  5. Monoclonal antibodies and the modification of their therapeutic profile through glycoengineering
  6. EPO “the same but different”
  7. Current topics: Biosimilars and the currently marketed Biopharmaceuticals

Lecture notes
The slides used for the lectures will be provided online

Literature

Prerequisites / notice
Requirements: Basic knowledge in molecular biology, protein chemistry and analytics. Basic knowledge in pharmacology.

535-0300-00L Molecular Mechanisms of Drug Actions and Targets W 1 credit 1V V. I. Otto

Abstract
In the last 10 years, an average of one drug per year was withdrawn from the market. Using selected examples of such drug failures, the course aims at analyzing the present explanations of drug actions as well as the design and predictive power of animal models and clinical trials. In addition, the ethical, societal, and economical expectations in new drugs shall be reflected.

Objective
- To develop a critical understanding of the relevance and limitations of the current approaches to explaining and anticipating drug effects.
- To critically appraise the ethical, societal, economical and political expectations in the development of new drugs.

Content
In December 2006, Pfizer stopped a large phase III study on the use of Torcetrapib for the prevention of atherosclerosis and cardiovascular disease. 800 million $ in development costs and 21 billion $ in stocks were annihilated overnight. The failure of Torcetrapib has pinpointed the limitations of an extremely reductionist view of atherosclerosis and it's prevention by drug therapy. It has also highlighted what high disease. 800 million $ in development costs and 21 billion $ in stocks were annihilated overnight. The failure of Torcetrapib has pinpointed the limitations of an extremely reductionist view of atherosclerosis and it's prevention by drug therapy. It has also highlighted what high disease.

Lecture notes
Printouts of the slides used for the lectures and literature for reading and discussions will be available online.

Literature
Recommended reading: John Abramson, Overdo$ed America, Harper Perennial, New York 2008

Prerequisites / notice
Requirements: Basic knowledge in Medicinal Chemistry and Pharmacology. Ability to read and understand scientific publications in English.

535-0022-00L Computer-Assisted Drug Design W 1 credit 1V G. Schneider

Abstract
The lecture series provides an introduction to computer applications in medicinal chemistry. A focus is on molecular representations, property predictions, molecular similarity concepts, virtual screening techniques, and de novo drug design. All theoretical concepts and algorithms presented are illustrated by practical applications and case studies

Objective
The students will learn how computer simulation generates ideas for drug design and development, understand the theoretical principles of property prediction and computer-generated compound generation, and understand possibilities and limitations of computer-assisted drug design in pharmaceutical chemistry. As a result, they are prepared for professional assessment of computer-assisted drug design studies in medicinal chemistry projects.

Literature
Recommended textbooks:
Successful participation in this course is required for a research project ("Forschungspraktikum") in the CADD group.

**Abstract**

This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

**Objective**

The main goal of this course is to enhance the student's ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.

**Content**

I. Ethics & the Process of Ethical Inquiry

*Introduction in Ethics and Research Ethics*
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important;
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

*Ethical approaches in the conduct of research (Normative Ethics)*
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

*Moral reasoning I: Arguments*
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

*Moral reasoning II: Decision-making*
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

*Integrity in Research & Research Misconduct*
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

*Data Management*
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

*Research involving animals*
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 R's (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

*Research involving human subjects*
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks;
- Ethics Committees / Institutional Review Boards (IRB)

*Authorship & Peer review*
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

*Social responsibility*
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

**Lecture notes**

Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

**Abstract**

Context recognition in mobile communication systems like mobile phone and wearable computer will be studied using advanced methods from sensor data fusion, pattern recognition, statistics, data mining and machine learning. Context comprises the behavior of individuals and of groups, their activities as well as the local and social environment.

**Objective**

Future mobile systems will act as personal and cooperative assistant by providing the appropriate information and services. The systems consist of a smartphone which communicates with sensors on-body and in the environment. Context comprises user's behavior, his activities, his local and social environment.

In the data path from the sensor level to signal segmentation to the classification of the context, advanced methods of signal processing, pattern recognition and machine learning will be applied. Sensor data generated by crowdsourcing methods are integrated. The validation using MATLAB is followed by implementation and testing on a smartphone.

Context recognition as the crucial function of mobile systems is the main focus of the course. Using MATLAB the participants implement and verify the discussed methods also using a smartphone.

**Content**

- The next generation of mobile communication systems are integrated in our clothes and act as personal and cooperative assistant providing information we need just now (see www.wearable.ethz.ch).
- Context recognition - what is the situation of the user, his activity, his environment, how is he doing, what are his needs - as the central functionality of mobile systems constitutes the focus of the course.
- The main topics of the course include:
  - The exercises show concrete design problems like motion and gesture recognition using distributed sensors, detection of activity patterns and identification of the local environment.
  - Presentations of the PhD students and the visit at the Wearable Computing Lab introduce in current research topics and international research projects.

**Prerequisites**

Language: german/english (depending on the participants)

**Abstract**

This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies.

**Objective**

Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems.

The basic elements, design issues and techniques for analog integrated circuits will be taught in this course.

**Content**

- Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc; Amplifiers: differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; Stability; Comparators; Second-order effects in analog circuits such as mismatch, noise and offset; A/D and D/A converters; Introduction to switched capacitor circuits.
- The exercise sessions aim to reinforce the lecture material by well guided step-by-step design tasks. The circuit simulator SPECTRE is used to facilitate the tasks. There is also an experimental session on op-amp measurements.
- Handouts of presented slides. No script but an accompanying textbook is recommended.

**Prerequisites**

No special prerequisites

**Literature**

- Handouts of presented slides. No script but an accompanying textbook is recommended.
- Literature

- Presentations of the PhD students and the visit at the Wearable Computing Lab introduce in current research topics and international research projects.

**Abstract**

The course covers the foundations of semiconductor nanostructures, e.g., materials, band structures, bandgap engineering and doping, field-effect transistors. The physics of the quantum Hall effect and of common nanostructures based on two-dimensional electron gases will be discussed, i.e., quantum point contacts, Aharonov-Bohm rings and quantum dots.

**Objective**

At the end of the lecture the student should understand four key phenomena of electron transport in semiconductor nanostructures:

1. The integer quantum Hall effect
2. Conductance quantization in quantum point contacts
3. the Aharonov-Bohm effect
4. Coulomb blockade in quantum dots

**Content**

1. Introduction and overview
2. Semiconductor crystals: Fabrication and band structures
3. k.p-theory, effective mass
4. Envelope functions and effective mass approximation, heterostructures and band engineering
5. Fabrication of semiconductor nanostructures
6. Elektrostatics and quantum mechanics of semiconductor nanostructures
7. Heterostructures and two-dimensional electron gases
8. Drude Transport
9. Electron transport in quantum point contacts; Landauer-Büttiker description
10. Ballistic transport experiments
11. Interference effects in Aharonov-Bohm rings
12. Electron in a magnetic field, Shubnikov-de Haas effect
13. Integer quantum Hall effect
14. Coulomb blockade and quantum dots

**Lecture notes**

In addition to the lecture notes, the following supplementary books can be recommended:

Prerequisites / notice
The lecture is suitable for all physics students beyond the bachelor of science degree. Basic knowledge of solid state physics is recommended. Very ambitioned students in the third year may be able to follow. The lecture can be chosen as part of the PhD-program. The course is taught in English.

Autumn Semester 2015
Page 1080 of 1432

**Objective**

Introduction to HPC for scientists and engineers

**Fundamental of:**
- 1. Parallel Computing Architectures
- 2. MultiCores
- 3. ManyCores

**Content**

Programming models and languages:
1. C++ threading (2 weeks)
2. OpenMP (4 weeks)
3. MPI (5 weeks)

Computers and methods:
1. Hardware and architectures
2. Libraries
3. Particles: N-body solvers
4. Fields: PDEs
5. Stochastics: Monte Carlo

**Lecture notes**

**Abstract**

Practical course: Students are introduced to the process steps required for the fabrication of MEMS (Micro Electro Mechanical System) and carry out the fabrication and testing steps in the clean rooms by themselves. Additionally, they learn the requirements for working in clean rooms. Processing and characterization will be documented and analyzed in a final report. Limited access

**Objective**

Students learn the individual process steps that are required to make a MEMS (Micro Electro Mechanical System). Students carry out the process steps themselves in laboratories and clean rooms. Furthermore, participants become familiar with the special requirements (cleanliness, safety, operation of equipment and handling hazardous chemicals) of working in the clean rooms and laboratories. The entire production, processing, and characterization of the MEMS is documented and evaluated in a final report.

**Content**

With guidance from a tutor, the individual silicon microsystem process steps that are required for the fabrication of an accelerometer are carried out:
- Photolithography, dry etching, wet etching, sacrificial layer etching, critical point drying, various cleaning procedures
- Packaging and electrical connection of a MEMS device
- Testing and characterization of the MEMS device
- Written documentation and evaluation of the entire production, processing and characterization

**Lecture notes**

A document containing theory, background and practical course content is distributed at the first meeting of the course.

**Literature**

The document provides sufficient information for the participants to successfully participate in the course.

**Prerequisites / notice**

Participating students are required to attend all scheduled lectures and meetings of the course.

Participating students are required to provide proof that they have personal accident insurance prior to the start of the laboratory portion of the course.

This master's level course is limited to 15 students per semester for safety and efficiency reasons.

If there are more than 15 students registered, we regret to restrict access to this course by the following rules:

Priority 1: master students of the master's program in "Micro and Nanosystems"

Priority 2: master students of the master's program in "Mechanical Engineering" with a specialization in Microsystems and Nanoscale Engineering (MAVT-tutors Profs Daraio, Dual, Hierold, Koumoutsakos, Nelson, Norris, Park, Poulikakos, Pratsinis, Stemmer), who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

Priority 3: master students, who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

Priority 4: all other students (PhD, bachelor, master) with a background in silicon or microsystems process technology.

If there are more students in one of these priority groups than places available, we will decide by drawing lots.

Students will be notified at the first lecture of the course (introductory lecture) as to whether they are able to participate.

The course is offered in autumn and spring semester.

**Abstract**

The course will cover the basic principles of wave propagation in periodic media. It will discuss the fundamental principles used to describe linear and nonlinear wave propagation in continuum and discrete media. Selected recent scientific advancements in the dynamics of periodic media will also be discussed.

**Objective**

Students learn the basic principles governing the propagation of waves in discrete and continuum solid media. These methods can be used to engineer materials with predefined properties and to design dynamical systems for a variety of engineering applications (e.g., vibration mitigation, impact absorption and sound insulation).

**Content**

Wave propagation in solids including applications. Phenomenology of wave propagation (plane waves, harmonic waves, dispersion, attenuation, group and phase velocity), transmission and reflection, impact problems, waves in linear elastic media, discrete media, experimental and numerical methods.

**Lecture notes**

Handouts

**Literature**

Various books will be recommended pertaining to the topics covered.

151-0255-00L | Energy Conversion and Transport in Biosystems | W    | 4    | 2V+1U | D. Poulikakos, A. Ferrari      |

Theory and application of thermodynamics and energy conversion in biological systems and biomedicine at the macro scale and the cellular level.
Objective
Theory and application of energy conversion at the macro scale and the cellular level. Understanding of the basic features governing fluid transport in the principal systems of the human cell. Connection of characteristics and patterns from other fields of engineering to biofluidics. Heat and mass transport processes within the human body and relation to biomedical technologies.

Content
Mass transfer models for the transport of chemical species in the human cell. Organization and function of the cell membrane and of the cell cytoskeleton. The role of molecular motors in cellular force generation and their function in cell migration. Description of the functionality of these systems and of analytical experimental and computational techniques for understanding of their operation. Introduction to bioengineering approaches for the treatment of common pathogenic conditions of these systems. Introduction to cell metabolism, cellular energy transport and cellular thermodynamics.

Lecture notes
Script as well as additional material in the form of hand-outs will be distributed.

Literature
Lecture notes and references therein.

402-0572-00L Aerosols I: Physical and Chemical Principles
W 4 credits 2V+1U M. Gysel, U. Baltensperger, H. Burtscher

Abstract
Aerosols I deals with basic physical and chemical properties of aerosol particles. The importance of aerosols in the atmosphere and in other fields is discussed.

Objective
Knowledge of basic physical and chemical properties of aerosol particles and their importance in the atmosphere and in other fields.

Content
physical and chemical properties of aerosols, aerosol dynamics (diffusion, coagulation...), optical properties (light scattering, -absorption, -extinction), aerosol production, physical and chemical characterization.

Lecture notes
Materiel is distributed during the lecture

Literature

151-0605-00L Nanosystems
W 4 credits 4G A. Stemmer, J.N. Tisserant

Abstract
From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles. Intermolecular forces, their macroscopic manifestations, and ways to control such interactions. Self-assembly and directed assembly of 2D and 3D structures. Special emphasis on the emerging field of molecular electronic devices.

Objective
Familiarize students with basic science and engineering principles governing the nano domain.

Content
The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics that are traditionally taught separately.

Prerequisites / notice
Topics are treated in 2 blocks:

(I) From Quantum to Continuum
From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale
Intermolecular forces, their macroscopic manifestations, and ways to control such interactions. Self-assembly and directed assembly of 2D and 3D structures.

**Content**

Rheology is the science of flow and deformation of matter such as polymers, dispersions (emulsions, foams, suspensions), and colloidal systems. The fluid dynamical basis, measuring techniques (rheometry), and the flow properties of different fluids (Newtonian, non-Newtonian, viscoelastic) are introduced and discussed.

The concept of rheological constitutive equations and the application to different material classes. The course provides an introduction on the link between flow and structural properties of flowing material. Rheometrical techniques and appropriate measuring protocols for the characterization of complex fluids will be discussed.

Lectures will be given on general introduction (4h), fluid dynamics (4h), complex flow behavior (4h), influence of temperature (2h), rheometers (4h), rheological tests (6h) and structure and rheology of complex fluids (4h).

**Lecture notes**

Notes will be handed out during the lectures.

**Literature**

Provided in the lecture notes.

---

**Abstract**

The course addresses the physical principles of modern semiconductor devices and the foundations of their modeling and numerical simulation. Necessary basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided. Computer simulations of the most important devices and of interesting physical effects supplement the lectures.

**Objective**

The course aims at understanding the principle physics of modern semiconductor devices, of the foundations in the physical modeling of transport and its numerical simulation. During the course also basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided.

The main topics are: transport models for semiconductor devices (quantum transport, Boltzmann equation, drift-diffusion model, hydrodynamic model), physical characterization of silicon (intrinsic properties, scattering processes), mobility of cold and hot carriers, recombination (Shockley-Read-Hall statistics, Auger recombination), impact ionization, metal-semiconductor contact, metal-insulator-semiconductor structure, and heterojunctions.

The exercises are focussed on the theory and the basic understanding of the operation of special devices, as single-electron transistor, resonant tunneling diode, pn-diode, bipolar transistor, MOSFET, and laser. Numerical simulations of such devices are performed with an advanced simulation package (Sentaurus-Synopsys). This enables to understand the physical effects by means of computer experiments.

**Prerequisites / Literature**

---

**Abstract**

The class is intended to provide a comprehensive overview of the theory of linear dynamical systems, their use in control, filtering, and estimation and their applications to areas ranging from avionics to systems biology.

By the end of the class students should be comfortable with the fundamental results in linear system theory and the mathematical tools used to derive them.

- Rings, fields and linear spaces, normed linear spaces and inner product spaces.
- Ordinary differential equations, existence and uniqueness of solutions.
- Continuous and discrete time, time varying linear systems. Time domain solutions. Time invariant systems treated as a special case.
- Controllability and observability, canonical forms, Kalman decomposition. Time invariant systems treated as a special case.
- Stability and stabilization, observers, state and output feedback, separation principle.
- Realization theory.

**Prerequisites / Literature**

The script (in book style) is sufficient. Further reading will be recommended in the lecture.

---

**Abstract**

Failures have to be avoided by proper design, material selection and manufacturing. Properties, degradation mechanisms, and expected lifetime of materials are introduced and the basics of failure analysis and analysis equipment are presented. Failures will be demonstrated experimentally and the opportunity is offered to perform a failure analysis with advanced equipment in the laboratory.

Introduction to the degradation and failure mechanisms and causes of electronic components, devices and systems as well as to methods and tools of reliability testing, characterization and failure analysis.

**Content**

Summary of reliability and failure analysis terminology; physics of failure: materials properties, physical processes and failure mechanisms; failure analysis of ICs, PCBs, opto-electronics, discrete and other components and devices; basics and properties of instruments; application in circuit design and reliability analysis

**Lecture notes**

Comprehensive copy of transparencies
Content

An embedded system is a microprocessor used as a component in another piece of technology, such as cell phones or automobiles. In this intensive two-week block course the students are presented the principles of embedded digital control systems using a haptic device as an example for a mechatronic system. A haptic interface allows for a human to interact with a computer through the sense of touch.

Subjects covered in lectures and practical lab exercises include:
- The application of C-programming on a microprocessor
- Digital I/O and serial communication
- Quadrature decoding for wheel position sensing
- Queued analog-to-digital conversion to interface with the analog world
- Pulse width modulation
- Timer interrupts to create sampling time intervals
- System dynamics and virtual worlds with haptic feedback
- Introduction to rapid prototyping

Lecture notes

Lecture notes, lab instructions, supplemental material

Prerequisites / notice

Prerequisite courses are Control Systems I and Informatics I.

This course is restricted to 33 students due to limited lab infrastructure. Interested students please contact Marianne Schmid (E-Mail: schmid@idsc.mavt.ethz.ch).

After your reservation has been confirmed please register online at www.mystudies.ethz.ch.

Detailed information can be found on the course website http://www.idsc.ethz.ch/education/lectures/embedded-control-systems.html

Autumn Semester 2015
Electromagnetic oscillations known as surface plasmon polaritons have many unique properties that are useful across a broad set of applications in biology, chemistry, physics, and optics. The field of plasmonics has arisen to understand the behavior of surface plasmon polaritons and to develop applications in areas such as catalysis, imaging, photovoltaics, and sensing. In particular, metallic nanoparticles and patterned metallic interfaces have been developed to utilize plasmonic resonances. The aim of this course is to provide the basic knowledge to understand and apply the principles of plasmonics. The course will strive to be approachable to students from a diverse set of science and engineering backgrounds.

### Content
- Fundamentals of Plasmonics
  - Basic electromagnetic theory
  - Optical properties of metals
  - Surface plasmon polaritons on surfaces
  - Surface plasmon polariton propagation
  - Localized surface plasmons
- Applications of Plasmonics
  - Waveguides
  - Extraordinary optical transmission
  - Enhanced spectroscopy
  - Sensing
  - Metamaterials

### Literature

### Prerequisites / notice
- Class notes and handouts

### 151-0642-00L Seminar on Micro and Nanosystems
- **Abstract:** Scientific presentations from the field of Micro- and Nanosystems
- **Objective:** In particular, the seminar addresses students, who are interested in scientific work in the field of Micro- and Nanosystem technologies, or who have started already with it. Respectively, current examples in the research will be discussed.
- **Content:** Current themes in the field of Micro- and Nanosystem technologies using the examples of intern and external research groups, as well as ongoing themes of study-, diplom- and doctoral thesis will be introduced and discussed. The scope of the seminar is broadened by occasional guest speakers.

### Literature
- Master of MNS, MAVT, ITET, Physics

### Prerequisites / notice
- -

### 227-0663-00L Nano-Optics
- **Abstract:** Nano-Optics is the study of optical phenomena and techniques on the nanometer scale. It is an emerging field of study motivated by the rapid advance of nanoscience and technology. It embraces topics such as plasmonics, optical antennas, optical trapping and manipulation, and high-resolution imaging and spectroscopy.
- **Objective:** Understanding concepts of light localization and light-matter interactions on the nanoscale.
- **Content:** Starting with an angular spectrum representation of optical fields the role of inhomogeneous evanescent fields is discussed. Among the topics are: theory of strongly focused light, point spread functions, resolution criteria, confocal microscopy, and near-field optical microscopy. Further topics are: optical interactions between nanoparticles, atomic decay rates in inhomogeneous environments, single molecule spectroscopy, light forces and optical trapping, photonic bandgap materials, and theoretical methods in nano-optics.

### Literature
- Relevant articles and reading materials will be provided. Various books will be recommended pertaining to the topics covered.

### Prerequisites / notice
- -

### 151-0104-00L Uncertainty Quantification for Engineering & Life Sciences
- **Abstract:** Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.
- **Objective:** The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.
- **Content:** Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

### Literature
- 1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
- 2. Probability Theory: The Logic of Science by E. T. Jaynes
- 3. Class Notes

### Prerequisites / notice
- Fundamentals of Probability, Fundamentals of Computational Modeling
Abstract

This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers.

Objective

This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers. The way the exam is done allows for the different interests of the two groups.

The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.

Content

At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during the whole term to analyze circuits and understand how signals propagate through them. The theory and CMOS implementation of active Filters is then discussed in detail using the example of Gm-C filters and active-RC filters. The ideal and nonideal behaviour of opamps, current conveyors, and inductor simulators follows. The link to the practical design of circuits and systems is done with an overview over different quality measures and figures of merit used in scientific literature and datasheets. Finally, an introduction to discrete-time and mixed-domain filters and circuits is given, including sensor read-out amplifiers, correlated double sampling, and chopping, and an introduction to sigma-delta A/D and D/A conversion on a system level.

Lecture notes

The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

Details: https://people.ee.ethz.ch/~haschmid/asfwiki/

Some material is protected by password; students from ETHZ who are interested can write to haschmid@ethz.ch to ask for the password even if they do not attend the lecture.

Prerequisites / notice

Prerequisites: Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.

151-0735-00L Dynamic Behavior of Materials and Structures W 4 credits 2V+2U D. Mohr

Abstract

Lectures and computer labs concerned with the modeling of the deformation response and failure of engineering materials (metals, polymers and composites) subject to extreme loadings during manufacturing, crash, impact and blast events.

Objective

Students will learn to apply, understand and develop computational models of a large spectrum of engineering materials to predict their dynamic deformation response and failure in finite element simulations. Students will become familiar with important dynamic testing techniques to identify material model parameters from experiments. The ultimate goal is to provide the students with the knowledge and skills required to engineer modern multi-material solutions for high performance structures in automotive, aerospace and naval engineering.

Content

Topics include viscoelasticity, temperature and rate dependent plasticity, dynamic brittle and ductile fracture; impulse transfer, impact and wave propagation in solids; computational aspects of material model implementation into hydrocodes; simulation of dynamic failure of structures;

Lecture notes

Slides of the lectures, relevant journal papers and users manuals will be provided.

Literature

Various books will be recommended covering the topics discussed in class.

Prerequisites / notice

Course in continuum mechanics (mandatory), finite element method (recommended)

► Multidisciplinary Courses

The students are free to choose individually from the entire course offer of ETH Zurich, ETH Lausanne and the Universities of Zurich and St. Gallen.

Course Catalogue of ETH Zurich

► Compulsory Electives in Humanities, Social and Political Sciences

Recommended GESS compulsory elective courses (Type B) for D-MAVT.

see GESS Compulsory Electives: Type A: Enhancement of Reflection Capability

see GESS Compulsory Electives: Language Courses ETH/UZH

► Semester Project

</tr>
</tbody>
</table>

Abstract

The subject of the Semester Project and the choice of the supervisor (ETH-professor) are to be approved in advance by the tutor.

Objective

The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

► Industrial Internship

</tbody>
</table>

Abstract

The main objective of the 12-week internship is to expose master's students to the industrial work environment. During this period, students have the opportunity to be involved in on-going projects at the host institution.

Objective

The main objective of the 12-week internship is to expose master's students to the industrial work environment.

► Master Thesis

Only students who fulfill the following criteria are allowed to begin with their Master Thesis:

- Successful completion of the Bachelor programme
- Any additional requirements for admission to the degree programme have been fulfilled
- Have achieved at least 32 credits in the category “Core Courses”
- Successful completion of the Semester Project (the corresponding credits have been acquired)

The subject of the Master Thesis and the choice of the supervisor (ETH-professor) are to be approved in advance by the tutor. To choose an adjunct professor of D-MAVT as a supervisor (http://www.mavt.ethz.ch/people/adjunct/index), please contact the Student Administration Office of D-MAVT.

Abstract

Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

Objective

The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem.

Exchange Students

Courses for Exchange Students

Prepare a study plan
In case the course catalogue of the upcoming semester is not available yet, please expect it to be like the year before.

You can study at ETH Zurich as an exchange student for 1 or 2 semesters, starting in the autumn or in the spring semester.

Exchange students may choose courses from different curricula and years, provided that at least two thirds of all courses are taken in the ETH Zurich department they are registered in. Please be sure to coordinate your schedule with your home university.

Exam sessions and End-of-semester examinations
Like all ETH Zurich students, exchange students are obliged to sit their exams during the official examination periods. Students are requested to be present at ETH Zurich during these periods. You are therefore expected to plan your studies, internships, jobs, and financial means accordingly.

by individual arrangement

b. fulfilling of any additional requirements necessary to gain admission to the master programme;
c. internship fulfilled

Abstract

In the Master thesis students prove their ability to independent, structured and scientific working. The Master thesis is supervised by the tutor and normally deals with a subject contained in the major fields. The research will be performed normally within a private company or at the ETH Zurich.

ECTS European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
The Neuroinformatics Journal Club is a weekly meeting during which students present current research papers. It is a commonplace that scientists rarely cite literature that is older than 10 years and when they do, they usually cite one paper that serves as the representative for a larger body of work that has long since been incorporated anonymously in textbooks. Worse than that, many authors have not even read the papers they cite in their own publications. This course, Foundations of Neuroscience is one antidote.

Content
It is a commonplace that scientists rarely cite literature that is older than 10 years and when they do, they usually cite one paper that serves as the representative for a larger body of work that has long since been incorporated anonymously in textbooks. Worse than that, many authors have not even read the papers they cite in their own publications. This course, Foundations of Neuroscience is one antidote.

Thirteen major areas of research have been selected, which cover the key concepts that have led to our current ideas of how the nervous system is built and functions. Unusually, we will explore these areas of research by reading the original publications, instead of reading someone else’s digested summary from a textbook or review. By doing this, we will learn how the discoveries were made, what instrumentation was used, how the scientists interpreted their own findings, and how the work, often over many decades and linked together with related findings from many different scientists, generate the current views of mechanism and structure of the nervous system.

To give one concrete example, in 1890 Roy and Sherrington showed that there was a neural activity-dependent regulation of blood flow in the brain. One hundred years later, Ogawa discovered that they could use Nuclear Magnetic Resonance (NMR) to measure a blood oxygen-level dependent (BOLD) signal, which they showed was neural activity-dependent. This discovery led to the development of human functional Magnetic Resonance Imaging (fMRI), which has revolutionized neuropsychology and neuropsychiatry.

We will read both these original papers and explore the conceptual links between them and discuss the sociology of science, which in this case, the pursuit of basic science questions over a century of research, led to an explosion in applications. We will also explore the personalities of the scientists and the context in which they made their seminal discoveries. Each week the course members will be given original papers to read for homework, they will have to write a short abstract for each paper. We will then meet weekly with the course leader (KACM) and an assistant for an hour-or-so long interactive seminar. An intimate knowledge of the papers will be assumed so that the discussion does not center simply on an explication of the contents of the papers. Assessment will in the form of a written exam in which the students will be given a paper and asked to write a short abstract of the contents.
Introduction to Systems Neuroscience

The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

Methods & Models for fMRI Data Analysis

This course teaches methods and models for fMRI data analysis, covering all aspects of statistical parametric mapping (SPM), including preprocessing, the general linear model, statistical inference, multiple comparison corrections, event-related designs, and Dynamic Causal Modelling (DCM), a Bayesian framework for identification of nonlinear neuronal systems from neurophysiological data.

Neuromorphic Engineering I

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

| Abstract     | Basic concepts from probability and statistics: - introduction to probability theory - short introduction to basic concepts and methods from statistics
b) probabilistic thinking and stochastic modelling

c) ability to perform basic statistical tests and to interpret the results |
| Objective    | The conceptual goals are
  - the laws of randomness and probabilistic thinking (thinking in probabilities)
  - understanding and intuition for stochastic modelling
  - simple and basic methods from statistics |
| Content      | The contents of the course encompasses
  - an introduction to probability theory: basic concepts (probability space, probability measure), independence, random variables, discrete and continuous distributions, conditional probability, expectation and variance, limit theorems
  - methods from statistics: parameter estimation, maximum likelihood and moment methods, tests, confidence intervals |
| Lecture notes| Lecture notes for the course (in German) will be made available electronically at the beginning of the course. |
| Prerequisites / notice | On request the "Lehrsprache" may be changed to German. |
| 227-1044-00L | Auditory Informatics                | W    | 2 credits | 1S    | R. Stoop              |
| Abstract     | Invited talks on current research from the following areas: Auditory information processing, auditory sensors (biological and electrical), coding of information, perception, scene-segmentation. |
| Objective    | Exchange with researchers in the domain of auditory informatics. Preparing and giving a presentation on a suitable topic in front of a scientific audience. |
| Content      | The semester program is available under: http://stoop.ini.uzh.ch/teaching/seminar-on-auditory-informatics |
| Prerequisites / notice | On request the "Lehrsprache" may be changed to German. |
| 227-1035-00L | Dynamical Systems in Biology       | W    | 6 credits | 2V+1U | R. Stoop              |
| Abstract     | This lecture uses the concepts from dynamical systems (Course: "Computable Chaos in Dynamical Systems") for the description of salient phenomena in complex examples from population dynamics, neuroinformatics and system biology. A particular focus is on the concept of limit cycle solutions and their coupling. |
| Objective    | Applying concepts from nonlinear dynamics to biological systems. Combining theoretical modeling with supporting computer simulations. |
| 402-0811-00L | Programming Techniques for Scientific Simulations I | W    | 5 credits | 4G    | M. Troyer             |
| Abstract     | This lecture provides an overview of programming techniques for scientific simulations. The focus is on advances C++ programming techniques and scientific software libraries. Based on an overview over the hardware components of PCs and supercomputer, optimization methods for scientific simulation codes are explained. |
| 402-0809-00L | Introduction to Computational Physics | W    | 8 credits | 2V+2U | H. J. Herrmann        |
| Abstract     | This course offers an introduction to computer simulation methods for physics problems and their implementation on PCs and super computers: classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell's equation), Monte Carlo simulations, percolation, phase transitions. |
| Prerequisites / notice | Lecture and exercise lessons in english, exams in German or in English |
| Abstract     | A comprehensive understanding of the interaction of electrons with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials. |
| Objective    | A comprehensive understanding of the interaction of electrons with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials. |
This course provides a general introduction into electron microscopy of organic and inorganic materials. In the first part, the basics of transmission- and scanning electron microscopy are presented. The second part includes the most important aspects of specimen preparation, imaging and image processing. In the third part, recent applications in materials science, solid state physics, structural biology, structural geology and chemical oceanography will be reported.

402-0341-00L | Medical Physics I | W | 6 | 2V+1U | P. Manser |
| Abstract | Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations. |
| Objective | Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefit of patients and the society. |
| Content | The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the excercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications. |
| Lecture notes | A script will be provided. |

227-1047-00L | Consciousness: From Philosophy to Neuroscience | W | 3 | 2V | D. Kiper, A. Gamma |
| Abstract | This seminar reviews the philosophical and phenomenological as well as the neurobiological aspects of consciousness. The subjective features of consciousness are explored, and modern research into its neural substrate, particularly in the visual domain, is explained. Emphasis is placed on students developing their own thinking through a discussion-centered course structure. |
| Objective | The course's goal is to give an overview of the contemporary state of consciousness research, with emphasis on the contributions brought by modern cognitive neuroscience. We aim to clarify concepts, explain their philosophical and scientific backgrounds, and to present experimental protocols that shed light on a variety of consciousness related issues. |
| Content | The course includes discussions of scientific as well as philosophical articles. We review current schools of thought, models of consciousness, and proposals for the neural correlate of consciousness (NCC). |

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 1094 of 1432
Academic Year: Autumn Semester 2015

**Course Title:** Computational Biology

**Type:** Lecture notes

**Credits:** 6

**Instructor:** G. H. Gonnet

**Description:**

Study of computational techniques, algorithms and data structures used to solve problems in computational biology. Topics: basic biology, string alignment, phylogeny (distance, character, parsimony), molecular evolution, multiple sequence alignment, probabilistic and statistical models, Markov models, microarrays, dynamic programming, maximum likelihood and specialized DNA and protein analysis.

**Objectives:**

Familiarize students with the basic concepts of molecular biology and the models and algorithms used to understand, classify and predict behaviour of living organisms. This course is at the most basic level, where the main issues, mostly of molecular sequences, are studied.

**Prerequisites:**

- local bachelors: course "Discrete-Time and Statistical Signal Processing" (5. Sem.)
- others: solid basis in linear algebra and probability theory

**Lecture notes:**

None

**Literature notice:**

We display articles pertaining to the issues we cover in the class on the course's webpage.

**Prerequisites / notice:**

Since we are all experts on consciousness, we expect active participation and discussions!

---

**Course Title:** Signal and Information Processing: Modeling, Filtering, Learning

**Type:** Lecture notes

**Credits:** 6

**Instructor:** H.A. Loeliger

**Description:**

Fundamentals in signal processing, detection/estimation, and machine learning.

I. Linear signal representation and approximation: Hilbert spaces, LMMSE estimation, regularization and sparseness.

**Objectives:**

The course is an introduction to several basic topics in signal processing, detection/estimation theory, and machine learning. The following topics are likely to be covered: Introduction, mathematical models of evolution, protein and DNA sequence alignment and its meaning, phylogenetic tree construction, multiple sequence alignments, secondary structure prediction, molecular dynamics, threading, role of bioinformatics in drug design, etc. From the computer science point of view we concentrate our attention in practical solutions for the above problems. Biological knowledge is an asset but not a prerequisite.

**Prerequisites:**

- local bachelors: course "Discrete-Time and Statistical Signal Processing" (5. Sem.)
- others: solid basis in linear algebra and probability theory

**Lecture notes:**

None

**Literature notice:**

None

---

**Course Title:** Machine Learning

**Type:** Lecture notes

**Credits:** 6

**Instructor:** J. M. Buhmann

**Description:**

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

**Objectives:**

Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:
- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
Solid basic knowledge in analysis, statistics and numerical methods for CSE. Experience in programming for solving the project tasks.

Compulsory Electives in Humanities, Social and Political Sciences

Recommended GESS compulsory elective courses (Type B) for D-ITET.

Abstract
In this course, one acquires an understanding of the basic neutronics interactions occurring in a nuclear fission reactor and, as such, the conditions for establishing and controlling a nuclear chain reaction.

Objective
By the end of the course, the student must be able to:
- Elaborate on neutron diffusion equation
- Systematize nuclear reaction cross sections
- Formulate approximations to solving the diffusion equation for simple systems

Content
Content:
- Brief review of nuclear physics
- Historical: Constitution of the nucleus and discovery of the neutron - Nuclear reactions and radioactivity - Cross sections - Differences between fusion and fission.
- Nuclear fission
- Characteristics - Nuclear fuel - Introductory elements of neutronics.
- Fissile and fertile materials - Breeding.
- Neutron diffusion and slowing down
- Monoenergetic neutrons - Angular and scalar flux
- Diffusion theory as simplified case of transport theory - Neutron slowing down through elastic scattering.
- Multiplying media (reactors)
- Multiplication factors - Criticality condition in simple cases.
- Reactor kinetics
- Point reactor model: prompt and delayed transients - Practical applications.
- Reactivity variations and control
- Short, medium and long term reactivity changes ? Different means of control.

Literature
Distributed documents, recommended book chapters

Abstract
To gain hands-on experience in the conduction of nuclear radiation measurements, as also in the execution and analysis of reactor physics experiments using the CROCUS reactor.

Objective
To gain hands-on experience in the conduction of nuclear radiation measurements, as also in the execution and analysis of reactor physics experiments using the CROCUS reactor.

Content
- Radiation detector systems, alpha and beta particles
- Radiation detector systems, gamma spectroscopy
- Introduction to neutron detectors (He-3, BF3)
- Slowing-down area (Fermi age) of Pu-Be neutrons in H2O
- Approach-to-critical experiments
- Buckling measurements
- Reactor power calibration
- Control rod calibration

Literature
Distributed documents, recommended book chapters

Prerequisites / notice
Prerequisite for: Special Topics in Reactor Physics (2nd sem.)

<table>

Abstract
This course provides an overview of microfabrication processes used to produce micro-scale robots and will cover topics related to microactuators, microsensors, and modeling at these scales. The course will also investigate micromanipulation technologies, incl. the assembly of micron-sized parts, the manipulation of biological cells, and the types of robots used to perform these tasks.

Objective
To comprehend (particularly in the context of light water reactors) the basic heat removal phenomena in a reactor core, identify the technological limits for heat generation from the viewpoints of fuel, cladding and coolant, and be introduced to optimization principles in reactor thermal design.
151-2019-00L Advanced Fossil and Renewable Energy Systems

**Objective**
To understand the basic principles governing the advanced energy conversion systems and the perspective for technological progress. To present the characteristics of the main fossil and renewable energy systems from a resource and production technology viewpoint. The students will learn to assess the globally and locally available resources of such fossil or renewable energies and be able to make a rough dimensioning of the installations that will use them.

**Content**
- Overview of fossil and renewable energy resource characteristics
- Reminder of Thermodynamic Laws and exergy theory
- Vapour and gas cycles, combined cycles. Natural gas, coal and nuclear power plants
- Fuel cell principles and technologies. Hybrid fuel cell - turbine cycles
- Technologies of heat pumps (compression, absorption, magnetic) and Organic Rankine Cycles (ORC). Co- and tri-generation
- Biomass technologies for both fuel (liquid or gas) or electricity
- Solar energy resources
- Solar-thermal and photovoltaic systems
- Hydraulic resources
- Hydraulic turbines and schemes
- Wind energy resources
- Wind turbines
- Other renewable technologies

**Literature**
Bibliographie:
Notes of the lectures; Borel, Favrat Thermodynamique et énergétique PPUR 2005, Haldi et al. Systèmes énergétiques PPUR 2003
(distributed course notes and partial translation of chapters of books)

**Prerequisites / notice**
Required prior knowledge: Neutronics
Prerequisite for: Nuclear Safety (2nd sem.)

151-2021-00L Hydraulic Turbomachines

**Objective**
Mastering the scientific design of a hydraulic machine, pump and turbine, by using the most advanced engineering design tools. For each chapter the theoretical basis are first established and then practical solutions are discussed with the help of recent design examples.

**Content**
- Turbomachine equations, mechanical power balance in a hydraulic machines, moment of momentum balance applied to the runner/impeller, generalized Euler equation.
- Hydraulic characteristic of a reaction turbine, a Pelton turbine and a pump, losses and efficiencies of a turbomachine, real hydraulic characteristics.
- Similitude laws, non dimensional coefficients, reduced scale model testing, scale effects.
- Cavitation, hydraulic machine setting, operating range, adaptation to the piping system, operating stability, start stop transient operation, runaway.
- Reaction turbine design: general procedure, general project layout, design of a Francis runner, design of the spiral casing and the distributor, draft tube role, CFD validation of the design, design fix, reduced scale model experimental validation.
- Pelton turbine design: general procedure, project layout, injector design, bucket design, mechanical problems.
- Centrifugal pump design: general architecture, energetic loss model in the diffuser and/or the volute, volute design, operating stability.

**Literature**
Notes de cours polycopiées et littérature spécialisée (IMHEF, industrie, associations scientifiques, congrès, etc.).

**Prerequisites / notice**
Required prior knowledge: Basic knowledge of physics and thermodynamics

**Abstract**
No enrolment to this course at ETH Zurich. Book the corresponding module directly at EPFL.

**Content**
- Fuel rod, LWR fuel elements
- Temperature field in fuel rod
- Reactor core, design
- Flux and heat source distribution, cooling channel
- Single-phase convective heat transfer, axial temperature profiles
- Boiling crisis and DNB ratio
- Pressurized water reactors, design
- Primary circuit design
- Steam generator heat transfer, steam generator types
- Boiling water reactors
- Reactor design
- LWR power plant technology
- Other types of reactors (overview)
- Generation IV systems

**Literature**
Distributed documents, recommended book chapters

**Prerequisites / notice**
Required prior knowledge: Neutronics
Prerequisite for: Nuclear Safety (2nd sem.)
### Prerequisites / notice
**Prérequis:**
Mécanique des milieux continus; Introduction aux turbomachines.
**Préparation pour:**
Choix des équipements hydrauliques; Projets et travail pratique de Master

### 151-2023-00L Nuclear Fusion and Plasma Physics (EPFL)
**W** 4 credits 4G  external organisers

**Objective**
Achieve basic understanding of plasma physics concepts for fusion energy, and of basic principles of fusion reactors

**Content**
- 1) Basics of thermonuclear fusion
- 2) The plasma state and its collective effects
- 3) Charged particle motion and collisional effects
- 4) Fluid description of a plasma
- 5) Plasma equilibrium and stability
- 6) Magnetic confinement: Tokamak and Stellarator
- 7) Waves in plasma
- 8) Wave-particle interactions
- 9) Heating and non inductive current drive by radio frequency waves
- 10) Heating and non inductive current drive by neutral particle beams
- 11) Material science and technology: Low and high Temperature superconductor - Properties of material under irradiation
- 12) Some nuclear aspects of a fusion reactor: Tritium production
- 13) Licensing a fusion reactor: safety, nuclear waste
- 14) Inertial confinement

**Literature**

### 151-2025-00L Introduction to Particle Accelerators (EPFL)
**W** 4 credits 4G  external organisers

**Objective**
By the end of the course, the student must be able to:
- Design basic linear and non-linear charged particles optics
- Elaborate basic ideas of physics of accelerators
- Use a computer code for optics design
- Optimize accelerator design for a given application
- Estimate main beam parameters of a given accelerator

**Content**
Overview, history and fundamentals
- Transverse particle dynamics (linear and nonlinear)
- Longitudinal particle dynamics
- Linear accelerators
- Circular accelerators
- Acceleration and RF-technology
- Beam diagnostics
- Accelerator magnets
- Injection and extraction systems
- Synchrotron radiation

**Literature**
Recommended during the course

### 151-2041-00L Medical Radiation Physics (EPFL)
**W** 4 credits 3G  external organisers

**Objective**
No enrolment to this course at ETH Zurich. Book the corresponding module directly at EPFL.

**Abstract**
The course covers the physical principles underlying modern accelerators. We will examine key features and limitations of these machines as used in accelerator driven sciences like high energy physics, materials and life sciences.

**Content**
Physics of radiography: X-ray production, Radiation-patient interaction, Image detection and display
- Image quality: Wagner's taxonomy, MTF, NPS, contrast, SNR, DQE, NEQ, CNR
- Dose to the patient: External irradiation, Internal contamination, compartmental models
- Physics of computer tomography (CT)
- Risk and radiation: Rational risk and state of our knowledge, Psychological aspects, Ethics and communication
- Physics of single-photon emission computed tomography (SPECT)
- Physics of mammography
- Receiver operating characteristics (ROC) and hypothesis testing: Link between medical diagnostic and statistical hypothesis testing, Sensitivity, specificity, prevalence, predictive values
- Physics of radioscopy
- Model observers in medical imaging: Human visual characteristics and their quantification, Bayesian cost and Ideal model observer, Anthropomorphic model observers, Detection experiments (rating, M-AFC, yes-no)
- Physics of positron emission tomography (PET)
- Physics of resonance magnetic imaging
The course deals with the important challenges for materials (structural and fuel) for current and advanced nuclear power plants.

### Hours
Lecturers

Topics that will be covered include: Uncertainty quantification under
Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively
Basics: radiation sources and interaction with matter, radioisotope production using reactors and accelerators, radiation protection and
Nuclear Computations Lab
- Lattice (assembly) calculations
- Thermal-hydraulic analysis
- Reactor core analysis
- Multi-physics core dynamics calculations
- Best-estimate NPP transient analysis

To acquire hands-on experience with the running of large computer codes in relation to the static analysis of nuclear reactor cores and the
To acquire hands-on experience with the running of large computer codes in relation to the static analysis of nuclear reactor cores and the

### Objective

By the end of the course, the student must be able to:

- Explain the basic physics principles that underpin radiotherapy, e.g. types of radiation, atomic structure, etc.
- Explain the interaction mechanisms of ionizing radiation at keV and MeV energies with matter.
- Explain the principles of radiation dosimetry.
- Explain the principles of therapeutic radiation physics including X-rays, electron beam physics, radioactive sources, use of unsealed sources and Brachytherapy.
- Describe how to use radiotherapy equipment both for tumour localisation, planning and treatment.
- Define quality assurance and quality control, in the context of radiotherapy and the legal requirements.
- Explain the principles and practice of radiation protection, dose limits, screening and protection mechanisms.
- Explain the use of radiation in industrial and research applications.

### Content

Basics: radiation sources and interaction with matter, radioisotope production using reactors and accelerators, radiation protection and shielding.
Medical applications: diagnostic tools, radiopharmaceuticals, cancer treatment methodologies such as brachytherapy, neutron capture therapy and proton therapy.
Industrial applications: radiation gauges, radiochemistry, tracer techniques, radioisotope batteries, sterilization, etc.
Applications in research: dating by nuclear methods, applications in environmental and life sciences, etc.

### Prerequisites

Required prior knowledge: Special Topics in Reactor Physics, Nuclear Safety

### Literature

Distributed documents, recommended book chapters

### Notice

No enrolment to this course at ETH Zurich. Book the corresponding module directly at EPFL.

| 151-0150-00L | Advanced Topics in Nuclear Reactor Materials | W | 4 credits | 3G | M. A. Pouchon, P. J.P. Späting, M. Streit |
|              | Students registered at ETH Zurich have to enroll to this course at ETH. EPFL students can enroll to this course directly at EPFL. |
| Abstract     | The course deals with the important challenges for materials (structural and fuel) for current and advanced nuclear power plants. Experimental techniques and tools used for working with active materials are discussed in detail. Students will be well acquainted with analytical and modeling methodologies for damage assessment and residual life determination and with the behavior of high burnup fuel. The course will highlight the above needs from different points of view. Experimental methods for the control and analysis of nuclear components and materials in operating NPPs will be presented. Advanced analytical and modeling tools will be introduced for characterization and understanding of irradiation damage, creep, environment effects, etc. Insights acquired from recent experimental programs into high burnup fuel behavior under hypothetical accident conditions (RIA, LOCA) will be presented. Materials for advanced future nuclear plants will be discussed. |
| Objective    | The behaviour of materials in nuclear reactors determines the reliability and safety of nuclear power plants (NPPs). Life extension and the understanding of fuel behavior under high burn-up conditions is of central importance for current-day NPPs. Advanced future systems (fission and fusion) need materials meeting additional challenges such as high temperatures and/or high doses. The course will cover these topics in detail. |

| Objective    | The course deals with the important challenges for materials (structural and fuel) for current and advanced nuclear power plants. Experimental techniques and tools used for working with active materials are discussed in detail. Students will be well acquainted with analytical and modeling methodologies for damage assessment and residual life determination and with the behavior of high burnup fuel. The course will highlight the above needs from different points of view. Experimental methods for the control and analysis of nuclear components and materials in operating NPPs will be presented. Advanced analytical and modeling tools will be introduced for characterization and understanding of irradiation damage, creep, environment effects, etc. Insights acquired from recent experimental programs into high burnup fuel behavior under hypothetical accident conditions (RIA, LOCA) will be presented. Materials for advanced future nuclear plants will be discussed. |
| Content      | - Lattice (assembly) calculations |
|             | - Thermal-hydraulic analysis |
|             | - Reactor core analysis |
|             | - Multi-physics core dynamics calculations |
|             | - Best-estimate NPP transient analysis |
| Literature   | Distributed documents, recommended book chapters |
| Prerequisites | Required prior knowledge: Special Topics in Reactor Physics, Nuclear Safety |
Comprehensive knowledge is provided on the phenomena during a Beyond Design Bases Accident (BDBA) in a Nuclear Power Plants (NPP), on their modelling as well as on countermeasures taken against radioactive releases into the environment, both by Severe Accident Management Guidelines (SAMG), together with technical backfitting measures in existing plants and an extended design of new NPP.

**Objective**
Deep understanding of the processes associated with core degradation and fuel melting in case of sustained lack of Core Cooling Systems, potential threats to the containment integrity, release and transport of active and inactive materials, the function of the containment, countermeasures mitigating release of radioactive material into the environment (accident management measures, backfitting and extended design), assessment of timing and amounts of released radioactive material (source term).

**Content**
Physical basic understanding of severe accident phenomenology: loss of core cooling, core dryout, fuel heat-up, fuel rod cladding oxidation and hydrogen production, loss of core coolability and, fuel melting, melt relocation and melt accumulation in the lower plenum of the reactor pressure vessel (RPV), accident evolution at high and low reactor coolant system pressure, heat flux from the molten debris in the lower plenum and its distribution to the lower head, RPV failure and melt ejection, direct containment heating, molten corium and concrete interaction, in- and ex-vessel molten fuel coolant interaction (steam explosions), hydrogen distribution in the containment, hydrogen risk (deflagration, transition to detonation), pressure buildup and containment vulnerability, countermeasures mitigating/avoiding hydrogen deflagration, formation, transport and deposition of radioactive aerosols, iodine behavior, plant ventilation filtration systems, filtered venting to avoid containment failure and mitigate activity release into the environment, containment bypass scenarios, source term assessment, in-vessel and ex-vessel corium retention, behavior of fuel elements in the spent fuel pool during long-lasting station blackout, cladding oxidation in air, discussion of occurred severe accidents (Harrisburg, Chernobyl, Fukushima), internal and external emergency response. Probabilistic assessment and interfacing with severe accident phenomenology.

**Lecture notes**
Hand-outs will be distributed.

**Prerequisites / notice**
Prerequisites: Recommended courses: 151-0156-00L Safety of Nuclear Power Plants plus either 151-0163-00L Nuclear Energy Conversion or 151-2015-00L Reactor Technology

---

**Electives**
Course from the catalogue of Master courses ETH Zurich and EPFL. At least 4 credit points must be collected from the offer of GESS compulsory electives at ETH Zurich or Management of Technology and Entrepreneurship at EPFL.

---

**Industrial Internship**

**Abstract**
The main objective of the 12-week internship is to expose master's students to the industrial work environment within the field of nuclear energy. During this period, students have the opportunity to be involved in on-going projects at the host institution.

**Objective**
The main objective of the 12-week internship is to expose master's students to the industrial work environment within the field of nuclear energy.

**Prerequisites / notice**
The internship must be approved by the tutor.

</tbody>
</table>

The subject of the Semester Project and the choice of the supervisor (ETH or EPFL professor) are to be approved in advance by the tutor.

**Abstract**
The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

**Objective**
The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program.

Only students who fulfill the following criteria are allowed to begin with their Master Thesis:

a. Successful completion of the Bachelor programme
b. Any additional requirements for admission to the degree programme have been fulfilled
c. Have achieved a total of at least 72 credits in the categories “Core Subjects” and “Electives”
d. Successful completion of the Semester Project (the corresponding credits have been acquired)

The supervisor of the Master Thesis and the choice of the supervisor (ETH or EPFL professor) are to be approved in advance by the tutor.

Abstract
Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

Objective
The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem.

**Abstract**
First identification with Pharmaceutical Sciences; motivation for profiling in the Natural Sciences, which are focused on within the first two years as a preparation for the specialized studies; sensitization for the duties and the responsibilities of a person with a federal diploma in Pharmacy; information about job opportunities.

**Objective**
First identification with Pharmaceutical Sciences; motivation for profiling in the Natural Sciences as a preparation for the specialized studies; sensitization for the duties and the responsibilities of a person with a federal diploma in Pharmacy; information about job opportunities.

**Content**
Introduction to Pharmaceutical Sciences by selected milestones of research and development. Overview on research activities at the Institute of Pharmaceutical Sciences that is focussed on drug delivery and development (from concepts to prototypes). Sensitization for communication skills and information management. Demonstration of job opportunities in community pharmacies, in the hospital, in industry, and in the public sector by experts in the different fields.

**Lecture notes**
Handouts for individual lectures.

**Abstract**
Mathematics I/II is an introduction to one- and multidimensional calculus and linear algebra emphasizing on applications.

**Objective**
Students understand mathematics as a language for modeling and as a tool for solving practical problems in natural sciences.

**Content**

- **Eindimensionale diskrete Entwicklungen**
  - linear, exponentiell, begrenzt, logistisch
  - Fixpunkte, diskrete Veränderungsrate
  - Folgen und Grenzwerte

- **Funktionen in einer Variablen**
  - Reproduktion, Fixpunkte,
  - Periodizität,
  - Stetigkeit

- **Differentialrechnung (I)**
  - Veränderungsrate/-geschwindigkeit
  - Differentialquotient und Ableitungsfunktion
  - Anwendungen der Ableitungsfunktion

- **Integralrechnung (I)**
  - Stammfunktion
  - Integrationstechniken

- **Gewöhnliche Differentialgleichungen (I)**
  - Qualitative Beschreibung an Beispielen:
    - Beschränkt, Logistisch, Gompertz
    - Stationäre Lösungen
    - Lineare DGL 1. Ordnung
    - Trennung der Variablen

- **Lineare Algebra**
  - Erste Arithmetische Aspekte
  - Matrizenrechnung
  - Eigenwerte / -vektoren
  - Quadratische LGS und Determinante

**Lecture notes**
In Ergänzung zu den Vorlesungskapiteln der Lehrveranstaltungen fassen wir wichtige Sachverhalte, Formeln und weitere Ausführungen jeweils in einem Vademecum zusammen. Die pdfs finden Sie unter Lernmaterial > Dokumente.

Dabei gilt:

- Die Skripte ersetzen nicht die Vorlesung und/oder die Übungen!
- Ohne den Besuch der Lehrveranstaltungen verlieren die Ausführungen ihren Mehrwert.
- Details entwickeln wir in den Vorlesungen und den Übungen, um die hier bestehenden Lücken zu schliessen.
- Prüfungsrelevant ist, was wir in der Vorlesung und in den Übungen behandeln.
**Literatur**

**Prerequisites / notice**

### Übungen und Prüfungen ##

- Die Übungsaufgaben (inkl. Multiple-Choice) sind ein wichtiger Bestandteil der Lehrveranstaltung.
- Es wird erwartet, dass Sie mindestens 75 % der wöchentlichen Serien bearbeiten und zur Korrektur einreichen.
- Der Prüfungsstoff ist eine Auswahl von Themen aus Vorlesung und Übungen. Für eine erfolgreiche Prüfung ist die konzentrierte Bearbeitung der Aufgaben unerlässlich.

### Einschreibung in die Übungen ##

Die Einschreibung in die Übungsgruppen erfolgt online. Alle unter http://www.mystudies.ethz.ch/ für die Vorlesung Eingeschriebenen erhalten rechtzeitig per Email einen personalisierten Link zur Einschreibung. Behalten Sie diesen Link.

### Zugang Übungsserien ##

Erfolgt auch online. Alle unter http://www.mystudies.ethz.ch/ für die Vorlesung Eingeschriebenen erhalten rechtzeitig per Email einen 2. personalisierten Link. Behalten Sie auch diesen Link.

**Abstract**

Students learn to apply selected concepts and tools from computer science for working on interdisciplinary projects.

**Objective**

- The students learn to understand the role of computer science in science.
- To control computer and automate processes of problem solving by programming.
- Choose and apply appropriate tools from computer science.
- Process and analyze real-world data from their subject of study.
- Handle the complexity of real-world data.
- Know universal methods for algorithm design.

**Content**

1. The role of computer science in science
2. Introduction to Programming with Python
3. Modeling and simulations
4. Introduction to Matrices with Matlab
5. Visualizing multidimensional data
6. Data management with lists and tables
7. Data management with a relational database
8. Universal methods for algorithm design

**Abstract**

The lecture deals with a number of basic chemistry concepts. These include (amongst others) chemical reactions, energy transfer during chemical reactions, properties of ionic and covalent bonds, Lewis structures, properties of solutions, kinetics, thermodynamics, acid-base equilibria, electrochemistry and properties of metal complexes.

**Objective**

The course is designed to provide an understanding of the basic principles and concepts of general and inorganic chemistry.

**Content**

The lecture deals with a number of basic chemistry concepts. These include (amongst others) chemical reactions, energy transfer during chemical reactions, properties of ionic and covalent bonds, Lewis structures, properties of solutions, kinetics, thermodynamics, acid-base equilibria, electrochemistry and properties of metal complexes.

**Literature**

**Weiterführende Literatur:**

Brown, LeMay, Bursten CHEMIE (deutsch)
Housecroft and Constable, CHEMISTRY (englisch)
Oxtoby, Gillis, Nachtrieb, MODERN CHEMISTRY (englisch)
The course is divided into several chapters:

- Introduction into basic skills of rhetoric, presentation, communication.
- Introduction into learning and working techniques and writing.

Organic molecules: Isolation, separation and characterization of organic compounds. Classical structure theory: constitution, covalent, K.H. Altmann, J. Hall,

Communication: models, E. Hafen

Title

Lecture notes are available. Exercises, answer keys and other handouts can be downloaded from the Moodle course "Organic Chemistry I" of the current semester (https://moodle-app2.let.ethz.ch).

Prerequisites / notice

The course consists of plenary lectures (2 h per week) and problem-solving lessons (2 h per week, groups of ca. 25 people). In addition, online exercises are available in the e-learning environment Moodle (Course OC I).

551-0105-00L Fundamentals of Biology IA  O  5 credits  5G  M. Aebi, E. Hafen

Abstract

The course provides an introduction to the basics of molecular- and cell biology and genetics.

Objective

Introduction to modern biology and to principal biological concepts.

Content

The course is divided into several chapters:

1. Basic principles of Evolution.
2. Chemistry of Life: Water; Carbon and molecular diversity; biomolecules
3. The cell; structure; membrane structure and function, cell cycle
4. Metabolism: Respiration; Photosynthesis; Fermentation
5. Inheritance: meiosis and sexual reproduction; Mendelian genetics, chromosomal basis of inheritance, molecular basis of inheritance, from gene to protein, regulation of gene expression; genomes and their evolution

Lecture notes

None.

Literature

The text-book "Biology" (Campbell, Reece) (10th edition) is the basis of the course.

The structure of the course is largely identical with that of the text-book.

Prerequisites / notice

Certain sections of the text-book must be studied by self-instruction.

Additional First Year Courses

535-0667-00L Communication and Social Competences  O  1 credit  1V  J. Stadelwieser

Abstract

Students . . .

(1) recognize the importance of effective communication/presentation regarding objectives and audience;
(2) know the basics of rhetoric, communication, presentation, learning and working techniques;
(3) are enabled to prepare presentations (with slides/powerpoint);
(4) know four types of protocols;
(5) are enabled to write protocols;
(6) know possibilities to optimize their learning and working success;
(7) are enabled to scrutinize a scientific text.

Content

- Communication: models
- Preparation of presentation
- Analysis of the audience; definition of goals
- Language, prononciation, technique, space
- Stagefright
- Protocols: types, writing protocols
- Scientific text: scrutinize
- Learning effectively
- Working rules

Lecture notes

no script; handout and working papers.

Literature

- Stadelwieser Jürg, Kommunikation als Schlüssel zum Erfolg, Tobler, 2000 (vergriffen/Bibliothek).

535-1001-00L Laboratory Course General Chemistry (for Biology and Pharmacy)  O  6 credits  8P  R. O. Kissner, K.H. Altmann, J. Hall, D. Neri, G. Schneider, M. D. Wörle

Abstract

Introduction to the practical work in a chemistry laboratory. The most important manipulations and techniques are treated, as well as the the most fundamental chemical reaction types.

Objective

- Knowledge of the basic chemical laboratory methods.
- Basic knowledge of the scientific approach in experimenting.
- Observation and interpretation of real-world chemical processes.
- Keeping of a reliable laboratory journal.

Content

- Simple chemical methods and calculations.
- Separation techniques.
- Simple physical measurements.
- Ionic solids (salts).
- Acid/Base chemistry, buffers.
- Redox reactions.
- Metal complexes.
- Titration methods.
- Introduction to qualitative analysis.
Lecture notes: Course manual (is handed out to the students at the beginning of the lessons).

Language: German, English upon request.

 references:

is a suitable textbook.

Prerequisites / notice: This practical course causes costs for materials and chemicals. The costs are charged to the students at the end of the semester.

| Abstract      | The goal of this course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others. |
Objective: The goal of this course is to provide students with a wide general understanding cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Content: The focus is animal cells and the development of multicellular organisms with a clear emphasis on the molecular basis of cellular structures and phenomena. The topics include biological membranes, the cytoskeleton, protein sorting, energy metabolism, cell cycle and division, viruses, extracellular matrix, cell signaling, embryonic development and cancer research.

Lecture notes: The lectures are presented in the Powerpoint format. These are available on the WEB for ETH students over the netzh (Moodle). Some lectures are available on the ETH WEB site in a live format (Livestream) at the above WEB site.

Prerequisites / notice: Some of the lectures are given in the English language. Certain sections of the text-book must be studied by self-instruction.

Abstract: The lectures give an overview of selected drugs and the molecular mechanisms underlying their therapeutic effects in disease. The historical and modern-day methods by which these drugs were discovered and developed are described. Structure-function relationships and the biophysical rules underlying ligand-target interactions will be discussed and illustrated with examples.

Objective: Basic understanding of therapeutic agents with respect to molecular, pharmacological and pharmaceutical properties.

Content: Molecular mechanisms of action of drugs. Structure function and biophysical basis of ligand-target interactions will be discussed and illustrated with examples.

Lecture notes: Will be provided in parts before each individual lecture.

Introduction and overview of important fundamentals, principles and technologies for the development and manufacturing of dosage forms

Galenical Pharmacy I
Knowledge of the most important pharmaceutical excipients, materials, containers, liquid and semi-solid dosage forms, of their production, function, quality and application. Comprehension of molecular interactions in solution and colloidal systems. Comprehension of interfacial phenomena and stabilization measures in dosage forms.

Objective
Knowledge of the most important pharmaceutical excipients, materials, containers, liquid and semi-solid dosage forms, of their production, function, quality, stability and application. Comprehension of the molecular interactions in solution and colloidal systems. Comprehension of interfacial phenomena and stabilization measures in dispense dosage forms.

Content
Introduction and overview of important fundamentals, principles and technologies for the development and manufacturing of dosage forms and drug delivery systems. Overview of the most important pharmaceutical excipients and polymers, their structure, properties and processing; importance of materials properties for containers. Pharmaceutical solvents, fundamentals of solubility and solubilization of drugs. Water treatment processes, sterilization techniques and quality requirements of pharmaceutical water. Parenteral dosage forms and liquid ophthalmics. Surfactants, micel formation and colloidal systems. Liquid suspensions and emulsions. Stabilization measures in dosage forms.

H. Leuenberger (Hrsg.) - Physikalische Pharmazie, Wissenschaftliche Verlagsgesellschaft, Stuttgart 2002
R. Voigt, Pharmazeutische Technologie, 10. Auflage, Deutscher Apotheker Verlag, Stuttgart, 2006

Language: German and English

Prerequisites / notice
Requirements: Knowledge of physical and organic chemistry, biochemistry and biology.
Attendance of Medicinal Chemistry II in the spring semester.

Pharmacology and Toxicology I
The two-semester lecture course will provide a detailed understanding of the fundamentals of drug action and the mechanisms of action and therapeutic use of the important classes of drugs. The lectures are intended for students of pharmaceutical sciences.

Objective
The lectures will provide a comprehensive survey of pharmacology and toxicology. Special emphasis is placed on the interrelationship between pharmacological, pathophysiological and clinical aspects.

Content
Topics include disease-relevant macroscopic, microscopic, pathobiochemical and functional disturbances of specific organs and organ systems. The lectures integrate disease pathology with mechanisms of drug action, usage, metabolism, pharmacokinetics, side effects, toxicity, contraindications and dosage of relevant drug classes. Basic principles of clinical pharmacology and pharmacotherapy will be covered.

Lecture notes
Für jede Vorlesung wird ein Skript abgegeben, das eine Zusammenfassung mit den wichtigsten Stichpunkten beinhaltet.

Prerequisites / notice
Voraussetzungen: Abschluss Grundstudium
The aim of the lecture course is to provide a solid overview of the science and issues in gene technology and genome science.

Get Students familiar with basic Immunological concepts of pharmaceutical relevance.

- There is no English translation of the above textbook (or any reasonably equivalent text). Students intending to take the exam for Chapters 1 - 11 of Janeway's ImmunoBiology, by Kenneth Murphy (8th Edition; Garland).

The course will provide a solid overview of the science and issues in gene technology and genome science.

Consideration on pharmacokinetics and half-life extension

Proteins: chemical modification and detection of biomolecular interactions

Chemical modifications of proteins

Radioactive labeling of proteins

Affinity constant: definition and its experimental measurement

Genomics: Applications to Human Biology

Protein cloning and expression

Functional Genomics

Sequencing genomes and novel sequencing methods

Genetic disorders: discovery and pharmaceutical implications

Transcriptomics

Proteomics

Principles of Cancer

Principles of Vaccine Development

Principles of Gene Therapy

3. Genomics: Applications to Human Biology

4: Pharmaceuticals: Focus on Discovery

Chemical Libraries

Protein Therapeutics

Consideration on pharmacokinetics and half-life extension

Lecture notes: Skript "Gene Technology" by Prof. Dario Neri

Abstract

The structure and biosynthesis of plant constituents and the pharmacological effects and therapeutic applications of biogenic drugs of plant origin (extract-based herbal medicines; isolated natural products) are discussed. Areas of focus are (a) major biosynthetic pathways for plant-derived natural products, (b) pharmacological effects of herbal extracts, and (c) molecular mechanisms of action.

Objective

The understanding of the biosynthesis of plant-derived natural products. Acquisition of fundamental knowledge on the medical applications of important herbal medicines and of isolated natural products (general disease areas, molecular constituents of medicinal plants and herbal medicines in general, molecular constituents responsible for pharmacological activity, possible mechanisms of action, available clinical data to support medical use).

Content

The lecture is centered around the discussion of medicinal plants and herbal medicines and their common medical applications. The main addressed in the lecture are (a) the structure and biosynthesis of plant constituents (i.e. plant-derived natural products) and (b) the pharmacological effects and therapeutic applications of biogenic drugs of plant origin (herbal medicines based on plant extracts as well as isolated natural products). The basic pathways for the biosynthesis of the most important classes of plant-derived natural products are discussed in detail. Likewise, the molecular basis of the pharmacological effects of medicinal plant extracts (and derived herbal medicines) and their individual constituent components (isolated natural products) is broadly addressed. As part of this discussion the availability of clinical data (or lack thereof) to support specific clinical applications of herbal medicines will be repeatedly highlighted. Potential risks associated with the use of herbal medicines are discussed for selected cases.

The lecture is structured according to the major classes of natural products prevalent in medicinal plants and herbal medicines: Carbohydrates, lipids, terpenes, phenolic compounds, alkaloids, essential oils.

Prerequisites / notice

Requirements: Lecture courses in basic organic chemistry, biochemistry, and biology

Abstract

The aim of the lecture course is to provide a solid overview of the science and issues in gene technology and genome science.

Topics: Antibody phage technology, protein modification technology, genome projects, genome sequencing, transcriptomics, proteomics and SNP technology. The course is suited for advanced undergraduate and early graduate students in pharmaceutical sciences or related fields.

Objective

The course will provide a solid overview of the science and issues in gene technology and genome science.

Content

1. Antibody phage technology

The antibody molecule

V genes, CDRs, basics of antibody engineering

Principles of phage display

Phagemid and phage vectors

Antibody libraries

Phage display selection methodologies

Other phage libraries (peptides, globular proteins, enzymes)

Alternative screening/selection methodologies

DNA-encoded chemical libraries

2. Proteins: chemical modification and detection of biomolecular interactions

Homo- and hetero-dimerization of proteins

Chemical modifications of proteins

Radioactive labeling of proteins

Affinity constant: definition and its experimental measurement

3. Genomics: Applications to Human Biology

Protein cloning and expression

Functional Genomics

Sequencing genomes and novel sequencing methods

Genetic disorders: discovery and pharmaceutical implications

4: Pharmaceuticals: Focus on Discovery

Chemical Libraries

Protein Therapeutics

Consideration on pharmacokinetics and half-life extension

Lecture notes

- There is no English translation of the above textbook (or any reasonably equivalent text). Students intending to take the exam for the course and are not sufficiently proficient in German should contact the lecturer before the start of the course.

Abstract

Introduction of basic principles of radiation, structure and function of radiopharmaceuticals, examples of radiopharmaceuticals in nuclear medicine practice, discussion of functional radiopharmaceuticals, molecular imaging, targeted radionuclide therapy, radiopharmaceutical synthesis.

Objective

Introduction of basic principle of radiation, structure and function of radiopharmaceuticals, examples of radiopharmaceuticals in nuclear medicine practice, discussion of functional radiopharmaceuticals, molecular imaging, targeted radionuclide therapy, radiopharmaceutical synthesis.

Content

Introduction radioactivity, radiopharmaceuticals, PET- and SPET- nuclides, radionuclide generators, radiopharmaceuticals for imaging the heart, infection- and lung diagnostics, groups of brain radiopharmaceuticals, PET-kinetik modelling, molecular imaging, application in nuclear medicine, tumor-affine radiopharmaceuticals, targeted radionuclide therapy, radioimmunoconjugates, dosis calculations, nuclear medicine practice, radiopharmaceutical chemistry.

Lecture notes

Laboratory Courses 3rd Year

Respective lectures must be attended before/together with the Laboratory Courses. Special schedule for the Laboratory Courses.

Besides regarding basic concepts, this lecture focus on applied aspects of ecotoxicology. Case studies and effects of environmental chemicals on cells, organisms up to ecosystems are regarded. In a multidisciplinary approach based on toxicological concepts, pollutants are analysed, in particular hormonally active compounds and their effects on reproduction.
Handouts can be accessed online.

The aim is to give a deepened insight on the normal development, of the nervous system based on molecular, cellular and biochemical processes.

W.D. Hardt, P. Christen, K. Maniura, R. Müller

Tissue and Cellular Biomechanics, Molecular Biomechanics and Biopolymers, Computational Biomechanics, Biomaterials, Tissue Engineering, Radiation and Radiographic Imaging, Diagnostic Ultrasound Imaging, Magnetic Resonance Imaging, Biomedical Optics and Lasers.

The main focus is on the development of the NS: Early development of the NS, cellular processes, nerve fiber growth, building of synapses and neuronal networks.

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

Prerequisites / notice

Auxiliary tools: None. Bring something to write and your student ID.

376-1305-00L Development of the Nervous System

Abstract

The course covers the development of the nervous system (NS) with a focus on neurogenesis and migration, axon growth, synapse formation, mol. & cell. mechanisms, and diseases of the developing NS.

Objective

The aim is to give a deepened insight on the normal development, of the nervous system based on molecular, cellular and biochemical approaches.

Content

The main focus is on the development of the NS: Early development of the NS, cellular processes, nerve fiber growth, building of synapses and neuronal networks.

Lecture notes

Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz/ as BIO344

Literature

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

Prerequisites / notice

Repetitionsprüfung 15. Juni 2016, HG E 26.1, 9-10.30h

376-1314-00L Biocompatible Materials

Abstract

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Objective

The class consists of three parts:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

Content

Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed. In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

Lecture notes

Handouts can be accessed online.

**Objective**

Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis. This concept class will be based on common concepts (Grundlagen der Biologie IIB, Teil Mikrobiologie) and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Content**

Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Lecture notes**

Updated handouts will be provided during the class.

**Literature**

Current literature references will be provided during the lectures.

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

**Objective**

To familiarize with the structure, properties and reactivity of food constituents. To understand the relationship between the multiple chemical reactions and the quality of food.

**Content**

Descripive chemistry of food constituents (proteins, lipids, carbohydrates, plant phenolics, flavour compounds).

**Lecture notes**

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

The lectures Food Chemistry I and Food Chemistry II constitute a unit.

**Literature**

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**Objective**

This lecture is the first part of a one-year course. It offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms. The lecture offers insights into the basics, practical consequences and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts, molds and protozoa in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms. The focus of this first part of the lecture will be on the organisms, but also on the factors which determine spoilage and foodborne disease.
1. History of Food Microbiology
   1.1. Short synopsis of foodborne microorganisms
   1.2. Spoilage of Foods
   1.3. Foodborne Disease
   1.4. Food Preservation
   1.5. VIP's of Food Microbiology
2. Overview of Microorganisms in Foods
   2.1. Origin of foodborne Microorganisms
   2.2. Bacteria
   2.3. Yeasts
   2.4. Molds
3. Microbial Spoilage of Foods
   3.1. Intrinsic and Extrinsic Parameters
   3.2. Meats, Seafoods, Eggs
   3.3. Milk and Milk Products
   3.4. Vegetable and Fruit Products
   3.5. Miscellaneous (baked goods, nuts, spices, ready-to-eat products)
   3.6. Drinks and Canned Foods
4. Foodborne Disease
   4.1. Significance and Transmission of Foodborne pathogens
   4.2. Staphylococcus aureus
   4.3. Gram-positive Sporeformers (Bacillus & Clostridium)
   4.4. Listeria monocytogenes
   4.5. Salmonella, Shigella, Escherichia coli
   4.6. Vibrio, Yersinia, Campylobacter
   4.7. Brucella, Mycobacterium, Aeromonas, Plesiomonas
   4.8. Parasites
   4.9. Viruses and Bacteriophages
   4.10. Mycotoxins
   4.11. Bioactive Amines
   4.12. Miscellaneous (Antibiotic-resistant Bacteria, Biofilms)

Lecture notes
Electronic copies of the presentation slides (PDF) will be made available for download.

Literature
Recommendations will be given in the first lecture

752-2017-00L Biomechanics of Sports Injuries and Rehabilitation
3 credits
2V
K.U. Schmitt, J. Goldhahn

Abstract
This lectures introduces the basic principles of injury mechanics and rehabilitation focussing on sports injuries.

Objective
Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

Content
This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented. Furthermore possibilities to prevent injuries are discussed. Thereby the lecture focuses on sports injuries.

Lecture notes
Handouts can be downloaded.

Literature

Prerequisites / notice
A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

752-4009-00L Molecular Biology of Foodborne Pathogens
3 credits
2V
M. Loessner, M. Schuppler

Abstract
The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective
Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks.

Content
Molecular biology of infectious foodborne pathogens (Listeria, Vibrio, E. coli, Campylobacter, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks?

Lecture notes
Electronic copies of the presentation slides (PDF) will be made available for download to registered students.

Literature
Recommendations will be given in the first lecture

Prerequisites / notice
Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until 11:15 h), with no break.

752-5103-00L Functional Microorganisms in Foods
3 credits
2G
C. Lacroix, T. de Wouters, L. Meile, C. Schwab

Abstract
This integration course will discuss new applications of microorganisms with functional properties in food and functional food products. Selected topics will be used to illustrate the rapid development but also limits of basic knowledge for applications of functional microorganisms to produce food with high quality, safety and potential health benefits for consumers.

Objective
To understand the principles, roles and mechanisms of microorganisms with metabolic activities of high potential for application in traditional and functional foods utilization with high quality, safety and potential health benefits for the consumers. This course will integrate basic knowledge in food microbiology, microbial physiology, biochemistry, and technology.
This course will address selected and current topics on new applications of microorganisms with functional properties in food and functional food products and characterization of functionality and safety of food bacteria. Specialists from the Laboratory of Food Biotechnology, as well as invited speakers from the industry will contribute to the selected topics as follows:

- **Probiotics and Prebiotics**: Probiotics, functional foods and health, towards understanding molecular modes of probiotic action; Challenges for the production and addition of probiotics to foods; Prebiotics and other microbial substrates for gut functionality.

- **Bioprotective Cultures and Antimicrobial Metabolites**: Antifungal cultures and applications in foods; Antimicrobial peptide-producing cultures (bacteriocins) for enhancing food quality and safety; Development of new protective cultures, the long path from research to industry.

- **Legal and Protection Issues Related Functional Foods**

- **Industrial Biotechnology of Flavor and Taste Development**

- **Safety of Food Starter Cultures and Probiotics**

Students will be required to complete a group project on food products and ingredients with contributions of from functional bacteria. The project will involve information research and analysis followed by an oral presentation and short written report.

- **Content**

- **Objective**

- **Prerequisites / notice**

No compulsory prerequisites, but prior completion of Human Nutrition I + II (Humanernährung I+II) is strongly advised.

<td>Drug therapy is nothing less than interference with a highly complex biological system, which is affected by various internal and external factors. A profound understanding of drug effects thus requires a transdisciplinary approach of investigation. The drug seminars provide a platform for the presentation and discussion of these transdisciplinary approaches for the investigation of drug action. The faculty members of the Institute of Pharmaceutical Sciences offer specific projects from different areas of the pharmaceutical sciences, each of which is elaborated by a small groups of students (4-8). Each group is tutored by a faculty member. The objective of this work is to achieve an in-depth understanding of the problem investigated and to present the results of the work to an audience composed of all students participating in the drug seminar and the faculty of the Institute of Pharmaceutical Sciences. Presentations will take place in the framework of a dedicated mini-symposium, which is part of the external seminar week. The possibility exists to invite external experts from industry or the public health sector to participate in the mini-symposium. Students are strongly encouraged to make use of this option and will again be supported in these efforts by the faculty members.</td>

<td>In this course, various topics related to the development, GMP production and application of therapeutic proteins will be discussed. Furthermore, students will expand their training in pharmaceutical immunology and will be introduced to the basic concepts of pharmaceutical product quality management. Students know and understand: - basic mechanisms and regulation of the immune response - the pathogenic mechanisms of the most important immune-mediated disorders - the most frequently used expression systems for the production of therapeutic proteins - the use of protein engineering tools for modifying different features of therapeutic proteins - the mechanism of action of selected therapeutic proteins and their application - basic concepts in the GMP production of therapeutic proteins The course consists of two parts: In a first part, students will complete their training of pharmaceutical immunology (Chapter 13 - 16 Immunobiology VIII textbook). This part particularly focuses on the pathogenic mechanisms of immune-mediated diseases. Deepened knowledge of immunology will be relevant for understanding the mechanism of action of many therapeutic proteins, as well as for understanding one major concern related to the use of protein-based drugs, namely, immunogenicity. The second part focuses on topics related to the development and application of therapeutic proteins, such as protein expression, protein engineering, reducing immunogenicity, and GMP production of therapeutic proteins. Furthermore, selected examples of approved therapeutic proteins will be discussed.</td>

Data: 06.10.2017 12:56  Autumn Semester 2015 Page 1117 of 1432
Objective: To familiarize participants with the principles of pharmacoepidemiology and epidemiology in addressing drug related questions with concern to the use, effects and risks of medicinal products in a large population. To introduce participants to fundamental statistical, economic and epidemiological concepts and methods. To provide the appropriate tools to critique pharmacoepidemiologic studies in the literature and to critically read and understand papers in the medical literature which relate to drug benefits, risks, and costs. To address controversial topics in drug use and benefit-risk assessment, and to critically appraise the outcome of drug therapy. To equip participants with skills to facilitate further studies in these areas.

Content:
The contribution of epidemiology to the study of drug uses, effects and risks: -Pharmacoepidemiology study methodologies, concepts and strategies, -Detection and identification of unintended drug effects (pharmacovigilance), -Quantifying unintended effects and drug interactions, -Bias and confounding by indication, -Drug utilization

Pharmacoepidemiology and outcome assessment of drug therapy.

Meta-analysis in pharmacoepidemiology.

Lecture notes
This course will be a combination of formal lectures, group discussions and self-directed project work. Course material will be taught through seminars, case studies and group projects. Reading material and scripts will be given for each week.

Literature
A reading list pertinent to the course will be provided during the course.

Limited number of participants.

Abstract
The practical course is open for master and graduate students to get an introduction into hands-on computer-assisted drug design. The class includes an introduction to computer-based screening of a virtual compound library, subsequent synthesis of candidate ligands, and biochemically testing for activity on pharmaceutically important drug targets.

Objective
Participants become familiar with state-of-the-art methodologies in a real-life computer-aided medicinal chemistry project. Participants work as small teams, perform literature research and discuss recent research findings. A seminar talk is to be given presenting the molecular design strategy chosen and the results obtained during the course.

Content
The course offers the possibility for people with and without computational and or laboratory background to get an introduction into computer-assisted drug design, as well as practical training in a modern chemical laboratory. Using various software suites, the participants will computationally create and screen a virtual compound library for potential active small molecules. The process will involve an introduction to screening a virtual compound library, synthesizing candidate inhibitors, and biophysical testing against a pharmaceutically important drug target.

Lecture notes
Detailed information will be handed out during the course.

Literature

Prerequisites / notice
The class is organized as a two-week block course.

The number of participants is limited.

Kick-off meeting and confirmation of registration (Vorbesprechung und Platzvergabe): During the last lecture of the class "Computer-Assisted Drug Design" (535-0022-00).

Ideally, students interested in the course participated and successfully passed the lecture "Computer-Assisted Drug Design" (535-0022-00).

Additional selected literature will be provided during the lecture.

Complementary to the practical course "Computer-Assisted Drug Design (Practical Course)" 535-0023-00L.

Abstract
The lecture is organized as a two-week block during the practical course "Computer-Assisted Drug Design" (535-0023-00 P), totalling 10 two-hour lectures. It provides an introduction to advanced drug design techniques and approaches emphasizing computer-assisted molecular design.

Objective
Participants will learn about computational algorithms and advanced experimental approaches to drug discovery and design, including selected actual topics and practical applications. The contents of the lecture will allow for a deeper understanding of modern computer-assisted drug design methods and how they are linked to experimental applications. The main focus is on computational medicinal chemistry, so that participants will be able to use relevant computer-based methods in own research projects.

Literature

Prerequisites / notice
The lecture is mandatory for all participants of the course "Computer-Assisted Drug Design" (535-0023-00 P).

Knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.

Objective
Goals: knowledge of the major reactions of biotransformation in drug therapy, prediction of possible metabolites of drugs and xenobiotics, recognition of structure elements and reactions which can lead to toxic metabolites. Knowledge of inter- and intraindividual factors influencing metabolism.
Content

Major reactions of biotransformation. Major enzymes and reaction partners involved in the biotransformation of drugs and xenobiotics. Toxic reactions of metabolites. Factors which affect the biotransformation.

Lecture notes

Biotransformation of drugs and xenobiotics

Literature

535-0137-00L Clinical Chemistry II W Dr 1 credit 1V M. Hersberger

Abstract

Detailed knowledge on particular aspects of clinical chemistry and medical laboratory diagnostics concerning quality control, point-of-care analytics, analytics of kidney stones, tumor markers, diagnosis of HIV and hepatitis, pharmacogenetics, thyroid function, bone metabolism and laboratory diagnosis of hypertension.

Objective

Detailed knowledge on the implementation and interpretation of clinical laboratory diagnostic tests. Competence to interpret selected tests.

Content

Internal and external quality control; point-of-care analytics, analytics of kidney stones, use of tumor marker determinations, diagnosis of HIV and hepatitis, pharmacogenetics, thyroid function, bone metabolism and laboratory diagnosis of hypertension.

Lecture notes / Literature

- Jürgen Hallbach, Klinische Chemie und Hämatologie für den Einstieg, Thieme Verlag
- Harald Renz, Praktische Labordiagnostik, de Gruyter Verlag
- Walter Guder, Das Laborbuch für Klinik und Praxis, Elsevier Verlag
- Lothar Thomas, Labor und Diagnose, Thi Books

Prerequisites / notice

Requirement: basic knowledge in clinical chemistry and laboratory diagnostics

535-0015-00L History of Pharmacy W Dr 1 credit 1V M. Fankhauser

Abstract

The students will receive the basic knowledge of the history of pharmacy. This knowledge will allow them to have a detailed approach to the actual pharmacy and the development of the materia medica.

Objective

The students will receive the basic knowledge of the history of pharmacy. This knowledge will allow them to have a detailed approach to the actual pharmacy and the development of the materia medica.

Content

In the first part of the lecture we will talk about the position of the pharmacist in the past and in society. We go through the milestones of the social and legal development of pharmacy. The second part will deal with the history of pharmacology with development of therapeutical theories and the evolution of the used remedies. It also includes their sometimes mystical and symbolical dimension.

Literature

Wird in der ersten Veranstaltung mitgeteilt.

Prerequisites / notice

Voraussetzungen: Keine. Interesse für die Rolle der Pharmazie und der Medikamente in der Vergangenheit von Vorteil.

535-0344-00L From Ethnopharmacy to Molecular Pharmacognosy W Dr 1 credit 1V B. Frei Haller, J. Gertsch

Abstract

Basic understanding and awareness of ethnopharmaceutical and ethnopharmacological issues and research. Knowledge of methods used in drug discovery from natural sources. Discussion of the issues around law and international treaties. Importance of ethnopharmaceutical knowledge for world health.

Objective

Basic understanding and awareness of ethnopharmaceutical and ethnopharmacological issues and research. Knowledge of methods used in drug discovery from natural sources. Discussion of the issues around law and international treaties. Importance of ethnopharmaceutical knowledge for world health.

Content

Introduction into ethnopharmacy and related disciplines: definitions of terms, working methods, research projects, bioprospecting. Traditional medicinal plants of different cultures and their role in modern Western medicine (rational application of traditional uses), today’s "fashion plants." Empirical, traditional knowledge versus Evidence-Based Medicine. The role of biodiversity (CBD, Rio 1992; Nagoya, 2010) and problems associated with drug discovery from natural products. Screening strategies for drug discovery (random screening versus screening based on cultural, ecological, ethnopharmaceutical, chemotaxonomic criteria). Traditional knowledge in relation to the fight against malaria and its implementation in research, product development and development cooperation. Introduction to and selected examples of herbal drugs and poisons, mode of action, and their ethnopharmacological importance. Critical analysis of bioprospecting as a drug discovery strategy.

Lecture notes / Literature

Handouts will be provided.

Prerequisites / notice

535-0423-00L Drug Delivery and Drug Targeting W Dr 2 credits 2V J.C. Leroux, D. Brambilla

Abstract

The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.

Objective

The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.

Content

The course covers the following topics: drug targeting and delivery principles, radiopharmaceuticals, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, delivery of active agents in tissue engineering, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices and novel trends in transdermal and nasal drug delivery.

Lecture notes / Literature

Selected lecture notes, documents and supporting material will be directly provided or may be downloaded using http://www.galenik.ethz.ch/teaching/drug_del_drug_targ

The website also displays additional information on peroral delivery systems, transdermal systems and systems for alternative routes (nasal, pulmonary) of delivery. These fields are covered in detail in the course Galenische Pharmazie II (Galenic Pharmacy II).

Further references will be provided in the course.

535-0300-00L Molecular Mechanisms of Drug Actions and Targets W Dr 1 credit 1V V. I. Otto

Abstract

In the last 10 years, an average of one drug per year was withdrawn from the market. Using selected examples of such drug failures, the course aims at analyzing the present explanations of drug actions as well as the design and predictive power of animal models and clinical trials. In addition, the ethical, societal, and economical expectations in new drugs shall be reflected.

Objective

To develop a critical understanding of the relevance and limitations of the current approaches to explaining and anticipating drug effects. To critically appraise the ethical, societal, economical and political expectations in the development of new drugs.
In December 2006, Pfizer stopped a large phase III study on the use of Torcetrapib for the prevention of atherosclerosis and cardiovascular disease. 800 million $ in development costs and 21 billion $ in stocks were annihilated overnight. The failure of Torcetrapib has pinpointed the limitations of an extremely reductionist view of atherosclerosis and it's prevention by drug therapy. It has also highlighted what high expectations we have in a safe and wide applicability of drugs and of their economical success. Torcetrapib is not a single case. In the last 10 years, on average one drug per year was withdrawn from the market due to lack of efficacy, unexpected side effects or toxicity. This clearly shows that the common investigations and the modern understanding of drug actions are often not sufficient to predict the effects a drug will have in large patient populations.

These are the topics of the present course. Using three particularly informative examples of drug failures, the problems encountered and the concepts and informative value of preclinical and clinical studies will be analyzed and discussed. Furthermore, the ethical, societal, economical and political expectations in new drugs shall be reflected.

Abstract
Vitamins are essential organic compounds that cannot be synthesized by an organism and hence, they have to be acquired from the diet. This lecture will give an overview about the application of vitamins in health and disease.

Objective
The aim of this lecture is a critical examination of the students with the topic of "Vitamins in Health and Disease". The students will get an overview of vitamins, of their medical applications and the role of the pharmacist with "over-the-counter" products.

Content
Deficiencies of particular vitamins result in specific diseases such as for example scurvy (vitamin C deficiency). Such disease patterns are usually easily recognized and facile to be treated. The clinical utility of supplementation concerns people with severe deficiencies and a risk of complications. Latent vitamin deficiencies might result in variable disorders and risks. As an example neurological disorders in elderly as a consequence of chronic lack of vitamin B12 should be mentioned. Subclinical deficiencies are often difficult to assess. However, these are exactly the cases where advice of a pharmacist is requested. A large intake of vitamins by over-supplementation or food fortification might be dangerous (hypervitaminosis). This is in particular the case for fat-soluble vitamins or in the case of constant intake of high amounts of water-soluble vitamins over a long time period.

The lecture 'Vitamins in Health and Disease' will give an overview over the history and applications of vitamins and their functions to preserve good health. The utility of vitamin supplementation during conditions of deficiencies, potential consequences of a latent deficiency as well as risks of over-supplementation will be discussed.

Lecture notes
Hand-outs will be distributed during the lecture (in English).

Literature
Book recommendation: reference books:
- Handbuch Nährstoffe, Burgerstein, Trias Verlag ISBN 978-3-8304-6071-8

Prerequisites / notice
Requirements: Basic knowledge in biochemistry and pharmacology. Ability to read and understand scientific publications in English.
Abstract
This course will provide an up-to-date, comprehensive review of the industrial perspective at the interface of biomaterials and drugs. This covers regulatory, clinical, pre-clinical and manufacturing concepts. The presentations are provided in an effort to maximize the interaction of student and lecturer.

Objective
- The student will be able to categorize a drug-biomaterial as a "drug" or a "material" from a regulatory perspective and can summarize general regulatory pathways for material/drug development.
- The student will be able to summarize the current concepts and challenges for the industry at the material-drug interface.
- The student will actively develop innovative, industrial concepts at the drug-biomaterial interface.

Content
This course will provide an up-to-date comprehensive review of the industrial perspective at the interface of biomaterials and drugs. General concepts related to regulatory affairs or such as cost-conscious planning of manufacturing processes will be covered by interactive case-studies and in close interaction between students and lecturers. The course covers the future at the biomaterial - implant interface - as it is seen by the industry today - and will be reviewed by experienced and long-standing faculty from industry with the aim to provide a balanced, insightful perspective. From that, clinical development concepts, regulatory pathways and real-life case studies will be discussed with the students. Finally the students - working in small groups of 4-5 - will outline a development pathway for an industrial project and present it to the course and in presence of all faculty to receive maximum feedback to their approaches.

The student will become familiar with the major elements required for a successful development and which challenges have to be taken into account to translate an idea into a successful product.

Abstract
Organisation of institutional environments (emergency hospitals), with special focus on the medication process and institutional pharmaceutical care (continuum of care).

Objective
Students understand the concept of continuum of care and its practical implementation. They know the medication process within an institutional environment. They are able to find the necessary information and deal with problems in connection with pharmaceuticals, to evaluate them and to communicate and document their findings adequately. They know how a hospital is organised (procedures, possible problems), responsibilities of the different members of the staff and, most importantly, what the function of a hospital pharmacy is.

Content
Principals of the organisation of institutional environments (emergency hospitals), with special focus on medication processes and institutional pharmaceutical care (circulation of medication, continuum of care). Hygiene regulations, medical products, applications, drug formularies, patient files, SOAP notes, kardex study. Participation at interdisciplinary visits, internal trainings and doctors’ reports as well as visitation of the emergency room. Drug interaction, generic substitution, quality management and pharmaceutical vigilance.

535-5504-00L Basics of Practical Pharmacy O 6 credits 7G P. Wiedemeyer, S. Erni, B. Falch, K. Fünfschilling

Abstract
Introduction to managed care systems (Pharmaceutical Care und Public Health): problems with regard to therapy and approaches to solutions, service, first aid and medicinal products. Methods of illness prevention and health promotion. Important additional assortments including complementary medicine. Law and economy in everyday pharmacy, structures of the national health care system.

Objective
Students know the most important concepts and methods of pharmaceutical care of patients with regard to OTC and Rx-only drugs as well as the essential concepts and methods of public health, prevention and health care. They master the basic rules concerning the pharmaceutical triage and their implications. For the clinical pictures covered during the course, they are able to make therapeutic plans or accompany and optimize doctor’s orders. Students show an adequate understanding of the rights and duties of pharmacists as medical personnel regarding medical care and service within the framework of the Swiss health care system. They are capable of handling important medical products and instructing patients about their use. Students have the necessary basic skills and applications of first aid and emergency medicine. They know the essence, chances and limits with reference to additional assortments, therapeutic options like phytotherapy, complementary medicine, veterinary pharmacy and non-medical methods of healing. Students have the essential knowledge of legal aspects and regulations concerning pharmacists and know the basics of business administration.

Content
Pharmaceutical Care: possibilities of pharmaceutical care of patients regarding OTC and Rx-only drugs in the officinal pharmacy. Good pharmaceutical triage in practice, introduction to the pharmacutic validation of prescriptions, recognition of medicinal, patient related, therapeutic problems and the finding of solutions: Choice of therapy (OTC), accompanying and optimizing therapies (Rx), compliance, correct administration of drugs, cooperation with other medical professions in the field of outpatient treatment. Traditional and proactive pharmaceutical service.: development of adequate means of documentations of intervention and consultation as well as pharmaceutical follow-up care. Public health: role and possibilities of officinal pharmacies as partners within the Swiss health care system: primary health care, prevention, campaigns, early detection, instruction and medication, referral to doctors. Needs of customers, patients and employees, and social interaction. Significance of the medical profession (illness, suffering, promotion of health and well-being). Basic training in first aid, emergency medicine and wound care. Medical products: handling of important applications and instruction of patients. Important and additional forms of therapy and assortments: phytotherapy, complementary medicine, veterinary pharmacy, non-medical methods of healing. Economy and law in everyday pharmacy: overview of the Swiss legal system. Relevant legal framework, jurisdiction and regulations and their meaning with regard to quality assurance for practicing pharmacists. Basics of finance and accounting as well as personnel management and insurance matters. Organisation and competencies of the various partners within the Swiss health care system, focusing on the intermediate position and the role of pharmacists as part of the medical community.

Compensatory Block Courses
All Elective Block Courses of the second year in Master studies are eligible as Compensatory Block Courses. Elective Block courses take place in Spring Semester.

Course Units for Additional Admission Requirements
The courses below are only available for MSc students with additional admission requirements.

Abstract
Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

Objective
The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

Content
From "Statistics for research" (online)
Ch 1: The Role of Statistics
Ch 2: Populations, Samples, and Probability Distributions
Ch 3: Binomial Distributions
Ch 6: Sampling Distribution of Averages
Ch 7: Normal Distributions
Ch 8: Student’s t Distribution
Ch 9: Distributions of Two Variables

From "Introductory Statistics with R (online)"
Ch 1: Basics
Ch 2: The R Environment
Ch 3: Probability and distributions
Ch 4: Descriptive statistics and tables
Ch 5: One- and two-sample tests
Ch 6: Regression and correlation
The students know the relevance and the role of quality assurance measures to assure quality, efficacy and safety of drugs. The students know the most important Swiss regulations, including the associated European regulations, which are relevant from a quality assurance point of view and they are able to interpret the content of this regulations.

402-2883-00L Physics III

Abstract
Introductory course on quantum and atomic physics including optics and statistical physics.

Objective
A basic introduction to quantum and atomic physics, including basics of optics and equilibrium statistical physics. The course will focus on the relation of these topics to experimental methods and observations.

Content
Evidence for Quantum Mechanics: atoms, photons, photo-electric effect, Rutherford scattering, Compton scattering, de-Broglie waves. Quantum mechanics: wavefunctions, operators, Schrodinger's equation, infinite and finite square well potentials, harmonic oscillator, hydrogen atoms, spin.

Atomic structure: Perturbation to basic structure, including Zeeman effect, spin-orbit coupling, many-electron atoms. X-ray spectra, optical selection rules, emission and absorption of radiation, including lasers.

Optics: Fermat's principle, lenses, imaging systems, diffraction, interference, relation between geometrical and wave descriptions, interferometers, spectrometers.

Statistical mechanics: probability distributions, micro and macrostates, Boltzmann distribution, ensembles, equipartition theorem, blackbody spectrum, including Planck distribution

402-2203-01L Classical Mechanics

Abstract
A conceptual introduction to theoretical physics: Newtonian mechanics, central force problem, oscillations, Lagrangian mechanics, symmetries and conservation laws, spinning top, relativistic space-time structure, particles in an electromagnetic field, Hamiltonian mechanics, canonical transformations, integrable systems, Hamilton-Jacobi equation.

302-0255-00L Introduction to Solid State Physics

Abstract
The course provides an introduction to solid state physics, covering several topics that are later discussed in more detail in other more specialized lectures. The central topics are: solids and their lattice structures; interatomic bindings; lattice dynamics, electronic properties of insulators, metals, semiconductors, transport properties, magnetism, superconductivity.

Objective
Introduction to Solid State Physics.

Content
The course provides an introduction to solid state physics, covering several topics that are later discussed in more detail in other more specialized lectures. The central topics are: solids and their lattice structures; interatomic bindings; lattice dynamics, thermal properties of insulators; metals (classical and quantum mechanical description of electronic states, thermal and transport properties of metals); semiconductors (bandstructure and n/p-type doping); magnetism, superconductivity.

402-2805-00L Quantum Mechanics I

Abstract
Introduction to non-relativistic single-particle quantum mechanics. In particular, the basic concepts of quantum mechanics, such as the quantisation of classical systems, wave functions and the description of observables as operators on a Hilbert space, and the formulation of symmetries will be discussed. Basic phenomena will be analysed and illustrated by generic examples.

Objective
Introduction to single-particle quantum mechanics. Familiarity with basic ideas and concepts (quantisation, operator formalism, Dirac notation, symmetries, perturbation theory) and generic examples and applications (bound states, tunneling, scattering states, in one- and three-dimensional settings). Ability to solve simple problems.

Content
Keywords: Schrödinger equation, basic formalism of quantum mechanics (states, operators, commutators, measuring process), symmetries (translations, rotations), quantum mechanics in one dimension, spherically symmetric problems in three dimensions, scattering theory, density matrices, Schrödinger-, Heisenberg-, Dirac-pictures, time reversal, perturbation theory, variational techniques, spin, addition of angular momenta, relation between QM and classical physics.

Abstract
Experiments in condensed matter physics. The work includes the planning, build-up, data taking and analysis, and interpretation of the experimental results.

Objective

Content

Lecture notes
n/a

Prerequisites / notice
Arbeiten in einer Forschungsgruppe sind besonders gut geeignet, die Studierenden mit aktuellen Forschungsthemen und mit moderner Instrumentierung bekannt zu machen.

402-0400-BSL Advanced Quantum Electronics Experiments W 9 credits 18P Supervisors
Advisors for this experimental semester paper:
Prof. Tilman Esslinger
Prof. Jérôme Faist
Prof. Rachel Grange
Prof. Jonathan Home
Prof. Atac Imamoglu
Prof. Steven Johnson
Prof. Ursula Keller

Abstract
Implementation of experiments in quantum electronics. Planning, design, realisation, evaluation, and interpretation of the experiments.

Content

402-0719-BSL Particle Physics at PSI (Paul Scherrer Institute) W 9 credits 18P C. Grab

Abstract
During semester breaks 6-12 students stay for 3 weeks at PSI and participate in a hands-on course on experimental particle physics. A small real experiment is performed in common, including apparatus design, construction, running and data analysis. The course includes some lectures, but the focus lies on the practical aspects of experimenting.

Objective
Students learn all the different steps it takes to perform a complete particle physics experiment in a small team. They acquire skills to do this themselves in the team, including design, construction, data taking and data analysis.

402-0717-BSL Particle Physics at CERN W 9 credits 18P F. Nessi-Tedaldi, W. Lustermann

Abstract
During the semester break participating students stay for 4 weeks at CERN and perform experimental work relevant to our particle physics projects. Dates to be agreed upon.

Objective
Students learn, by doing, the needed skills to perform a small particle physics experiment: setup, problem solving, data taking, analysis, interpretation and presentation in a written report of publication quality.

Content
Detailed information in: http://www/cmsdoc.cern.ch/~nessif/ETHTeilchenpraktikumCERN.html

Language of instruction: English or German

402-0340-BSL Medical Physics W 9 credits 18P A. J. Lomax, R. Müller, K. P. Prüssmann, M. Rudin

Abstract
In agreement with the lecturers a semester paper in the context of the topics discussed in the lectures can be written.

402-0240-00L Advanced Physics Laboratory II W 9 credits 18P C. Grab, T. M. Ihn
Prerequisite: "Advanced Physics Laboratory I" completed. Please enrol in "Advanced Physics Laboratory II".

Enrol at most once in the course of the Bachelor programme!

Abstract
This laboratory course provides basic experimental skill training for performing physics experiments, including: Implementation of physics experiments using an instruction manual. Planning, designing, realizing, analyzing, and interpreting experiments. Estimating measurement precision.

Objective
Students should learn how to perform a bit more complex experiments, analyze the data and interpret the results.

Number Title Type ECTS Hours Lecturers
401-2003-00L Algebra I Z 7 credits 4V+2U R. Pink

Abstract
Introduction and development of some basic algebraic structures - groups, rings, fields.

Objective
Introduction to basic notions and results of group, ring and field theory.

Content
Basic notions and examples of groups;
Subgroups, Quotient groups and Homomorphisms,
Group actions and applications
Basic notions and examples of rings;
Ring Homomorphisms,
ideals, and quotient rings, rings of fractions
Euclidean domains, Principal ideal domains, Unique factorization domains
Basic notions and examples of fields;
Field extensions, Algebraic extensions, Classical straight edge and compass constructions

Abstract
Research colloquium

Prerequisites / notice
Occasionally, talks may be delivered in German.

Abstract
Research colloquium

Objective
The Zurich Theoretical Physics Colloquium is jointly organized by the University of Zurich and ETH Zurich. Its mission is to bring both students and faculty with diverse interests in theoretical physics together. Leading experts explain the basic questions in their field of research and communicate the fascination for their work.

Objective:

- Stay informed about current research results in elementary particle physics.
- Ph.D. students are expected to give a first research colloquium within their first years of their graduate time, another colloquium in their third year, and their doctoral exam talk before or after the exam. Other members of the institute are also invited to give talks. The goals are:
  - keep other members of the institute oriented on current research
  - test new ideas within the institute before going outside
  - train students to give scientific talks

Content:

- In Seminarvorträgen werden aktuelle Fragestellungen aus der Teilchenphysik vom theoretischen und experimentellen Standpunkt aus diskutiert. Besonders wichtig erscheint uns der Bezug zu den eigenen Forschungsmöglichkeiten am PSI, CERN und DESY.

Prerequisites / notice:

- Occasionally, talks may be delivered in German.

- On request the "Lehrsprache" may be changed to German.

- No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. The UZH Module Code is AST006.

- Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

- On the request the "Lehrsprache" may be changed to German.

</table>
| **Objective** | Successful students know:  
- experimental methods to measure cosmic ray particles over full energy range  
- current knowledge about the composition of cosmic ray  
- possible cosmic acceleration mechanisms  
- correlation between astronomical object classes and cosmic accelerators  
- information about our galaxy and cosmology gained from observations of cosmic ray |
| **Content** | First semester (Astro-Particle Physics I):  
- definition of 'Astro-Particle Physics'  
- important historical experiments  
- chemical composition of the cosmic rays  
- direct observations of cosmic rays  
- indirect observations of cosmic rays  
- 'extended air showers' and 'cosmic muons'  
- 'knee' and 'ankle' in the energy spectrum  
- the 'anti-matter problem' and the Big Bang  
- 'cosmic accelerators' |
| **Lecture notes** | See lecture home page: http://ihp-lx2.ethz.ch/AstroTeilchen/ |

| 402-0737-00L | Energy and Environment in the 21st Century (Part I) | W    | 6 credits | 2V+1U | M. Dittmar |
| **Abstract** | The energy and related environmental problems, the physics principles of using energy and the various real and hypothetical options are discussed from a physicist point of view. The lecture is intended for students of all ages with an interest in a rational approach to the energy problem of the 21st century. |
| **Objective** | Scientists and espially physicists are often confronted with questions related to the problems of energy and the environment. The lecture tries to address the physical principles of todays and tomorrow energy use and the resulting global consequences for the world climate. The lecture is for students which are interested participate in a rational and responsible debate about the energy problem of the 21. century. |
| **Content** | Introduction: energy types, energy carriers, energy density and energy usage. How much energy does a human needs/uses?  
Energy conservation and the first and second law of thermodynamics  
Fossil fuels (our stored energy resources) and their use.  
Burning fossil fuels and the physics of the greenhouse effect.  
physics basics of nuclear fission and fusion energy  
controlled nuclear fission energy today, the different types of nuclear power plants, uranium requirements and resources, natural and artificial radioactivity and the related waste problems from the nuclear fuel cycle.  
Nuclear reactor accidents and the consequences, a comparison with risks from other energy using methods.  
The problems with nuclear fusion and the ITER project.  
Nuclear fusion and fission: "exotic" ideas.  
Hydrogen as an energy carrier: ideas and limits of a hydrogen economy.  
new clean renewable energy sources and their physical limits (wind, solar, geothermal etc)  
Energy perspectives for the next 100 years and some final remarks |

Environmental Physics: Boeker and Egbert New York Wiley 1999 |
Prerequisites / notice
Scientific principles of relations as our intelligence can seize:

not only promised us peace or happiness

Gustave Le Bon

Physicists learned to realize that whether they like a theory or

they don't like a theory is not the essential question.

Rather, it's whether or not the theory gives predictions that agree with experiment.

Richard Feynman, 1985

402-0461-00L

Quantum Information Theory

W 8 credits 2V+1U R. Renner

Abstract
The goal of this course is to introduce the foundations of quantum information theory. It starts with a brief introduction to the mathematical

theory of information and then discusses the basic information-theoretic aspects of quantum mechanics. Further topics include applications

such as quantum cryptography and quantum computing.

Objective
The course gives an insight into the notion of information and its relevance to physics and, in particular, quantum mechanics. It also serves as

a preparation for further courses in the area of quantum information sciences.

402-0580-00L

Superconductivity

W 6 credits 2V+1U R. Chitra

Abstract
Topics: occurrence of superconductivity, basic phenomena, thermodynamics, electrodynamics, London equation, Pippard theory,

Ginzburg-Landau theory and -equations, flux quantization, magnetic properties of type I and II superconductors, BCS theory, tunnel effects

with superconductors, Josephson effects, superconducting quantum interference devices (SQUID), introduction to high-Tc superconductivity.

Objective
Introduction to the most important aspects of superconductivity

Content
This lecture course provides an introduction to superconductivity, covering both experimental as well as theoretical aspects. The following

subtopics are discussed: occurrence of superconductivity, basic phenomena, thermodynamics, electrodynamics, London equation, Pippard

theory, Ginzburg-Landau theory, Ginzburg-Landau equations, flux quantization, magnetic properties of type I and II superconductors, BCS

theory, tunnel effects with superconductors, Josephson effects, superconducting quantum interference devices (SQUID), short introduction to

high-Tc superconductivity.

Literature
M. Tinkham "Introduction to Superconductivity"

P. G. de Gennes "Superconductivity Of Metals And Alloys"

A. A. Abrikosov "Fundamentals of the Theory of Metals"

Prerequisites / notice

The preceding attendance of the scheduled lecture courses Introduction to Solid State Physics and Quantum Mechanics I are expected.

402-0674-00L

Physics in Medical Research: From Atoms to Cells

W 6 credits 2V+1U B. K. R. Müller

Abstract
Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For

quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple

metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning

tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining

the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is

characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the

mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's

shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena

are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need
to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic

excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy

electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from

ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism

and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical

implants and the determination of tissue's anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to

quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell

proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly

porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

227-1037-00L

Introduction to Neuroinformatics

W 6 credits 2V+1U K. A. Martin, M. Cook, V. Mante, M. Pfeiffer

Abstract
The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties

(action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and

behavior will be explained. Some artificial systems (robot, chip) are presented.

Objective
Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can

contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the

monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the

enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to

discovering solutions.
This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

401-3531-00L  Differential Geometry I  W  10 credits  4V+1U  M. Burger

Abstract
This course is an introduction to differential and riemannian geometry.

Objective
The aim is to lead students from a reasonable knowledge of advanced calculus, basic knowledge of general topology and solid knowledge of linear algebra to fundamental knowledge of differentiable manifolds and their basic tools. Riemannian geometry, some basic Lie theory, and de Rham cohomology will be developed as applications.

Literature
W. Boothby “An introduction to differentiable manifolds and Riemannian geometry”
J. M. Lee “Introduction to smooth manifolds”
M. P. Do Carmo “Riemannian Geometry”

401-3461-00L  Functional Analysis I  W  10 credits  4V+1U  D. A. Salamon

Abstract
Baire category; Banach and Hilbert spaces, bounded linear operators; Three Fundamental Principles: Uniform Boundedness, Open Mapping/Closed Graph, Hahn-Banach; Convexity; Dual Spaces: weak and weak* topologies, Banach-Alaoglu, reflexive spaces; Ergodic Theorem; compact operators and Fredholm theory, Closed Image Theorem; Spectral theory, self-adjoint operators.

Literature
W. D. Blair “Riemannian Geometry”

401-3601-00L  Probability Theory  W  10 credits  4V+1U  A. S. Sznitman

Abstract
Basics of probability theory and the theory of stochastic processes in discrete time

Objective
This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:
Basics in measure theory, random series, law of large numbers, weak convergence, characteristic functions, central limit theorem, conditional expectation, martingales, convergence theorems for martingales, Galton Watson chain, transition probability, Theorem of Ionescu Tulcea, Markov chains.

Content
This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:
Basics in measure theory, random series, law of large numbers, weak convergence, characteristic functions, central limit theorem, conditional expectation, martingales, convergence theorems for martingales, Galton Watson chain, transition probability, Theorem of Ionescu Tulcea, Markov chains.

Number of participants limited to 30.

Abstract
This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Objective
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice
This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

<table>

Number of participants limited to 30.

Abstract
The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

<table>

Abstract
Literature from the learning sciences is critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and two further meetings will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

Objective
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

Simultaneous enrolment in Introductory Internship Physics - course 402-0920-00L - is compulsory for Teaching Diploma Physic

Objective
Die Studierenden verfügen über fachdidaktisches Grundwissen für den Physikunterricht an einer Mittelschule. Sie können eigene Lektionen unter Berücksichtigung der vielfältigen Rahmenbedingungen planen, durchführen und evaluieren. Sie reflektieren ihren Unterricht und sind bestrebt, ihn didaktisch und pädagogisch weiter zu entwickeln.

Die Studierenden kennen die Einsatzmöglichkeiten, Chancen und Schwierigkeiten verschiedener Unterrichtsmethoden und Hilfsmittel. Sie können die Eignung von Unterrichtsformen im Hinblick auf eine Lernsituation beurteilen. Sie bemühen sich in ihrem Unterricht, geeignete Methoden und Medien angepasst an die Klasse und das Thema einzusetzen.

Themenatische Schwerpunkte
Fachspezifisches: Sachstrukturen der gängigen Unterrichtsthemen, Alltagsbeziehungen, Fehlvorstellungen, Demonstrations- und Schülerexperimente, Arbeitsmittel zu physikalischen Themen des Grund- und Schwerpunktunterrichts
Einsatz verschiedener Unterrichtsmaterialien: Experimente, Computer, Taschenrechner, Video, Simulation Unterrichtsformen: Lernaufgabe, Werkstatt, Puzzle, Projekt, Gruppenarbeit, Praktikum
Lernformen
Interaktive Lehr-Lernveranstaltung mit Vorträgen und Demonstrationen des Dozenten, studierender Einzel- und Kleingruppenarbeit, kurzen Präsentationen der Studierenden, Verpflichtung der Inhalte durch Bearbeitung von Aufträgen ausserhalb der Kontakttstunden

402-0915-00L  Teaching Internship Including Examination Lessons
O  4 credits  9P  M. Mohr

Abstract
Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Objective
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content

402-0917-00L  Mentored Work Subject Didactics Physics A
O  2 credits  4A  G. Schiltz, A. Vaterlaus, C. Wagner

Abstract
In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

Objective
The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Content
Thematic Focus
The topics of the mentored work are mostly chosen from the high school curriculum.

Methods
With the help of the mentor the students individually work on a topic and write a thesis about it.

Specialized Courses in Respective Subject with Educational Focus

Abstract
The energy and related environmental problems, the physics principles of using energy and the various real and hypothetical options are discussed from a physicist point of view. The lecture is intended for students of all ages with an interest in a rational approach to the energy problem of the 21st century.

Objective
Scientists and especially physicists are often confronted with questions related to the problems of energy and the environment. The lecture tries to address the physical principles of todays and tomorrow energy use and the resulting global consequences for the world climate.

The lecture is for students which are interested participate in a rational and responsible debate about the energyproblem of the 21. century.
Content

Introduction: energy types, energy carriers, energy density and energy usage. How much energy does a human needs/uses?

Energy conservation and the first and second law of thermodynamics

Fossil fuels (our stored energy resources) and their use.

Burning fossil fuels and the physics of the greenhouse effect.

Physics basics of nuclear fission and fusion energy

Controlled nuclear fission energy today, the different types of nuclear power plants, uranium requirements and resources, natural and artificial radioactivity and the related waste problems from the nuclear fuel cycle.

Nuclear reactor accidents and the consequences, a comparison with risks from other energy using methods.

The problems with nuclear fusion and the ITER project.

Nuclear fusion and fission: "exotic" ideas.

Hydrogen as an energy carrier: ideas and limits of a hydrogen economy.

New clean renewable energy sources and their physical limits (wind, solar, geothermal etc)

Energy perspectives for the next 100 years and some final remarks

402-0922-00L Mentored Work Specialised Courses in Physics with an Educational Focus A

Mentored Work Specialised Courses in the Respective Subject with an Educational Focus in Physics for TC and Teaching Diploma.

Abstract

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

Objective

Practice in the explanation of complex topics in physics as the core competence of the teaching profession

Content

Improvement of the physics education by providing attractive recent topics with regard to future curricular decisions and the public view of physics

402-0944-00L Science in School (Current Topics for the Classroom)

Enrolment in Physics Didactics I (402-0910-00L) and Physics Didactics II (402-0910-00L) is mandatory.

Content

Kennenlernen und erarbeiten (Übungen) von Unterrichtsssequenzen zu modernen Themen der Physik.

Special students and auditors need special permission from the lecturers.
The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting in teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturers in this course. Basic conceptual and methodological issues are the topic of a series of plenary meetings; however, the major part of the work is done in small-group meetings with the advising researcher, and in self-directed research projects.

Prerequisites / notice
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungsetermin ersucht.

**Physics Teaching Diploma**

The programme "Teaching Diploma, Two Subjects in One-Step Procedure" will not be offered anymore since Autumn Semester 2010. Therefore new matriculations are no longer possible. The courses offered below are valid only for students who have registered before.

**Detailed information on the programme at: www.didaktischeausbildung.ethz.ch**

> Physics as First Subject

<td></td>
</tr>
<tr>
<td></td>
<td>In teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturers in this course. Basic conceptual and methodological issues are the topic of a series of plenary meetings; however, the major part of the work is done in small-group meetings with the advising researcher, and in self-directed research projects.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Objective</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The course is targeted at advanced students who have taken an interest in gathering practical research experience in the field of Learning &amp; Instruction. In teams of two, students conduct their own research projects (planning, conducting, analyzing, interpreting, and presenting research); thus, the course requires a high amount of self-directed working. Students are personally advised, and supported in their research project, by one of the researchers serving as lecturers in this course. During the first half the semester, relevant methodological knowledge and skills are practiced during plenary meetings and in students’ independent reading (e.g. generating and testing research questions, designing experiments, and analyzing data in the field of Learning and Instruction)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Learning goals include:</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can illustrate and explain basic methods and concepts for research in the fields of Learning and Instruction, e.g. with the help of practical examples.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can generate testable research questions for a topic relevant in the fields of Learning and Instruction.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can design and conduct a study that is relevant for answering their research question.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can summarize and evaluate the main results from a study in the field of learning and Instruction, with regard to the research question being asked.</td>

Simultaneous enrolment in Introductory Internship Physics - course 402-0920-00L - is compulsory for Teaching Diploma Physic

Objective

Content

Thematische Schwerpunkte

Fachspezifisches: Sachstrukturen der gängigen Unterrichtsthemen, Alltagsbezüge, Fehlvorstellungen, Demonstrations- und Schülerexperimente, Arbeitsmittel zu physikalischen Themen des Grundlagen- und Schwerpunktsunterrichts

Einsatz verschiedener Unterrichtsmaterialien: Experimente, Computer, Taschenrechner, Video, Simulation

Unterrichtsformen: Lernaufgabe, Werkstatt, Puzzle, Projekt, Gruppenarbeit, Praktikum

Lernformen

Interaktive Lehr-Lernveranstaltung mit Vorträgen und Demonstrationen des Dozenten, studentischer Einzel- und Kleingrupenarbeit, kurzen Präsentationen der Studierenden, Vertiefung der Inhalte durch Bearbeitung von Aufträgen ausserhalb der Kontaktpausen

Lecture notes

Foliendrucke und weitere Unterlagen werden zur Verfügung gestellt

Literature

Die Veranstaltung ist zusammen mit dem Einführungspraktikum zu belegen

Prerequisites / notice

Four credits

Methods

With the help of the mentor the students individually work on a topic and write a thesis about it.

Abstract

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

Objective

The objective is for the students:

- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.

- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Content

Thematic Focus

The topics of the mentored work are mostly chosen from the high school curriculum.

Methods

With the help of the mentor the students individually work on a topic and write a thesis about it.

Content

Focus of content

The topics of the mentored work are mostly chosen from the high school curriculum.

Methods

With the help of the mentor the students individually work on a topic and write a thesis about it.
The teaching practice takes in 50 lessons: 30 are taught by the students, and the students sit in on 20 lessons. The teaching practice lasts 2P.

The teaching practice (Einführungspraktikum) offers an insight into the working life of a teacher to students. The Aufbaupraktikum addresses students who already hold the Didaktik certificate in their field and are now pursuing the Master of Advanced Studies in Secondary and Higher Education. In this additional internship, they gain experience in the didactic aspects they have acquired during their training, in the subject-matter and subject-didactics field.

In order to prepare for the Examination Lesson II, the candidates provide evidence of their subject-matter-based and didactic skills they acquired in the course of their training. A teaching internship (Teaching Internship Physics) is compulsory. Simultaneous enrolment in "Examination Lesson I Physics" (402-0921-01L) is compulsory. Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching. They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils. They acquire the skills of the teaching trade. They propose the balance between instruction and openness so that pupils can, and, indeed, must make their own cognitive contribution. They learn to assess pupils' work. Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

The course and grades of the students are evaluated by the Praktikumslehrperson. The evaluation is based on the criteria the teacher has defined and is aimed at evaluating the students' preparation for their future careers as teachers. The students are also evaluated on the basis of the assignments they complete during their training. The schriftlich dokumentierten Ergebnisse der Arbeitsaufträge sind Bestandteil des Portfolios der Studierenden.

The didactic internship course is optional. The didactic internship (Teaching Internship Physics for Teaching Diploma) is required for students upgrading TC to Teaching Diploma.

In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of their subject-matter-based and didactic skills they have acquired in the course of their training.

The candidates show that they are in a position to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle.

The candidates analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Subject didactics training.

The students also conduct work assignments in parallel to their teaching practice.

**Title**

Energy and Environment in the 21st Century (Part I)

**Type**

W

**ECTS**

6

**Hours**

2V+1U

**Lecturers**

M. Dittmar

**Abstract**

The energy and related environmental problems, the physics principles of using energy and the various real and hypothetical options are discussed from a physicist point of view. The lecture is intended for students of all ages with an interest in a rational approach to the energy problem of the 21st century.

**Objective**

Scientists and espially physicists are often confronted with questions related to the problems of energy and the environment. The lecture tries to address the physical principles of todays and tomorrow energy use and the resulting global consequences for the world climate.

The lecture is for students which are interested participate in a rational and responsible debate about the energyproblem of the 21. century.

**Content**

Introduction: energy types, energy carriers, energy density and energy usage. How much energy does a human needs/uses?

Energy conservation and the first and second law of thermodynamics

Fossil fuels (our stored energy resources) and their use.

Burning fossil fuels and the physics of the greenhouse effect.

physics basics of nuclear fission and fusion energy

controlled nuclear fission energy today, the different types of nuclear power plants, uranium requirements and resources, natural and artificial radioactivity and the related waste problems from the nuclear fuel cycle.

Nuclear reactor accidents and the consequences, a comparison with risks from other energy using methods.

The problems with nuclear fusion and the ITER project.

Nuclear fusion and fission: ”exotic” ideas.

Hydrogen as an energy carrier: ideas and limits of a hydrogen economy.

new clean renewable energy sources and their physical limits (wind, solar, geothermal etc)

Energy perspectives for the next 100 years and some final remarks

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 1143 of 1432

Prerequisites / notice

402-0922-00L Mentored Work Specialised Courses in Physics with an Educational Focus A W 2 credits 4A G. Schiltz, A. Vaterlaus, C. Wagner

Mentored Work Specialised Courses in the Respective Subject with an Educational Focus in Physics for TC and Teaching Diploma.

Abstract

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

Objective

Practice in the explanation of complex topics in physics as the core competence of the teaching profession

Content

Choice of topic by individual arrangement

402-0923-00L Mentored Work Specialised Courses in Physics with an Educational Focus B W 2 credits 4A G. Schiltz, A. Vaterlaus, C. Wagner

Mentored Work Specialised Courses in the Respective Subject with an Educational Focus in Physics for Teaching Diploma and for students upgrading TC to Teaching Diploma.

Compulsory Elective Courses

Further course offerings from the category Educational Science are listed under “Programme: Educational Science for Teaching Diploma and TC”.

Teaching Diploma in 2 Subjects in One-Step Procedure:
a) the course 402-0904-00L "Professional Exercises: Experiments in physics teaching" (takes place in Spring Semester only) must be completed within the category Compulsory Elective Courses;
b) courses from the category Compulsory Elective Courses of the Minor Subject may also be selected;
c) courses from the category Specialized Courses in the Respective Subject, either of the Major or the Minor Subject, may also be selected.

Physicists learned to realize that whether they like a theory or they don't like a theory is not the essential question. Rather, it's whether or not the theory gives predictions that agree with experiment.
Richard Feynman, 1985

402-0944-00L Science in School (Current Topics for the Classroom) W 2 credits 2G C. Wagner, A. Vaterlaus

402-0855-00L Computer Science in Secondary School Mathematics W 4 credits 3G J. Hromkovic, G. Serafini

Abstract
The unit "Computer Science in Secondary School Mathematics" addresses key contributions of computer science to general education, the tight relations between the algorithmic and the mathematical way of thinking, and the thoughtful choice of computer science topics for high school mathematics classes.
The general goal of the course consists in presenting ways to teach fundamentals of computer science, which are closely related to contents and methods of mathematics. After attending the course unit, a mathematics teacher is able to teach selected fundamentals of computer science in mathematics classes.
The students understand the fundamental concepts of computer science in the context of a broad and deep knowledge. Through this understanding, they manage to prepare teaching materials for a successful knowledge transfer and to pass their passion for the subject on to their pupils.
The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners inside a class. Besides holding classes, the students do care about the individual pupil support.
They encourage the autonomy of the learners, manage to work with diverse target groups and to establish a positive learning environment.
The students are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.
The main topics of the course unit "Computer Science in Secondary School Mathematics" represent a scientific and didactic added value for mathematics classes.

The course covers the didactics of logic, of cryptography, of finite state automata, of computability and of the introduction to programming. The students develop the understanding of fundamental scientific concepts such as algorithm, program, complexity, determinism, computation, automata, verification, testing, security of a cryptosystem and secure communication. They reflect on ways to embed them into a scientifically sound and didactically sustainable mathematics course.

In a semester exercise, the students develop an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

Teaching Internship Including Examination Lessons

Physics

Teaching Internship Physics for TC and Teaching Diploma Physics as Minor Subject.

Repetition of the Teaching Internship is excluded even if Examination Lessons are to be repeated.

Abstract

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Objective

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content

Die Themen für die beiden Prüfungslektionen am Schluss des Praktikums erfahren die Studierenden in der Regel eine Woche vor dem Prüfungstermin. Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie bis am Vortrag um 12 Uhr den beiden Prüfungsexperten (Fachdidaktiker/-in, Departementsvertreter/-in) ein. Die gehaltenen Lektionen werden kriteriumsbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltenen Lektionen im Rahmen eines kurzen Kolloquiums.

Lecture notes

Dokument: schriftliche Vorbereitung für Prüfungslektionen.

Literature

Wird von der Praktikumslehrperson bestimmt.

Special students and auditors need special permission from the lecturers.
One Core Course in Experimental or Theoretical Physics from Physics Bachelor is eligible; however, this Core Course from Physics Bachelor cannot be used to compensate for the mandatory Core Course in Experimental or Theoretical Physics.

For the category assignment keep the choice “no category” and take contact with the Study Administration Office (www.phys.ethz.ch/phys/education/studiensekretariat/?lang=en) after having received the credits.

Content

- Today's challenges and opportunities in Solid State Physics

- Phase transitions and critical phenomena
  - Main concepts: coherence length, symmetry, order parameter, correlation functions, generalized susceptibility
  - Bragg-Williams mean field theory
  - Landau theory of phase transitions
  - Fluctuations in Landau theory
  - Critical exponents: significance, measurement, inequalities, equalities
  - Scaling and hyperscaling
  - Universality
  - Critical dynamics
  - Quantum phase transitions and quantum criticality

- Fermi surface instabilities
  - The concept of the Landau Fermi liquid in metals
  - Kohn anomalies
  - Charge density waves
  - Metallic ferromagnets and half-metals
  - Spin density waves

- Magnetism of insulators
  - Magnetic interactions in solids and the spin Hamiltonian
  - Magnetic structures and phase transitions
  - Spin waves
  - Quantum magnetism

- Electron correlations in solids
  - Mott insulating state
  - Phases of the Hubbard model
  - Layered cuprates (non-superconducting properties)

Lecture notes

The printed material for this course involves: (1) a self-contained script, distributed electronically at semester start. (2) experimental examples (Power Point slide-style) selected from original publications, distributed at the start of every lecture.

Literature

A list of books will be distributed. Numerous references to useful published scientific papers will be provided.

Prerequisites / notice

This course is for students who like to be engaged in active learning. The "exercise classes" are organized in a non-traditional way: following the idea of "less is more", we will work on only about half a dozen topics, and this gives students a chance to take a look at original literature (provided), and to get the grasp of a topic from a broader perspective.

Students report back that this mode of "exercise class" is more satisfying than traditional modes, even if it does not mean less effort.

402-0442-00L Quantum Optics W 10 credits 3V+2U T. Esslinger

Abstract

This course gives an introduction to the fundamental concepts of Quantum Optics and will highlight state-of-the-art developments in this rapidly evolving discipline. The topics covered include:

- coherence properties of light
- quantum nature of light: statistics and non-classical states of light
- light matter interaction: density matrix formalism and Bloch equations
- quantum description of light matter interaction: the Jaynes-Cummings model, photon blockade
- laser manipulation of atoms and ions: laser cooling and trapping, atom interferometry,
- further topics: Rydberg atoms, optomechanics, quantum computing, complex quantum systems.

Lecture notes

Selected book chapters will be distributed.

Abstract

Ultrafast processes in solids are of fundamental interest as well as relevant for modern technological applications. The dynamics of the lattice, the electron gas as well as the spin system of a solid are discussed. The focus is on time resolved experiments which provide insight into pico- and femtosecond dynamics.

Objective

After attending this course you understand the dynamics of essential excitation processes which occur in solids and you have an overview over state of the art experimental techniques used to study fast processes.

Content

1. Experimental techniques, an overview
2. Dynamics of the electron gas
   2.1 First experiments on electron dynamics and lattice heating
   2.2 The finite lifetime of excited states
   2.3 Detection of lifetime effects
   2.4 Dynamical properties of reactions and adsorbents
3. Dynamics of the lattice
   3.1 Phonons
   3.2 Non-thermal melting
4. Dynamics of the spin system
   4.1 Laser induced ultrafast demagnetization
   4.2 Ultrafast spin currents generated by lasers
   4.3 Landau-Lifschitz-Dynamics
   4.4 Laser induced switching
5. Correlated materials

Lecture notes

will be distributed

Literature

relevant publications will be cited

Prerequisites / notice

The lecture can also be followed by interested non-physics students as basic concepts will be introduced.

This lecture is complementary to the lecture on "ultrafast methods for solid state physics" of the spring semester. Both lectures can be attended independently. The focus of this lecture is on the physical processes whereas the focus of the "ultrafast methods for solid state physics" lecture is on the experimental techniques.

402-0535-00L | Introduction to Magnetism | W    | 6    | 2V+1U     | D. Pescia, A. Vindigni     |

Abstract

Atomic paramagnetism and diamagnetism, intra- and inter-atomic exchange, Stoner model, RKKY exchange interaction, Ising and Heisenberg models, the mean field approximation, spin waves, magnetic phase transition, domains and domain walls, dynamical aspects

Content

The lecture "Introduction to Magnetism" is the regular course on Magnetism for the Master curriculum of the Department of Physics of ETH Zurich. With respect to the similar lecture course in previous semesters we have decided that we need to insist on the fundamental aspects of magnetism -- the Quantum mechanical aspects on one side and the statistical physics aspects on the other, which are often not comprehensively spelled out in conventional lectures on solid state physics.

The preliminary Content of the lecture in this semester is the following:
- Magnetism in Atoms (the role of magnetism in classical physics, the quantum mechanics of atoms, exchange interaction)
- These two chapters will be given by D. Pescia. They will give, for instance, the opportunity of revising with concrete examples the subjects related to spin physics that have been treated at a theoretical level in Quantum Mechanics I and Quantum Mechanics II.
- Magnetic order at finite temperatures (Ising and Heisenberg models, mean field approximation, phase transitions, low-dimensional magnetism)
- Topological excitations (domains, domain walls, magnetic anisotropy, dipolar interaction)
- Spin Physics in the time Domain
- These three Chapters will be given by A. Vindigni and are an essential introduction to more specialized Topics given in selected lectures, such as the one by R. Allenspach in FS16.

Lecture notes

A manuscript is made available.

Prerequisites / notice

The former title of this course unit was "Fundamental Aspects of Magnetism". This lecture insists on the fundamental aspects -- Quantum physics and statistical physics of magnetism. Applications to nanoscale magnetism will be discussed within this fundamental Approach.

402-0595-00L | Semiconductor Nanostructures | W    | 6    | 2V+1U     | T. M. Ihn                   |

Abstract

The course covers the foundations of semiconductor nanostructures, e.g., materials, band structures, bandgap engineering and doping, field-effect transistors. The physics of the quantum Hall effect and of common nanostructures based on two-dimensional electron gases will be discussed, i.e., quantum point contacts, Aharonov-Bohm rings and quantum dots.

Objective

At the end of the lecture the student should understand four key phenomena of electron transport in semiconductor nanostructures:
1. The integer quantum Hall effect
2. Conductance quantization in quantum point contacts
3. the Aharonov-Bohm effect
4. Coulomb blockade in quantum dots
### Content

1. Introduction and overview
2. Semiconductor crystals: Fabrication and band structures
3. k.p-theory, effective mass
4. Envelope functions and effective mass approximation, heterostructures and band engineering
5. Fabrication of semiconductor nanostructures
6. Electrostatics and quantum mechanics of semiconductor nanostructures
7. Heterostructures and two-dimensional electron gases
8. Drude Transport
9. Electron transport in quantum point contacts; Landauer-Büttiker description
10. Ballistic transport experiments
11. Interference effects in Aharonov-Bohm rings
12. Electron in a magnetic field, Shubnikov-de Haas effect
13. Integer quantum Hall effect
14. Coulomb blockade and quantum dots

### Lecture notes

- In addition to the lecture notes, the following supplementary books can be recommended:

### Prerequisites / notice

The course is taught in English.

**Objective**

A comprehensive understanding of the interaction of x-rays with condensed matter and their use in materials analysis; acquiring hands-on experience with the use of synchrotron radiation.

**Content**

Interaction of x-rays with matter:
- Elastic scattering from bound electron, atom and assemblies of atoms; Compton scattering; principles of diffraction from crystals and scattering from disordered systems; thermal diffuse scattering, small-angle scattering from nanometre-sized objects; X-ray absorption spectroscopy; microscopy; comparison with neutron scattering, where appropriate.

The generation of high-brilliance x-ray beams at synchrotron radiation sources:
- Undulators, wigglers and bending magnets; comparison with conventional lab sources; the future x-ray free electron laser.

**Instrumentation:**
- Monochromator; diffractometer; detector.

**Determination of materials properties:**
- Crystal structure; defects and strain fields; structure of surfaces and interfaces; chemical bonding properties.

**New methods:**
- Coherent x-ray scattering and diffractive imaging.

**Literature**

- The lab course has been designed by J. Als-Nielsen in collaboration with staff from the SLS.

**Prerequisites / notice**

Part of the course is in the form of practical work at the Swiss Light Source. During two days (dates to be agreed), the following experiments will be performed: (1) elastic and Compton scattering, (2) liquid scattering and powder diffraction, and (4) X-ray absorption spectroscopy.

**402-0313-00L / 402-0314-00L**

**Semiconductor Materials: Fundamentals and Fabrication**

**Abstract**

This course gives an introduction into the fundamentals of semiconductor materials. The main focus is on state-of-the-art fabrication and characterization methods. The course will be continued in the spring term with a focus on applications.

**Objective**

Basic knowledge of semiconductor physics and technology. Application of this knowledge for state-of-the-art semiconductor device processing.

**Content**

- Fundamentals of Solid State Physics: Semiconductor materials, band structures, carrier statistics in intrinsic and doped semiconductors, p-n junctions, low-dimensional structures;
- Bulk Material growth of Semiconductors: Czochralski method, floating zone method, high pressure synthesis;
- Semiconductor Epitaxy: Fundamentals, MBE, MOCVD, LPE;
- In situ characterization: RHEED, LEED, AES, XPS, process control (temperature, thickness)

**Lecture notes**

**402-0543-00L**

**Neutron Scattering in Solid State Physics**

**Abstract**

Introduction to neutron scattering: quantum-mechanical description in terms of correlation functions. Principles of neutron instrumentation. Applications to basic problems of solid state physics: diffraction from crystals, lattice dynamics, scattering by liquids, magnetic structures and magnetic excitations.

**Objective**

Derivation and comprehension of neutron scattering cross sections, principles of neutron instrumentation, and applications (lecture and exercises) to basic problems of solid state physics: static and dynamics of condensed matter, magnetic structures as well as magnetic excitations.
The course aims to give students the ability to follow and explain on a conceptual level the ways in which accelerator-based facilities

Abstract
Ultrashort pulse generation, few-cycle pulses, frequency combs, ultrafast measurement techniques
Objective
This lecture will introduce students to active ongoing research topics and provide their fundamental background.
Terahertz frequency electromagnetic radiation lies at the border between electronics and optics, and as such has many unique properties

Dispersion and dispersion compensation, linear and nonlinear pulse propagation, relaxation oscillations, Q-switching, modelocking, pulse diagnostics, pulse generation in the few-optical-cycle regime (i.e. around 5 fs in the near infrared wavelength regime), carrier-envelope offset control and frequency combs, ultrafast measurement techniques (pump-probe measurements, time-resolved four-wave mixing, THz-Spectroscopy, optical coherence tomography), hot topics such as attosecond pulse generation and supercontinuum generation.

Although many lectures will follow the course texts, significant deviations will be distributed as a script.

Physics and design of particle accelerators.

1. Examples of modern experiments

3V+1U

Successful students know:

- experimental methods to measure cosmic ray particles over full energy range
- current knowledge about the composition of cosmic ray
- possible cosmic acceleration mechanisms
- correlation between astronomical object classes and cosmic accelerators
- information about our galaxy and cosmology gained from observations of cosmic ray

This course gives a practical overview over the generation of THz frequency electromagnetic radiation and over the applications of this radiation in a variety of fields, both scientific and industrial.

Terahertz frequency electromagnetic radiation lies at the border between electronics and optics, and as such has many unique properties that make it well-suited to study the electronic, magnetic and structural properties of many materials. The course objective is to give students the ability to identify problems that can be addressed using terahertz frequency radiation and to design (on a conceptual level) a way to implement solutions to these problems. These "problems" include both scientific (in physics, chemistry and biology) and industrial (medicine, pharmaceuticals, security) areas.

On the scientific side the applications of THz relate to understanding the electronic, structural and magnetic properties of materials by studying the optical response at low frequencies without the need for physical contact with the sample. The industrial applications tend to be more related imaging (e.g. THz-based airport scanners), but also some spectroscopy is done to identify materials.

Topics to be discussed in the class include:

1) Overview of THz & interactions with matter
2) THz generation methods
3) THz optics and electronics
4) THz detection methods
5) THz applications
   - a) Spectroscopy
   - b) Imaging

Although many lectures will follow the course texts, significant deviations will be distributed as a script.

The readings for the course will be selected from several different texts. All of these are available electronically via the ETH library system.

You can also order a black-and-white paperback via an "on-demand" system for a pretty reasonable price.

Principles of Terahertz Science and Technology, Yun-Shick Lee (Springer, 2008). More of a focus on basic principles, many of the readings will come from this book.

Introduction to THz Wave Photonics, Xi-Cheng Zhang and Jingzhou Xu (Springer, 2010). Fairly good overview, also good description of applications.

Quantum electronics.

Terahertz Technology and Applications

This lecture gives an overview of the present research in the field of Astro-Particle Physics, including the different experimental techniques. In the first semester, main topics are the charged cosmic rays including the antimatter problem. The second semester focuses on the neutral components of the cosmic rays as well as on some aspects of Dark Matter.
The course aims to provide an introduction to selected advanced topics in low energy particle physics with neutrons and muons. Besides the sensitivity to effects related with new physics (e.g. lepton flavor violation, symmetry violations, CPT tests, search for electric dipole moments, new low mass exchange bosons etc.), low energy physics provides the best test of QED (electron g-2), the best tests of bound-state QED (atomic physics and exotic atoms), precise determinations of fundamental constants, information about the CKM matrix, precise information on the weak and strong force even in the non-perturbative regime etc.

In this lecture, we will concentrate on selected experiments, using mainly neutrons and muons, which have significantly improved our understanding of particle physics today. Starting from a general introduction on high intensity/high precision particle physics and the main characteristics of muons and neutrons and their production, we will then focus on the discussion of fundamental problems and ground-breaking experiments:

- Production and characteristics of muon and neutron beams
- Ultracold neutron production
- Measurement of the neutron lifetime and electric dipole moment
- The neutron in the gravitational field and its electric charge
- Muon and neutron decay correlations
- Lepton flavour violations with muons to search for new physics
- What atomic physics can do for particle physics and vice versa
- Laser experiments at accelerators
- From myonic hydrogen to the proton structure and bound-state QED
- From pionic hydrogen to the strong interaction and effective field theories
- etc.

Besides the sensitivity to effects related with new physics (e.g. lepton flavor violation, symmetry violations, CPT tests, search for electric dipole moments, new low mass exchange bosons etc.), low energy physics provides the best test of QED (electron g-2), the best tests of bound-state QED (atomic physics and exotic atoms), precise determinations of fundamental constants, information about the CKM matrix, precise information on the weak and strong force even in the non-perturbative regime etc.

In this lecture, we will concentrate on selected experiments, using mainly neutrons and muons, which have significantly improved our understanding of particle physics today. Starting from a general introduction on high intensity/high precision particle physics and the main characteristics of muons and neutrons and their production, we will then focus on the discussion of fundamental problems and ground-breaking experiments:

402-0851-00L QCD: Theory and Experiment

Abstract
An introduction to the theoretical aspects and experimental tests of QCD, with emphasis on perturbative QCD and related experiments at colliders.

Objective
Knowledge acquired on basics of perturbative QCD, both of theoretical and experimental nature. Ability to perform simple calculations of perturbative QCD, as well as to understand modern publications on theoretical and experimental aspects of perturbative QCD.

Content
- QCD Lagrangian and Feynman Rules
- QCD running coupling
- Parton model
- Altarelli-Parisi equations
- Basic processes
- Experimental tests at lepton and hadron colliders
- Measurements of the strong coupling constant

Literature
2) R. K. Ellis, W. J. Stirling, B. R. Webber: "QCD and Collider Physics" (Cambridge Monographs on Particle Physics, Nuclear Physics & Cosmology)

Prerequisites / notice
This lecture is also suited for PhD. students.

402-0737-00L Energy and Environment in the 21st Century (Part I)

Abstract
The energy and related environmental problems, the physics principles of using energy and the various real and hypothetical options are discussed from a physicist point of view. The lecture is intended for students of all ages with an interest in a rational approach to the energy problem of the 21st century.

Objective
Scientists and especially physicists are often confronted with questions related to the problems of energy and the environment. The lecture tries to address the physical principles of today's and tomorrow's energy use and the resulting global consequences for the world climate. The lecture is for students which are interested to participate in a rational and responsible debate about the energy problem of the 21st century.

Content
- Introduction: energy types, energy carriers, energy density and energy usage. How much energy does a human need/use?
- Energy conservation and the first and second law of thermodynamics
- Fossil fuels (our stored energy resources) and their use.
- Burning fossil fuels and the physics of the greenhouse effect.
- Physics basics of nuclear fission and fusion energy
- Controlled nuclear fission energy today, the different types of nuclear power plants, uranium requirements and resources, natural and artificial radioactivity and the related waste problems from the nuclear fuel cycle.
- Nuclear reactor accidents and their consequences, a comparison with risks from other energy using methods.
- The problems with nuclear fusion and the ITER project.
- Nuclear fusion and fission: "exotic" ideas.
- Hydrogen as an energy carrier: ideas and limits of a hydrogen economy.
- New clean renewable energy sources and their physical limits (wind, solar, geothermal etc)
- Energy perspectives for the next 100 years and some final remarks

Lecture notes
many more details (in english and german) here:
http://ihp-lx2.ethz.ch/energy21/

Literature

Environmental Physics: Boeker and Egbert New York Wiley 1999

Prerequisites / notice
Will be given as block course, language: English.
For students of both ETH and University of Zurich.
### 402-0883-63L Symmetries in Physics

**Type**: W  **ECTS**: 6 credits  **Hours**: 2V+1U  **Lecturers**: N. Beisert

**Abstract**: The course gives an introduction to symmetry groups in physics. It will explain the relevant mathematical background (finite groups, Lie groups and algebras, etc.) and illustrate their important role in modern physics.

**Objective**: The aim of the course is to give a self-contained introduction into finite group theory as well as Lie theory from a physicists point of view. Abstract mathematical constructions will be illustrated with examples from physics.

### 402-0898-00L The Physics of Electroweak Symmetry Breaking

**Type**: W  **ECTS**: 6 credits  **Hours**: 2V+1U  **Lecturers**: not available

**Abstract**: The aim is to understand the need of physics beyond the Standard Model, the basic techniques of model building in theories BSM and the elements of collider physics required to analyze their phenomenological implications. After an introduction to the SM and alternative theories of electroweak symmetry breaking, we will investigate these issues in the context of models with warped extra dimensions.

**Objective**: After the course the student should have a good knowledge of some of the most relevant theories beyond the Standard Model and have the techniques to understand those theories that have not been surveyed in the course. He or she should be able to compute constraints on any model of new physics, its successes explaining current experimental data and its main phenomenological implications at colliders.

**Prerequisites / notice**: The former title of this course unit was “The Physics Beyond the Standard Model”. If you already got credits for “The Physics Beyond the Standard Model” (402-0898-00L), you cannot get credits for “The Physics of Electroweak Symmetry Breaking” (402-0898-00L).

### 402-0899-65L Higgs Physics

**Type**: W  **ECTS**: 6 credits  **Hours**: 2V+1U  **Lecturers**: M. Donegà, M. Grazzini

**Abstract**: The course introduces the theory and phenomenology of the recently discovered Higgs boson. With this course the students will receive a detailed introduction to the physics of the Higgs boson in the Standard Model. They will acquire the necessary theoretical background to understand the main production and decay channels of the Higgs boson at high-energy colliders, and the corresponding experimental results.

**Objective**: With this course the students will receive a detailed introduction to the physics of the Higgs boson in the Standard Model. They will acquire the necessary theoretical background to understand the main production and decay channels of the Higgs boson at high-energy colliders, and the corresponding experimental signatures.

**Content**: Theory part:
- the Standard Model and the mass problem: WW scattering and the no-lose theorem
- the Higgs mechanism and its implementation in the Standard Model
- radiative corrections and the screening theorem
- the hierarchy problem
- Higgs production in e+e- collisions
- Higgs production at hadron colliders
- Higgs decays to fermions and vector bosons
- Higgs differential distributions, rapidity distribution, pt spectrum and jet vetoes
- Higgs properties and beyond the Standard Model perspective
- Outlook: The Higgs sector in weakly coupled and strongly coupled new physics scenarios.

Experimental part:
* Introductory material:
  - reminders of detectors/accelerators
  - reminders of statistics: likelihoods, hypothesis testing
  - reminders of multivariate techniques: Neural Networks, Decision Trees
* Main topics:
  - pre-history (pre-LEP)
  - LEP1: measurements at the Z-pole
  - LEP2: towards the limit mH<114 GeV
  - TeVatron searches
  - LHC:
    - main channel's overview
    - dissect on analysis
    - combine information from all channels
    - differential measurements
    - off-shell measurements
    - Future:
      -- pseudo-observables / EFT
      -- Beyond Standard Model

**Literature**: 
- Higgs Hunter's Guide (by S. Dawson, J. Gunion, H. Haber and G. Kane)
- Prerequisites: Quantum Field Theory I, Phenomenology of Particle Physics I

### 402-0849-00L Introduction to Lattice QCD

**Type**: W  **ECTS**: 6 credits  **Hours**: 2V+1U  **Lecturers**: P. De Forcrand

**Abstract**: This course offers an introduction to quantum field theories, in particular QCD, formulated on a space-time lattice. The course provides a non-perturbative, gauge-invariant regularization scheme for the Euclidean path integral. The course introduces both the theoretical background and the computational tools, like Monte Carlo simulations, used for the quantitative study of quarks and gluons.

**Objective**: To gain familiarity with the formalism of lattice field theories and their numerical simulation methods.

### 402-0461-00L Quantum Information Theory

**Type**: W  **ECTS**: 8 credits  **Hours**: 3V+1U  **Lecturers**: R. Renner

**Abstract**: The goal of this course is to introduce the foundations of quantum information theory. It starts with a brief introduction to the mathematical theory of information and then discusses the basic information-theoretic aspects of quantum mechanics. Further topics include applications such as quantum cryptography and quantum computing.

**Objective**: The course gives an insight into the notion of information and its relevance to physics and, in particular, quantum mechanics. It also serves as a preparation for further courses in the area of quantum information sciences.

### 402-0866-00L Soft Condensed Matter

**Type**: W  **ECTS**: 6 credits  **Hours**: 2V+1U  **Lecturers**: V. Geshkenbein

**Abstract**: Elasticity, Dislocation mediated melting of 2d crystals, Roughening transition, Liquid crystals (classification, elasticity, defects...), Polymers (single chain, Flory scaling, dynamics...).

**Content**: Elasticity, Dislocation mediated melting of 2d crystals, Roughening transition, Liquid crystals (classification, elasticity, defects...), Polymers (single chain, Flory scaling, dynamics...), Membranes...

### 402-0875-65L Topological Aspects of Condensed Matter Physics

**Type**: W  **ECTS**: 4 credits  **Hours**: 2G  **Lecturers**: G. M. Graf

Abstract
The course begins with some mathematical background like fibre bundles. It covers the quantum Hall effect from various perspectives (phenomenology, heuristic explanation, role of disorder, Landau Hamiltonian, Kubo formula, Chern numbers, index of a pair of projections, bulk and edge). Also discussed: Topological insulators and their indices; the Kitaev table. If time permits, quantum pumps.

Content
The course begins with some mathematical background like fibre bundles, connections, holonomy and curvature. It covers the quantum Hall effect from various perspectives (phenomenology, heuristic explanation, role of disorder, Landau Hamiltonian, Kubo formula, Chern numbers, index of a pair of projections, bulk and edge). Also discussed in a similar vein: Topological insulators and their indices; the Kitaev table. If time permits, quantum pumps.

### Selection: Astronomy

#### 402-0375-63L
**Statistical Methods in Cosmology and Astrophysics**
- **Abstract**: Statistical methods play a vital role in modern cosmology and astrophysics studies. This course will give an overview of the statistical principles and tools that are used in these fields. Topics covered will include basic probability theory, Bayesian inference, hypothesis testing, sampling and estimators.
- **Objective**: Develop an understanding of basic probability and statistical theory. Gain practical knowledge of statistical methods commonly used in cosmology and astrophysics.
- **Prerequisites / notice**: Credit or current enrollment in Astrophysics I is recommended but not required.

#### 402-0381-64L
**Hot Topics in Astrophysics**
- **Abstract**: The theme we want to discuss this year is: what do we know about the assembly of diffuse baryons into galaxies and stars, from the physics that govern the birth of new stars, out to the dark matter halos onto which baryons are accreted on cosmological timescales. Specifically, we will focus on the following two -- or, time-permitting, three -- Hot Topics in Astrophysics.
- **Objective**: The goal of this course is to understand some of the phenomena that stand in the forefront of current research in astrophysics, the physical processes behind them, and how these phenomena are observed by state-of-the-art astronomical facilities. These goals will be achieved by communal discussions, led by the students and chaired by the teachers.

#### 402-0353-63L
**Observational Techniques in Astrophysics**
- **Abstract**: The course introduces analysis techniques, the basics of astronomical instruments, real-world observational tools, data reduction strategy and software packages used in astrophysics research. The course will also include discussions of current topics in astrophysics with a focus on active galaxies. The course will include the reduction and analysis of real data from a variety of observatories.
- **Objective**: The goal is to acquaint students with the basics of a range of astrophysical observation techniques including the modern software tools needed to analyze data.
Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the fundamental principles of neural computation and to teach the conception, simulation, and physical layout of such circuits with chip design tools.

<tr>
<td>Content</td>
<td>Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on the physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.</td>

Abstract
This lecture course targets physics students and students of interdisciplinary sciences (major physics) for their education in biophysics. In this course the basics of molecular biology are presented bearing in mind the special interests of the physics students.

Objective
Basics of molecular biology and biophysics in in view of the special interest of students in physics.

Content
This lecture course targets physics students and students of interdisciplinary sciences (major physics) for their education in biophysics. In this course the basics of molecular biology are presented bearing in mind the special interests of the physics students. The topics include: properties of biological macromolecules, introduction to the genetic system of E. coli bacteria, transcription, translation, discussion of structure and function of proteins, quantitative description of enzyme function and allosteric interactions, biotechnology, introduction to optical spectroscopy, X-ray crystallography and nuclear magnetic resonance (NMR) spectroscopy of biopolymers in solution.

<td>Abstract</td>
<td>Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.</td>

<td>The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocYTE behaviour.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.</td>
<td></td>

This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are:

1. "Formation of stars" (S. Stahler and F. Palla - Wiley editions, this is the book on which about half of the classes will be based and will be available, will be sold in the course)
2. "Radiative processes in astrophysics" (R. Ribycki and A. Lightman)
3. "The Physics of Stars" (A.C. Philllips)

Prerequisites / notice
- A basic undergraduate course on probability.

### Selection: Electives at the University of Zurich

University of Zurich lecturers explicitly recommended the following courses also to physics students at ETH Zurich.

Recognition of the corresponding external ECTS credits has to be granted by the Head of Studies. Submit your request to the Study Administration Office (www.phys.ethz.ch/phys/education/studiensekretariat/?lang=en).
Objective
Acquire knowledge of main methodologies for computer-based models of astrophysical systems, the physical equations behind them, and train such knowledge with simple examples of computer programmes.

Content
1. Integration of ODE, Hamiltonians and Symplectic integration techniques, time adaptivity, time reversibility
2. Large-N gravity calculation, collisionless N-body systems and their simulation
3. Fast Fourier Transform and spectral methods in general
4. Eulerian Hydrodynamics: Upwinding, Riemann solvers, Limiters
5. Lagrangian Hydrodynamics: The SPH method
6. Resolution and instabilities in Hydrodynamics
7. Initial Conditions: Cosmological Simulations and Astrophysical Disks
8. Physical Approximations and Methods for Radiative Transfer in Astrophysics

Literature
Galactic Dynamics (Binney & Tremaine, Princeton University Press),
Computer Simulation using Particles (Hockney & Eastwood CRC press),
Targeted journal reviews on computational methods for astrophysical fluids (SPH, AMR, moving mesh)

Prerequisites / notice
Some knowledge of UNIX, scripting languages (see www.physik.uzh.ch/lectures/informatik/python/ as an example), some prior experience in programming, knowledge of C, C++ beneficial.

General Electives

Students may choose General Electives from the entire course programme of ETH Zurich - with the following restrictions: courses that belong to the first or second year of a Bachelor curriculum at ETH Zurich as well as courses from the Compulsory Electives in Humanities, Social and Political Sciences are not eligible here.

The following courses are explicitly recommended to physics students by their lecturers. (Courses in this list may be assigned to the category "General Electives" directly in myStudies. For the category assignment of other eligible courses keep the choice "no category" and take contact with the Study Administration Office (www.phys.ethz.ch/phys/education/studiensekretariat/?lang=en) after having received the credits.)

529-0433-00L Advanced Physical Chemistry: Statistical Thermodynamics

- Lecture notes: See homepage of the lecture.
- Literature: See homepage of the lecture.
- Prerequisites / notice: Chemical Thermodynamics, Reaction Kinetics, Molecular Quantum Mechanics and Spectroscopy; Mathematical Foundations (Analysis, Combinatorial Relations, Integral and Differential Calculus)

151-0163-00L Nuclear Energy Conversion

- Lecture notes: Hand-outs will be distributed. Additional literature and information on the website of the lab: https://www.ethz.ch/content/specialinterest/mavt/energy-technology/lab-of-nuclear-energy-systems/en/studium/teaching-materials/151-0163-00l-nuclear-energy-conversion.html
- Literature: Dieter Smidt: Reaktortechnik, Band 1 und Band 2, G. Braun Karlsruhe, 1971

151-0103-00L Fluid Dynamics II

- Prerequisites / notice: Analysis III, Knowledge of Fluid Dynamics I, thermodynamics of ideal gas

151-0213-00L Fluid Dynamics with the Lattice Boltzmann Method

- Lecture notes: The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations.
Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations.

During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on.

Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course).

The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microflows among others.

Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.

The course addresses mainly graduate students (MSc/PhD) but BSc students can also attend.

Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided. Selected original and review papers are provided for some of the lectures on advanced topics. Relativistic fluid dynamics; flows with phase transitions.

Selected original and review papers are provided for some of the lectures on advanced topics. Relativistic fluid dynamics; flows with phase transitions.

Selected original and review papers are provided for some of the lectures on advanced topics. Relativistic fluid dynamics; flows with phase transitions.

Content
Fundamentals of Plasmonics
- Basic electromagnetic theory
- Optical properties of metals
- Surface plasmon polaritons on surfaces
- Surface plasmon polariton propagation
- Localized surface plasmons

Applications of Plasmonics
- Waveguides
- Extraordinary optical transmission
- Enhanced spectroscopy
- Sensing
- Metamaterials

Physics I, Physics II

151-0107-20L High Performance Computing for Science and Engineering (HPCSE) I

Abstract
This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering.

Objective
Introduction to HPC for scientists and engineers
Fundamental of:
1. Parallel Computing Architectures
2. MultiCores
3. ManyCores

Content
Programming models and languages:
1. C++ threading (2 weeks)
2. OpenMP (4 weeks)
3. MPI (5 weeks)

Computers and methods:
1. Hardware and architectures
2. Libraries
3. Particles: N-body solvers
4. Fields: PDEs
5. Stochastics: Monte Carlo

227-1047-00L Consciousness: From Philosophy to Neuroscience

Abstract
This seminar reviews the philosophical and phenomenological as well as the neurobiological aspects of consciousness. The subjective features of consciousness are explored, and modern research into its neural substrate, particularly in the visual domain, is explained. Emphasis is placed on students developing their own thinking through a discussion-centered course structure.

Objective
The course's goal is to give an overview of the contemporary state of consciousness research, with emphasis on the contributions brought by modern cognitive neuroscience. We aim to clarify concepts, explain their philosophical and scientific backgrounds, and to present experimental protocols that shed light on a variety of consciousness related issues.

Content
The course includes discussions of scientific as well as philosophical articles. We review current schools of thought, models of consciousness, and proposals for the neural correlate of consciousness (NCC).

Lecture notes
None

Literature
We display articles pertaining to the issues we cover in the class on the course's webpage.

Prerequisites / notice
Since we are all experts on consciousness, we expect active participation and discussions!

151-0621-00L Microsystems Technology

Abstract
Students are introduced to the basics of micromachining and silicon process technology and will learn about the fabrication of microsystems and -devices by a sequence of defined processing steps (process flow).

Objective
Students are introduced to the basics of micromachining and silicon process technology and will understand the fabrication of microsystem devices by the combination of unit process steps (= process flow).

Content
- Introduction to microsystems technology (MST) and micro electro mechanical systems (MEMS)
- Basic silicon technologies: Thermal oxidation, photolithography and etching, diffusion and ion implantation, thin film deposition.
- Specific microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical and thermal properties, piezoelectric and piezoresitive materials.

Lecture notes
Handouts (available online)

227-0385-10L Biomedical Imaging

New course. Not to be confounded with 227-0385-00L of fall 2014.

Abstract
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

Objective
To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with Will be indicated during the lecture.

The main topics are: transport models for semiconductor devices (quantum transport, Boltzmann equation, drift-diffusion model, S. J. Ferguson, - X-ray imaging
H. Kaeslin

Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques 3G

The course aims at the understanding of the principle physics of modern semiconductor devices, of the foundations in the physical Lecture notes and handouts

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on Know how to design digital VLSI circuits that are safe, testable, durable, and make economic sense.

This second course in our VLSI series is concerned with how to turn digital netlists into safe, testable and manufacturable mask layout, taking into account various parasitic effects (clock skew, metastability, ground bounce, IR-drop, electromigration, ESD, latchup). Economic aspects and management issues of VLSI projects are also addressed.

VLSI II: Design of Very Large Scale Integration Circuits

H. Kaeslin, N. Felber

7 credits

5G

This second course in our VLSI series is concerned with how to turn digital netlists into safe, testable and manufacturable mask layout, taking into account various parasitic effects (clock skew, metastability, ground bounce, IR-drop, electromigration, ESD, latchup). Economic aspects and management issues of VLSI projects are also addressed.

Objective

Know how to design digital VLSI circuits that are safe, testable, durable, and make economic sense.
Chapter 1: The Wave Equations in Nonlinear Optics

Nonlinear Optics deals with the interaction of light with material, the response of material to light and the mathematical framework to describe the phenomena. As an example we will cover fundamental phenomena such as the refractive index, the electro-optic effect, second harmonic generation, four-wave mixing or soliton propagation and others. The important nonlinear optical phenomena are understood and can be classified. The effects can be described mathematical by means of the susceptibility.

Nano-Optics is the study of optical phenomena and techniques on the nanometer scale. It is an emerging field of study motivated by the rapid advance of nanoscience and technology. It embraces topics such as plasmonics, optical antennas, optical trapping, manipulation, and high-resolution imaging and spectroscopy. Understanding concepts of light localization and light-matter interactions on the nanoscale.

Objective
Starting with an angular spectrum representation of optical fields the role of inhomogeneous evanescent fields is discussed. Among the topics are: theory of strongly focused light, point spread functions, resolution criteria, confocal microscopy, and near-field optical microscopy. Further topics are: optical interactions between nanoparticles, atomic decay rates in inhomogeneous environments, single molecule spectroscopy, light forces and optical trapping, photonic bandgap materials, and theoretical methods in nano-optics.

Literature

Prerequisites
Students are offered the opportunity to design a circuit of their own which then gets actually fabricated as a microchip! Students who elect to participate in this program register for a term project at the Integrated Systems Laboratory in parallel to attending the VLSI II course.

---

227-0301-00L  Optical Communication Fundamentals  W  6 credits  2V+1U+1P  J. Leuthold

Abstract
The path of an analog signal in the transmitter to the digital world in a communication link and back to the analog world at the receiver is discussed. The lecture covers the fundamentals of all important optical and optoelectronic components in a fiber communication system.

This includes the transmitter, the fiber channel and the receiver with the electronic digital signal processing elements.

Objective
An in-depth understanding on how information is transmitted from source to destination. Also the mathematical framework to describe the important elements will be passed on. Students attending the lecture will further get engaged in critical discussion on societal, economical and environmental aspects related to the on-going exponential growth in the field of communications.
Content

- Chapter 1: Introduction: Analog/Digital conversion, The communication channel, Shannon channel capacity, Capacity requirements.
- Chapter 4: The Receiver: Photodiodes, Receiver noise, Detector schemes (direct detection, coherent detection), Bit-error ratios and error estimations.
- Chapter 5: Digital Signal Processing Techniques: Digital signal processing in a coherent receiver, Error detection techniques, Error correction coding.
- Chapter 6: Pulse Shaping and Multiplexing Techniques: WDM/FDM, TDM, OFDM, Nyquist Multiplexing, OCDMA.
- Chapter 7: Optical Amplifiers: Semiconductor Optical Amplifiers, Erbium Doped Fiber Amplifiers, Raman Amplifiers.

This master's level course is limited to 15 students per semester for safety and efficiency reasons. If there are more than 15 students registered, we regret to restrict access to this course by the following rules:

- Priority 1: master students of the master's program in "Micro and Nanosystems"
- Priority 2: master students of the master's program in "Mechanical Engineering" with a specialization in Microsystems and Nanoscale Engineering (MATT-tutors Profs Daraio, Dural, Hierold, Koumoutsakos, Nelson, Norris, Park, Poulikakos, Pratsinis, Stemmer), who attended the bachelor course "151-0621-00L Microsystems Technology" successfully. 
- Priority 3: master students, who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.
- Priority 4: all other students (PhD, bachelor, master) with a background in silicon or microsystems process technology.

If there are more students in one of these priority groups than places available, we will decide by drawing lots.

Students will be notified at the first lecture of the course (introductory lecture) as to whether they are able to participate.

The course is offered in autumn and spring semester.

**Lecture notes**

English
A successful participant of the course is able to:

1. **Finding solutions**
   - understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
   - apply the problem solving cycle as a systematic approach to identify problems and their solutions
   - calculate project schedules according to the critical path method
   - setup and run systems dynamics models by means of the Vensim software
   - identify feedback cycles and reasons for unintended systems behavior
   - analyze the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics

2. **Implementing solutions**
   - project management, critical path method, quality control feedback loop
   - Vensim software, feedback cycles, control parameters, instabilities, chaos, oscillations and cycles, supply and demand, production functions, investment and consumption

3. **Controlling solutions**
   - systems dynamics, nonlinear dynamics and macroeconomic modeling
   - why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics?

The course is structured along three main tasks:

**PART 1** introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

**PART 2** discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

**PART 3**, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM.

The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

Self-study tasks (discussion exercises, Vensim exercises) are provided as home work. Weekly exercise sessions (45 min) are used to discuss selected solutions. Regular participation in the exercises is an efficient way to understand the concepts relevant for the final exam.

Abstract
During the semester break participating students stay for 4 weeks at CERN and perform experimental work relevant to our particle physics projects. Dates to be agreed upon.

Objective
Students learn, by doing, the needed skills to perform a small particle physics experiment: setup, problem solving, data taking, analysis, interpretation and presentation in a written report of publication quality.

402-0719-MSL Particle Physics at PSI (Paul Scherrer Institute)  W  9 credits  18P
C. Grab

Abstract
During semester breaks 6-12 students stay for 3 weeks at PSI and participate in a hands-on course on experimental particle physics. A small real experiment is performed in common, including apparatus design, construction, running and data analysis. The course includes some lectures, but the focus lies on the practical aspects of experimenting.

Objective
Students learn all the different steps it takes to perform a complete particle physics experiment in a small team. They acquire skills to do this themselves in the team, including design, construction, data taking and data analysis.

402-0340-MSL Medical Physics  W  9 credits  18P
A. J. Lomax, R. Müller, K. P. Prüssmann, M. Rudin

Abstract
In agreement with the lecturers a semester paper in the context of the topics discussed in the lectures can be written.

Compulsory Electives in Humanities, Social and Political Sciences

Recommended GESS compulsory elective courses (Type B) for D-PHYS.

### 402-0890-00L Seminars of the Platform for Advanced Scientific Computing (PASC)

**Abstract**
Seminars by invited speakers in the area of advanced scientific computing.

**Objective**
Discussion of state of the art techniques and methodologies in scientific computing.

**Content**
This course consists in a series of seminars by invited speakers on subjects of interest for the "Platform for Advanced Scientific Computing".

**Lecture notes**
There is no script.

**Literature**
Literature will be provided by the speakers in their respective presentations.

**Prerequisites / notice**
Participants should have experience on advanced scientific computing.

**Credits**
E- 0 credits

**Hours**
2S

**Instructor**
H. J. Herrmann, T. C. Schulthess, N. Spaldin, M. Troyer

**Department**
University lecturers

The seminar is aimed at all students who, during their studies, are confronted with age determination methods based on long-living radionuclides found in nature. Basic methodology, the latest developments, and special examples from a wide range of applications will be discussed.

Seminar on Biomedical Magnetic Resonance

Objective: Actuel developments and problems of magnetic resonance imaging (MRI)

Neuroinformatics - Colloquia

Objective: The colloquium in Neuroinformatics is a series of lectures given by invited experts. The lecture topics reflect the current themes in neurobiology and neuromorphic engineering that are relevant for our Institute.

Content: The topics depend heavily on the invited speakers, and thus change from week to week. All topics concern neural computation and their implementation in biological or artificial systems.

Auditory Informatics

Objective: Exchange with researchers in the domain of auditory informatics. Preparing and giving a presentation on a suitable topic in front of a scientific audience.

Content: On request the "Lehrsprache" may be changed to German.

Seminar in Glaciology

Lecture notes: benötigte Unterlagen werden im Verlauf der Veranstaltung abgegeben

Course Units for Additional Admission Requirements

The courses below are only available for MSc students with additional admission requirements.

Abstract

- Derivation and discussion of Maxwell's equations, from the static limit to the full dynamical case. Wave equation, waveguides, cavities.

Objective

- Develop a physical understanding for static and dynamic phenomena related to (moving) charged objects and understand the structure of the classical field theory of electrodynamics (transverse versus longitudinal physics, invariances (Lorentz-, gauge-)). Appreciate the interrelation between electric, magnetic, and optical phenomena and the influence of media. Understand a set of classic electrodynamical phenomena and develop the ability to solve simple problems independently. Apply previously learned mathematical concepts (vector analysis, complete systems of functions, Green's functions, co- and contravariant coordinates, etc.). Prepare for quantum mechanics (eigenvalue problems, wave guides and cavities).

Content

- Classical field theory of electrodynamics: Derivation and discussion of Maxwell equations, starting from the static limit (electrostatics, magnetostatics, boundary value problems) in the vacuum and in media and subsequent generalization to the full dynamical case (Faraday's law, Ampere/Maxwell law; potentials and gauge invariance). Wave equation and solutions in full space, half-space (Snell's law), waveguides, cavities, generation of electromagnetic radiation, scattering and diffraction of light (optics). Application to various specific examples. Discussion of the structure of Maxwell's equations, Lorentz invariance, relativity theory and covariance, Lagrangian formulation. Dynamics of relativistic particles in the presence of fields and their radiation properties (synchrotron).

Literature

- J.D. Jackson, Classical Electrodynamics
- W.K.H Panovevly and M. Phillips, Classical electricity and magnetism
- J.D. Landau, E.M. Lifshitz, and L.P. Pitaevskii, Electrodynamics of continuous media
- B. Sommerfeld, Elektrodynamik, Optik (Vorlesungen über theoretische Physik)
- M. Born and E. Wolf, Principles of optics
- R. Feynman, R. Leighton, and M. Sands, The Feynman Lectures of Physics, Vol II
Content

The course will cover the following chapters:

1. Direct Methods for linear systems of equations
2. Interpolation
3. Iterative Methods for non-linear systems of equations
4. Krylov methods for linear systems of equations
5. Eigensolvers
6. Least Squares Techniques
7. Filtering Algorithms
8. Approximation of Functions
9. Numerical Quadrature
10. Clustering Techniques
11. Single Step Methods for ODEs
12. Stiff Integrators

Lecture notes

Comprehensive lecture materials are available upon request from the lecturer.

Abstract
First introduction to main modelling ideas and mathematical tools from mathematical finance

Objective
This course gives a first introduction to the main modelling ideas and mathematical tools from mathematical finance. It aims at a double audience: mathematicians who want to learn the modelling ideas and concepts for finance, and non-mathematicians who need an introduction to the main tools from stochastics used in mathematical finance. The main emphasis will be on ideas, but important results will be given with (sometimes partial) proofs.

Content
Topics to be covered include
- financial market models in finite discrete time
- absence of arbitrage and martingale measures
- valuation and hedging in complete markets
- basics about Brownian motion
- stochastic integration
- stochastic calculus: Itô’s formula, Girsanov transformation, Itô’s representation theorem
- Black-Scholes formula

Lecture notes
Lecture notes will be sold at the beginning of the course.

Literature
Lecture notes will be sold at the beginning of the course. Additional (background) references are given there.

Prerequisites / notice
Prerequisites: Results and facts from probability theory as in the book "Probability Essentials" by J. Jacod and P. Protter will be used freely. Especially participants without a direct mathematics background are strongly advised to familiarise themselves with those tools before (or very quickly during) the course. (A possible alternative to the above English textbook are the (German) lecture notes for the standard course "Wahrscheinlichkeitstheorie").

For those who are not sure about their background, we suggest to look at the exercises in Chapters 8, 9, 22-25, 28 of the Jacod/Protter book. If these pose problems, you will have a hard time during the course. So be prepared.

<td>I. Flückiger</td>
</tr>
</tbody>
</table>

Abstract
On the end-to-end process of data analytics in organisations & business and how to transform data into insights for fact based decisions. Presentation of the process from the beginning with framing the business problem to presenting the results and making decisions by the use of data analytics. For each topic case studies from the financial service, healthcare and retail sectors will be presented.

Objective
The goal of this course is to give the students the understanding of the data analytics process in the business world, with special focus on the skills and techniques used besides the technical skills. The student will become familiar with the "business language", current problems and thinking in organisations and business and tools used.

Content

Framing the Business Problem
Framing the Analytics Problem
Data
Methodology
Model Building
Deployment
Model Lifecycle

Soft Skills for the Statistical/Mathematical Professional

Lecture notes
Lecture Notes will be available.

<td>Interest Rate Modeling in Discrete Time</td>
<td>W</td>
<td>4 credits</td>
<td>2V</td>
<td>M. V. Wüthrich</td>
</tr>
</tbody>
</table>

Abstract
This course gives an introduction to stochastic interest rate modeling in discrete time. Starting from cash flow valuation with state price deflators, we derive the equivalent martingale measures for pricing financial instruments and derivatives of primary assets. The lecture is supplemented by several examples such as the Vasicek model where we also study model calibration.

Objective
The students are familiar with the basic terminology of stochastic interest rate modeling and he is able to transfer his (financial) mathematical knowledge to real world pricing of cash flows and financial instruments.

Content
The following topics are covered:
1) stochastic discounting with state price deflators
2) equivalent martingale measures
3) pricing of cash flows and primary assets
4) pricing of derivatives, e.g. European put options
5) (multi-factor) Vasicek state price deflator model
6) Heath-Jarrow-Morton interest rate modeling framework

Lecture notes
In Mathematical Finance, asset prices are typically assumed to be given exogenously. This leads to tractable models that are well-suited to numerical approximations of stochastic ordinary differential equations driven by Wiener processes. These equations have applications to computational finance: Option valuation, Monte Carlo methods for the numerical integration of random variables, Monte Carlo methods for random variables, and option pricing and hedging. For this the course teaches a decent knowledge of the different numerical methods, their underlying ideas, convergence properties and implementation issues.

Prerequisites: knowledge of probability theory, statistics and applied stochastic processes.
Lecture notes
Lecture Notes will be available.

Literature
P. Glassermann:
Monte Carlo Methods in Financial Engineering.

P. E. Kloeden and E. Platen:
Numerical Solution of Stochastic Differential Equations.

Prerequisites / notice
Prerequisites:
Mandatory: Probability and measure theory, basic numerical analysis and basics of MATLAB programming.

a) mandatory courses:
Elementary Probability, Probability Theory I.

b) recommended courses:
Stochastic Processes.

401-3922-00L Life Insurance Mathematics W 4 credits 2V M. Koller
Abstract
The classical life insurance model is presented together with the important insurance types (insurance on one and two lives, term and endowment insurance and disability). Besides that the most important terms such as mathematical reserves are introduced and calculated. The profit and loss account and the balance sheet of a life insurance company is explained and illustrated.

401-4905-60L Interest Rate Theory W 8 credits 3V+1U not available
Abstract
We introduce and discuss the most important models for interest rate markets. Emphasis will be placed both on theoretical foundations and on numerical implementation and calibration.

Objective
-Gain overview of interest rate markets and the corresponding financial products.

-Understand the various modeling approaches used (short-rate models, Heath-Jarrow-Morton models, LIBOR market models).

-Get a firm grasp of the underlying theory, and practice numerical implementation of concrete examples.

-Get a firm grasp of the underlying theory, and practice numerical implementation of concrete examples.

-Learn about extensions that have recently become increasingly important: default risk, multiple yield curves, etc.

-Learn about extensions that have recently become increasingly important: default risk, multiple yield curves, etc.

Content
-Gain overview of interest rate markets and the corresponding financial products.

-Understand the various modeling approaches used (short-rate models, Heath-Jarrow-Morton models, LIBOR market models).

-Learn about extensions that have recently become increasingly important: default risk, multiple yield curves, etc.

-Learn about extensions that have recently become increasingly important: default risk, multiple yield curves, etc.

Literature

Prerequisites / notice
-Option pricing and hedging for equity markets as covered, e.g., in "Mathematical Foundations for Finance".
-Itô calculus.

Spatial Development and Infrastructure Systems Master

1. Semester

Compulsory Courses

<table>
<thead>
<tr>
<th>Number</th>
<th>Title</th>
<th>Type</th>
<th>ECTS</th>
<th>Hours</th>
<th>Lecturers</th>
</tr>
</thead>
</table>

Abstract
History, impact and principles of the design and operation of transport systems

Objective
Introduction of the basic principles of the design and operation of transport systems (road, rail, air) and of the essential pathways of their impacts (investment, generalised costs, accessibilities, external effects)

Content
Transport systems and land use; network design; fundamental model of mobility behaviour; costs and benefits of mobility; transport history

Lecturer notes
Lecturer notes and slides as well as hints to further literature will be given during the course.

Prerequisites / notice
Obligatory lecture for students of the first semester of MSc Spatial development and Infrastructure Systems

Abstract
The lectures impart important knowledge for solving spatial relevant conflicts and problems. Case studies will be used to demonstrate the implementation in practice.

Objective
Spatial development deals with the development and the design of our living space. To meet the expectations, the interests and the plans of the different actors, it is needed a planning approach considering the overview of both the actual and future situation.

Content
Tasks of Spatial Planning and development
Issues of local and supra-local interest
Recurring spatial changes, impacts and key figures
Formal and informal instruments and procedures in spatial planning
Spatial Design - Ideas about the future
Reasoning and assessing the situation in spatial planning
Spatial planning as a sequence of decisions and interventions
Process and procedures management
Focus issues - Inner development before external development
Focus issues - Cross-border tasks
Focus issues - Integrated spatial and infrastructure development

Lecturer notes
Further information and the documents for the lecture can be found on the homepage of the Chair of Spatial Development.

</tr>
</tbody>
</table>

Abstract
In the course, methods for the identification and measurement of landscape characteristics, as well as measures and implementation of landscape planning are taught. Landscape planning is put into the context of the environmental systems (soil, water, air, climate, flora and fauna) and discussed with regard to socio-political questions of the future.

Objective
The aims of this course are:
1) To illustrate the concept of landscape planning, the economic relevance of landscape and nature in the context of the environmental systems (soil, water, air, climate, flora and fauna).
2) To show landscape planning as an integral information system for the coordination of different instruments by illustrating the aims, methods, instruments and their functions in landscape planning.
3) To show the importance of ecosystem services.
4) To point out basic information about nature and landscape: Analysis and assessment of the complex interactions between landscape elements, effects of existing and foreseeable utilization of space (nature goods and services and landscape functions).
5) To identify and measure the characteristics of landscape.
6) Learn how to use the instrument of GIS appropriately in landscape planning.

Content
In this course, the following topics are discussed:
- Definition of the concept of landscape
- Landscape change
- Landscape planning
- Methods, instruments and aims of landscape planning (politics)
- Socio-political questions of the future
- Environmental systems, IUCN Red List, ecological connectivity
- Urban landscape services
- Practice of landscape planning
- Use of GIS in landscape planning

Lecturer notes
No script. The documentation, consisting of presentation slides are partly handed out and are provided for download on the PLUS website.

Prerequisites / notice
The contents of the course will be illustrated in the associated lecture 103-0467-01 U (Transport Systems and Environmental Systems (exercises)). An combination of courses is recommended.

103-0377-00L | Introduction to the Data Analysis Software R | W | 1 credit | 1G | A. Grêt-Regamey, M. J. Van Strien

**Abstract**
R is one of the most popular statistical open-source software for data analysis and data modeling. It has proved very useful for a variety of tasks commonly faced by planners, such as data preparation, exploratory analysis, model estimation or graphical display. R is also a programming language providing users with a more flexible and powerful tool for solving more complex problems.

**Objective**
The aim of this course is to provide participants with an introduction to the statistical open-source software R. Students will learn how to read data from files and write data to files, and how these data can be used to plot graphs and maps. Since R is a command-line software, that is, one has to type in text commands at a prompt, rather than just clicking menus and buttons, students will also learn how to write their own functions.

**Content**
- Reading data from files
- Creating and handling R objects such as matrices, vectors and arrays
- Plotting data: histograms, boxplots, scattered plots
- Writing data to files
- Reading raster and vector data
- Writing for- and while-loops
- Writing your own functions

**Lecture notes**
Handsouts of the lectures and exercises will be distributed available online at http://cran.r-project.org/doc/manuals/R-intro.pdf

**Prerequisites / notice**
The course will be held in English and no prior knowledge on R is required.

---

#### Number | Title | Type | ECTS | Hours | Lecturers
---|---|---|---|---|---
103-0337-00L | Site and Project Development | W | 3 credits | 2G | G. Nussbaumer

**Abstract**
The main focus of the lecture is on site and project development questions in relation to recycling of industrial wasteland. A semester exercise covers a specific major project and serves as the semester grade (project report and presentation).

**Objective**
Objectives of the lecture are:
1. Get knowledge of comprehensive and multifunctional large-scale projects and their problem areas
2. Get deepened knowledge in selected fields (site analysis, market analysis, project development, cooperative planning, participation processes)
3. Practical orientation, insight into occupational fields
4. Independent acquirement and acquisition of theoretical knowledge
The lecture consists of several modules. The main focus is on site and project development questions in relation to recycling of industrial wasteland. Technical presentations, lectured by scientific staff of the division of Planning of Landscape and Urban Systems PLUS as well as guest referees treat different subjects.

The subjects are:
- Site and market analysis
- Real estate development
- Project development from the perspective of project developers and investors
- Parking and transportation models
- Cooperative planning, participation processes, mediation

The theory is discussed and illustrated at case studies and exercises. Specific large-scale projects that are currently in the development phase will be discussed, for example the area Sihl-Maregg in Zurich (GreenCity) or the area Alter Plattenmarkt (Niedfeld) Luzern. For one specific industrial wasteland area the students will develop a vision for a possible redevelopment and a new land-use concept, which will be discussed with experts.

Lecture notes
- Handouts of the lectures
- Extracts from relevant scientific articles and theory literature
- Exercise material

<td>History of Urban Design I</td>
<td>2G</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Abstract</td>
<td>The lecture covers the time from the beginning of urban culture until the mid 19th century. With selected examples it emphasizes on the historical plannings and methods of European cities. Each specific urban development will be presented within a broader context. The course analyzes the history of urban architecture primarily in its existing three dimensional form as a complex human artefact. It also explores the inspirations that prompted the creation of this artefact: philosophical and religious concepts, social conditions, property relationships and the mechanisms that exploit the economies of real estate and the influence of building technology. Intellectual, literary or artistic modes of thought will also be assessed with regard to their impact on urban development. Urbanism has its own distinctive approach as a discipline, but it is also clearly responsive to the influence of related disciplines. Study is made of actual cities and urban expansion plans which are in the process of implementation, as well as unrealized projects and visions of the future. These projects sometimes illustrate ways of thinking that are equal to, or clearer than, actual urban situations.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

The course content of the lecture Landscape Planning and Environmental Systems (103-0347-00 V) will be illustrated.

A. Grêt-Regamey, S. Huber, W., M. J. Van Strien

The course examines the patterns of cleavage, conflict, convergence of interest, and consensus that have structured spatial planning. This course aims to provide students with knowledge of the historical background to understand the current spatial structure and to face the current challenges in spatial planning. Social, cultural, and economic forces will be analyzed for the roles they have played in shaping the landscapes and cityscapes and the answers spatial planning had to spatial development. The course focuses on the history of planning ideas, paradigms and approaches. A link is made to current challenges in spatial planning. Die Veranstaltung gibt einen Überblick über die Geschichte der Raumplanung. Sie möchte das Verständnis für die Ideengeschichte wecken und den historischen Kontext für die gegenwärtige Raumplanung und Raumstruktur vermitteln.

| 103-0307-00L | Multi-Criteria Decision Analysis | W | 3 credits | 2G | A. Grêt-Regamey |
| **Abstract** | Planners need to make decisions about the best possible mix of land uses. With increasing availability of spatial databases and the analytical capabilities of GIS, more effective decision support systems can be developed. The goal of the course is to provide the basics of spatial analysis and to teach the integration of spatial data into multicriteria decision-making systems. | | | | |
| **Objective** | This course will: 1) introduce students to techniques and issues associated with spatial modeling and decision support systems, including analytical techniques that are unique to spatial analysis 2) provide hands-on training in the use of these spatial tools in R while addressing real planning problems. | | | | |
| **Lecture notes** | The emphasis is on concepts, resources, and analysis tools that students can use in science, private companies and government careers. - Handouts of the lectures - Script - Exercise material Download: http://www.irl.ethz.ch/plus/education |
| **Prerequisites / notice** | The course will be held in German and English. It is highly recommended to attend the lecture “Introduction to the data analysis software R” (“Einführung in die R Umgebung für Datenaanalysen”), providing the basic principles of using the R-Software. |

| 103-0347-01L | Landscape Planning and Environmental Systems (Exercises) | W | 3 credits | 2U | A. Grêt-Regamey, S. Huber, S.E. Rabe |
| **Abstract** | The course content of the lecture Landscape Planning and Environmental Systems (103-0347-00 V) will be illustrated. | | | | |
| **Objective** | To show the importance of ecosystem services. Analysis and assessment of the complex interactions between landscape elements. To identify and measure the characteristics of landscape. Learn how to use the instrument of GIS appropriately in landscape planning. | | | | |
The course covers the basic history and theory of garden design and landscape architecture from its beginnings to the 21st century. The focus is on the spatial and cultural relationship between the garden, the city and the landscape, as well as the changing perceptions of nature and its representation.

**Space Planning Law and Environment**

**Abstract**

System of Swiss planning law, Constitutional and statutory provisions, Space planning and fundamental rights, Instruments, Application, legal protection, enforcement, Practical training.

**Objective**

Basic understanding of nature and function of space planning from a legal point of view. Basic knowledge of space planning instruments, relationship between space planning and constitutional law (especially property rights), solving of practical cases.

**Content**

This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to agricultural and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development.

Traffic Engineering

Introduction to the Data Analysis Software R

R is one of the most popular statistical open-source software for data analysis and data modeling. It has proved very useful for a variety of tasks commonly faced by planners, such as data preparation, exploratory analysis, model estimation or graphical display. R is also a programming language providing users with a more flexible and powerful tool for solving more complex problems.

Objective
The aim of this course is to provide participants with an introduction to the statistical open-source software R. Students will learn how to read data from files and write data to files, and how these data can be used to plot graphs and maps. Since R is a command-line software, that is, one has to type in text commands at a prompt, rather than just clicking menus and buttons, students will also learn how to write their own functions.

Content
Die Vorlesung besteht aus folgenden Blöcken:
1) Einführung ins Vorgehenskonzept (1W)
2) Risikoanalyse (6W + Exkursion) mit:
   - Systemabgrenzung
   - Gefahrenbeurteilung
   - Exposition- und Folgenanalyse
3) Risikobewertung (2W)
4) Risikomanagement (2W + Exkursion)
5) Abschlussbesprechung (1W)

Infrastructure Management

Fundamentals of Natural Hazards Management

Abstract
Risks to life and human assets result when settlement areas and infrastructure overlap regions where natural hazard processes occur. This course utilizes case studies to teach how a future natural hazards-specialist should analyze, assess and manage risks.

Objective
Concepts will be explained step-by-step through a set of case studies, and applied in lab by the students. The following principal steps are used when coping with natural hazard-risks. At each step, students will learn and apply the following skills:

- Risk analysis - What can happen?
- Characterize the processes and environmental measures that lead to a natural hazard and integrate modeling results of these processes.
- Identify threats to human life and assets exposed to natural hazards and estimate possible drawbacks or damages.

Content

- Explain the principles of risk-governance
- Apply principles to determine acceptable risks to human life and assets in order to identify locations which should receive added protection.
- Explain causes for conflicts between risk perception and risk analysis.
- Risk management - What steps should be taken to manage risks?
- Explain how various hazard mitigation approaches reduce risk.
- Describe hazard scenarios as a base for adequate dimensioning of control measures.
- Identify the best alternative from a set of thinkable measures based on an evaluation scheme.
- Evaluate the outcomes of the risk-governance.

Energy and Mobility

Abstract
The lecture Energy and Transportation imparts profound knowledge of energy- and environment-related difficulties of the intersection of energy and transportation with focus on the motorized individual traffic. The students gain the ability to approach energy- and environment-related problems with special consideration of the demand side, and to evaluate possible solutions.

Objective
The main objectives of this lecture are:
(i) The students gain profound knowledge of energy- and environment-related difficulties of the intersection of energy and transportation, and learn strategies to cope with these difficulties.
(ii) The students are able to approach energy- and environment-related problems with special consideration of the demand side, and to evaluate possible solutions.

Content
The lecture Energy and Transportation deals with the intersection of energy and transportation with focus on the motorized individual traffic.

Main topics are:
(i) Fundamentals of energy use in the transportation sector, today's present state and future developments.
(ii) Technical potentials for the reduction of greenhouse gas (GHG) emissions and the dependence on fossil fuels: Evaluation of (a) alternative fuels, and (b) alternative propulsion systems.
(iii) The relevance of demand on efforts to reduce GHG emissions and the dependence on fossil fuels.
(iv) Strategies and measures for influencing the demand side.
All necessary materials (e.g. transparencies and hand-outs) will be handed out at the beginning of each class.

The aim of this course is to provide participants with an introduction to the statistical open-source software R. Students will learn how to read data from files and write data to files, and how these data can be used to plot graphs and maps. Since R is a command-line software, that is, one has to type in text commands at a prompt, rather than just clicking menus and buttons, students will also learn how to write their own functions.

Content
- Reading data from files
- Creating and handling R objects such as matrices, vectors and arrays
- Plotting data: histograms, boxplots, scattered plots
- Reading data to files
- Reading raster and vector data
- Writing for- and while-loops
- Writing your own functions

Lecture notes
Handouts of the lectures and exercises will be distributed

Literature
- "Introduction to R" by W. N. Venables and D. M. Smith
- available online at http://cran.r-project.org/doc/manuals/R-intro.pdf

Prerequisites / notice
The course will be held in English and no prior knowledge on R is required.

101-0579-00L
Infrastructure Maintenance Processes

Abstract
This course provides an introduction to:
- how to model the changes in infrastructure objects over time,
- how to monitor these changes and assess the benefits of monitoring,
- how to intervene to improve infrastructure performance and assess the benefits of interventions, and
- how to model the changes in stakeholders interests over time.

Objective
to provide the basic information and tools to be used to make decisions with respect to existing infrastructure

Content
- Deterioration
  - manifest and latent processes,
  - modeling
- Monitoring
  - non-destructive and destructive techniques,
  - evaluation of benefits of monitoring
- Intervention
  - types of intervention,
  - evaluation of benefits of intervention
- Benefits
  - modeling of stakeholder benefits over time

Lecture notes
All necessary materials (e.g. transparencies and hand-outs) will be handed out at the beginning of each class.

Literature
Appropriate reading material will be assigned when necessary.

101-0187-00L
Structural Reliability and Risk Analysis

Abstract
Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.

Objective
The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. After this course the students will have refreshed their knowledge of probability theory and statistics to model uncertainties in view of engineering applications. They will be able to analyze the reliability of a structure and to use risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.

Content
Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. When designing new structures and systems, the design codes such as SIA or Euro-codes usually provide a framework that guarantees safety and reliability. However the level of safety is not quantified explicitly, which does not allow the analyst to properly choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FOSM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and pre-post risk assessment methods are presented. Bayesian networks are introduced as a generic numerical tool for solving such problems. The course also includes a tutorial using a software dedicated to real world structural reliability analysis.

Literature

Prerequisites / notice
Basic course on probability and statistics

101-0549-00L
Selected Topics on Legal Aspects in Civil Engineering

Abstract
Basic knowledge in public and private law of civil engineering. Examples of the subjects treated: space management, protection of the environment, legal procedures, standards for building technology and contracts.
The objective of the course is to provide graduate students with an understanding of the economic factors which give rise to urban spatial structures and the models which have been employed to study these processes. The course aims to help students develop an appreciation for the use of economic models in both positive and normative frameworks. We will assess both the history of thought regarding the role of markets in creating urban development, and we will read about modern theories of externalities and economic factors which induce agglomeration. The final section of the course will focus on transportation problems in urban areas and the use of economic models to assess public policy measures to deal with congestion and associated externalities.

Prerequisite: one semester in microeconomics.

Objective
The objective of the course is to provide graduate students with an understanding of the economic factors which give rise to urban spatial structures and the models which have been employed to study these processes. The course aims to help students develop an appreciation for the use of economic models in both positive and normative frameworks. We will assess both the history of thought regarding the role of markets in creating urban development, and we will read about modern theories of externalities and economic factors which induce agglomeration. The final section of the course will focus on transportation problems in urban areas and the use of economic models to assess public policy measures to deal with congestion and associated externalities.

Content
Topic 1: Why do cities exist?
Topic 2: The Basic Muth-Mills model
Topic 3: The New Economic Geography
Topic 4: Business demand for land and Von Thünen's model
Topic 5: Urban spatial structure
Topic 6: Land use control
Topic 7: City size and city growth
Topic 8: Traffic externalities and congestion
Topic 9: Public transport

Lecture notes
- Cities, agglomeration and spatial equilibrium by E. L. Glaeser, 2008, Oxford University Press.
- The new introduction to geographical economics, Steven Brakman, Harry Garretsen and Charles van Marrewijk, Cambridge.

This course was offered as “Transport Systems Approach with Cost Benefit Analysis in Transport” until HS14.
Objective
An effective and efficient flow of goods, data, and control in and between companies contributes significantly to the value added for the customer. Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Content
Strategic and tactical concepts in logistics, operations, and supply chain management: Conflicts of objectives and strategies and in the entrepreneurial context; business process analysis and fundamental logistics concepts; the MRP II / ERP concept; business processes and methods; the lean / just-in-time and repetitive manufacturing; concepts for product families and one-of-a-kind production; concepts for the process industry.

Lecture notes

This book also serves as textbook for LOS II (spring term) as well as ERP and SCM software systems (autumn term). In addition pointtouch-handouts and documents for case studies.

Literature
Sales at 17.9.15, from 12:45, before and during breaks of the first lecture.

Prerequisites / notice
As for the lecture of the 3rd week (BEMAD, a much-liked Business Engineering and Management Ability Development game), this lecture (of Oct. 1) will follow a specific schedule in specific rooms. The schedule will be presented at Sept. 17 during the 1st lecture.

Due to the big number of students, about half of the students will play this game, instead of Oct. 1, at Friday afternoon, Oct. 2. Please be available. Thank you for your help in this matter.

363-0445-02L Logistics, Operations, and Supply Chain Management I (Additional Cases) W 1 credit 2A P. Schönsleben

Abstract
Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Objective
An effective and efficient flow of goods, data, and control in and between companies contributes significantly to the value added for the customer. Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

101-0491-00L Agent Based Modeling in Transportation W 3 credits 2G F. Ciari, R. Waraich

Abstract
The main topics of the lecture are:
1) Introduction to the agent-based paradigm and overview on existing agent-based models in transportation, including MATSim
2) Learn how to setup MATSim for policy analysis
3) Learn about the interfaces available to enhances the software (includes Java programming)
4) Create, run and analyse a policy study

Objective
The objective of this course is to make the students familiar with agent-based models and in particular with the software MATSim. They will learn the pros and cons of this type of approach versus traditional transport models and will learn to use the simulation. They will design a policy study and run simulations to evaluate the impacts of the proposed policies.

Content
The main topics are:
1) Introduction to the agent-based paradigm and overview on existing agent-based models in transportation, including MATSim
2) Introduction of basic building blocks of simulation approaches (random numbers generation, experiment design, variance control, response surface estimation)
3) Revision of the key submodels and their parameters and concepts (value of time, Wardrop (Nash) equilibrium, etc.)
3) Learn how to setup MATSim for policy analysis
4) Learn about the interfaces available to enhances the software (includes Java programming)
5) Create, run and analyse a policy study

Literature
Agent-based modeling in general

Prerequisites / notice
Additional relevant readings, mostly scientific articles, will be recommended throughout the course.

440-0497-00L Safety and Reliability of Railway Systems W 3 credits 3G U. A. Weidmann, O. Fink, M. Montigel

Abstract
Transport and administrative policy, international and national regulation, business management of public transport companies, marketing, advertising and pricing; quality management

Objective
Comprehension of the transport and administrative policy as well as of the regulation of public transport companies. To develop a full understanding of the three important public transport system operations management processes: (1) Business management; (2) Marketing; (3) Quality control. The course will teach essential working techniques in each of these processes.

Content
(1) Transport and administrative policy: Goals of the state related to public transports, governmental activities in public transport, regulation.
(2) Business management in public transport enterprises: goals of public transport companies, goals of the business management; management of public transport on the different management levels, business organization. (3) Marketing, advertising and pricing: Fundamentals and goals; marketing strategies and concepts in public transports; marketing tools; putting marketing into action. (4) Quality control: Quality in transport systems; goals of quality management; structuring quality control measures; collecting quality data in an operating service; use of quality control systems for service optimization.

Lecture notes
Course notes will be provided in German. Slides will be made available.

Literature
References to technical literature will be included in the course script. An additional list of literature will be given during the course.

Prerequisites / notice
Lectures System and Network Planning as well as Systems Dimensioning and Capacity recommended.

Autumn Semester 2015
Page 1185 of 1432

Data: 06.10.2017 12:56
Abstract

Railway safety policies and safety concepts, command and control technologies for railways, optimization systems, European Train Control System, reliability availability maintainability safety (RAMS) of railway systems.

Objective

The students comprehend the main principles of safety, reliability and optimization for railway systems and understand the basic concepts of command and control technologies for railways.

Content

Railway safety strategies
- Safety in public transport
- Safety relevant characteristic of railway transport
- Safety requirements for railway transport
- Safety concepts

Command and control technologies for railway systems
- Protective functions
- Ensure the sequence/spacing of trains
- Ensure route protection
- Ensure level crossing protection
- Technical realization for protective functions
- European Train Control System

Operational command/control systems
- Dispatching
- Operational control systems
- Concepts of optimization

RAMS for railway systems
- Accident investigation methods
- RAMS standards for railways
- Risk analysis and hazard control
- RAMS methods
- Design principles for availability and safety
- Maintenance strategies
- Life Cycle Costs (LCC)
- Human Factor
- Safety in long railway tunnels

tutorials in Railway Operation Laboratory
field trip to Siemens Wallisellen (command and control technologies)

Lecture notes

The slides will be provided in German.

Literature

References will be included in the lecture notes. An additional list of literature will be given during the course.

Prerequisites / notice

some of the tutorials will be held at the IVTs Railway Operation Laboratory. The lecture Systems Dimensioning and Capacity is recommended.

363-0445-00L Logistics, Operations and Supply Chain Management I W 3 credits 2G P. Schönsleben, E. Scherer

Abstract

Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

The objective of the course is to provide graduate students with an understanding of the economic factors which give rise to urban spatial structure and the models which have been employed to study these processes. The course aims to help students develop an appreciation for the use of economic models in both positive and normative frameworks. We will assess both the history of thought regarding the role of markets in creating urban development, and we will read about modern theories of externalities and economic factors which induce agglomeration. The final section of the course will focus on transportation problems in urban areas and the use of economic models to assess public policy measures to deal with congestion and associated externalities.

### Content

#### Outline of Lectures

- **Topic 1:** Why do cities exist?
- **Topic 2:** The Basic Muth-Mills model
- **Topic 3:** The New Economic Geography
- **Topic 4:** Business demand for land and Von Thünen's model
- **Topic 5:** Urban spatial structure
- **Topic 6:** Land use control
- **Topic 7:** City size and city growth
- **Topic 8:** Traffic externalities and congestion
- **Topic 9:** Public transport

#### Literature

#### Lecture notes

- Textbook
- Autography River Engineering (in German)

### Objective

- **Main subjects treated:**
  - Fundamentals (e.g. sediment sampling methods), alluvial channel hydraulics, incipient motion, bed forms, bed load and suspended load, sediment budget and morphological changes, river morphology, scour, river management concepts and selected measures (e.g. bank and bed protection works).
- **Objective:**
  - be able to describe quantitatively the interrelation between discharge, sediment transport and channel evolution
  - know the fundamentals and be able to apply the approaches and methods to treat river engineering problems associated with flood protection and river restoration
- **Content:**
  - The first part of the lecture treats the fundamentals required to deal with river engineering problems. Sampling methods for the river bed material and methods to calculate the discharge in alluvial rivers are presented. The process of river bed armoring and the principles of incipient motion, of bed load and suspended load transport are treated.
  - In the second part of the lecture the procedures to quantify the sediment budget and the morphological changes (erosion, aggradation) in river systems are explained. Furthermore, the process of natural channel formation and the different plan forms of rivers (straight, meandering, braided) are discussed. Own chapters are dedicated to the topics of bed forms, river morphology and scour.
  - The last part of the lecture concentrates on the design and dimensioning of river engineering works. The topics treated are the stabilization of banks and of the longitudinal profile of rivers.

### Prerequisites / notice

- **Lecture notes** Autography River Engineering (in German)
- **Literature** The autography contains a comprehensive list of references to relevant literature.
- **strongly recommended:**
  - Hydrology, Hydraulics I and Hydraulic Engineering

The voluntary and unmarked exercise bases on field data, which are collected by the students on a river in nature. Besides the collection of fundamentals and field data, the exercise comprehends the calculation of the stage-discharge relationship, of the critical discharges at the onset of bed load transport and bed erosion and of the annual sediment load in a given river reach.

<tr>
<td><strong>Objective</strong></td>
<td>The objective of this course is to conduct a realistic traffic engineering project from beginning to end. During the process, students will also familiarize themselves with microscopic traffic simulation, and will use the simulation software for modeling and analyzing the traffic operations in reality. The emphasis is not only on building the simulation model, but also how to evaluate results. The final goal is to make valid and concrete engineering proposals based on the simulation model.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
In this course the students will complete a traffic engineering project with microscopic traffic simulator VISSIM. An emphasis will be on traffic signals at intersections.

Specific tasks will include:
1) Building a model with the simulator VISSIM in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/extend the model to improve the traffic performance.

The lecture notes and additional handouts will be provided before the lectures. Additional literature recommendations will be provided at the lectures.

There are no pre-requisites for this course. The course Transport Simulation (101-0438-00 G) and previous experience with VISSIM is helpful but not mandatory. In addition, simultaneously taking the course Traffic Engineering (101-0437-00 G) is encouraged.

**Abstract**
Track geometry including calculation and measuring as well as related data systems; interaction between track and vehicles, vehicle dynamics, stress; track construction including special features of railway bridges and tunnels; track diagnostics and forecast; track maintenance and related methods.

**Objective**
The lecture gives a deeper insight into track geometry, the interaction between track and vehicles as well as in construction and dimensioning of the track. Methods for the diagnosis of the state of the track and its forecast are shown. State-of-the-art maintenance strategies and technologies are presented.

**Content**
- Track geometry including calculation and measuring as well as related data systems; interaction between track and vehicles, vehicle dynamics, stress; track construction including special features of railway bridges and tunnels; track diagnostics and forecast; track maintenance and related methods

**Abstract**
The course will provide an introduction to the human and computerized systems used to manage infrastructure.

**Objective**
Upon completion of the course students will have the fundamental knowledge required to:
- to identify and model the processes used in organizations to manage infrastructure,
- to establish benchmarks that can be used to measure the performance of organizations that manage infrastructure, and
- to evaluate organizations that manage infrastructure.

**Content**
- Introduction
- Organisation types used to manage infrastructure
- Processes used in organizations that manage infrastructure
- Methods used to evaluate organizations that manage infrastructure, including the establishment of appropriate benchmarks

**Lecture notes**
Appropriate reading / and study material will be handed out during the course.

**Literature**
Transparencies will be handed out at the beginning of each class.

**Abstract**
The course examines the patterns of cleavage, conflict, convergence of interest, and consensus that have structured spatial planning.

**Objective**
This course aims to provide students with knowledge of the historical background to understand the current spatial structure and to face the current challenges in spatial planning. Social, cultural, and economic forces will be analyzed for the roles they have played in shaping the landscapes and cityscapes and the answers spatial planning had to spatial development. The course focuses on the history of planning ideas, paradigms and approaches. A link is made to current challenges in spatial planning.

**Content**
Die Veranstaltung gibt einen Überblick über die Geschichte der Raumplanung. Sie möchte das Verständnis für die Ideengeschichte wecken und den historischen Kontext für die gegenwärtige Raumplanung und Raumstruktur vermitteln.
Appropriate reading / and study material will be handed out during the course.

A. E. Braunschweig

Lecture notes/handouts will be available online.

Upon completion of the course students will have the fundamental knowledge required to operate in a world where environmental, economic, and social developments are interrelated, and the understanding to participate in decision making processes, to understanding the role of sustainability assessments.

B. T. Adey

Selected Topics on Hydraulic Engineering

Prerequisites: 101-0247-01L Hydraulic Engineering II or equivalent course

Abstract

The lecture focuses on selected topics in hydraulic engineering, water management and aquatic ecology relating to hydropower and flood protection projects.

Objective

to deepen knowledge on special aspects in hydraulic engineering and to understand the procedures and the planning sequence of hydropower projects.

Content

Different selected topics in hydraulic engineering will be focused on, e.g. dam safety, possible problems at reservoirs like sedimentation or natural hazards by impulse waves, the hydraulics of river flows, spillways and intake structures at dams and weirs, hydropower and ecology like fish-ecological aspects at low-head hydropower plants and eco-hydraulics like flow-vegetation interaction. Another focus will be put on typical approaches and procedures in the planning process of hydropower projects.

Lecture notes

Lecture notes/handouts will be available online.

External speakers will present current topics and projects in Switzerland and abroad.

S. Pfister

Infrastructure Maintenance Processes

W 3 credits 2G B. T. Adey

Abstract

This course provides an introduction to:

- how to model, simulate and assess the changes of infrastructure objects over time,
- how to monitor these changes and assess the benefits of monitoring,
- how to intervene to improve infrastructure performance and assess the benefits of interventions, and
- how to model changes in stakeholders interests over time.

Objective

to provide the basic information and tools to be used to make decisions with respect to existing infrastructure deterioration.

Content

Deterioration

- manifest and latent processes,
- modeling
- monitoring
- non-destructive and destructive techniques,
- evaluation of benefits of monitoring

Intervention

- types of intervention,
- evaluation of benefits of intervention

Benefits

- modeling of stakeholder benefits over time

Lecture notes

All necessary materials (e.g. transparencies and hand-outs) will be handed out at the beginning of each class.

Appropriate reading material will be assigned when necessary.

S. Hellweg

Infrastructure Management Systems

W 3 credits 2G B. T. Adey

Abstract

The course will provide an introduction to the human and computerized systems used to manage infrastructure maintenance, including the establishment of appropriate benchmarks.

Objective

Upon completion of the course students will have the fundamental knowledge required

- to identify and model the processes used in organizations to manage infrastructure,
- to establish benchmarks that can be used to measure the performance of organizations that manage infrastructure, and
- to evaluate organizations that manage infrastructure

Content

Introduction

- Organisation types used to manage infrastructure

Processes used in organizations that manage infrastructure

- Methods used to evaluate organizations that manage infrastructure, including the establishment of appropriate benchmarks

Lecture notes

Appropriate reading / and study material will be handed out during the course.

Transparencies will be handed out at the beginning of each class.

Appropriate literature will be handed out when required.

S. Hellweg

Advanced Environmental, Social and Economic Assessments

W 6 credits 3G+2U+2P A. E. Braunschweig, S. Hellweg, S. Pfister, R. Frischknecht

Abstract

This course deepens students’ knowledge of environmental, economic, and social assessment methodologies and their various applications.

Objective

This course has the aim of deepening students' knowledge of the environmental, economic and social assessment methodologies and their various applications.

In particular, students completing the course should have the

- ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors
- knowledge about the current state of the scientific discussion and new research developments
- ability to properly plan, conduct and interpret environmental assessment studies

In the course element "Implementation of...", students will learn to

- describe key sustainability problems of the current economic system and measuring units.
- describe the management system of an organisation and illustrate how to improve its sustainability management (especially planning and controlling), based on current ISO management standards and additional frameworks.
- discuss approaches to measure environmental performance measurement of an organisation, including ‘organisational LCA’ (Ecobalance)
- explain the pros and cons of single score env. assessment methods
- demonstrate life cycle costing from a sustainability viewpoint
- interpret stakeholder relations of an organisation
- (if time allows) describe sustainable supply chain management
Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by -

Will be made available in class.

Basic methods, technologies, scripting, and systems for interactive web mapping projects and in the internet cartography

L. Meier

Will be distributed

Thematic Cartography

Thematic map types (focus on quantitative information), analysis of themes and application, base maps, generalisation

4G

- Web mapping
- Web Map Services (WMS)
- User Interface design
- Symbolisation
- Programming
- Java Script
- Debugging
- Map production using GIS data
- 3D-applications in cartography

Lecture notes

Will be distributed

Accompanying e-learning module

Literature

- Terry A. Slocum, Terry et al. (2004): Thematic Cartography and Geographic Visualization. 2nd ed. Prentice Hall, ISBN 0130351237

Prerequisite: Cartography Introduction

Further information at http://www.karto.ethz.ch

103-0245-01L Thematic Cartography W 2 credits 2G L. Hurni

Abstract

Thematic map types (focus on quantitative information), analysis of themes and application, base maps, generalisation

Objective

Knowing of most important thematic map types.

Ability to design adequate thematic maps from statistical data.

Content

Thematic map types (focus on quantitative information)
Analysis of themes and application using adequate structural types
Use of adequate base maps
Generalisation of thematic maps
Dynamic thematic maps

Lecture notes

Will be distributed

Accompanying e-learning module

Literature

- Terry A. Slocum, Terry et al. (2004): Thematic Cartography and Geographic Visualization. 2nd ed. Prentice Hall, ISBN 0130351237

Prerequisite: Cartography Introduction

Further information at http://www.karto.ethz.ch

103-0227-00L Cartography III W 5 credits 4G L. Hurni

Abstract

Basic methods, technologies, scripting, and systems for interactive web mapping projects and in the internet cartography

Objective

Gain knowledge about basic methods, technologies, scripting, and systems for interactive web mapping projects. Assessment of existing products regarding production methods. Definition of useful methods for Web-based map projects.

Content

- Web mapping
- Web Map Services (WMS)
- User Interface design
- Symbolisation
- Programming
- Java Script
- Debugging
- Map production using GIS data
- 3D-applications in cartography

Lecture notes

Own script and instructions will be distributed.

Literature

Prerequisite: Kartografie I; Thematische Kartografie

Further information at http://www.karto.ethz.ch

401-0625-01L Applied Analysis of Variance and Experimental Design W 5 credits 2V+1U L. Meier

Abstract

Key concepts of experimental design. Planning and analysis of single factor experiments, block designs, full factorial and fractional designs, split-plot and strip-plot designs. Random effects and mixed effects models.

Objective

Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.
Content

Lecture notes
see website

Literature

751-1551-00L Ressourcen- und Umweltökonomie W 3 credits 2V L. Bretschger, A. Müller

Abstract
Relationship between economy and environment, market failure, external effects and public goods, contingencies, internalisation of externalities; economics of non-renewable resources, economics of renewable resources, cost-benefit analysis, sustainability, and international aspects of resource and environmental economics.

Objective
Understanding of the basic issues and methods in resource and environmental economics; ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

Topics are:
Introduction to resource and environmental economics
Importance of resource and environmental economics
Main issues of resource and environmental economics
Normative basis
Utilitarianism
Fairness according to Rawls
Economic growth and environment
Externalities in the environmental sphere
Governmental internalisation of externalities
Private internalisation of externalities: the Coase theorem
Free rider problem and public goods
Types of public policy
Efficient level of pollution
Tax vs. permits
Command and Control Instruments
Empirical data on non-renewable natural resources
Optimal price development: the Hotelling-rule
Effects of exploration and Backstop-technology
Effects of different types of markets.
Biological growth function
Optimal depletion of renewable resources
Social inefficiency as result of over-use of open-access resources
Cost-benefit analysis and the environment
Measuring environmental benefit
Measuring costs
Concept of sustainability
Technological feasibility
Conflicts sustainability / optimality
Indicators of sustainability
Problem of climate change
Cost and benefit of climate change
Climate change as international ecological externality
International climate policy: Kyoto protocol
Implementation of the Kyoto protocol in Switzerland
Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

Content
Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

Lecture notes
The script and lecture material are provided at: https://moodle-app2.let.ethz.ch/course/view.php?id=140

Literature

363-0541-00L Systems Dynamics and Complexity W 3 credits 3G F. Schweitzer, P. Mavrodiev

Abstract
Finding solutions: what is complexity, problem solving cycle.
Implementing solutions: project management, critical path method, quality control feedback loop.
Controlling solutions: Vensim software, feedback cycles, control parameters, instabilities, chaos, oscillations and cycles, supply and demand, production functions, investment and consumption

Objective
A successful participant of the course is able to:
- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyse the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics
Mathematical Optimization

The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical systems dynamics, nonlinear dynamics and macroeconomic modeling.

The course is structured along three main tasks:
1. Finding solutions
2. Implementing solutions
3. Controlling solutions

PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

This course is recommended for students participating in the Transdisciplinary Case Study 2016.

Lecture notes
Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM.

Prerequisites / notice
Self-study tasks (discussion exercises, Vensim exercises), are provided as home work. Weekly exercise sessions (45 min) are used to discuss selected solutions. Regular participation in the exercises is an efficient way to understand the concepts relevant for the final exam.

Content
The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines.

Objective
At the end of the course students should:
- Know: Function, purpose and algorithm of a selected number of transdisciplinary methods
- Understand: Functional application in case studies and other problem oriented projects
- Be able to reflect on: Potential, limits, and necessity of transdisciplinary methods
- Be prepared for: Transdisciplinary Case Study 2016

Lecture notes
Handouts are provided by the lecturers

Literature
Selected scientific articles and book-chapters

Prerequisites / notice
This course is recommended for students participating in the Transdisciplinary Case Study 2016.
Further information is available at http://www.hertig.ethz.ch/courses.htm

Introduction to Law for Civil Engineering

S. Scherler

Summary handouts for the lecture are available in the Teaching documents repository

G. Hertig

2V

Introduction to Ecocometrics with practical work on the PC. The lecture builds on Econometrics I (regression analysis, autocorrelated and heteroscedastic disturbances) and addresses four topics: (1) the problem of Multicollinearity, (2) the concept of Stationarity and Cointegration of time series and the related estimation of Error-correction models, (3) Simultaneous equation models, (4) Probit models. Practical exercises on the PC enhance the understanding (Program EViews).

Prerequisites / notice

Geplante Exkursionen: Betriebszentrale SBB, Zürich Flughafen Reparatur und Unterhalt, SBB Zürich Altstetten Fahrzeugfertigung, Stadler Bussnang

Abgabe der Unterlagen (gegen eine Schutzgebühr) zu Beginn des Semesters. Rechtzeitig eingeschriebene Teilnehmer können die Unterlagen auf Wunsch und gegen eine Zusatzgebühr auch in Farbe beziehen.

Lecture notes

Dozent:
Dr. Markus Meyer, Emknamatik GmbH

Voraussichtlich ein oder zwei Gastvorträge von anderen Referenten.

EST I (Herbstsemester) kann als in sich geschlossene einsemestrige Vorlesung besucht werden. EST II (Frühjahrssemester) dient der weiteren Vertiefung der Fahrzeugtechnik und der Integration in die Bahnninfrastruktur.

751-0422-00L Econometrics II

W 2 credits 2G P. Stalder

Abstract

Introduction to Econometrics with practical work on the PC. The lecture builds on Econometrics I (regression analysis, autocorrelated and heteroscedastic disturbances) and addresses the problem of multicollinearity, the estimation of error-correction models, simultaneous equation models and the Probit model.

Objective

Practical comprehension of econometric methods and models

Content

The lecture builds on Econometrics I (regression analysis, autocorrelated and heteroscedastic disturbances) and addresses four topics: (1) the problem of Multicollinearity, (2) the concept of Stationarity and Cointegration of time series and the related estimation of Error-correction models, (3) Simultaneous equation models, (4) Probit models. Literature

Prerequisites / notice

Prerequisite is Econometrics I or equivalently:

851-0703-03L Introduction to Law for Civil Engineering

W 2 credits 2V G. Hertig

Abstract

Introduction to Law for Civil Engineering - Only for Civil Engineering BSc, Environmental Engineering BSc and Spatial Development and Infrastructure Systems MSc

Students who have attended or will attend the lecture "Introduction to Law for Architecture * (851-0703-01L) cannot register for this course unit.

Objective

This class introduces students to basic features of the legal system. Questions of constitutional and administrative law, contract law, tort law, corporate law, as well as litigation are covered.

Content

1. Public Law
   Constitutional law: sources of law, organization of the state, fundamental rights. Administrative law: administrative decisions, organization of the administration, enforcement of administrative decisions, procedural law, basics of police, environmental and zoning law.
   2. Private law

Lecture notes

There will be 'Lecture Notes' (in German) for this course, starting in Fall 2015

Literature

Further information is available at http://www.hertig.ethz.ch/courses.htm

851-0733-00L Traffic Law / Traffic Commercial Law

W 2 credits 2G S. Scherler

Abstract

Within the scope of the lecture "Traffic Law / Traffic Commercial Law", besides an introduction into the legal basis of the national and international traffic, the main interest will be laid on actual political and economical questions and problems with respect to traffic (e.g. financing of traffic, road pricing, rail reform, air traffic vs. environment law etc.). With practical exercises and subsequent detailed reviews themes and subjects of special interest to participants are being treated more thoroughly.

Objective

Participants are acquiring a comprehensive summary about the system Traffic Law/Traffic Commercial Law in Switzerland. With practical exercises and subsequent detailed reviews themes and subjects of special interest to participants are being treated more thoroughly.

Content

Within the scope of the lecture "Traffic Law / Traffic Commercial Law", besides an introduction into the legal basis of the national and international traffic, the main interest will be laid on actual political and economical questions and problems with respect to traffic (e.g. financing of traffic, road pricing, rail reform, air traffic vs. environment law etc.). With practical exercises and subsequent detailed reviews themes and subjects of special interest to participants are being treated more thoroughly.

Lecture notes

Script will be distributed during the lecture.
Environmental Management  W  2 credits  2G  R. Züst

Abstract
An environmental management system has the objective to continuously improve the environmental performance of the activities, products and services of a company. The company has to introduce different management procedures. The goal of this lecture is to provide basics and specific procedure to implement the environmental dimension in the planning and decision making processes of an organisation.

Objective
Overview on environmental management and environmental management systems, general methods and principles.

Content
Introduction to environmental management / environmental management systems, energy and material flows; economical and ecological problems in industry; characterisation of an enterprise (incl. management handbook); structur and contents of an environmental management system; overview on the ISO 14001 ff. series; methods for environmental evaluation and assessment; integrated management systems; planning methodology and life-cycle-design design; planning example.

Lecture notes
Information about environmental management and environmental management systems will be provided by a CD or mail.

Literature
a list with literatures and links will be provided

Prerequisites / notice
Delivery of a case study, worked out in groups. Language: Teaching in English on request.

Fundamentals of Natural Hazards Management  W  3 credits  3G  H. R. Heinimann, B. Krummenacher, S. Löw

Abstract
Risks to life and human assets result when settlement areas and infrastructure overlap regions where natural hazard processes occur. This course utilizes case studies to teach how a future natural hazards-specialist should analyze, assess and manage risks.

Objective
Concepts will be explained step-by-step through a set of case studies, and applied in lab by the students. The following principal steps are used when coping with natural hazard-risks. At each step, students will learn and apply the following skills:

Risk analysis - What can happen?
- Characterize the processes and environmental measures that lead to a natural hazard and integrate modeling results of these processes.
- Risk assessment - What are the acceptable levels of risk?
- Apply principles to determine acceptable risks to human life and assets in order to identify locations which should receive added protection.
- Explain causes for conflicts between risk perception and risk analysis.

- Risk management - What steps should be taken to manage risks?
- Describe hazard scenarios as a base for adequate dimensioning of control measures.
- Explain the best alternative from a set of thinkable measures based on an evaluation scheme.
- Explain the principles of risk-governance.

Content
Die Vorlesung besteht aus folgenden Blöcken:
1) Einführung ins Vorgehenskonzept (1W)
2) Risikoanalyse (6W + Exkursion) mit:
   - Systemabgrenzung
   - Gefahrenbeurteilung
   - Expositions- und Folgenanalyse
3) Risikobewertung (2W)
4) Risikomanagement (2W + Exkursion)
5) Abschlussbesprechung (1W)

Master Thesis

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
103-0010-00L | Master's Thesis | O | 24 credits | 47D | Supervisors

Abstract
The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 16 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

Objective
To work independently and to produce a scientifically structured work.

Content
The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

### Block G3

All course units within Block G3 are offered in the spring semester.

### Block G4

Students that enrol for the second year in the CSE Bachelor Programme and whose first year examination did not involve the subject "Physics I" will instead take the "Physics I and II" (402-0043-00L and 402-0044-00L) courses with performance assessment as a yearly course.

<th>ECTS</th>
<th>Hours</th>
<th>Lecturers</th>
</tr>
</thead>
</table>

**Abstract**

This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering.

**Objective**

Introduction to HPC for scientists and engineers

- Fundamental of:
  1. Parallel Computing Architectures
  2. MultiCores
  3. ManyCores

**Content**

- Programming models and languages:
  1. C++ threading (2 weeks)
  2. OpenMP (4 weeks)
  3. MPI (5 weeks)

- Computers and methods:
  1. Hardware and architectures
  2. Libraries
  3. Particles: N-body solvers
  4. Fields: PDEs
  5. Stochastics: Monte Carlo

**Lecture notes**

http://www.cse-lab.ethz.ch/index.php/teaching/42-teaching/classes/615-hpcse1

### Fields of Specialization

#### Astrophysics

</tbody>
</table>

**Abstract**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: AST512

Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

**Literature**

1. “Formation of stars” (S. Stahler and F. Palla - Wiley editions, this is the book on which about half of the classes will be based and photocopies will be organized during first lecture)
2. “Radiative processes in astrophysics” (R. Ribycki and A. Lightman)

Additionally PowerPoint slides will be prepared by the lecturer on these and extra topics (e.g. planet formation).

**Prerequisites / notice**

Introduction to astrophysics (preferred but not obligatory).

#### Physics of the Atmosphere

<table>

**Abstract**

Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

**Objective**

Understanding of basic physical and chemical processes in the atmosphere. Understanding of mechanisms of and interactions between: weather - climate, atmosphere - ocean - continents, troposphere - stratosphere. Understanding of environmentally relevant structures and processes on vastly differing scales. Basis for the modelling of complex interrelations in the atmosphere.

**Content**

Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

**Lecture notes**

Written information will be supplied.

**Literature**

**Abstract**
This course provides an introduction and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. Its a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

**Objective**
Robotics is often viewed from three perspectives: perception (sensing), manipulation (affecting changes in the world), and cognition (intelligence). Robotic systems integrate aspects of all three of these areas. This course provides an introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. This course is a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

**Content**
An introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control.

**Lecture notes**
Lecture notes, problem set with solutions.

<td>3V+2U</td>
<td>E. W. Farkas, M. Schweizer</td>
</tr>
</tbody>
</table>

**Abstract**
First introduction to main modelling ideas and mathematical tools from mathematical finance

**Objective**
This course gives a first introduction to the main modelling ideas and mathematical tools from mathematical finance. It aims at a double audience: mathematicians who want to learn the modelling ideas and concepts for finance, and non-mathematicians who need an introduction to the main tools from stochastics used in mathematical finance. The main emphasis will be on ideas, but important results will be given with (sometimes partial) proofs.

**Content**
Topics to be covered include:
- financial market models in finite discrete time
- absence of arbitrage and martingale measures
- valuation and hedging in complete markets
- basics about Brownian motion
- stochastic integration
- stochastic calculus: Itô's formula, Girsanov transformation, Itô's representation theorem
- Black-Scholes formula

**Literature**
Lecture notes will be sold at the beginning of the course. Additional (background) references are given there.

**Prerequisites / notice**
Prerequisites: Results and facts from probability theory as in the book "Probability Essentials" by J. Jacod and P. Protter will be used freely. Especially participants without a direct mathematics background are strongly advised to familiarise themselves with those tools before (or very quickly during) the course. (A possible alternative to the above English textbook are the (German) lecture notes for the standard course "Wahrscheinlichkeitstheorie").

For those who are not sure about their background, we suggest to look at the exercises in Chapters 8, 9, 22-25, 28 of the Jacod/Protter book. If these pose problems, you will have a hard time during the course. So be prepared.

</tbody>
</table>

**Abstract**
Course on numerical approximations of stochastic ordinary differential equations driven by Wiener processes. These equations have several applications, for example in financial option valuation. This course also contains an introduction to random number generation and Monte Carlo methods for random variables.

**Objective**
The aim of this course is to enable the students to carry out simulations and their mathematical convergence analysis for stochastic models originating from applications such as mathematical finance. For this the course teaches a decent knowledge of the different numerical methods, their underlying ideas, convergence properties and implementation issues.

**Content**
Generation of random numbers
- Monte Carlo methods for the numerical integration of random variables
- Stochastic processes and Brownian motion
- Stochastic ordinary differential equations (SODEs)
- Numerical approximations of SODEs
- Multilevel Monte Carlo methods for SODEs
- Applications to computational finance: Option valuation

**Lecture notes**
Lecture Notes will be available.

Abstract
Physical modelling plays an important role in the analysis and design of new structures, especially for micro and nano devices where fabrication and measurement are difficult. After the fundamentals of electromagnetics, mechanics, and thermodynamics, an introduction to the main concepts and most widely used codes for physical modelling is given and commercial codes are applied.

Objective
Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability 1) to select appropriate software, 2) to apply it for solving given problems, 3) to validate the results, 4) to interactively improve the models until sufficiently accurate results are obtained.

Content
Since the fabrication and characterization of micro- and nanostructures is difficult, expensive, and time-consuming, numerical modelling drastically reduced the design process. Although many commercial software packages are available, it is important to know the drawbacks and difficulties of the numerical methods behind them and to be able to validate the results obtained with such packages. First, an introduction to the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics is given. This is important for understanding the problems to be analyzed and for validating results obtained from software packages. After this, the main concepts of numerical methods and of the most widely used codes for physical modelling are outlined and compared, which is essential for the adequate selection of software for solving given problems. After this, prominent commercial software packages are applied to various types of problems, ranging from electrodynamics to multiphysics. For becoming able to select appropriate software and to validate the results obtained, different commercial software packages will be used and compared during the exercises in form of small projects.

Geophysics

Abstract
In this course, students learn crucial partial differential equations (conservation laws) that are applicable to any continuum including the Earth's mantle, core, atmosphere and ocean. The course will provide step-by-step introduction into the mathematical structure, physical meaning and analytical solutions of the equations. The course has a particular focus on solid Earth applications.

Objective
The goal of this course is to learn and understand few principal partial differential equations (conservation laws) that are applicable for analysing and modelling of any continuum including the Earth's mantle, core, atmosphere and ocean. By the end of the course, students should be able to write, explain and analyse the equations and apply them for simple analytical cases. Numerical solving of these equations will be discussed in the Numerical Modelling I and II course running in parallel.
A provisional week-by-week schedule (subject to change) is as follows:

**Week 2: Density and gravity**
- Exercise: Computing density, thermal expansion and compressibility from an equation of state.

**Week 3: Stress and strain**
- Exercise: Analysing strain rate tensor for solid body rotation.

**Week 4: The momentum equation**
- Exercise: Deriving viscous rheological equations for computing effective viscosities from empirical flow laws.

**Week 5: Viscous rheology of rocks**
- Theory: Solid-state creep of minerals and rocks as the major mechanism of deformation of the Earth's interior. Dislocation and diffusion creep mechanisms. Rheological equations for minerals and rocks. Effective viscosity and its dependence on temperature, pressure and strain rate. Formulation of the effective viscosity from empirical flow laws.

**Week 6: The heat conservation equation**
- Exercise: steady temperature profile in case of channel flow.

**Week 7: Elasticity and plasticity**

**Week 8: "Free surface" boundary condition and "sticky air" approach. Free surface stabilization. Runge-Kutta schemes.**

**Week 9: Solving 2D heat conservation equation in case of constant thermal conductivity with explicit and implicit approaches.**

**Week 10: Solving 2D heat conservation equation in case of variable thermal conductivity with explicit and implicit approaches.**

**Week 11: Subgrid diffusion of temperature. Implementing subgrid diffusion to the thermomechanical code.**

**Week 12: Implementation of radioactive, adiabatic and shear heating to the thermomechanical code.**

**Week 13: Implementation of temperature-, pressure- and strain rate-dependent viscosity, temperature- and pressure-dependent density and temperature-dependent thermal conductivity to the thermomechanical code. Final project description.**

**GRADING** will be based on homeworks (30%) and oral exams (70%).

**Abstract**

Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

**Objective**

The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

**Content**

Biological systems often consist of a large number of interacting components and the systems are probabilistic, dynamic and nonlinear. Hence, the analysis of these systems requires computational approaches. Common examples for systems of this kind are fireballs in gases held under pressure, pollution and exhaust gases in tunnels (tunnel fires etc.).

The topics covered include: Emissions of liquids and gases from containers and pipelines, evaporation from pools and vaporization of liquids and gases, burning of fuel, spread and dilution of waste gas plumes in the atmosphere, deflagration and detonation of inflammable gases, fires and explosions in fire tunnels etc.

**Abstract**

The methods of fluid dynamics play an important role in the description of a chain of events, involving the release, spreading and dilution of dangerous fluids in the environment. Tunnel ventilation systems and strategies are studied, which must meet severe requirements during normal operation and in emergency situations (tunnel fires etc.).

**Objective**

Generally applicable methods in fluid dynamics and gas dynamics are illustrated and practiced using selected current examples.

**Content**

Often experts fall back on the methodology of fluid dynamics when involved in the construction of environmentally friendly processing and incineration facilities, as well as when choosing safe transport and storage options for dangerous materials. As a result of accidents, but also in normal operations, dangerous gases and liquids may escape and be transported further by wind or flowing water. There are many possible forms that the resulting damage may take, including fire and explosion when flammable substances are mixed. The topics covered include: Emissions of liquids and gases from containers and pipelines, evaporation from pools and vaporization of gases kept under pressure, the spread and dilution of waste gas plumes in the atmosphere, deflagration and detonation of inflammable gases, fires and explosions in fire tunnels etc.

**Lecture notes**

</tr>
</tbody>
</table>

**Abstract**

The course provides an introduction into stochastic methods that are applicable for example for the description and modeling of turbulent and subsurface flows. Moreover, mathematical techniques are presented that are used to quantify uncertainty in various engineering applications.

**Objective**

By the end of the course you should be able to mathematically describe random quantities and their effect on physical systems. Moreover, you should be able to develop basic stochastic models of such systems.
The goal of the lecture is to provide the students with the fundamentals of the non linear Finite Element Method (FEM).

Most problems in engineering are of nonlinear nature. The nonlinearities are caused basically due to the nonlinear material behavior, contact conditions and instability of structures. The principles of the nonlinear Finite-Element-Method (FEM) will be introduced in the scope of this lecture for treating such problems.

The goal of the lecture is to provide the students with the fundamentals of the non linear Finite Element Method (FEM). The lecture focuses on the principles of the nonlinear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Methods are simulations of:

- Crash
- Collapse of structures
- Materials in Biomechanics (soft materials)
- General forming processes

Special attention will be paid to the modeling of the nonlinear material behavior, thermo-mechanical processes and processes with large plastic deformations. The ability to independently create a virtual model which describes the complex non linear systems will be acquired through accompanying exercises. These will include the Matlab programming of important model components such as constitutive equations.

- Fundamentals of continuum mechanics to characterize large plastic deformations
- Elasto-plastic material models
- Updated-Lagrange (UL), Euler and combined Euler-Lagrange (ALE) approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- Modeling of crack propagation
- Introduction of advanced FE-Methods

If we will have a large number of students, two dates for the exercises will be offered.

The finite element (FE) method is the method of choice for (approximately) solving partial differential equations on complicated domains. In the first third of the lecture, we give an introduction to the method. The rest of the lecture will be devoted to methods for solving the large sparse linear systems of equation that is typical for the FE method. We will consider direct and iterative methods.

Students will know the most important direct and iterative solvers for sparse linear systems. They will be able to determine which solver to choose in particular situations.
I. THE FINITE ELEMENT METHOD

(1) Introduction, model problems.
(2) 1D problems. Piecewise polynomials in 1D.
(3) 2D problems. Triangulations. Piecewise polynomials in 2D.
(4) Variational formulations. Galerkin finite element method.
(5) Implementation aspects.

II. DIRECT SOLUTION METHODS

(6) LU and Cholesky decomposition.
(7) Sparse matrices.
(8) Fill-reducing orderings.

III. ITERATIVE SOLUTION METHODS

(9) Stationary iterative methods, preconditioning.
(10) Preconditioned conjugate gradient method (PCG).
(11) Incomplete factorization preconditioning.
(12) Multigrid preconditioning.
(13) Nonsymmetric problems (GMRES, BiCGstab).
(14) Indefinite problems (SYMMLQ, MINRES).

Literature

Prerequisites / notice
Prerequisites: Linear Algebra, Analysis, Computational Science.
The exercises are made with Matlab.

263-5150-00L Scientific Databases
Scientific databases share many aspects with classical DBs, but have additional specific aspects. We will review Relational DBs, Object Oriented DBs, Knowledge DBs, textual DBs and the Semantic Web. All these topics will be studied from the point of view of the scientific applications (Bioinformatics, Physics, Chemistry, Health, Engineering). A toy SDB will be used for exercises.

The goals of this course are to:
(a) Familiarize the students with how existing DBs can be used for scientific applications.
(b) Recognize the areas where SciDBs differ and require additional features compared to classical DBs.
(c) Be able to understand more easily SciDBs, improve existing ones or design/create new ones.
(d) Familiarize the students with at least two examples of SciDBs.

Abstract

G. H. Gonnet
The goal of this course is to give an overview of Big Data technologies. All aspects are covered: data formats and models, programming, 3V+1U+1A, T. Hoefler

One of the key challenges of the information society is to turn data into information, information into knowledge, and knowledge into value. Big Data

Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

1)  - Introduction, Statement of the problem, course structure, exercises, why Scientific DBs (SDBs) do not fit exactly the classical DB area. Hierarchy: File systems, data bases, knowledge bases and variations. Efficiency issues and how they differ from classical DB.

2)  - Relational DB used for scientific data, pros/cons

Introduction to RDB, limitations of the model, basics of SQL, handling of metadata, examples of scientific use of RDBs.

3)  - Object Oriented DB. Rich/structured objects are very appealing in SDB. OODB primitives and environments. OODB searching, Space and access time efficiency of OODBs.

4)  - Knowledge bases, key-value stores, ontologies, workflow-based architectures. WASA.

5)  - MapReduce / Hadoop

6)  - Storing and sharing mathematical objects, Open Math, its relation with OODB and Knowledge bases. Also the problem of chemical formula representation.

7)  - SGML and XML, human-readable databases, genomic databases. Advantages of human-readable databases (the huge initial success of genomic databases).

8)  - Semantic web, Resource Description Framework (RDF) triples, SparQL. An example of very flexible database for knowledge storage. Goals of the Semantic Web, discussion about its future.

9)  - An ideal scenario (and the design of a toy system with most of the desired features for exploration and exercises).

11)  - Functional testing, Verifiers, Consistency, Short-circuit testing, Recovery and Automatic recovery, Backup (incremental) methods.

12)  - Performance and space issues, various uses of compression, concurrency control. Hardware issues, clusters, Cloud computing, Crowd-sourcing.

13)  - Guest speaker: Ioannis Xenarios (UniProtKB/Swiss-Prot).

A significant amount of material will be delivered in the lectures making lecture attendance highly recommended.

263-3010-00L Big Data W 6 credits 3V+1U+1A T. Hofmann

Abstract
One of the key challenges of the information society is to turn data into information, information into knowledge, and knowledge into value. To turn data into value in this way involves collecting large volumes of data, possibly from many and diverse data sources, processing the data fast, and applying complex operations to the data.

Objective
To turn data into value in this way involves collecting large volumes of data, possibly from many and diverse data sources, processing the data fast, and applying complex operations to the data. This combination of requirements is typically referred to as Big Data and it has led to a completely new way to do business (e.g., develop new products and business models) and do science (sometimes referred to as data-driven science or the "fourth paradigm"). Unfortunately, big data grows faster than our ability to process the data so that new architectures and approaches for processing Big Data are needed.

Content
The goal of this course is to give an overview of Big Data technologies. All aspects are covered: data formats and models, programming languages, optimization techniques, systems, and applications.

Literature
Several papers and online articles will be made available. There is no single textbook for this course.

263-2800-00L Design of Parallel and High-Performance Computing W 7 credits 3V+2U+1A T. Hoefler, M. Püschel

Abstract
Advanced topics in parallel / concurrent programming.

Objective
Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large concurrent software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

227-0102-00L Discrete Event Systems W 6 credits 4G L. Thiele, L. Vanbever, R. Wattenhofer

Abstract
Introduction to discrete event systems. We start out by studying popular models of discrete event systems. In the second part of the course we analyze discrete event systems from an average-case and from a worst-case perspective. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Network Calculus.

Objective
Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by studying popular models of discrete event systems, such as automata and Petri nets. In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply Markov chains and queuing theory for an understanding of the typical behavior of a system. In the last part of the course we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queuing.
Abstract
Context recognition in mobile communication systems like mobile phone and wearable computer will be studied using advanced methods from sensor data fusion, pattern recognition, statistics, data mining and machine learning. Context comprises the behavior of individuals and of groups, their activities as well as the local and social environment.

In the data path from the sensor level to signal segmentation to the classification of the context, advanced methods of signal processing, pattern recognition and machine learning will be applied. Sensor data generated by crowdsourcing methods are integrated. The validation using MATLAB is followed by implementation and testing on a smart phone.

Context recognition as the crucial function of mobile systems is the main focus of the course. Using MATLAB the participants implement and verify the discussed methods also using a smart phone.

Objective
Future mobile systems will act as personal and cooperative assistant by providing the appropriate information and services. The systems consist of a smart phone which communicates with sensors on-body and in the environment. Context comprises user's behavior, his activities, his local and social environment.

Content
The next generation of mobile communication systems are integrated in our clothes and act as personal and cooperative assistant providing information we need just now (see www.wearable.ethz.ch). Context recognition - what is the situation of the user, his activity, his environment, how is he doing, what are his needs - as the central functionality of mobile systems constitutes the focus of the course.

The main topics of the course include
- Sensor nets, sensor signal processing, data fusion, time series (segmentation, similarity measures), supervised learning (Bayes Decision Theory, Decision Trees, Random Forest, kNN-Methods, Support Vector Machine, Hidden Markov Models, Adaboost), clustering (k-means, dbscan, topic models)
- Crowdsourcing,
- The exercises show concrete design problems like motion and gesture recognition using distributed sensors, detection of activity patterns and identification of the local environment.
- Presentations of the PhD students and the visit at the Wearable Computing Lab introduce in current research topics and international research projects.

Language: german/english (depending on the participants)

Lecture notes
Lecture notes for all lessons, assignments and solutions.
http://www.ife.ee.ethz.ch/education/wearable_systems_1

Literature
Literature will be announced during the lessons.

Prerequisites / notice
No special prerequisites
The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Lecture notes
Course material Script, computer demonstrations, exercises and problem solutions
Prerequisites
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C

227-0417-00L
Information Theory I
W
6 credits
4G
A. Lapidoth

Abstract
This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equipartition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

Objective
The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

Content
The entropy rate of a source. Typical sequences, the asymptotic equipartition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity

Literature
T.M. Cover and J. Thomas, Elements of Information Theory (second edition)

Prerequisites / notice

227-0427-00L
Signal and Information Processing: Modeling, Filtering, Learning
W
6 credits
4G
H.A. Loeliger

Abstract

Objective
The course is an introduction to some basic topics in signal processing, detection/estimation theory, and machine learning.

Content

Prerequisites / notice
Lecture notes

227-0627-00L
Applied Computer Architecture
W
6 credits
4G
A. Gunzinger

Abstract
This lecture gives an overview of the requirements and the architecture of parallel computer systems, performance, reliability and costs.

Objective
Understand the function, the design and the performance modeling of parallel computer systems.

Content
The lecture "Applied Computer Architecture" gives technical and corporate insights in the innovative Computer Systems/Architectures (CPU, GPU, FPGA, special processors) and their real implementations and applications. Often the designs have to deal with technical limits. Which computer architecture allows the control of the over 1000 magnets at the Swiss Light Source (SLS)? Which architecture is behind the alarm center of the Swiss Railway (SBB)? Which computer architectures are applied for driver assistance systems? Which computer architecture is hidden behind a professional digital audio mixing desk? How can data volumes about 30 TB/s, produced by a protonate accelerator, be processed in real time? Can the weather forecast also be processed with GPUs? How can a good computer architecture be found? Which are the driving factors in successful computer architecture design?

Prerequisites / notice
Script and exercises sheets.

252-0417-00L
Randomized Algorithms and Probabilistic Methods
W
7 credits
3V+2U+1A
A. Steger

Abstract
Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks

Objective
After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.

Content
Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas.

Prerequisites / notice

252-0546-00L
Physically-Based Simulation in Computer Graphics
W
4 credits
2V+1U
B. Solenthaler, B. Thomaszewski

Abstract
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

Objective
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.
The lecture covers topics in physically-based modeling, such as particle systems, mass-spring models, finite difference and finite element methods. These approaches are used to represent and simulate deformable objects or fluids with applications in animated movies, 3D games and medical systems. Furthermore, the lecture covers topics such as rigid body dynamics, collision detection, and character animation.

### Prerequisites / notice
Fundamentals of calculus and physics, basic concepts of algorithms and data structures, basic programming skills in C++. Knowledge on numerical mathematics as well as ordinary and partial differential equations is an asset, but not required.

**Objective**

Students learn the theoretical foundations of the selected methods, as well as practical skills to apply these methods and to interpret their outcomes.

**Content**

The course is roughly divided in three parts: (1) Supervised learning via (variations of) nearest neighbor methods, (2) the EM algorithm and clustering, (3) handling missing data and graphical models.

**Lecture notes**

We assume a solid background in mathematics, an introductory lecture in probability and statistics, and at least one more advanced course in statistics.

#### 401-3627-00L High-Dimensional Statistics

**Abstract**

"High-Dimensional Statistics" deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed.

**Objective**

Knowledge of methods and basic theory for high-dimensional statistical inference

**Content**

Lasso and Group Lasso for high-dimensional linear and generalized linear models; Additive models and many smooth univariate functions; Non-convex loss functions and 1-regularization; Stability selection, multiple testing and construction of p-values; Undirected graphical modeling

**Literature**

**Prerequisites / notice**

Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

**Abstract**

Statistical analysis and modeling of observations in temporal order, which exhibit dependence. Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. Implementations in the statistical software R.

**Objective**

Understanding of the basic models and techniques used in time series analysis and their implementation in the statistical software R.

**Content**

This course deals with modeling and analysis of variables which change randomly in time. Their essential feature is the dependence between successive observations. Applications occur in geophysics, engineering, economics and finance. Topics covered: Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. The models and techniques are illustrated using the statistical software R.

**Lecture notes**

A list of references will be distributed during the course.

**Abstract**

Mathematical treatment of diverse optimization techniques.

**Objective**

Advanced optimization theory and algorithms.

**Content**

1. Linear optimization: The geometry of linear programming, the simplex method for solving linear programming problems, Farkas' Lemma and infeasibility certificates, duality theory of linear programming.
3. Integer optimization: Ties between linear and integer optimization, total unimodularity, complexity theory, cutting plane theory.
4. Combinatorial optimization: Network flow problems, structural results and algorithms for matroids, matchings and, more generally, independence systems.

**Prerequisites / notice**

Basic knowledge in probability and statistics

This course covers advanced general and C++ programming techniques relevant for scientific simulations. This course covers advanced general and C++ programming techniques relevant for scientific simulations. The course will cover, in particular:

* generic algorithm and library design
* exception safety
* smart pointers and safe memory handling
* polymorphism at compile time, at run time and hybrid designs
* mixed language programs, in particular C++, C, Fortran and Python, and the Boost.Python library
* template meta programming and relevant libraries
* C++ libraries for parallel programming on distributed and shared memory machines
* Useful C++ libraries from Boost and other sources

**Prerequisites / notice**

Basic knowledge of computer science and mathematics, including algorithms and data structures. Knowledge of C++ is required.

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. 

Mind the enrolment deadlines at UZH:

http://www.uzh.ch/studies/application/mobilitaet_en.html
Objective: Acquire knowledge of main methodologies for computer-based models of astrophysical systems, the physical equations behind them, and train such knowledge with simple examples of computer programmes.

Content:
1. Integration of ODE, Hamiltonians, and Symplectic integration techniques, time adaptivity, time reversibility
2. Large-N gravity calculation, collisionless N-body systems and their simulation
3. Fast Fourier Transform and spectral methods in general
4. Eulerian Hydrodynamics: Upwinding, Riemann solvers, Limiters
5. Lagrangian Hydrodynamics: The SPH method
6. Resolution and instabilities in Hydrodynamics
7. Initial Conditions: Cosmological Simulations and Astrophysical Disks
8. Physical Approximations and Methods for Radiative Transfer in Astrophysics

Literature:
- Galactic Dynamics (Binney & Tremaine, Princeton University Press),
- Computer Simulation using Particles (Hockney & Eastwood CRC press),
- Targeted journal reviews on computational methods for astrophysical fluids (SPH, AMR, moving mesh)

Prerequisites / notice: Some knowledge of UNIX, scripting languages (see www.physik.uzh.ch/lectures/informatik/python/) as an example, some prior experience programming, knowledge of C. C++ beneficial

227-1033-00L

Neuromorphic Engineering I

W 6 credits 2V+3U T. Delbrück, G. Indiveri, S.C. Liu

Abstract: This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Objective: Understanding the characteristics of neuromorphic circuit elements.

Content: Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Literature: S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

Prerequisites / notice: Particular: The course is highly recommended for those who intend to take the spring semester course ‘Neuromorphic Engineering II’, that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

227-1037-00L

Introduction to Neuroinformatics

W 6 credits 2V+1U K. A. Martin, M. Cook, V. Mante, M. Pfeiffer

Abstract: The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

Objective: Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enforcements and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

Content: This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

327-1201-00L

Transport Phenomena I

W 4 credits 4G H. C. Öttinger

Abstract: Phenomenological approach to “Transport Phenomena” based on balance equations supplemented by thermodynamic considerations to formulate the understood fluxes in the local species mass, momentum, and energy balance equations; fundamentals, applications, and simulations

Objective: The teaching goals of this course are on five different levels:
(1) Deep understanding of fundamentals: local balance equations, constitutive equations for fluxes, entropy balance, interfaces, idea of dimensionless numbers, ...
(2) Ability to use the fundamental concepts in applications
(3) Insight into the role of boundary conditions
(4) Knowledge of a number of applications
(5) Flavor of numerical techniques: finite elements, finite differences, lattice Boltzmann, Brownian dynamics, ...

Content: Approach to Transport Phenomena
- Diffusion Equation
- Brownian Dynamics
- Refreshing Topics in Equilibrium Thermodynamics
- Balance Equations
- Forces and Fluxes
- Measuring Transport Coefficients
- Pressure-Driven Flows
- Heat Exchangers
- Complex Fluids

Lecture notes: A detailed manuscript is provided; this manuscript will be developed into a book entitled “A Modern Course in Transport Phenomena” by David C. Venerus and Hans Christian Öttinger.

<td>This course lies in the intersection between Computer Science and Molecular Biology. The main purpose is to study computational techniques, algorithms and data structures which are usually applied to solve problems in Molecular Biology and Biochemistry. The following topics are likely to be covered: Introduction, mathematical models of evolution, protein and DNA sequence alignment and its meaning, phylogenetic tree construction, multiple sequence alignments, secondary structure prediction, molecular dynamics, threading, role of bioinformatics in drug design, etc. From the computer science point of view we concentrate our attention in practical solutions for the above problems. Biological knowledge is an asset but not a prerequisite.</td>

</tbody>
</table>
The aim of the course is to provide an in-depth knowledge of theory and method development in theoretical chemistry. It will be shown that this is necessary in order to be able to solve actual chemical problems on a computer with quantum chemical methods.

The relativistic re-derivation of all concepts known from (nonrelativistic) quantum mechanics and quantum-chemistry lectures will finally explain the form of all operators in the molecular Hamiltonian - usually postulated rather than deduced. From this, we derive operators needed for molecular spectroscopy (like those required by magnetic resonance spectroscopy). Implications of other assumptions in standard non-relativistic quantum chemistry shall be analyzed and understood, too. Examples are the Born-Oppenheimer approximation and the expansion of the electronic wave function in a set of pre-defined many-electron basis functions (Slater determinants). Overcoming these concepts, which are so natural to the theory of chemistry, will provide deeper insights into many-particle quantum mechanics. Also revisiting the workhorse of quantum chemistry, namely density functional theory, with an emphasis on open-shell electronic structures (radicals, transition-metal complexes) will contribute to this endeavor. It will be shown how these insights allow us to make more accurate predictions in chemistry in practice - at the frontier of research in theoretical chemistry.

A set of detailed lecture notes will be provided, which will cover the whole course.

Prerequisites / notice

Strongly recommended (preparatory) courses are: quantum mechanics and quantum chemistry

151-0105-00L Quantitative Flow Visualization W 4 credits 2V+1U T. Rösgen

Objective
Introduction to modern imaging techniques and post processing algorithms with special emphasis on flow analysis and visualization. Understanding of hardware and software requirements and solutions. Development of basic programming skills for (generic) imaging applications.

Content
Fundamentals of optics, flow visualization and electronic image acquisition. Frequently used image processing techniques (filtering, correlation processing, FFTs, color space transforms). Image Velocimetry (tracking, pattern matching, Doppler imaging). Surface pressure and temperature measurements (fluorescent paints, liquid crystal imaging, infrared thermography). Laser induced fluorescence. (Digital) Schlieren techniques, phase contrast imaging, interferometry, phase unwrapping. Wall shear and heat transfer measurements. Pattern recognition and feature extraction, proper orthogonal decomposition.

Lecture notes
available

Prerequisites / notice
Prerequisites: Fluidodynamics I, Numerical Mathematics, programming skills. Language: German on request.

151-0109-00L Turbulent Flows W 4 credits 2V+1U P. Jenny

Objective

Lecture notes
Lecture notes are available

Literature

151-0207-00L Theory and Modeling of Reactive Flows W 4 credits 3G C. E. Frouzakis, I. Mantzaris

Objective
Theory of combustion with numerical applications

The course first reviews the governing equations and combustion chemistry, setting the ground for the analysis of homogeneous gas-phase mixtures, laminar diffusion and premixed flames. Catalytic combustion and its coupling with homogeneous combustion are dealt in detail, and turbulent combustion modeling approaches are presented. Available numerical codes will be used for modeling.
The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.
Objective

The objectives of this course are:

1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to make sense of the computer vision literature.

Content

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

636-0017-00L Molecular Evolution, Phylogenetics and Phylodynamics

Abstract

The aim of the course is to provide up-to-date knowledge on how we can obtain an understanding of the evolution and population dynamics of organisms based on their genetic sequencing data, employing key concepts from molecular evolution, phylogenetics and phylodynamics. Throughout the course, we tie the models and methods closely with applications, mainly in the field of epidemiology and evolution.

Objective

Attendees will learn what information is contained in genetic sequencing data and how this information is extracted from the sequencing data. The main concepts introduced are:

* models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics
* stochastic processes

Attendees will apply these concepts to a number of applications yielding biological insight into:

* epidemiology
* pathogen evolution
* macroevolution of species

Content

The course consists of three parts. We first introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Second, we employ these evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades.

Lecture notes

Slides of the lecture will be available online.

Literature

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice

Basic knowledge in linear algebra, analysis, and statistics.
Abstract
Introduction to scientific writing for students with focus on publication standards and ethical issues, especially in the case of citations (references to works of others.)

Objective
Learn the basic standards of scientific works in mathematics.

Content
- Types of mathematical works
- Publication standards in pure and applied mathematics
- Data handling
- Ethical issues
- Citation guidelines

Lecture notes
Moodle of the Mathematics Library: https://moodle-app2.let.ethz.ch/course/view.php?id=519

Prerequisites / notice
This course is completed by the optional course “Recherchieren in der Mathematik” (held in German) by the Mathematics Library. For more details see: http://www.math.ethz.ch/library/services/schulungen

401-3990-01L Bachelor's Thesis

No direct enrolment to this course unit in myStudies. Please fill in the online application form. Requirements and application form under www.math.ethz.ch/intranet/students/study-administration/theses.html

(Afterwards the enrolment will be done by the Study Administration)

Abstract
The BSc thesis concludes the curriculum. In their BSc thesis, students should demonstrate their ability to carry out independent, structured scientific work. The purpose of the BSc thesis is to deepen knowledge in a certain subject and to bring students into closer contact with applications in an existing computational group. The BSc thesis requires approximately 160 hours of work.

Objective
In their BSc thesis students should demonstrate their ability to carry out independent, structured scientific work. The purpose is to deepen knowledge in a certain subject and to enable students to collaborate in an existing scientific group to take a computational approach to problems encountered in applications.

Prerequisites / notice
The supervisor responsible for the Bachelor thesis defines the task and determines the start and the submission date. The Bachelor thesis concludes with a written report. The Bachelor thesis is graded.

**Abstract**

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are assessed as Examination Lessons.

**Objective**

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

**272-0101-00L Subject Didactics of Computer Science I Simultaneous enrolment in Introductory Practical in Computer Science - course 272-0201-00L - is compulsory.**

**Abstract**

The unit “Subject Didactics of Computer Science I” addresses key contributions of computer science to general education. The course deals with the thoughtful choice of educational contents for computer science classes, which takes into account its comprehensibility for different age groups as well as didactic approaches suitable for a successful knowledge transfer.

**Objective**

The general objective of the course consists in highlighting the tight connection between the mathematical and algorithmic way of thinking and the approaches adopted by engineering disciplines, and in reflecting on teaching approaches for sustainable computer science teaching activities.

**Content**

The students understand the fundamental concepts of computer science in the context of a broad and deep knowledge. Through this understanding, they manage to prepare teaching materials for a successful knowledge transfer and to pass their passion for the subject on to their pupils.

The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners inside a class. Besides holding classes, the students do care about the individual pupil support.

They encourage the autonomy of the learners, manage to work with diverse target groups and to establish a positive learning environment.

The students are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.

The course "Subject Didactics of Computer Science I" addresses key contributions of computer science to general education. The chosen topics support the young learners in developing a unique and indispensable way of thinking, in enhancing their understanding of our world as well as in achieving university education entrance qualifications.

The main topics of the course unit "Subject Didactics of Computer Science I" are the didactics of finite state automata, of formal languages and of the introduction to programming. The unit focuses on contents of computer science that contribute to general education. This involves the understanding of fundamental scientific concepts such as algorithm, complexity, determinism, computation, automata, verification, testing and programming language as well as the way to embed them into a scientifically sound and didactically sustainable computer science course.

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

**Lecture notes**

Unterlagen und Folien werden zur Verfügung gestellt.

**Abstract**

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.
### Machine Learning 2015

**Objective**
- The aim is for the students to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
- To independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
- To try out different options for specialist further training in their profession.

**Content**
- Algorithmic Game Theory: Introduction to game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.
- Introduction to information retrieval with a focus on text documents and images. Main topics comprise extraction of characteristic features from documents, index structures, retrieval models, search algorithms, benchmarking, and feedback mechanisms. Searching the web, images and XML collections demonstrate recent applications of information retrieval and their implementation.

**Literature**
- J. M. Buhmann, Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.
- Algorithmic Game Theory: P. Widmayer, M. Püschel, Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory.

**Prerequisites / notice**
- Solid basic knowledge in analysis, statistics and numerical methods for CSE. Experience in programming for solving the project tasks.
- The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.
- Topics covered in the lecture include:
  - Bayesian theory of optimal decisions
  - Maximum likelihood and Bayesian parameter inference
  - Classification with discriminant functions: Perceptrons, Fisher’s LDA and support vector machines (SVM)
  - Ensemble methods: Bagging and Boosting
  - Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
  - Non parametric density estimation: Parzen windows, nearest neighbour
  - Dimension reduction: principal component analysis (PCA) and beyond

**Lecture notes**
- No lecture notes, but slides will be made available on the course webpage.

**Literature**

**Prerequisites / notice**
- To try out different options for specialist further training in their profession.
- Advanced topics in parallel / concurrent programming.
- Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.

**Literature**
The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a particularly well-suited model for the behaviour and interaction of such selfish users and programs. Classical game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

Outline:
- Introduction to classical game theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for finding equilibria, computational complexity.
- The cost difference between an optimum under central control and an equilibrium under selfish agents, known as the "price of anarchy".
- Auction-like mechanisms and algorithms that "direct" the actions of selfish agents into a certain desired equilibrium situation.
- Selected current research topics of Algorithmic Game Theory, such as Web-Search Based Keyword Auctions, or Information Cascading in Social Networks

Lecture notes
No lecture notes.

Literature
"Game Theory and Strategy", Philip D. Straffin, The Mathematical Association of America, 5th printing, 2004

Prerequisites / notice
Several copies of both books are available in the Computer Science library.

Audience: Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.

Requirements: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.

252-0417-00L Randomized Algorithms and Probabilistic Methods W 7 credits 3V+2U+1A A. Steger

Abstract
Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks

Objective
After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.

Content
Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas.

Abstract
This course covers some of the fundamental concepts of computer graphics, namely 3D object representations and generation of photorealistic images from digital representations of 3D scenes.

Objective
At the end of the course the students will be able to build a rendering system. The students will study the basic principles of rendering and image synthesis. In addition, the course is intended to stimulate the students' curiosity to explore the field of computer graphics in subsequent courses or on their own.

Content
This course covers fundamental concepts of modern computer graphics. Students will learn about 3D object representations and the details of how to generate photorealistic images from digital representations of 3D scenes. Starting with an introduction to 3D shape modeling and representation, texture mapping and ray-tracing, we will move on to acceleration structures, the physics of light transport, appearance modeling and global illumination principles and algorithms. We will end with an overview of modern image-based image synthesis techniques, covering topics such as lightfields and depth-image based rendering.

Lecture notes
no

Prerequisites / notice
Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++, Visual Computing course recommended.

The programming assignments will be in C++. This will not be taught in the class.

Abstract
This course acquaints students with core knowledge in computer graphics, image processing, multimedia and computer vision. Topics include: Graphics pipeline, perception and camera models, transformation, shading, global illumination, texturing, sampling, filtering, image representations, image and video compression, edge detection and optical flow.

Objective
This course provides an in-depth introduction to the core concepts of computer graphics, image processing, multimedia and computer vision. The course forms a basis for the specialization track Visual Computing of the CS master program at ETH.

Content
Course topics will include: Graphics pipeline, perception and color models, camera models, transformations and projection, projections, lighting, shading, global illumination, texturing, sampling theorem, Fourier transforms, image representations, convolution, linear filtering, diffusion, nonlinear filtering, edge detection, optical flow, image flow, and image compression.

Lecture notes
A scriptum will be handed out for a part of the course. Copies of the slides will be available for download. We will also provide a detailed list of references and textbooks.

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensible to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:
- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non-parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
Solid basic knowledge in analysis, statistics and numerical methods for CSE. Experience in programming for solving the project tasks.

Abstract

Radiative processes in the interstellar medium; stellar structure and evolution; supernovae; white dwarfs; neutron stars; black holes; planet formation

Literature

(1) "Formation of stars" (S. Stahler and F. Palla - Wiley editions, this is the book on which about half of the classes will be based and photocopies will be organized during first lecture)
(2) "Radiative processes in astrophysics" (R. Ribycki and A. Lightman)
(3) "The Physics of Stars" (A.C. Phillips)
(4) "Black Holes, White Dwarfs and Neutron Stars: The physics of compact objects" (S. Shapiro and S.A. Teukolski).

Additionally PowerPoint slides will be prepared by the lecturer on these and extra topics (e.g. planet formation).

Abstract

Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Objective

Understanding of basic physical and chemical processes in the atmosphere. Understanding of mechanisms of and interactions between: weather - climate, atmosphere - ocean - continents, troposphere - stratosphere. Understanding of environmentally relevant structures and processes on vastly differing scales. Basis for the modelling of complex interrelations in the atmosphere.

Content

Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Lecture notes

Written information will be supplied.

Literature

651-4053-05L Boundary Layer Meteorology

Abstract

The Planetary Boundary Layer (PBL) constitutes the interface between the atmosphere and the Earth's surface. Theory on transport processes in the PBL and their dynamics is provided. This course treats theoretical background and idealized concepts. These are contrasted to real world applications and current research issues.

Objective

Overall goals of this course are given below. Focus is on the theoretical background and idealised concepts. Students have basic knowledge on atmospheric turbulence and theoretical as well as practical approaches to treat Planetary Boundary Layer flows. They are familiar with the relevant processes (turbulent transport, forcing) within, and typical states of the Planetary Boundary Layer. Idealized concepts are known as well as their adaptations under real surface conditions (as for example over complex topography).

Content

- Introduction
- Turbulence
- Statistical treatment of turbulence, turbulent transport
- Conservation equations in a turbulent flow
- Closure problem and closure assumptions
- Scaling and similarity theory
- Spectral characteristics
- Concepts for non-ideal boundary layer conditions available (i.e. in English)

Lecture notes

Prerequisites / notice

Urufli-Fluddynamik (701-0479-00L) (environment fluid dynamics) or equivalent and basic knowledge in atmospheric science

The students of this course are provided with an introduction into presentation techniques (talks and posters) and practice this knowledge by making an oral presentation about a classical or recent scientific publication.
Abstract
Molecular models, Force fields, Boundary conditions, Electrostatic interactions, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.

For more information: www.csms.ethz.ch/education/CSCBP

Objective
Introduction to computer simulation of (bio)molecular systems, development of skills to carry out and interpret computer simulations of biomolecular systems.

Content
Molecular models, Force fields, Spatial boundary conditions, Calculation of Coulomb forces, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.

Lecture notes
Available (copies of powerpoint slides distributed before each lecture)

Literature
See: www.csms.ethz.ch/education/CSCBP

Prerequisites / notice
Since the exercises on the computer do convey and test essentially different skills as those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam.

For more information about the lecture: www.csms.ethz.ch/education/CSCBP

252-0523-00L Computational Biology W 6 credits 3V+2U G. H. Gonnet

Abstract
Study of computational techniques, algorithms and data structures used to solve problems in computational biology. Topics: basic biology, sequence and structure comparison, molecular evolution, multiple sequence alignment, probabilistic and statistical models, Markov models, microarrays, dynamic programming, maximum likelihood and specialized DNA and protein analysis.

Objective
Familiarize the students with the basic concepts of molecular biology and the models and algorithms used to understand, classify and predict behaviour of living organism. This course is at the most basic level, where the main issues, mostly of molecular sequences, are studied.

Content
This course lies in the intersection between Computer Science and Molecular Biology. The main purpose is to study computational techniques, algorithms and data structures which are usually applied to solve problems in Molecular Biology and Biochemistry.

The following topics are likely to be covered: Introduction, mathematical models of evolution, protein and DNA sequence alignment and its meaning, phylogenetic tree construction, multiple sequence alignments, secondary structure prediction, molecular dynamics, threading, role of bioinformatics in drug design, etc. From the computer science point of view we concentrate our attention in practical solutions for the above problems. Biological knowledge is an asset but not a prerequisite.

529-0003-00L Advanced Quantum Chemistry W 7 credits 3G M. Reiher, S. Knecht

Abstract
Advanced, but fundamental topics central to the understanding of theory in chemistry and for solving actual chemical problems with a computer.

Examples are:
* Operators derived from principles of relativistic quantum mechanics
* Relativistic effects + methods of relativistic quantum chemistry
* Open-shell molecules + spin-density functional theory
* New electron-correlation theories

Objective
The aim of the course is to provide an in-depth knowledge of theory and method development in theoretical chemistry. It will be shown that this is necessary in order to be able to solve actual chemical problems on a computer with quantum chemical methods.

The relativistic re-derivation of all concepts known from (nonrelativistic) quantum mechanics and quantum-chemistry lectures will finally explain the form of all operators in the molecular Hamiltonian - usually postulated rather than deduced. From this, we derive operators needed for molecular spectroscopy (like those required by magnetic resonance spectroscopy), Implications of other assumptions in standard non-relativistic quantum chemistry shall be analyzed and understood, too. Examples are the Born-Oppenheimer approximation and the expansion of the electronic wave function in a set of pre-defined many-electron basis functions (Slater determinants). Overcoming these concepts, which are so natural to the theory of chemistry, will provide deeper insights into many-particle quantum mechanics. Also revisiting the workhorse of quantum chemistry, namely density functional theory, with an emphasis on open-shell electronic structures (radicals, transition-metal complexes) will contribute to this endeavor. It will be shown how these insights allow us to make more accurate predictions in chemistry in practice - at the frontier of research in theoretical chemistry.

Content
1) Introductory lecture: basics of quantum mechanics and quantum chemistry
2) Einstein's special theory of relativity and the (classical) electromagnetic interaction of two charged particles
3) Klein-Gordon and Dirac equation; the Dirac hydrogen atom
4) Numerical methods based on the Dirac-Fock-Coulomb Hamiltonian, two-component and scalar relativistic Hamiltonians
5) Response theory and molecular properties, derivation of property operators, Breit-Pauli-Hamiltonian
6) Relativistic effects in chemistry and the emergence of spin
7) Spin in density functional theory
8) New electron-correlation theories: Tensor network and matrix product states, the density matrix renormalization group
9) Quantum chemistry without the Born-Oppenheimer approximation

A set of detailed lecture notes will be provided, which will cover the whole course.

Literature
2) F. Schwabl, Quantenmechanik für Fortgeschrittene (QM II), Springer-Verlag, 1997 [english version available: F. Schwabl, Advanced Quantum Mechanics]
3) R. McWeeny: Methods of Molecular Quantum Mechanics, Academic Press, 1992

Note also the standard textbooks:
A) Szabo, N.S. Ostlund, Verlag, Dover Publications
B) L. N. Levine, Quantum Chemistry, Pearson

Prerequisites / notice
Strongly recommended (preparatory) courses are: quantum mechanics and quantum chemistry

401-5940-00L Seminar in Chemistry for CSE W 4 credits 2S P. H. Hünenberger, M. Reiher
The student will carry out a literature study on a topic of his or her liking or suggested by the supervisor in the area of computer simulation in chemistry, the results of which are to be presented both orally and in written form.

For more information: www.csms.ethz.ch/education/RW

**Fluid Dynamics**

One of the course units 151-0103-00L Fluid Dynamics II 151-0109-00L Turbulent Flows is compulsory. Students able to follow courses in German are advised to choose 151-0103-00L Fluid Dynamics II.

### Objective
Introduction to modern imaging techniques and post processing algorithms with special emphasis on flow analysis and visualization. Understanding of hardware and software requirements and solutions. Development of basic programming skills for (generic) imaging applications.

### Content
**Introduction to modern imaging techniques**: (Digital) Schlieren techniques, phase contrast imaging, interferometry, phase unwrapping. 
**Wall shear and heat transfer measurements**. Pattern recognition and feature extraction, proper orthogonal decomposition.

### Lecture notes
Available

### Prerequisites / notice
Prerequisites: Fluid dynamics I, Numerical Mathematics, programming skills.
Language: German on request.

<th>151-0213-00L</th>
<th>Fluid Dynamics with the Lattice Boltzmann Method</th>
<th>W 4 credits</th>
<th>3G</th>
<th>I. Karlin</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Abstract</strong></td>
<td>The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations. Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations. During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on. Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course). The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microflows among others. Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| **Objective** | The course builds upon three parts:  
I. Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.  
II. Theoretical basis of statistical mechanics and kinetic equations.  
III. Lattice Boltzmann method for real-world applications.  
The content of the course includes:  
1. Background: Elements of statistical mechanics and kinetic theory: Particle's distribution function, Liouville equation, entropy, ensembles; Kinetic theory: Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation.  
Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.  
3. Hands on: Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc).  
4. Practical issues of LBM for fluid dynamics simulations: Lattice Boltzmann simulations of turbulent flows; numerical stability and accuracy.  
5. Microflows: Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.  
6. Advanced lattice Boltzmann methods: Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.  
7. Introduction to LB models beyond hydrodynamics: Relativistic fluid dynamics; flows with phase transitions. |
| **Lecture notes** | Lecture notes on the theoretical parts of the course will be made available. Selected original and review papers are provided for some of the lectures on advanced topics. Handouts and basic code framework for implementation of the lattice Boltzmann models will be provided. |
| **Prerequisites / notice** | The course addresses mainly graduate students (MSc/Ph D) but BSc students can also attend. Language: German on request. |

This course provides an introduction and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degrees of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. Its a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

Robotics is often viewed from three perspectives: perception (sensing), manipulation (affecting changes in the world), and cognition (intelligence). Robotic systems integrate aspects of all three of these areas. This course provides an introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degrees of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. This course is a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

An introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degrees of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control.

The objectives of this course are:

- An introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degrees of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control.
- Lecture notes: The course will be taught in English.
- Prerequisites / notice: The course will be taught in English.

Topics covered in the lecture include:

- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

Lecture notes: No lecture notes, but slides will be made available on the course webpage.

Literature:

Prerequisites / notice: Solid basic knowledge in analysis, statistics and numerical methods for CSE. Experience in programming for solving the project tasks.

The goals of this course are to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

The objectives of this course are:

1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Content: Camera models and calibration, invariant features, Multi-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice: It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

The primary objective of this course is that the student deepens an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.
Content
The course consists of three parts: First, we will refresh and deepen the student's knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related design and control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in robotics. The last part finally covers different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.

Prerequisites / notice
The contents of the following ETH Bachelor lectures or equivalent are assumed to be known: Mechanics and Dynamics, Control, Basics in Fluid Dynamics.

401-5860-00L
Seminar in Robotics for CSE
W 4 credits 2S J. Buchli

Abstract
This course provides an opportunity to familiarize yourself with the advanced topics of robotics and mechatronics research. The study plan has to be discussed with the lecturer based on your specific interests and/or the relevant seminar series such as the IRIS's Robotics Seminars and BiRONZ lectures, for example.

Objective
The students are familiar with the challenges of the fascinating and interdisciplinary field of Robotics and Mechatronics. They are introduced in the basics of independent non-experimental scientific research and are able to summarize and to present the results efficiently.

Content
This 4 ECTS course requires each student to discuss a study plan with the lecturer and select minimum 10 relevant scientific publications to read through, or attend 5–10 lectures of the public robotics oriented seminars (e.g. Public robotics seminars such as the IRIS's Robotics Seminars http://www.iris.ethz.ch/iris/series/, and BiRONZ lectures http://www.birl.ethz.ch/bironz/index are good examples). At the end of semester, the results should be presented in an oral presentation and summarized in a report, which takes the discussion of the presentation into account.

Physics
For the field of specialization 'Physics' basic knowledge in quantum mechanics is required.

Number
Title
Type ECTS Hours Lecturers
402-0809-00L Introduction to Computational Physics W 8 credits 2V+2U H. J. Herrmann

Abstract
This course offers an introduction to computer simulation methods for physics problems and their implementation on PCs and super computers: classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell’s equation), Monte Carlo simulations, percolation, phase transitions.

Content

Prerequisites / notice
Lecture and exercise lessons in physics, exams in German or in English

402-0205-00L Quantum Mechanics I W 10 credits 3V+2U G. Blatter

Abstract
Introduction to non-relativistic single-particle quantum mechanics. In particular, the basic concepts of quantum mechanics, such as the quantisation of classical systems, wave functions and the description of observables as operators on a Hilbert space, and the formulation of symmetries will be discussed. Basic phenomena will be analysed and illustrated by generic examples.

Objective
Introduction to single-particle quantum mechanics. Familiarity with basic ideas and concepts (quantisation, operator formalism, Dirac notation, symmetries, perturbation theory) and generic examples and applications (bound states, tunneling, scattering states, in one- and three-dimensional settings). Ability to solve simple problems.

Content
Keywords: Schrödinger equation, basic formalism of quantum mechanics (states, operators, commutators, measuring process), symmetries (translations, rotations), quantum mechanics in one dimension, spherically symmetric problems in three dimensions, scattering theory, density matrices, Schrödinger-, Heisenberg-, Dirac-pictures, time reversal, perturbation theory, variational techniques, spin, addition of angular momenta, relation between QM and classical physics.

Deutsch

401-5810-00L Seminar in Physics for CSE W 4 credits 2S A. Soluyanov

Abstract
In this seminar the students present a talk on an advanced topic in modern theoretical or computational physics.

Computational Finance

For the field of specialization 'Computational Finance' basic knowledge in mathematics and computational methods is required.

Number
Title
Type ECTS Hours Lecturers
401-3913-01L Mathematical Foundations for Finance W 4 credits 3V+2U E. W. Farkas, M. Schweizer

Abstract
First introduction to main modelling ideas and mathematical tools from mathematical finance

Objective
This course gives a first introduction to the main modelling ideas and mathematical tools from mathematical finance. It aims at a double audience: mathematicians who want to learn the modelling ideas and concepts for finance, and non-mathematicians who need an introduction to the main tools from stochastics used in mathematical finance. The main emphasis will be on ideas, but important results will be given with (sometimes partial) proofs.

Content
Topics to be covered include
- financial market models in finite discrete time
- absence of arbitrage and martingale measures
- valuation and hedging in complete markets
- basics about Brownian motion
- stochastic integration
- stochastic calculus; Itô's formula, Girsanov transformation, Itô's representation theorem
- Black-Scholes formula

Lecture notes
Lecture notes will be sold at the beginning of the course.

Literature
Lecture notes will be sold at the beginning of the course. Additional (background) references are given there.

Prerequisites / notice
Prerequisites: Results and facts from probability theory as in the book "Probability Essentials" by J. Jacod and P. Protter will be used freely. Especially participants without a direct mathematics background are strongly advised to familiarise themselves with those tools before (or very quickly during) the course. (A possible alternative to the above English textbook are the (German) lecture notes for the standard course "Wahrscheinlichkeits theorie").

401-4657-00L Numerical Analysis of Stochastic Ordinary Differential Equations W 6 credits 3V+1U A. Jentzen

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 1228 of 1432
Alternative course title: "Computational Methods for Quantitative Finance: Monte Carlo and Sampling Methods"

Abstract
Course on numerical approximations of stochastic ordinary differential equations driven by Wiener processes. These equations have several applications, for example in financial option valuation. This course also contains an introduction to random number generation and Monte Carlo methods for random variables.

Objective
The aim of this course is to enable the students to carry out simulations and their mathematical convergence analysis for stochastic models originating from applications such as mathematical finance. For this the course teaches a decent knowledge of the different numerical methods, their underlying ideas, convergence properties and implementation issues.

Content
Generation of random numbers
Monte Carlo methods for the numerical integration of random variables
Stochastic processes and Brownian motion
Stochastic ordinary differential equations (SODEs)
Numerical approximations of SODEs
Multilevel Monte Carlo methods for SODEs
Applications to computational finance: Option valuation

Lecture notes
Lecture Notes will be available.

Literature

Prerequisites / notice
Prerequisites:
Mandatory: Probability and measure theory, basic numerical analysis and basics of MATLAB programming.

Financial Engineering (University of Zurich)
W 4.5 credits 3G University lecturers
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: MFOEC103
Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
This lecture is intended for students who would like to learn more on equity derivatives modelling and pricing.

Objective
Quantitative models for European option pricing (including stochastic volatility and jump models), volatility and variance derivatives, American and exotic options.

Content
After introducing fundamental concepts of mathematical finance including no-arbitrage, portfolio replication and risk-neutral measure, we will present the main models that can be used for pricing and hedging European options e.g. Black-Scholes model, stochastic and jump-diffusion models, and highlight their assumptions and limitations. We will cover several types of derivatives such as European and American options, Barrier options and Variance Swaps. Basic knowledge in probability theory and stochastic calculus is required. Besides attending class, we strongly encourage students to stay informed on financial matters, especially by reading daily financial newspapers such as the Financial Times or the Wall Street Journal.

Lecture notes
Script.

Prerequisites / notice
Basic knowledge of probability theory and stochastic calculus.

401-5820-00L
Seminar in Computational Finance for CSE
W 4 credits 2S D. Würtz

Abstract
The seminar establishes a guided self-study of original articles and advanced textbooks from the area of financial engineering. After an individual discussion with the seminar instructor each participant will deliver a 40 minutes talk (in English). Attendance during the entire semester is mandatory.

Objective

Content
Die Themen stammen aus den Gebieten Finanzmarktanalysen, Bewertung von Finanzmarktinstrumenten, Risiko Management, Portfolio Optimierung, Monte Carlo Methoden.

Literature
Papiere und Unterlagen werden in der ersten Semesterwoche verteilt.

Electromagnetics

Number Title Type ECTS Hours Lecturers
227-2037-00L Physical Modelling and Simulation W 5 credits 4G C. Hafner, J. Leuthold, J. Smajic

Abstract
Physical modelling plays an important role in the analysis and design of new structures, especially for micro and nano devices where fabrication and measurement are difficult. After the fundamentals of electromagnetics, mechanics, and thermodynamics, an introduction to the main concepts and most widely used codes for physical modelling is given and commercial codes are applied.
Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability 1) to select appropriate software, 2) to apply it for solving given problems, 3) to validate the results, 4) to interactively improve the models until sufficiently accurate results are obtained.

Since the fabrication and characterization of micro- and nanostructures is difficult, expensive, and time-consuming, numerical modelling drastically reduced the design process. Although many commercial software packages are available, it is important to know the drawbacks and difficulties of the numerical methods behind them and to be able to validate the results obtained with such packages.

First, an introduction to the fundamental equations and effects of electromagnetics, mechanics, and thermodynamics is given. This is important for understanding the problems to be analyzed and for validating results obtained from software packages. After this, the main concepts of numerical methods and of the most widely used codes for physical modelling are outlined and compared, which is essential for the adequate selection of software for solving given problems. After this, prominent commercial software packages are applied to various types of problems, ranging from electrodynamics to multiphysics. For becoming able to select appropriate software and to validate the results obtained, different commercial software packages will be used and compared during the exercises in form of small projects.

Typical optimization problems and their difficulties are outlined. Well-known deterministic search strategies, combinatorical minimization, and evolutionary algorithms are presented and compared. In engineering, optimization problems are often very complex. Therefore, new techniques based on the generalization and combination of known methods are discussed. To illustrate the procedure, various problems of practical interest are presented and solved with different optimization codes.

Lecture notes
PDF file see http://alphard.ethz.ch/hafner/Vorles/lect.htm

Prerequisites / notice
Lecture in the first half of the semester, exercises in form of small projects in the second half, presentation of the results in the last week of the semester.

The path of an analog signal in the transmitter to the digital world in a communication link and back to the analog world at the receiver is discussed. The lecture covers the fundamentals of all important optical and optoelectronic components in a fiber communication system. This includes the transmitter, the fiber channel and the receiver with the electronic digital signal processing elements.

An in-depth understanding on how information is transmitted from source to destination. Also the mathematical framework to describe the important elements will be passed on. Students attending the lecture will further get engaged in critical discussion on societal, economical and environmental aspects related to the on-going exponential growth in the field of communications.

* Chapter 1: Introduction: Analog/Digital conversion, The communication channel, Shannon channel capacity, Capacity requirements.  
* Chapter 4: The Receiver: Photodiodes, Receiver noise, Detector schemes (direct detection, coherent detection), Bit-error ratios and error estimations.  
* Chapter 5: Digital Signal Processing Techniques: Digital signal processing in a coherent receiver, Error detection techniques, Error correction coding.  
* Chapter 6: Pulse Shaping and Multiplexing Techniques: WDM/FDM, TDM, OFDM, Nyquist Multiplexing, OCDMA.  
* Chapter 7: Optical Amplifiers: Semiconductor Optical Amplifiers, Erbium Doped Fiber Amplifiers, Raman Amplifiers.

Lecture notes
Lecture notes are handed out.

Literature
Govind P. Agrawal; "Fiber-Optic Communication Systems"; Wiley, 2010

Prerequisites / notice

Various topics of electromagnetics, including electromagnetic theory, computational electromagnetics, electromagnetic wave propagation, applications from statics to optics. Traditional problems such as antennas, electromagnetic scattering, waveguides, resonators, etc. as well as modern topics such as photonic crystals, metamaterials, plasmonics, etc. are considered.

Knowledge of the fundamentals of electromagnetic theory, development and application of numerical methods for solving Maxwell equations, analysis and optimal design of electromagnetic structures

### Title
Continuum Mechanics

### Type
W

### ECTS
3 credits

### Hours
2V

### Lecturers
T. Gerya

In this course, students learn crucial partial differential equations (conservation laws) that are applicable to any continuum including the Earth’s mantle, core, atmosphere and ocean. The course will provide step-by-step introduction into the mathematical structure, physical meaning and analytical solutions of the equations. The course has a particular focus on solid Earth applications.

The goal of this course is to learn and understand few principal partial differential equations (conservation laws) that are applicable for analysing and modelling of any continuum including the Earth’s mantle, core, atmosphere and ocean. By the end of the course, students should be able to write, explain and analyse the equations and apply them for simple analytical cases. Numerical solving of these equations will be discussed in the Numerical Modelling I and II course running in parallel.
A provisional week-by-week schedule (subject to change) is as follows:

Week 1: The continuity equation
Theory: Definition of a geological media as a continuum. Field variables used for the representation of a continuum. Methods for definition of the field variables. Eulerian and Lagrangian points of view. Continuity equation in Eulerian and Lagrangian forms and their derivation. 
Exercise: Computing the divergence of velocity field.

Week 2: Density and gravity
Exercise: Computing density, thermal expansion and compressibility from an equation of state.

Week 3: Stress and strain
Theory: Definition and stresses. Definition of stress, strain and strain-rate tensors. Deviatoric stresses. Mean stress as a dynamic (nonlithostatic) pressure. Stress and strain rate invariants.
Exercise: Analysing strain rate tensor for solid body rotation.

Week 4: The momentum equation

Week 5: Viscous rheology of rocks
Theory: Solid-state creep of minerals and rocks as the major mechanism of deformation of the Earth's interior. Dislocation and diffusion creep mechanisms. Rheological equations for minerals and rocks. Effective viscosity and its dependence on temperature, pressure and strain rate. Formulation of the effective viscosity from empirical flow laws.
Exercise: Deriving viscous rheological equations for computing effective viscosities from empirical flow laws.

Week 6: The heat conservation equation
Exercise: Steady temperature profile in case of channel flow.

Week 7: Elasticity and plasticity

Week 9: Solving 2D heat conservation equation in case of constant thermal conductivity with explicit and implicit approaches.

Week 10: Solving 2D heat conservation equation in case of variable thermal conductivity with explicit and implicit approaches. Temperature advection with markers. Creating thermomechanical code by combining mechanical solution for 2D buoyancy driven flow with heat diffusion and advection based on marker-in-cell approach.

Week 11: Subgrid diffusion of temperature. Implementing subgrid diffusion to the thermomechanical code.

Week 12: Implementation of radioactive, adiabatic and shear heating to the thermomechanical code.

Week 13: Implementation of temperature-, pressure- and strain rate-dependent viscosity, temperature- and pressure-dependent density and temperature-dependent thermal conductivity to the thermomechanical code. Final project description.

GRADING will be based on homeworks (30%) and oral exams (70%).

Exam questions: http://www.erdw.ethz.ch/people/geophysics/tgerya/EXAM_QUESTIONS

GRADING will be based on weekly programming homeworks (50%) and a term project (50%) to develop an application of their choice to a more advanced level.
The course consists of three parts. We first introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Second, we employ these evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. Throughout the course, we tie the models and methods closely with applications, mainly in the field of epidemiology and population biology.

Attendees will apply these concepts to a number of applications yielding biological insight into:
* epidemiology
* pathogen evolution
* macroevolution of species

The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades.
**Literature**
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

**Prerequisites / notice**
Basic knowledge in linear algebra, analysis, and statistics.

- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- Modeling of crack propagation
- Introduction of advanced FE-Methods

Lecture notes yes

Literature

Prerequisites / notice
If we will have a large number of students, two dates for the exercises will be offered.

263-5001-00L Introduction to Finite Elements and Sparse Linear System Solving

Abstract
The finite element (FE) method is the method of choice for (approximately) solving partial differential equations on complicated domains. In the first third of the lecture, we give an introduction to the method. The rest of the lecture will be devoted to methods for solving the large sparse linear systems of equation that is typical for the FE method. We will consider direct and iterative methods.

Objective
Students will know the most important direct and iterative solvers for sparse linear systems. They will be able to determine which solver to choose in particular situations.

Content

I. THE FINITE ELEMENT METHOD

(1) Introduction, model problems.

(2) 1D problems. Piecewise polynomials in 1D.

(3) 2D problems. Triangulations. Piecewise polynomials in 2D.

(4) Variational formulations. Galerkin finite element method.

(5) Implementation aspects.

II. DIRECT SOLUTION METHODS

(6) LU and Cholesky decomposition.

(7) Sparse matrices.

(8) Fill-reducing orderings.

III. ITERATIVE SOLUTION METHODS

(9) Stationary iterative methods, preconditioning.

(10) Preconditioned conjugate gradient method (PCG).

(11) Incomplete factorization preconditioning.

(12) Multigrid preconditioning.

(13) Nonsymmetric problems (GMRES, BiCGstab).

(14) Indefinite problems (SYMMLQ, MINRES).

Literature

Prerequisites / notice
Prerequisites: Linear Algebra, Analysis, Computational Science.

The exercises are made with Matlab.
Content

1) Introduction, Statement of the problem, course structure, exercises, why Scientific DBs (SDBs) do not fit exactly the classical DB area. Hierarchy: File systems, data bases, knowledge bases and variations. Efficiency issues and how they differ from classical DB.

2) Relational DB used for scientific data, pros/cons Introduction to RDB, limitations of the model, basics of SQL, handling of metadata, examples of scientific use of RDBs.

3) Object Oriented DB. Rich structured objects are very appealing in SDB. OODB primitives and environments. OODB searching. Space and access time efficiency of OODBs.

4) Knowledge bases, key-value stores, ontologies, workflow-based architectures. WASA.

5) MapReduce / Hadoop

6) Storing and sharing mathematical objects, Open Math, its relation with OODB and Knowledge bases. Also the problem of chemical formula representation.

8) Semantic web, Resource Description Framework (RDF) triples, SparQL.

9) An ideal scenario (and the design of a toy system with most of the desired features for exploration and exercises).

12) Performance and space issues, various uses of compression, concurrency control. Hardware issues, clusters, Cloud computing, Crowd-sourcing.

13) Guest speaker: Ioannis Xenarios (UniProtKB/Swiss-Prot).

Literature

Several papers and online articles will be made available. There is no single textbook for this course. A significant amount of material will be delivered in the lectures making lecture attendance highly recommended.

<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss). The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>In this lecture we give an introduction to discrete event systems. We start out the course by studying popular models of discrete event systems, such as automata and Petri nets. In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply Markov chains and queueing theory for an understanding of the typical behavior of a system. In the last part of the course we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queuing.</td>

227-0197-00L Wearable Systems I
W 6 credits 4G G. Tröster, U. Blanke

Abstract
Context recognition in mobile communication systems like mobile phone and wearable computer will be studied using advanced methods from sensor data fusion, pattern recognition, statistics, data mining and machine learning. Context comprises the behavior of individuals and of groups, their activities as well as the local and social environment.

Objective
Future mobile systems will act as personal and cooperative assistant by providing the appropriate information and services. The systems consist of a smart phone which communicates with sensors on-body and in the environment. Context comprises user's behavior, his activities, his local and social environment.

In the data path from the sensor level to signal segmentation to the classification of the context, advanced methods of signal processing, pattern recognition and machine learning will be applied. Sensor data generated by crowdsourcing methods are integrated. The validation using MATLAB is followed by implementation and testing on a smart phone. Context recognition as the crucial function of mobile systems is the main focus of the course. Using MatLab the participants implement and verify the discussed methods also using a smart phone.

Content
The next generation of mobile communication systems are integrated in our clothes and act as personal and cooperative assistant providing information we need just now (see www.wearable.ethz.ch). Context recognition - what is the situation of the user, his activity, his environment, how is he doing, what are his needs - as the central functionality of mobile systems constitutes the focus of the course.

The main topics of the course include
- Sensor nets, sensor signal processing, data fusion, time series (segmentation, similarity measures), supervised learning (Bayes Decision Theory, Decision Trees, Random Forest, kNN-Methods, Support Vector Machine, Hidden Markov Models, Adaboost), clustering (k-means, dbscan, topic models)
- Crowdsourcing
- The exercises show concrete design problems like motion and gesture recognition using distributed sensors, detection of activity patterns and identification of the local environment.
- Presentations of the PhD students and the visit at the Wearable Computing Lab introduce in current research topics and international research projects.

Language: german/english (depending on the participants)

227-0447-00L Image Analysis and Computer Vision
W 6 credits 3V+1U G. Székely, O. Göksel, L. Van Gool

Abstract

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.
The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Lecture notes
Course material, Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice
Prerequisites:
- Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.
- The course language is English.

**227-0471-00L**
Information Theory I
W 6 credits 4G A. Lapidoth

Abstract
This course covers the basic concepts of information theory and communication theory. Topics covered include entropy rate of a source, mutual information, typical sequences, the asymptotic equipartition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

Objective
The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

Content
The entropy rate of a source, Typical sequences, the asymptotic equipartition property, the source coding theorem, Huffman coding, Antithetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity

Literature
T.M. Cover and J. Thomas, Elements of Information Theory (second edition)

Signal and Information Processing: Modeling, Filtering, Learning
W 6 credits 4G H.A. Loeliger

Abstract
Fundamentals in signal processing, detection/estimation, and machine learning.

I. Linear signal representation and approximation: Hilbert spaces, LMMSE estimation, regularization and sparseness.

Objective
The course is an introduction to some basic topics in signal processing, detection/estimation theory, and machine learning.

Content

Course language
English

**227-0627-00L**
Applied Computer Architecture
W 6 credits 4G A. Gunzinger

Abstract
This lecture gives an overview of the requirements and the architecture of parallel computer systems, performance, reliability and costs.

Objective
Understand the function, the design and the performance modeling of parallel computer systems.

Content
The lecture "Applied Computer Architecture" gives technical and corporate insights in the innovative Computer Systems/Architectures (CPU, GPU, FPGA, special processors) and their real implementations and applications. Often the designs have to deal with technical limits. Which computer architecture allows the control of the over 1000 magnets at the Swiss Light Source (SLS)? Which architecture is behind the alarm center of the Swiss Railway (SBB)? Which computer architectures are applied for driver assistance systems? Which computer architecture is hidden behind a professional digital audio mixing desk? How can data volumes about 30 TB/s, produced by a proton accelerator, be processed in real time? Can the weather forecast also be processed with GPUs? How can a good computer architecture be found? Which are the driving factors in successful computer architecture design?

Prerequisites
- local bachelors: course "Discrete-Time and Statistical Signal Processing" (5. Sem.)
- others: solid basics in linear algebra and probability theory

Literature
Lecture notes, Script and exercises sheets.

**252-0237-00L**
Concepts of Object-Oriented Programming
W 6 credits 3V+2U P. Müller

Abstract
Course that focuses on an in-depth understanding of object-oriented programming and compares designs of object-oriented programming languages. Topics include different flavors of type systems, inheritance models, encapsulation in the presence of aliasing, object and class initialization, program correctness, reflection

Objective
After this course, students will:
- Have a deep understanding of advanced concepts of object-oriented programming and their support through various language features.
- Be able to understand language concepts on a semantic level and be able to compare and evaluate language designs.
- Be able to learn new languages more rapidly.
- Be aware of many subtle problems of object-oriented programming and know how to avoid them.

Content
The main goal of this course is to convey a deep understanding of the key concepts of sequential object-oriented programming and their support in different programming languages. This is achieved by studying how important challenges are addressed through language features and programming idioms. In particular, the course discusses alternative language designs by contrasting solutions in programming languages such as C++, C#, Eiffel, Java, Python, and Scala. The course also introduces novel ideas from research languages that may influence the design of future mainstream languages.

The topics discussed in the course include among others:
- The pros and cons of different flavors of type systems (for instance, static vs. dynamic typing, nominal vs. structural, syntactic vs. behavioral typing)
- The key problems of single and multiple inheritance and how different languages address them
- Generic type systems, in particular, Java generics, C# generics, and C++ templates
- The situations in which object-oriented programming does not provide encapsulation, and how to avoid them
- The pitfalls of object initialization, exemplified by a research type system that prevents null pointer dereferencing
- How to maintain the consistency of data structures

Literature
Will be announced in the lecture.
### Prerequisites / notice

**Prerequisites:**
Mastering at least one object-oriented programming language (this course will NOT provide an introduction to object-oriented programming): programming experience

### 252-0417-00L

**Randomized Algorithms and Probabilistic Methods**  
**W**  
**7 credits**  
**3V+2U+1A**  
**A. Steger**

**Abstract**
Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks.

**Objective**
After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.

**Content**
Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas.

**Lecture notes**
Yes.

**Literature**

### 252-0527-00L

**Probabilistic Graphical Models for Image Analysis**  
**W**  
**4 credits**  
**3G**

**Abstract**
This course will focus on the algorithms for inference and learning with statistical models. We use a framework called probabilistic graphical models which include Bayesian Networks and Markov Random Fields.

**Objective**
Students will be introduced to probabilistic graphical models and will learn how to apply them to problems in image analysis and understanding. The focus will be to study various algorithms for inference and parameter learning.

**Literature**
Will be announced during the lecture.

### 252-0546-00L

**Physically-Based Simulation in Computer Graphics**  
**W**  
**4 credits**  
**2V+1U**  
**B. Solenthaler, B. Thomaszewski**

**Abstract**
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

**Objective**
The lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

**Content**
The lecture covers topics in physically-based modeling, such as particle systems, mass-spring models, finite difference and finite element methods. These approaches are used to represent and simulate deformable objects or fluids with applications in animated movies, 3D games and medical systems. Furthermore, the lecture covers topics such as rigid body dynamics, collision detection, and character animation.

**Prerequisites / notice**
Fundamentals of calculus and physics, basic concepts of algorithms and data structures, basic programming skills in C++. Knowledge on numerical mathematics as well as ordinary and partial differential equations is an asset, but not required.

### 401-4655-64L

**Numerical Analysis of High-Dimensional Problems for Uncertainty Quantification**  
**W**  
**6 credits**  
**3G**  
**C. Schwab**

**Abstract**
In many applications of mathematics, efficient numerical methods for PDEs on high dimensional state and/or parameter spaces is required. This course provides succinct surveys of recently developed numerical methods, their computer implementation for model problems, and elements of their mathematical analysis for the efficient approximation of high- and infinite-dimensional PDE problems.

**Content**
[not necessarily in order of appearance]

1. Infinite-Dimensional Analysis  
   - Probability spaces and measures,  
   - Tensor Products,  
   - Measures on function spaces,  
   - Covariance operators,  
   - PCA and KL-expansions,  
   - (generalized) polynomial chaos expansions,  
   - Kolmogoroff N-widths

2. Examples  
   - Parametric Approximation Problems,  
   - Parametric ODEs (biochemical reaction pathways),  
   - Parametric PDEs (diffusion problems with random coefficients),  
   - PDEs in Parametric Domains (Scattering from random obstacles).

4. Stochastic Galerkin Methods

5. Stochastic Collocation Methods  
   - Smolyak's algorithm and its generalizations; sparse, adaptive interpolation algorithms

6. Reduced Basis Methods

7. Monte Carlo Methods

8. Quasi-Monte Carlo Methods

9. Applications  
   - Bayesian Inverse Problems  
   - Shape Sensitivity Analysis of PDEs,  
   - Optimal Control of parametric ODEs and PDEs,  
   - Optimization of Parametric ODEs and PDEs.
Literature

Books and Surveys:

Prerequisites / notice

ETH BSc Math or equivalent

MATLAB (for MSc MATH)
or
Python and C/C++/MPI programming (MSc CSE).

401-3611-00L
Advanced Topics in Computational Statistics
4 credits
2V
M. H. Maathuis, M. Mächler

Abstract
This lecture covers selected advanced topics in computational statistics, including various classification methods, the EM algorithm, clustering, handling missing data, and graphical modelling.

Objective
Students learn the theoretical foundations of the selected methods, as well as practical skills to apply these methods and to interpret their outcomes.

Content
The course is roughly divided in three parts: (1) Supervised learning via (variations of) nearest neighbor methods, (2) the EM algorithm and clustering, (3) handling missing data and graphical models.

Lecture notes
Lecture notes.

Prerequisites / notice
We assume a solid background in mathematics, an introductory lecture in probability and statistics.

401-3627-00L
High-Dimensional Statistics
4 credits
2V
P. L. Bühlmann

Abstract
"High-Dimensional Statistics" deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed.

Knowledge of methods and basic theory for high-dimensional statistical inference

Objective
Knowledge of methods and basic theory for high-dimensional statistical inference

Content
Lasso and Group Lasso for high-dimensional linear and generalized linear models; Additive models and many smooth univariate functions; Non-convex loss functions and l1-regularization; Stability selection, multiple testing and construction of p-values; Undirected graphical modeling

Literature

Prerequisites / notice
Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

401-4623-00L
Time Series Analysis
6 credits
3G
R. Weismantel

Abstract
Statistical analysis and modeling of observations in temporal order, which exhibit dependence. Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. Implementations in the software R.

Objective
Understanding of the basic models and techniques used in time series analysis and their implementation in the statistical software R.

Content
This course deals with modeling and analysis of variables which change randomly in time. Their essential feature is the dependence between successive observations. Applications occur in geophysics, engineering, linear and generalized linear models, implementations in the software R.

Literature
A list of references will be distributed during the course.

Prerequisites / notice
Basic knowledge in probability and statistics.

401-3901-00L
Mathematical Optimization
11 credits
4V+2U
R. Weismantel

Abstract
Mathematical treatment of diverse optimization techniques.

Objective
Advanced optimization theory and algorithms.
## Content

1. Linear optimization: The geometry of linear programming, the simplex method for solving linear programming problems, Farkas' Lemma and infeasibility certificates, duality theory of linear programming.

3. Integer optimization: Ties between linear and integer optimization, total unimodularity, complexity theory, cutting plane theory.

4. Combinatorial optimization: Network flow problems, structural results and algorithms for matroids, matchings and, more generally, independence systems.

### 402-0867-00L Programming Techniques for Scientific Simulations II

<table>
<thead>
<tr>
<th>W</th>
<th>6 credits</th>
<th>3G</th>
<th>M. Troyer</th>
</tr>
</thead>
</table>

**Abstract**

This course covers advanced general and C++ programming techniques relevant for scientific simulations.

**Content**

- generic algorithm and library design
- exception safety
- smart pointers and safe memory handling
- polymorphism at compile time, at run time and hybrid designs
- mixed language programs, in particular C++, C, Fortran and Python, and the Boost, Python library
- template meta programming and relevant libraries
- C++ libraries for parallel programming on distributed and shared memory machines
- Useful C++ libraries from Boost and other sources

### 402-0777-00L Particle Accelerator Physics and Modeling I

<table>
<thead>
<tr>
<th>W</th>
<th>6 credits</th>
<th>2V+1U</th>
<th>A. Adelmann</th>
</tr>
</thead>
</table>

**Abstract**

This is the first of two courses, introducing particle accelerators from a theoretical point of view and covers state-of-the-art modeling techniques. It emphasizes the multidisciplinary aspect of the field, both in methodology (numerical and computational methods) and with regard to applications such as medical, industrial, material research and particle physics.

**Objective**

You understand the building blocks of particle accelerators. Modern analysis tools allows you to model state-of-the-art particle accelerators. In some of the exercises you will be confronted with next generation machines. We will develop a Python simulation tool (AcceLEGOrator) that reflects the theory from the lecture.

**Content**

- Particle Accelerators an Overview
- Relativity for Accelerator Physicists
- Building Blocks of Particle Accelerators
- Lie Algebraic Structure of Classical Mechanics and Applications to Particle Accelerators
- Symplectic Maps & Analysis of Maps
- Particle Tracking
- Linear & Circular Machines
- Cyclotrons
- Free Electron Lasers
- Collective effects in linear approximation
- Preview of Particle Accelerator Physics and Modeling II

**Literature**

Particle Accelerator Physics, H. Wiedemann, ISBN-13 978-3-540-49043-2, Springer

**Prerequisites / notice**

Physics, Computational Science (RW) at BSc. Level

This lecture is also suited for PhD. students

### 401-7855-00L Computational Astrophysics (University of Zurich)

<table>
<thead>
<tr>
<th>W</th>
<th>6 credits</th>
<th>2V</th>
<th>L. M. Mayer</th>
</tr>
</thead>
</table>

**Objective**

Acquire knowledge of main methodologies for computer-based models of astrophysical systems, the physical equations behind them, and train such knowledge with simple examples of computer programmes

**Content**

1. Integration of ODE, Hamiltonians and Symplectic integration techniques, time adaptivity, time reversibility
2. Large-N gravity calculation, collisionless N-body systems and their simulation
3. Fast Fourier Transform and spectral methods in general
4. Eulerian Hydrodynamics: Upwinding, Riemann solvers, Limiters
5. Lagrangian Hydrodynamics: The SPH method
6. Resolution and instabilities in Hydrodynamics
7. Initial Conditions: Cosmological Simulations and Astrophysical Disks
8. Physical Approximations and Methods for Radiative Transfer in Astrophysics

**Literature**

Galactic Dynamics (Binney & Tremaine, Princeton University Press),
Computer Simulation using Particles (Hockney & Eastwood CRC press),
Targeted journal reviews on computational methods for astrophysical fluids (SPH, AMR, moving mesh)

**Prerequisites / notice**

Some knowledge of UNIX, scripting languages (see www.physik.uzh.ch/lectures/informatik/python/ as an example), some prior experience programming, knowledge of C, C++ beneficial

### 227-1033-00L Neuromorphic Engineering I

<table>
<thead>
<tr>
<th>W</th>
<th>6 credits</th>
<th>2V+3U</th>
<th>T. Delbrück, G. Indiveri, S.C. Liu</th>
</tr>
</thead>
</table>

**Abstract**

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

**Objective**

Understanding the characteristics of neuromorphic circuit elements.
Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

227-1037-00L Introduction to Neuroinformatics W 6 credits 2V+1U K. A. Martin, M. Cook, V. Mante, M. Pfeiffer

Abstract The course provides an introduction to the fundamental properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

Objective Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

Content This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

151-0104-00L Uncertainty Quantification for Engineering & Life Sciences W 4 credits 3G J. Beck, P. Koumoutsakos

Abstract Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Lecture notes The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Literature
1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes
3. Class Notes

Prerequisites / notice Fundamentals of Probability, Fundamentals of Computational Modeling

327-1201-00L Transport Phenomena I W 4 credits 4G H. C. Öttinger

Abstract Phenomenological approach to “Transport Phenomena” based on balance equations supplemented by thermodynamic considerations to formulate the undefined fluxes in the local species mass, momentum, and energy balance equations; fundamentals, applications, and simulations

Objective The teaching goals of this course are on five different levels:
(1) Deep understanding of fundamentals: local balance equations, constitutive equations for fluxes, entropy balance, interfaces, idea of dimensionless numbers, ...
(2) Ability to use the fundamental concepts in applications
(3) Insight into the role of boundary conditions
(4) Knowledge of a number of applications
(5) Flavours of numerical techniques: finite elements, finite differences, lattice Boltzmann, Brownian dynamics, ...

Content Approach to Transport Phenomena
- Diffusion Equation
- Brownian Dynamics
- Refreshing Topics in Equilibrium Thermodynamics
- Balance Equations
- Forces and Fluxes
- Measuring Transport Coefficients
- Pressure-Driven Flows
- Heat Exchangers
- Complex Fluids

Lecture notes A detailed manuscript is provided; this manuscript will be developed into a book entitled “A Modern Course in Transport Phenomena” by David C. Venerus and Hans Christian Öttinger

Target audience:
Third year Bachelor students;
Master students who cannot document to have received an adequate training in working scientifically.

Mandatory for all Bachelor and Master students with matriculation in the autumn semester 2014 or later.
Optional for Bachelor and Master students with matriculation until or before the spring semester 2014.
Example: You matriculated in the autumn semester 2013 into the first semester of the Bachelor programme, are now in the third year and plan to matriculate in the autumn semester 2016 into the first semester of the Master programme. In this case, you don’t need “Scientific Works in Mathematics” in order to complete the Bachelor degree, but for the Master degree you will need it. In this case, we recommend that you register for “Scientific Works in Mathematics” in the autumn semester 2015 or spring semester 2016.

Directive

Abstract
Introduction to scientific writing for students with focus on publication standards and ethical issues, especially in the case of citations (references to works of others.)
Objective
Learn the basic standards of scientific works in mathematics.

Content
- Types of mathematical works
- Publication standards in pure and applied mathematics
- Data handling
- Ethical issues
- Citation guidelines

Lecture notes
Moodle of the Mathematics Library: https://moodle-app2.let.ethz.ch/course/view.php?id=519

Prerequisites / notice
This course is completed by the optional course "Recherchieren in der Mathematik" (held in German) by the Mathematics Library. For more details see: http://www.math.ethz.ch/library/services/schulungen

401-4990-01L Master's Thesis O 30 credits 57D Professors
Only students who fulfil the following criteria are allowed to begin with their master's thesis:
a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.
For Programme Regulations 2014 there are additional requirements.

No direct enrolment to this course unit in myStudies.
Please fill in the online application form.
Requirements and application form under
www.math.ethz.ch/intranet/students/study-administration/theses.html
(Afterwards the enrolment will be done by the Study Administration.)

Abstract
The master's thesis concludes the study programme. Thesis work should prove the students' ability to independent, structured and scientific working.

Objective
Thesis work should prove the students' ability to independent, structured and scientific working.

Colloquia

Number Title Type ECTS Hours Lecturers

Abstract
Research colloquium

Course Units for Additional Admission Requirements

The courses below are only available for MSc students with additional admission requirements.

Number Title Type ECTS Hours Lecturers
151-0122-AAL Fluid Dynamics for CSE E- 5 credits 11R T. Rösgen

Abstract
An introduction to the physical and mathematical foundations of fluid dynamics is given.
Topics include dimensional analysis, integral and differential conservation laws, inviscid and viscous flows, Navier-Stokes equations, boundary layers, turbulent pipe flow. Elementary solutions and examples are presented.

Objective
An introduction to the physical and mathematical principles of fluid dynamics. Fundamental terminology/principles and their application to simple problems.

Content
Phänomene, Anwendungen, Grundfragen
Dimensionsanalyse und Ähnlichkeit; Kinematische Beschreibung; Erhaltungssätze (Masse, Impuls, Energie), integrale und differentielle Formulierungen; Reibungsfreie Strömungen: Euler-Gleichungen, Stromfadentheorie, Satz von Bernoulli; Reibungsbehaftete Strömungen: Navier-Stokes-Gleichungen; Grenzschichten; Turbulenz

Lecture notes
Eine erweiterte Formelsammlung zur Vorlesung wird elektronisch zur Verfügung gestellt.

Literature
Empfohlenes Buch: Fluid Mechanics, P. Kundu & I. Cohen, Elsevier

Prerequisites / notice
Performance Assessment: session examination
Allowed aids:
Textbook (free selection, list of assignments), list of formulars IFD, 8 Sheets (=4 Pages) own notes, calculator

406-0353-AAL Analysis III E- 4 credits 9R A. Iozzi

Abstract
Introduction to partial differential equations. Differential equations which are important in applications are classified and solved. Elliptic, parabolic and hyperbolic differential equations are treated. The following mathematical tools are introduced: Laplace transforms, Fourier series, separation of variables, methods of characteristics.

Objective
Mathematical treatment of problems in science and engineering. To understand the properties of the different types of partial differential equations.
Content

Laplace Transforms:
- Laplace Transform, Inverse Laplace Transform, Linearity, s-Shifting
- Transforms of Derivatives and Integrals, ODEs
- Unit Step Function, t-Shifting
- Short Impulses, Dirac’s Delta Function, Partial Fractions
- Convolution, Integral Equations
- Differentiation and Integration of Transforms

Fourier Series, Integrals and Transforms:
- Fourier Series
- Functions of Any Period p=2L
- Even and Odd Functions, Half-Range Expansions
- Forced Oscillations
- Approximation by Trigonometric Polynomials
- Fourier Integral
- Fourier Cosine and Sine Transform

Partial Differential Equations:
- Basic Concepts
- Modeling: Vibrating String, Wave Equation
- Solution by separation of variables; use of Fourier series
- D’Alembert Solution of Wave Equation, Characteristics
- Heat Equation: Solution by Fourier Series
- Heat Equation: Solutions by Fourier Integrals and Transforms
- Modeling Membrane: Two Dimensional Wave Equation
- Laplacian in Polar Coordinates: Circular Membrane, Fourier-Bessel Series
- Solution of PDEs by Laplace Transform

Fourier Series, Integrals and Transforms:
- Fourier Series
- Functions of Any Period p=2L
- Even and Odd Functions, Half-Range Expansions
- Forced Oscillations
- Approximation by Trigonometric Polynomials
- Fourier Integral
- Fourier Cosine and Sine Transform

Prerequisites / notice
Up-to-date information about this course can be found at:

Stochastics (Probability and Statistics)

Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

Objective
The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

Content
From "Statistics for research" (online)
Ch 1: The Role of Statistics
Ch 2: Populations, Samples, and Probability Distributions
Ch 3: Binomial Distributions
Ch 4: Binomial Distributions
Ch 6: Sampling Distribution of Averages
Ch 7: Normal Distributions
Ch 8: Student’s t Distribution
Ch 9: Distributions of Two Variables

From "Introductory Statistics with R" (online)
Ch 1: Basics
Ch 2: The R Environment
Ch 3: Probability and distributions
Ch 4: Descriptive statistics and tables
Ch 5: One- and two-sample tests
Ch 6: Regression and correlation

Numerical Methods for CSE

Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
Introduction into fundamental techniques and algorithms of numerical mathematics which play a central role in numerical simulations in science and technology.

Objective
* Knowledge of the fundamental algorithms in numerical mathematics
* Knowledge of the essential terms in numerical mathematics and the techniques used for the analysis of numerical algorithms
* Ability to choose the appropriate numerical method for concrete problems
* Ability to interpret numerical results
* Ability to implement numerical algorithms efficiently

Literature

For reference/complement of the Analysis I/II courses:
Christian Blatter: Ingenieur-Analysis (Download PDF)
Content

The course will cover the following chapters:

1. Direct Methods for linear systems of equations
2. Interpolation
3. Iterative Methods for non-linear systems of equations
4. Krylov methods for linear systems of equations
5. Eigensolvers
6. Least Squares Techniques
7. Filtering Algorithms
8. Approximation of Functions
9. Numerical Quadrature
10. Clustering Techniques
11. Single Step Methods for ODEs
12. Stiff Integrators

Lecture notes

Comprehensive lecture materials are available upon request from the lecturer.

Prerequisites / notice

Solid knowledge about fundamental concepts and techniques from linear algebra & calculus as taught in the first year of science and engineering curricula.

252-0232-AAL Software Design

Enrolment only for MSc students who need this course as additional admission requirement.

Abstract

The course Software Design presents and discusses design patterns regularly used to solve problems in object oriented design and object oriented programming. The presented patterns are illustrated with examples from the Java libraries and are applied in a project.

Objective

- The students
- know the principles of object oriented programming and can apply these.
- know the most important object oriented design patterns.
- can apply design patterns to solve design problems.
- discover in a given design the use of design patterns.

529-0483-AAL Statistical Physics and Computer Simulation

Enrolment only for MSc students who need this course as additional requirement.

Abstract

Principles and applications of statistical mechanics and equilibrium molecular dynamics, Monte Carlo simulation, Stochastic dynamics. Exercises using a MD simulation program to generate ensembles and subsequently calculate ensemble averages.

Objective

Introduction to statistical mechanics with the aid of computer simulation, development of skills to carry out statistical mechanical calculations using computers and interpret the results.

Content

Principles and applications of statistical mechanics and equilibrium molecular dynamics, Monte Carlo simulation, Stochastic dynamics. Exercises using a MD simulation program to generate ensembles and subsequently calculate ensemble averages.

Literature

available

Prerequisites / notice

additional information will be provided in the first lecture.

**Abstract**
Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

**Objective**
The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

**Content**
Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

**Lecture notes**
The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

**Literature**
1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes
3. Class Notes

**Prerequisites / notice**
Fundamentals of Probability, Fundamentals of Computational Modeling

**Abstract**
This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering.

**Objective**
Introduction to HPC for scientists and engineers Fundamental of:
1. Parallel Computing Architectures
2. MultiCores
3. ManyCores

**Content**
Programming models and languages:
1. C++ threading (2 weeks)
2. OpenMP (4 weeks)
3. MPI (5 weeks)

Computers and methods:
1. Hardware and architectures
2. Libraries
3. Particles: N-body solvers
4. Fields: PDEs
5. Stochastics: Monte Carlo

**Lecture notes**

**Abstract**
This course provides a comprehensive overview of embedded control systems. The concepts introduced are implemented and verified on a microprocessor-controlled haptic device.

**Objective**
Familiarize students with main architectural principles and concepts of embedded control systems.
This intensive two-week block course the students are presented the principles of embedded digital control systems using a haptic device as an example for a mechatronic system. A haptic interface allows for a human to interact with a computer through the sense of touch.

Subjects covered in lectures and practical lab exercises include:
- The application of C-programming on a microprocessor
- Digital I/O and serial communication
- Quadrature decoding for wheel position sensing
- Queued analog-to-digital conversion to interface with the analog world
- Pulse width modulation
- Timer interrupts to create sampling time intervals
- System dynamics and virtual worlds with haptic feedback
- Introduction to rapid prototyping

This course is restricted to 33 students due to limited lab infrastructure. Interested students please contact Marianne Schmid (E-Mail: schmid@idsc.mavt.ethz.ch) and after your reservation has been confirmed please register online at www.mystudies.ethz.ch.

Detailed information can be found on the course website http://www.idsc.ethz.ch/education/lectures/embedded-control-systems.html

The course content will be taught in English.

Lecture notes
The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be available electronically.

Prerequisites / notice
Lecture notes, lab instructions, supplemental material

Prerequisite courses are Control Systems I and Informatics I.

This course provides an introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, and vision, with control. This course is a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

The lecture will be taught in English.

Lecture notes
The course notes are available.

Prerequisites / notice
The course will be taught in English.

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: BMINF010

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: BMINF010

Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

The objective of this course is to expose students to the fundamentals of the emerging field of robotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Lecture notes
The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

Prerequisites / notice
The course will be taught in English.

This course provides an introduction to the fundamentals of the field, including rigid motions, homogeneous transformations, and vision, with control. This course is a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

The lecture will be taught in English.

**Abstract**

We will provide an overview on how to kinematically and dynamically model typical robotic systems such as robot arms, legged robots, rotary wing systems, or fixed wing.

**Objective**

The primary objective of this course is that the student deepens an applied understanding of how to model the most common robotic systems. The student receives a solid background in kinematics, dynamics, and rotations of multi-body systems. On the basis of state of the art applications, he/she will learn all necessary tools to work in the field of design or control of robotic systems.

**Content**

The course consists of three parts: First, we will refresh and deepen the student’s knowledge in kinematics, dynamics, and rotations of multi-body systems. In this context, the learning material will build upon the courses for mechanics and dynamics available at ETH, with the particular focus on their application to robotic systems. The goal is to foster the conceptual understanding of similarities and differences among the various types of robots. In the second part, we will apply the learned material to classical robotic arms as well as legged systems and discuss kinematic constraints and interaction forces. In the third part, focus is put on modeling fixed wing aircraft, along with related design and control concepts. In this context, we also touch aerodynamics and flight mechanics to an extent typically required in robotics. The last part finally covers different helicopter types, with a focus on quadrotors and the coaxial configuration which we see today in many UAV applications. Case studies on all main topics provide the link to real applications and to the state of the art in robotics.

<td>Discrete Event Systems</td>
<td>W 6 credits</td>
<td>4G</td>
<td>L. Thiele, L. Vanbever, R. Wattenhofer</td>
</tr>
</tbody>
</table>

**Abstract**

Introduction to discrete event systems. We start out by studying popular models of discrete event systems. In the second part of the course we analyze discrete event systems from an average-case and from a worst-case perspective. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Network Calculus.

**Objective**

Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g., hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by studying popular models of discrete event systems, such as automata and Petri nets. In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply Markov chains and queuing theory for an understanding of the typical behavior of a system. In the last part of the course we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queuing.

**Content**

1. Introduction
2. Automata and Languages
3. Smarter Automata
4. Specification Models
5. Stochastic Discrete Event Systems
6. Worst-Case Event Systems
7. Network Calculus

**Lecture notes**

Available
Process automation, concept of control. Modelling of dynamical systems - examples, state space description, linearisation, study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of control systems for single input - single output and multivariable systems.

Basics of the switching behavior, gate drive and snubber circuits of power semiconductors and auxiliary circuits for minimizing the switching losses are explained. Furthermore, the course should convey knowledge on the switching frequency related losses of power semiconductors and inductive power components and introduce the concept of space vector calculus which provides a basis for the comprehensive discussion of three-phase PWM converter systems in the lecture Power Electronic Systems II.

MATLAB is used for system analysis and simulation.

Lecture notes
Slides can be downloaded from the course website. A printed version with additional content is offered via SPOD (student print on demand) for a fee (ca. 10-15 CHF).

Literature

Prerequisites / notice
Prerequisites: Signal and Systems Theory II.
Objective
The course provides advanced knowledge in the design of complex computer systems, in particular embedded systems. Models and methods are discussed that are fundamental for systems that consist of software and hardware components. Practical examples will illustrate some topics, especially some control software coding using industry standard programming tools based on IEC61131-3.

Material for exercises, copies of transparencies.
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the

No lecture notes, but slides will be made available on the course webpage.

This course will focus on the algorithms for inference and learning with statistical models. We use a framework called probabilistic graphical models which include Bayesian Networks and Markov Random Fields.

We will use examples from traditional vision problems such as image registration and image segmentation, as well as recent problems such as object recognition.

Students will be introduced to probabilistic graphical models and will learn how to apply them to problems in image analysis and understanding. The focus will be to study various algorithms for inference and parameter learning.

Will be announced during the lecture.

- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher’s LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

No lecture notes, but slides will be made available on the course webpage.

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Solid basic knowledge in analysis, statistics and numerical methods for CSE. Experience in programming for solving the project tasks.

Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory.

Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.

The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don’t care about others, and the same is true for computational load or download rates. Game theory provides a particularly well-suited model for the behaviour and interaction of such selfish users and programs. Classical game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

- Introduction to classical game theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- The cost difference between an optimum under central control and an equilibrium under selfish agents, known as the “price of anarchy”.
- Auction-like mechanisms and algorithms that “direct” the actions of selfish agents into a certain desired equilibrium situation.
- Selected current research topics of Algorithmic Game Theory, such as Web-Search Based Keyword Auctions, or Information Cascading in Social Networks

No lecture notes.
The course provides an introduction to the field of human-computer interaction, emphasising the central role of the user in system design.

Advanced Topics in Machine Learning

"Game Theory and Strategy", Philip D. Straffin, The Mathematical Association of America, 5th printing, 2004

Several copies of both books are available in the Computer Science library.

Audience: Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.

Requirements: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.

252-3110-00L Human Computer Interaction

Abstract
The course provides an introduction to the field of human-computer interaction, emphasising the central role of the user in system design. Through detailed case studies, students will be introduced to different methods used to analyse the user experience and shown how these can inform the design of new interfaces, systems and technologies.

Objective
The goal of the course is that students should understand the principles of user-centred design and be able to apply these in practice.

Content
The course will introduce students to various methods of analysing the user experience, showing how these can be used at different stages of system development from requirements analysis through to usability testing. Students will get experience of designing and carrying out user studies as well as analysing results. The course will also cover the basic principles of interaction design. Practical exercises related to touch and gesture-based interaction will be used to reinforce the concepts introduced in the lecture. To get students to further think beyond traditional system design, we will discuss issues related to ambient information and awareness.

252-5051-00L Advanced Topics in Machine Learning

Abstract
In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine learning.

Objective
The seminar "Advanced Topics in Machine Learning" familiarizes students with recent developments in pattern recognition and machine learning. Original articles have to be presented and critically reviewed. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar presentation is to summarize the essential ideas of the paper in sufficient depth while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations.

Content
The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.

252-5701-00L Advanced Topics in Computer Graphics and Vision

Abstract
This seminar covers advanced topics in computer graphics, such as modeling, rendering, animation, real-time graphics, physical simulation, and computational photography. Each time the course is offered, a collection of research papers is selected and each student presents one paper to the class and leads a discussion about the paper and related topics.

Objective
The goal is to get an in-depth understanding of actual problems and research topics in the field of computer graphics as well as improve presentations and critical analysis skills.

Content
This seminar covers advanced topics in computer graphics, including both seminal research papers as well as the latest research results. Each time the course is offered, a collection of research papers are selected covering topics such as modeling, rendering, animation, real-time graphics, physical simulation, and computational photography. Each student presents one paper to the class and leads a discussion about the paper and related topics. All students read the papers and participate in the discussion.

263-5210-00L Probabilistic Artificial Intelligence

Abstract
This course introduces core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as sensor networks, robotics, and the Internet.

Objective
How can we build systems that perform well in uncertain environments and unforeseen situations? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as sensor networks, robotics, and the Internet. The course is designed for upper-level undergraduate and graduate students.

Content
Topics covered:
- Search (BFS, DFS, A*), constraint satisfaction and optimization
- Tutorial in logic (propositional, first-order)
- Probability
- Bayesian Networks (models, exact and approximate inference, learning) - Temporal models (Hidden Markov Models, Dynamic Bayesian Networks)
- Probabilistic planning (MDPs, POMDPs)
- Reinforcement learning
- Combining logic and probability

Prerequisites / notice
Solid basic knowledge in statistics, algorithms and programming

263-2600-00L Robotics Programming Laboratory

Number of participants limited to 18.
The course is open to students of computer science, electrical engineering, and mechanical engineering background (although students from other departments will be considered).

In the Master Programme max. 10 credits can be accounted by Labs on top of the Interfocus Courses. Additional Labs will be listed on the Addendum.
Virtual Reality has the potential to support medical training and therapy. This lecture will derive the technical principles of multi-modal input devices, displays, and rendering techniques. Examples are presented in the fields of surgical training, intra-operative augmentation, and rehabilitation. The lecture is accompanied by practical courses and excursions.

Prerequisites / notice
Students will program Thymio II educational robot with a Carmine 1.09 RGBD camera as the sensor.

Combination of lectures and a semester-long project.

263-5902-00L Computer Vision W 6 credits 3V+1U+1A M. Pollefeys, L. Van Gool
Abstract
The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Objective
The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve these.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Content
Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice
Prior programming experience required. Object-oriented programming (especially Eiffel and C++) strongly recommended. Experience with Linux helpful.

Limited to 18 students.

- Expected to work both individually and in teams of 2-3 students

263-1279-00L Virtual Reality in Medicine ■ W 3 credits 2V R. Riener, M. Harders
Abstract
Virtual Reality has the potential to support medical training and therapy. This lecture will derive the technical principles of multi-modal (audiovisual, haptic, tactile etc.) input devices, displays and rendering techniques. Examples are presented in the fields of surgical training, intra-operative augmentation, and rehabilitation. The lecture is accompanied by practical courses and excursions.

Objective
Provide theoretical and practical knowledge of new principles and applications of multi-modal simulation and interface technologies in medical education, therapy, and rehabilitation.

Content
Virtual Reality has the potential to provide descriptive and practical information for medical training and therapy while relieving the patient and/or the physician. Multi-modal interactions between the user and the virtual environment facilitate the generation of high-fidelity sensory impressions, by using not only visual and auditory modalities, but also kinesthetic, tactile, and even olfactory feedback. On the basis of the existing physiological constraints, this lecture will derive the technical requirements and principles of multi-modal input devices, displays, and rendering techniques. Several examples are presented that are currently being developed or already applied for surgical training, intra-operative augmentation, and rehabilitation. The lecture will be accompanied by several practical courses on graphical and haptic display devices as well as excursions to facilities equipped with large-scale VR equipment.

Target Group:
Students of higher semesters and PhD students of:
- D-HEST, D-MAVT, D-ITET, D-INFK, D-PHYS
- Robotics, Systems and Control Master
- Biomedical Engineering/Movement Science and Sport
- Medical Faculty, University of Zurich

Students of other departments, faculties, courses are also welcome!

Literature

Prerequisites / notice
The course language is English.

Basic experience in Information Technology and Computer Science will be of advantage

More details will be announced in the lecture.

376-1504-00L Physical Human Robot Interaction (pHRI) ■ W 4 credits 2V+2U R. Gassert, O. Lamercy, R. Riener
Number of participants limited to 26.

Abstract
This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems.

Objective
The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and de- sign safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the defined design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.
Content

This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and safety and stability analysis, safety hardware and protocols. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, reading on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Students will attend periodic laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the safety features of haptic device design will be identified and theoretical aspects are organized into lectures that aim to bring students up to speed with the basics of these systems, reading on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Lecture notes

Will be distributed through the document repository before the lectures.

http://www.relab.ethz.ch/education/courses/phri.html

Literature

Prerequisites / notice

Notice:
The registration is limited to 26 students
There are 4 credit points for this lecture.
The lecture will be held in English.
The students are expected to have basic control knowledge from previous classes.

Computational Systems Biology

W

6 credits

3V+2U

J. Stelling

Objective

The aim of this course is to provide an introductory overview of mathematical and computational tools for the modeling, simulation and analysis of biological networks. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of mathematical and computational tools for the modeling, simulation and analysis of biological networks.

Content

Biological systems have witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label “Systems Biology”, focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) quantitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

</table>

**Abstract**

The subject of the Semester Project and the choice of the supervisor (ETH-professor) are to be approved in advance by the tutor.

**Objective**

The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

**Abstract**

Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

**Objective**

The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem.

<tr>
<td>Objective</td>
<td>Public policies result from decision-making processes that take place within formal institutions of the state (parliament, government, public administration, courts). That is, policies are shaped by the characteristics of decision-making processes and the characteristics of public institutions and related actors (e.g. interest groups). In this course, students acquire the contextual knowledge for analyzing public policies. They learn why and how public policies and laws are developed, designed, and implemented at national and international levels. The course is organized in three modules. The first module (Stefan Bechtold) examines basic concepts and the role of law, law-making, and law enforcement in modern societies. The second module (Thomas Bernauer) deals with the functioning of legislatures, governments, and interest groups. The third module (Frank Schimmelfennig) focuses on the European Union and international organisations.</td>

<td>Abstract</td>
<td>The lectures will introduce students to the principles of quantitative policy analysis, namely the methods to predict and evaluate the social, economic, and environmental effects of alternative strategies to achieve public objectives. A series of graded assignments will give students an opportunity for students to apply those methods to a set of case studies</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The objectives of this course are to develop the following key skills necessary for policy analysts:  - Identifying the critical quantitative factors that are of importance to policy makers in a range of decision-making situations. - Developing conceptual models of the types of processes and relationships governing these quantitative factors, including stock-flow dynamics, feedback loops, optimization, sources and effects of uncertainty, and agent coordination problems. - Develop and program numerical models to simulate the processes and relationships, in order to identify policy problems and the effects of policy interventions.  - Communicate the findings from these simulations and associated analysis in a manner that makes transparent their theoretical foundation, the level and sources of uncertainty, and ultimately their applicability to the policy problem. The course will proceed through a series of policy analysis and modeling exercises, involving real-world or hypothetical problems. The specific examples around which work will be done will concern the environment, energy, health, and natural hazards management.</td>

Abstract
This course introduces the mathematical software package MATLAB.

Objective
The students should learn how to use MATLAB as a tool to solve various scientific problems. MATLAB is an integrated environment with a high level programming language which makes it possible to quickly find numerical solutions to a wide range of scientific problems. Furthermore, it includes a rich set of tools for graphically presenting the results.

After the students have learned the basic structure of the programming language, they should be able to implement social simulation models in MATLAB and document their skills by a seminar thesis, a coding project and finally give a short oral presentation.

351-0778-01L Discovering Management (Exercises)

**Prerequisite:** Participation and successful completion of the module Discovering Management (351-0778-00L) is mandatory.

Abstract
This course is offered complementary to the basis course 351-0778-00L, “Discovering Management”. The course offers additional exercises and case studies.

Objective
This course is offered to complement the course 351-0778-00L. The course offers additional exercises and case studies.

Content
The course offers additional exercises and case studies concerning:

- Strategic Management
- Technology and Innovation Management
- Operations and Supply Chain Management
- Finance and Accounting
- Marketing and Sales

Please refer to the course website for further information on the content, credits and schedule of the module: www.dm.ethz.ch

351-0778-00L Discovering Management

**Entry level course in management for BSc, MSc and PHD students at all levels not belonging to D-MTEC. This course can be complemented with Discovering Management (Exercises) 351-0778-01L.**

Abstract
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. The module provides an overview of the principles of management, teaches knowledge about management that is highly complementary to the students' technical knowledge, and provides a basis for advancing the knowledge of the various subjects offered at D-MTEC.

Objective
Discovering Management offers an integrated learning system, which combines in an innovative format a set of lectures, an advanced business game simulation and a set of group exercises involving industry speakers (ranging from leading venture capitalists to executives at established corporations). Unlike more traditional courses, the learning model for Discovering Management involves 'learning by doing'.

While the 14 different lectures, in-class discussions and assigned readings provide the theoretical and conceptual foundations, the experiential learning outcomes result from the interrelated group activities: 1) the interactive case studies and exercises, 2) the business game simulation.

By discovering the key aspects of entrepreneurial management, the purpose of the course is to advance students' understanding of factors driving company success, where success is understood as a broad construct including financial return, employee, customer and supplier satisfaction as well as social and ecological responsibility.

Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Entrepreneurial Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich. No prior knowledge of business or economics is required to successfully complete this course.

Content
The lectures for Discovering Management are designed to broaden the participant's understanding of the principles of entrepreneurial management, emphasizing the interdependence of various specialties in the development and management of a firm. For this reason, the lectures are structured on the basis of a coherent business model and will be presented by the respective area specialists at D-MTEC.

The lectures broaden the view and the understanding of technology by interlinking it with society. Corporate sustainability, for example, introduces economic, ecological and social issues that are relevant to all engineering disciplines. Practical examples stimulate the students to assess these issues and be aware of their responsibilities as engineers. Technology and innovation management, to mention a second example, focuses on the interplay of technical and organizational change, and how these often neglected interactions explain why many new technologies are never used. It fosters the students' ability to see the business and social consequences of their 'technical' decisions.

Critical skills will be trained by the case study exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of the decision maker, as they learn more about the specific case and identify the challenge they are faced with. Students will be presented real case scenarios by industry guests from established corporations and will have to critically analyze specific issues. The case study exercise will provide an insight into the context of a managerial problem-solving and enhance the participant's appreciation for the complex tasks companies deal with.

Discovering Management attempts to overcome the limitations of traditional teaching curricula of management in technical universities, which often merely focus on transferring specific skills to students, e.g. planning or forecasting. In response to the new challenges for entrepreneurial decision-making, students will be offered the opportunity to actively engage in an advanced business game simulation; a business game that establishes a link between business management theory and business management in practice. The simulation presents a realistic model of a company and provides participants with the opportunity to quickly gain the lasting effects of practical experience in a risk-free environment. All this provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyze the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities.

Prerequisites / notice
Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Business Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich. No prior knowledge of business or economics is required to successfully complete this course.

**Simultaneous enrolment in Introductory Internship Sport - course 557-0210-00L - is compulsory.**

### Abstract

Practical implementation in sports of general didactics, with the planning, implementation and evaluation of topics from all the sports-specific areas of tuition in secondary school Level II.

### Objective

- The students:
  - Implement the objectives of general didactics in respect of the different types of sport at school.
  - Master the planning, implementation and evaluation of topics from all the sports-specific areas of tuition.
  - Gain an overview of the preparation necessary for the different requirements placed on a sports teacher at secondary school Level II.
  - Try out different teaching structures, such as the lesson, teaching unit, block periods and extra units in sport in addition to those on the timetable.

### Content

Implementation of practical sport into general teacher training with planning, execution and evaluation of the topics from all sport-specific areas of the education at this level in Section II.

### Literature

Lehrmittel Sporterziehung, ESK 1997/98.

### Prerequisites / notice

Lehrdiplom-Studierende müssen die Fachdidaktik Sport I zusammen mit dem Einführungspraktikum Sport - LE 557-0210-00 - belegen.
This is a supplement to the Teaching Internship required to obtain a Teaching Diploma in Sports. It is aimed at enlarging the already professional fields of sports tuition.

Autumn Semester 2015

Page 1263 of 1432
In the final phase of their training, students have to apply and test the insights, abilities and skills they have acquired. They spend 3-5 weeks in an educational institution, during which time they observe 10 lessons and teach 20 lessons independently. The Teaching Internship is complemented by 10 further observed lessons, which are integrated into the Mentored Work in Subject Didactics. Students will improve their teaching skills and knowledge by instructing and observing sports lessons compulsorily part of the Teaching Diploma in Sports. Application of scientific knowledge to analyse and improve instructional and teaching skills.

Abstract
In the final phase of their training, students have to apply and test the insights, abilities and skills they have acquired. They spend 3-5 weeks in an educational institution, during which time they observe 10 lessons and teach 20 lessons independently. The Teaching Internship is complemented by 10 further observed lessons, which are integrated into the Mentored Work in Subject Didactics.

Abstract

Objective
Students improve their teaching skills and knowledge by instructing and observing sports lessons

Objective

Content
Compulsory part of the Teaching Diploma in Sports. Application of scientific knowledge to analyse and improve instructional and teaching skills.

Content

Lecture notes

Prerequisites / notice
Voraussetzung für das Unterrichtspraktikum ist ein abgeschlossenes Einführungspraktikum und die Fachdidaktik I.

Prerequisites / notice

557-0207-00L Teaching Internship Including Examination Lessons W 4 credits 9P O. Graf

Sport
Teaching Internship Sport ONLY for Teaching Diploma in 2 Subjects in One-Step Procedure and Sport as Second Subject.

Sport

Repetition of the Teaching Internship is excluded even if Examination Lessons are to be repeated.

Repetition of the Teaching Internship is excluded even if Examination Lessons are to be repeated.

Abstract
Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are assessed as Examination Lessons.

Abstract

Objective
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.

Literature

Literature

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 1264 of 1432
This lecture is intended as an introduction to sport psychology and imparts knowledge on selected areas of the subject. Students are given insight into different work areas of sport psychology. In order to understand what «sport psychology» is, it is necessary to explain the essence and tasks of sport psychology and what it relates to, and to work out an underlying basis for key topics, such as cognition and emotions. Students’ expertise is furthered by presenting and providing more in-depth treatment of additional topics of sport psychology. Selected intervention forms are intended to provide insight into applied sport psychology and ensure that mental processes and their impact in sport can be recognised. Case studies and practical exercises (e.g. objective training) are intended to prompt students to reflect to a greater extent on the forms in which sport psychology can be applied in their practice of sports and to integrate these in their teaching.

Main Topics
- Introduction to sport psychology
- Cognitions in sports: mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

Selected materials for the lecture are available under www.LSSFB.ch --> Lehre

Sport and social change: developments and trends

A detailed program with additional references will be delivered at the beginning of the lecture.
The assessment monitors both the physical fitness of the students and their skills in the fields of athletics and fitness, which forms the basis for a successful rounding off of the respective direction of study. Competent "didactical implementation" of research content. The Fachwissenschaftliche Vertiefung II orientates itself to the guiding principles of cognitive, conditional and coordination aspects of movement.

### Specialized Courses in Respective Subject with Educational Focus II

At least 6 CP's *must* be acquired in this category. Further courses must be chosen from the "Sport Practical: Major Education and Specialized Education".

**Abstract**
Refurbishment of research projects dealing with motor competencies in sport and professional scientific content related to this area.

**Objective**
scientific analysis of sports disciplines in order to improve instruction

**Content**
see specific subjects

**Literature**
Skript unter: https://moodle-app2.let.ethz.ch/course/view.php?id=117

**Prerequisites / notice**
Mentorated paper in selected sports disciplines.

#### Compulsory Elective Courses

At least 6 CP's *must* be acquired in this category. Further courses must be chosen from the "Sport Practical: Major Education and Specialized Education".

- a) the course 557-0215-00L "Professional Exercises" *must* be completed within the category Compulsory Elective Courses;
- b) courses from the category Compulsory Elective Courses of the Minor Subject may also be selected;
- c) courses from the category Specialized Courses in the Respective Subject, either of the Major or the Minor Subject, may also be selected.

#### Sport Practical

The Teaching Diploma in Sport - or in Sport as major subject for a Teaching Diploma in a major and a minor subject - *will* only be granted to students holding a Master, Diploma or Licentiate degree in Sport. Additionally, a Sport Practical encompassing 56 CP's is required. The Sport Practical can be partly conducted during the Bachelor and Master programmes in Sport.

**Abstract**
The assessment II 'achievement' allows students to continue their studies in the basic subjects of athletics, fitness, swimming, ice sports and trend sports. Aim is to acquire the basic skills for the respective sports discipline.

**Objective**
The assessment monitors both the physical fitness of the students and their skills in the fields of athletics and fitness, which forms the basis for a successful rounding off of the respective direction of study.

**Content**
Im Assessment II Leisten werden einige Elemente der Sportarten Fitness und Leichtathletik erworben. Unter anderem Grundschritte Aerobic, wesentliche Übungen zur Körperkraftigkeit, Gewandtheit, Hochsprung, Kugelstossen und Ausdauer.

**Prerequisites / notice**
Kenntnisse (Schulniveau) in den Sportfächern Fitness und Leichtathletik werden ebenso vorausgesetzt wie angemessene konditionelle Fähigkeiten.

**Prerequisites:** Assessment I+II (BSc HST) passed.
Technique: ECTS Basketball II

Objective
Participants know how to play and exercise new sports and are able to teach them to pupils.

Content
Introduction of new sports like Badminton, Flagball, Touch, contact games, a.s.o.

Lecture notes
Information is provided on Moodle.

Prerequisites / notice
Students need to be inscribed in LD Sport or must have passed assessment II.

557-0522-01L Handball I ▶ W 2 credits 2G O. Buholzer

Prerequisites: Practical course Movement Sciences III (BSc HMS) or Assessment III (BSc HST).

Abstract
Learn by playing - from three-a-side to four-a-side games.

Game development takes place over the zone play of the game (2/1) or 3/2 to the game 4/4 or (6/6).

The introduced technical elements form the requirements for the tactically-orientated zone plays and are exclusively trained in the execution and formation steps.

Objective
The students improve their personal skills and demonstrate the game in teams as well as groups of 4 against 4. They deepen the development of the game

They improve their personal skills with an individual emphasis on game and practice.

Content
Spielend Handball lernen - Über das Spiel zum Spiel (Vom Spiel 3/3 zum Spiel 4/4)

Techniktraining ist Sache der Studierenden.

Die individuelle Grundschulung wird mit Lernkontrollen überprüft (Kontrollblätter).

Alle ausgewählten Formen müssen als Lernkontrolle durchführbar sein.

Literature
Lecture notes
Lehrunterlagen können von der Homepage abgerufen werden.

Prerequisites / notice
Testatbedingungen
Präsenz:
Maximale Abwesenheiten (3 entschuldigte und 3 unentschuldigte Absenzen)

Testübungen: Im Rahmen der Ausbildung werden Zonenspiele und Fertigkeiten erarbeitet. Für das Testat (Bewegungswissenschaftler) müssen insgesamt 6 Testatübungen aus mind. 4 praktischen Bereichen abgegeben werden.

Prüfungen Inhalte: Die Prüfungsinhalte werden während des Semesters erarbeitet und am Ende des Semesters schriftlich abgegeben.

Prerequisite: Basic course scompleted

Abstract
Further development of the technical skills. Structural development of defensive behavior appropriate to the game situation. Introduction to the pre-tactical element of the pick away. Additionally the role and use of the inside players on offense and defense is looked at. In the center of attention during games stands the game management the combination of roles - teacher/coach/referee.

Objective
- Further training of the individual basketball skills
- Participants know the tactical and technical aspects of the pick away
- Participants can make the right decisions in various defensive situations and with that make it more difficult for the offense.
- Leadership of a team during the game and during physical education class

Content
- Individual basics Passing/Footwork/Dribbling/Shooting
- Basics in the man-to-man defense on ball/off ball/stop the cut
- Basics on offense getting open/cutting/scoring
- Movement of the inside players
- pick away
- Game management in the classroom combination of roles teacher/coach/referee
557-0545-00L  Volleyball II
Prerequisites: Basic course completed

Objective
To learn the game of volleyball through the interaction between individual playing positions. To achieve skills in a six-a-side game without specialization. (system 3-2-1, setter position 1)

Content
- To know the chain of action for each players position in the game
- To be able to play volleyball 6 against 6 without specialization (system 3-2-1, setter position 1)
- Individual tactics: chain of action, attack in all 3 net positions, setting from position 1, statistical evaluation of the game
- Methodical steps: planning of training session, adaptation for stronger and weaker players, individual corrections for players

557-0605-00L  Snowsport II
Prerequisites: Basic course in Snowsport I completed.

Abstract
Specialization training: Acquisitions of special skills, getting to know the performance factors and training methods in the areas of Snowsports.

Objective
Snow sports (Skiing/Snowboarding):
- To deepen and expand experience and skills in snow sports and in the personal competency of technique of the chosen snow sport.
- To expand skills to the area of telemark and competition

Off-piste education:
- To acquire knowledge and experience in planning and realization of back-country skiing and consider the environment

Content
- Snow sports (skiing/snowboarding):
  - General and specific education of personal competency in technique of the chosen snow sport.
  - Telemark or competition as an extra experience in the framework of technique.

Off-piste education:
- Planning and realization of back-country skiing
- Handling of the environment
- Avalanche prophylaxis

Prerequisites / notice
Requirement: Basic course in Snowsport I completed.

557-0426-00L  Fitness II
Prerequisites: successful completion of Basic Education in Fitness.

Abstract
A consolidation of fitness education; relevant performance factors in the training of physical fitness.
Acquisition of skills, tactics, methodology in the areas of fitness and aerobics.
Getting to know current and prophylactic training aspects and the training thereof.

Objective
To deepen knowledge of relevant components of physical fitness
To get to know and to enhance knowledge of actual preventative aspects of fitness training

Content
- Fittness im Fitnessbereich
- Krafttrainings- und Ausdauergeräte
- Trainingsprogramme im Fitnessbereich für Kraft, Ausdauer und Beweglichkeit
- Programmabläufe bei Problemen am Bewegungsapparat
- Einführung von Personen an Fitnessgeräten
- Funktionelle Anatomiekenntnisse im Fitnessbereich
- Aerobics: Aufbau und Einführung von Aerobicblöcken

557-0434-01L  Acrobatics II
Prerequisites: successful completion of Basic Education.

Abstract
To get to know and understand the basics of movement (core movements) and its respective actions and functions on the floor, in acrobatics and partner acrobatics as well as in Parkour to create individual and cooperative combinations according to qualitative criteria.

Objective
The students should be able to:
- acquire and consolidate core movements as well as to apply and create such combinations
- utilize their own strength as well as the resulting impact in a differential way in order to precisely and economically move the swinging, flying, falling and twisting body
- gain orientation safety and room orientation while twisting and flying
- gain sensitivity for social competences (e.g. to assist, to observe, to advise) within a small group
- compose and present within a group of three a creative performance
Content - Freerunning
- creative and cooperative composition in a threesome accompanied by music
- core movements and combinations on the floor, the tumbling-track (airtrack) and the wall
- vault springs and touching down springs (stuetz springs) to overcome obstacles in a artful way
- methodical didactical inputs

More information: www.samariter.ch.

External education! Credit points only for Sport Teaching Diploma!

Abstract

Objective
- To be able to judge an injured person and to apply life saving actions
- To carry out wound treatment with actual bandage
- To list the characteristics of a sprain, strain, dislocation and to apply first-aid interventions
- To carry out fixed bandages with common material
- To explain the function of the cardiovascular system
- To name the symptoms of poisoning
- To list the signs of acute illness
- To put together the content of a first-aid box
- To carry out safety interventions in daily situations.

Content
* Hautverletzungen
* Wundinfektion / Blutvergiftung
* Stürze im Alltag (Verstauchungen, Prellungen, Quetschungen)
* Sportverletzungen, Knochenbrüche
* Herzkreislaufstörungen
* Alltagserkrankungen in der Familie

ECTS European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
The course shall make sure that the participants are fit to make the adequate decisions when encountering legal questions and issues in their career.

In order to achieve this goal, legal problems and issues will be presented to the participants and then discussed in class.

The course covers topics relevant to Contract Law (formation of contract and contract performance), Tort Law (including liability limitation), corporate law (types of corporations, formation of LLC), civil procedure (jurisdiction and applicable law, costs, when and how to engage a lawyer) and insurance law (duty to disclose relevant facts, gross negligence).

The course 'Introduction au Droit civil' (851-0709-00) provides an introduction to the law of Contracts and Torts in French.

---

**Leadership I**

This lecture is designed to give students an introductory overview of important topics regarding leadership research and practice, thus enabling them to gain a deeper understanding of the leadership phenomenon. Students should understand different concepts of leadership in the complex interaction between individuals, groups, organisation, context and situation. They should be informed about the evolution of the understanding of mankind in relation to working processes and its impact on organisations and the understanding of leadership theory in the past 100 years. They should grasp the concept of leadership responsibility (leadership ethics) and be able to derive consequences for leadership in practical situations. They should recognize the fundamental importance of communication in leadership situations and receive input which enables them to communicate adequately in specific situations.

The 1-hour written exam will take place during the last lecture in the semester.
Military Psychology and Pedagogy I

Abstract
Introduction to the economic decisions of households and firms, and their coordination through markets. Analysis of different market structures and of situations in which markets may lead to socially undesirable outcomes.

Objective
Understanding of basic microeconomic models. Ability to apply these models to real world economic situations.

Content
Economics as a science, division of labour and welfare (concept of comparative advantage), supply and demand (market equilibrium, elasticity), households (preferences, demand), firms (technology, cost analysis, profit maximisation, supply), perfect competition, monopoly and oligopoly, externalities, public goods, information, factor markets and income distribution

Lecture notes via email

Prerequisites / notice
Course macroeconomics in the summer term

853-0725-00L History Part One: Europe O 3 credits 2V M. Mühligheim

Abstract
Using concrete regional examples, this lecture offers a survey and analysis of the crucial historical transformations that engendered "modernity" in Europe from the late 18th to the mid 20th centuries.

Objective
At the end of this lecture course, students can: (a) highlight the most important changes in the "long nineteenth century" in Europe (b) explain their long-term effects; and (c) relate these changes to global developments.

Content
The thematic foci include: the economic and social consequences of the industrial revolution, the genesis of political ideologies and social movements, shifts in gender roles, colonialism and imperialism, as well as the emergence of consumerism and a "leisure society."

Lecture notes
Power Point Slides and handouts will be made available at https://ilias-app2.let.ethz.ch/goto.php?target=crs_85665&client_id=ilias_lda in the course of the semester.

Literature
Mandatory and further reading will be made available at https://ilias-app2.let.ethz.ch/goto.php?target=crs_85665&client_id=ilias_lda.

853-0037-00L Military Psychology and Pedagogy I O 4 credits 2V+1U H. Annen

Abstract
Examine the fundamentals of the two sciences and establish links with military life. Discuss various schools of thought in psychology and focus on content and process theories of motivation. Explore characteristics of pedagogical thinking and discuss the values of military education with reference to the young adult serving in the armed forces.

Objective
- Becoming acquainted with basic psychological views of human behaviour and experience
- Knowing the content and theories of motivation and being able to transfer them to the military context
- Knowing the possibilities and limitations of military education and deriving consequences

Content
Overall, the objective is to become acquainted with the basics of both scientific areas and to make references to military practice. Military psychology is a branch of applied psychology; consequently selected aspects of psychological principles will be covered. Military pedagogy hasn't yet established itself firmly as an independent scientific discipline, it nevertheless can draw on a deep-seated tradition in Switzerland. Thus, the great importance that has been attached to the discussion of education in Swiss society and academia will be taken into account.

Subjects:
- History of military psychology
- Psychological images of humanity (psychoanalysis, behaviourism, behavioural biology, humanistic psychology, cognitivism)
- Motivational theories
- Defence, service, operational- and combat motivation
- Swiss military pedagogy
- Education as defining feature of pedagogic thinking and acting

This course is completed by a compulsory one week course between terms.

Literature
- Stadelmann, J.: Führung unter Belastung, Huber, Frauenfeld 1998 (provided as pdf)

The lecture is supported by a virtual learning environment containing relevant documents (presentations and texts) and information to further literature.

<td>2S</td>
<td>R. Huber</td>
</tr>
</tbody>
</table>
| Abstract
Teaching of formal requirements of scientific work (philosophy of science with a focus on the social sciences); literature reviews and the basics of conducting independent research on short as well as simple topics; basics of conceptualizing research designs for politically relevant questions and hypotheses.

Objective
1) Understanding the goal and the basic procedures of (empirical social sciences) scientific work (philosophy of science, theory building, research design, as well as the correct employment of sources, data and literature),
2) Identification of relevant research questions.
3) Creating a common basis for a thorough and systematic analysis of these.

Content
Political Methodology I seeks to introduce students to the basics of scientific work and procedures in the social sciences, which in turn shall allow them - also in conjunction with Political Methodology II - to conduct work that fulfills satisfactory standards of research quality throughout their further studies.

With regard to Political Methodology I, this seminar primarily focuses on the philosophy and theory of (empirical social) sciences, its structure, and procedures. The seminar emphasizes substantive contents and ways of presenting them, research and, conceptual work. Additionally, it deals with the basis of establishing research designs with politically relevant questions and hypotheses.

Literature

Prerequisites / notice
Each student will be graded by two exercises (50% each).

1) Source analysis and acquisition: based upon a research article that the student chooses on her/his own, the student shall write a critical comprehensive list of the relevant literature and summarize that with her/his own words.

2) Critical analysis of sources: based upon a research article that the student chooses on her/his own, the student shall write a critical analysis of that, which mirrors frame and structure of scientific writing

Submission dates will be communicated in the first meeting.

853-0064-00L Military Sociology I O 3 credits 2V T. Szvircev Tresch

Abstract
Introduction to the economic decisions of households and firms, and their coordination through markets. Analysis of different market structures and of situations in which markets may lead to socially undesirable outcomes.

Objective
Understanding of basic microeconomic models. Ability to apply these models to real world economic situations.

Content
Economics as a science, division of labour and welfare (concept of comparative advantage), supply and demand (market equilibrium, elasticity), households (preferences, demand), firms (technology, cost analysis, profit maximisation, supply), perfect competition, monopoly and oligopoly, externalities, public goods, information, factor markets and income distribution

Lecture notes via email

Prerequisites / notice
Course macroeconomics in the summer term
Abstract
Beside of the most important terms of sociology, demographic changes and the related value and structure change will be analysed. The second part focuses on organizational sociology. Thirdly, the course examines to which extent armed forces can be considered as organizations like any other and to which extent they constitute a special case from an organizational and normative point of view.

Objective
Recognize and explain current changes (social change) in modern society (individualisation, pluralisation); describe demographic changes in Switzerland; explain the structures of societies; define issues and fields of research in modern military sociology and explain the foundations of organisational sociology; explain the military in terms of organisational sociology and identify specific traits of the military as an organisation.

Content
Societal change; organizations as societal phenomena; aims, structures, environments of organizations; specifics of the military as an organization; impacts of technological and societal changes on the armed forces in modern societies.

Literature
A reader with a set of texts will be handed out.

853-0065-00L Business Administration I O 4 credits 3V J.P. Chardonnens

Abstraaact

The course offers a foundation in accounting and financial management. It covers topics in financial accounting (recording of transactions, preparation of balance sheet and income statement, methods of using accounting information for decision-making purposes) and financial management (profitability, liquidity, capital budgeting, financing).

Objecctive

Objectives:
- Develop corporate finance thinking
- Record transactions and prepare financial statements
- Master tools and methods used for financial management

Content

1. Financial Accounting
   - Accounts
   - Balance sheet and income statement
   - Inventories,
   - Value-added tax, prepayments and accruals
   - Provisions, depreciation,
   - Evaluation, hidden reserves

2. Financial Management
   - Financial report and -analysis
   - Profitability and capital turnover
   - Financial planning
   - Cash budget
   - Capital budgeting

853-0063-00L Military History I (with Exercises) O 4 credits 2V+1U M. Olsansky

Abstraaact

The lecture outlines the development of the armed forces (assets regarding manpower, technology and armament), the concepts of warfare and the actual warfare in the 19th and 20th century.

Objecctive

- Distinguish between military history as a subject and historiography as a way of describing events;
- Analyse the modern developments regarding armed forces and warfare in the context of socio-economic changes;
- Based on the approach regarding revolution in military affairs, describe the evolution of the armed forces and of warfare;
- Exemplify the issues regarding the evolution of the combat (First and Second World War, Vietnam War and Algerian War).

Content

The lecture first examines the bases of the science of (military) history. It focuses on how military history developed from war history, on specific similarities and differences between military history and general historiography, the different ways of dealing with history in Switzerland, Germany, France and in the Anglo-Saxon cultural area (different approaches) as well as on institutions which deal with military history such as universities, military academies, national and international commissions and associations etc.

The lecture is structured along the lines of the concept of “Military Revolution” and starts with the formation of modern, European armed forces after the Oranian Army reform in the 17th century.

Based on the “Military Revolution” approach, the lecture examines the structural changes regarding the armed forces and the development of warfare from the 18th to the 20th century. Special emphasis will be put on how the battlefield was revolutionized due to the Napoleonic wars, the industrialization in the 19th century, the First World War, the mechanization and totalization during the Second World War and the period of the Cold War.

Literature

853-0082-00L Strategic Studies I O 3 credits 2V M. Mantovani

Abstraaact

The lecture series, spread over two terms, deals with the leading concepts of (military) strategy and theories of war from antiquity to the present. It focuses in particular on the backgrounds of these concepts, their implementation as well as their significance for subsequent conceptual thinking.

Objecctive

The participants know the classical conceptions of strategy and war theory from antiquity to the present against their specific background. They recognize aspects, which are useful for the understanding of modern/current conflicts. They are capable of analyzing critically original texts and modern scholarly works in the field of strategic studies.

Content

The lecture series introduces the basic concepts of strategy and war theory and wants to present the variety of asymmetric warfare throughout history. It critically highlights in particular Sun Tzu, Machiavelli, Jomini, Clausewitz, Moltke, Mahan, Corbett, Douhet, Fuller, Liddell Hart, Swetchn, Tuchatschevsky, Mao and Che Guevara, etc. (see program). If appropriate, a specific Swiss view is being applied.

Lecture notes

A textbook with primary sources and a list of further reading are available with the lecturer or electronically on the MILAK website (Lehre und Forschung/Dozentur/Vorlesungsunterlagen).

Slides are being distributed.

853-0302-00L European Integration: Seminar O 4 credits 3S F. Schimmelfennig

Abstraaact

The seminar covers the theory, development, and core policy fields of European integration as well as structures and processes of the EU as a decision- and policy-making system.

Objecctive

The seminar is designed to help students understand the European Union as a particular kind of political system that differs both from the nation-state and from other international organizations. It imparts basic knowledge on the development, institutions, procedures, and policies of the EU and provides an introduction to major approaches to integration theory and political science research on the EU.
Content
1. Introduction
2. Development of European integration
3. Integration theories
4. Deepening
5. Widening and differentiation
6. Attitudes and public opinion
7. The institutions of the EU
8. Legislation and adjudication in the EU
9. Democracy in the European Union
10. Internal market and monetary union
11. Foreign and security policy
12. Justice and home affairs
13. EEA, Switzerland, and Neighbourhood Policy

Abstract
The knowledge and skills acquired in the second semester serve as a basis for further improvements in the areas of speaking, listening, reading and writing, which will enable students to enroll for the Cambridge exams. The goal is to reach Council of Europe (CEFR) level C1 or C2 depending on the linguistic proficiency of the students.

Objective
This three-semester English course should enable the participants to successfully use the English language in an international military setting.

Content
- Read, analyse and write military and civilian documents
- Listening comprehension using current radio or TV reports
- Practise speaking with group discussions and short presentations
- Systematic revision and extension of key grammar points
- Systematic acquisition of general and military vocabulary

Abstract
This introduction into the constitutional elements of security policy includes questions of competences (separation of powers, federalism) and considerations on the constitutional mandates and powers of military, police and private actors - especially in the state of emergency.

Objective
Students should:
- know the basic terms of security law;
- understand the actors of security policy and their position within the constitutional order;
- know the constitutional mandate and powers of the military and the police;
- know the elements of cooperation between military and police;
- know the constitutional rules to deal with a state of emergency;
- know the legal status of members of the military forces;
- know any persons rights of judicial review of security measures.

853-0060-00L Current Issues in Security Policy O 3 credits 2V A. Wenger, O. Thränert

Abstract
This course provides an overview of the development of the international system and the central security challenges since the end of the Cold War. The focus of this course will be on security issues of the post 9/11 era: new risks, arcs of crises, security strategies and core actors will be presented during the course.

Objective
Participants should gain a solid understanding of current issues in international security policy as well as of the central academic debates.

Content
The aim of the course is to provide the participants with an overview of international security politics in a globalized world. After dealing with the major changes of the international security environment as compared to the cold war era, we will concentrate on some of the key challenges (international terrorism, proliferation of weapons of mass destruction etc.). The third part of the lecture focuses on security strategies pursued by the 'Western' world.

Lecture notes
A reading list will be distributed at the beginning of the spring semester.

Literature
An online learning platform serves as a supplement to the lecture course.

853-0038-00L Swiss Foreign Policy O 3 credits 2V D. Möckli
Based on the knowledge and skills acquired during the first semester, speaking and discussion skills related to military situations are

Abstract

This course analyzes the foundations and central challenges of Swiss foreign policy. After reviewing the history of foreign and neutrality policy conceptions since the early 20th century, the determining factors of Swiss foreign policy will be discussed, and issues such as the Ukraine crisis, Swiss-EU relations, and Switzerland and the Middle East will be examined.

Objective

Students should acquire a sound understanding of foreign policy and the relevant academic and political debates associated with it.

Content

After introducing the field of Foreign Policy Analysis, this course will first deal with the historical foundations and the conceptual development of Swiss foreign policy. The focus will be on Switzerland's different reactions to the new international orders after 1918, 1945, and 1989 as well as on the significance of the 9/11 terrorist attacks and the global financial and debt crises since 2009 for Swiss foreign policy. We will also discuss the extent to which the Ukraine crisis and the annexation of Crimea by Russia mark a watershed in the international order - and how Switzerland should respond to these challenges.

Subsequently, key determinants of Swiss foreign policy will be analyzed, with specific attention on neutrality, direct democracy, and the special case paradigm. Finally, the discussion will center on current challenges and issues such as Swiss-EU relations, the Ukraine crisis and the OSCE engagement, Switzerland's role in the UN, Swiss peacebuilding efforts, Swiss policy in the Middle East, and development cooperation.

The first hour will consist of a lecture; in the second hour, we will deepen and discuss the respective issues together with guest speakers from the Swiss foreign ministry, including Secretary of State Rossier.

Chinese, 4 credits

Prerequisites / notice

Students will receive a handout of slides accompanying the lectures.

Literature

A reading list will be handed out at the beginning of the semester.

BA Colloquium

O

2

2K

A. Wenger, M. Dunn Cavelti

Bachelor Colloquium and Bachelor Thesis
Content: The BA Colloquium prepares students for their BA thesis with regard to content, administration, and methodology. During the colloquium, students choose a topic and a supervisor for their thesis. The skills students have acquired during the course of their studies are also enhanced and optimized.

Objectives: The students are being prepared administratively and methodologically to write their BA-thesis after completing the course.

The Bachleor Thesis completes the Bachelor program and consists of a scientific project carried out independently under the tutorship of an ETH or MILAK lecturer in Public Policy.

Objective: To gain basic knowledge of sports pedagogy and to recognize starting points for applied sports pedagogical intervention in schools.

Inhaltliche Schwerpunkte der Vorlesung sind:

- Überblick über die Geschichte der Olympischen Spiele in der Antike und Gegenwart.

Students who are intrinsically interested in business-related issues will be provided with a big picture that transcends the micro view of business administration. Students learn how to integrate security and resource-related issues into a global economic analysis and how to derive relevant consequences, particularly economic ones, for Switzerland.

Objective: The elaboration of the Bachelor Thesis should further students' capacities to work independently, structured and scientifically.

The elective course Military Business Administration II builds on the mandatory course Military Business Administration I and adds to it. It deals with in-depth case studies from international security and economic policy with a special emphasis on the economic and practical relevance of these issues for the Swiss Armed Forces.

Objective: Students who are intrinsically interested in business-related issues will be provided with a big picture that transcends the micro view of business administration. Students learn how to integrate security and resource-related issues into a global economic analysis and how to derive relevant consequences, particularly economic ones, for Switzerland.

Content: The program of the course is organized into 14 units of 90 minutes each. The units combine the elements of lecture (where analytical concepts are taught) and application (where these concepts as applied). Additionally, guest lecturers will hold talks on selected issues.

- Swiss economic autarchy - madness or option?
- Global resource positions and world trade: Implications for the Swiss Armed Forces I
- Global resource positions and world trade: Implications for the Swiss Armed Forces II
- Economic causes of military instability
- Aggressive emerging economies: Economic growth and rearmament
- The process of an arms deal
- Costs and financing of a military conflict
- Economic analysis of terrorism
- Economic analysis of cyberwar
- Economic analysis of the present GSOA initiative: Compulsory military service vs. voluntary militia
- Global arms production and international arms trade
- The privatisation of military security
- Standardisation and interoperability: Does NATO membership increase Swiss military efficiency
- Written exam

Lecture notes: As this course has been completely redesigned and is being offered for the first time in the fall semester of 2013, a script is not yet available. However, the lecturer will distribute all necessary course material in time and directly to the students, either in the classroom or by uploading files to a public server.

Literature: The Lecturer will distribute all necessary literature directly to the students by disseminating pdf files or citing links to online references.

Electives: These Electives may be chosen from the start of the Bachelor Study Programme.

Number | Title | Type | ECTS | Hours | Lecturers

---|---|---|---|---|---
376-1117-00L | Sport Psychology | W | 2 credits | 2V | H. Gubelmann

Abstract: This lecture is intended as an introduction to sport psychology and imparts knowledge on selected areas of the subject.
Objective

Students are given insight into different work areas of sport psychology. In order to understand what «sport psychology» is, it is necessary to explain the essence and tasks of sport psychology and what it relates to, and to work out an underlying basis for key topics, such as cognition and emotions. Students’ expertise is futhered by presenting and providing more in-depth treatment of additional topics of sport psychology. Selected intervention forms are intended to provide insight into applied sport psychology and ensure that mental processes and their impact in sport can be recognised. Case studies and practical exercises (e.g. objective training) are intended to prompt students to reflect to a greater extent on the forms in which sport psychology can be applied in their practice of sports and to integrate these in their teaching.

Content

Main Topics
- Introduction to sport psychology
- Cognitions in sports: mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

Lecture notes

Unterrichtsmaterialien zu den einzelnen Veranstaltungen werden den Studierenden zur Verfügung gestellt.

Literature

376-1127-00L Sociology of Sport W 2 credits 2V M. Lamprecht

Abstract

These lectures deal with the current changes in society and sport and provide an overview of the many different problems and perspectives of sport sociology.

Objective

The lectures set out to:
- present the different dimensions, functions and interrelationships of present-day sport
- provide an introduction to the central theories and models of (sport) sociology
- show how far sport reflects society and how it changes and becomes more differentiated in the process
- take current examples from newspapers, magazines and television to highlight the sociological view of sport.

Content

Sport and social change: developments and trends
The economy and the media: dependencies, consequences, scandals
Social inequities and distinctions: gender differences and group behavior
Conflicts and politics: sports organizations, doping, violence

Lecture notes

Selected materials for the lecture are available under www.LSSFB.ch --> Lehre

Literature

A detailed program with additional references will be delivered at the beginning of the lecture.

851-0549-00L WebClass Introductory Course History of Technology W 3 credits 2V D. Gugerli

Number of participants limited to 100.

Abstract

WebClass Introductory Course History of Technology is an introductory course to the history of technology. The students are challenged to discover how technological innovations take place within complex economical, political and cultural contexts. They get introduced into basic theories and practices of the field.

Objective

Students are introduced into how technological innovations take place within complex economical, political and cultural contexts. They get to know basic theories and practices of the field.

Prerequisites / notice

851-0589-00L Technology and Innovation for Development W 3 credits 2V P. Aerni

Abstract

Technological change plays a crucial role in efforts to create a more sustainable future. In this context, policy decision makers must design rules that minimize its risks and maximize its benefits for society at large. The course discusses this challenge from an interdisciplinary perspective taking into account legal, economic, historical, development and environmental aspects.

Objective

- to recognize the challenges and opportunities of technological change in terms of sustainable development
- to become familiar with policy instruments to promote innovation
- to improve understanding of political decision-making processes in the regulation of science & technology
- improved understanding of the role of science and technology in the context of human and societal development
This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.

This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course will discuss the challenges and opportunities of technological change in terms of sustainable development and show how public policy on the national and the international level is responding to this change.

In this context, students are to become familiar with the basic principles of political economy and New Growth Theory and how such theories help explain political decisions as well as political outcomes in the area of Science, Technology and Innovation. State interventions are either designed to regulate (e.g. environmental regulations, anti-trust law) or facilitate (e.g. intellectual property rights protection, public investment in R&D and technical education, technology transfer) technological change. This will be illustrated by looking at different industries and different national systems of innovation. Subsequently the positive and negative consequences for society and the natural environment will be discussed from a short-term and a long-term perspective.

The course will discuss the challenges and opportunities of technological change in terms of sustainable development and show how public policy on the national and the international level is responding to this change.

In this context, students are to become familiar with the basic principles of political economy and New Growth Theory and how such theories help explain political decisions as well as political outcomes in the area of Science, Technology and Innovation. State interventions are either designed to regulate (e.g. environmental regulations, anti-trust law) or facilitate (e.g. intellectual property rights protection, public investment in R&D and technical education, technology transfer) technological change. This will be illustrated by looking at different industries and different national systems of innovation. Subsequently the positive and negative consequences for society and the natural environment will be discussed from a short-term and a long-term perspective.

Particularly suitable for students of D-ITET, D-USYS

Prerequisites / notice

The 2-hour course (5-7 p.m.) will be held as a series of lectures. The course materials will be available in form of an electronic Reader at the beginning of the semester. The class will be taught in English. Students will be asked to give a (a) presentation (15 Minutes) or write a review paper based on a article selected from the electronic script, and (b) they will have to pass a written test at the end of the course in order to obtain 3 credit points in the ECTS System. In the final mark (a) will have a weight of 40% and (b) 60%.

International Environmental Politics

W 4 credits 2V T. Bernauer

Content

Science and Technology Policy is normally associated with the improvement of national competitiveness; yet, it is also an integral part of effective environmental and development policies.

This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

The course will discuss the challenges and opportunities of technological change in terms of sustainable development and show how public policy on the national and the international level is responding to this change.

In this context, students are to become familiar with the basic principles of political economy and New Growth Theory and how such theories help explain political decisions as well as political outcomes in the area of Science, Technology and Innovation. State interventions are either designed to regulate (e.g. environmental regulations, anti-trust law) or facilitate (e.g. intellectual property rights protection, public investment in R&D and technical education, technology transfer) technological change. This will be illustrated by looking at different industries and different national systems of innovation. Subsequently the positive and negative consequences for society and the natural environment will be discussed from a short-term and a long-term perspective.

This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.

This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 4 ECTS credit points. The workload is around 120 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

Lecture notes

Slides and reading material will be made available at www.ib.ethz.ch (teaching, materials, then menu on the left side of the screen). They are password protected. Use your Nethz username and password to access the material.

Lecture notes

Reader with issue-specific articles. E-version is partly available under http://www.ib.ethz.ch/teaching/material/stpp

The class will be taught in English.

851-0594-00L

International Environmental Politics

W 4 credits 2V T. Bernauer

Particularly suitable for students of D-ITET, D-USYS

Abstract

This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

Objective

The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.

Content

This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 4 ECTS credit points. The workload is around 120 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

Lecture notes

Slides and reading material will be made available at www.ib.ethz.ch (teaching, materials, then menu on the left side of the screen). They are password protected. Use your Nethz username and password to access the material.

Literature

See www.ib.ethz.ch (teaching, materials)
Students from ETH will receive 4 ECTS credit points if they attend classes regularly and obtain a grade of 4.0 or higher for the written exam in the final week of the semester. Students who obtain a grade of less than 4.0 for the end-of-semester test will have a second chance in the first week of the following semester. The rules of the game are defined in detail on the course syllabus. Students who do not participate in the end of semester test will not have access to the repeat exam unless they submit compelling and documented reasons for why they were unable to participate in the first test. Except for language dictionaries, no additional materials and no laptops and mobile phones are allowed during the exam.

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

The workload for this course is approx. 120 hours (all inclusive).

### Course Information

**851-0585-15L Complexity and Global Systems Science**

- **Content**
  - This course discusses complex techno-socio-economic systems, their counter-intuitive behaviors, and how their theoretical understanding empowers us to solve some long-standing problems that are currently bothering the world.
  - The course progresses by demonstrating the relevance of these properties for understanding societal and, at times, global-scale problems such as traffic jams, crowd disasters, breakdowns of cooperation, crime, conflict, social unrests, political revolutions, bubbles and crashes in financial markets, epidemic spreading, and/or "tragedies of the commons" such as environmental exploitation, overfishing, or climate change. Based on this understanding, the course points to possible ways of mitigating techno-socio-economic-environmental problems, and what data science may contribute to their solution.

- **Prerequisites**
  - Mathematical skills can be helpful

- **Objective**
  - Participants should learn to get an overview of the state of the art in the field, to present it in a well understandable way to an interdisciplinary scientific audience, to develop models for open problems, to analyze them, and to defend their results in response to critical questions. In essence, participants should improve their scientific skills and learn to think scientifically about complex dynamical systems.

- **Content**
  - This course starts with a discussion of the typical and often counter-intuitive features of complex dynamical systems such as self-organization, emergence, (sudden) phase transitions at "tipping points", multi-stability, systemic instability, deterministic chaos, and turbulence. It then discusses phenomena in networked systems such as feedback, side and cascade effects, and the problem of radical uncertainty. The course progresses by demonstrating the relevance of these properties for understanding societal and, at times, global-scale problems such as traffic jams, crowd disasters, breakdowns of cooperation, crime, conflict, social unrests, political revolutions, bubbles and crashes in financial markets, epidemic spreading, and/or "tragedies of the commons" such as environmental exploitation, overfishing, or climate change. Based on this understanding, the course points to possible ways of mitigating techno-socio-economic-environmental problems, and what data science may contribute to their solution.

- **Prerequisites / notice**
  - Mathematical skills can be helpful

---

**363-0622-00L Basic Management Skills**

- **Content**
  - This 2x5 days-seminar teaches basic and practical management skills.

- **Objective**
  - To convey management behaviour based on practical examples, own experiences and team discussions complemented by short theory sessions (subsidized from the donation for promotion and training in enterprise sciences at the ETHZ).

- **Content**
  - 1 Fundamentals of Communication Psychology
  - 2 Communication in Business-Life
  - 3 Fundamentals of Leadership
  - 4 Self-Management and Life Balance
  - 5 Leadership Tools
  - 6 Problem Solving and Decision Making Techniques
  - 7 Performance Coaching
  - 8 Conflict Management
  - 9 Personality
  - 10 Summary-Day, Domino-Examination

- **Prerequisites / notice**
  - Special permission from lecturers required
  - The number of participants is limited. Please send an email to bms@ethz.ch by 03.08.15 for your registration

---

**853-8000-00L History of Switzerland in the Late Middle Ages 1415-1515 (University of Zurich)**

- **Abstract**
  - Currently the Late Middle Ages takes center stage in debates on national commemorative culture and identity, not least in connection with the centenary celebrations of the Aargau conquest (1415) and the battle of Marignano (1515). The lecture departs from the ongoing political use of history and confronts it with scholarly perspectives on the period.

---

**751-1551-00L Ressourcen- und Umweltökonomie**

- **Abstract**
  - Relationship between economy and environment, market failure, external effects and public goods, contingent valuation, internalisation of externalities; economics of non-renewable resources, economics of renewable resources, cost-benefit analysis, sustainability, and international aspects of resource and environmental economics.
Objective
Understanding of the basic issues and methods in resource and environmental economics: ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

Topics are:
- Introduction to resource and environmental economics
- Importance of resource and environmental economics
- Main issues of resource and environmental economics
- Normative basis
- Utilitarianism
- Fairness according to Rawls
- Economic growth and environment
- Externalities in the environmental sphere
- Governmental internalisation of externalities
- Private internalisation of externalities: the Coase theorem
- Free rider problem and public goods
- Types of public policy
- Efficient level of pollution
- Tax vs. permits
- Command and Control Instruments
- Empirical data on non-renewable natural resources
- Optimal price development: the Hotelling-rule
- Effects of exploration and Backstop-technology
- Effects of different types of markets.
- Biological growth function
- Optimal depletion of renewable resources
- Social inefficiency as result of over-use of open-access resources
- Cost-benefit analysis and the environment
- Measuring environmental benefit
- Measuring costs
- Concept of sustainability
- Technological feasibility
- Conflicts sustainability / optimality
- Indicators of sustainability
- Problem of climate change
- Cost and benefit of climate change
- Climate change as international ecological externality
- International climate policy: Kyoto protocol
- Implementation of the Kyoto protocol in Switzerland

Content
- Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

Lecture notes
The script and lecture material are provided at: https://moodle-app2.let.ethz.ch/course/view.php?id=140

Literature
Für die Kreditvergabe sind die vorgeschriebenen Semesterarbeiten und die Präsenz zwingend. Die Benotung erfolgt durch eine schriftliche Arbeit.

Planung
Die Planungsunterlagen werden zu Semesterbeginn abgegebenen, sind provisorisch und können vom Dozenten geändert werden. Die Praxislektionen werden jeweils am Mittwoch von 13.00 - 15.00 abgehalten. Die Termine werden in Absprache festgelegt.

Die Semesterarbeit ist 4 Wochen nach Semesterende abzugeben.

Statistics Master
The following courses belong to the curriculum of the Master's Programme in Statistics. The corresponding credits do not count as external credits even for course units where an enrolment at ETH Zurich is not possible.

Core Courses
In each subject area, the core courses offered are normally mathematical as well as application-oriented in content. For each subject area, only one of these is recognised for the Master degree.

Regression

Knowledge of methods and basic theory for high-dimensional statistical inference

Overview over the basics of likelihood inference.

Statistical and Mathematical Courses

401-3601-00L  Probability Theory  W  10 credits  4V+1U  A.S. Sznitman

Abstract
This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:
- Basics in measure theory, random series, law of large numbers, weak convergence, characteristic functions, central limit theorem, conditional expectation, martingales, convergence theorems for martingales, Galton Watson chain, transition probability, Theorem of Ionescu Tulcea, Markov chains.

Content
This course presents the basics of probability theory and the theory of stochastic processes in discrete time. The following topics are planned:
- Basics in measure theory, random series, law of large numbers, weak convergence, characteristic functions, central limit theorem, conditional expectation, martingales, convergence theorems for martingales, Galton Watson chain, transition probability, Theorem of Ionescu Tulcea, Markov chains.

Lecture notes
available, will be sold in the course

A. Klenke, Wahrscheinlichkeitstheorie, Springer 2006
D. Williams, Probability with martingales, Cambridge University Press 1991

401-3627-00L  High-Dimensional Statistics  W  4 credits  2V  P. L. Bühlmann

Abstract
"High-Dimensional Statistics" deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed.

Objective
Knowledge of methods and basic theory for high-dimensional statistical inference

Content
Lasso and Group Lasso for high-dimensional linear and generalized linear models; Additive models and many smooth univariate functions; Non-convex loss functions and l1-regularization; Stability selection, multiple testing and construction of p-values; Undirected graphical modelling

Literature

Prerequisites / notice
Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

401-3611-00L  Advanced Topics in Computational Statistics  W  4 credits  2V  M. H. Maathuis, M. Mächler

Abstract
This lecture covers selected advanced topics in computational statistics, including various classification methods, the EM algorithm, clustering, handling missing data, and graphical modelling.

Objective
Students learn the theoretical foundations of the selected methods, as well as practical skills to apply these methods and to interpret their outcomes.

Content
The course is roughly divided in three parts: (1) Supervised learning via (variations of) nearest neighbor methods, (2) the EM algorithm and clustering, (3) handling missing data and graphical models.

Prerequisites / notice
We assume a solid background in mathematics, an introductory lecture in probability and statistics, and at least one more advanced course in statistics.

401-3633-00L  Data Analytics in Organisations and Business  W  5 credits  2V+1U  I. Flückiger

Abstract
On the end-to-end process of data analytics in organisations & business and how to transform data into insights for fact based decisions. Presentation of the process from the beginning with framing the business problem to presenting the results and making decisions by the use of data analytics. For each topic case studies from the financial service, healthcare and retail sectors will be presented.

Objective
The goal of this course is to give the students the understanding of the data analytics process in the business world, with special focus on the skills and techniques used besides the technical skills. The student will become familiar with the "business language", current problems and thinking in organisations and business and tools used.

Content
Framing the Business Problem
Framing the Analytics Problem
Data Methodology
Model Building
Deployment
Model Lifecycle
Soft Skills for the Statistical/Mathematical Professional

Prerequisites / notice
Prerequisites: Basic statistics and probability theory and regression

401-6217-00L  Using R for Data Analysis and Graphics (Part II)  W  1 credit  1G  A. J. Papritz, C. B. Schwierz

Abstract
The course provides the second part an introduction to the statistical software R for scientists. Topics are data generation and selection, graphical functions, important statistical functions, types of objects, models, programming and writing functions. Note: This part builds on "Using R... (Part I)", but can be taken independently if the basics of R are already known.

Objective
The students will be able to use the software R efficiently for data analysis.
The course provides the second part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part II of the course builds on part I and covers the following additional topics:
- Elements of the R language: control structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of vectors, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tayloring R: options;
- Extending basic R: packages

Rough Outline:
2G
Starting with an overview of selected results from parametric inference, kernel smoothing (including local polynomials) will be introduced along with some asymptotic theory, optimal bandwidth selection, data driven algorithms and some special topics. Examples from environmental research will be used for motivation, but the methods will also be applicable elsewhere.

The students will learn about methods of kernel smoothing and application of concepts to data. The aim will be to build sufficient interest in the topic and intuition as well as the ability to implement the methods to various different datasets.

Content
- Parametric estimation methods: selection of important results
  o Maximum likelihood
  o Least squares: regression & diagnostics
- Nonparametric curve estimation
  o Density estimation, Kernel regression, Local polynomials, Bandwidth selection
  o Selection of special topics (as time permits, we will cover as many topics as possible) such as change points, modes & monotonicity, robustness, partial linear models, roughness penalty, local likelihoods, etc.
- Applications: potential areas of applications will be discussed such as, change assessment, trend and surface estimation, probability and quantile curve estimation, and others.

Lecture notes
Brief summaries or outlines of some of the lecture material will be posted at http://www.wsl.ch/info/mitarbeitende/ghosh/index_EN (click on “ETH Course” in the left panel).

NOTE: The posted notes will tend to be just sketches whereas only the in-class lessons will contain complete information.

LOG IN: In order to have access to the posted notes, you will need the course user id & the password. These will be given out on the first day of the lectures.

Resampling Methods
Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to kanzlei@rektorat.ethz.ch. The Registrar's Office will then register you for the course.

Abstract
This course covers several generally useful statistical methods: Nonparametric tests, randomization tests, jackknife and bootstrap, as well as asymptotic approximations and robustness properties of estimators.

Objective
For the classical parametric models there are optimal statistical estimators and test statistics, and their distributions can often be determined exactly. The methods covered in this course allow for finding statistical procedures for more general models and to derive exact or approximate distributions of complicated estimators and test statistics. They thus make it possible to use specific models for any applications under consideration and to derive corresponding statistical procedures.

Content
Nonparametric tests, randomization tests, jackknife and bootstrap, asymptotic approximations and robustness properties of estimators.

Lecture notes
http://stat.ethz.ch/~meier/teaching/resampling/
Knowledge on estimation of probability densities and regression functions via various statistical methods.

Data Mining

This course focuses on nonparametric estimation of probability densities and regression functions. These recent methods allow modelling without restrictive assumptions such as 'linear function'. These smoothing methods require a weight function and a smoothing parameter. Focus is on one dimension, higher dimensions and samples of curves are treated briefly. Exercises at the computer.

Prerequisites / notice

This course is part of the programme for the certificate and diploma in Advanced Studies in Applied Statistics. It is given every second year in the winter semester break.

401-6221-00L Nonparametric Regression W 1 credit 1G

Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to kanzlei@rektorat.ethz.ch. The Registrar's Office will then register you for the course.

Abstract

This course focusses on nonparametric estimation of probability densities and regression functions. These recent methods allow modelling without restrictive assumptions such as 'linear function'. These smoothing methods require a weight function and a smoothing parameter. Practical application on data sets at the computer.

401-6233-00L Spatial Statistics W 1 credit 1G

Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to kanzlei@rektorat.ethz.ch. The Registrar's Office will then register you for the course.

Abstract

In many research fields, spatially referenced data are collected. When analysing such data the focus is either on exploring their structure (dependence on explanatory variables, autocorrelation) and/or on spatial prediction. The course provides an introduction to geostatistical methods that are useful for such purposes.

Objective

Knowledge on estimation of probability densities and regression functions via various statistical methods. Understanding of the choice of weight function and of the smoothing parameter, also done automatically.

Lecture notes

Slides, descriptions of the problems for the data analyses and worked-out solutions to them will be provided.

Literature

263-5200-00L Data Mining: Learning from Large Data Sets W 4 credits 2V+1U A. Krause

Abstract

Many scientific and commercial applications require insights from massive, high-dimensional data sets. This course introduces principled, state-of-the-art techniques from statistics, algorithms and discrete and convex optimization for learning from such large data sets. The course both covers theoretical foundations and practical applications.

Objective

The participants will learn a number of geostatistical techniques and acquire some familiarity with software that is useful for analysing spatial data.

Content

After an introductory discussion of the types of problems and the kind of data that arise in environmental research, an introduction into linear geostatistics (models: stationary and intrinsic random processes, modelling large-scale spatial patterns by regression, modelling autocorrelation by variogram; kriging: mean-square prediction of spatial data) will be taught. The lectures will be complemented by data analyses that the participants have to do themselves.

Lecture notes

Slides, descriptions of the problems for the data analyses and worked-out solutions to them will be provided.

401-6245-00L Data Mining W 1 credit 1G

Special Students "University of Zurich (UZH)" in the Master Program in Biostatistics at UZH cannot register for this course unit electronically. Forward the lecturer's written permission to attend to the Registrar's Office. Alternatively, the lecturer may also send an email directly to kanzlei@rektorat.ethz.ch. The Registrar's Office will then register you for the course.

Abstract

This course is part of the programme for the certificate and diploma in Advanced Studies in Applied Statistics. It is given every second year in the winter semester break.

Part 1, Classification: logistic regression, linear/quadratic discriminant analysis, Bayes classifier; additive and tree models; further flexible ("nonparametric") methods.

Part 2, Flexible Prediction: additive models, MARS, Y-Transformation models (ACE,AVAS); Projection Pursuit Regression (PPR), neural nets.
"Data Mining" is a large field from which in this block course, we only treat so called prediction problems, aka "supervised learning". Part 1, Classification, recalls logistic regression and linear / quadratic discriminant analysis (LDA/QDA) and extends these (in the framework of "Bayes classifier") to (generalized) additive (GAM) and tree models (CART), and further mentions other flexible ("nonparametric") methods. Part 2, Flexible Prediction (of continuous or "class" response/target) contains additive models, MARS, Y-Transformation models (ACE, AVAS); Projection Pursuit Regression (PPR), neural nets. 

The block course is based on (German language) lecture notes. The exercises are done exclusively with the (free, open source) software "R" (http://www.r-project.org). A final exam will also happen at the computers, using R (and your brains!).

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 1289 of 1432
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can

- Understand the fundamental "scientific process" in the field of Statistical Bioinformatics
- Be equipped with the skills/tools to preprocess genomic data (Unix, Bioconductor, mapping, etc.) and ensure reproducible research
- Have a general knowledge of the range of statistical methods that get used with microarray and sequencing data
- Gain the ability to apply statistical methods/knowledge/software to a collaborative biological project
- Have the general knowledge of the types of data and biological applications encountered with microarray and sequencing data
- Write a coherent summary of a bioinformatics problem and its solution in statistical terms

Lectures will include: microarray preprocessing; normalization; exploratory data analysis techniques such as clustering, PCA and multidimensional scaling; Controlling error rates of statistical tests (FPR versus FDR versus FWER); limma (linear models for microarray analysis); mapping algorithms (for RNA/ChIP-seq); RNA-seq quantification; statistical analyses for differential count data; isoform switching; epigenomics data including DNA methylation; gene set analyses; classification

Lecture notes, published manuscripts

Prerequisites / notice

Prerequisites: Basic knowledge of the programming language R, sufficient knowledge in statistics

Former course title: Statistical Methods for the Analysis of Microarray and Short-Read Sequencing Data

### 401-8625-00L Statistical Methods in Clinical Research (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

**Module Code:** STA404

**Abstract**

Discussion of the different statistical methods that are used in clinical research.

**Content**

Discussion of the different statistical methods that are used in clinical research. Among other subjects the following will be introduced: sample size calculation, randomization and blinding, analysis of clinical trials (parallel groups design, analysis of covariance, crossover design, equivalence studies), intention-to-treat analysis, multiple testing, group sequential methods, adaptive designs, diagnostic studies, and agreement studies.

**Literature**

**Prerequisites / notice**

Basic knowledge of the programming language R, sufficient knowledge in calculus, linear algebra, probability, statistics

### 252-0535-00L Machine Learning

**Module Code:** STA426

**Abstract**

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

**Objective**

Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensible to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.

**Content**

- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

**Lecture notes**

No lecture notes, but slides will be made available on the course webpage.

**Literature**

**Prerequisites / notice**

Solid basic knowledge in analysis, statistics and numerical methods for CSE. Experience in programming for solving the project tasks.
The seminar "Advanced Topics in Machine Learning" familiarizes students with recent developments in pattern recognition and machine learning. Topics include, among others, Markov models, microarrays, dynamic programming, maximum likelihood and specialized DNA and protein analysis.

Objective
Familiarize the students with the basic concepts of molecular biology and the models and algorithms used to understand, classify and predict behaviour of living organism. This course is at the most basic level, where the main issues, mostly of molecular sequences, are studied.

Content
This course lies in the intersection between Computer Science and Molecular Biology. The main purpose is to study computational techniques, algorithms and data structures which are usually applied to solve problems in Molecular Biology and Biochemistry. The following topics are likely to be covered: introduction, mathematical models of evolution, protein and DNA sequence alignment and its meaning, phylogenetic tree construction, multiple sequence alignments, secondary structure prediction, molecular dynamics, threading, role of bioinformatics in drug design, etc. From the computer science point of view we concentrate our attention in practical solutions for the above problems. Biological knowledge is an asset but not a prerequisite.

</tr>
</tbody>
</table>

Abstract
The course provides the first part an introduction to the statistical software R for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

Objective
The students will be able to use the software R for simple data analysis.

Content
The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetic;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc.; simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

Application Areas
Students select one area of application and look for suitable courses in which quantitative methods and modeling play a role. They need the consent by the Advisor (http://stat.ethz.ch/~kalisch/) that the chosen courses are eligible in the category "Application Areas".

For the category assignment of eligible courses keep the choice "no category" and take contact with the Study Administration Office (www.math.ethz.ch/studienverwaltung/staff/ekuenti) after having received the credits. The Study Administration Office needs the Advisor's consent.

Abstract
In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine learning.

Objective
The seminar "Advanced Topics in Machine Learning" familiarizes students with recent developments in pattern recognition and machine learning. Original articles have to be presented and critically reviewed. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar presentation is to summarize the essential ideas of the paper in sufficient depth while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations.
The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which relies more and more on machine learning methodology and statistical models.

The papers will be presented in the first session of the seminar.

Target audience:

Third year Bachelor students;
Master students who cannot document to have received an adequate training in working scientifically.

Mandatory for all Bachelor and Master students with matriculation in the autumn semester 2014 or later.
Optional for Bachelor and Master students with matriculation until or before the spring semester 2014.

Example: You matriculated in the autumn semester 2013 into the first semester of the Bachelor programme, are now in the third year and plan to matriculate in the autumn semester 2016 into the first semester of the Master programme. In this case, you don't need "Scientific Works in Mathematics" in order to complete the Bachelor degree, but for the Master degree you will need it. In this case, we recommend that you register for "Scientific Works in Mathematics" in the autumn semester 2015 or spring semester 2016.

Directive

Abstract
Introduction to scientific writing for students with focus on publication standards and ethical issues, especially in the case of citations (references to works of others.)

Objective
Learn the basic standards of scientific works in mathematics.

Content
- Types of mathematical works
- Publication standards in pure and applied mathematics
- Data handling
- Ethical issues
- Citation guidelines

Lecture notes
Moodle of the Mathematics Library: https://moodle-app2.let.ethz.ch/course/view.php?id=519

Prerequisites / notice
This course is completed by the optional course "Recherchieren in der Mathematik" (held in German) by the Mathematics Library. For more details see: http://www.math.ethz.ch/library/services/schulungen

401-4990-02L Master's Thesis

Only students who fulfill the following criteria are allowed to begin with their master's thesis:

- a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme;
c. They have acquired at least 16 credits in the category Core Courses.

No direct enrolment to this course unit in myStudies. Please fill in the online application form.

Requirements and application form under www.math.ethz.ch/intranet/students/study-administration/theses.html
(Afterwards the enrolment will be done by the Study Administration.)

Abstract
The master's thesis concludes the study programme. Thesis work should prove the students' ability to independent, structured and scientific working.

Objective
Thesis work should prove the students' ability to independent, structured and scientific working.

Content
Five-month project to solve a research question. The content can be more theoretical (e.g. proving a new result) or applied (developing new methods or making a very sophisticated application and adapting existing methods).

Prerequisites / notice
Supervisors are chosen on a first-come-first-served basis. Collaborations with industry are possible.

| Objective        | To gain competency in methods used to plan and analyse systems. |
|                  | To gain the ability to formulate, analyse and solve complex problems. |
|                  | To gain competency in the methods used for the evaluation of multiple solutions. |
| Content          | Introduction. |
|                  | System development. |
|                  | System analysis. |
|                  | Networks. |
|                  | Decision theory. |
|                  | Economic analysis. |
|                  | Cost-benefit analysis. |
| Lecture notes    | Script and transparencies as well as additional material via Moodle. |

| 651-0032-00L     | Geology and Petrography               | O    | 4    | 2V+1U    | C. A. Heinrich, S. Löw, K. Rauchenstein |
| Abstract         | This course gives an overview of the basic concepts of geology and petrography and shows some links to the application of these concepts. The course consists of lectures and exercises in groups. The lectures cover all aspects of the dynamic earth, from the history of the earth, to the formation of rocks, mountains, and oceans, and the degradation processes shaping the uppermost earth's crust. |
| Objective        | This course gives an overview of the basic concepts of geology and petrography and shows some links to the application of these concepts. |
| Lecture notes    | Übungen zum Gesteinsbestimmen und Lesen von geologischen, tektonischen und geotechnischen Karten, einfache Konstruktionen. |
| Literature       | The course is based on the book Dynamic Earth from Press & Siever |
|                  | Press, F.; Siever, R.: Allgemeine Geologie, Spektrum Akademischer Verlag, Heidelberg |

| 529-2001-02L     | Chemistry I                           | O    | 4    | 2V+2U    | W. Uhlig, J. E. E. Buschmann, S. Canonica, P. Funck, E. C. Meister, R. Veerel |

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 1294 of 1432
Abstract
General Chemistry I: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium.

Objective
Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

Content
1. Stoichiometry
2. Atoms and Elements (Quantenmechanical Model of the Atom)
3. Chemical Bonding
4. Thermodynamics
5. Chemical Kinetics
6. Chemical Equilibrium (Acids and Bases, Solubility Equilibria)

Lecture notes
ca. 360 Seiten mit vielen Figuren und durchgerechneten Beispielen.

Literature
- Brown, LeMay, Bursten CHEMIE (deutsch)
- Housecroft and Constable, CHEMISTRY (englisch)
- Oxtoby, Gillis, Nachtrieb, MODERN CHEMISTRY (englisch)

| 102-0293-00L    | Hydrology      | O    | 3    | 2G      | P. Burlando       |
|                 | Abstract       |      |      |         |                   |
|                 | The course introduces the students to engineering hydrology. It covers first physical hydrology, that is the description and the measurement of hydrological processes (precipitation, interception, evapotranspiration, runoff, erosion, snow), and it introduces then the basic mathematical models of the single processes and of the rainfall-runoff transformation, thereby including flood analysis. |
|                 | Objective      |      |      |         |                   |
|                 | Know the main features of engineering hydrology. Apply methods to estimate hydrological variables for dimensioning hydraulic structures and managing water resources. |

M. Ackermann

Lecture notes
Ein internes Skript ist zur Verfügung (kostenpflichtig, nur Herstellungskosten)

S. Güsewell

Prerequisites / notice
Vorbereitende zur Hydrologie I sind die Vorlesungen in Statistik. Der Inhalt, der um ein Teil der Übungen zu behandeln und um ein Teil der Vorlesungen zu verstehen notwendig ist, kann zusammengefasst werden, wie hintereinander es beschrieben wird:

1. Elementare Datenverarbeitung: Hydrologische Messungen und Daten, Datenreduzierung (grafische Darstellungen und numerische Kenngrößen).

Content
- Der hydrologische Kreislauf: Globale Wasserressourcen, Wasserbilanz, räumliche und zeitliche Dimension der hydrologischen Prozesse.
- Interzeption: Messung und Schätzung.
- Evaporation und Evapotranspiration: Prozesse, Messung und Schätzung, potentielle und effektive Evapotranspiration, Energiebilanzmethode, empirische Methode.
- Infiltration: Messung, Horton-Gleichung, empirische und konzeptionelle Methoden, F-index und Prozentuale Methode, SCS-CN Methode.
- Schnee und Eis: Schneeigenschaften und -messungen, Schätzung des Schneeschmelzprozesses durch die Energiebilanzmethode, Abfluss aus Schneemelze, Temperatur-Index- und Grad-Tag-Verfahren.
- Niederschlag-Abfluss-Modelle (N-A): Grundlagen der N-A Modelle, Lineare Modelle und das Instantaneaus System Hydrograph (IUh)
- Konzept, linearer Speicher, Nash Modell.

Lecture notes
Die Kopie der Folien zur Vorlesung können auf den Webseiten der Professur für Hydrologie und Wasserwirtschaft herunterladen werden

Examination Block 2

Number Title Type ECTS Hours Lecturers
752-4001-00L Microbiology O 2 credits 2V M. Ackermann, M. Schuppler, J. Vorholt-Zambelli

Abstract
Teaching of basic knowledge in microbiology. With main focus on Microbial Cell Structure and Function, Molecular Genetics, Microbial Growth, Metabolic Diversity, Phylogeny and Taxonomy, Prokaryotic Diversity, Human-Microbe Interactions, Biotechnology.

Objective
Teaching of basic knowledge in microbiology.

Wird von den jeweiligen Dozenten ausgegeben.

Die Behandlung der Themen erfolgt auf der Basis des Lehrbuchs Brock, Biology of Microorganisms.

**701-0255-00L Biochemistry**  
*O 2 credits 2V  H.P. Kohler*

**Abstract**  
Building on the biology courses in the 1st and 2nd semesters, this course covers basic biochemical knowledge in the areas of enzymology and metabolism. Those completing the course are able to describe and understand fundamental cellular metabolic processes.

**Objective**  
- Students are able to understand
- the structure and function of biological macromolecules
- the kinetic bases of enzyme reactions
- thermodynamic and mechanistic basics of relevant metabolic processes

Students are able to describe the relevant metabolic reactions in detail

**Content**  
Program

Introduction, basics, composition of cells, biochemical units, repetition of relevant organic chemistry

Structure and function of proteins  
Carbohydrates  
Lipids an biological membranes  
Enzymes and enzyme kinetics  
Catalytic strategies  
Metabolism: Basic concepts and design. Repetition of basic thermodynamics  
Glycolysis, fermentation  
The citric acid cycle  
Oxidative phosphorylation  
Fatty acid metabolism

**Lecture notes**  
Horton et al. (Pearson) serves as lecture notes.

**Prerequisites / notice**  
Basic knowledge in biology and chemistry is a precondition.

---

**5. Semester**

**Compulsory Courses 5. Semester**

**Examination Block 3**

As of examination session winter 2015, examination block 3 will be implemented in its new structure (i.e. new, Earth Observation will be examined within examination block 3 instead of within examination block 4). The new structure is valid for those students NOT having taken exams of examination block 3 nor of examination block 4 for the first time. All other students take the exams of examination block 3 as well as of examination block 4 in the present structure, including repetition where applicable.

Content
Introdiction, aquifers, groundwater use, sustainability, porosity.

Properties of porous media.
Exercises: Groundwater use, porosity, grain size analysis.

Flow properties, Darcy's law, filter.

Flow equations, stream function.
Exercises: Darcy's law.

Analytical solutions, confined aquifers, steady-state flow.
Exercises: Head isolines.

Use of superposition principles, transient flow, freee surface flow.
Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems I.
Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems II.
Exercises: Finite difference formulations to flow problems.

Transport processes.
Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems I.
Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems II.
Exercises: Analytical solutions to transport problems.

Path lines, groundwater protection.
Exercises: Groundwater remediation.

Groundwater remediation, groundwater management.
Exercises: Groundwater remediation.

102-0635-01L Air Pollution Control O 6 credits 4G B. Buchmann, P. Hofer

Abstract
The lecture provides in the first part an introduction to the formation of air pollutants by technical processes, the emission of these chemicals into the atmosphere and their impact on air quality. The second part covers different strategies and techniques for emission reduction. The basic knowledge is deepened by the discussion of specific air pollution problems of today's society.

Objective
The students gain general knowledge of the factors resulting in air pollution and the techniques used for air pollution control. The students can identify major air pollution sources and understand the methods for measurement, data collection and analysis. The students can evaluate possible control methods and equipment, design a control system and estimate the efficiency and cost. The students know the different techniques of air pollution control and their scientific basements. They are able to incorporate goals concerning the air quality into their engineering work.

Content
Part 1 Emission, Immission, Transmission
Fluxes of pollutants and their environmental impact
- physical and chemical processes leading to emission of pollutants
- mass and energy of processes
- Emission measurement techniques and concepts
- quantification of emissions from individual and aggregated sources
- extent and development of the emissions (Switzerland and global)
- propagation and transport of pollutants (transmission)
- meteorological parameters influencing air pollution dispersion
- deterministic and stochastic models, describing the air pollution dispersion
- dispersion models (Gaussian model, box model, receptor model)
- measurement concepts for ambient air (immission level)
- extent and development of ambient air mixing ratios
- goal and instrument of air pollution control

Part 2 Air Pollution Control Technologies
- The reduction of the formation of pollutants is done by modifying the processes (process-integrated measures) and by different engineering operations for the cleaning of waste gas (downstream pollution control). It will be demonstrated, that the variety of these procedures can be traced back on the application of a few basic principles of physical chemistry.
- Procedures for the removal of particles (inertial separator, filtration, electrostatic pre-cipitators, scrubbers) with their different mechanisms (field forces, impaction and diffusion processes) and the modelling of these mechanisms.
- Procedures for the removal of gaseous pollutants and the description of the driving forces involved, as well as the equilibrium and the kinetics of the relevant processes (absorption, adsorption as well as thermal, catalytic and biological conversions).
- Discussion of the technical possibilities to solve the actual air pollution problems.
The aim of the course is to provide the fundamental knowledge about earth observation sensors, techniques and methods for bio/geophysical environmental parameter estimation.

Objective

The aim of the course is to provide the fundamental knowledge about earth observation sensors, techniques and methods for bio/geophysical environmental parameter estimation. Students should know at the end of the course:

1. Basics of measurement principle
2. Fundamentals of image acquisition
3. Basics of the sensor-specific geometries
4. Sensor-specific determination of environmental parameters

Content

Die Lehrveranstaltung gibt einen Einblick in die heutige Erdbeobachtung mit dem folgenden skizzierten Inhalt:

1. Einführung in die Fernerkundung von Luft- und Weltraum gestützten Systemen
2. Einführung in das Elektromagnetische Spektrum
3. Einführung in optische Systeme (optisch und hyperspektral)
4. Einführung in Mikrowellen-Technik (aktiv und passiv)
5. Einführung in atmosphärische Systeme (meteo und chemisch)
6. Einführung in die Techniken und Methoden zur Bestimmung von Umweltparametern
7. Einführung in die Anwendungen zur Bestimmung von Umweltparametern in der Hydrologie, Glaziologie, Forst und Landwirtschaft, Geologie und Topographie

Lecture notes

Folien zu jeden Vorlesungsblock werden zur Verfügung gestellt.

Literature

Ausgewählte Literatur wird am Anfang der Vorlesung vorgestellt.

**851-0703-03L Introduction to Law for Civil Engineering**

W 2 credits 2V G. Hertig

*Only for Civil Engineering BSc, Geomatic Engineering BSc and Spatial Development and Infrastructure Systems MSc*

Students who have attended or will attend the lecture "Introduction to Law for Architecture " (851-0703-01L) cannot register for this course unit.

**Abstract**

This class introduces students to basic features of the legal system. Questions of constitutional and administrative law, contract law, tort law, corporate law, as well as litigation are covered.

**Objective**

Introduction to fundamental questions of public and private law which serves as a foundation for more advanced law classes.

1. Public Law
   - Constitutional law: sources of law, organization of the state, fundamental rights. Administrative law: administrative decisions, organization of the administration, enforcement of administrative decisions, procedural law, basics of police, environmental and zoning law.

**Lecture notes**

There will be 'Lecture Notes' (in German) for this course, starting in Fall 2015

**Literature**

Further information is available at http://www.hertig.ethz.ch/courses.htm

**851-0709-00L Introduction to Civil Law**

W 2 credits 2V H. Peter

**Abstract**

The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

**Objective**

**Content**

- Sont indispensables:
  - le Code civil et le Code des obligations;
  - le droit et le droit des obligations à l'usage des ingénieurs et des architectes, trad. Bovay, J.-P., éd. Payot, Lausanne
  - Boillot, J.-P.: Manuel de droit, éd Slatkine, Genève

**Prerequisites / notice**

Remarques
- Le cours de droit civil et le cours de droit public (2e sem.) sont l'équivalent des cours "Recht I" et "Recht II" en langue allemande et des exercices y relatifs.

**Additional Compulsory Courses**

- Examen au 1er propédeutique; convient pour travail de semestre.

**101-0515-00L Project Management**

O 2 credits 2G M. Kersting

**Abstract**

Introduction to the development, the life cycle and the characteristics of projects. Introduction to, and experience with, the methods and tools to help with the preparation, evaluation, organisation, planning, controlling and completion of projects.

**Objective**

To introduce the methods and tools of project management. To impart knowledge in the areas of project organisation and structure, project planning, resource management, project controlling and on team leadership and team work.

**Content**

- From strategic planning to implementation (Project phases, goals, constraints, and feasibility)
- Project leadership (Leadership, Teams)
- Project organization (Structure)
- Project planning (Schedule, cost and resource planning)
- Project controlling
- Risk and Quality Management
- Project completion

**Lecture notes**

Yes

The transparencies will be available for download from the website at least one week before each class.

Copies of all necessary documents will be distributed at appropriate times.
The students will understand the basics of noise abatement: acoustics, impact of noise, measurement techniques and legislation. The students will be able to analyze different noise prob-lems and they will be able to solve simple problems of noise abatement.

Physikalische Grundlagen: Schalldruck, Wellen, Quellenarten.

Akustische Messtechnik: Umgang mit Dezibel, Akustische Masse, Schallpegelmesser, Spektralanalyse.

Lärmwirkungen: Gehör, Gesundheitswirkungen von Lärm, Störung/Belästigung, Belastungsmasse.

Kurze Einführung in die Bauakustik und in die einfachsten Grundlagen der Raumakustik.

Lärmarten und Prognoseverfahren: Messen/Berechnen, Strassenlärm, Eisenbahnlärm, Fluglärm, Schiesslärm, Industrielllärm.

Lecture notes

Skript "Lärmbekämpfung" erhältlich zu Beginn der Vorlesung.

Corinne.Gianola@empa.ch

Prerequisites / notice

1 - 2 Exkursionen

Environmental Engineering Seminars

The course is organized in the form of seminars held by the students. Topics selected from the core disciplines of the curriculum (water resources, urban water engineering, material fluxes, waste technology, air polution, earth observation) are discussed in the class on the basis of scientific papers that are illustrated and critically reviewed by the students.

Learn about recent research results in environmental engineering and analyse practical applications in environmental engineering.

Elective Block: Environmental Planning

Noise Abatement

The students will understand the basics of noise abatement: acoustics, impact of noise, meas-urement techniques and legislation. The students will be able to analyze different noise prob-lems and they will be able to solve simple problems of noise abatement.

Elective Block: Soil Protection

Pedosphere

Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

Definition of the pedosphere, soil functions, rocks as parent materials, minerals and weathering, soil organisms, soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

Definition of the pedosphere, soil functions, rocks as parent materials, minerals and weathering, soil organisms, soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

Lecture notes

Lecture notes can be purchased during the first lecture (15.- SFr)

Prerequisites: Basic knowledge in chemistry, biology and geology.

Elective Block: Civil Engineering

Environmental Geotechnics

Introduction of basic knowledge about problems with contaminated sites, investigation of this sites, risk management, remediation and reclamation techniques as well as monitoring systems.

Introduction in landfill design and engineering with focus on barrier- and drainage systems and lining materials, evaluation of geotechnical problems, e.g. stability

Introduction of basic knowledge about problems with contaminated sites, investigation of this sites, risk management, remediation and reclamation techniques as well as monitoring systems.

Introduction in landfill design and engineering with focus on barrier- and drainage systems as wellas lining materials, evaluation of geotechnical problems, e.g. stability

101-1249-00L Wastewater Hydraulics W 3 credits 2G W. H. Hager

Abstract
The basics of wastewater hydraulics are described from the environmental and the hydraulic points of views thereby presenting also examples from engineering practice. Typical case studies are further described during a laboratory visit of VAW.

Objective
The understanding and the computation of the essential hydraulic processes in wastewater hydraulics are presented. On the one hand, free-surface hydraulics is reviewed with particular reference to problems in wastewater hydraulics, whereas various special hydraulic structures such as manholes, separation structures and collector channels are analyzed with a hydraulic approach on the other hand. Particularities of wastewater schemes including depositions and the choking of a sewer as the abrupt transition from free-surface to pressurized high-speed flow are highlighted.

Content
- Fundamentals
- Hydraulic losses
- Design of hydraulic elements
- Uniform flow
- Critical flow
- Energy dissipation
- Backwater curves
- Culvert and inverted siphon
- Overflows
- Venturi flume
- Mobile discharge measurement
- Drop and vortex drop
- Bend and junction manhole
- Sidewir
- Lateral overflow
- Bottom opening
- Side channel

Lecture notes
Text books

Exhaustive references are contained in the 'scripts'.

Content
Fundamentals of chemistry and physics are a prerequisite for this course.

Prerequisites / notice
Visit of VAW hydraulic laboratories to add to applied resources. Description of a number of selected, at the time available hydraulic models.

Abstract
Scenarios for world energy demand and CO2 emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry), Wind and ocean energy, heat pumps, geothermal energy, energy from waste. CO2 sequestration.

Objective
Scenarios for the development of world primary energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO2 emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

Content

Lecture notes
Lecture notes will be distributed during the course.

Literature

Prerequisites / notice
Fundamentals of chemistry and physics are a prerequisite for this course.

Electives
The entire course programs of ETH Zurich and the University of Zurich are open to the students to individual selection.

Electives ETH Zurich

Compulsory Electives in Humanities, Social and Political Sciences

Recommended GESS compulsory elective courses (Type B) for D-BAUG.

see GESS Compulsory Electives: Type A: Enhancement of Reflection Capability
# Bachelor Thesis

The Bachelor Programme concludes with the Bachelor Thesis. This project is supervised by a professor. Writing up the Bachelor Thesis encourages students to show independence and to produce structured work.

### Objective

Encourages students to show independence, to produce scientifically structured work and to apply engineering working methods.

### Content

The contents base upon the fundamentals of the Bachelor Programme. Students can choose from different subjects and tasks. The thesis consists of both a written report and an oral presentation.

Abstract: Technical systems are investigated in projects with measurement campaigns and numerical modeling. The students learn how to answer given questions with target oriented methodologies.

Objective: Technical systems are investigated in projects with measurement campaigns and numerical modeling. The students learn how to answer given questions with target oriented methodologies.

Content: The following projects are conducted:
- Construction, operation and characterisation of a mini wastewater treatment plant
- Characterization of aquifers with pumping experiments
- Modeling of hydrological systems
- Measuring and modeling of nanoparticles at workplaces
- Measuring and modeling of sediment transport in rivers
- Investigations of polluted terrain

Lecture notes: Written material will be available.

Abstract: In the course Numerical Hydraulics the basics of numerical modelling of flows are presented.

Objective: The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use commercial software in a responsible and critical way.

Content: The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.

All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as Hydraulic Systems and HEC RAS for non-steady flows are used.

Lecture notes: Lecture notes, powerpoints shown in the lecture and programs used can be downloaded. They are also available in German.

Literature: Given in lecture.

Abstract: The course presents an integrated view of the river basin and fluvial system. The fluvial system is viewed in terms of the dynamics in the transfer of water and sediment, the resulting geomorphology of the river network and streams, and finally the basin and river management options for conservation and restoration.

Objective: The goal of the course is to develop process-understanding of fluvial systems and to introduce the students to appropriate analysis tools. In the first section the estimation of basin sediment supply from upland sheet, rill and gully erosion, and basin sediment yield are discussed. The second section focuses on sediment transport in rivers in general, e.g. basic mechanics of sediment laden flows, bedforms, flow resistance, sediment type and load measurement and estimation, the morphology of rivers. It is illustrated how the river network can be analysed in terms of its connectivity and topological characteristics. Channel stability and channel erosion modelling are discussed. The third section looks at fluvial system management in terms of engineering and nonstructural sediment (e.g. upland and channel erosion protection) and water (e.g. the importance of the natural streamflow regime on riverine ecosystem integrity, river rehabilitation) resource management.

Lecture notes: There is no script.

Literature: Study materials (lecture handouts and selected papers) are distributed in class and available on the web.

Prerequisites / notice: Prerequisites: Hydrology 1 and Hydrology 2 (or contact instructor).

Objectives: The goal of this unit is to provide the background for the understanding, design and simulation of todays biological wastewater treatment and sludge stabilization processes. The students shall be capable to apply and recognize the limits of the kinetic models which have been developed to simulate these systems.

Content: Microbial transformation processes
- Introduction to the activated sludge process
- Modeling activated sludge systems
- Nitrification / denitrification / biological P elimination
- Enrichment, selectors, filamentous growth
- Biofilm kinetics and application to full scale plants
- Anaerobic processes, industrial applications, sludge stabilization
- Aerobic thermophilic processes

Lecture notes: Copies of overheads will be made available.

Literature: There will be a required textbook that students need to purchase (see http://www.ifu.ethz.ch/SWW/education/lectures/Proc_Eng_I for further information).

Prerequisites / notice: This course will be offered together with the course Systems Analysis and Mathematical Modeling. It is advantageous to follow both courses simultaneously. For detailed information on prerequisites and information needed from Systems Analysis and Mathematical Modeling the student should consult the lecture program and important information (syllabus) of Process Engineering I that can be downloaded at http://www.ifu.ethz.ch/SWW/education/lectures/Proc_Eng_I.

102-0227-00L Systems Analysis and Mathematical Modeling in Urban Water Management
- 6 credits
- 4G
- E. Morgenroth, M. Maurer

Abstract: This course supports the course in Biological Wastewater Treatment (102-0217-00L). It is therefore advantageous to follow both courses simultaneously.

Objective: The goal of this course is to provide the students with an understanding and the tools to develop their own mathematical models, to plan experiments, to evaluate error propagation and to test simple process control strategies in the field of process engineering in urban water management.

Content: The course will provide a broad introduction into the fundamentals of modeling water treatment systems. The topics are:
- Introduction into modeling and simulation
- The material balance equations, transport processes, transformation processes (kinetics, stoichiometry, conservation)
- Ideal reactors
- Hydraulic residence time distribution and modeling of real reactors
- Dynamic behavior of reactor systems
- Systems analytical tools: Sensitivity, parameter identification, error propagation, Monte Carlo simulation
- Introduction to process control (PID controller, fuzzy control)

Lecture notes: Copies of overheads will be available.

Literature: There will be a required textbook that students need to purchase:

Prerequisites / notice: This course will be offered together with the course Process Engineering I. It is advantageous to follow both courses simultaneously.

Prerequisites / notice: This course will be offered together with the course Systems Analysis and Mathematical Modeling. It is advantageous to follow both courses simultaneously. For detailed information on prerequisites and information needed from Systems Analysis and Mathematical Modeling the student should consult the lecture program and important information (syllabus) of Process Engineering I that can be downloaded at http://www.ifu.ethz.ch/SWW/education/lectures/Proc_Eng_I.
This course deepens students' knowledge of environmental, economic, and social assessment methodologies and their various applications. In particular, students completing the course should have the following:\n- ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors\n- knowledge about the current state of the scientific discussion and new research developments\n- ability to properly plan, conduct and interpret environmental assessment studies

In the course element "Implementation of...", students will learn to describe key sustainability problems of the current economic system and its measuring units; the structure of a management system, and elements to integrate environmental management (ISO 14001) and social management (SA8000 as well as ISO 26000), especially into strategy development, planning, controlling and communication; Sustainability Opportunities and Innovation\nThe concept of 'Continuous Improvement'\nLife Cycle Costing, Life Cycle Management\nenvironmental performance measurement of an organisation, including 'organisational LCA' (Ecobalance), based on practical examples of companies and new concepts\nsingle score env. assessment methods (Swiss ecopoints)\n- stakeholder management and sustainability oriented communication\nan intro into sustainability issues of supply chain management

Students will get small exercises related to course issues.

Part II (Implementation of Environmental and other Sustainability Goals):\n- Sustainability problems of the current economic system and its measuring units;\n- the structure of a management system, and elements to integrate environmental management (ISO 14001) and social management (SA8000 as well as ISO 26000), especially into strategy development, planning, controlling and communication;\n- Sustainability Opportunities and Innovation\n- The concept of ‘Continuous Improvement’\n- Life Cycle Costing, Life Cycle Management\n- environmental performance measurement of an organisation, including ‘organisational LCA’ (Ecobalance), based on practical examples of companies and new concepts\n- single score env. assessment methods (Swiss ecopoints)\n- stakeholder management and sustainability oriented communication\n- an intro into sustainability issues of supply chain management

This course should only be elected by students of environmental engineering with the Major in ESD, Air Quality Control and Waste Management. All other students should take the individual courses in Advanced Environmental Assessment and/or Implementation of Environmental goals (with or without exercise and lab).

Basic knowledge of environmental assessment tools is a prerequisite for this class. Students who have not yet had classwork in this topic are required to read an appropriate textbook before or at the beginning of this course (e.g. Baumann&Tillman, The Hitchhiker’s Guide to LCA: An Orientation in Life Cycle assessment Methodology and Applications, Studentliteratur, Lund, 2004).

### Lecture notes
- Part I: (-)
- Part II: Documents will be available on Ilias
- Part III Lab: (-)

### Literature
- Will be made available in class.

### Prerequisites / notice
- This course should only be elected by students of environmental engineering with the Major in ESD, Air Quality Control and Waste Management. All other students should take the individual courses in Advanced Environmental Assessment and/or Implementation of Environmental goals (with or without exercise and lab).

### Abstract
Waste Recycling Technology (WRT) is sub-discipline of Mechanical Process Engineering. WRT is employed in production plants processing contaminated soil, construction wastes, scrap metal, recovered paper and the like. While WRT is well established in Central Europe, it is only just now catching on in emerging markets as well.

### Objective
At the core of this course is the separation of solid materials according to their physical properties such as color, electrical conductivity, magnetism and so forth. After having taken this course, the students should have concept not only of the unit operations employed in WRT but also of how these unit operations are integrated into the flow sheets of production plants.

### Content
- Introduction
- Waste Recycling; Scope and objectives
- Waste recycling technologies in Switzerland

- Fundamentals
  - Properties of particles; Liberation conditions, Particle size and shape, Porosity of bulk materials
  - Fluid dynamics of particles: Stationary particle beds, Fluidized beds, Free settling particles
  - Flow sheet basics: Balancing mass flows
  - Standard processes: batch vs. continuous
  - Assessment of separation success: Separation function; grade vs. recovery

- Separation Process
  - Separation according to size and shape (Classification): Screening, Flow separation
  - Separation according to material properties (Concentration): Manual Sorting, Gravity concentration; Magnetic separation, Eddy current separation, Electrostatic separation, Sensor technology, Froth flotation

### Lecture notes
- The script consists of the transparencies shown during the lectures. Background material will be provided on the script-server.

### Literature
- A list of recommended books will be provided.

### Prerequisites / notice
- We will approach this topic from the perspective not of theory, but of practical application. However, solid fundamentals in physics (in particular in mechanics) are strongly recommended.
Abstract
Air pollutants cause negative effects on humans, wildlife and buildings. To control and reduce the impact of air pollutants, their transfer from sources to receptors needs to be known. This transfer includes transport within the atmospheric boundary layer, chemical transformation reactions and phase-transfer processes from air to liquid and solid materials (aerosols, water, ...).

Objective
The students understand the fundamental principles of atmospheric transport, dispersion and chemistry of pollutants on the local to regional scale and their transfer between air and condensed phases (aerosols, water, solids). This includes the knowledge of important atmospheric reactions, sources and sinks. The obtained understanding enables the students to apply computational tools to predict the transport and transformation of chemicals at the local to regional scale.

Content
- Structure of the Atmosphere
- Thermodynamics of the atmosphere
- Atmospheric stability
- Atmospheric boundary layer and turbulence
- Dispersion in the atmospheric boundary layer
- Numerical models of atmospheric dispersion
- Gas phase reaction kinetics
- Tropospheric chemistry and ozone formation
- Chemistry box models
- Volatile organic pollutants (VOCs) and semi-volatile organic pollutants (SVOCs)
- Distribution of chemicals between different phases
- Kinetics of phase transfer processes
- Computational tools to estimate volatility, distribution and phase transfer rates of organic chemicals

Lecture notes
Hand-outs of lecture material with extended comments will be made available along with the lecture.

Literature
Lists of suitable books and papers will be provided in the lecture.

Prerequisites / notice
strongly recommended: 102-0635-01L Luftreinhaltung (Air Pollution Control) or similar

Objectives of the Lecture
This lecture course comprises of lectures with exercises and guided case studies.

This is an interdisciplinary course aimed at environmental scientists and environmental engineers.

102-0337-00L Landfilling, Contaminated Sites and Radioactive Waste Repositories

Abstract
Practices of landfilling and remediation of contaminated sites and disposal of radioactive waste are based on the same concepts that aim to protect the environment. The assessment of contaminants that may leach into the environment as a function of time and how to reduce the rate of their release is key to the design of chemical, technical and geological barriers.

Objective
Upon successful completion of this course students are able to:
- assess the risk posed to the environment of landfills, contaminated sites and radioactive waste repositories in terms of fate and transport of contaminants
- describe technologies available to minimize environmental contamination
- describe the principles in handling of contaminated sites and to propose and evaluate suitable remediation techniques
- explain the concepts that underlie radioactive waste disposal practices

Content
This lecture course comprises of lectures with exercises and guided case studies.
- A short overview of the principles of environmental protection in waste management and how this is applied in legislation.
- A overview of the chemistry underlying the release and transport of contaminants from the landfilled/contaminated material/radioactive waste repository focusing on processes that control redox state and pH buffer capacity; mobility of heavy metals and organic compounds
- Technical barrier design and function. Clay as a barrier.
- Contaminated site remediation: Site evaluation, remediation technologies
- Concepts and safety in radioactive waste management
- Role of the geological and engineered barriers and radon-transport in geological media.

Lecture notes
Short script plus copies of overheads

Literature
Literature will be made available.

Prerequisites / notice
This is an interdisciplinary course aimed at environmental scientists and environmental engineers.

★★★ Major in Hydraulic Engineering

Number Title ECTS Hours Lecturers
101-0247-01L Hydraulic Engineering II 6 credits 4G R. Boes

Abstract
Hydraulic structures and their function within a hydraulic scheme are explained. The basic concepts of their layout and design with regard to economy and safety are provided.

Objective
Knowledge of hydraulic structures and their function within a hydraulic scheme. Skills for the layout and design of hydraulic structures with regard to economy and safety.

Content
Weirs: Weir stability, gates, inflatable dams, appurtenant structures.
Conduits: Design of headraces, pressure shafts, and penstocks, constructive details and construction.
Dams: Dam types, appurtenant structures (diversion, spillways, bottom outlet), dam type selection criteria, layout and design of gravity dams, buttress dams, arch dams, rockfill dams with central core or concrete face, measures in the foundation, mass concrete, RCC dams, reservoir siltation and sediment management, dam surveillance.
Artificial reservoirs: Purpose, layout, sealing, appurtenant structures, environmental aspects.

Lecture notes
manuscript and further documentation

Literature
is specified in the lecture and in the manuscript

Prerequisites / notice
Information: Enrolment of Hydraulic Engineering II is not recommended without having attended Hydraulic Engineering (101-0206-00L) previously since Hydraulic Engineering II is strongly based on Hydraulic Engineering (101-0206-00L).

102-0617-00L Basics and Principles of Radar Remote Sensing for Environmental Applications

Abstract
The course will provide the basics and principles of Radar Remote Sensing (specifically Synthetic Aperture Radar (SAR)) and its imaging techniques for the use of environmental parameter estimation.

Objective
The course should provide an understanding of SAR techniques and the use of the imaging tools for bio/geophysical parameter estimation.
At the end of the course the student has the understanding of
1. SAR basics and principles,
2. SAR polarimetry,
3. SAR interferometry and
4. environmental parameter estimation from multi-parametric SAR data
The course is giving an introduction into SAR techniques, the interpretation of SAR imaging responses and the use of SAR for different environmental applications. The outline of the course is the following:

1. Introduction to SAR basics and principles
2. Introduction into electromagnetic wave theory
3. Introduction into scattering theory and decomposition techniques
4. Introduction into SAR interferometry
5. Introduction into polarimetric SAR interferometry
6. Introduction into bio/geophysical parameter estimation (classification/segmentation, soil moisture estimation, earth quake and volcano monitoring, forest height inversion, wood biomass estimation etc.)

**Prerequisites / notice**

This course in combination with 102-0627-00-G: Applied Radar Remote Sensing for Environmental Parameter Estimation is providing a profound basis for independent data analysis. It is recommended to take both courses together.

**101-0258-00L River Engineering**

**Abstract**

Main subjects treated:
- Fundamentals (e.g. sediment sampling methods), alluvial channel hydraulics, incipient motion, bed forms, bed load and suspended load, sediment budget and morphological changes, river morphology, scour, river management concepts and selected measures (e.g. bank and bed protection works).
- A practical exercise (voluntary, unmarked) is offered to deepen the learned subjects.

**Objective**

The students shall
- be able to describe quantitatively the interrelation between discharge, sediment transport and channel evolution
- know the fundamentals and be able to apply the approaches and methods to treat river engineering problems associated with flood protection and river restoration

**Content**

The first part of the lecture treats the fundamentals required to deal with river engineering problems. Sampling methods for the river bed material and methods to calculate the discharge in alluvial rivers are presented. The process of river bed armoring and the principles of incipient motion, of bed load and suspended load transport are treated.

In the second part of the lecture the procedures to quantify the sediment budget and the morphological changes (erosion, aggradation) in river systems are explained. Furthermore, the process of natural channel formation, and the different plan forms of rivers (straight, meandering, braided) are discussed. Own chapters are dedicated to the topics of bed forms, river morphology and scour.

The last part of the lecture concentrates on the design and dimensioning of river engineering works. The topics treated are the stabilization of banks and of the longitudinal profile of rivers.

**Literature**

Autography River Engineering (in German)

The autography contains a comprehensive list of references to relevant literature.

**Prerequisites**

Hydrology, Hydraulics I and Hydraulic Engineering

The voluntary and unmarked exercise bases on field data, which are collected by the students on a river in nature. Besides the collection of fundamentals and field data, the exercise comprehends the calculation of the stage-discharge relationship, of the critical discharges at the onset of bed load transport and bed erosion and of the annual sediment load in a given river reach.

**101-0269-00L Numerical Modelling in Fluvial Hydraulics and River Engineering**

**Abstract**

Get to know possibilities and limitations of numerical modelling in fluvial hydraulics and river engineering.

- Governing equations and modelling approaches
- Initial and boundary conditions
- Simulation process and grid generation
- Numerical methods: basics, accuracy and stability
- Examples of numerical schemes, 1D and 2D models

**Lecture notes**

Slides of lecture are available for download as PDF. Supplementary material will be provided during lecture.

**Literature**

Relevant books and citations will be mentioned.

**Prerequisites**

Exercises are based on the simulation software BASEMENT (www.basement.ethz.ch), the open-source GIS Qgis (www.qgis.org) and code examples written in MATLAB. The applications comprise one- and two-dimensional approaches for the modelling of flow and sediment transport.

---

### Major in Soil Protection

**As replacement of 101-0314-99 Soil Mechanics, one of following three courses is compulsory for students of major Soil Protection:**

1. 651-4033-00 Soil Mechanics and Foundation (HS), or
2. 751-3404-00 Nutrient Fluxes in Soil-Plant Systems (FS), or
3. 701-1802-00L Ökologie von Waldböden (FS)

</table>

**Abstract**

The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/ near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

**Objective**

Students are able to
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media,
- quantify driving forces and resulting fluxes of water, solute, and heat in soils.
- apply modern measurement methods and analytical tools for hydrological data collection
- conduct and interpret a limited number of experimental studies
- explain links between physical processes in the vadose-zone and major societal and environmental challenges

---

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 1308 of 1432
The students gain a detailed understanding of the sources and the cycling of trace elements in the terrestrial and aquatic environment. The students apply a regional balance model for Swiss regions in computer exercises and assess major soil functions of agricultural soils. The course addresses major biogeochemical processes that drive the cycling of different groups of trace elements (heavy metals, redox-sensitive and chalcophile elements) in the environment, and the chemical methods that are used to study the behavior of these elements in the geosphere.

Biogeochemistry of Trace Elements

Weeks 1 to 3: Physical Properties of Soils and Other Porous Media
- Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics)
- The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:
- Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.
- Part 2 - Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.
- Midterm exam
- Part 3 - Use of Hydrus model for simulation of unsaturated flow
- Additional topics: Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

Lecture notes
- Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller (available at the beginning of the semester)
- Literature: Supplemental textbook (not mandatory) - Environmental Soil Physics, by: D. Hiller

701-1315-00L Biogeochemistry of Trace Elements O 3 credits 2G A. Voegelin, J. G. Wiederhold, L. Winkel

Objective
- The students gain a detailed understanding of the sources and the cycling of trace elements in the terrestrial and aquatic environment. The interaction of environmentally important trace elements with abiotic and biotic geosphere components as well as their abiotically and biotically driven transformations will be discussed. Relevant methods/techniques to study these processes will be presented.

Content
- The course deals in-depth with the major biogeochemical processes controlling the cycling of different groups of trace elements (heavy metals, redox-sensitive and chalcophile elements) in the environment. Sources and cycling of trace elements as related to interactions with abiotic and biotic geosphere components, and abiotically and biotically driven transformations will be discussed. The techniques most commonly used to study these processes will be presented as well.

Additional topics:
- Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.
- Biological Processes in the Vadose Zone - An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.

Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.
Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.
Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:
- Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.
- Biological Processes in the Vadose Zone - An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.

Lecture notes
- Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller (available at the beginning of the semester)
- Literature: Supplemental textbook (not mandatory) - Environmental Soil Physics, by: D. Hiller

701-1681-00L Element Balancing and Soil Functions in Managed Ecosystems O 3 credits 2G A. Keller

Abstract
- Applying element balances of agricultural soils and the assessment of soil functions for real applications in computer exercises to design preventive strategies against soil pollution and to support sustainable management of regional agroecosystems also in the context of spatial planning procedures.

Objective
- The students learn to critically assess changes in land use management on element cycles in agro-ecosystems and to assess soil services (soil functions). You design solutions for chemical problems in soil protection at the regional scale and learn to assess soil functions using different methods.

Content
- The students apply a regional balance model for Swiss regions in computer exercises and assess major soil functions of agricultural soils. You assess the sustainability of current land use and analyse management options improving nutrient and metal cycling in agro-ecosystems. The students will have the opportunity to calculate specific scenarios regarding land use management and environmental changes. Special focus we be paid on the soil services such as regulation-, production function and soil as habitat, and the assessment of these functions based on soil mapping data.

Lecture notes
- Literature and Exercises for a case study
- Literature will be provided.
651-4033-00L

Abstract
The course presents the principles of soil mechanics and soil behaviour characteristics and its applications in geotechnical structures and systems. It is based on more descriptive courses on Engineering Geology within the BSc Geol. Program and is a compulsory prerequisite for other courses within the MSc Eng. Geol. program.

Objective
Understanding the principles of soil behaviour and the fundamentals of geotechnical practices in soils. Ability to communicate with geotechnical engineers.

Content
Soil Mechanics:
- Fundamental concepts of strength and deformation of different soils. Introduction to geotechnical calculations
- Significance of (ground)water
- Geotechnical Engineering in Soils:
  - Evaluation of geotechnical scenarios, handling of forecast uncertainties, relation of soil properties and soil composition, interactions between soil and building,
  - standard construction methods in soils (foundations, slopes, dams and levees),
  - requirements for the geotechnical prognosis

Lecture notes
This lecture is supported by the textbook: “Geotechnical Engineering” by Donald P. Coduto, 2nd edition, 2011; ISBN-13: 978-0-13-125425-8

Prerequisites / notice
Courses must be completed:
- Introduction to Engineering Geology (BSc level)
- Introduction to Groundwater
- Sedimentology and Quaternary deposits
- Principles of Physics

Courses recommended:
- Eng Geol Site Investigations
- Eng Geol Field Course I (soils)
- Clay Mineralogy

Abstract

Objective
The goal of this course is to provide the students with an understanding and the tools to develop their own mathematical models, to plan experiments, to evaluate error propagation and to test simple process control strategies in the field of process engineering in urban water management.

Content
The course will provide a broad introduction into the fundamentals of modeling water treatment systems. The topics are:
- Introduction into modeling and simulation
- The material balance equations, transport processes, transformation processes (kinetics, stoichiometry, conservation)
- Ideal reactors
- Hydraulic residence time distribution and modeling of real reactors
- Dynamic behavior of reactor systems
- Systems analytical tools: Sensitivity, parameter identification, error propagation, Monte Carlo simulation
- Introduction to process control (PID controller, fuzzy control)

Lecture notes
Copies of overheads will be made available.

Literature

Prerequisites / notice
This course will be offered together with the course Process Engineering I. It is advantageous to follow both courses simultaneously.
101-0247-01L Hydraulic Engineering II

Abstract
Hydraulic structures and their function within a hydraulic scheme are explained. The basic concepts of their layout and design with regard to economy and safety are provided.

Objective
Knowledge of hydraulic structures and their function within a hydraulic scheme. Skills for the layout and design of hydraulic structures with regard to economy and safety.

Content
- Weirs: Weir stability, gates, inflatable dams, appurtenant structures.
- Conduits: Design of head races, pressure shafts, and penstocks, constructive details and construction.
- Power plants: Power house and turbine types, design, structure, construction.
- Dams: Dam types, appurtenant structures (diversion, spillways, bottom outlet), dam type selection criteria, layout and design of gravity dams, buttress dams, arch dams, rockfill dams with central core or concrete face, measures in the foundation, mass concrete, RCC dams, reservoir siltation and sediment management, dam surveillance.
- Artificial reservoirs: Purpose, layout, sealing, appurtenant structures, environmental aspects.

Literature
Lecture notes and further documentation is specified in the lecture and in the manuscript.

Prerequisites / notice
Information: Enrolment of Hydraulic Engineering II is not recommended without having attended Hydraulic Engineering (101-0206-00L) previously since Hydraulic Engineering II is strongly based on Hydraulic Engineering (101-0206-00L).

101-0269-00L Numerical Modelling in Fluvial Hydraulics and River Engineering

Abstract
The basics of numerical modelling of fluvial hydraulics and river engineering problems are presented. The governing equations for flow and sediment transport in open channels and corresponding numerical solution strategies are introduced. The theoretical parts are discussed by examples.

Objective
- Governing equations and modelling approaches
- Initial and boundary conditions
- Simulation process and grid generation
- Numerical methods: basics, accuracy and stability
- Examples of numerical schemes, 1D and 2D models

Content
Lecture notes
Slides of lecture are available for download as PDF. Supplementary material will be provided during lecture.

Literature
Relevant books and citations will be mentioned.

Prerequisites / notice
Exercises are based on the simulation software BASEMENT (www.basement.ethz.ch), the open-source GIS Qgis (www.qgis.org) and code examples written in MATLAB. The applications comprise one- and two-dimensional approaches for the modelling of flow and sediment transport.

Information: Enrolment of Hydraulic Engineering II is not recommended without having attended Hydraulic Engineering (101-0206-00L) previously since Hydraulic Engineering II is strongly based on Hydraulic Engineering (101-0206-00L).

101-0249-00L Selected Topics on Hydraulic Engineering

Abstract
The lecture focuses on selected topics in hydraulic engineering, water management and aquatic ecology relating to hydropower and flood protection projects.

Objective
to deepen knowledge on special aspects in hydraulic engineering and to understand the procedures and the planning sequence of hydropower projects

Content
Different selected topics in hydraulic engineering will be focused on, e.g. dam safety, possible problems at reservoirs like sedimentation or natural hazards by impulse waves, the hydraulics of river flows, spillways and intake structures at dams and weirs, hydropower and ecology like fish-ecological aspects at low-head hydropower plants and eco-hydraulics like flow-vegetation interaction. Another focus will be put on typical approaches and procedures in the planning process of hydropower projects.

Lecture notes
Lecture notes/handouts will be available online.

Literature
Relevant speakers will present current topics and projects in Switzerland and abroad.

Prerequisites / notice
External speakers will present current topics and projects in Switzerland and abroad.

101-0289-00L Applied Glaciology

Abstract
We will explain the fundamentals of physics of glaciers which are necessary for treating applied problems. We will go into climate-glacier interactions, flow of glaciers, lake ice and hydrology of glaciers.

Objective
To understand the fundamental physical processes in glaciology.

Content
Basics in physical glaciology
- Dynamics of glaciers: deformation of glacier ice, role of water in glacier motion, reaction of glaciers to climate changes, glacier calving, surges
- Ice falls, ice avalanches
- Glacier floods
- Lake ice and bearing capacity

Lecture notes
Handouts are available.

Literature
Relevante Literatur wird während der Vorlesung angegeben.

Prerequisites / notice
Für aktuelle Fallbeispiele werden risikobasierte Massnahmen bei glaziologischen Naturgefahren diskutiert.

Voraussetzungen: Es werden Grundkenntnisse in Mechanik und Physik vorausgesetzt.

102-0287-00L Fluvial Systems

Abstract
The course presents an integrated view of the river basin and fluvial system. The fluvial system is viewed in terms of the dynamics in the transfer of water and sediment, the resulting geomorphology of the river network and streams, and finally the basin and river management options for conservation and restoration.
The goal of the course is to develop process-understanding of fluvial systems and to introduce the students to appropriate analysis tools. In the first section the estimation of basin sediment supply from upland sheet, rill and gully erosion, and basin sediment yield are discussed. The second section focuses on sediment transport in rivers in general. e.g. basic mechanics of sediment laden flows, bedforms, flow resistance, sediment type and load measurement and estimation, the morphology of rivers. It is illustrated how the river network can be analysed in terms of its connectivity and topological characteristics. Channel stability and channel erosion modelling are discussed. The third section looks at fluvial system management in terms of engineering and nonstructural sediment (e.g. upland and channel erosion protection) and water (e.g. the importance of the natural streamflow regime on riverine ecosystem integrity, river rehabilitation) resource management.

All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as Hydraulic Systems and HEC RAS for non-steady flows are used.

**Prerequisites / notice**

Study materials (lecture handouts and selected papers) are distributed in class and available on the web. Literature will be made available.

**Sustainability Goals**

- Multicriteria analysis
- Subjectivity in environmental assessments
- Uncertainty analysis
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Recent development in impact assessment
- Consequential and marginal analysis
- Hybrid LCA methods.
- Consequential and marginal analysis
- Recent development in impact assessment
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Uncertainty analysis
- Subjectivity in environmental assessments
- Multicriteria analysis
- Case Studies

**Prerequisites / notice**

Basic knowledge of environmental assessment tools is a prerequisite for this class. Students that have not done classwork in this topic before are required to read an appropriate textbook before or at the beginning of this course (e.g. Baumann&Tillman, The Hitch Hiker's Guide to LCA: An Orientation in Life Cycle Assessment Methodology and Applications, Studentliteratur, Lund, 2004).
Abstract
How to make sustainability operational - in industry, services and other organizations: You will learn how to put sustainability into practice by integrating environmental, social and economic aspects into organisations’ management and processes. The course contains both a management view, as well as a sustainability view - and how to combine them.

Objective
To provide understanding of how sustainability can be made operational in an organisation. To do so, students will understand how to integrate sustainability thinking into the typical current organisational environment and processes, such as planning, implementing and controlling.

Content
We meet for five 3-hour-lectures, with discussions and case studies during course time. Additionally, small case studies in-between courses will be given at most course days. Course topics are:
- Sustainable Development and its meaning for Management
- Management Standards for Sustainability (ISO and others)
- Sustainability Opportunities and Innovation
- Organisation and Implementation
- The concept of ‘Continuous Improvement’
- Environmental Performance Measurement (Concepts, Standards, Methods)
- Life Cycle Costing, Life Cycle Management
- (Sustainable) Supply Chain Management
- Communication of Sustainability Issues

Lecture notes
Course documentation as well as case study descriptions will be provided during the course via the “Ilias” repository.

Literature
There are two ways to approach the course's issues:

c) We will touch upon the hotel sustainable scheme and label “ibex” see: http://www.e2mc.com/images/stories/e2_bilder/downloads/Umwellfokus_d.pdf (for an english version, pls contact the lecturer at arthurb@ethz.ch )

Prerequisites / notice
If you have specific interests or questions, let me know at arthurb@ethz.ch. Maybe I can include your issues - or I can’t :-(

102-0357-00L Waste Recycling Technologies W 3 credits 2G R. Bunge

Abstract
Waste Recycling Technology (WRT) is sub-discipline of Mechanical Process Engineering. WRT is employed in production plants processing contaminated soil, construction wastes, scrap metal, recovered paper and the like. While WRT is well established in Central Europe, it is only just now catching on in emerging markets as well.

Objective
At the core of this course is the separation of mixtures of solid bulk materials according to physical properties such as color, electrical conductivity, magnetism and so forth. After having taken this course, the students should have concept not only of the unit operations employed in WRT but also of how these unit operations are integrated into the flow sheets of production plants.

Content
Introduction
Waste Recycling: Scope and objectives
Waste recycling technologies in Switzerland

Fundamentals
Properties of particles: Liberation conditions, Particle size and shape, Porosity of bulk materials
Fluid dynamics of particles: Stationary particle beds, Fluidized beds, Free settling particles
Flow sheet basics: Balancing mass flows
Standard processes: batch vs. continuous
Assessment of separation success: Separation function; grade vs. recovery

Separation Process
Separation according to size and shape (Classification): Screening, Flow separation
Separation according to material properties (Concentration): Manual Sorting, Gravity concentration; Magnetic separation, Eddy current separation, Electrostatic separation, Sensor technology, Froth flotation

Lecture notes
The script consists of the transparencies shown during the lectures. Background material will be provided on the script-server.

Literature
A list of recommended books will be provided.

Prerequisites / notice
We will approach this topic from the perspective not of theory, but of practical application. However, solid fundamentals in physics (in particular in mechanics) are strongly recommended.

102-0617-00L Basics and Principles of Radar Remote Sensing for Environmental Applications W 3 credits 2G I. Hajnsek

Abstract
The course will provide the basics and principles of Radar Remote Sensing (specifically Synthetic Aperture Radar (SAR)) and its imaging techniques for the use of environmental parameter estimation.

Objective
At the end of the course the student has the understanding of:
- SAR basics and principles,
- SAR polarimetry,
- SAR interferometry and
- environmental parameter estimation from multi-parametric SAR data

Content
The course is giving an introduction into SAR techniques, the interpretation of SAR imaging responses and the use of SAR for different environmental applications. The outline of the course is the following:

1. Introduction into SAR basics and principles
2. Introduction into electromagnetic wave theory
3. Introduction into scattering theory and decomposition techniques
4. Introduction into SAR interferometry
5. Introduction into polarimetric SAR interferometry
6. Introduction into bio/geophysical parameter estimation (classification/segmentation, soil moisture estimation, earth quake and volcano monitoring, forest height inversion, wood biomass estimation etc.)

Lecture notes
Handouts for each topic will be provided.
The course in combination with 102-0627-00-G: Applied Radar Remote Sensing for Environmental Parameter Estimation is providing a profound basis for independent data analysis. It is recommended to take both courses together.

**102-0627-00L Applied Radar Remote Sensing for Environmental Parameter Estimation**

**Abstract**
The course is providing practical exercises for the use of Radar Remote Sensing, specifically Synthetic Aperture Radar (SAR) to estimate environmental parameters.

**Objective**
The course should enable the independent use and handling of SAR data for environmental parameter estimation. At the end of the course the student has the ability to:

1. Read and display multi-parametric SAR data
2. Apply and pre-process SAR data (speckle filtering, polarimetric and interferometric processing steps)
3. Derivation of bio/geophysical environmental parameter

**Content**
The main focus of the course is the handling of multi-parameter SAR data for environmental parameter estimation with the following content:

1. Read and display multi-parametric SAR data
2. Application of different speckle filtering techniques
3. Derivation of the coherency and covariance matrix
4. Application of polarimetric correlation functions
5. Application of different decomposition techniques
6. Generation of a polarimetric SAR interferometry data set from a simulated forest
7. Processing of the polarimetric SAR interferometry data set
8. Estimation of environmental parameters (segmentation, soil moisture estimation, forest height estimation, etc.)

**Literature**
First readings for the course:

**Prerequisites / notice**
This course in combination with 102-0617-G: Basics and Principles of Radar Remote Sensing provides the basis for an independent handling of multi-parametric SAR data. The content of this course is offering to apply the theory to practical exercises using the free software PolSARPro.

**101-0187-00L Structural Reliability and Risk Analysis**

**Abstract**
Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.

**Objective**
The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. After this course the students will have refreshed their knowledge of probability theory and statistics to model uncertainties in view of engineering applications. They will be able to analyze the reliability of a structure and to use risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.

**Content**
Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. When designing new structures and systems, the design codes such as SIA or Euro-codes usually provide a framework that guarantees safety and reliability. However the level of safety is not quantified explicitly, which does not allow the analyst to properly choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FOSM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and post-post risk assessment methods are presented. Bayesian networks are introduced as a generic numerical tool for solving such problems. The course also includes a tutorial using a software dedicated to real world structural reliability analysis.

**Literature**

**Prerequisites / notice**
Basic course on probability theory and statistics

**529-0047-00L Risk Assessment of Chemicals**

**Abstract**
Projects on chemical assessment with the focus on the analysis and assessment of basic substance data for selected chemical classes; analysis and modelling of technical processes; characterisation of environmental and health risks. Risk assessment on the basis of quality and protection goals. Estimation of model and parameter uncertainty. Precaution and safety measures.

**Objective**
Project thesis (report) on chemicals assessment; time frame totals ca. 80 hours.
Projects on chemical assessment with the focus on the following aspects:

- Analysis and assessment of basic substance data for selected chemical classes: physical chemical properties, environmental behaviour (distribution, persistence), human and eco-toxicity (biochemical metabolism, effect mechanisms), safety.
- Analysis and modelling of technical processes determining chemical release into the environment, e.g., chemicals applications.
- Characterisation of environmental and health risks on the basis of exposure and effect models, QSARs from environmental chemistry, toxicology and methods of risk analysis.
- Risk assessment on the basis of quality and safety goals. Estimation of the model and data uncertainty.
- Demonstration of possibilities and limits of precaution and safety measures (technical, organisational, concerning personnel) including effectiveness and efficiency.

### Literature

**P. Krütli**

**Lecture notes**

See recommended literature.

**Literature**

**Prerequisites / notice**

Co-operation with chemical companies.
The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines.

Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.

**Objective**

At the end of the course students should:

Know:
- Function, purpose and algorithm of a selected number of transdisciplinary methods

Understand:
- Functional application in case studies and other problem oriented projects

Be able to reflect on:
- Potential, limits, and necessity of transdisciplinary methods

Be prepared for:
- Transdisciplinary Case Study 2016

**Content**

The course is seminar-like, interactive.

**Content**

The course is seminar-like, interactive.

The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines.

Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.
Science and Technology Policy is normally associated with the improvement of national competitiveness; yet, it is also an integral part of effective environmental and development policies. The course will discuss the challenges and opportunities of technological change in terms of sustainable development and show how public policy on the national and the international level is responding to this change.

In this context, students are to become familiar with the basic principles of political economy and New Growth Theory and how such theories help explain political decisions as well as political outcomes in the area of Science, Technology and Innovation. State interventions are either designed to regulate (e.g. environmental regulations, anti-trust law) or facilitate (e.g. intellectual property rights protection, public investment in R&D and technical education, technology transfer) technological change. This will be illustrated by looking at different industries and different national systems of innovation. Subsequently the positive and negative consequences for society and the natural environment will be discussed from a short-term and a long-term perspective.

**Objective**

1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Involving stakeholders
4. Collaborating disciplines
5. Exploration of tools and methods
6. Analysing participants' projects to improve inter- and transdisciplinary elements

**Prerequisites / notice**

The 2-hour course (5-7 p.m.) will be held as a series of lectures. The course materials will be available in form of an electronic Reader at the beginning of the semester. The class will be taught in English.

Students will be asked to give a (a) presentation (15 Minutes) or write a review paper based on an article selected from the electronic script, and (b) they will have to pass a written test at the end of the course in order to obtain 3 credit points in the ECTS System. In the final mark (a) will have a weight of 40% and (b) 60%.

**Literature**

- Diamond, Jared. 2012. 'The World Until Yesterday; What Can We Learn from Traditional Societies?' New York: Viking.

**Literature**

**Prerequisites / notice**

The seminar is specifically suitable for PhD or PostDoc researchers. It is open to master students (minor "global change and sustainability") and further interested people, who preferably are preparing, or working on, a project/thesis.

**Literature**

- Data: 06.10.2017 12:56  Autumn Semester 2015  Page 1317 of 1432
This course covers the basic physical concepts and mathematical equations used to describe environmental fluid systems on the rotating Earth. Fundamental concepts (e.g. vorticity dynamics and waves) are formally introduced, applied quantitatively and illustrated using examples. Exercises help to deepen knowledge of the material.

**Objective**

Students are able to:
- to name the bases, concepts and methods of environmental fluid dynamics,
- to understand and discuss the components of the basic physical equations in fluid dynamics,
- to apply basic mathematical equations to simple problems of environmental fluid dynamics.

**Content**

Basic physical terminology and mathematical laws:
- Continuum hypothesis, forces, constitutive laws, state equations and basic principles of thermodynamics, kinematics, laws of mass and momentum on rotating earth.
- Concepts and illustrative flow systems: vorticity dynamics, boundary layers, instability, turbulence - with respect to environmental fluid systems.
- Scale analysis: dimensionless variables and dynamical similarity, simplification of the fluid system, e.g. shallow water assumption, geostrophic flow.
- Waves in environmental fluid systems.

**Lecture notes**

In English language

**Literature**

Will be presented in class. See also: web-site.

---

The course addresses major biogeochemical processes that drive the cycling of different groups of trace elements (heavy metals, redox-sensitive trace elements, chalcophile elements) in the environment, and the chemical methods that are used to study the behavior of these elements in the geosphere.

**Objective**

The students gain a detailed understanding of the sources and the cycling of trace elements in the terrestrial and aquatic environment. The interaction of environmentally important trace elements with abiotic and biotic geosphere components as well as their abiotically and biotically driven transformations will be discussed. Relevant methods/techniques to study these processes will be presented.

**Content**

The course deals in-depth with the major biogeochemical processes controlling the cycling of different groups of trace elements (heavy metals, redox-sensitive and chalcophile elements) in the environment. Sources and cycling of trace elements as related to interactions with abiotic and biotic geosphere components, and abiotically and biotically driven transformations will be discussed. The techniques most commonly used to study these processes will be presented as well.

**Lecture notes**

Selected handouts (lecture notes, literature, exercises) will be distributed during the course.

**Prerequisites / notice**

Students are expected to be familiar with the concepts of aquatic or soil chemistry covered in the respective classes at the bachelor level.

---

Applying element balances of agricultural soils and the assessment of soil functions for real applications in computer exercises to design preventive strategies against soil pollution and to support sustainable management of regional agroecosystems also in the context of spatial planning procedures.

**Objective**

The students learn to critically assess changes in land use management on element cycles in agro-ecosystems and to assess soil services (soil functions). You design solutions for chemical problems in soil protection at the regional scale and learn to assess soil functions using different methods.

**Content**

The students apply a regional balance model for Swiss regions in computer exercises and assess major soil functions of agricultural soils. You assess the sustainability of current land use and analyse management options improving nutrient and metal cycling in agro-ecosystems. The students will have the opportunity to calculate specific scenarios regarding land use management and environmental changes. Special focus will be paid on the soil services such as regulation-, production function and soil as habitat, and the assessment of these functions based on soil mapping data.

**Lecture notes**

Literature and Exercises for a case study

**Prerequisites / notice**

The course consists of lectures and computer exercises. The course take place every 2 weeks à 4 hours. Recommended prerequisites for attending this course:
- Bodenschutz und Landnutzung
- Biochemie of Trace Elements
- Angewandte Bodenökologie

---

---

**Abstract**

Main subjects treated:
- Fundamentals (e.g. sediment sampling methods), alluvial channel hydraulics, incipient motion, bed forms, bed load and suspended load, sediment budget and morphological changes, river morphology, scour, river management concepts and selected measures (e.g. bank and bed protection works).
- A practical exercise (voluntary, unmarked) is offered to deepen the learned subjects.

**Objective**

The students shall:
- be able to describe quantitatively the interrelation between discharge, sediment transport and channel evolution,
- know the fundamentals and be able to apply the approaches and methods to treat river engineering problems associated with flood protection and river restoration.

**Content**

The first part of the lecture treats the fundamentals required to deal with river engineering problems. Sampling methods for the river bed material and methods to calculate the discharge in alluvial rivers are presented. The process of river bed armoring and the principles of incipient motion, of bed load and suspended load transport are treated.

In the second part of the lecture the procedures to quantify the sediment budget and the morphological changes (erosion, aggradation) in river systems are explained. Furthermore, the process of natural channel formation and the different plan forms of rivers (straight, meandering, braided) are discussed. Own chapters are dedicated to the topics of bed forms, river morphology and scour.

The last part of the lecture concentrates on the design and dimensioning of river engineering works. The topics treated are the stabilization of banks and of the longitudinal profile of rivers.

**Lecture notes**

Autography River Engineering (in German)

**Literature**

The autography contains a comprehensive list of references to relevant literature.
Prerequisites / notice

strongly recommended:
Hydrology, Hydraulics I and Hydraulic Engineering

The voluntary and unmarked exercise bases on field data, which are collected by the students on a river in nature. Besides the collection of fundamentals and field data, the exercise comprehends the calculation of the stage-discharge relationship, of the critical discharges at the onset of bed load transport and bed erosion and of the annual sediment load in a given river reach.

102-0337-00L Landfilling, Contaminated Sites and Radioactive Waste Repositories

W 3 credits 2G  W. Hummel, L. M. Plötze

Abstract
Practices of landfilling and remediation of contaminated sites and disposal of radioactive waste are based on the same concepts that aim to protect the environment. The assessment of contaminants that may leach into the environment as a function of time and how to reduce the rate of their release is key to the design of chemical, technical and geological barriers.

Objective
Upon successful completion of this course students are able to:
- assess the risk posed to the environment of landfills, contaminated sites and radioactive waste repositories in terms of fate and transport of contaminants
- describe technologies available to minimize environmental contamination
- describe the principles in handling of contaminated sites and to propose and evaluate suitable remediation techniques
- explain the concepts that underlie radioactive waste disposal practices

Content
This lecture course comprises of lectures with exercises and guided case studies.
- A short overview of the principles of environmental protection in waste management and how this is applied in legislation.
- A overview of the chemistry underlying the release and transport of contaminants from the landfilled/contaminated material/radioactive waste repository focusing on processes that control redox state and pH buffer capacity; mobility of heavy metals and organic compounds
- Technical barrier design and function. Clay as a barrier.
- Contaminated site remediation: Site evaluation, remediation technologies
- Concepts and safety in radioactive waste management
- Role of the geological and engineered barriers and radionuclide transport in geological media.

Lecture notes
Short script plus copies of overheads

Literature
Literature will be made available.

Prerequisites / notice
This is an interdisciplinary course aimed at environmental scientists and environmental engineers.

151-0709-00L Stochastic Methods for Engineers and Natural Scientists

W 4 credits 3G  D. W. Meyer-Massetti

Abstract
The course provides an introduction into stochastic methods that are applicable for example for the description and modeling of turbulent and subsurface flows. Moreover, mathematical techniques are presented that are used to quantify uncertainty in various engineering applications.

Objective
By the end of the course you should be able to mathematically describe random quantities and their effect on physical systems. Moreover, you should be able to develop basic stochastic models of such systems.

Content
- Probability theory, single and multiple random variables, mappings of random variables
- Stochastic differential equations, Ito calculus, PDF evolution equations
- Polynomial chaos and other expansion methods
- All topics are illustrated with application examples from engineering.

Lecture notes
Detailed lecture notes will be provided.

Literature
Some textbooks related to the material covered in the course:

102-0377-00L Air Pollution Modeling and Chemistry

W 3 credits 2G  S. Henne, A. C. Gerecke

Abstract
Air pollutants cause negative effects on humans, wildlife and buildings. To control and reduce the impact of air pollutants, their transfer from sources to receptors needs to be known. This transfer includes transport within the atmospheric boundary layer, chemical transformation reactions and phase-transfer processes from air to liquid and solid materials (aerosols, water).

Objective
The students understand the fundamental principles of atmospheric transport, dispersion and chemistry of pollutants on the local to regional scale and their transfer between air and condensed phases (aerosols, water, solids). This includes the knowledge of important atmospheric reactions, sources and sinks. The obtained understanding enables the students to apply computational tools to predict the transport and transformation of chemicals at the local to regional scale.

Content
- Structure of the Atmosphere
- Thermodynamics of the atmosphere
- Atmospheric stability
- Atmospheric boundary layer and turbulence
- Dispersion in the atmospheric boundary layer
- Chemical kinetic models
- Chemical box models
- Volatile organic pollutants (VOCs) and semi-volatile organic pollutants (SVOCs)
- Distribution of chemicals between different phases
- Kinetics of phase transfer processes
- Computational tools to estimate volatility, distribution and phase transfer rates of organic chemicals

Lecture notes
Hand-outs of lecture material with extended comments will be made available along with the lecture.

Literature
Lists of suitable books and papers will be provided in the lecture.

Prerequisites / notice
strongly recommended: 102-0635-01L Luftreinhaltung (Air Pollution Control) or similar

701-0535-00L Environmental Soil Physics/Vadose Zone Hydrology

W 3 credits 2G+2U  D. Or

Abstract
The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/ near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

Objective
Students are able to:
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media,
- quantify driving forces and resulting fluxes of water, solute, and heat in soils,
- apply modern measurement methods and analytical tools for hydrological data collection
- conduct and interpret a limited number of experimental studies
- explain links between physical processes in the vadose-zone and major societal and environmental challenges

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 1319 of 1432
Content

Weeks 1 to 3: Physical Properties of Soils and Other Porous Media. Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior.

Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity.

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:

Lab 1: Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.

Lab 2: Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.

Midterm exam

Lab 3: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.

Part 3 - Use of Hydrus model for simulation of unsaturated flow

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils. Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.

Lab 4: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:

Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

Biological Processes in the Vadose Zone. An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmospheric gaseous exchange; and challenges for bio- and phytoremediation.

Lecture notes

Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller (available at the beginning of the semester)

http://www.step.ethz.ch/education/active-courses/vadose-zone-hydrology

Literature

Supplemental textbook (not mandatory) - Environmental Soil Physics, by: D. Hillel

102-0317-01L Advanced Environmental Assessment (Computer Lab and Exercises) 3 credits 2U+2P S. Pfister

102-0317-01 Advanced Environmental Assessments (Exercises) (2KP) and 102-0317-02 Advanced Environmental Assessment (Lab) (2KP) cannot be chosen if 102-0307-00 Advanced Environmental, Social and Economic Assessments (6KP) is selected. 102-0317-01 and 102-0317-02 are already included in 102-0307-00.

Abstract

Technical systems are investigated in projects with numerical modeling. The students learn how to answer given questions with target oriented methodologies using various software programs for environmental assessment.

Objective

Become acquainted with various software programs for environmental assessment including Life Cycle Assessment, Environmental Risk Assessment, Probabilistic Modelling, Material Flow Analysis.

Minors Limited to 6 KP Totaly

Abstract

Objective

The students will understand the basics of noise abatement: acoustics, impact of noise, measure-ment techniques and legislation. The students will be able to analyze different noise prob-lems and they will be able to solve simple problems of noise abatement.

Content

Physikalische Grundlagen: Schall, Wellen, Quellenarten.

Akustische Messtechnik: Umgang mit Dezibel, Akustische Masse, Schallpegelmesser, Spektralanalyse.

Lärmwirkungen: Gehör, Gesundheitliche Wirkungen von Lärm, Störung/Belästigung, Belastungsmasse.

Lecture notes

Only students who fulfill the following criteria are allowed to begin with their master thesis: a. successful completion of the bachelor programme; b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract
The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 16 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

Objective
To work independently and to produce a scientifically structured work.

Content
The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

Abstract
Introduction to urban water management (water supply, urban drainage, wastewater treatment, sewage sludge treatment). Introduction to Urban Water Management is a self-study course.
### Objective
This course provides an introduction and an overview over the topics of urban water management (water supply, urban drainage, wastewater treatment, sewage sludge treatment). It supports the understanding of the interactions of the relevant technical and natural systems. Simple design models are introduced.

### Content
- Overview over the field of urban water management.
- Introduction into systems analysis.
- Characterization of water and water quality.
- Requirement of drinking water, production of wastewater and pollutants
- Production and supply of drinking water.
- Urban drainage, treatment of combined sewer overflow.
- Wastewater treatment, nutrient elimination, sludge handling.
- Planning of urban water infrastructure.

### Lecture notes
Water Supply and Pollution Control. 8th edition (2009).

### Literature
In this self-study course the students must work through and understand selected sections from the following book

Students must understand and be able to discuss the required reading in a 30 min oral exam. The required reading is explained in detail on the website of the professorships of urban water management. Additional information can be asked during the office hours of the professors' assistants.

The required reading and studying should correspond roughly the time invested in the course Siedlungswasserwirtschaft GZ. Students are welcome to ask the assistants (http://www.ifu.ethz.ch/SWW/aboutassistants/index_EN) for help with questions they have regarding the reading.

### Prerequisites / notice
Some students joining the MSc program in Environmental Engineering at ETH Zürich have to take additional courses from our BSc program. The decision of what courses to take is done at the time of admission at ETH.

Enrolment only for MSc students who need this course as additional admission requirement.

### Prerequisites / notice
The course on “Introduction to Urban Water Management” is offered at ETH Zürich only in German. Students who can speak and understand German must take the course (Siedlungswasserwirtschaft G2) and get a passing grade. For students that do not have sufficient German language skills there is a self-study course and they have to take an oral exam.

This course is required for further in depth courses in urban water management.

Prerequisite: Hydraulics I and Hydrology

<tr>
<td>Abstract</td>
<td>The course provides an introduction into quantitativ analysis of groundwater flow and transport. It is focussed on formulating flow and transport problems in groundwater, which are to be solved analytically or numerically.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Objective

a) Students understand the basic concepts of flow and contaminant transport processes and boundary conditions in groundwater.

b) Students are able to formulate simple practical flow and transport problems.

c) Students are able to understand and apply simple analytical solutions to simple flow and transport problems.

d) Students are able to use simple numerical codes to adequately solve simple flow (and transport) problems.

Content

Introduction, aquifers, groundwater use, sustainability, porosity.

Properties of porous media.

Exercises: Groundwater use, porosity, grain size analysis.

Flow properties, Darcy's law, filter.

Flow equations, stream function.

Exercises: Darcy's law.

Analytical solutions, confined aquifers, steady-state flow.

Exercises: Head isolines.

Use of superposition principles, transient flow, freee surface flow.

Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems I.

Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems II.

Exercises: Finite difference formulations to flow problems.

Transport processes.

Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems I.

Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems II.

Exercises: Analytical solutions to transport problems.

Path lines, groundwater protection.

Exercises: Analytical solutions to transport problems.

Groundwater remediation, groundwater management.

Exercises: Groundwater remediation.

Literature

Text book

Prerequisites / notice

College lectures on basic physics, chemistry and mathematics.

102-0635-AAL Air Pollution Control E- 6 credits 4R J. Wang, B. Buchmann

Enrolment only for MSc students who need this course as additional admission requirement.

Objective

The students gain general knowledge of the factors resulting in air pollution and the techniques used for air pollution control. The students can identify major air pollution sources and understand the methods for measurement, data collection and analysis. The students can evaluate possible control methods and equipment, design a control system and estimate the efficiency and cost.

Content

- the physical and chemical processes leading to emission of pollutants
- air quality analysis
- the meteorological parameters influencing air pollution dispersion
- deterministic and stochastic models, describing the air pollution dispersion
- measurement concepts to observe ambient air pollution
- removal of gaseous pollutants by absorption and adsorption
- control of NOx and SOx
- fundamentals of particulate control
- design and application of wet scrubbers

Literature

Text book

Prerequisites / notice

College lectures on basic physics, chemistry and mathematics.

102-0474-AAL Introduction to Water Resources Management E- 6 credits 4R P. Burlando

Enrolment only for MSc students who need this course as additional admission requirement.
The students will be able to write simple programs and to modify existing programs. The course offers an introduction to the basics of water resources analysis and management covering the topics of water demand vs. supply, water quality and pollution, water conservation and remediation in rivers, lakes and aquifers, sustainable water use.

Abstract

Introduction to the basics of water resources management based on physical and chemical processes; principle of sustainability and risk.

Objective

The students will be able to write simple programs and to modify existing programs.

Content

The course offers an introduction to programming in Java. Procedural foundations of programming and outlook to object oriented programming. Variables, types, assignments, control structures (branch, loop), data structures, algorithms, line graphics, graphical user interface. Writing small programs. Working with a professional programming environment (Eclipse).

Prerequisites

The students need to be familiar with basic programming constructs and have knowledge of variables, control structures (branch, loop), data structures, algorithms.

Lecture notes

Script in wöchentlichen Folgen.
Ein internes Skript ist zur Verfügung (kostenpflichtig, nur Herstellungskosten)

Kenntnis der Grundzüge der Hydrologie. Kennenlernen von Methoden, zur Abschätzung hydrologischer Größen, die zur Dimensionierung

**Biochemistry**

**Program**

Introduction to basic biochemistry and the most important metabolic reactions.

**Content**

Introduction, basics, composition of cells, biochemical units, repetition of relevant organic chemistry
Structure and function of proteins
Carbohydrates, structure of DNA
Lipids an biological membranes
Enzymes and enzyme kinetics
Catalytic strategies
Metabolism: Basic concepts and design. Repetition of basic thermodynamics
Glycolysis
The citric acid cycle
Oxidative phosphorylation
Fatty acid metabolism

The successful participation in EW1 ("Human Learning") and EW2 ("Designing Learning Environments for School") is recommended, but not a mandatory prerequisite.

**Abstract**

In this class, students will learn concepts and skills for coping with psychosocial demands of teaching.

**Objective**

Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

1. They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).
2. They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions).

**Abstract**
General Chemistry I: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium.

**Objective**
Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

**Content**
1. Stoichiometry
2. Atoms and Elements (Quantenmechanical Model of the Atom)
3. Chemical Bonding
4. Thermodynamics
5. Chemical Kinetics
6. Chemical Equilibrium (Acids and Bases, Solubility Equilibria)

**Lecture notes**
ca. 360 Seiten mit vielen Figuren und durchgerechneten Beispielen.

**Literature**

**Abstract**
This course covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems - notably through ordinary differential equations.

**Objective**
Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of both of these courses.

**Content**
1. Single-Variable Calculus:
   - review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.
2. Linear Algebra and Complex Numbers:
   - systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.
3. Ordinary Differential Equations:
   - separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

**Literature**
- Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).

**Prerequisites / notice**
Prerequisites: familiarity with the basic notions from Calculus, in particular those of function and derivative.

**Assistance:**
Mondays 12-13, Tuesdays 17-19, Wednesdays 17-19, in Room HG E 41.

**Abstract**
This course covers the bases for understanding micro- and macroeconomic issues and theories. Participants are given the tools to argue in economic and political terms and to evaluate the corresponding measures. Group and individual exercises deepen the knowledge gained.

**Objective**
Students are able to
- describe fundamental micro- and macroeconomic issues and theories.
- apply suitable economic arguments to a given theme.
- evaluate economic measures.

**Content**
Supply and demand behaviour of firm and households; market equilibrium and taxation; national income and indicators; inflation; unemployment; growth; macroeconomic policies

**Lecture notes**
available on electronic platform

**Abstract**
Imparting basic understanding of systematical problem-solving and target-oriented process presentations. Introduction of methods for working out environmentally relevant problems.

Practical application of theoretical knowledge on a case study on renewable energy. Practice of communication skills, especially of writing a scientific report.
In der Vorlesung "Problemlösen im Rahmen von Projekten" werden folgende Inhalte behandelt:
- Dimensionen einer Problemlösestrategie (Logik, Prozesse, Sache)
- Problemlöse-, Entwurfs- und Entwicklungsstrategien
- Managementkonzeptionen am Beispiel Projektmanagement
- Modelle der Prozessgestaltung und -steuerung
- Kooperation im Rahmen von Gruppen und Teams (Projektleitung, Teammoderation, Grouppewarekonzepte, interaktive elektronische Kommunikationskonzepte)

Im theoretischen Teil des Seminars "E in den Umgang mit Umweltystemen" geht es um die Schwerpunkte:
- Techniken und Methoden zur Bearbeitung von naturwissenschaftlichen, juristischen, akteurbezogenen sowie ökonomischen Aspekten von komplexen umweltrelevanten Problemstellungen.
- Techniken der Ziel- und Massnahmenfindung sowie der Bewertung.
- Wie schreibe ich einen wissenschaftlichen Bericht.

Bei der Bearbeitung eines konkreten Falles soll:
- Das theoretische Wissen mit Unterstützung von Expertinnen und Experten anwendet werden.
- Zu einem Teilbereich ein wissenschaftlicher Bericht geschrieben werden.
- Eine Methode der Wissensintegration angewandt werden.
- Auf eine strategische Planung ausgerichtete Massnahmen entwickelt werden.
- Die gewonnenen Erkenntnisse Kolleginnen und Kollegen sowie den am Fall beteiligten Akteuren in Form von schriftlichen Berichten und Vorträgen präsentiert werden.

The Campbell Chapters 1-4 (10th edition) under the heading "The role of chemistry in biology" are expected. We will treat the following Campbell chapters:

5 Biochemistry Biological Macromolecules and Lipids
7 Cell biology Cell Structure and Function
8 Cell biology Cell Membranes
10 Cell biology Cellular Respiration: An Introduction to Metabolism
10 Cell biology Cellular Respiration
11 Cell biology Photosynthesis
12 Cell Biology Mitosis
13 The Genetic Basis of Life Sexual Life Cycles and Meiosis
14 The Genetic Basis of Life Mendelian Genetics
15 The Genetic Basis of Life Linkage and Chromosomes
20 The Genetic Basis of Life The Evolution of Genomes
21 Evolution How Evolution Works
22 Evolution Phylogenetic Reconstruction
23 Evolution Microevolution
24 Evolution Species and Speciation
25 Evolution Macroevolution

The lecture is the first in a series of two lectures given over two semesters for students of agricultural and food sciences, as well as of environmental sciences.

Die Lehrveranstaltung beinhaltet neben einer Auskursion auch verschiedene Gruppensitzungen sowie ein Blockseminar.

The lecture is the first in a series of two lectures given over two semesters for students with biology as a basic subject.
Understanding basic geological and geophysical processes

The students learn to

Overview of the Earth as a system, with emphasis on plate tectonic theory and the geological rock-cycle. Provides a basic introduction to

W+

Dynamic Earth I

Type

Earth and Natural Production Systems

Origin of the planetary system, composition of the earth and the atmosphere, formation of continents and oceans, biogeochemical cycles, plate tectonics and earthquakes, erosion, climate, water cycle, surface waters, vegetation, forests and crops, food production including related worldwide ecological and economical interactions.

L. E. Fässler

This course is intended to provide an overview of experimental chemical methods.

G. Bernasconi-Green

1. Simulation and Modeling

Exercises and short excursions in small groups (10-15 students) will be lead by student assistants. Specific topics in earth sciences will be discussed using examples and case studies. Hand samples of the major rock types will be described and interpreted. Short excursions in the region of Zurich will permit direct experience with earth science processes (e.g. earth surface processes) and recognition of earth challenges such as climate change, water crises, deforestation, north-south conflict and biodiversity.

Exercises are conducted in small groups to provide more in depth understanding of concepts and content of the lectures.

Informatics

O

2 credits

2G

L. E. Fässler, H. J. Böckenhauer, M. Dahinden, D. Komm

Students learn to apply selected concepts and tools from computer science for working on interdisciplinary projects. The following topics are covered: publishing over the internet, processing and visualizing time series, visualizing multi-dimensional data, managing data with lists and tables and with relational databases, introduction to macro programming, universal methods for algorithm design.

The students learn to

- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data,
- know universal methods for algorithm design.

1. Simulation and Modeling
2. Visualizing multidimensional data
3. Data management with lists and tables
4. Data management with a relational database
5. Introduction to macro programming
6. Introduction to programming with Python

This course is based on application-oriented learning.

The students spend most of their time working through electronic tutorials and discussing their results with teaching assistants

This course provides an introduction to elementary laboratory techniques. The experiments cover a wide range of techniques, including analytical and synthetic techniques (e.g. investigation of soil and water samples or the preparation of simple compounds). Furthermore, the handling of gaseous substances is practised.

The handling of chemicals and proper laboratory techniques represent the main learning targets. Furthermore, the description and recording of laboratory processes is an essential part of this course.

N. Kober, M. Morbidelli

The students spend most of their time working through electronic tutorials and discussing their results with teaching assistants

Laboratory Course: Elementary Chemical Techniques

O

3 credits

6P

N. Kobot, M. Morbidelli

This practical course provides an introduction to elementary laboratory techniques. The experiments cover a wide range of techniques, including analytical and synthetic techniques (e.g. investigation of soil and water samples or the preparation of simple compounds). Furthermore, the handling of gaseous substances is practised.

This course is intended to provide an overview of experimental chemical methods.

The handling of chemicals and proper laboratory techniques represent the main learning targets. Furthermore, the description and recording of laboratory processes is an essential part of this course.

N. Kobot, M. Morbidelli
The classification and analysis of natural and artificial compounds is a key subject of this course. It provides an introduction to elementary laboratory techniques, and the experiments cover a wide range of analytic and synthetic tasks:

Selected samples (e.g. soil and water) will be analysed with various methods, such as titrations, spectroscopy or ion chromatography. The chemistry of aqueous solutions (acid-base equilibria and solvatisation or precipitation processes) is studied.

The synthesis of simple inorganic complexes or organic molecules is practised.

Furthermore, the preparation and handling of environmentally relevant gaseous species like carbon dioxide or nitrogen oxides is a central subject of the Praktikum.

### Literature

A thorough study of all script materials is requested before the course starts.

**751-0801-00L**  
**Biology I: Laboratory Exercises**  
O 1 credit 2U  
*E. B. Truernit*

**Abstract**  

**Objective**  
Measuring object sizes with the microscope. Preparation of specimen for light microscopy. Plant tissue staining techniques. Special features of plant cells: Plastids, vacuole, cell wall. Anatomy of seed plants: From cells to organs. Anatomy and function of various plant tissues (epidermis, vascular tissue, wood, etc.). Anatomy and function of different plant organs (root, stem, leaf, flower, fruit, seed). Anatomical adaptations to different environments.

**Lecture notes**  
Handouts

**Literature**  
For further reading (not obligatory): Gerhard Wanner; Mikroskopisch-Botanisches Praktikum, Georg Thieme Verlag, Stuttgart.

**Prerequisites / notice**  
Groups of a maximum of 30 students.

|              | Building on the biology courses in the 1st and 2nd semesters, this course covers basic biochemical knowledge in the areas of enzymology and metabolism. Those completing the course are able to describe and understand fundamental cellular metabolic processes. |
### Objective

Students are able to understand
- the structure and function of biological macromolecules
- the kinetic bases of enzyme reactions
- thermodynamic and mechanistic basics of relevant metabolic processes

Students are able to describe the relevant metabolic reactions in detail

### Program

- Introduction, basics, composition of cells, biochemical units, repetition of relevant organic chemistry
- Structure and function of proteins
- Carbohydrates
- Lipids and biological membranes
- Enzymes and enzyme kinetics
- Catalytic strategies
- Metabolism: Basic concepts and design. Repetition of basic thermodynamics
- Glycolysis, fermentation
- The citric acid cycle
- Oxidative phosphorylation
- Fatty acid metabolism

### Lecture notes

Horton et al. (Pearson) serves as lecture notes.

### Prerequisites / notice

Basic knowledge in biology and chemistry is a precondition.

#### Abstract

Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

#### Objective

Understanding of basic physical and chemical processes in the atmosphere. Understanding of mechanisms of and interactions between: weather - climate, atmosphere - ocean - continents, troposphere - stratosphere. Understanding of environmentally relevant structures and processes on vastly differing scales. Basis for the modelling of complex interrelations in the atmosphere.

#### Content

- Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

#### Lecture notes

Written information will be supplied.

#### Abstract

Qualitative and quantitative understanding of the physical processes that control the terrestrial water cycle. Energy and mass exchange, mixing and transport processes are described and the coupling of the hydrosphere with the atmosphere and the solid Earth are discussed.

#### Objective

Qualitative and quantitative understanding of the physical processes that control the terrestrial water cycle. Energy and mass exchange, mixing and transport processes are described and the coupling of the hydrosphere with the atmosphere and the solid Earth are discussed.

#### Content

Topics of the course.
- Physical properties of water (i.e. density and equation of state)
- Global water resources
- Exchange at boundaries
- Energy (thermal & kinetic), gas exchange
- Mixing and transport processes in open waters
- Vertical stratification, large scale transport
- Turbulence and mixing
- Mixing and exchange processes in rivers
- Groundwater and its dynamics
- Ground water as part of the terrestrial water cycle
- Ground water hydraulics, Darcy's law
- Aquifers and their properties
- Hydrochemistry and tracer
- Ground water use
- Case studies

#### Lecture notes

In addition to the suggested literature handouts are distributed.

#### Abstract

These topics are important for the understanding of a number of evolutionary problems in the basic and applied sciences.

#### Content

- Introduction to Evolutionary Biology
- Evolutionary Analysis
- Scott Freeman and Jon Herron
### Objective

The objective of the systems analysis course is to deepen and illustrate the mathematical concepts on the basis of a series of very concrete examples. Topics covered include: linear box models with one or several variables, non-linear box models with one or several variables, time-discrete models, and continuous models in time and space.

### Content

Definition of the pedosphere, soil functions, rocks as parent materials, minerals and weathering, soil organic matter, physical soil properties and functions, chemical soil properties and functions, soil formation, principles of soil classification, global soil regions, soil fertility, land use and soil degradation.

### Lecture notes

Lecture notes can be purchased during the first lecture (15.- SFr)

### Literature

Prerequisites: Basic knowledge in chemistry, biology and geology.

**Abstract**
We introduce the concept of corporate sustainability; discuss its implications focusing on strategy, technology, and financial markets; and offer e-modules to train relevant critical thinking skills. With this input, students explore the practical challenges of corporate sustainability in a group project, focusing on one of the four sustainability challenges of water, energy, mobility, and food.

**Objective**
Understand the limits and the potential of corporate sustainability for sustainable development

Develop critical thinking skills that are useful for corporate sustainability (argumentation, communication, evaluative judgment)

Be able to recognize and realize opportunities for corporate sustainability in a business environment

**Content**
Business implications of sustainable development, in particular for corporate strategy, marketing & leadership, technology & innovation, and financial markets.

Critical thinking skills for corporate sustainability

In-depth case study of concrete corporate sustainability challenge in the group project phase, such as: How to deal with environmental pressure groups? How to use the strengths of business to solve pressing sustainability problems? How to catalyze radical innovations for sustainability? How to invest money in a sustainable way?

**Lecture notes**
Presentation slides will be distributed prior to lectures.

**Abstract**
Relationship between economy and environment, market failure, external effects and public goods, contingent valuation, internalisation of externalities; economics of non-renewable resources, economics of renewable resources, cost-benefit analysis, sustainability, and international aspects of resource and environmental economics.

**Objective**
Understanding of the basic issues and methods in resource and environmental economics; ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

**Topics are:**
- Introduction to resource and environmental economics
- Importance of resource and environmental economics
- Main issues of resource and environmental economics
- Normative basis
- Utilitarianism
- Fairness according to Rawls
- Economic growth and environment
- Externalities in the environmental sphere
- Governmental internalisation of externalities
- Private internalisation of externalities: the Coase theorem
- Free rider problem and public goods
- Types of public policy
- Efficient level of pollution
- Tax vs. permits
- Command and Control Instruments
- Empirical data on non-renewable natural resources
- Optimal price development: the Hotelling-rule
- Effects of exploration and Backstop-technology
- Effects of different types of markets.
- Biological growth function
- Optimal depletion of renewable resources
- Social inefficiency as result of over-use of open-access resources
- Cost-benefit analysis and the environment
- Measuring environmental benefit
- Measuring costs
- Concept of sustainability
- Technological feasibility
- Conflicts sustainability / optimality
- Indicators of sustainability
- Problem of climate change
- Cost and benefit of climate change
- Climate change as international ecological externality
- International climate policy: Kyoto protocol
- Implementation of the Kyoto protocol in Switzerland

**Content**
Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

This course deals with fundamental and proven management concepts. The lecturers emphasize the practical applicability of concepts. The course was designed in close cooperation with practitioners; e.g. will Mr. S. Baldenweg, mechanical engineer ETH, MBA Insead, share his experience in several guest lectures.
Discovering Management offers an integrated learning system, which combines in an innovative format a set of lectures, an advanced business game simulation, and a set of group exercises involving industry speakers (ranging from leading venture capitalists to executives at established corporations). Unlike more traditional courses, the learning model for Discovering Management involves ‘learning by doing’. While the 13 different lectures, in-class discussions, and assigned readings provide the theoretical and conceptual foundations, the experiential learning outcomes result from the interrelated group activities: 1) the interactive case studies and exercises, and 2) the business game simulation.

By discovering the key aspects of entrepreneurial management, the purpose of the course is to advance students’ understanding of factors driving company success, where success is understood as a broad construct including financial return, employee, customer and supplier satisfaction as well as social and ecological responsibility.

Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Entrepreneurial Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich. No prior knowledge of business or economics is required to successfully complete this course.

Students:
- will be familiar with basic general management concepts.
- will learn about the fundamental concepts of strategy development with practical examples.
- will get to know the basic organisational issues and the essential types of organisations.
- will get a rough overview on the concepts of financial management.
- will learn about the strategic positioning of small departments within larger organisations.
- will learn about the fundamental mechanisms for handling change, and will be able to recognise these situations.
- will learn the basic principles of project management and of successful self-management.
- will reflect on customer oriented information representation.

Students:
- get a rough overview on the concepts of financial management.
- will learn about the strategic positioning of small departments within larger organisations.
- will learn about the fundamental mechanisms for handling change, and will be able to recognise these situations.

Overview on environmental management and environmental management systems, general methods and principles.

Environmental Management

P. Baschera

An environmental management system has the objective to continuously improve the environmental performance of the activities, products and services of a company. The company has to introduce different management procedures. The goal of this lecture is to provide basics and specific procedure to implement the environmental dimension in the planning and decision making processes of an organisation.

Students:
- will get a rough overview on the concepts of financial management.
- will learn about the strategic positioning of small departments within larger organisations.
- will learn about the fundamental mechanisms for handling change, and will be able to recognise these situations.

Prerequisites:
- Environmental Management (Excercises) 351-0778-01.

Discovering Management

Entry level course in management for BSc, MSc and PHD students at all levels not belonging to D-MTEC. This course can be complemented with Discovering Management (Excercises) 351-0778-01.

Students:
- will get a rough overview on the concepts of financial management.
- will learn about the strategic positioning of small departments within larger organisations.
- will learn about the fundamental mechanisms for handling change, and will be able to recognise these situations.

Prerequisites:
- Environmental Management (Excercises) 351-0778-01.

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 1338 of 1432
The lectures for Discovering Management are designed to broaden the participant's understanding of the principles of entrepreneurial management, emphasizing the interdependence of various specialties in the development and management of a firm. For this reason, the lectures are structured on the basis of a coherent business model and will be presented by the respective area specialists at D-MTEC. The lectures broaden the view and the understanding of technology by interlinking it with society. Corporate sustainability, for example, introduces economic, ecological and social issues that are relevant to all engineering disciplines. Practical examples stimulate the students to assess these issues and be aware of their responsibilities as engineers. Technology and innovation management, to mention a second example, focuses on the interplay of technical and organizational change, and how these often neglected interactions explain why many new technologies are never used. It fosters the students' ability to see the business and social consequences of their 'technical' decisions. Critical skills will be trained by the case study exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of the decision maker, as they learn more about the specific case and identify the challenge they are faced with. Students will be presented real case scenarios by industry guests from established corporations and will have to critically analyze specific issues. The case study exercise will provide an insight into the context of a managerial problem-solving and enhance the participant's appreciation for the complex tasks companies deal with.

Discovering Management attempts to overcome the limitations of traditional teaching curricula of management in technical universities, which often merely focus on transferring specific skills to students, e.g. planning or forecasting. In response to the new challenges for entrepreneurial decision-making, students will be offered the opportunity to actively engage in an advanced business game simulation; a business game that establishes a link between business management theory and business management in practice. The simulation presents a realistic model of a company and provides participants with the opportunity to quickly gain the lasting effects of practical experience in a risk-free environment. All this provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyze the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities.

No prior knowledge of business or economics is required to successfully complete this course.

**Prerequisites / notice**

Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Business Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich.

**Course documentation and specified educational books**

- Lecture notes, exercises and reference material can be downloaded from Moodle.
- Part I: Principles of agricultural economics
- Microeconomic analysis of supply, demand, and price determination in agricultural markets. It contains aspects of supply, demand, price determination, market structures, and instruments of the agricultural trade.
- Part II: Aspects of globalization, development, natural resources, and public health.
- Handouts (power point presentations)

Please refer to the course website for further information on the content, credit conditions and schedule of the module: www.dm.ethz.ch

---

**351-0778-01L Discovering Management (Exercises)**

| W | 1 credit | P. Frauenfelder |

**Abstract**

This course is offered complementary to the basis course 351-0778-00L, "Discovering Management". The course offers additional exercises and case studies.

**Objective**

This course is offered to complement the course 351-0778-00L. The course offers additional exercises and case studies.

**Content**

The course offers additional exercises and case studies concerning:

- Strategic Management; Technology and Innovation Management; Operations and Supply Chain Management; Finance and Accounting; Marketing and Sales.

Please refer to the course website for further information on the content, credit conditions and schedule of the module: www.dm.ethz.ch

---

**363-0503-00L Principles of Microeconomics**

| W | 3 credits | M. Filippini |

**Abstract**

The course introduces basic principles, problems and approaches of microeconomics.

**Objective**

The course includes the following main topics:

- Basic principles of demand and supply, market and state in a modern economy, externalities, cost analysis, consumer behaviour, economies of scale and economies of scope, perfect competition, monopoly, oligopoly, monopolistic competition, mathematical treatment of some basic concepts.

**Literature**

- Lecture notes, exercises and reference material can be downloaded from Moodle.
- The book can also be used for the course ‘Principles of Microeconomics’ (Sturm)

For students taking only the course ‘Principles of Microeconomics’ there is a shorter version of the same book:

**Complementary**

---

**751-1101-00L Finances and Accounting System**

| W | 2 credits | M. Dumondel |

**Abstract**

To understand accounting as a component of the complex system of the enterprise

**Objective**

To understand accounting not as an isolated discipline, but as a part of the complex system of the enterprise

**Content**

Accounting system as a part of management economics.

The different steps for scheduling and evaluation of the accountancy will be studied. The main part of the lecture is dedicated to the financial accounting nevertheless the fundamentals of the internal cost-accounting will also be presented. The lecture will also include the clarification of concrete cases and the calculation of practical exercises.

**Literature**

- Lecture documentation and specified educational books

In the lecture one indicates

---

**751-1651-00L World Food Economy and Agricultural Markets**

| W | 2 credits | R. Jörin |

**Abstract**

Following microeconomic courses we teach in this course economic aspects of the world food situation and the international and national agricultural markets. It contains aspects of supply, demand, price determination, market structures and instruments of the agricultural trade.

**Objective**

Economic understanding of agricultural markets and the aspects of the world food problem.

**Content**

Part I: Principles of agricultural economics

Microeconomic analysis of supply, demand, and price determination in agricultural markets.

Part II: Aspects of globalization, development, natural resources and public health.

**Literature**

- Southgate. D. et al., 2010. The World Food Economy, Blackwell Publishing, Malden MA, USA

---

**851-0626-01L International Aid and Development**

| W | 2 credits | I. Günther |

**Prerequisites**: Basic knowledge of economics
This course is based on the following textbook:

**The processes of change, overuse or destruction of the natural environment through humans have historically placed high demands on**

### Objective

**Beyond acquiring basic knowledge about policy analysis, this course teaches students how to analytically address current and concrete questions of environmental policy. Through exercises the students learn about political science concepts and frameworks as well as real-life political decision-making processes. The well-grounded examination of complex political conflict situations is an important precondition for the entry into the environmental policy workforce or a future research career.**

### Content

The processes of change, overuse or destruction of the natural environment through humans have historically placed high demands on social and political institutions. In the interplay between the environment, society and economy, the environmental policy field encompasses the sum of public measures that have the goal to eliminate, reduce or avoid environmental degradation. The course provides insight into the development of Swiss environmental policy and systematically presents the basics of environmental policy actors, instruments, programs and processes as well as their change over time. A key aspect is the distinction between politics and political science and specifically environmental policy. Instead of lecture notes different texts on policy analysis and Swiss environmental policy are made available to the students.

Das Seminar führt in die Umweltsoziologie ein. Dabei werden verschiedene theoretische Ansätze besprochen (Fokus: Rational Choice).

Various studies are used to introduce basic sociological concepts, theories and empirical research methods, along with selected environmental sociology.

The lecture treats the social intercourse with risks of technical systems. The notion of risk and the perception of risk are discussed by case studies and specific issues illustrated therein will be provided during the course (uploaded on Moodle).

Prerequisites / notice

The performance assessment will consist of an individual essay to be written by each student based on at least five references in addition to the sources provided in the course. Students can choose from a list of topics. Criteria for assessment will be communicated at the beginning of the course.

701-0731-00L

Environmental Sociology

Abstract

This introductory class in environmental sociology covers different theoretical approaches but the main focus is on recent empirical research on topics such as environmental behavior, environmental concern, social dilemmas, social norms, environmental justice, and risk perception.

Objective

Basic knowledge of environmental sociology
Overview on current fields of research in environmental sociology and their relevance for environmental protection
Basic notion of the structure of empirical research papers in social sciences

Content

Das Seminar führt in die Umweltsoziologie ein. Dabei werden verschiedene theoretische Ansätze besprochen (Fokus: Rational Choice).

Der Schwerpunkt des Kurses liegt auf aktuellen empirischen Untersuchungen zu Themen wie Umweltverhalten, Umweltbewusstsein, soziale Dilemmata, soziale Normen, Umweltgerechtigkeit und Risikowahrnehmung.

Fragen, die uns dabei beispielsweise beschäftigen: Wer belastet die Umwelt besonders stark oder ist besonders stark vermögend? Umweltbelastungen ausgesetzt? Was beeinflusst das Umweltverhalten der Menschen? Welche Rolle spielen äußere Faktoren (Möglichkeiten, Kosten etc.)? Welchen Einfluss haben soziale Aspekte oder Einstellungen? Wovon hängt es ab, ob eine Technologie als risikoreich eingestuft wird?

Students can choose from a list of topics. Criteria for assessment will be communicated at the beginning of the course.

701-0985-00L

Social Intercourse with Current Environmental Risks

Abstract

The lecture treats the social intercourse with risks of technical systems. The notion of risk and the perception of risk are discussed by case studies (e.g. nanotechnology) and socio-political instruments for decision-making are presented. Methods are presented that can be applied to deal with environmental risks and how they can be used for sustainable innovation.

Objective

Getting acquainted with the extended risk concept
Evaluation of the risks caused by technology within the societal context
Knowledge about the mode science and society handle current environmental risks (examples gene- and nanotechnology)
Knowledge about handling risks (e.g. precautionary principle, protection goal, damage definition, ethics)
Knowledge about possibilities for sustainable innovation

Content

- Risks and technical systems (risk categories, risk perception, risk management)
- Illustration with case studies (nanotechnology)
- Implementation (politics, science, media, etc.)
- Decision making (technology assessment, cost/benefit analysis etc.)
- The role of the media
- Prospects for future developments

Lecture notes

Copies of slides and selected documents will be distributed

Prerequisites / notice

The lecture is held biweekly (for 2 hours). The dates are 21.9., 28.9 (attention, out of schedule) ; 19.10, 2.11, 16.11, 30.11, 14.12

227-0802-02L

Sociology

Abstract

Various studies are used to introduce basic sociological concepts, theories and empirical research methods, along with selected sociological topics. The goal of the course is to provide participants with an understanding of working practice in empirical sociology and the central findings of sociological studies.

Objective

To learn about methods of empirical social research and key results of classic and modern sociological studies.
Content

1. Einführung

Gruppenarbeiten

- Schriftliche Arbeit in Soziologie (Durchführung einer kleinen empirischen Studie, Konstruktion eines Simulationsmodells sozialer Prozesse oder Diskussion einer vorliegenden soziologischen Untersuchung).

851-0591-00L

Digital Sustainability in the Knowledge Society

PARTICULARLY SUITABLE FOR STUDENTS OF D-INFK, D-ITET, D-MATL, D-MAVT, D-MTEC, D-USYS

Objective

How do various interest groups influence the methods of production, distribution, and use of digital resources? Current models focusing on strong intellectual property rights are contrasted with open models like, e.g. Open Source/Content/Access. The course discusses consequences from different models and introduces «digital sustainability» as an alternative vision for society.

Objective

At the heart of the discourse is the handling of digital goods and intellectual property in society. Digitization and the Internet allow handling knowledge in a way, which directly contrasts with the traditional understanding of "intellectual property" and the industries based on it. Starting from economic and legal basics, we compare proprietary and open/free models. Sustainable development as a concept is transferred to digital goods, taking into account the particular nature of digital stuff.

After the lecture, you should (hopefully) be able to
- characterize the nature of digital goods vs. physical goods
- critique the basic concepts of copyright and patent rights
- explain the political/legal and economic differences between proprietary and open approaches to the production and use of digital goods
- using an example, explain the meaning of digital sustainability and argue why it is relevant for a knowledge society
- transfer the ideas of the free/open source software model to other digital goods (e.g., open content, open access)

Content

Technical reality: Within minutes you can make perfect copies of high-value digital goods of knowledge or culture (as text, audio, video, images or software) and distribute them around the globe -- for free. «Digitalization plus Internet» allows for the first time in humankind's history the (theoretically) free access and global exchange of knowledge at minimal cost. A tremendous opportunity for societal development, in north and south. «Cool, so what's the problem?»

The problem is, that this reality poses a fundamental threat to today's business model of the knowledge and culture industries (starting from the music label and Hollywood, via publishers, up to software vendors). Powerful commercial interests are at stake as «knowledge» (the fourth factor of production) will become ever more important in the 21st century. Accordingly, «piracy» and «file-sharing» are attacked with all means. At the core lies the question about the design of property in digital assets. For that, we apply a concept of "intellectual property", which is several hundred years old and does not address digital reality in an adequate manner, sometimes leading to absurd situations. Its original goal seems to get forgotten: to help society develop by spreading knowledge as much as possible.

Using the PC becomes the new cultural technique of the 21st century. In contrast to «reading, writing and arithmetic», this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency extends to the provider of the infrastructure, who can define technical rules, which can take away or restrict the user's freedom. Even advanced users may have difficulties in recognizing these hidden, restrictions and in evaluating their societal relevance.

The course discusses sustainable development as a concept is transferred to digital goods, taking into account the particular nature of digital stuff.

Starting from economic and legal basics, we compare proprietary and open/free models. Sustainable development as a concept is transferred to digital goods, taking into account the particular nature of digital stuff.

Using the PC becomes the new cultural technique of the 21st century. In contrast to «reading, writing and arithmetic», this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency extends to the provider of the infrastructure, who can define technical rules, which can take away or restrict the user's freedom. Even advanced users may have difficulties in recognizing these hidden, restrictions and in evaluating their societal relevance. But exactly these invisible consequences we need to understand and investigate, because they decide about access, distribution and usage of digital knowledge.

Comparative to the environmentalist movement of the 60s and 70s, a growing political movement for «Free Software» exists today, with «GNU/Linux» as its most popular symbol. The movement fights against treating software code as private property but as a central cultural asset of our time. The problem is, that this reality poses a fundamental threat to today's business model of the knowledge and culture industries (starting from the music label and Hollywood, via publishers, up to software vendors). Powerful commercial interests are at stake as «knowledge» (the fourth factor of production) will become ever more important in the 21st century. Accordingly, «piracy» and «file-sharing» are attacked with all means. At the core lies the question about the design of property in digital assets. For that, we apply a concept of "intellectual property", which is several hundred years old and does not address digital reality in an adequate manner, sometimes leading to absurd situations.

As a «teaser» to the lecture, you are invited to read the essay «ETH Zurich - A Pioneer in Digital Sustainability!». It can be downloaded from www.essays2030.ethz.ch.

Lecture notes

Slides and other material (both usually in English) will be made available on a weekly basis as the lecture proceeds.

Literature

Content of the following books is covered (PDFs freely available online):

- International Environmental Politics
- Literature

T. Bernauer

Objective

This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.

Prerequisites / notice

For administrative and didactic reasons (high level of interaction and credit group assignments on current hot topics), the number of participants is limited to 45.

Data: 06.10.2017 12:56  Autumn Semester 2015  Page 1342 of 1432
Content
This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation, various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 4 ECTS credit points. The workload is around 120 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

Lecture notes
Slides and reading material will be made available at www.ib.ethz.ch (teaching, materials), then menu on the left side of the screen). They are password protected. Use your Nethz username and password to access the material.

Literature
See www.ib.ethz.ch (teaching, materials)

Prerequisites / notice
Students from ETH will receive 4 ECTS credit points if they attend classes regularly and obtain a grade of 4.0 or higher for the written exam in the final week of the semester. Students who obtain a grade of less than 4.0 for the end-of-semester test will have a second chance in the first week of the following semester. The rules of the game are defined in detail on the course syllabus. Students who do not participate in the end of semester test will not have access to the repeat exam unless they submit compelling and documented reasons for why they were unable to participate in the first test. Except for language dictionaries, no additional materials and no laptops and mobile phones are allowed during the exam.

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

The workload for this course is approx. 120 hours (all inclusive).

Abstract
This course provides an introduction to psychological research and modelling, focusing on cognitive psychology and the psychological experiment. Participants learn to formulate problems for psychological investigation and apply basic forms of psychological experiment.

Objective
Students are able to:
- describe the areas, concepts, theories, methods and findings of psychology.
- differentiate scientific psychology from "everyday" psychology.
- structure the conclusions and significance of an experiment according to a theory of psychology.
- formulate a problem for psychological investigation.
- apply basic forms of psychological experiment.

Content

Abstract
"Environmental Consciousness and Public Relations" shows how to communicate about environment and sustainability successfully. We look at campaigns, exhibitions and other public relations measures to learn, how to design and realize good communication.

Objective
You learn how to handle tools and concepts in environmental communication. And you can evaluate communication projects.

Content
- Methods and tools in environmental communication.
- Marketing mix
- Examples of campaigns, events, print products, media relations.
- Integral sustainability

Abstract
The course gives an introductory overview in research questions, theoretical perspectives and empirical results of science communication and environmental communication. They will be illustrated by concrete examples and via lectures from external guests.

Objective
Goals: Learning to understand structures and processes of environmental and science communication, becoming more sensitive for problems of science public relations, getting an insight into public debates about environmental issues.

Methods: Case studies, invitation of media practitioners and experts, discussions, lectures on key theoretical concepts of communication.

Topics: Concrete communication instruments like media conferences, theoretical perspectives of public relations, basic principles and examples of information campaigns, environment and science as media topics, functions and structures of science communication, relations between science, media and politics.
I. Introduction
- Topics: Environment, Science, Risks, Media
- Forms, Functions, Effects of Public and Mass Communication

II. Stakeholders and their Public Relations Efforts
- Public Relations and Science PR: Theoretical Perspectives, Instruments

III. Science and Environmental Issues in the Media
- Forms and Functions of Science Journalism
- Problems of Selection, Interpretation, Quality
- Media Content Analysis
- Online Communication

IV. Uses and Effects of Science and Environmental Communication
- Extent of Media Use
- Effects on Knowledge, Risk Perceptions, Environmental Attitudes
- Effects on Science itself

Lecture notes
Literature

Die Vorlesung wendet sich auch an Studierende der Publizistikwissenschaft der Universität Zürich

Voraussetzungen: Die Vorlesung hat einführenden Charakter.

Module Humanities
Compulsory Courses

Number Title Type ECTS Hours Lecturers
701-0701-00L Philosophy of Science O 3 credits 2V G. Hirsch Hadorrn, C. J. Baumberger

Abstract
The lecture explores various strands in philosophy of science in a critical way, focusing on the notion of rationality in science, especially with regards to environmental research. It addresses the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

Objective
- Students learn to engage with problems in the philosophy of science and to relate them to natural and environmental sciences, thus developing their skills in critical thinking about science and its use. They know the most important positions in philosophy of science and the objections they face. They can identify, structure and discuss issues raised by the use of science in society.

Content
- Core differences between classical Greek and modern conceptions of science.
- Classic positions in the philosophy of science in the 20th century: logical empiricism and critical rationalism (Popper); the analysis of scientific concepts and explanations.
- Objections to logical empiricism and critical rationalism, and further developments: What is the difference between the natural sciences, the social sciences and the arts and humanities? What is progress in science (Kuhn, Fleck, Feyerabend)? Is scientific knowledge relativistic? What is the role of experiments and computer simulations?
- Issues raised by the use of science in society: The relation between basic and applied research; inter- and transdisciplinarity; ethics and accountability of science.

Lecture notes
A reader will be available for students.

Literature
A list of introductory literature and handbooks will be distributed to the students.

Prerequisites / notice
Oral examination during the Prüfungssession.

The optional exercises accompany the lecture and offer the opportunity for an in-depth discussion of selected texts from the reader.

Number Title Type ECTS Hours Lecturers
701-0703-00L Environmental Ethics O 2 credits 2V M. Huppenbauer

Abstract
The lecture begins with an introduction to applied ethics in general. The main focus is on environmental ethics. Students learn to handle important concepts and positions of environmental ethics. They achieve a deeper understanding of these concepts and positions in applying them to ecological problems and discussing them in case studies.

Objective
On completion of this lecture course you will have acquired the ability to identify and process general and environmental ethical problems. You will be capable of recognising and analysing environmental ethical problems and of working towards a solution. You will have acquired a fundamental knowledge of standpoints and arguments to be found within the field of environmental ethics and will have practised these in small case studies.

Content
- Introduction to general and applied ethics.
- Overview and discussion of ethical theories relevant to the environment.
- Familiarisation with various basic standpoints within environmental ethics.
- Cross-section topics, such as sustainability, intergenerational justice, protection of species, etc.
- Practising of newly acquired knowledge in case studies (protection of species, climate change, etc.)
Summaries of the individual sessions will be distributed, including the most important theories and keywords; reading list.

In the part of the course serving as an introduction to general and applied ethics, we shall be using the following textbook: Barbara Bleisch/Markus Huppenbauer: Ethische Entscheidungsfindung. Ein Handbuch für die Praxis, Zürich 2010 (to be published Autumn 2010).

- Andrew Light/Holmes Rolston III, Environmental Ethics. An Anthology, 2003
- John O'Neill et al., Environmental Values, 2008
- Klaus Peter Rippe, Ethik im ausserhumanen Bereich, Paderborn (mentis) 2008

General introductions:
- Marcus Düwell et. al (Hrg.), Handbuch Ethik, 2. Auflage, Stuttgart (Metzler Verlag), 2006
- Johann S. Ach et. al (Hrg.), Grundkurs Ethik 1. Grundlagen, Paderborn (mentis) 2008

Prerequisites / notice
The procedure for accumulating CP will be explained at the start of term.

I expect participants to be motivated and contribute to discussions, keeping the course interesting and lively.

Abstract
The exercises in philosophy of science serve to develop skills in critical thinking by discussing seminal texts about the rationality of science. Topics discussed include the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

Objective
Students can engage with problems in the philosophy of science and to relate them to natural and environmental sciences. They learn to analyze and summarize philosophical texts. In this way, they develop their skills in critical thinking with a focus on the rationality of science.

Content
The optional exercises accompany the lecture and serve to develop skills in critical thinking with a focus on the rationality of science, based on discussing seminal texts. The texts cover important positions in the philosophy of science and their critics. Topics discussed include the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

Lecture notes
A reader will be available for students.

Literature
A list of literature will be distributed to the students together with the reader.

Prerequisites / notice
Students that want to subscribe for this course also have to subscribe for the lecture "Wissenschaftsphilosophie". Credit points are given for preparing a structure and a summary of one of the texts.

Number of participants limited to 100.

Abstract
Our society faces a serious ecological crisis. Of what historical dimension is this crisis? How have human societies already in earlier times changed their environment, and, consequently, perhaps also ours? What were the main ecological challenges for societies and how did they change over time? And how did societies adapt to changing environmental conditions?

Objective
Introduction into environmental history; survey of long-term development of human-nature-interrelations; discussion of selected problems. Improved ability to assess current problems from a historical perspective and to critically interrogate one's own standpoint.

Lecture notes
Course material is provided on OLAT.

Literature

Uekötter, Frank (Ed.) 2010. The turning points of environmental history, Pittsburgh: University of Pittsburgh Press.

Prerequisites / notice
Students are asked to write an exam during the second last session (11.12.2015).

Abstract
Basic knowledge of the anatomy and physiology of tissues, of the embryonal and postnatal development, of the basic terminology of pathology, the neuro-muscular system, the cardiovascular system and the respiratory system.

Objective
Basic knowledge of human anatomy and physiology and basics of clinical pathophysiology.

Content
Anatomy and Physiology I (fall term):
- Basics of anatomy, physiology and general pathology.
- Anatomy and Physiology I (fall term):
  - Basics of cytology, histology, embryology, general pathology; nervous system, muscles, cardiovascular system, respiratory system.

Anatomy and Physiology II (spring term):
- Digestive system, kidney and urinary tract, endocrine system, skin, thermoregulation, sensory organs, male and female reproductive system, pregnancy and child birth.
Important topics include the structure and properties of clays and oxides, the chemistry of the soil solution, gas equilibria, dissolution and precipitation of trace elements, and the influence of these chemical processes on nutrient availability and soil health.

**Handouts in lectures.**

Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien".

**Immunology I**

ECTS: 3 credits

W 3 credits 2V A. Oxenius, M. Kopf

**Abstract**

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

**Objective**

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

**Content**

- Introduction and historical background
- Innate and adaptive immunity. Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histocompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

**Lecture notes**

Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien".

**Literature**

**Prerequisites / notice**

Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung".

**Environmental Soil Physics/Vadose Zone Hydrology**

ECTS: 3 credits

W 3 credits 2G+2U D. Or

**Abstract**

The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/sediments through the vadose zone. The students are introduced to the fundamental processes of water, solute, and heat transport in the vadose zone, as well as the measurements and modeling techniques used to quantify these processes. Emphasis is placed on the importance of understanding these processes in the context of land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

**Objective**

Students are able to:

- describe the qualitative and quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media,
- quantify driving forces and resulting fluxes of water, solute, and heat in soils,
- apply modern measurement methods and analytical tools for hydrological data collection,
- conduct and interpret a limited number of experimental studies,
- explain links between physical processes in the vadose-zone and major societal and environmental challenges.

**Prerequisites / notice**

Voraussetzungen: 1. Jahr, naturwissenschaftlicher Teil
Weeks 1 to 3: Physical Properties of Soils and Other Porous Media. Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior.

Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity.

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing.

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:

Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.

Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.

Part 2 - Unsaturated steady state flow: unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.

Midterm exam

Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.

Part 3 - Use of Hydrus model for simulation of unsaturated flow.

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils - Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.

Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:

Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

Biological Processes in the Vadose Zone - An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.

Methods of Statistical Data Analysis

<table>

Statistical methods from current publications in environmental sciences are presented and applied. Students are enabled to understand the methods, clean datasets, analyse them using the software package R and present the results in a suitable form. They will be able to describe strengths and weaknesses of the methods for given fields of application.
Objective

Students are able to
- use suitable statistical methods for data analysis in their subject area.
- characterize data sets using explorative methods
- check the suitability of data sets to answer a given question, prepare data sets for import to a statistics program and conduct the analysis.
- interpret statistical analyses and process them graphically for use in presentations and publications.
- describe the basics of statistical methods used in current publications.
- use the software package R for statistical analysis

Content

Statistische Methoden: Regression (lineare Modelle; generalisierte lineare Modelle; GLMs); Varianzanalyse; gemischte Modelle für gruppierte Daten (mixed-effects models); Fragebogenstatistik; Tests (t Test; Chiquadrat Test; Fisher Test); Power-Analyse

Werkzeuge: Explorative Datenanalyse für Hypothesenbildung; Auswahlverfahren für geeignete statistische Verfahren; Datenaufbereitung (Excel -> R; Datenbereinigung); graphische Darstellung von Resultaten; statistische Verfahren in Publikationen erkennen
Wir arbeiten mit dem Softwarepaket R.

Prerequisites / notice

Besuch von "Mathematik IV: Statistik" oder vergleichbare Lehrveranstaltung

701-1671-00L Sampling Techniques for Forest Inventories

Abstract

Introduction to design and model assisted sampling theory for finite populations as well as to the infinite population model for forest inventory. Two-phase two-stage forest inventories with simple or cluster sampling. Small area estimation. Presentation of the Swiss National Inventory.
Short introduction to Kriging techniques.

Objective

Students should have a good understanding of the concepts of general sampling theory in a modern framework. They should also master the specific problems arising in forest inventory and be able, if necessary, to read more specialized books or research papers.

Content

Prerequisites / notice

Sampling techniques for forest inventories. Daniel Mandallaz, Chapman and Hall. A free electronic copy of the book is also available. A PDF file containing parts of the book will be mailed to the participants

401-6215-00L Using R for Data Analysis and Graphics (Part I)

Abstract

The course provides the first part an introduction to the statistical software R for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

Objective

The students will be able to use the software R for simple data analysis.

Content

The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Lecture notes

Prerequisites / notice

The course resources will be provided via the Moodle web learning platform
Please login (with your ETH (or other University) username+password) at https://moodle-app2.let.ethz.ch/enrol/users.php?id=1149
Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

401-6217-00L Using R for Data Analysis and Graphics (Part II)

Abstract

The course provides the second part an introduction to the statistical software R for scientists. Topics are data generation and selection, graphical functions, important statistical functions, types of objects, models, programming and writing functions.

Note: This part builds on "Using R... (Part I)", but can be taken independently if the basics of R are already known.

Objective

The students will be able to use the software R efficiently for data analysis.

Content

The course provides the second part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part II of the course builds on part I and covers the following additional topics:
- Elements of the R language: structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of vectors, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tailoring R: options;
- Extending basic R: packages.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 1348 of 1432
The course resources will be provided via the Moodle web learning platform. Please login with your ETH (or other University) username+password at https://moodle-app2.let.ethz.ch/enrol/users.php?id=1145

Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

**401-0625-01L Applied Analysis of Variance and Experimental Design**

**Abstract**
Key concepts of experimental design. Planning and analysis of single factor experiments, block designs, full factorial and fractional designs, split-plot and strip-plot designs. Random effects and mixed effects models.

**Objective**
Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.

**Content**

**Prerequisites / notice**

Basic knowledge of R equivalent to "Using R ... (part 1)" ( = 401-6215-00L ) is a prerequisite for this course.

**401-0649-00L Applied Statistical Regression**

**Abstract**
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning “good practice” that can be applied in every student’s own projects and daily work life.

**Objective**
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

**Content**
The course starts with the basics of linear regression modeling, and then proceeds to parameter estimation, tests and confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, categorical input variables, shrinkage and general modeling strategies.

**Prerequisites / notice**
The course resources, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L “Applied Statistical Regression” and 401-3622-00L “Regression” are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

<tbody>
<tr>
<td>701-0305-00L</td>
<td>Vertebrate Ecology</td>
<td>W</td>
<td>2</td>
<td>2G</td>
<td>W. Suter, J. Senn</td>
</tr>
</tbody>
</table>

**Abstract**
The course offers an overview on the ecology and conservation biology of birds and mammals. Important concepts from phylogeny, behavioural ecology, population biology, biogeography and community ecology will be linked to applications in conservation and management. A worldwide perspective will be complemented by a focus on the Central European fauna and its dynamics.

**Objective**
The students are familiar with important topics in animal ecology, with an emphasis on birds and mammals. They are able to link theoretical concepts with visible ecological phenomena, and view them against an evolutionary backdrop. They can thus appraise applied aspects of the conservation and the use of animal populations, such as the influence of larger predators on prey populations or of herbivores on vegetation, the effects of hunting, landscape change, or of other human influences on animal populations. They understand the biogeographical characteristics of the Central European vertebrate fauna and its temporal and spatial dynamics.

**Content**
The course deals with a number of main topics that include feeding and resource use, spatial behaviour and migrations, reproduction, population dynamics, competition and predation, biodiversity and distributions, and dynamics of the Central European fauna. There is an emphasis on linking theory with management issues in conservation and management of wildlife populations. During the first half of the course, examples will be drawn worldwide whereas during the second half, the course will focus more strongly on the European fauna, particularly of the Alpine region. Although the course is not designed to teach natural history of the native species, examples will cover much of the taxonomic breadth of the European fauna. Students are expected to read one paper and to present it to the audience. In addition, two optional field trips will be offered on weekends during the semester (2 days in the Swiss National Park: probably 10-11 October, one day in an important wetland for waterbirds: a Saturday in Nov./Dec., by arrangement). For the detailed program, see the German text.

**Lecture notes**
Lecture notes will be available.

**Literature**
Literature will be listed in the lecture notes, and papers to be presented will be distributed if needed. Some books relevant to the course are (optional reading):

- Everybody will be expected to present a scientific paper in class, to be chosen from a list given.

---

### Fresh Water: Concepts and Methods for Sustainable Management

<table>

Lecture notes will be available.

**Literature**
Literature will be listed in the lecture notes, and papers to be presented will be distributed if needed. Some books relevant to the course are (optional reading):

- Everybody will be expected to present a scientific paper in class, to be chosen from a list given.
Abstract
In this course the important freshwater ecosystems, on a global perspective, will be presented. The foci of the lectures are basic ecological properties of those aquatic systems, their anthropogenic influences and subsequent modifications. The learning is organized along case studies, for which conflicting interests, as well as concepts and methods for sustainable management will be discussed.

Objective
- basics concerning the functioning of the most important freshwater ecosystems
- basics of the sustainable management of aquatic ecosystems
- application of these principles with case studies
- critical analyses, organization of discussion groups

Content
1. Globaler Zustand der Binnengewässer und Entwicklungen
2. Globale Wasserkonflikte
3. Stauhaltungen und downstream Effekte
4. Restwasser und Schwalm-Sunk Management, Thermische Verunreinigung
5. Renaturierung von Fliesegewässern
6. Interessenskonflikte bei Renaturierung: Trinkwasser, Hochwasserschutz und Biodiversität
7. Feuchtgebiete
8. Management urbaner Gewässer, wasserbürdige Krankheiten
9. Gewässerschutz und gesetzliche Grundlagen
10. Invasion ortsstrender Arten und Biodiversität
11. Europäische Wasserrahmenrichtlinie

Lecture notes
The lecture notes will be distributed online.

Literature

Prerequisites / notice
Basic ecology lectures of the first four semesters. Students will organize discussion groups.

- In this course, significant organic environmental pollutants and the physical-chemical bases required to understand their environmental behavior, and deepen knowledge through exercises. The most important analytical methods for the qualitative and quantitative determination of organic pollutants in environmental samples are discussed.

- The students are able to:
  - name and recognise the most important classes of environmentally-relevant anthropogenic chemicals.
  - explain, on the basis of physical-chemical foundations, the most important processes which determine the environmental behavior of organic pollutants.
  - name fundamental methods of trace analysis of organic pollutants in environmental sampling.
  - propose experimental methods for determining substance-specific properties.
  - identify, on the basis of chemical structure, the processes relevant for the environmental behavior of a compound.
  - critically evaluate published work and data.

- Overview of the most important classes of environmental organic pollutants
- Molecular interactions that determine the partitioning behavior (adsorption and absorption processes) of organic compounds between different environmental compartments (gas, liquid, solid)
- Physical-chemical properties (vapor pressure, aqueous solubility, air-water partition constant, organic solvent-water partition constants, etc) and partitioning behavior of organic compounds between environmentally relevant phases (air, aerosols, soil, water, biota)
- Basics of trace analytical methods to determine organic compounds (enrichment techniques, separation (chromatography), detection)
- Chemical transformation reactions of organic pollutants in aquatic and in terrestrial systems (reactions with nucleophiles incl. hydrolysis, elimination, addition)

- Lecture notes

- Literature

- Prerequisites / notice
  - Die Lehrveranstaltung richtet sich nicht nur an jene Studierenden, welche sich später chemisch vertiefen wollen, sondern ausdrücklich auch an alle jene, welche sich mit der Problematik von organischen Schadstoffen in der Umwelt vertraut machen wollen, um dieses Wissen in anderen Vertiefungen anzuwenden

Abstract
This course covers the basic physical concepts and mathematical equations used to describe environmental fluid systems on the rotating Earth. Fundamental concepts (e.g. vorticity dynamics and waves) are formally introduced, applied quantitatively and illustrated using examples. Exercises help to deepen knowledge of the material.

Objective
- Students are able to name the basics, concepts and methods of environmental fluid dynamics.
- To understand and discuss the components of the basic physical equations in fluid dynamics.
- To apply basic mathematical equations to simple problems of environmental fluid dynamics.

Content
- Basic physical terminology and mathematical laws:
- Continuum hypothesis, forces, constitutive laws, state equations and basic principles of thermodynamics, kinematics, laws of mass and momentum on rotating earth.
- Concepts and illustrative flow systems: vorticity dynamics, boundary layers, instability, turbulence - with respect to environmental fluid systems.
- Scale analysis: dimensionless variables and dynamical similarity, simplification of the fluid system, e.g. shallow water assumption, geostrophic flow.
- Waves in environmental fluid systems.

Lecture notes
In English language.

Literature
Will be presented in class. See also: web-site.

101-0203-01L Hydraulics I W 5 credits 3+1U R. Stocker

Abstract
The course teaches the basics of hydromechanics, relevant for civil and environmental engineers.

Objective
- Familiarization with the basics of hydromechanics of steady state flows.

Content
- Properties of water, hydrostatics, continuity, Euler equation of motion, Navier Stokes equation, similarity, Bernoulli principle, momentum equation for finite volumes, potential flows, ideal fluids-real fluids, boundary layer, pipe flow, open channel flow, flow in porous media, flow measurements, demonstration experiments in the lecture hall and in the laboratory.

Lecture notes
Script and collection of problems available.

Literature
Bollrich, Technische Hydromechanik 1, Verlag Bauwesen, Berlin

102-0455-01L Groundwater I W 3 credits 2G M. Willmann

Abstract
The course provides an introduction into quantitative analysis of groundwater flow and transport. It is focused on formulating flow and transport problems in groundwater, which are to be solved analytically or numerically.

Objective
- a) Students understand the basic concepts of flow and contaminant transport processes and boundary conditions in groundwater.
- b) Students are able to formulate simple practical flow and transport problems.
- c) Students are able to understand and apply simple analytical solutions to simple flow and transport problems.
- d) Students are able to use simple numerical codes to adequately solve simple flow (and transport) problems.
Content

Introduction, aquifers, groundwater use, sustainability, porosity.

Properties of porous media.
Exercises: Groundwater use, porosity, grain size analysis.

Flow properties, Darcy's law, filter.

Flow equations, stream function.
Exercises: Darcy's law.

Analytical solutions, confined aquifers, steady-state flow.
Exercises: Head isolines.

Use of superposition principles, transient flow, free surface flow.
Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems I.
Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems II.
Exercises: Finite difference formulations to flow problems.

Transport processes.
Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems I.
Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems II.
Exercises: Analytical solutions to transport problems.

Path lines, groundwater protection.
Exercises: Analytical solutions to transport problems.

Groundwater remediation, groundwater management.
Exercises: Groundwater remediation.

Spatial and Transport Planning

Number Title Type ECTS Hours Lecturers
701-0951-00L GIS - Introduction into Geoinformation Science and Technology W 5 credits 2V+3P M. A. M. Niederhuber, S. Salvini

Abstract

Theoretical basics and fundamental concepts of Geographic Information Science (GIS) are imparted and subsequently further elaborated with the software ArcGIS. At the end, the students will be able to independently solve basic realistic GIS problems.

Objective

Students are able to:
- elucidate the theoretical and conceptional foundations of geographic information systems (GIS)
- independently perform normal GIS work using commercial software and practical examples

Number of participants limited to 80.
The course covers the following topics:
- What is GIS? What are spatial data?
- The representation of reality by means of spatial data models; vector, raster, TiN
- The four phases of data modelling: Spatial, conceptual, logical and physical model
- Basic concepts of database management systems and spatial databases
- Possibilities of data collection
- Transition of reference frame
- Spatial Analysis I: query and manipulation of vector data
- Spatial Analysis II: operators and functions with raster data
- Digital elevation models and derived products
- Process modelling with vector and raster data
- Presentation possibilities of spatial data

One Friday is reserved for a field trip or guest speaker;

529-0193-00L Renewable Energy Technologies I W 4 credits 3G A. Wokaun, A. Steinfield

Abstract Scenarios for world energy demand and CO2 emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity), wind and ocean energy, heat pumps, geothermal energy, C02 sequestration.

Objective Scenarios for the development of world primary energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO2 emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

Lecture notes Lecture notes will be distributed during the course.

Prerequisites / notice Fundamentals of chemistry and physics are a prerequisite for this course.

Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.

Abstract Woody plants are important elements of forest ecosystems and landscapes. The practical characterization of forest stands often requires the identification of woody plants in winter. The course focuses on the practical identification of native tree and shrub species to be used for the characterization of forest stands.

Objective Knowledge of selected native tree and shrub species in winter. Understanding relationships of trees and forest ecosystems by situ observation of woody plants and forest stands. Introduction into the characterization of forest stands.

Content Four half-day excursions in the surroundings of Zurich and Baden the identification of native tree and shrub species is treated. The course aims at broadening and application of species knowledge towards the identification of woody plants during the leafless phase and their identification from distance (selected native species). By the application in characterization of forest stands the relationships of trees and forest ecosystems as well as forestry aspects are elucidated. In the context of an individual work the students will practically train and deepen their acquired knowledge.

Lecture notes Rudow, A., 2013: Dendrologie Grundlagen - Bestimmungshilfe (in German, will be provided for registered students on an online-platform)

Literature Rudow 2011 (betaversion): EBot Dendrologie.E-learning-Tool for the support of dendrology courses at ETHZ, integrated into online-application eBot.

An overview of the most adequate literature will be given at the introduction (sept 23).

Prerequisites / notice Half-day excursions into forests. Weatherproof clothes are presupposed.

The course is based on the Introduction into Dendrology (2nd sem).

Abstract The lecture series will introduce tools for reading contemporary urban conditions, urban models and operational modes. Urban development will be deciphered, presented as operational tools, extracted from cities where they have been tested and became exemplary samples, most relevant for providing the understanding of how urban landscape has taken shape as well as inspiration for future practice.

Objective How can a glossary of tools be used as a basis for reading cities and recognizing in them current trends and urban phenomena? The lectures series will produce a glossary of operational urban tools with collected urban knowledge that provides students with an 'improvised' manual to navigate theories. Urban Stories is a lecture series that aims to amplify your repertoire of urban instruments and empowers you to read cities and to critically reflect on the urban environment. The course will approach a series of case studies, employing an analytical, research-based model for crosscutting scale, political, economical and social components. Through this lens, and with our toolbox, we aim to tell the fundamental story of our cities from today and provide information, analysis and knowledge to help students prepare for justifiable own contributions and interventions in the future. Also the aspect of knowledge transfer will be considered in order to sensibilize the students to understand how to operate in an international context.

Content How did cities develop into the cities we live in now? Which urban plans, instruments, visions, political decisions, economic reasonings, cultural inputs and social organization have been used to operate in urban settlements in specific moments of change? Which cities are exemplary in illustrating how these instruments have been implemented and how they have shaped urban environments? Can these instruments be transcribed into urban operational tools that we recognize within existing tested cases in contemporary cities across the globe? How can cities be returned to the physical space. Cities are the result of social construction, under the influence of technologies, ecology, culture, the impact of experts and accidents. Urban unbalanced processes respond to political interests, economic pressure, cultural inclinations, along with the imagination of architects and planners and the informal powers at work in complex adaptive systems. Current urban phenomena are the result of an urban evolution. The facts stored in urban environments include contributions from its entire lifecycle. That is true for the physical environment, but also for non-physical aspects, the imaginary city that exists along with its potentials and problems and with the conflicts that have evolved over time. Knowledge and understanding along with a critical observation of the actions and policies are necessary to understand the diversity and instability present in the contemporary city and to understand how urban form evolved to its current state. This lecture series will introduce urban knowledge and the way it has introduced urban models and operational modes within different concrete realities, therefore shaping cities. Urban Knowledge will be translated into operational tools, extracted from cities where they have been tested and become exemplary samples, most relevant for providing the understanding of how urban landscape has taken shape. Case studies will be identified to compile documents and an archive, that we use as templates to read the city and to critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life as well as to provide instruments for valuable contributions and interventions.

D. Or

Introduction to the chemistry of aquatic systems. Regulation of the composition of natural waters by chemical, geochemical and biological processes. Significant agricultural approaches will be evaluated using practical examples, including prevention using natural resources, surveillance and forecasting, resistance management, as well as product registration, incl. ecotoxicology.

Content

* providing insights on coupling mechanisms between biological and geochemical processes.

Abstract

The focus is on the potential to assess strategies and tactics of pest management, taking into account the demands from the economy, the environment and the society. Significant agricultural approaches will be evaluated using practical examples, including prevention using natural resources, surveillance and forecasting, resistance management, as well as product registration, incl. ecotoxicology.

Objective

The students gain a good understanding of fundamental aspects of pest management in agroecosystems. They will have the ability to assess options for action in view of requirements from the economy, the ecology and the society. Further, they will learn to perform searches on relevant issues in pest management, and to critically evaluate case studies.

Biogeochemical Cycles

W

3 credits

2G

B. Wehrli

Biogeochemical cycles in aquatic systems are discussed from a global or regional perspective, important methods to determine reaction rates and pathways are introduced and typical mechanisms are discussed on a molecular level.

Objectives

* connecting global and molecular ideas;
* informing the students how to determine rates and pathways of biogeochemical cycles;
* providing insights on coupling mechanisms between biological and geochemical processes.

Abstract

Biogeochemical cycles in aquatic systems will be discussed from three perspectives: 1) Case studies with a global or regional point of view will document the relevant background information on rates, time-scales and reservoirs of selected element cycles such as C; N, P, S, Fe, Mn Cd, Cu, Mo and As. 2) From a practical perspective we will compare the potential and limits of different methods to quantify biogeochemical processes in aquatic systems. 3) On a molecular level we will discuss mechanisms and pathways of relevant reactions.

Seminar for Bachelor Students: Biogeochemistry

O

2 credits

2S

G. Furrer, R. Kretzschmar, B. Wehrli

The seminar provides an introduction to the literature in biogeochemistry of aquatic and terrestrial systems. The students present their summary and review of recent or classical papers. Therefore they get familiar with online-access tools and improve their communication and presentation skills.

Objectives

Getting to know relevant journals in the field of biogeochemistry. Reading, assessing and discussing scientific publications. Improving of presentation skills. Exercising and Improving of moderation skills.

Abstract

Part 2: Common literature study; online-exchange of information. Presentation and discussion moderated by the students.

Lecture notes

Selected handouts will be distributed in class.

https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php

Prerequisites / notice

Deadline for enrollment is the FIRST day of the semester. Later enrollment can only be accepted in exceptional cases and under certain conditions (e.g., restricted choice of topics and dates).

701-0423-00L

Chemistry of Aquatic Systems

W

3 credits

2G

L. Winkel

This course gives an introduction to chemical processes in aquatic systems and shows applications to various systems. The following topics are treated: acid-base reactions and carbonate system, solubility of solids and weathering, redox reactions, complexation of metals, reactions at the solid/water interface, applications to lakes, rivers and groundwater.

Objectives

Understanding of chemical processes in aquatic systems. Quantitative application of chemical equilibria to processes in natural waters. Evaluation of analytical data from aquatic systems.

Content

Introduction to the chemistry of aquatic systems. Regulation of the composition of natural waters by chemical, geochemical and biological processes. Quantitative application of chemical equilibria to processes in natural waters. The following topics are treated: acid-base reactions, carbonate system; solubility of solid phases and weathering; complexation of metals and metal cycling in natural waters; redox reactions; reactions at the interface solid phase-water; applications to lakes, rivers, groundwater.

3 credits

2G

R. Kretzschmar, D. I. Christl

This course discusses chemical and biogeochemical processes in soils and their influence on the behavior and cycling of nutrients and pollutants in terrestrial systems. Approaches for quantitative modeling of the processes are introduced.

Objective

Understanding of important chemical soil properties and processes and their influence on the behavior (e.g., speciation, bioavailability, mobility) of nutrients and pollutants.

Content

Important topics include the structure and properties of clays and oxides, the chemistry of the soil solution, gas equilibria, dissolution and precipitation of mineral phases, cation exchange, surface complexation, chemistry of soil organic matter, redox reactions in flooded soils, soil acidification and soil salinization.

Lecture notes

Handouts in lectures.

Literature

Atmosphere and Climate

Seminar for Bachelor Students: Atmosphere and Climate

Abstract
The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

Objective
Students are able to:
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media;
- quantify driving forces and resulting fluxes of water, solute, and heat in soils;
- apply modern measurement methods and analytical tools for hydrological data collection;
- conduct and interpret a limited number of experimental studies;
- explain links between physical processes in the vadose-zone and major societal and environmental challenges

Content
Weeks 1 to 3: Physical Properties of Soils and Other Porous Media. Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior

Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:
- Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.
- Part 2 - Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.
- Midterm exam
- Part 3 - Use of Hydrus model for simulation of unsaturated flow

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils - Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.

Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:
Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

Lecture notes
Biological Processes in the Vadose Zone - An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.

Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller (available at the beginning of the semester)
http://www.step.ethz.ch/education/active-courses/vadose-zone-hydrology

Midterm exam

Lecturers
R. Knutti, E. M. Fischer, O. Stebler

Numerical Methods in Environmental Sciences

Abstract
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 1356 of 1432
Objective
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

Content
Classification of numerical problems, introduction to finite-difference methods, time integration schemes, non-linearity, conservative numerical techniques, an overview of spectral and finite-element methods. Examples and exercises from a diverse cross-section of Environmental Science.

Lecture notes
Is provided (CHF 10.- per copy).

Literature
List of literature is provided.

Prerequisites / notice
Die Vorlesung verlangt Vorkenntnisse in Linearer Algebra, Analysis und Physik (z.B. komplexe Zahlen, Beschreibung von eebenen Wellen, einfache gewöhnliche Differentialgleichungen)

This course provides the ecological systems’ knowledge needed to question applied solutions to current environmental issues. Our central aim is to balance participants’ respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.
In the seminar, students explore a specific topic in environmental biology (ecology, evolution, health). They find and read scientific articles.

Week 1: Choice of topics and tutors

Seminar for Bachelor Students: Environmental Biology

Objective

At the end of the course...
...you know how to structure your inquiry and how to proceed the analysis when faced with a complex environmental issue. You can formulate the relevant questions, find answers (supported by discussions, input from the lecturers and the literature), and you are able to present your conclusions clearly and cautiously.
...you understand the complexity of interactions and structures in ecosystems. You know how ecosystem processes, functions and services interact and feed back across multiple spatio-temporal scales (in general, plus in depth case examples).
...you understand that biodiversity and the interaction between organisms are an integral part of ecosystems. You are aware that the link between biodiversity and process/function/service is rarely fully understood. You know how to honestly deal with this lack of understanding and can nevertheless find, critically analyze and communicate solutions.
...you understand the importance of ecosystem services for society.
...you have an overview of the methods of ecosystem research and have a deeper insight into some of them, e.g. ecosystem observation, manipulation and modelling.
...you have reflected on ecology as a young discipline at the heart of significant applied questions.

Content

This course provides the ecological systems' knowledge needed to question applied sustainability solutions. We will critically assess the complexity of current environmental issues, illustrating basic ecological concepts and principles. Our central aim is to balance participants' respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

The course is structured around four larger topical areas: (1) Integrated Water Management -- Green infrastructure (land management options) as an alternative to engineered solutions (e.g. large reservoirs) in flood and drought management; (2) Fire dynamics, the water cycle and biodiversity -- The surprising dynamics of species life cycles and populations in arid landscapes; (3) Rewilding, e.g. re-introducing apex predators (e.g. wolves), or large ungulates (e.g. bisons) in protected areas -- A nature conservation trend with counterintuitive effects; (4) Coupling of aquatic and terrestrial systems: carbon, nitrogen and phosphorus transfers of global importance on landscape scale.

Lecture notes

We would be happy to collaborate with interested participants to produce an (online)script of this course on the basis of our materials (this is a new course that runs for the first time). We will discuss this during the first lecture.

Literature

It is not essential to borrow/buy the following books. We will continuously provide excerpts and other literature during the course.

Schulze et al. (2005) Plant Ecology; Springer.

Prerequisites / notice

The course combines elements of a classic lecture, group discussions and problem based learning. It is helpful, but not essential to be familiar with the "seven stages" method (see e.g. course 701-0352-00L "Analysis and Assessment of Environmental Sustainability" by Christian Pohl et al.).

701-0302-00L Seminar for Bachelor Students: Environmental Biology

Objective

Students will acquire skills in:
- finding literature in scientific databases
- structuring a scientific topic through research questions
- giving a clear scientific presentation
- contributing constructively to a scientific discussion

Content

Week 1: Choice of topics and tutors
Week 3: Literature search
Week 5: course for presentation techniques
Weeks 1 - 7: Meetings with tutors, preparation of presentations
Weeks 8 - 14: Presentations and discussions

Lecture notes

Will be handed out during classes

701-0323-00L Plant Ecology

Abstract

This class focuses on ecological processes involved with plant life, mechanisms of plant adaptation, plant-animal and plant-soil interactions, plant strategies and implications for the structure and function of plant communities. The discussion of original research examples familiarises students with research questions and methods; they learn to evaluate results and interpretations.
Prerequisites
- General knowledge of plant functioning (Biologie I+II)
- General ecological concepts (Biologie III)
- Overview of plant taxonomy and vegetation types (Biologie IV)

701-1413-00L Population and Quantitative Genetics W 3 credits 2V T. Städler, P. C. Brunner

Abstract
This course is an introduction to the rapidly developing fields of population and quantitative genetics, emphasizing the major concepts and ideas over mathematical formalism. An overview is given of how mutation, genetic drift, gene flow, mating systems, and selection affect the genetic structure of populations. Evolutionary processes affecting quantitative and Mendelian characters are discussed.

Objective
Students are able to
- describe types and sources of genetic variation.
- describe fundamental concepts and methods of quantitative genetics.
- use basic mathematical formalism to describe major population genetic concepts.
- discuss the main topics and developments in population and quantitative genetics.
- model population genetic processes using specific computer programs.

Content
Population Genetics:
- Types and sources of genetic variation: randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.

Quantitative Genetics:
- Continuous variation: measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher's fundamental theorem.

Lecture notes
Handouts

Literature

Prerequisites / notice
There will be 5 optional extra sessions for the population genetics part (following lectures 2-6) for computer simulations, designed to help understand the course material.

701-1413-01L Ecological Genetics W 3 credits 2V A. Widmer, M. C. Fischer, A. Guggisberg

Abstract
This course provides an introduction to the concepts and methods used in ecological genetics. Topics covered include genetic diversity, adaptation, reproductive isolation, hybridization and speciation.

Objective
To understand how knowledge from individual disciplines can be combined to understand how organisms interact with each other and their environment.

Content
Concepts and methods for the study of genetic diversity, adaptation, reproductive isolation, hybridization and speciation.

Lecture notes
Handouts will be distributed in the lectures.

701-1415-00L Population Biology W 3 credits 2V

Abstract
This course provides an understanding of the basic concepts of population biology. It presents models regarding the dynamics and evolution of populations, and experimental designs for investigating population biology hypotheses (e.g., population growth, species interactions, epidemiology, metapopulations, life history evolution, local adaptation, evolution of sex, and coevolution).

Objective
Students are able
- to describe and apply population biology models (e.g. growth, species interactions)
- to describe and apply epidemiological models
- to substantiate evolutionary concepts (e.g., life history evolution, coevolution, evolution of sex) using population biology arguments and provide examples
- to propose population biology experiments

Content
Population growth, population regulation, predator-prey interactions, host-pathogen interactions, competition, metapopulations, life history evolution, local adaptation, mating systems, sexual selection, coevolution.

Human-Environment Systems

Number Title Type ECTS Hours Lecturers
701-0651-00L Coevolution between Society and Environment: Analysis and Influence W 3 credits 2V J. Minsch

Abstract
Analysis of central mechanisms of the anthroposphere: ecological economics, theory of institutions and innovation, development economics.

Objective
Introduction to the theoretical foundations of the analysis of central mechanisms of the anthroposphere in a sustainable development perspective.

Knowledge of the different scientific and political discussions on sustainable development.

Knowledge of selected analytical tools (Ecological Economics, economic analysis of institutions, innovation theory, Ordnungstheorie, Theory of liberal economic policy).

Ability to identify central non sustainable mechanisms and policies, to formulate adequate research questions, to choose and to use adequate analytical tools, and to elaborate solutions.
The structure of the course is as follows:
Quantification of anthropogenic resource, energy and material flows based on "Systemanalyse". Introductions into concepts for integrating material flow models with approaches from social sciences.
Approaches for decision modeling

Further reading and citations are listed in the skript and mentioned in the course.

Willings to prepare intensively the topics and to participate actively in the course

**Lecture notes**

**Content**
Sustainable development-update: origins, conceptions, state of the discussion. What's left after 25 years of discussion?
Market Economy:
Its Critics, Reforms and new Developments.
An Inquiry into the Nature and Causes of ...Non-Sustainability:
Selected mechanisms and trends. The neo-mercantilism-syndrom

**New Trends in the Growth Debate:**
The Growth-spiral (Hans Chr. Binswanger), Prosperity without growth? (T. Jackson), Intelligent Growth (R. Fucks)
The Internet of Things and Collaborative Commons - on the road to "The Zero Marginal Cost Society"?

**Sufficiency:** Perspectives of a resource-light society
Corporation 2020 - Transforming Business for Tomorrow's World (Remarks on Pavan Sukhdev's bestseller)
Finance Crash and Debt Crisis - new challenges for Democracy & Market Economy

**Globalization:** Facts and elements of a fair globalization
It's the software! Institutional Innovations for Sustainable Development. Let's continue writing The Federalist Papers!
On the way to the second "Great Transformation"

**Modeling Human-Environment Systems Using the Example of Resource Management**  
**Abstract**
The course "Modelling of Human-Environment Systems" provides the basic foundations for the analysis and steering of anthropogenic resource, energy and material flows. This involves (i) systematic analysis of resource problems; (ii) mathematical modelling; and (iii) concepts for the integration of scientific and social-scientific models to steer human-environment systems.

**Objective**
Students are able to:
- name the most important resource, energy and material flows and utilize mathematical models for their quantitative description.
- systematically analyse resource problems in the anthroposphere on various levels (company, region, nation).
- observe human-environment systems from the stakeholder perspective.
- analyse, as an example, the interaction of nutrition and climate change as a human-environment system.
- describe approaches for modelling (collective) human behavior and concepts and methods for integrating scientific and social-scientific models.

**Content**
The structure of the course is as follows:
Quantification of anthropogenic resource, energy and material flows
Mathematical modeling of anthropogenic resource, energy and material flows based on "Systemanalyse". 
Introduction into concepts for integrating material flow models with approaches from social sciences.
Approaches for decision modeling

**Data:** 06.10.2017 12:56  
**Autumn Semester 2015**  
**Page 1360 of 1432**
The course will focus on integrated landscape approaches for the management of tropical forest landscapes, by addressing the complex interactions between ecological processes, stakeholders’ strategies and public policies. Dedicated tools such as games and simulation models to improve knowledge and foster collective decision-making processes will be explored.

To gain exposure to methods for assessing stakeholders perceptions/practices/knowledge.

A major objective of the course is to encourage students to develop a critical analysis of existing conservation and development narratives within the frame of agroforestry and forested agricultural landscapes. The course will also provide students with methods and tools to assess stakeholders perceptions/practices/knowledge, that will be of use in their professional life.

The course will tackle new and emerging topics such as the role of forests and trees in adaptation to climate change, the links between forest, poverty and food security, and the need to mainstream conservation of biodiversity outside protected areas. The course will draw from diverse disciplines, from ecology, economy, sociology, political sciences and legal studies as the most preeminent ones.

The course will enable the students of the ecological process to the social and political components of tropical social and ecological systems. It will address topics and case studies that the students will have little opportunity to address elsewhere, linking them to issues of global relevance in environmental sciences.

The course will introduce the Forest Transition curve as guiding framework for the course, a series of case studies will be presented, highlighting the different drivers and issues at each stage of the transition curve (Kanninen et al. 2007).

Our society faces a serious ecological crisis. Of what historical dimension is this crisis? How have human societies already in earlier times responded to similar challenges? The course will draw from diverse disciplines, from ecology, economy, sociology, political sciences and legal studies as the most preeminent ones.

The course will enable the students of the ecological process to the social and political components of tropical social and ecological systems. It will address topics and case studies that the students will have little opportunity to address elsewhere, linking them to issues of global relevance in environmental sciences.
The main objectives of this lecture are:
(i) The students gain profound knowledge of energy- and environment-related difficulties of the intersection of energy and transportation, and learn strategies to cope with these difficulties.
(ii) The students are able to approach energy- and environment-related problems with special consideration of the demand side, and to evaluate possible solutions.
(iii) The relevance of demand on efforts to reduce GHG emissions and the dependence on fossil fuels.
(iv) Strategies and measures for influencing the demand side.

Main topics are:
(i) Fundamentals of energy use in the transportation sector, today's present state and future developments.
(ii) Technical potentials for the reduction of greenhouse gas (GHG) emissions and the dependence on fossil fuels: Evaluation of (a) alternative fuels, and (b) alternative propulsion systems.
(iii) The role of landscape change for plants, animals, and humans; measuring landscape change; simulation of disturbances on ecological communities.
(iv) Sustainable landscape management using various examples.

 CONTENT
A. Theoretical aspects
- Introduction to Landscape Ecology as a discipline
- Methodological tools of Landscape Ecology
- Landscape analysis I: Qualitative landscape description; landscape patterns and ecological significance for fauna and flora
- Landscape analysis II: Spatial patterns, landscape metrics with practical examples
- Landscape analysis III: Human landscape perception and habitat requirements
- Landscape change I: The role of landscape change for plants, animals, and humans; measuring landscape change; simulation of disturbances on ecological communities
- Landscape change II: Simulating landscape development with various models

B. Applied landscape ecology in nature and landscape management and corresponding products
- Simulating spatial distribution of selected plant and animal species. Applying distribution models in nature and landscape management, dealing with risks and scenarios
- Modern river management: flood protection and river restoration (guest lecture)
- Landscape and habitat Inventories: Traditional methods, types of inventories, problems of up-dating, new methods for analyzing landscape potentials, new methods for landscape indicators
- Large conservation areas: GIS assisted search strategies with landscape ecological data
- Modern river management: flood protection and river restoration (guest lecture)

Lecture notes
Lecture notes will be delivered (in English and partially in German).

Reference Literature
The contents of the following courses of the 2nd year of the USYS BSc are required:

5)    Abschlussbesprechung (1W)
4)    Risikomanagement (2W + Exkursion)
3)    Risikobewertung (2W)
-    Expositions- und Folgenanalyse
-    Gefahrenbeurteilung
-    Systemabgrenzung
2)    Risikoanalyse (6W + Exkursion) mit:
- Explain the principles of risk-governance.

Course objectives:
- Identify threats to human life and assets exposed to natural hazards and estimate possible drawbacks or damages.
- Explain how various hazard mitigation approaches reduce risk.
- Describe hazard scenarios as a base for adequate dimensioning of control measures.
- Identify the best alternative from a set of thinkable measures based on an evaluation scheme.
- Explain causes for conflicts between risk perception and risk analysis.
- Explain how various natural hazard mitigation approaches reduce risk.
- Explain causes for conflicts between risk perception and risk analysis.
- Explain the principles of risk-governance.

Course content:
1)    Einführung ins Vorgehenskonzept (1W)
2)    Risikoanalyse (6W + Exkursion) mit:
- Systemabgrenzung
- Gefahrenbeurteilung
- Expositions- und Folgenanalyse
3)    Risikobewertung (2W)
4)    Risikomanagement (2W + Exkursion)
5)    Abschlussbesprechung (1W)

Objective:
- Explain causes for conflicts between risk perception and risk analysis.
- Explain how various hazard mitigation approaches reduce risk.
- Describe hazard scenarios as a base for adequate dimensioning of control measures.
- Identify the best alternative from a set of thinkable measures based on an evaluation scheme.
- Explain the principles of risk-governance.

Prerequisites:
Basics in General and Systematic Biology, good knowledge of morphology and biology of the most common forest tree species in Switzerland.

The course includes practical work (microscopy).

Lecture slides are available in electronic form.

Lecture notes
Handouts (mixture of overhead slides and full text chapters) are sold at cost.

Literature

--------------------------------------------------------------------------------

Goal of the course:

Risk management - What steps should be taken to manage risks?

Course utilizes case studies to teach how a future natural hazards-specialist should analyze, assess and manage risks.

Course includes practical work (microscopy).

Prerequisites:
Basics in General and Systematic Biology, good knowledge of morphology and biology of the most common forest tree species in Switzerland.

The course includes practical work (microscopy).

Literature
A bachelor's thesis in "Natural sciences" deals with a topic at the interface of natural sciences, the environment and sustainability. The methods of data collection, analysis and interpretation appropriate to the natural sciences are used.

A thesis in "Engineering" deals with the environmental effects of use and application. The thesis may take the form of an analysis or review of a current technology, or the design of a future technological application. In an inter- or transdisciplinary thesis, knowledge from various fields and disciplines would be merged on the basis of an overarching question, or developed via the input of key societal actors.

A short bachelor's thesis should consist of a text, with graphs and figures, of 15-20 pages.

**701-0010-10L Bachelor's Thesis**

**Abstract**

By developing the bachelor's thesis, students learn to (a) analyse a problem using scientific methods and concepts, (b) write a report according to scientific standards and (c) correctly cite scientific literature. Depending on the chosen orientation of the thesis, the students learn these skills through an empirical analysis, a literature review, via design tasks or through an an applied project.

**Objective**

By developing the bachelor's thesis, students learn to (a) analyse a problem using scientific methods and concepts, (b) write a report according to scientific standards and (c) correctly cite scientific literature.

**Content**

The BA is written either under the "Social sciences and humanities" or the "Natural sciences and technology" modules. The thesis may also be inter- and transdisciplinary. A bachelor's thesis in the domain "Social sciences and humanities" usually deals with an issue at the interface of those sciences, the environment and sustainability. Methods of data collection, analysis and interpretation stemming from the social sciences are applied. A bachelor's thesis in "Natural sciences" deals with a topic at the interface of natural sciences, the environment and sustainability. The methods of data collection, analysis and interpretation appropriate to the natural sciences are used. A thesis in "Technology" deals with the environmental effects of use and application. The thesis may take the form of an analysis or review of a current technology, or the design of a future technological application. In an inter- or transdisciplinary thesis, knowledge from various fields and disciplines would be merged on the basis of an overarching question, or developed via the input of key societal actors.

A bachelor's thesis should consist of a text, with graphs and figures, of 30-40 pages.

**Boundary Layer Meteorology**

Students will gain an appreciation and understanding of the complex processes in clouds and the necessary physical phenomenon that are involved and need to be accounted for in order to study cloud and precipitation formation.

**Objective**

- Introduction
- Turbulence
- Statistical treatment of turbulence, turbulent transport
- Conservation equations in a turbulent flow
- Closure problem and closure assumptions
- Scaling and similarity theory
- Spectral characteristics
- Concepts for non-ideal boundary layer conditions

**Literature**

- Pichler H., Dynamik der Atmosphäre, Bibliographisches Institut, 456 pp. 1997

**Prerequisites / notice**

**Lecture notes**

Available (i.e. in English)

**Course number**

651-4053-05L

**Abstract**

The Planetary Boundary Layer (PBL) constitutes the interface between the atmosphere and the Earth's surface. Theory on transport processes in the PBL and their dynamics is provided. This course treats theoretical background and idealized concepts. These are contrasted to real world applications and current research issues.

**Objective**

Overall goals of this course are given below. Focus is on the theoretical background and idealised concepts.

- Students have basic knowledge on atmospheric turbulence and theoretical as well as practical approaches to treat Planetary Boundary Layer flows. They are familiar with the relevant processes (turbulent transport, forcing) within, and typical states of the Planetary Boundary Layer. Idealized concepts are known as well as their adaptations under real surface conditions (as for example over complex topography).

**Lecture notes**

Powerpoint slides will be made available

**Literature**

**Prerequisites / notice**

Lecture notes

Umwelt-Fluiddynamik (701-0479-00L) (environment fluid dynamics) or equivalent and basic knowledge in atmospheric science

![Climate Processes and Feedbacks](image-url)
Abstract
Clouds are a fascinating climate phenomenon central to the hydrological cycle and the Earth's radiation balance. Interactions between cloud particles can result in precipitation, glaciation or evaporation of the cloud depending on its microstructure and microphysical processes. In this course the sought-after topic of ice formation in clouds is studied from a theoretical and empirical perspective.

Objective
Students will be able to understand the microphysics cloud and precipitation formation. To this end, we will discuss the relevant chapters in the textbook of Lamb & Verlinde with the same title as this lecture.

Conceptual and Quantitative Methods in Geochemistry

Prerequisites / notice
Pre-requisite: Geochemistry (651-3400-00L), Isotope Geochemistry and Geochronology (651-3501-00L).

Data: 06.10.2017 12:56
Autumn Semester 2015
Page 1367 of 1432
The students can understand the role of land processes and associated feedbacks for the climate system. Additional literature is presented during the course.

The purpose of this course is to provide fundamental background on the role of land surface processes (vegetation, soil moisture dynamics, land energy and water balances) for the climate system. The course consists of 2 contact hours per week, including 2 computer exercises.

The students can understand the role of land processes and associated feedbacks for the climate system.

Powerpoint slides will be made available

Monitoring of hydrological systems (point and space monitoring, remote sensing). The use of GIS in hydrology (practical applications).

The lecture also provides an introduction into R, a programming language and graphics tool frequently used for data analysis in meteorology and climatology. During hands-on computer exercises the student will become familiar with the practical application of the methods.

The lecture also provides an introduction into R, a programming language and graphics tool frequently used for data analysis in meteorology and climatology. During hands-on computer exercises the student will become familiar with the practical application of the methods.

The lecture also provides an introduction into R, a programming language and graphics tool frequently used for data analysis in meteorology and climatology. During hands-on computer exercises the student will become familiar with the practical application of the methods.

The lecture notes

Documentation and supporting material include:
- documented view graphs used during the lecture
- exercise sets and solutions
- R-packages with software and example datasets for exercise sessions

All material is made available via the lecture web-page.

Suggested literature:

Prerequisites / notice

Prerequisites: Introductory lectures in atmospheric and climate science

The course presents advanced hydrological analyses of rainfall-runoff processes. The course is given in English.

Tools for hydrological modelling are discussed at the event and continuous scale. The focus is on the description of physical processes and their modellisation with practical examples.

Monitoring of hydrological systems (point and space monitoring, remote sensing). The use of GIS in hydrology (practical applications).

The course provides an introduction into R, a programming language and graphics tool frequently used for data analysis in meteorology and climatology. During hands-on computer exercises the student will become familiar with the practical application of the methods.

Hydrology II: Atmospheric, Mathematik IV: Statistik, Anwendungsnahes Programmieren.
In this seminar, the process of writing a scientific proposal will be introduced. The essential elements of a proposal, including the peer review process, will be outlined and class exercises will train scientific writing skills. Knowledge exchange between class participants is promoted through the preparation of a master thesis proposal and evaluation of each other's work.

### Abstract

In this seminar, the process of writing a scientific proposal will be introduced. The essential elements of a proposal, including the peer review process, will be outlined and class exercises will train scientific writing skills. Knowledge exchange between class participants is promoted through the preparation of a master thesis proposal and evaluation of each other's work.

### Objective

Training scientific writing skills.

### Content

In this seminar, the process of writing a scientific proposal will be introduced. <td>The students gain general knowledge of the factors resulting in air pollution and the techniques used for air pollution control. The students can identify major air pollution sources and understand the methods for measurement, data collection and analysis. The students can evaluate possible control methods and equipment, design a control system and estimate the efficiency and cost. The students know the different techniques of air pollution control and their scientific basements. They are able to incorporate goals concerning the air quality into their engineering work.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Content

Part 1 Emission, Immission, Transmission
- Fluxes of pollutants and their environmental impact
- physical and chemical processes leading to emission of pollutants
- mass and energy of processes
- Emission measurement techniques and concepts
- quantification of emissions from individual and aggregated sources
- extent and development of the emissions (Switzerland and global)
- propagation and transport of pollutants (transmission)
- meteorological parameters influencing air pollution dispersion
- deterministic and stochastic models, describing the air pollution dispersion
- dispersion models (Gaussian model, box model, receptor model)
- measurement concepts for ambient air (immission level)
- extent and development of ambient air mixing ratios
- goal and instrument of air pollution control

Part 2 Air Pollution Control Technologies
- The reduction of the formation of pollutants is done by modifying the processes (process-integrated measures) and by different engineering operations for the cleaning of waste gas (downstream pollution control). It will be demonstrated, that the variety of these procedures can be traced back on the application of a few basic principles of physical chemistry.
- Procedures for the removal of particles (inertial separator, filtration, electrostatic precipitators, scrubbers) with their different mechanisms (field forces, impaction and diffusion processes) and the modelling of these mechanisms.
- Procedures for the removal of gaseous pollutants and the description of the driving forces involved, as well as the equilibrium and the kinetics of the relevant processes (absorption, adsorption as well as thermal, catalytic and biological conversions).
- Discussion of the technical possibilities to solve the actual air pollution problems.

Lecture notes
- Brigitte Buchmann, Air pollution control, Part I
- Peter Hofer, Air pollution control, Part II
- Lecture slides and exercises

Prerequisites / notice
College lectures on basic physics, chemistry and mathematics
Seminar in Hydrology

The goal of the course is to develop process-understanding of fluvial systems and to introduce the students to appropriate analysis tools.

Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller

2G

Study materials (lecture handouts and selected papers) are distributed in class and available on the web.

a) Students understand the basic concepts of flow and contaminant transport processes and boundary conditions in groundwater.

b) Students are able to formulate simple practical flow and transport problems.

c) Students are able to understand and apply simple analytical solutions to simple flow and transport problems.

d) Students are able to use simple numerical codes to adequately solve simple flow (and transport) problems.

Objective

Abstract

The course presents an integrated view of the river basin and fluvial system. The fluvial system is viewed in terms of the dynamics in the river network and streams, and finally the basin and river management options for conservation and restoration.

The second section focuses on sediment transport in rivers in general, e.g. basic mechanics of sediment laden flows, bedforms, flow resistance, sediment type and load measurement and estimation, the morphology of rivers. It is illustrated how the river network can be analyzed in terms of its connectivity and topological characteristics. Channel stability and channel erosion modelling are discussed. The third section looks at fluvial system management in terms of engineering and nonstructural sediment (e.g. upland and channel erosion protection) and water (e.g. the importance of the natural streamflow regime on riverine ecosystem integrity, river rehabilitation) resource management.

The course provides an introduction into quantitative analysis of groundwater flow and transport. It is focused on formulating flow and transport problems in groundwater, which are to be solved analytically or numerically.

a) Students understand the basic concepts of flow and contaminant transport processes and boundary conditions in groundwater.

b) Students are able to formulate simple practical flow and transport problems.

c) Students are able to understand and apply simple analytical solutions to simple flow and transport problems.

d) Students are able to use simple numerical codes to adequately solve simple flow (and transport) problems.
Content

1. Introduction to groundwater problems. Concepts to quantify properties of aquifers.
2. Flow equation. The generalized Darcy law.
3. The water balance equation.
5. Analytical solutions to flow problems I
6. Analytical solutions to flow problems II
7. Finite difference solution to flow problems.
12. Analytical solutions to transport problems I.
13. Analytical solutions to transport problems II

Lecture notes

Handouts of slides.

Abstract

The lecture will introduce the student to the thematics of solar ultraviolet radiation and its effects on the atmosphere and the biosphere. The lecture will cover the modeling and the measurement of solar ultraviolet radiation. The instruments used for solar radiation measurements will also be introduced.

Objective

The lecture should enable the student to understand the specific problematics related to solar ultraviolet radiation and its interaction with the atmosphere and the biosphere.
1) Einführung in die Problematik  Motivation
Begriffe (UV-C, UV-B, UV-A,...)
Einfluss der UV Strahlung auf Biosphäre (Mensch, Tier, Pflanzen)
Positive und schädliche Effekte
Wirkungsspektrum, Konzept, Beispiele
UVIndex:

2) Geschichtlicher Rückblick
Rayleigh - Himmelsblau
1907: Dorno, PMOD
1970: Bener, PMOD
1980: Berger, Erythemal sunburn meter
1990- : State of the Art

3) Extraterrestrische UV Strahlung
Spektrum
Energieverteilung
Variabilität (Spektral, zeitlich, relativ zu Totalstrahlung)
Satellitenmessungen, Übersicht

4) Einfluss der Atmosphäre auf die solare UV Strahlung
Atmosphärenaufbau
Beinflussende Parameter (Ozon, Wolken, ...)
Ozon, Stratosphärisches versus troposphärisches
Geschichte: Ozondepletion, Polare Ozonlöcher und Einfluss auf die UV Strahlung
Wolken
Aerosole
Rayleighstreuung
Trends (Ozon, Wolken, Aerosole)
Radiation Amplification Factor (RAF)

5-6) Strahlungstransfer
Strahlungsstransfergleichung
Modellierung, DISORT
libRadtran, TUV, FASTRT
Parameter
Sensitivitätsstudien
Vergleiche mit Messungen
3-D Modellierung (MYSTIC)
Beer-Lambert Gesetz

7) Strahlungsmessungen
Instrumente zur Strahlungsmessung
Messgrössen: Irradiance (global, direct, diffus), radianze, aktinischer Fluss
Horizontale und geneigte Flächen
Generelle Problematic: Freiluftmessungen...
Qualitätssicherung

8) Solare UV Strahlungsmessungen
Problematic: Dynamik, Spektrale Variabilität, Alterung
Stabilität
Spezifische Instrumente: Filterradiometer, Spektroradiometer, Dosimetrie
Übersicht Aufbau und Verwendung

9-10) Solare UV Strahlungsmessgeräte
Spektroradiometer, Filterradiometer (Breit und schmalbandig)
Charakterisierung
Kalibriermethoden (Im Labor, im Feld)
Qualitätssicherung, Messkampagnen

11-12) Auswerteverfahren
Atmosphärische Parameter aus Strahlungsmessungen
Ozon, SO2
Albedo (Effektiv versus Lokal)
Aerosol Parameter (AOD, SSA, g, Teilchenverteilungen)
Zusammenspiel Messungen - Modellierung
Aktinische UV-Strahlungsfüssle und Bestimmung von atmosphärischen Photolysefrequenzen

13) UV Klimatologie
Trends
UV Klimatologie durch Messnetze
UV Klimatologie durch Satellitenmessungen am Beispiel von TOMS
Modellierung am Beispiel Meteosat-JRC
UV Rekonstruktionen

14) Aktuelle Forschungen
Internationale Projekte, Stand der Forschung

---

Numerical Modelling in Fortran

W  3 credits  2V  P. Tackley

Abstract
This course gives an introduction to programming in FORTRAN95, and is suitable for students who have only minimal programming experience. The focus will be on Fortran 95, but Fortran 77 will also be covered for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts.

Objective
FORTRAN 95 is a modern programming language that is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95, but Fortran 77 will also be covered for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

Lecture notes
See http://jupiter.ethz.ch/~pjt/FORTRAN/FortranClass.html
The course aims at understanding the fractionation of stable isotopes in biogeochemical processes. Students learn to know the origin and decay modes of relevant radiogenic isotopes. They discover the spectrum of possible geochemical tracers and biomarkers, their potential and limitations and get familiar with important applications.

**Abstract**
The project consists of writing a Fortran program to solve a problem agreed upon between the instructor and student; the topic is often related to (and helps to advance) the student's Masters or PhD research. The project is typically started towards the end of the end of the main Fortran class when the student has acquired sufficient programming skills, and is due by the end of Semesterprüfung week.

**Lecture notes**
See http://jupiter.ethz.ch/~pjt/FORTRAN/FortranProject.html

<td></td>
<td></td>
</tr>
</tbody>
</table>
This lecture course comprises of lectures with exercises and guided case studies.

**Objective**
- Successful application of knowledge gained in the traditional disciplines of environmental sciences (e.g. biogeochemistry, environmental chemistry) to elucidate nanomaterial fate and behavior in the environment
- Identify key parameters of nanomaterials that potentially influence their environmental fate and behavior
- Get acquainted with the most common analytical tools for the quantification of nanomaterials in the environment
- Critical assessment of current state of research in this juvenile field, including the sometimes controversial literature data

**Content**
Topics
- Definitions; nano-effects; engineered, natural and incidental nanoparticles
- Sources and release; Material flow modeling
- Analysis in environmental samples
- Fate in technical systems: water treatment, waste incineration
- Fate in the environment: water and soil
- Effects: nano-ecotoxicology
- Environmental risk assessment

**Group work**
Case studies about specific nanomaterials in environmental systems, topics will be provided
Written report submitted and presentation at the end of the lecture
Handouts will be provided during lecture

**Literature**
- Literature will be made available.
- This is an interdisciplinary course aimed at environmental scientists and environmental engineers.

### Forest Soils - Functions and Responses to Environmental Changes

**701-1337-00L**

**Title:** Forest Soils - Functions and Responses to Environmental Changes

**Content:**
- Basics: O-H isotopes as tracers for mixing in aquatic systems;
  carbon isotopes as tracer for methane oxidation;
  210Pb, 137Cs as a tracer for sedimentation rate/mixing;
  SF6, Neon, He as tracers for exchange processes at the air/water interface.

**Case assessment:**
- Sampling of a Swiss lake (Rotsee);
- Sampling techniques for different elements;
- Sample preparation for different techniques;
- Measurements at isotope mass spectrometer/gamma counter.

**Abstract**

The students are measuring carbon and nutrient fluxes in forest soils under a changing climate and land-use. In laboratory and field experiments, they are manipulating climatic conditions (temperature, drought) and quantify the response of C and N fluxes in soils, and plant-soil interactions. The results will be interpreted and discussed in the context of changes in climate and land-use.

**Objective**

The students get first-hand experience with field and laboratory methods to measure carbon and nutrient fluxes. They shall learn about physico-chemical properties of Swiss forest soils and how these properties determine the ecological functions of soils and their response to environmental changes. Finally the students shall interpret, discuss and present their experimental data.

**Content**

1. Introduction to the ecological functions of Swiss forest soils
2. Measurement of soil CO2 efflux, carbon and nutrient leaching in a forest soil
3. Sampling and preparation of litter and soil samples from selected soil profiles under different land-uses
4. Setting-up laboratory experiments in microcosms. Measurement of soil respiration and leaching of carbon, nutrients and/or contaminants in climate chambers under different environmental conditions.
5. Analyses of litter, soil, and soil water for selected physical and chemical properties
6. Interpretation and final presentation of data

**Lecture notes / Literature**

A manual will be distributed during the course.

**Selected publications will be distributed during the course.**

### Soil Solids Laboratory

**701-1339-00L**

**Title:** Soil Solids Laboratory

**Number of participants limited to 12.**

**Abstract**

The main part of the course is the investigation of real samples of soils/sediments in the lab working in groups. A brief theoretical introduction into the overall principle and the meaning of physical, mineralogical and chemical parameters of soils and sediments and into each analytical method for their investigation will be given in advance.

**Objective**

Upon successful completion of this course students are able to:
- describe structural, mineralogical and chemical properties of the inorganic solid part of soils and sediments,
- propose and apply different advanced methods and techniques to measure these properties,
- critically assess the data and explain the relationships between them,
- communicate the results in a scientific lab report.

**Content**

Basic introduction to mineralogy and texture of soils

Analytical techniques

Practical exercises in sample preparation

Measurement and evaluation of the data:
- physical parameters (grain size distribution, surface, densities, porosity, (micro)structure)
- mineralogical/geochemical parameters (quantitative mineralogical composition, thermal analysis, cation exchange etc.)

**Lecture notes / Literature**

**Prerequisites / notice**

In order to allow for effective lab work not more than 12 students can join the course.

**Useful preparatory courses are:** "Soil Chemistry", "Clay Mineralogy", and "X-ray powder diffraction".

### Semester Paper and Seminar

#### Term Paper 2: Seminar

**Number:** 701-1302-00L

**Title:** Term Paper 2: Seminar

**Prerequisite:** Term Paper 1: Writing (701-1303-00L).

**Abstract**

This class is the 2nd part of a series and participation is conditional on the successful completion of the Term paper Writing class (701-1303-00L). The results from the term paper written during the winter term are presented to the other students and advisors.

**Objective**

The goal of the term paper Seminars is to train the student's ability to communicate the results to a wider audience and the ability to respond to questions and comments.

**Content**

Each student presents the results of the term paper to the other students and advisors and responds to questions and comments from the audience.

**Lecture notes / Literature**

None

**Prerequisites / notice**

The term papers will be made publically available after each student had the opportunity to make revisions.

There is no final exam. Grade is assigned based on the quality of the presentation and ensuing discussion.

**Number:** 701-1303-00L

**Title:** Term Paper 1: Writing

**Abstract**

The ability to critically evaluate original (scientific) literature and to summarize the information in a succinct manner is an important skill for any student. This course aims to practise this ability, requiring each student to write a term paper on a topic of relevance for research in the areas of biogeochemistry and pollutant dynamics.

**Number:** 701-1303-00L

**Title:** Term Paper 1: Writing

**Abstract**

The ability to critically evaluate original (scientific) literature and to summarize the information in a succinct manner is an important skill for any student. This course aims to practise this ability, requiring each student to write a term paper on a topic of relevance for research in the areas of biogeochemistry and pollutant dynamics.
Each student is expected to write a paper with a length of approximately 15 pages. The students can choose from a list of topics prepared by the supervisors, but the final topic will be determined based on a balance of choice and availability. The students will be guided and advised by their advisors throughout the term. The paper itself should contain the following elements: Motivation and context of the given topic (25%), concise presentation of the state of the science (50%), identification of open questions and perhaps outline of opportunities for research (25%). In addition to the accurate use of citations, attribution of ideas, and the judicious use of figures, tables, equations and references are critical components of a successful paper. Specialized knowledge is not expected, nor required, neither is new research.

Guidelines and supplementary material will be handed out at the beginning of the class. There is no final exam. Grade is assigned based on the quality of the term paper and the submission of another student’s review.

Students are expected to take Term Paper Writing and Term Paper Seminar classes in sequence.

Abstract: In this research seminar we will critically discuss current topics in Ecological Genetics using publications from the leading scientific journals in this field.

Objective: It is our aim that participants gain insight into the current research topics and knowledge available in Ecological Genetics and learn to critically assess and appreciate scientific publications in this field.

Lecture notes: None.

Literature: Active participation in the discussions is a prerequisite for this course.

Abstract: We will discuss interfacial processes and mechanisms by which microorganisms and plants interact with their extracellular environment, particularly with mineral surfaces.

Objective: Students will become acquainted with interfacial biogeochemistry of bio-mineral Interactions.

Content: Reactions at mineral surfaces: precipitation, dissolution; redox reactions; photochemistry. Biological surfaces: structure of microbial cell surfaces; adsorption reaction at cell surfaces; structure of plant roots. Microbe / mineral interactions: recognition and chemotaxis; adhesion of microbes at mineral surfaces; enzymatic reactions at the cell/mineral interface; extracellular electron transfer; biominalization; nutrient acquisition; interactions of nanoparticles with microbes; mineral weathering; microbial/enzymatic reactions; reactions in stratified environments (soils, sediments).

Lecture notes: The Lecture will be taught as a 4-day block in February. Exact dates will be announced.

### Data: 06.10.2017 12:56 Autumn Semester 2015 Page 1378 of 1432
The course consists of three parts. We first introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Second, we employ these evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets, giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades.

Lecture notes
Slides of the lecture will be available online.

Literature
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST.

Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics.

701-0263-01L & 0264-01L Seminar in Evolutionary Ecology of Infectious Diseases
Abstract
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Objective
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content
A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Lecture notes
Papers will be assigned and downloaded from a web page announced during the lecture.

Literature
Papers and class notes can be downloaded from a web page announced during the lecture.

701-1441-00L Alpine Ecology and Environments
Abstract
The online course ALPECOLe provides a global overview of the complex ecosystems of mountain regions, and of their great diversity of habitats and organisms. The course is strongly interdisciplinary and the various approaches are designed to help understand the past, present and future of mountain ecosystems.

Objective
Knowledge of alpine environments worldwide and their ecology

Content
The online course is subdivided into:
- 5 lessons on abiotic factors: geology, soils and their forming processes, climate, and disturbance factors
- 12 lessons on plants: diversity, patterns and processes, tree lines, water & nutrients, carbon cycle, atmospheric influences, sexual and clonal reproduction, and one specific lesson on aquatic environments
- 5 lessons on animals: habitats and adaptations, origin of species, food ecology and impact of domestic livestock
- 3 lessons on landscape evolution: quaternary paleoenvironments, methods like radiocarbon dating, pollen records, dendrochronology, stable isotopes, and historical data
- 1 lesson on global change

Prerequisites / notice
Online course
Course language is English

701-1676-01L Landscape Genetics
Abstract
This six-day winter school aims at teaching advanced Master students, PhD students and postdocs on landscape genetics. It provides both theoretical background as well as hands-on exercises on major topics of contemporary landscape genetics and landscape genomics such as landscape effects on gene flow and adaptive genetic variation in a landscape context.

Objective
Landscape genetics is an evolving scientific field of both basic and applied interest. Researchers as well as conservation managers make increasing use of landscape genetic thinking and methods. Landscape genetics builds on concepts and methods from landscape ecology and population genetics. This winter school introduces advanced students to major concepts and methods of landscape genetics and genomics, i.e. (i) the study of landscape effects on dispersal and gene flow and (ii) the study of the interactions between the environment and adaptive genetic variation. The winter school focuses on currently used methods and hands-on exercises. It is specifically aimed at the needs of advanced students (Master, PhD and postdocs).

Content
Themes:
(1) Genetic data: estimates of gene flow; genetic distances; assignment tests and parentage analysis.
(2) Landscape data: landscape resistance and least cost paths; transects.
(3) Landscape genetic analysis of gene flow: partial Mantel tests and causal modeling; multiple regression on distance matrices and mixed effects models.
(4) Networks and graph theory.
(5) Landscape genomics: adaptive genetic variation; outlier detection; environmental association.
(6) Overlays: Bayesian clustering; barrier detection; kriging.

Lecture notes
Hand-outs will be distributed.

Literature
The course requires 4 hours of preparatory reading of selected papers on landscape genetics. These papers will be distributed by e-mail.

Prerequisites / notice
Grading will be according to a short written report (4 pages) on one of the themes of the course (workload: about 8 hours) and according to student contributions during the course.

Prerequisites: students should have basic knowledge in population genetics, GIS and R.

751-5101-00L Biogeography and Sustainable Management
Abstract
This course focuses on the interactions between ecology, biogeography and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochecical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Data: 06.10.2017 12:56
Autumn Semester 2015
Page 1379 of 1432
Objective

Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small (interdisciplinary) teams.

Content

Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods.

Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods. Students will engage in discussion and critical analyses of relevant papers and present their evaluations in a seminar setting.

Objective

Recent Advances in Biocommunication

Number of participants limited to 25

</tbody>
</table>
This class provides students with an overview of techniques for data analysis used in modern ecological research, as well as practical experience in running these analyses with R and interpreting the results. Topics include linear models, generalized linear models, mixed models, model selection and randomization methods.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being.

Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

This class provides students with an overview of techniques for data analysis used in modern ecological research, as well as practical experience in running these analyses with R and interpreting the results. Topics include linear models, generalized linear models, mixed models, model selection and randomization methods.

Students will be able to:
- describe the aims and principles of important techniques for the analysis of ecological data
- choose appropriate techniques for given problems and types of data
- evaluate assumptions and limitations
- implement the analyses in R
- represent the relevant results in graphs, tables and text
- interpret and evaluate the results in ecological terms

- Linear models for experimental and observational studies
- Model selection
- Introduction to likelihood inference and Bayesian statistics
- Analysis of counts and proportions (generalised linear models)
- Models for non-linear relationships
- Grouping and correlation structures (mixed models)
- Randomisation methods

### Abstract
This course combines Limnology (the study of inland waters in its broad sense) with Ecological and Evolutionary concepts. It deals with rivers, groundwater and lakes.

This course contains a lecture part, an experimental part as well as 1-day excursions.

### Objective
During this course you will get an overview of the world's typical freshwater ecosystems. After this course you will be able to understand how aquatic organisms have adapted to their habitat, and how the interactions (e.g. food web) between organisms work.

During the experimental part of this course you will learn the principles of doing research to observe interrelations in aquatic ecosystems. You will measure and interpret biological and physical data (e.g. during experiments, field work) and present the collected knowledge.

In short: apply the theoretical / lecture knowledge to field situations in a lake and river.

### Content
The course contains a lecture part, an experimental part and field excursions.

The lecture part covers ecology and evolution of aquatic organisms in lentic and lotic waters. Topics include: Adaptations, distribution patterns, biotic interactions, and conceptual paradigms in freshwater ecosystems. Important aspects regarding ecosystem metabolism and habitat properties of freshwater systems. Applied case studies and experiments testing ecological and evolutionary processes in freshwater systems. The lectures are given by Piet Spaak (Eawag), Florian Altermatt (Uni, Eawag), Tom Gonser (Eawag), Katja Räsänen (Eawag) and Chris Robinson (Eawag), specialists from the Aquatic Ecology department of Eawag and University of Zurich.

Practical part:
The practical part contains 1-day excursions to a lake (Greifensee) and rivers (Sense, Töss) as well as research projects in small groups within research groups at Eawag.

The practical part includes an assessment of the ecological state of lake Greifensee and the streams Glatt and Chriesbach. On this practical part you will work with survey methods used in research and practice.

### Lecture notes
Course notes and power point presentations provided during the course.

### Prerequisites / notice
This course can only be taken together with "701-1437-01 Bestimmungskurs aquatische Makroinvertebraten" and "701-1437-02 Bestimmungskurs aquatische Mikroinvertebraten und Kryptogamen".

The maximal participating number of students is 8 from D-USYS and 14 from D-BIOL (ETH & UNI).

Registration for the course until Thu 10.9.2015, free places will be distributed Fri 11.9.2015.

The course includes a mandatory field trip to the Sense River floodplain. It will take place Saturday, September 26.

### Abstract
This course provides training for advanced students (master, doctoral or post-doctoral level) in how to measure and collect genetic diversity data from populations, experiments, field and laboratory. Different DNA/RNA extraction, genotyping and gene expression techniques will be addressed. Choice of topic by demand and/or availability of data.

### Objective
To learn and improve on standard and modern methods of genetic data collection. Examples are: use of pyrosequencing, expression analysis, SNP typing, next-generation sequencing, etc.

A course for practitioners.

### Content
After an introduction (one afternoon), students will have 3 weeks to work independently or in groups through different protocols. At the end the whole group meets for another afternoon to present the techniques/results and to discuss the advantages and disadvantages of the different techniques.

Techniques addressed are: RNA/DNA extractions and quality control, SNP genotyping, pyrosequencing, real-time qPCR.

### Lecture notes
Material will be handed out in the course.

### Literature
Material will be handed out in the course.

### Prerequisites / notice
Two afternoons are held in the class. The lab work will be done from the students according to their timetable, but has to be finished after 3 weeks. Effort is roughly 1-2 days per week, depending on the skills of the student.

### Abstract
This course gave an overview of the typical aquatic macroinvertebrate groups in Switzerland. Beside a theoretical background on the different groups the focus was laid on the determination of the most important species groups and their identification traits, also using identification keys. Practical experience in benthic sampling techniques was collected during an excursion.

### Objective
During this course you will get an overview of the typical aquatic macroinvertebrates in Switzerland and the common sampling techniques.

After this course you will be able to identify the most important aquatic species groups at the level of order/family and know the most important identification traits. You will also be able to use identification literature commonly used in Switzerland.

During an excursion, you will apply the theoretical identification knowledge to field situations.
The colloquium introduces students to the disciplines in plant sciences and provides integrated knowledge from the molecular level to the ecosystems and from basic research to applications, making use of the synergies between the different research groups of the PSC. The colloquium offers a unique chance to approach interdisciplinary topics as a challenge in the field of plant sciences.

### Course notes and power point presentations provided during the course.

The maximal participating number of students is 8 from D-USYS and 14 from D-BIOL. In case of too many students, those that simultaneously participate in the courses "701-1437-00 Limnoecology" and "701-1437-02 Bestimmungskurs aquatischer Mikroinvertebraten und Kryptogramen" are given priority. Sign in until 10.9.2015, free places will be distributed 11.9.2015.

The fieldexcursion takes place Wednesday afternoon 15.10.2014 from 13-17.

#### 701-1437-02L Practical Course Microinvertebrates and Cryptogames W 2 credits 2P J. Jokela

**Abstract**

This course gave an overview of the typical aquatic microinvertebrate groups and cryptogames in Switzerland. Beside a theoretical background of the different groups the focus was laid on the recognition of the most important species groups and their identification traits. Practical experience was collected during an excursion.

**Objective**

During this course you will get an overview of the typical aquatic microinvertebrates and algae in Switzerland. After this course you will know the most important aquatic species groups and the most important identification traits. You will apply the theoretical knowledge during an excursion.

**Content**

The taxonomic part will cover microinvertebrates and cryptogames. The goal is to get to know the most common aquatic taxa in Switzerland, to identify them and to get an idea how these organisms are used in research and practice. (language: German, translation of the most important things during the course possible)

The excursion takes place Friday 03.10.2014 from 13-17.

**Abstract**

Individual writing of an essay-type review paper about a specialized topic in the field of ecology and evolution, based on substantial reading of original literature and discussions with a senior scientist.

**Objective**

- Students acquire a thorough knowledge on a topic in which they are particularly interested
- They learn to assess the relevance of original literature and synthesize information
- They make the experience of becoming "experts" on a topic and develop their own perspective
- They practise academic writing according to professional standards in English

**Content**

Topics for the essays are proposed by the professors and lecturers of the major in Ecology and Evolution at a joint meeting at the beginning of the semester (the date will be communicated by e-mail to registered students).

Students will:

- choose a topic
- search and read appropriate literature
- develop a personal view on the topic and structure their arguments
- prepare figures and tables to represent ideas or illustrate them with examples
- write a clear, logical and well-structured text
- refine the text and present the paper according to professional standards

In all steps, they will benefit from the advice and detailed feedback given by a senior scientist acting as personal tutor of the student.

**Abstract**

The colloquium introduces students to the disciplines in plant sciences and provides integrated knowledge from the molecular level to ecosystems and from basic research to applications, making use of the synergies between the different research groups of the PSC. The colloquium offers a unique chance to approach interdisciplinary topics as a challenge in the field of plant sciences.

**Objective**

Major objectives of the colloquium are:

- introduction of graduate students and Master students to the broad field of plant sciences
- promotion of an interdisciplinary and integrative teaching program
- promotion of active participation and independent work of students
- promotion of presentation and discussion skills
- increased interaction among students and professors

**Content**

Challenges in Plant Sciences will cover the following topics:

1. Chemical communication among plants, insect and pathogens.
2. Specificity in hormone signaling.
5. Resilience of tropical ecosystems.
6. Regulatory factors controlling cell wall formation.
7. Chlorophyll breakdown.
8. Innate immunity.
9. Disease resistance genes.
10. Sustainable agroecosystems.

Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  No Lecture: First day of autumn semester

Week 2  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nematode attack strategies and types of damage.

Week 5  Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6  Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7  Pisatin and pisatin demethylase. Local and systemic acquired resistance, signal molecules.

Week 8  Pathogen effects on food quality and safety.

Week 9  Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 10  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11  Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELISA, PCR, rDNA and rep-PCR.

Week 12  Strategies for minimizing disease risks: principles of disease control and management.

Week 13  Disease control strategies: economic thresholds, physical control methods.

Week 14  Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

Lecture notes
Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

701-0290-00L Seminar in Microbial Evolution and Ecology (HS) Z 0 credits 2S S. Bonhoeffer
Seminar of the groups Ackermann, Bonhoeffer, Schmid-Hempel, Velicer. Talks given by members of these groups and external visitors.

In-depth introduction into microbial evolution and ecology, especially the aspects that are the focus of on-going research in this area at D-USYS.

► Major in Human-Environment-Systems
Students can register for the Major in Human-Environment-Systems in autumn semester 2015 for the last time.

►► Natural and Technological Systems

Abstract
This course deepens students' knowledge of the environmental assessment methodologies and their various applications.

Objective
This course has the aim of deepening students' knowledge of the environmental assessment methodologies and their various applications. In particular, students completing the course should have the following abilities:
- Ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment models and factors
- Knowledge about the current state of the scientific discussion and new research developments
- Ability to properly plan, conduct and interpret environmental assessment studies
- Knowledge of how to use LCA as a decision support tool for companies, public authorities, and consumers
Foundations of Ecosystem Management

Landscape and Ecosystems

This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management approaches. This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental wellbeing. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

Students should be able to
- propose appropriate and realistic solutions to ecosystem management problems that integrate ecological, economic and social dimensions across relevant temporal and spatial scales.
- identify important stakeholders, their needs and interests, and the main conflicts that exist among them in the context of land and resource management.

Content

- Inventory developments, transparency, data quality, data completeness, and data exchange formats
- Allocation (multinput processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Recent development in impact assessment
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Uncertainty analysis
- Subjectivity in environmental assessments
- Multicriteria analysis
- Case Studies

Lecture notes

No script. Lecture slides and literature will be made available.

Literature

No script. Lecture slides and literature will be made available.

Prerequisites / notice

Basic knowledge of environmental assessment tools is a prerequisite for this class. Students that have not done coursework in this topic before are required to read an appropriate textbook before or at the beginning of this course (e.g. Baumann&Tillman, The Hitch Hiker's Guide to LCA: An Orientation in Life Cycle assessment Methodology and Applications, Studentliteratur, Lund, 2004).

Abstract

Technical systems are investigated in projects with numerical modeling. The students learn how to answer given questions with target oriented methodologies using various software programs for environmental assessment.

Objective

Become acquainted with various software programs for environmental assessment including Life Cycle Assessment, Environmental Risk Assessment, Probabilistic Modelling, Material Flow Analysis.

Landscape and Ecosystems

This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It explores case studies of ecosystem management approaches and considers their practicability, their achievements and possible barriers to their uptake.

Abstract

The course provides methods and tools for ecological evaluations dealing with nature conservation or landscape planning. It covers census methods, ecological criteria, indicators, indices and critically appraises objectivity and accuracy of the available methods, tools and procedures. Birds and plants are used as main example guiding through different case studies.

Objective

Students will be able to:
- critically consider biological data books and local, regional, and national inventories;
- evaluate the validity of ecological criteria used in decision making processes;
- critically appraise the handling of ecological data and criteria used in the process of evaluation;
- perform an ecological evaluation project from the field survey up to the decision making and planning.

Lecture notes

Powerpoint slides are available on the webpage. Additional documents are handed out as copies.

Literature

Basic literature and references are listed on the webpage.

Prerequisites / notice

The course structure changes between lecture parts, seminars and discussions. The didactic atmosphere is intended as working group.

Prerequisites for attending this course are skills and knowledge equivalent to those taught in the following ETH courses:
- Pflanzen- und Vegetationsökologie
- Systematische Botanik
- Raum- und Regionalentwicklung
- Naturschutz und Stadtbioökologie

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions

The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

Physiological, physical, and cognitive factors in sensation and perception
- Body spaces and functional anthropometry
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. - Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

Every day humans interact with various systems. Strategies of interaction, individual needs, physical & mental abilities, and system properties are important factors in controlling the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction & overall performance.

- Physiological, physical, and cognitive factors in sensation and perception
- Body spaces and functional anthropometry
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

The course addresses environmental policies, focusing on new approaches, which are generally summarized as environmental governance. The course also provides a broader introduction to social science concepts to provide students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

To understand how an environmental problem may (or not) become a policy and explain political processes, using basic concepts and techniques from political science.
To analyze the evolution as well as the key elements of environmental governance.
To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of 'environmental governance' and how legitimate and effective are these approaches in addressing persistent environmental challenges?

A detailed course schedule will be made available at the beginning of the semester.

We recommend that students have (a) Three-years BSc education of a (technical) university; (b) Successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) Familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)

This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.

Data: 06.10.2017 12:56 Autumn Semester 2015 Page 1386 of 1432
Content

This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 4 ECTS credit points. The workload is around 120 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

Lecture notes

Slides and reading material will be made available at www.ib.ethz.ch (teaching, materials, then menu on the left side of the screen). They are password protected. Use your Netzhz username and password to access the material.

Literature

See www.ib.ethz.ch (teaching, materials)

Prerequisites / notice

Students from ETH will receive 4 ECTS credit points if they attend classes regularly and obtain a grade of 4.0 or higher for the written exam in the final week of the semester. Students who obtain a grade of less than 4.0 for the end-of-semester test will have a second chance in the first week of the following semester. The rules of the game are defined in detail on the course syllabus. Students who do not participate in the end of semester test will not have access to the repeat exam unless they submit compelling and documented reasons for why they were unable to participate in the first test. Except for language dictionaries, no additional materials and no laptops and mobile phones are allowed during the exam.

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory (http://www.rektorat.ethz.ch/students/admission/auditors/specialstudents_uzh/index_EN; see menu on left side of that webpage for students from other universities).

The workload for this course is approx. 120 hours (all inclusive).

</tr>
</tbody>
</table>

Objective

The aim of this course is to make students with a technical scientific background aware of the legal and political context of environmental policy in order to place technical solutions in their regulatory context.

Content

Topics covered in lectures:

(1) Environmental Regulation
a. Perspectives
b. Regulatory Challenges of Environment Problems
c. Regulatory Tools

(2) Law: International, European and national laws
a. International law
b. European law
c. National law

(3) Policy: Case studies

Assessment:

(i) Class participation (25%): Students will be expected to contribute to class discussions and prepare short memos on class readings.
(ii) Exam (75%) consisting of three parts:
   a. Policy brief - a maximum of 2 pages (including graphs and tables);
   b. Background document to the policy brief - this document sets out a more detailed and academic overview of the topic (maximum 8 pages including graphs and tables);
   c. Presentation of the policy brief: presentations can use a maximum of 5 slides and can last 7 minutes.

Lecture notes

The course is taught as a small interactive seminar and significant participation is expected from the students. Participation will be capped at 15 in order to maintain the interactive nature of the first class. All classes, readings, and assignments, are in English.

Teaching will take place over two weeks in September and October. The exam date will be in December.

Literature

An electronic copy of relevant readings will be provided to the students at no cost before the start of the lectures.

No specific pre-existing legal knowledge is required, however all students must have successfully completed Grundzüge des Rechts (851-0708-00 V) or an equivalent course.

The course is (inter)related to materials discussed in Politikwissenschaft: Grundlagen (851-0577-00 V), Ressourcen- und Umweltökonomie (751-1551-00 V), Umweltrecht: Konzepte und Rechtsgebiete (851-0705-01 V), Rechtlicher Umgang mit natürlichen Ressourcen (701-0745-01 V), Environmental Governance (701-1651-00 G), Policy and Economics of Ecosystem Services (701-1653-00 G), International Environmental Politics: Part I (851-0594-00 V).

The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines. Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.
### Sustainability Assessment

**Number:** 701-1551-00L  
**Title:** Sustainability Assessment  
**ECTS:** 3 credits  
**Lecturers:** P. Krüttli, C. E. Pohl

**Abstract:** The course deals with the concepts and methodologies for the analysis and assessment of sustainable development. A special focus is given to the social dimension and to social justice as a guiding principle of sustainability as well as to trade-offs between the three dimensions of sustainability.

**Objective:** At the end of the course students should:
- Know: Function, purpose and algorithm of a selected number of transdisciplinary methods
- Understand: Functional application in case studies and other problem oriented projects
- Be able to reflect on: Potential, limits, and necessity of transdisciplinary methods
- Be prepared for: Transdisciplinary Case Study 2016

**Content:**
- Overview of concepts and methods of inter/transdisciplinary integration of knowledge, values and interests (approx. 20%)
- Analysis of a selected number of transdisciplinary methods focusing process and impact (approx. 50%)
- Practical application of the methods in a broader project setting (approx. 30%)

**Literature:** Selected scientific articles and book-chapters

**Prerequisites / notice:** This course is recommended for students participating in the Transdisciplinary Case Study 2016.

---

### Policy, Decision Analysis and Modeling

**Number:** 701-1561-00L  
**Title:** Modeling Environmental Policy Problems  
**ECTS:** 3 credits  
**Lecturers:** A. Patt, T. Schmidt, E. Trutnevyte, O. van Vliet

**Abstract:** The lectures will introduce students to the principles of quantitative policy analysis, namely the methods to predict and evaluate the social, economic, and environmental effects of alternative strategies to achieve public objectives. A series of graded assignments will give students an opportunity for students to apply those methods to a set of case studies.

**Objective:** At the end of the course students should:
- Know: core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.
- Understand and reflect on: the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

**Content:** The course is structured as follows:
- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;
- Tradeoffs in selected examples.

**Literature:** Selected scientific articles & book chapters

---

### Electives

**Number:** 701-1541-00L  
**Title:** Multivariate Methods

**Abstract:** The course teaches multivariate statistical methods such as linear regression, analysis of variance, cluster analysis, factor analysis and logistic regression.

** Objective:** Upon completion of this course, the student should have acquired:
1. Knowledge on the foundations of several methods of multivariate data analysis, along with the conditions under which their use is appropriate.
2. Skill in the estimation, specification and diagnostics of the various models.
3. Hands-on experience with those methods through the use of appropriate software and actual data sets in the PC lab.

**Content:** The course will begin with an introduction to multivariate methods such as analysis of variance and multiple linear regression, where a metric dependent variable is "explained" by two or more independent variables. Then two methods for structuring complex data, cluster analysis and factor analysis will be covered. In the last part, procedures for the analysis of relationships involving dichotomous or polytomous dependent variables (e.g., the choice of a mode of transportation) will be discussed.
The objective of this lecture is to demonstrate the cultural foundations of ecological phenomena and the use and management of nature and natural resources as responses of man and society towards their environment. An introspection into the rationale of cultural processes of nature appropriation shall enable students to understand human and social development processes throughout the history of culture and mind.

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

**Content**

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering devices are put into place through government intervention. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors’ behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

**Key questions that this course seeks to answer:** What are the core characteristics of environmental challenges from a policy perspective? What are key elements of 'environmental governance' and how legitimate and effective are these approaches in addressing persistent environmental challenges?

**Lecture notes**

Lecture slides and additional course material will be provided throughout the semester.

**Literature**

**Prerequisites / notice**

A detailed course schedule will be made available at the beginning of the semester.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent!)) and (c) Familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy).

**851-0589-00L**

**Introduction to Cultural Ecology**

The lecture introduces to the basic principles of cultural ecology in a historical and cross-cultural perspective. It presents the most important scientific theories and methods in cultural studies and relates them to selected case studies relevant to environment and ecology. Human and social environment interactions are analysed in various European and Non-European settings.

**Objective**

The objective of this lecture is to demonstrate the cultural foundations of ecological phenomena and the use and management of nature and natural resources as responses of man and society towards their environment. An introspection into the rationale of cultural processes of nature appropriation shall enable students to understand human and social development processes throughout the history of culture and mind.

**Abstract**

Technological change plays a crucial role in efforts to create a more sustainable future. In this context, policy decision makers must design rules that minimize its risks and maximize its benefits for society at large. The course discusses this challenge from an interdisciplinary perspective taking into account legal, economic, historical, development and environmental aspects.

**Objective**

- to recognize the challenges and opportunities of technological change in terms of sustainable development
- to become familiar with policy instruments to promote innovation
- to improve understanding of political decision-making processes in the regulation of science & technology
- improved understanding of the role of science and technology in the context of human and societal development

**Content**

Science and Technology Policy is normally associated with the improvement of national competitiveness; yet, it is also an integral part of effective environmental and development policies.

The course will discuss the challenges and opportunities of technological change in terms of sustainable development and show how public policy on the national and the international level is responding to this change.

In this context, students are to become familiar with the basic principles of political economy and New Growth Theory and how such theories help explain political decisions as well as political outcomes in the area of Science, Technology and Innovation. State interventions are either designed to regulate (e.g. environmental regulations, anti-trust law) or facilitate (e.g. intellectual property rights protection, public investment in R&D and technical education, technology transfer) technological change. This will be illustrated by looking at different industries and different national systems of innovation. Subsequently the positive and negative consequences for society and the natural environment will be discussed from a short-term and a long-term perspective.

**Lecture notes**

Reader with issue-specific articles. E-version is partly available under http://www.ib.ethz.ch/teaching/material/stpp
Students have a theoretically and empirically sound understanding of the prospects and limitations of international development aid.

A. Patt

The objectives of this course are to develop the following key skills necessary for policy analysts:

- Communicate the findings from these simulations and associated analysis in a manner that makes transparent their theoretical foundations, the level and sources of uncertainty, and ultimately their applicability to the policy problem.

- Develop and program numerical models to simulate the processes and relationships, in order to identify policy problems and the effects of policy interventions.

- Develop conceptual models of the types of processes and relationships governing these quantitative factors, including stock-flow dynamics, feedback loops, optimization, sources and effects of uncertainty, and agent coordination problems.

- Identifying the critical quantitative factors that are of importance to policy makers in a range of decision-making situations.

The 2-hour course (5-7 p.m.) will be held as a series of lectures. The course materials will be available in form of an electronic Reader at the beginning of the semester. The class will be taught in English. Students will be asked to give a (a) presentation (15 Minutes) or write a review paper based on a article selected from the electronic script, and (b) they will have to pass a written test at the end of the course in order to obtain 3 credit points in the ECTS System. In the final mark (a) will have a weight of 40% and (b) 60%.

The lectures will introduce students to the principles of quantitative policy analysis, namely the methods to predict and evaluate the social, economic, and environmental effects of alternative strategies to achieve public objectives. A series of graded assignments will give students an opportunity for students to apply those methods to a set of case studies.

The course will proceed through a series of policy analysis and modeling exercises, involving real-world or hypothetical problems. The specific examples around which work will be done will concern the environment, energy, health, and natural hazards management.

Articles and book abstracts will be uploaded to a course website.

GIS - Introduction into Geoinformation Science and Technology
Number of participants limited to 80.

Abstract
Theoretical basics and fundamental concepts of Geographic Information Science (GIS) are imparted and subsequently further elaborated with the software ArcGIS. At the end, the students will be able to independently solve basic realistic GIS problems.

Objective
Students are able to:
- elucidate the theoretical and conceptional foundations of geographic information systems (GIS)
- independently perform normal GIS work using commercial software and practical examples

Content
The course covers the following topics:
- What is GIS? What are spatial data?
- The representation of reality by means of spatial data models: vector, raster, TIN
- The four phases of data modelling: Spatial, conceptual, logical and physical model
- Basic concepts of database management systems and spatial databases
- Possibilities of data collection
- Transition of reference frame
- Spatial Analysis I: query and manipulation of vector data
- Spatial Analysis II: operators and functions with raster data
- Digital elevation models and derived products
- Process modelling with vector and raster data
- Presentation possibilities of spatial data

One Friday is reserved for a field trip or guest speaker;

Literature

Ecological Assessment and Evaluation

Abstract
The course provides methods and tools for ecological evaluations dealing with nature conservation or landscape planning. It covers census methods, ecological criteria, indicators, indices and critically appraises objectivity and accuracy of the available methods, tools and procedures. Birds and plants are used as main example guiding through different case studies.

Objective
Students will be able to:
1) critically consider biological data books and local, regional, and national inventories;
2) evaluate the validity of ecological criteria used in decision making processes;
3) critically appraise the handling of ecological data and criteria used in the process of evaluation
4) perform an ecological evaluation project from the field survey up to the decision making and planning.

Lecture notes
Powerpoint slides are available on the webpage. Additional documents are handed out as copies.

Literature
Basic literature and references are listed on the webpage.

Prerequisites / notice
The course structure changes between lecture parts, seminars and discussions. The didactic atmosphere is intended as working group.
Prerequisites for attending this course are skills and knowledge equivalent to those taught in the following ETH courses:
- Pflanzen- und Vegetationsökologie
- Systematische Botanik
- Raum- und Regionalentwicklung
- Naturschutz und Stadtbioökologie

Systems Dynamics and Complexity

Abstract
Finding solutions: what is complexity, problem solving cycle.
Implementing solutions: project management, critical path method, quality control feedback loop.
Controlling solutions: Vensim software, feedback cycles, control parameters, instabilities, chaos, oscillations and cycles, supply and demand, production functions, investment and consumption

Objective
A successful participant of the course is able to:
- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyse the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics
Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical systems dynamics, nonlinear dynamics and macroeconomic modeling. The course is structured along three main tasks:
1. Finding solutions
2. Implementing solutions
3. Controlling solutions

PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM. The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

Self-study tasks (discussion exercises, Vensim exercises), are provided as home work. Weekly exercise sessions (45 min) are used to discuss selected solutions. Regular participation in the exercises is an efficient way to understand the concepts relevant for the final exam.

#### Abstract

The lectures will introduce students to the principles of quantitative policy analysis, namely the methods to predict and evaluate the social, economic, and environmental effects of alternative strategies to achieve public objectives. A series of graded assignments will give students an opportunity for students to apply those methods to a set of case studies.

#### Objective

- Identifying the critical quantitative factors that are of importance to policy makers in a range of decision-making situations.
- Developing conceptual models of the types of processes and relationships governing these quantitative factors, including stock-flow dynamics, feedback loops, optimization, sources and effects of uncertainty, and agent coordination problems.
- Develop and program numerical models to simulate the processes and relationships, in order to identify policy problems and the effects of policy interventions.
- Communicate the findings from these simulations and associated analysis in a manner that makes transparent their theoretical foundation, the level and sources of uncertainty, and ultimately their applicability to the policy problem.

The course will proceed through a series of policy analysis and modeling exercises, involving real-world or hypothetical problems. The specific examples around which work will be done will concern the environment, energy, health, and natural hazards management.
Abstract
The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines.

Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.

Objective
At the end of the course students should:

Know:
- Function, purpose and algorithm of a selected number of transdisciplinary methods

Understand:
- Functional application in case studies and other problem oriented projects

Be able to reflect on:
- Potential, limits, and necessity of transdisciplinary methods

Be prepared for:
- Transdisciplinary Case Study 2016

Content
The lecture is structured as follows:

- Overview of concepts and methods of inter-/transdisciplinary integration of knowledge, values and interests (approx. 20%)
- Analysis of a selected number of transdisciplinary methods focusing problem framing, problem analysis, and impact (approx. 50%)
- Practical application of the methods in a broader project setting (approx. 30%)

Lecture notes
Handouts are provided by the lecturers

Literature
Selected scientific articles and book-chapters

Prerequisites / notice
This course is recommended for students participating in the Transdisciplinary Case Study 2016.

701-1551-00L Sustainability Assessment W 3 credits 2G P. Krütli, C. E. Pohl

Abstract
The course deals with the concepts and methodologies for the analysis and assessment of sustainable development. A special focus is given to the social dimension and to social justice as a guiding principle of sustainability as well as to trade-offs between the three dimensions of sustainability.

The course is seminar-like, interactive.

Objective
At the end of the course students should

Know:
- core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

Content
The course is structured as follows:

- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;
- Tradeoffs in selected examples.

Lecture notes
Handouts.

Selected scientific articles & book chapters

851-0735-11L Environmental Regulation: Law and Policy W 3 credits 1S J. van Zeben

Abstract
The course is fully booked

Objective
The aim of the course is to make students with a technical scientific background aware of the legal and political context of environmental policy in order to place technical solutions in their regulatory context.

The aim of this course is to equip students with a legal and regulatory skill-set that allows them to translate their technical knowledge into a policy brief directed at legally trained regulators. More generally, it aims to inform students with a technical scientific background of the legal and political context of environmental policy. The focus of the course will be on international and European issues and regulatory frameworks - where relevant, the position of Switzerland within these international networks will also be discussed.

Content
Topics covered in lectures:

(1) Environmental Regulation
   a. Perspectives
   b. Regulatory Challenges of Environment Problems
   c. Regulatory Tools
(2) Law: International, European and national laws
   a. International law
   b. European law
   c. National law
(3) Policy: Case studies

Assessment:
(i) Class participation (25%): Students will be expected to contribute to class discussions and prepare short memos on class readings.
(ii) Exam (75%) consisting of three parts:
   a. Policy brief - a maximum of 2 pages (including graphs and tables);
   b. Background document to the policy brief - this document sets out a more detailed and academic overview of the topic (maximum 8 pages including graphs and tables);
   c. Presentation of the policy brief: presentations can use a maximum of 5 slides and can last 7 minutes.
1. Encompassing concepts and approaches

To know current biological and ecological research on selected diseases, to be able to comment on it and to understand the methods.

The course is taught as a small interactive seminar and significant participation is expected from the students. Participation will be capped.

An electronic copy of relevant readings will be provided to the students at no cost before the start of the lectures.

No specific pre-existing legal knowledge is required, however all students must have successfully completed Grundzüge des Rechts (851-0708-00 V) or an equivalent course.

The course is (inter)related to materials discussed in Politikwissenschaft: Grundlagen (851-0577-00 V), Ressourcen- und Umweltökonomie (751-1551-00 V), Umweltrecht: Konzepte und Rechtsgebiete (851-0705-01 V), Rechtlicher Umgang mit natürlichen Ressourcen (701-0743-01 V), Environmental Governance (701-1651-00 G), Policy and Economics of Ecosystem Services (701-1653-00 G), International Environmental Politics: Part I (851-0594-00 V).

**Abstract**

This course introduces landscapes as socially perceived, spatially and temporally dynamic entities that are shaped by natural and societal factors. Concepts and qualitative and quantitative methods to study landscapes from an ecological, societal and historical perspective are presented. In a term paper students work on a landscape-related topic of their choice.

**Objective**

Students will:

- learn about concepts and methods to quantify structural and functional connectivity in landscapes, particularly
- be introduced to the topic of landscape genetics and its benefits and (current) limitations for applied conservation
- learn about concepts and methods in scenario-based land-use change modelling
- approach an understanding of landscape as perceived environment
- learn about concepts of landscape preference and related measurement methods
- understand the role of landscape for human well-being
- be introduced into approaches of actively influencing attitudes and behavior as well as related scientific evaluation
- make use of various historical sources to study landscapes and their dynamics
- interpret landscapes as a result of ecological constraints and anthropogenic activities.

**Content**

1. Encompassing concepts and approaches
   - European Landscape Convention (ELC)
   - Ecosystem Services (ES): introduction and critical evaluation
   - Thematic topics
     2. Ecological approach:
        - green infrastructure (e.g., ecological conservation areas)
        - landscape connectivity
        - landscape genetics and management applications
     3. Social-science approach:
        - principle of landscape as perceived and connoted environment
        - theories on landscape preference and place identity
        - role of landscapes for recreation, health and well-being
        - intervention approaches for influencing attitudes and related behavior
        - methods of investigating the human-landscape relationship and evaluating interventions
     4. Historical approach:
        - land use history of Switzerland (agricultural history, forest and woodland history)
        - historical legacies of land use in landscapes and ecosystems
        - historic-ecological approaches and applications
     5. Land change science:
        - modelling future land-use (CLUE, other scenario-based models)
        - landscape functions and services
   - Basic Landscape Ecology courses at Bachelor level

**Lecture notes**

Handouts will be available in the course and for download

**Abstract**

In-depth understanding of concepts, insight into current research and experience with methods of Forest Pathology based on selected pathosystems.

**Objective**

To know current biological and ecological research on selected diseases, to be able to comment on it and to understand the methods.

To understand the dynamics of selected pathosystems.

To be able to diagnose tree diseases and injuries.

To know forest protection strategies and to be able to comment on them.

**Content**

Stress and disease, virulence and resistance, disease diagnosis and damage assessment, tree disease epidemiology, disease management, ecosystem pathology.

Systems (examples): Air pollution and trees, endophytic fungi, mycorrhiza, wood decay, conifer- root rot, Phytophthora diseases, chestnut canker and its hypoviruses, urban trees, complex diseases, emerging diseases

**Lecture notes**

no script, the ppt-presentations and specific articles will be made available

among others:

Students should be able to
J. W. Kirchner
Identification of social needs for the multi-dimensional ecosystem goods and services and their transformation into detailed objectives
Forests in heavily populated areas need to provide diverse ecosystem services and goods for the benefits of society. Multifunctional forest

P. Rotach
Multifunctional forest management needs to control natural processes such that they efficiently provide the diverse services and goods

J. Ghazoul
5 credits
Hands on approach to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental wellbeing. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources across relevant temporal and spatial scales. The course will identify important stakeholders, their needs and interests, and the conflicts that exist among them in the context of land and resource management.

701-1635-00L Multifunctional Forest Management W 5 credits 3G P. Rotach
Multifunctional forest management needs to control natural processes such that they efficiently provide the diverse services and goods for society in a sustainable and close to nature way. This course provides the basic knowledge, the principles and the management tools for successful multifunctional forest management. Forests in heavily populated areas need to provide diverse ecosystem services and goods for the benefits of society. Multifunctional forest management thus needs to control natural processes such that they efficiently provide these services and goods in a sustainable and close to nature way. This course provides the tools, the principles and the management tools for multifunctional forest management. Different strategies and management options are presented and discussed.

Lecture notes
No class notes or text books
Lecture presentations are available for download
Reading assignments are given in class
A bibliography of cited literature will be available
Additional field excursions focusing on the Swiss forest management system, the Plenter- and other irregular systems will be offered during spring term in an optional course named "AK des multifunktionalen Waldmanagements". 9 days of field trips will provide the possibility to consolidate theoretical knowledge, to apply it to real examples in the field, to discuss and further consolidate what has been taught in this class. The additional course is an important part of the overall formation on forest management and is highly recommended.

</table>

**Objective**

- The course teaches the possibilities and limits of the law in order to protect natural resources and landscapes against harm and nuisance. The learning concept is based on the co-ordinated implementation of the relevant legislations. The complexity of the legal situation will be discussed by analysing virtual and real law cases focused on spatial projects and planning.
- The students know the opportunities and restrictions which are given by the law when using natural resources. They have insights into the complex environmental legal system and their application in concrete cases. The students are able to formulate typical legal questions, to understand the argumentation of courts and to solve simple legal problems with respect to environmental problems.
- The students will be able to apply legal principles to the protection of the environment in international and national case studies.

**Content**

- Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.
- We analyze the evolution as well as the key elements of environmental governance. The course also provides a broader introduction to social science concepts to provide students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

**Prerequisites / notice**

- The course is based on a strong background in environmental science and law. Students are expected to have completed an introductory course to environmental policy and have a basic understanding of political science.
- The course is designed for students with a background in environmental science, law, or related fields.
- We recommend that students have (a) Three-years BSc education of a (technical) university; (b) Successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) Familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy).

**Prerequisites / notice**

Students will be able to:

1) critically consider biological data books and local, regional, and national inventories;
2) evaluate the validity of ecological criteria used in decision making processes;
3) critically appraise the handling of ecological data and criteria used in the process of evaluation;
4) perform an ecological evaluation project from the field survey up to the decision making and planning.

The course provides methods and tools for ecological evaluations dealing with nature conservation or landscape planning. Based on lectures and field- and laboratory training the students learn to apply modern methods to determine forest inventory parameters and to measure subsurface properties and processes.

The course structure changes between lecture parts, seminars and discussions. The didactic atmosphere is intended as working group.

| Objective  | Students will be able to:
1) critically consider biological data books and local, regional, and national inventories;
2) evaluate the validity of ecological criteria used in decision making processes;
3) critically appraise the handling of ecological data and criteria used in the process of evaluation
4) perform an ecological evaluation project from the field survey up to the decision making and planning. |
| Lecture notes | Basic literature and references are listed on the webpage. |
| Literature  | Powerpoint slides are available on the webpage. Additional documents are handed out as copies. |
| Prerequisites / notice | The course structure changes between lecture parts, seminars and discussions. The didactic atmosphere is intended as working group. |

Prerequisites for attending this course are skills and knowledge equivalent to those taught in the following ETH courses:
- Pflanzen- und Vegetationsökologie
- Systematische Botanik
- Raum- und Regionalentwicklung
- Naturschutz und Stadtbioökologie

Autumn Semester 2015

Data: 06.10.2017 12:56
The field course in Belize will develop an understanding of, and solutions to, issues of landscape management relevant to conservation and natural resources. Students will be expected to integrate skills in quantitative natural science with social science approaches in real world, and hence highly complex, settings.

The aim of this course is to equip students with a legal and regulatory skill-set that allows them to translate their technical knowledge into a policy brief directed at legally trained regulators. More generally, it aims to inform students with a technical scientific background of the legal and political context of environmental policy. The focus of the course will be on international and European issues and regulatory frameworks - where relevant, the position of Switzerland within these international networks will also be discussed.

To address complex multi-dimensional environmental problems through the application of interdisciplinary and transdisciplinary skills.

Day 1: Ecology of the forest habitats
A first impression of the biology of the region will be gained through an exploration of the different forest formations, ranging from mesic forests to dry evergreen, dry deciduous, and mangrove forests. The learning objective will be to understand the underlying environmental conditions that determine forest formations within the relatively small area of Shipstern Reserve. This includes linking climate, soil, and geology with community processes to understand the mosaic of habitat types, their distribution, form, and function.

Day 2: The ecology of natural resources
Students will begin to explore how people use forest resources, ranging from timber, to a variety of non-timber forest products, and animals for hunting. This will lead to an evaluation of threats to species and habitats, and hence set the scene for subsequent work.

Day 3: Familiarisation with landscape scale dynamics
We will explore the land uses in the landscape in the vicinity of Shipstern and Freshwater creeks. This will encompass a range of land uses, including small scale to large scale agriculture, extractive forest reserves, and protected forests. In the process the students will gain a better understanding of the pressures on land and forests, and a chance to meet some of the local stakeholders involved in land use transformations.

Days 4 & 5: Problem conceptualisation
Working with reserve managers and local stakeholders the students will develop a conceptual understanding of the key problems in the region, including the underlying drivers of change.

Days 6-9: Integrative analysis
Students, working in small groups, will analyse selected natural resource problems in greater depth. Options include biodiversity responses to habitat fragmentation, conservation management of mangrove and coral reef systems, restoration ecology, community forest management, and tourism development, among others. Students will have opportunities to collect original data across natural and social sciences, and will use different modelling approaches to explore future development trajectories.

Day 10-11: Synthesis and presentation of results
Research will be synthesised and presented to the local management community of Shipstern and Freshwater Creek reserves. The course will conclude with an afternoon allocated to discussion and debriefing, including an appraisal of the challenges of addressing natural resource management issues in complex socioecological systems, and the lessons learned.

The course is (inter)related to materials discussed in Politikwissenschaft: Grundlagen (851-0577-00 V), Ressourcen- und Umweltökonomie (751-1551-00 V), Umweltrecht: Konzepte und Rechtsgebiete (851-0705-01 V), Rechtlicher Umgang mit natürlichen Ressourcen (701-0743-01 V), Environmental Governance (701-1651-00 G), Policy and Economics of Ecosystem Services (701-1653-00 G), International Environmental Politics: Part I (851-0594-00 V).

### Literature

An electronic copy of relevant readings will be provided to the students at no cost before the start of the lectures.

The course is related to materials discussed in Politikwissenschaft: Grundlagen (851-0577-00 V), Ressourcen- und Umweltökonomie (751-1551-00 V), Umweltrecht: Konzepte und Rechtsgebiete (851-0705-01 V), Rechtlicher Umgang mit natürlichen Ressourcen (701-0743-01 V), Environmental Governance (701-1651-00 G), Policy and Economics of Ecosystem Services (701-1653-00 G), International Environmental Politics: Part I (851-0594-00 V).

### Prerequisites / notice

Foundations of Ecosystem Management

During the second week of the teaching period, students will have individual 30-minute meetings with the lecturer to discuss their project.

Teaching will take place over two weeks in September and October. The exam date will be in December.

Particularly suitable for students of D-USYS

No specific pre-existing legal knowledge is required, however all students must have successfully completed Grundzüge des Rechts (851-0708-00 V) or an equivalent course.

The course is (inter)related to materials discussed in Politikwissenschaft: Grundlagen (851-0577-00 V), Ressourcen- und Umweltökonomie (751-1551-00 V), Umweltrecht: Konzepte und Rechtsgebiete (851-0705-01 V), Rechtlicher Umgang mit natürlichen Ressourcen (701-0743-01 V), Environmental Governance (701-1651-00 G), Policy and Economics of Ecosystem Services (701-1653-00 G), International Environmental Politics: Part I (851-0594-00 V).
Introduction to design and model assisted sampling theory for finite populations as well as to the infinite population model for forest inventory. Two-phase two-stage forest inventories with simple or cluster sampling. Small area estimation. Presentation of the Swiss National Inventory.

Students should have a good understanding of the concepts of general sampling theory in a modern framework. They should also master the specific problems arising in forest inventory and be able, if necessary, to read more specialized books or research papers.

Sampling techniques for forest inventories. Daniel Mandallaz, Chapman and Hall. A free electronic copy of the book is also available. A PDF file containing parts of the book will be mailed to the participants.

A simulation software will be used throughout the lectures to illustrate the theoretical developments. Upon request a half day field demonstration can be organized at the WSL outside the lecture time. A rettortorium for the exam is also offered.

The course communicates a deepened understanding of geoprocessing frameworks arcpy and covers basic language concepts of Python. Furthermore, the basics of the programming language Python will be communicated which is required for the implementation of multilevel spatial analysis and dynamic models.

Overview and history of dendrochronology. The impact of different environmental influences on tree-ring characteristics will be shown. The students learn various methods to date tree rings and they understand how ecological and environmental processes and patterns can be reconstructed using tree rings.

The students...
- understand, how wood is configured and how tree-ring structures are formed.
- are able to identify and describe different tree-ring structures.
- understand the theoretical and practical aspects of the dating of tree rings.
- know the effects of different abiotic and biotic environmental influences (climate, site, competition, insects, fire, physical-mechanical influences) on trees and tree rings.
- discover a tool for understanding and reconstructing global change processes.
- learn software to date, standardize and analyze tree rings.
- get hands-on experience based on the demonstration of wood (increment cores, stem discs, wedges), sampling in the field, and measuring and dating of tree rings in the tree-ring lab.
- solve R-based exercises (R tutorial will be provided) and answer questions in Moodle.
- work out an independent research question related to a dendroecological topic and write a short literature review based on scientific papers.

- Overview and history of dendrochronology
- Principles of dendrochronology
- Evolution of tree rings
- Formation and structure of wood and tree rings
- Intra-seasonal tree-ring growth
- Continuous and discontinuous tree-ring characteristics
- Sampling and measuring
- Crossdating methods (visual, skeleton plots, quantitative)
- Standardization of tree-ring series
- Development of tree-ring chronologies
- Dendrochronology, dendrohydrology, dendroclimatology
- Stable isotopes
- Climate, climate-growth relationships, climate reconstructions
- Age and size structures, forest dynamics (regeneration, growth, competition, mortality)
- Disturbance ecology (fire, insects, blowdown)
- Application of tree-ring research in practice and in interdisciplinary research projects
- Field and lab day (date for one entire day or two half days will be searched together with the students in the beginning of the semester): discussion of different dendroecological questions in the forest; sampling of trees; insight into different tree-ring projects in the labs (Swiss Federal Institute for Forest, Snow and Landscape Research WSL).

Lecture notes
The lecture notes (in English) will be handed out in the class.

Prerequisites / notice
The lecture notes and further documents (papers, software) can also be downloaded from Moodle (https://moodle-app2.let.ethz.ch) following registration for the course.

Time schedule (total of 90 hours): There will be 12 lectures with each two hours (total of 24 hours presence) as well as a field and lab day (8 hours presence). In addition, the students are expected to put 18 hours into the preparation of the lectures as well as 18 hours for the exercises. 4 hours are reserved for the lab work and 18 hours for the project.

The class language is German and English, on request English only.

Requirements:
- Basics of biology, ecology and forest ecology

The course offers a general introduction into the geoprocessing framework of ArcGIS and shows how to use python scripts to access and automate geoprocessing tasks. Furthermore, the basics of the programming language Python will be communicated which is required for the implementation of multilevel spatial analysis and dynamic models.

The students learn the basics of their own geographic data processing based on the programming language Python and ArcGIS (arcpy). They get the ability to implement their own processing sequences and models for geoprocessing.

The course communicates a deepened understanding of geoprocessing frameworks arcpy and covers basic language concepts of Python e.g. like control structures, functions and sequences.

Lecture notes
Lecture notes, exercises and worked out solutions to them will be provided.

Literature

Winter Semester 2016
1 credit
401-0627-00L Smoothing and Nonparametric Regression with Examples

Abstract
Starting with an overview of selected results from parametric inference, kernel smoothing (including local polynomials) will be introduced along with some asymptotic theory, optimal bandwidth selection, data driven algorithms and some special topics. Examples from environmental research will be used for motivation, but the methods will also be applicable elsewhere.

Objective
The students will learn about methods of kernel smoothing and application of concepts to data. The aim will be to build sufficient interest in the topic and intuition as well as the ability to implement the methods to various different datasets.

Content
Rough Outline:

- Parametric estimation methods: selection of important results
  - Maximum likelihood
  - Least squares: regression & diagnostics

- Nonparametric curve estimation
  - Density estimation, Kernel regression, Local polynomials, Bandwidth selection
  - Selection of special topics (as time permits, we will cover as many topics as possible) such as change points, modes & monotonicity, robustness, partial linear models, roughness penalty, local likelihoods, etc.

- Applications: potential areas of applications will be discussed such as, change assessment, trend and surface estimation, probability and quantile curve estimation, and others.

Lecture notes
Brief summaries or outlines of some of the lecture material will be posted at http://www.wsl.ch/info/mitarbeitende/ghosh/index_EN (click on "ETH Course" in the left panel).

NOTE: The posted notes will tend to be just sketches whereas only the in-class lessons will contain complete information.

LOG IN: In order to have access to the posted notes, you will need the course user id & the password. These will be given out on the first day of the lectures.

Literature
References:
- Statistical Inference, by S.D. Silvey, Chapman & Hall.
- Density Estimation, by B.W. Silverman, Chapman and Hall.
- Kernel Smoothing, by M.P. Wand and M.C. Jones, Chapman and Hall.
- Nonparametric Simple Regression, by J. Fox, Sage Publications.

Additional references will be given out in the lectures.

Prerequisites / notice
Prerequisites: A background in Linear Algebra, Calculus, Probability & Statistical Inference including Estimation and Testing.

Colloquium

Number Title Type ECTS Hours Lecturers
701-1691-00L Colloquium Forest and Landscape Management W 0 credits 1.5K H. R. Heinimann

Major in Human Health, Nutrition and Environment

Public Health

Number Title Type ECTS Hours Lecturers
752-6105-00L Epidemiology and Prevention W 3 credits 2V M. Eichholzer

Abstract
The module Epidemiology and prevention gives a brief introduction to epidemiology with the aim to enable students to judge the scientific evidence on dietary habits and health. The importance of nutrition in the prevention of chronic diseases such as type 2 diabetes, cardiovascular diseases, cancer, obesity etc. is presented.

Objective
Students are able:
- to evaluate the scientific evidence on the effects of diet on human health
- to describe the role of nutritional factors in the prevention of chronic diseases
- to assess the nutritional status of a population (Switzerland taken as an example)
- to put forward preventive measures addressing individuals but also our society in relation to the obesity epidemic

Content
The module Epidemiology and prevention gives a brief introduction to epidemiology with the aim to enable students to judge the scientific evidence on dietary habits and health. The importance of nutrition in the prevention of chronic diseases such as type 2 diabetes, cardiovascular diseases, cancer, obesity etc. is presented. Switzerland taken as an example, the health risks associated with our nutritional habits will be evaluated. Finally, examples of preventive measures addressing individuals but also the society in relation to the obesity epidemic and other threats to health are discussed.

752-6151-00L Public Health Concepts W 3 credits 2V R. Heusser

Abstract
The module "public health concepts" offers an introduction to key principles of public health. Students get acquainted with the concepts and methods of epidemiology. Students also learn to use epidemiological data for prevention and health promotion purposes. Public health concepts and intervention strategies are presented, using examples from infectious and chronic diseases.

Objective
At the end of this module students are able:
- to interpret the results of epidemiological studies
- to critically assess scientific literature
- to know the definition, dimensions and determinants of health
- to plan public health interventions and health promotion projects

Content
Concepts of descriptive and analytical epidemiology, study designs, measures of effect, confounding and bias, screening, surveillance, definition of health and health promotion, health dimensions and health determinants, prevention strategies, public health interventions, public health action cycle, epidemiology and prevention of infectious and chronic diseases (HIV, Tuberculosis, Obesity, Public health nutrition).

Lecture notes
Handouts are provided to students in the classroom.

Prerequisites / notice
Language of the course is English

401-0629-00L Applied Biostatistics W 4 credits 3G M. Müller
701-0263-01L Seminar in Evolutionary Ecology of Infectious Diseases

Abstract
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Objective
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content
A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Lectures
Publications and class notes can be downloaded from a web page announced during the lecture.

Literature
Documents of the lectures are available for download at: https://moodle-app2.let.ethz.ch/course/view.php?id=998

551-0223-00L Immunology III

Abstract
This course provides a detailed understanding of
- development of T and B cells
- the dynamics of an immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.

Objective
Obtain a detailed understanding of
- the development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses,
- recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells,
- optimization of B cell responses by intelligent design of new vaccines

Content
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the “Danger” concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Literature
Documents of the lectures are available for download at: https://moodle-app2.let.ethz.ch/course/view.php?id=998

551-1171-00L Immunology: from Milestones to Current Topics

Abstract
Milestones in Immunology: on old concepts and modern experiments

Objective
The course will cover six grand topics in immunology (B cells, innate immunity, antigen presentation, tumor immunity, thymus and T cells, cytotoxic T cells and NK cells) and for each grand topic four hours will be allocated. During the first double hour, historical milestone papers will be presented by the supervisor providing an overview on the development of the conceptional framework and critical technological advances. The students will also prepare themselves for this double lecture by reading the historical milestone papers and contributing to the discussion. In the following lecture up to four students will present each a recent high impact research paper which emerged from the landmark achievements of the previously discussed milestone concepts.

Content
Milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells and NK cells, and tumor immunity.

Literature
Literaturunterlagen werden vor Beginn des Kurses auf folgender website zugänglich sein: Moodle Course https://moodle-app2.let.ethz.ch/course/view.php?id=1002

572-4009-00L Molecular Biology of Foodborne Pathogens

Abstract
The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective
Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks.

Content
Molecular biology of infectious foodborne pathogens (Listeria, Vibrio, E. coli, Campylobacter, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks?

**Abstract**
- This course focuses on food consumer behavior, consumer's decision-making processes and consumer's attitudes towards food products.
- The course provides an overview about the following topics: Factors influencing consumer's food choice, food and health, attitudes towards new foods and food technologies, labeling and food policy issues.

**Objective**
- To understand the principles, roles and mechanisms of microorganisms with metabolic activities of high potential for application in traditional and functional foods utilization with high quality, safety and potential health benefits for consumers.
- This course will integrate basic knowledge in food microbiology, microbial physiology, biochemistry, and technology.

**Content**
- Probiotics and Prebiotics: Probiotics, functional foods and health, towards understanding molecular modes of probiotic action; Challenges for the production and addition of probiotics to foods; Prebiotics and other microbial substrates for gut functionality.
- Bioprotective Cultures and Antimicrobial Metabolites: Antifungal cultures and applications in foods; Antimicrobial peptide-producing cultures (bacteriocins) for enhancing food quality and safety; Development of new protective cultures, the long path from research to industry.
- Legal and Protection Issues Related Functional Foods
- Industrial Biotechnology of Flavor and Taste Development
- Safety of Food Starter Cultures and Probiotics

Students will be required to complete a group project on food products and ingredients with or from functional bacteria. The project will involve information research and analysis followed by an oral presentation and short written report.

**Nutrigenomics - toward personalized nutrition?**

Breakthroughs in biology recently led nutrition scientists to apply modern tools (genomics, transcriptomics, proteomics, metabolomics, genetics, epigenetics) to the analysis of the interactions of food with humans. The lecture presents these tools and illustrates their application in selected topics relevant to human nutrition and food sciences.

**Objective**
- Overall understanding of the transdisciplinary research being conducted under the term nutrigenomics.
- Overall understanding of the omics technologies used in nutrigenomics and their applications to human nutrition and food science.
- Ability to critically evaluate the potential and risks associated with the field of nutrigenomics.

**Content**
- For the content of the script see section "Script" below.
- The lecture is completed by an optional project entitled 'Personalized Nutrition' in which the students have the opportunity to receive a personalized nutritional guidance that is based on their own genetic makeup. The scientific literature on which the genetic tests are based is presented by the students during the lecture.
Lecture notes
The script is composed of circa 450 slides (ca 18 slides/lecture) organized in 9 modules

Module A
From biochemical nutrition research to nutrigenomics

Module B
Nutritional genomics

Module C
Nutrigenetics

Module D
Nutri-epigenomics

Module E
Transcriptomics in nutrition research

Module F
Proteomics in nutrition research

Module G
Metabolomics in nutrition research

Module H
Nutritional systems biology

Module I
Individualized nutrition - opportunities and challenges

Prerequisites / notice
Basic training in biochemistry, molecular biology, physiology, and human nutrition. Interest in interdisciplinary sciences linking molecular biology to human health. Interest in the application of analytical laboratory methods to the understanding of human biology, in particular nutrition.

Abstract
The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. Natural processes, anthropogenic pollution, legislation of groundwater and surface water and of drinking water as well as water treatment will be discussed for industrialized and developing countries.

Objective
The goal of this lecture is to give an overview over the whole path of drinking water from the source to the tap and understand the involved physical, chemical and biological processes which determine the drinking water quality.

Content
The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. The various water resources, particularly groundwater and surface water, are discussed as part of the natural water cycle influenced by anthropogenic activities such as agriculture, industry, urban water systems. Furthermore legislation related to water resources and drinking water will be discussed. The lecture is focused on industrialized countries, but also addresses global water issues and problems in the developing world. Finally unit processes for drinking water treatment (filtration, adsorption, oxidation, disinfection etc.) will be presented and discussed.

Abstract
Project development in renewable Energies
Realization of projects in the field of renewable energies, analysis of frame conditions and risks. The students learn basics of renewable energy project realization from acknowledged experts active in the field. They identify the different tasks of various investor types. They develop sample projects in practice within groups

Objective
- You become acquainted with the regulative, juridical and economic requirements of project development in renewable energies.
- You learn to launch and judge projects by exercises in groups
- You recognize chances and risks of renewable energy projects
Content

Business models for renewable energy projects
Introduction of market trends, market structure, technical trends and regulation in Switzerland and in the EU internal energy market
Necessary frame conditions for profitable projects
Project development samples and exercises in wind power
hydro power
photovoltaics
due diligence and country assessment.

701-1346-00L Carbon Mitigation

Abstract

The reduction of CO2 emissions is the only option for keeping future climate change within reasonable bounds. In this course, we will discuss a portfolio of options involving the alteration of natural carbon sinks and carbon sequestration. The course includes introductory lectures, presentations from guest speakers from industry and the public sector, and final presentations by the students.

Objective

The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences.

Content

From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.

Lecture notes

None

Literature

Will be identified based on the chosen topic.

Prerequisites / notice

Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion.

051-0551-00L Energy- and Climate Systems I

Abstract

The lecture contains concepts, physics and components of building technologies for the efficient and sustainable energy supply and climatisation of buildings and their interaction with architecture and urban design. Using calculations, students learn to ascribe relevant numbers and assess the performance of solutions.

Objective

The lecture's target is the knowledge of the physical basics and technical components of relevant systems for an efficient and sustainable climatisation and maintenance of buildings and their interdependency with the architectonic design and construction. By learning rough calculation methods, determination of relevant dimensions and identification of important parameters becomes possible. Hence, adequate approaches for the own design can be chosen, reviewed quantitatively and qualitatively and set in with a synergistic effect.

Content

1. Introduction
2. Thermal systems
3. Ventilation
4. Daylight and artificial lighting

EK I lectures focus on technical components in use as well as their rough calculation methods and their integration into design and construction.

Based on EK I, the EK II lectures focus on all possible systems and concepts available to the architect for a sustainable design.

Lecture notes

The Slides from the lecture serve as lecture notes and are available as download.

Literature

A bibliography will be distributed at the beginning of the lecture.

227-0731-00L Power Market I - Portfolio and Risk Management

Abstract

Portfolio and risk management in the electrical power business, Pan-European power market and trading, futures and forward contracts, hedging, options and derivatives, performance indicators for the risk management, modelling of physical assets, cross-border trading, ancillary services, balancing power market, Swiss market model, strategy development and positioning.

Objective

Content

1. Pan-European power market and trading
   1.1. Power trading
   1.2. Development of the European power markets
   1.3. Energy economics
   1.4. Spot and OTC trading
   1.5. European energy exchange EEX

2. Market model
   2.1. Market place and organisation
   2.2. Balance groups / balancing energy
   2.3. Ancillary services
   2.4. Market for ancillary services
   2.5. Cross-border trading
   2.6. Capacity auctions

3. Portfolio and Risk management
   3.1. Portfolio management 1 (introduction)
   3.2. Forward and futures contracts
   3.3. Risk management 1 (m²m, VaR, hpfc, volatility, cVaR)
   3.4. Risk management 2 (PaR)
   3.5. Contingency valuation (HPFC)
   3.6. Portfolio management 2
   2.8. Risk Management 3 (enterprise wide)

4. Energy & Finance I
   4.1. Options 1 basics
   4.2. Options 2 hedging with options
   4.3. Introduction to derivatives (swaps, cap, floor, collar)
   4.4. Financial modelling of physical assets
   4.5. Trading and hydro power
   4.6. Incentive regulation

5. Strategy
   5.1. Strategic Positioning
   5.2. Development of strategies and examples
   5.3. Cases for team work

Lecture notes
Handouts of the lecture

Prerequisites / notice
1 excursion per semester, 2 case studies, guest speakers for specific topics

529-0193-00L  Renewable Energy Technologies I  W  4 credits  3G  A. Wokaun, A. Steinfeld

Abstract
Scenarios for world energy demand and CO2 emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaics, electricity, solar chemistry). Wind and ocean energy, heat pumps, geothermal energy, energy from waste. CO2 sequestration.

Objective
Scenarios for the development of world energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO2 emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

Content

Lecture notes
Lecture notes will be distributed during the course.

Literature

Prerequisites / notice
Fundamentals of chemistry and physics are a prerequisite for this course.

Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.

Minor in Global Change and Sustainability

Number  Title  Type  ECTS  Hours  Lecturers
701-0015-00L  Seminar on Transdisciplinary Research for Sustainable Development  W  2 credits  2S  C. E. Pohl, M. Stauffacher

Abstract
The seminar is designed for students and researchers (MA, PhD, PostDoc) who use inter- and transdisciplinary elements in their projects. It addresses the challenges of this research: How to integrate disciplines? How (and in what role) to include societal actors? How to bring results to fruition? We discuss these questions based on case studies and theories and on the participant's projects.

Objective
The participants understand the specific challenges of inter- and transdisciplinary research in general and in the context of sustainable development in particular. They know methods and concepts to address these challenges and apply them to their research projects.

Content
The seminar covers the following topics:
(1) Theories and concepts of inter- and transdisciplinary research
(2) The specific challenges of inter- and transdisciplinary research
(3) Involving stakeholders
(4) Collaborating disciplines
(5) Exploration of tools and methods
(6) Analysing participants' projects to improve inter- and transdisciplinary elements

Literature
Literature will be made available to the participants

Prerequisites / notice
The seminar is specifically suitable for PhD or PostDoc researchers. It is open to master students (minor "global change and sustainability") and further interested people, who preferably are preparing, or working on, a project/thesis.
The course deals with the concepts and methodologies for the analysis and assessment of sustainable development. A special focus is given to the social dimension and to social justice as a guiding principle of sustainability as well as to trade-offs between the three dimensions of sustainability.

The course is seminar-like, interactive.

At the end of the course students should:

Know:
- core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

The course is structured as follows:
- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;
- Tradeoffs in selected examples.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 4 ECTS credit points. The workload is around 120 hours (meetings, reading assignments, preparation of test).

Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.

Disciplines.

Students from ETH will receive 4 ECTS credit points if they attend classes regularly and obtain a grade of 4.0 or higher for the written exam in the final week of the semester. Students who obtain a grade of less than 4.0 for the end-of-semester test will have a second chance in the first week of the following semester. The rules of the game are defined in detail on the course syllabus. Students who do not participate in the end of semester test will not have access to the repeat exam unless they submit compelling and documented reasons for why they were unable to participate in the first test. Except for language dictionaries, no additional materials and no laptops and mobile phones are allowed during the exam.

The workload for this course is approx. 120 hours (all inclusive).

The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines.

Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.

At the end of the course students should:

Know:
- Function, purpose and algorithm of a selected number of transdisciplinary methods

Understand:
- Functional application in case studies and other problem oriented projects

Be able to reflect on:
- Potential, limits, and necessity of transdisciplinary methods

Be prepared for:
- Transdisciplinary Case Study 2016
The course deepens students' knowledge of the environmental assessment methodologies and their various applications.

Lecturers
Become acquainted with various software programs for environmental assessment including Life Cycle Assessment, Environmental Risk Assessment, Probabilistic Modelling, Material Flow Analysis.

Selected scientific articles & book chapters
This course is recommended for students participating in the Transdisciplinary Case Study 2016.

**Objective**

- Inventory developments, transparency, data quality, data completeness, and data exchange formats
- Allocation (multiooutput processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Recent development in impact assessment
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Uncertainty analysis
- Subjectivity in environmental assessments
- Multicriteria analysis
- Case Studies

**Prerequisites / notice**

Basic knowledge of environmental assessment tools is a prerequisite for this class. Students that have not done classwork in this topic before are required to read an appropriate textbook before or at the beginning of this course (e.g. Baumann&Tillman, The Hitch Hiker's Guide to LCA: An Orientation in Life Cycle Assessment Methodology and Applications, Studentlitteratur, Lund, 2004).

### Lectures notes

No script. Lecture slides and literature will be made available.

### Literature

Literature will be made available.

**Notice**

This course was offered as "Sustainable Construction" until HS14.
This year the UN Conference in Paris will shape future world objectives to tackle climate change. The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development
- Case Study 1: Sustainable construction, the role of construction industry (national/international)
- Case Study 2: Cities, forms of settlements
- Case Study 3: Material resources, scenarios, energy, construction materials, urban metabolism
- Case Study 4: Buildings, heating/cooling, consumers, prosumers and other stakeholder, cooperations
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Economics for sustainable construction
- Method 3: Construction, flexibility, modularity
- Synthesis 1: Climate Change mitigation and adaptation in cities
- Synthesis 2: Transition to sustainable development

Exercises are an integral part of the lecture. Prerequisites:
529-0051-00 "Analytische Chemie I (3. Semester)"
529-0058-00 "Analytische Chemie II (4. Semester)"
(or equivalent)

Copies of problem sets and solutions will be distributed free of charge

All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

  - 529-0058-00 "Analytical Chemistry II (4. Semester)"
  (or equivalent)
Abstract
The course introduces the scientific concepts and typical applications of tracers in biogeochemistry. The course covers stable and radioactive isotopes, geochemical tracers and biomarkers and their application in biogeochemical processes as well as regional and global cycles. The course provides essential theoretical background for the lab course "Isotopic and Organic Tracers Laboratory".

Objective
The course aims at understanding the fractionation of stable isotopes in biogeochemical processes. Students learn to know the origin and decay modes of relevant radiogenic isotopes. They discover the spectrum of possible geochemical tracers and biomarkers, their potential and limitations and get familiar with important applications.

Content
Geogenic and cosmogenic radionuclides (sources, decay chains);
stable isotopes in biogeochemistry (natural abundance, fractionation);
geochemical tracers for processes such as erosion, productivity, redox fronts; biomarkers for specific microbial processes.

Lecture notes
handouts will be provided for every chapter

Literature
A list of relevant books and papers will be provided

Prerequisites / notice
Students should have a basic knowledge of biogeochemical processes (BSc course on Biogeochemical processes in aquatic systems or equivalent)

701-1315-00L Biogeochemistry of Trace Elements W 3 credits 2G A. Voegelin, J. G. Wiederhold, L. Winkel

Abstract
The course addresses major biogeochemical processes that drive the cycling of different groups of trace elements (heavy metals, redox-sensitive trace elements, chalcophile elements) in the environment, and the chemical methods that are used to study the behavior of these elements in the geosphere.

Objective
The students gain a detailed understanding of the sources and the cycling of trace elements in the terrestrial and aquatic environment. The interaction of environmentally important trace elements with abiotic and biotic geosphere components as well as their abiotically and biotically driven transformations will be discussed. Relevant methods/techniques to study these processes will be presented.

Content
The course deals in-depth with the major biogeochemical processes controlling the cycling of different groups of trace elements (heavy metals, redox-sensitive and chalcophile elements) in the environment. Sources and cycling of trace elements as related to interactions with abiotic and biotic geosphere components, and abiotically and biotically driven transformations will be discussed. The techniques most commonly used to study these processes will be presented as well.

Lecture notes
Selected handouts (lecture notes, literature, exercises) will be distributed during the course.

Prerequisites / notice
Students are expected to be familiar with the concepts of aquatic or soil chemistry covered in the respective classes at the bachelor level.

This lecture is a prerequisite for attending the laboratory course "Trace elements laboratory".

701-1341-00L Water Resources and Drinking Water W 3 credits 2G S. Hug, M. Berg, F. Hammes, U. von Gunten

Abstract
The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. Natural processes, anthropogenic pollution, legislation of groundwater and surface water and of drinking water as well as water treatment will be discussed for industrialized and developing countries.

Objective
The goal of this lecture is to give an overview over the whole path of drinking water from the source to the tap and understand the involved physical, chemical and biological processes which determine the drinking water quality.

Content
The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. The various water resources, particularly groundwater and surface water, are discussed as part of the natural water cycle influenced by anthropogenic activities such as agriculture, industry, urban water systems. Furthermore legislation related to water resources and drinking water will be discussed. The lecture is focused on industrialized countries, but also addresses global water issues and problems in the developing world. Finally unit processes for drinking water treatment (filtration, adsorption, oxidation, disinfection etc.) will be presented and discussed.

Lecture notes
Handouts will be distributed

Literature
Will be mentioned in handouts

701-1346-00L Carbon Mitigation W 3 credits 2G N. Gruber

Abstract
The reduction of CO2 emissions is the only option for keeping future climate change within reasonable bounds. In this course, we will discuss a portfolio of options involving the alteration of natural carbon sinks and carbon sequestration. The course includes introductory lectures, presentations from guest speakers from industry and the public sector, and final presentations by the students.

Objective
The goal of this lecture is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences.

Content
From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.

Lecture notes
None

Literature
Will be identified based on the chosen topic.

Prerequisites / notice
Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion.

102-0337-00L Landfilling, Contaminated Sites and Radioactive Waste Repositories W 3 credits 2G W. Hummel, L. M. Plötze

Abstract
Practices of landfilling and remediation of contaminated sites and disposal of radioactive waste are based on the same concepts that aim to protect the environment. The assessment of contaminants that may leach into the environment as a function of time and how to reduce the rate of their release is key to the design of chemical, technical and geological barriers.

Objective
Upon successful completion of this course students are able to:
- assess the risk posed to the environment of landfills, contaminated sites and radioactive waste repositories in terms of fate and transport of contaminants
- describe technologies available to minimize environmental contamination
- describe the principles in handling of contaminated sites and to propose and evaluate suitable remediation techniques
- explain the concepts that underlie radioactive waste disposal practices

Content
This lecture course comprises of lectures with exercises and guided case studies.

- A short overview of the principles of environmental protection in waste management and how this is applied in legislation.
- A overview of the chemistry underlying the release and transport of contaminants from the landfilled/contaminated material/radioactive waste repository focusing on processes that control redox state and pH buffer capacity; mobility of heavy metals and organic compounds
- Technical barrier design and function. Clay as a barrier.
- Contaminated site remediation: Site evaluation, remediation technologies
- Concepts and safety in radioactive waste management
- Role of the geological and engineered barriers and radionuclide transport in geological media.

Lecture notes
Short script plus copies of overheads

Literature
Literature will be made available.

Prerequisites / notice
This is an interdisciplinary course aimed at environmental scientists and environmental engineers.
The course outlines the physical principles governing the gravity-driven motion of glacier ice. This is applied to understand the response of erosion and sedimentation by glaciers as a function of topography, englacial temperature, sediment balance, sliding and melt water runoff.

The course introduces the students to engineering hydrology. It covers first physical hydrology, that is the description and the measurement of hydrological processes (precipitation, interception, evapotranspiration, runoff, erosion, snow), and it introduces then the basic mathematical models of the single processes and of the rainfall-runoff transformation, thereby including flood analysis.

To understand the fundamental physical processes in glaciology.
To learn some basic numerical modelling techniques for glacier flow.
To identify glaciological hazards and to learn some assessment and mitigation possibilities.

Basics in physical glaciology
Dynamics of glaciers: deformation of glacier ice, role of water in glacier motion, reaction of glaciers to climate changes, glacier calving, surges
Ice falls, ice avalanches
Glacier floods
Lake ice and bearing capacity

Seminar in Glaciology
651-1581-00L
W

Fundamentals of Natural Hazards Management

W  3 credits  3G  H. R. Heinimann,

B. Krummenacher, S. Löw

Abstract

Risks to life and human assets result when settlement areas and infrastructure overlap regions where natural hazard processes occur. This course utilizes case studies to teach how a future natural hazards-specialist should analyze, assess and manage risks.

Objective

Concepts will be explained step-by-step through a set of case studies, and applied in lab by the students. The following principal steps are used when coping with natural hazard-risks. At each step, students will learn and apply the following skills:

Risk analysis - What can happen?
- Characterize the processes and environmental measures that lead to a natural hazard and integrate modeling results of these processes.
- Identify threats to human life and assets exposed to natural hazards and estimate possible drawbacks or damages.

Risk assessment - What are the acceptable levels of risk?
- Apply principles to determine acceptable risks to human life and assets in order to identify locations which should receive added protection.
- Explain causes for conflicts between risk perception and risk analysis.

Risk management - What steps should be taken to manage risks?
- Explain how various hazard mitigation approaches reduce risk.
- Describe hazard scenarios as a base for adequate dimensioning of control measures.
- Identify the best alternative from a set of thinkable measures based on an evaluation scheme.
- Explain the principles of risk-governance.

Abstract
Production processes are changing the properties of substances, energy and information in terms of time, location, quantity, quality, and their interactions. The learning unit aims at developing analytical and problem solving skills that are essential in engineering sciences. Case studies are characteristic examples for timber harvesting and manufacturing.

Objective
Prozessnetzwerke werden als Material- und Informationsflüsse auf einem Graphen abgebildet, analysiert und zielgerichtet beeinflusst. Die Studierenden sollen dabei:
- Die wirtschaftlichen Grundlagen des Systems Engineering verstehen,
- Die Fertigkeiten für die Anwendung und den Umgang mit Tools für die Analyse von Prozessnetzwerken und Teilsystemen zu festigen,
- Die Problemloskompetenz vertiefen,
- Ausgewählte Themen anhand von Originalliteratur vertiefen und kritisch beleben.
- Die Konzepte bestmögliche Vorgehensweise (best practice BP) und beste verfügbare Technik (best available technology BAT) auf Exkursionen und anhand von Fallstudien verstehen.

Abstract
The lecture Wood structure and function conveys basic knowledge on the microstructure of softwoods and hardwoods as well as general and species-specific relationships between growth processes, wood properties and wood function in the living tree.

Objective
Learning target is to build a basic understanding of the anatomy of wood and the related impact of endogenous and exogenous factors. The students will learn how to distinguish common central European wood species at the macroscopic and microscopic level. A deeper insight will be given by wood identification exercises for softwood species. Further the students will gain insight into the relationships between tree growth and wood properties with a specific focus on the wood function in the living tree.

Content
In an introduction to wood anatomy, the general structural features of softwoods and hardwoods will be explained and factors of diversity and variability will be discussed. A specific focus is laid on common central European tree species with relevance in the wood sector, which will be studied in macro-and microstructural investigations. For softwoods, exercises for the identification of species will be conducted. In the following, relationships between wood structure, properties and function in the living tree will be in the focus of the lecture. Topics covered are mechanical stability and water transport, branches, reaction wood formation (compression wood, tension wood), spiral growth, growth stresses as well as adaptive growth of trees.

Abstract
The lecture Wood processing conveys knowledge on technological properties of wood and wood-based materials as well as on industrial processes for the fabrication of a vast variety of wood products.

Objective
Learning target is a fundamental understanding of the dominating wood machining processes, which are applied to fabricate common wood products. Students will be introduced to the economic relevance of the renewable resource wood and are trained in its technological properties. The students will learn to identify the relationships between wood species and their properties as well as the suitable machining processes to fabricate targeted wood products.

Content
The general introduction shows the economic relevance of the resource wood in a global, European and Swiss context and reflects aspects of sustainability in wood production and certification. In terms of bulk wood products a specific focus is laid on sawn timber production and drying processes. With regard to wood veneer production, steaming, veneer cutting and assembly to veneer lumber products are presented. Further the common production of particle boards and fibre boards as well as paper will be discussed. In the following, the topics are related to wood gluing and wood protection as well as potentials and limitations in the application of wood and wood-based products. At the end of the lecture an excursion to a Swiss wood manufacturer is planned, in order to facilitate practical experience.

Abstract
Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Objective
An effective and efficient flow of goods, data, and control in and between companies contributes significantly to the value added for the customer. Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Content
Strategic and tactical concepts in logistics, operations, and supply chain management: Conflicts of objectives and strategies and in the entrepreneurial context; business process analysis and fundamental logistics concepts; the MRP II / ERP concept; business processes and methods; the lean / just-in-time and repetitive manufacturing; concepts for product families and one-of-a-kind production; concepts for the process industry.
Lecture notes

This book also serves as textbook for LOS II (spring term) as well as ERP and SCM software systems (autumn term). In addition powerpoint-handouts and documents for case studies.

Sales at 17.9.15, from 12:45, before and during brakes of the first lecture.

see "script"

Literature

Prerequisites / notice

As for the lecture of the 3rd week (BEMAD, a much-liked Business Engineering and Management Ability Development game), this lecture (of Oct. 1) will follow a specific schedule in specific rooms. The schedule will be presented at Sept. 17 during the 1st lecture.

Due to the big number of students, about half of the students will play this game, instead of Oct. 1, at Friday afternoon, Oct. 2. Please be available. Thank you for your help in this matter.

363-0445-02L Logistics, Operations, and Supply Chain Management W I (Additional Cases) 1 credit 2A P. Schönlsb

Abstract

Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Objective

An effective and efficient flow of goods, data, and control in and between companies contributes significantly to the value added for the customer. Students will acquire know-how, from a strategic and tactic viewpoint, to organize and realize operational business processes as well as to plan and control value-added systems, both in an industry and a service industry environment.

Environmental Management

Number Title Type ECTS Hours Lecturers

102-0317-00L Advanced Environmental Assessments W 3 credits 2G S. Helliweg, R. Frischknecht

102-0317-00 Advanced Environmental, Social and Economic Assessments (6KP) and 102-0317-00 Advanced Environmental Assessments (3KP) cannot be chosen both. 102-0317-00 is already included in 102-0307-00.

Abstract

This course deepens students' knowledge of the environmental assessment methodologies and their various applications.

Objective

This course has the aim of deepening students' knowledge of the environmental assessment methodologies and their various applications. In particular, students completing the course should have the

- Ability to judge the scientific quality and reliability of environmental assessment studies, the appropriateness of inventory data and modelling, and the adequacy of life cycle impact assessment methods.
- Knowledge about the current state of the scientific discussion and new research developments
- Ability to properly plan, conduct and interpret environmental assessment studies
- Knowledge of how to use LCA as a decision support tool for companies, public authorities, and consumers

Content

- Inventory developments, transparency, data quality, data completeness, and data exchange formats
- Allocation (multioutput processes and recycling)
- Hybrid LCA methods.
- Consequential and marginal analysis
- Recent development in impact assessment
- Spatial differentiation in Life Cycle Assessment
- Workplace and indoor exposure in Risk and Life Cycle Assessment
- Uncertainty analysis
- Subjectivity in environmental assessments
- Multicriteria analysis
- Case Studies

Lecture notes

No script. Lecture slides and literature will be made available.

Literature

Literature will be made available.

Prerequisites / notice

Basic knowledge of environmental assessment tools is a prerequisite for this class. Students that have not done classwork in this topic before are required to read an appropriate textbook before or at the beginning of this course (e.g. Baumann&Tilman, The Hitch Hiker's Guide to LCA: An Orientation in Life Cycle Assessment Methodology and Applications, Studentlitteratur, Lund, 2004).

102-0317-01L Advanced Environmental Assessment (Computer Lab and Exercises) W 3 credits 2U+2P S. Pfister

102-0317-01 Advanced Environmental Assessments (Exercises) (2KP) and 102-0317-02 Advanced Environmental Assessment (Lab) (2KP) cannot be chosen both. If 102-0307-00 Advanced Environmental, Social and Economic Assessments (6KP) is selected, 102-0317-01 and 102-0317-02 are already included in 102-0307-00.

Abstract

Technical systems are investigated in projects with numerical modeling. The students learn how to answer given questions with target oriented methodologies using various software programs for environmental assessment.

Objective

Become acquainted with various software programs for environmental assessment including Life Cycle Assessment, Environmental Risk Assessment, Probabilistic Modelling, Material Flow Analysis.

Minor in Soil-Plant Relations and Land Use

Number Title Type ECTS Hours Lecturers

701-1681-00L Element Balancing and Soil Functions in Managed Ecosystems W 3 credits 2G A. Keller

Abstract

Applying element balances of agricultural soils and the assessment of soil functions for real applications in computer exercises to design preventive strategies against soil pollution and to support sustainable management of regional agroecosystems also in the context of spatial planning procedures.

Objective

The students learn to critically assess changes in land use management on element cycles in agro-ecosystems and to assess soil services (soil functions). You design solutions for chemical problems in soil protection at the regional scale and learn to assess soil functions using different methods.

Content

The students apply a regional balance model for Swiss regions in computer exercises and assess major soil functions of agricultural soils. You assess the sustainability of current land use and analyse management options improving nutrient and metal cycling in agro-ecosystems. The students will have the opportunity to calculate specific scenarios regarding land use management and environmental changes. Special focus we be paid on the soil services such as regulation-, production function and soil as habitat, and the assessment of these functions based on soil mapping data.

Lecture notes

Literature and Exercises for a case study
Radio-Isotopes in Plant Nutrition

Abstract
The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine element availability. Finally, published studies from other groups will be analyzed and presented by the students.

Objective
At the end of this course the students are familiar with the principles on which radioisotope works are based and they have learned from case studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotope work.

Content
Radioisotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, radionuclides) within a given system and to assess the importance of processes controlling these fluxes (e.g. exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.).

The course will first present the principles and the theoretical framework that underlay the work with radioisotopes. It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g. number and size of compartments). Secondly, case studies on isotopic dilution and tracer work will be presented for instance on the isotopic exchange kinetics method to determine nutrients or pollutants availability. The case studies will be adapted to the ongoing research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.

Lecture notes
Documents will be distributed during the lecture.

Prerequisites / notice
The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at:
http://www.pe.ipw.agri.ethz.ch/about/reach

Biogeochemistry and Sustainable Management

Abstract
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems and their ecosystems develop and evolve over time. The focus will be on the interactions between the land management/farming practices and the biogeochemical cycles of the ecosystems. The students learn how changes in land management and farming practices change the biogeochemical cycles and thereby affect the ecosystem services that are provided by the ecosystem.

Objective
Students study the complex and interacting processes of biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, learn literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small interdisciplinary teams.

Content
Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Lecture notes
Handouts will be available on the webpage of the course.

Rhizosphere Ecology

Abstract
This course emphasizes interactions among physicochemical and biological processes and highlights implications for plant nutrition, growth, and health. Nutrient mobilization and acquisition by plants in response to fertilization, other plants, and microbes, are explored in model systems. Newly gained knowledge is applied to understand results of a pot experiment and thereby critically reflected.

Objective
To gain a holistic understanding of resource-driven and regulatory processes in natural and agronomic plant-microbe-soil systems. To practice activities to read scientific literature, understand it, present it, and discuss it with peers. To combine available and newly acquired knowledge from soil physics, chemistry and (micro)-biology, plant physiology, pathology, and ecology and reflect on their relative importance for plant production, bioremediation, and nature conservation when considered together. To practice manual skills in handling seedlings, soil, plant, and DNA samples, laboratory equipment, and working with different computer software. To make observations, analyse, display, interpret and present own data. To get familiar with (bio-)chemical, molecular genetic, and simple bioinformatics analyses. To prepare as a group of course participants a poster on one selected aspect of a bigger pot experiment, present it, and discuss findings and posters of other course participants. To combine findings with available knowledge, generate explanatory hypotheses, and identify potentially informative further analyses and experiments.

Content
This course comprised lectures, the set-up, harvest and data analysis of an experiment, soil (bio-)chemical, microbiological and molecular genetic analyses in the laboratory and practical computational data analyses. The focus is set on a better understanding of the role played by spatial and temporal physicochemical and microbiological gradients and various soil organisms in plant mineral nutrition. Nutritional interactions between plant roots and microbes, such as the root symbiosis with mycorrhizal fungi and root nodule-inducing bacteria are discussed. Rhizobia are isolated from field-collected root nodules and characterized, using molecular genetic tools. A short introduction into DNA-based bioinformatics and phylogenetic analyses is given to demonstrate how bacterial species are identified and potential host ranges of isolated rhizobia can be inferred, using so-called functional genes. A pot experiment in the glasshouse on cereal-legume mixed intercropping, including effects of pot size, intra- and interspecific plant competition, and root traits, allows to relate scientifically interesting research topics to practical application, while simultaneously stimulating critical reflections.

Lecture notes
Lecture slides and laboratory protocols are being made available in the directory "751-5123-00L Rhizosphere Ecology" of the electronic document exchange platform LIAS, LDA-ELBA:

Arbuscular mycorrhizas in soil nutrient management, e-learning module of Sustainable Plant Systems by Gamper, HA, van der Heijden, MGA, Hofmann, A.: https://www.olat.uzh.ch/olat/auth/1%3A1%3A0%3A0%3A0/

How microbes can feed the world (American Academy of Microbiology) http://academy.asm.org/index.php/browse-all-reports/600-how-microbes-can-help-feed-the-world

Can microbes feed the world? (Society for general microbiology) http://www.sgm.ac.uk/en/publications/microbiology-today/past-issues.cfm/publication/can-microbes-feed-the-world

For students of the Agricultural Sciences of D-USYS: Lectures in Plant Nutrition I and II (Nutrient cycling in agroecosystems by Prof. E. Frossard).
We ask all other course participants to read and understand the e-learning module Plant Nutrition I by Prof. E. Frossard: https://moodle-app2.let.ethz.ch/course/view.php?id=279
This course on Rhizosphere Ecology is complementary to those on Radiisotopes in Plant Nutrition, and Nutrient Fluxes in Soil-Plant Systems. However, a limited number of thematic overlaps cannot be avoided. Particular emphasis is given to the ecophysiology of interacting organisms and detection, enumeration, culturing, and molecular genetic identification of root-associated microbes. A written closed book exam will take place on Friday January 8, 2016, from 10.15-12.15am in Eschikon. Maximum number of participants: 18. Students of the agricultural sciences of D-USYS will be reimbursed for travel expenses upon handover of collected tickets of the public transport systems, excluding the tax zone of the town of Zurich.

103-0317-00L Sustainable Spatial Development I W 3 credits 2G B. Scholl
Only for master students, otherwise a special permisson by the lecturer is required.

Abstract The lectures impart important knowledge for solving spatial relevant conflicts and problems. Case studies will be used to demonstrate the implementation in practice.
Spatial development deals with the development and the design of our living space. To meet the expectations, the interests and the plans of the different actors, it is needed a planning approach considering the overview of both the actual and future situation. The concept of sustainable development in spatial planning leads necessarily to an efficient management of the resources, especially regarding the resource land. The basics of this important discipline will be the subject of this lecture, which is therefore organised in three parts:
- Inner development
- Integrated spatial and infrastructure development
- Cross-border issues in spatial development

## Contents

Tasks of Spatial Planning and development
Issues of local and supra-local interest
Recurring spatial changes, impacts and key figures
Formal and informal instruments and procedures in spatial planning
Spatial Design - Ideas about the future
Reasoning and assessing the situation in spatial planning
Spatial planning as a sequence of decisions and interventions
Process and procedures management
Focus issues - Inner development before external development
Focus issues - Cross-border tasks
Focus Issues - Integrated spatial and infrastructure development

Lecture notes
Further information and the documents for the lecture can be found on the homepage of the Chair of Spatial Development.

The focus will be on the basic principles of biology and ecology of weeds, crop-weed interactions and basic knowledge of chemical, physical and biological weed control with their respective (dis-) advantages. Furthermore students will get an introduction on the mechanisms of weed management in different farming systems and crops.

751-4003-01L  Current Topics in Grassland Sciences (HS)  W  2 credits  2S  N. Buchmann

Abstract
Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Objective
Students will be able to understand and evaluate experimental design and data interpretation of on-going studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

Content
Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Lecture notes
none

Prerequisites / notice
Prerequisites: Basic knowledge of plant ecophysiology, terrestrial ecology and management of agro- and forest ecosystems. Course will be taught in English.

751-4104-00L  Alternative Crops  W  2 credits  2V  A. Walter, B. Büter

Abstract
Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.

Objective
During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

Prerequisites / notice
Students signing up for this class should have a strong interest in tropical agriculture and science communication.

751-5001-00L  Agroecologists without Borders  W  2 credits  2S  C. Decock, A. Hofmann, J. Six

Abstract
In this seminar students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

Objective
(1) Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
(2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
(3) Students articulate complexity and challenges in agricultural development interventions.
(4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

Prerequisites / notice
Students signing up for this class should have a strong interest in tropical agriculture and science communication.

751-5003-00L  Sustainable Agroecosystems II  W  2 credits  2V  J. Six, A. Hofmann

Abstract
This class is intended to convey methods of agroecological research through selected case studies from current research projects and hands-on exercises. Students will gain an overview on actors in the field of sustainable agricultural development.

Objective
(1) Get to know methods for field and laboratory investigations in agroecology, (2) Analyze case studies from current agroecological research, (3) Place institutions and related projects into the context of sustainable agricultural development

Literature

Prerequisites / notice
Prior participation in the lecture Nachhaltige Agrarökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (in spring semester) recommended; classes taught mostly in English

Minor in Environmental, Resource and Food Economics

Number  Title  Type  ECTS  Hours  Lecturers
363-0537-00L  Resource and Environmental Economics  W  3 credits  2G  L. Bretschger, A. Vinogradova

Relationship between economy and environment, market failure, external effects and public goods, contingent valuation, internalisation of externalities; economics of non-renewable resources, economics of renewable resources, cost-benefit analysis, sustainability, and international aspects of resource and environmental economics.
Objective

Understanding of the basic issues and methods in resource and environmental economics; ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

Topics are:
- Introduction to resource and environmental economics
- Importance of resource and environmental economics
- Main issues of resource and environmental economics
- Normative basis
- Utilitarianism
- Fairness according to Rawls
- Economic growth and environment
- Externalities in the environmental sphere
- Governmental internalisation of externalities
- Private internalisation of externalities: the Coase theorem
- Free rider problem and public goods
- Types of public policy
- Efficient level of pollution
- Tax vs. permits
- Command and Control Instruments
- Empirical data on non-renewable natural resources
- Optimal price development: the Hotelling-rule
- Effects of exploration and Backstop-technology
- Effects of different types of markets.
- Biological growth function
- Optimal depletion of renewable resources
- Social inefficiency as result of over-use of open-access resources
- Cost-benefit analysis and the environment
- Measuring environmental benefit
- Measuring costs
- Concept of sustainability
- Technological feasibility
- Conflicts sustainability / optimality
- Indicators of sustainability
- Problem of climate change
- Cost and benefit of climate change
- Climate change as international ecological externality
- International climate policy: Kyoto protocol
- Implementation of the Kyoto protocol in Switzerland

Content

Economy and natural environment, welfare concepts and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

| Objective   | The two objectives of the class are:  
- to provide an overview of the important issues related to food markets and supply chains.  
- to present the economics concepts and tools that are useful to understand the functioning of food supply chains under various governance regimes or policies (emphasis on welfare analysis) |
| Content     | The course is balanced between presentation of economics concepts and illustration by case-studies. The lecture titles include:  
Demand for food.  
Matching demand with supply.  
Industrial organization in the food supply chain.  
Non-quality attributes of food.  
When information is costly.  
Food production and the environment.  
The food sector within human economies.  
In addition, the students collectively identify and address an applied research question. We implement an empirical strategy to tackle the question before results are discussed individually by students during the final written examination. |
| Lecture notes | Lecture notes are made available after each lecture. |
| Literature  | Readings in the standard economics literature include:  

Prerequisites / notice

Students are expected to master basic microeconomics concepts such as demand, supply, or consumer and producer surplus. We will review how to calculate elasticities, tax and quota impacts on prices etc...but the class focuses on applications of these tools rather than on basic understanding. Students are expected to have taken at least one intermediary microeconomics class.

**Abstract**
This course introduces students to foundational texts that led to the emergence of the environment as a subject of scientific importance, and shaped its relevance to society. Above all, the course seeks to give confidence and raise enthusiasm among students to read more widely around the broad subject of environmental sciences and, more specifically, the environmental sciences. Students will gain familiarity with the foundational texts, but also understand the historical context within which their academic and future professional work is based. More directly, the course will encourage debate and discussion of each text that is studied, from both the original context as well as the modern context. In so doing students will be forced to consider and justify the current societal relevance of their work.

**Objective**
The course will provide students with opportunities to read, discuss, evaluate and interpret key texts that have shaped the environmental movement and, more specifically, the environmental sciences. Students will gain familiarity with the foundational texts, but also understand the historical context within which their academic and future professional work is based. More directly, the course will encourage debate and discussion of each text that is studied, from both the original context as well as the modern context. In so doing students will be forced to consider and justify the current societal relevance of their work.

**Content**
The course will be run as a book reading club. The first session will provide a short introduction as to how to explore a particular text (that is not a scientific paper) to identify the key points for discussion.

Thereafter, in each week a text (typically a chapter from a book or a paper) considered to be seminal or foundational will be assigned by a course lecturer. The lecturer will introduce the selected text with a brief background of the historical and cultural context in which it was written, with some additional biographical information about the author. He/she will also briefly explain the justification for selecting the particular text.

The students will read the text, with two to four students (depending on class size) being assigned to present it at the next session. Presentation of the text requires the students to prepare by, for example:
- identifying the key points made within the text
- identifying issues of particular personal interest and resonance
- considering the impact of the text at the time of publication, and its importance now
- evaluating the text from the perspective of our current societal and environmental position

Such preparation would be supported by a mid-week tutorial discussion (about 1 hour) with the assigning lecturer.

These students will then present the text (for about 15 minutes) to the rest of the class during the scheduled class session, with the lecturer facilitating the subsequent class discussion (about 45 minutes). Towards the end of the session the presenting students will summarise the emerging points (5 minutes) and the lecturer will finish with a brief discussion of how valuable and interesting the text was (10 minutes). In the remaining 15 minutes the next text will be presented by the assigning lecturer for the following week.

**Literature**
The specific texts selected for discussion will vary, but examples include:
- Leopold (1949) A Sand County Almanach
- Carson (1962) Silent Spring
- Jared Diamond (2005) Collapse

Discussions might also encompass films or other forms of media and communication about nature.

**Abstract**
The lecture Environmental Mineralogy provides an outline of chemical and physical properties of iron oxides, clays, and carbonates. Analytical methods (XRD, spectroscopy and magnetics) are presented in order to identify and characterize minerals in natural samples as a tool for the reconstruction of weathering in soils, of diagenesis in sediment, and of phase transitions in hydrothermal systems.

**Objective**
Knowledge of the most important minerals (Fe-oxides, carbonates, and sheet silicates) in environmental systems
- Knowing about the technical and analytical tools for the identification and characterization of mineral phases.
- Development of strategies for the analytical handling of multiminerals systems.
- The application of mineralogical informations to solve specific environmental problems.

**Content**
Short introduction to mineral sciences
- Inorganic minerals and biominerals
- Analytical methods for the identification and characterization of minerals
- Weathering & diagenesis and the formation of minerals
- Minerals as environmental indicators (tropical soils and lacustrine sediments as case studies)
- The use of minerals in the environmental management (e.g. controlled landfills)

**Abstract**

In the mandatory internship outside of ETH, the students in Environmental Sciences learn about how environmental issues are handled professionally through their own practical work and by applying the knowledge they acquired. They will analyse complex environmental problems on scientific, technical and social levels and develop solutions in conjunction with social actors.

**Objective**

The students experience political/legal, economic, social and psychological aspects in a professional working environment and acquire key skills such as communication and planning skills, cooperation with non-specialists or recognition of relevant aspects. Further they make useful contacts for starting their careers.

**Content**

This internship takes place outside of ETH. The main locations of an internship are the following:

- environmental consulting firms, planning and engineering offices, industrial and service companies, public administration, environmental organisations (nature conservation and protection, development cooperation).

The internship is a mandatory part of the two-year Master programme and lasts for at least 18 weeks (30 credit points). The internship agreement is a condition for the performance assessment of the internship.

The students look for a placement themselves.

**Lecture notes**

**Prerequisites / notice**

Listed in the Praxisregister are Swiss companies that offer internship to students in Environmental Sciences, some explicitly offer internships in English: [www.intranet.usys.ethz.ch/UMNW/berufspraxis/Praxisregister](http://www.intranet.usys.ethz.ch/UMNW/berufspraxis/Praxisregister)

Current employment opportunities can be found at [www.intranet.usys.ethz.ch/UMNW/stellen-plattform/berufspraxisarbeiten](http://www.intranet.usys.ethz.ch/UMNW/stellen-plattform/berufspraxisarbeiten)

To get an overview, subjects of previous internships can be found at [www.intranet.usys.ethz.ch/UMNW/berufspraxis/Berufspraxisarbeiten](http://www.intranet.usys.ethz.ch/UMNW/berufspraxis/Berufspraxisarbeiten)

If publication is permitted, reports of former internships are available online as PDF-files.

**Abstract**

The course is completed by a Master thesis. This component is designed to enable the students to explore how the course content can be applied to an actual scientific problem. The thesis also provides an opportunity for the students to exercise initiative and to demonstrate that they are capable of working independently and in a scientifically structured manner.

Literature see “Content” Friedhelm Kuypers Physik für Ingenieure und Naturwissenschaftler Band 2 Elektrizität, Optik, Wellen Verlag Wiley-VCH, 2003, Fr. 77.-

Enrolment only for MSc students who need this course as additional admission requirement.

Objective Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of both of these courses.

Content 1. Linear Algebra and Complex Numbers:

- systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.

- review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.

3. Ordinary Differential Equations:

separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

Abstract This course covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems — notably through ordinary differential equations.

2. Single-Variable Calculus:

- Multiple Integrals, line and surface integrals, work and flux, Green, Gauss and Stokes theorems, applications.

- Partial Differential Equations:

separation of variables, Fourier series, heat equation, wave equation, Laplace equation, Fourier transform.

- Thomas, G. B.: Thomas’ Calculus, Parts 1 - Early Transcendentals (Pearson Addison-Wesley).

- Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).

Abstract Continuation of the topics of Mathematics I. Main focus: multivariable calculus and partial differential equations.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of both of these courses.

Content 1. Multiple Integrals:

- multiple integrals, line and surface integrals, work and flux, Green, Gauss and Stokes theorems, applications.

- Partial Differential Equations:

separation of variables, Fourier series, heat equation, wave equation, Laplace equation, Fourier transform.

- Thomas, G. B.: Thomas’ Calculus, Parts 2 (Pearson Addison-Wesley).

Abstract Mathematics I covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems — notably through ordinary differential equations.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of both of these courses.

**Stochastics (Probability and Statistics)**

Enrolment only for MSc students who need this course as additional admission requirement.

**Abstract**
Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

**Objective**
The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

**Content**
From "Statistics for research" (online)
- Ch 1: The Role of Statistics
- Ch 2: Populations, Samples, and Probability Distributions
- Ch 3: Binomial Distributions
- Ch 4: Sampling Distribution of Averages
- Ch 5: Normal Distributions
- Ch 6: Student’s t Distribution
- Ch 7: Distributions of Two Variables

From "Introductory Statistics with R (online)"
- Ch 1: Basics
- Ch 2: The R Environment
- Ch 3: Probability and distributions
- Ch 4: Descriptive statistics and tables
- Ch 5: One- and two-sample tests
- Ch 6: Regression and correlation

**Chemistry I and II**
Enrolment only for MSc students who need this course as additional admission requirement.

**Abstract**
General Chemistry I and II: Chemical bond and molecular structure, chemical thermodynamics, chemical equilibrium, kinetics, acids and bases, electrochemistry

**Objective**
Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

**Content**
1. Stoichiometry
2. Atoms and Elements (Quantenmechanical Model of the Atom)
3. Chemical Bonding
4. Thermodynamics
5. Chemical Kinetics
6. Chemical Equilibrium (Acids and Bases, Solubility Equilibria)
7. Electrochemistry

Enrolment only for MSc students who need this course as additional admission requirement.

Abstract
Basics of structure, formation and function of cells and biomacromolecules, principles of metabolism, as well as basic classical and molecular genetics and evolutionary biology.

This is a virtual self-study lecture for non-german speakers of the *Allgemeine Biology I (551-0001-00L) lecture. The exam will be written jointly with the participants of this lecture.

Objective
The understanding of some basic principles of biology; the hierarchy of the structural levels of biological organisation, with particular emphasis on the cell and its functions, as well as metabolism, inheritance and evolution.

Content
The structure and function of biomacromolecules; basics of metabolism; cell biology; membrane structure and function; basic energetics of cellular processes; respiration, photosynthesis; cell cycle, meiosis and sexual life cycles; Mendelian and molecular genetics; animal reproduction and behavior; sensory and motor mechanisms; population biology and evolution; principles of phylogeny.

The Campbell Chapters 1-4 (10th edition) under the heading ‘The role of chemistry in biology’ are expected. We will treat the following Campbell chapters:

5 Biochemistry  Biological Macromolecules and Lipids
7 Cell biology  Cell Structure and Function
8 Cell biology  Cell Membranes
10 Cell biology  Cellular Respiration: An Introduction to Metabolism
10 Cell biology  Cellular Respiration
11 Cell biology  Photosynthesis
12 Cell Biology  Mitosis
13 The Genetic Basis of Life  Sexual Life Cycles and Meiosis
14 The Genetic Basis of Life  Mendelian Genetics
15 The Genetic Basis of Life  Linkage and Chromosomes
20 The Genetic Basis of Life  The Evolution of Genomes
21 Evolution  How Evolution Works
22 Evolution  Phylogenetic Reconstruction
23 Evolution  Microevolution
24 Evolution  Species and Speciation
25 Evolution  Macroevolution

Lecture notes

Basic general and organic chemistry

701-0023-AAL
Atmosphere
- 3 credits 6R
H. Wernli, T. Peter

Abstract
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Objective
Understanding of basic physical and chemical processes in the atmosphere. Understanding of mechanisms of and interactions between: weather - climate, atmosphere - ocean - continents, troposphere - stratosphere. Understanding of environmentally relevant structures and processes on vastly differing scales. Basis for the modelling of complex interactions in the atmosphere.

Content
Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Lecture notes
Written information will be supplied.

Literature

701-0243-AAL
Biology III: Essentials of Ecology
- 3 credits 6R
J. Levine

Abstract
This course assigns reading for students needing further background for understanding ecological processes. Central problems in ecology, including population growth and dynamics, the dynamics of species interactions, the influence of spatial structure, the controls over species invasions, and community responses to environmental change will be explored from basic and applied perspectives.
Objective

Original language Students will understand how ecological processes operate in natural communities. They will appreciate how mathematical theory, field experimentation, and observational studies combine to generate a predictive science of ecological processes.

Upon completing the course, students will be able to:

Understand the factors determining the outcome of species interactions in communities, and how this information informs management. Apply theoretical knowledge on species interactions to predict the potential outcomes of novel species introductions. Understanding the role of spatial structure in mediating population dynamics and persistence, species interactions, and patterns of species diversity.

Use population and community models to predict the stability of interactions between predators and prey and between different competitors.

Content

Readings from a text book will focus on understanding central processes in community ecology. Topics will include demographic and spatial structure, consumer resource interactions, food webs, competition, invasion, and the maintenance of species diversity. Each of these more conceptual topics will be discussed in concert with their applications to the conservation and management of species and communities in a changing world.

Abstract
This is an introductory course in psychology. This course will emphasize cognitive psychology and the psychological experiment.

Objective
Knowledge of key concepts and exemplary theories of psychology and their relation to "daily" psychology. Comprehension of relation between theory and experiment in psychology.

Goals: Learning how psychologists are thinking, a side change from the ETH natural science perspective to psychological thinking.

Domains of psychology:
- Psychology fields
- Concept definitions of psychology
- Theories of psychology
- Methods of psychology
- Results of psychology

Capability:
Be able to define a psychological research question
Basics understanding of role of psychology

Comprehension:
Psychology as a science of experience and behavior of the human

Content
Einführung in die psychologische Forschung und Modellbildung unter besonderer Berücksichtigung der kognitiven Psychologie und des psychologischen Experiments. Themen sind u.a.: Wahrnehmung; Lernen und Entwicklung; Denken und Problemlösen; Kognitive Sozialpsychologie; Risiko und Entscheidung.

Literature
English book of Zimbardo (http://www.amazon.de/Psychology-Life-Discovering-Psych-Lab/dp/0205654770/ref=sr_1_2?s=books-intl-de&ie=UTF8&qid=1317208260&sr=1-2)

Prerequisites / notice
Determine with Prof. Dr. Michael Siegrist the chapters in "Zimbardo" which are compulsory reading

Read the two Psychology chapters (6 + 7) from the book of Prof. Roland W. Scholz

701-0757-AAL  Principles of Economics  E-  3 credits  6R  R. Schubert
Enrolment only for MSc students who need this course as additional requirement.

Abstract
Students understand basic microeconomics and macroeconomics problems and theories. They are able to argue along economic principles and to judge policy measures.

Objective
Students should be enabled to understand basic microeconomics and macroeconomics problems and theories. They should be able to argue along economic principles and to judge policy measures.

Content
Supply and demand behaviour of firm and households; market equilibrium and taxation; national income and indicators; inflation; unemployment; growth; macroeconomics policies

Lecture notes
available on electronic platform

Literature

Prerequisites / notice

701-1901-AAL  Systems Analysis  E-  3 credits  6R  N. Gruber
Enrolment only for MSc students who need this course as additional requirement.

Abstract
Self study course in Systems Analysis to fulfill requirements for enrollment into the master program. Topics covered include linear box models with one and several variables; non-linear box models with one or several variables; discrete-time models; and continuous models in space and time.

Objective
The aim of this course is to develop an understanding of the dynamical behavior of environmental systems and how this behavior can be captured and understood using mathematical concepts.

Lecture notes
For English Speaking students:
Chapters 12.3, 12.4, 18.2, 21, 22.1 and 22.2

Abstract
This summer school will function as an inter-disciplinary think-tank, exploring the requisites for sustainable urban development in Barranquilla through the lens of architecture, engineering, and environmental sciences. You will be challenged to work in an intensive cross-cultural setting and develop solutions in a complex, real-life context with local practitioners and stakeholders.

Objective
You will receive full support on-site from Universidad del Norte and ETH tutors from your discipline. In developing the scenarios you will work side by side with young professionals with a grounded knowledge of the field, and be joined by a wide variety of local stakeholders.

The program will combine site visits, expert lectures and workshops to allow you to develop the following skills:

The capacity to work to address urban challenges in an inter-disciplinary team

Apply Scenario Analysis technique to structure and integrate knowledge from various fields

Cross cultural understanding and skills in an international collaboration

Mechanisms to collaborate and communicate with practitioners and stakeholders

Understanding of integrated and sustainable urban development

Ability to use stakeholder participation to solve real world problems
Mid-sized cities in Latin America are growing at unprecedented rates. The next decade will be decisive in terms of demographic and economic growth, creating a time window to respond to unprecedented demands on resources, such as land, water and energy.

Are these boomtowns doomed to follow the fate of megacities or will they successfully avoid the pitfalls of rapid urban development? This program is part of a three-year ambitious collaboration with the Inter American Development Bank’s Emerging and Sustainable Cities Initiative and the Swiss Ministry for Economic Cooperation (SECO). It will influence decision makers and engage with real issues.

ETH is teaming up with the leading Universidad del Norte in Colombia to focus on Barranquilla, a rapidly growing city of 1.2 million inhabitants on the Atlantic coast of Colombia. Following a period of decline, vast sums of foreign investment are now flowing into this port city, with the potential to reverse current inequalities and spark more sustainable development.

In a team, you will produce alternative urban scenarios for the redevelopment of Barranquilla’s Central Market. You will contribute your expertise and unpack the realities of sustainable development in a tropical climate. How can knowledge from the ETH be combined with leading Colombian research and translated to a Latin American context? Through debate, controversy and collaboration it is expected you produce scenarios that integrate your different disciplines and question the preconceptions of sustainable urban development.

This immersive summer school will be structured in three interlocking modules:

1. In the first module you will investigate the central market and gain a strong understanding of the social, environmental and built context in Barranquilla. You will employ and combine your varied disciplinary methodologies to gain insight into the sustainability challenges facing the city and the redevelopment of the avenue.

2. In the second module, you will develop a series of scenarios for the central market in Barranquilla, proposing alternatives for its sustainable future. You will build on research from the first module, and explore the potential of your ideas with local stakeholders and professionals from your field. You will document these scenarios using creative and varied representational methods.

3. In the final module you will pitch your scenarios to decision makers. During this high-level event you will measure their preferences, debate the associated trade-offs, and provide a series of orientations for those planning the future of Barranquilla.

Enthusiastic students currently enrolled in a masters program in ETH Zurich and Universidad del Norte, Barranquilla Colombia. A balanced group of 12 ETH master students from the D-ARCH, D-USYS and D-BAUG departments will be selected. They will be joined by 12 Colombian students from our partner university in Barranquilla, Universidad del Norte.

Applicants should have a strong interest in sustainable urban development and transdisciplinary collaborative research. They should be able to demonstrate their academic strength, motivation, interest and expertise. Knowledge of Spanish is welcomed but not obligatory.

ETH participants will be charged a fee of 300 CHF to cover local activities, travel and accommodation.

Students will be responsible for organising visa, health insurance, and transportation to and from Barranquilla. Flights to Barranquilla from Zurich cost approximately 1700 CHF. Additional travel grants are available for ETH students.

Applications can be submitted including curriculum vitae, portfolio where relevant and letter of motivation as portable document format (pdf) by May 30th, 17:00 CET to hertzog@usys.ethz.h

### Abstract
This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering.

### Objective
Introduction to HPC for scientists and engineers

**Fundamental of:**
1. Parallel Computing Architectures
2. MultiCores
3. ManyCores

### Content

#### Programming models and languages:
1. C++ threading (2 weeks)
2. OpenMP (4 weeks)
3. MPI (5 weeks)

#### Computers and methods:
1. Hardware and architectures
2. Libraries
3. Particles: N-body solvers
4. Fields: PDEs
5. Stochastics: Monte Carlo

### Abstract
The course provides an introduction to theoretical foundations and practical usage of the Lattice Boltzmann Method for fluid dynamics simulations.

### Objective
Methods like molecular dynamics, DSMC, lattice Boltzmann etc are being increasingly used by engineers all over and these methods require knowledge of kinetic theory and statistical mechanics which are traditionally not taught at engineering departments. The goal of this course is to give an introduction to ideas of kinetic theory and non-equilibrium thermodynamics with a focus on developing simulation algorithms and their realizations.

During the course, students will be able to develop a lattice Boltzmann code on their own. Practical issues about implementation and performance on parallel machines will be demonstrated hands on.

Central element of the course is the completion of a lattice Boltzmann code (using the framework specifically designed for this course).

The course will also include a review of topics of current interest in various fields of fluid dynamics, such as multiphase flows, reactive flows, microflows among others.

Optionally, we offer an opportunity to complete a project of student's choice as an alternative to the oral exam. Samples of projects completed by previous students will be made available.

### Content
The course builds upon three parts:

I. Elementary kinetic theory and lattice Boltzmann simulations introduced on simple examples.
II. Theoretical basis of statistical mechanics and kinetic equations.
III. Lattice Boltzmann method for real-world applications.

The content of the course includes:

1. Background: Elements of statistical mechanics and kinetic theory:
   - Particle's distribution function, Liouville equation, entropy, ensembles;
   - Kinetic theory: Boltzmann equation for rarefied gas, H-theorem, hydrodynamic limit and derivation of Navier-Stokes equations, Chapman-Enskog method, Grad method, boundary conditions; mean-field interactions, Vlasov equation;
   - Kinetic models: BGK model, generalized BGK model for mixtures, chemical reactions and other fluids.

2. Basics of the Lattice Boltzmann Method and Simulations:
   - Minimal kinetic models: lattice Boltzmann method for single-component fluid, discretization of velocity space, time-space discretization, boundary conditions, forcing, thermal models, mixtures.

3. Hands on:
   - Development of the basic lattice Boltzmann code and its validation on standard benchmarks (Taylor-Green vortex, lid-driven cavity flow etc);

4. Practical issues of LBM for fluid dynamics simulations:
   - Lattice Boltzmann simulations of turbulent flows;
   - numerical stability and accuracy.

5. Microflow:
   - Rarefaction effects in moderately dilute gases; Boundary conditions, exact solutions to Couette and Poiseuille flows; micro-channel simulations.

6. Advanced lattice Boltzmann methods:
   - Entropic lattice Boltzmann scheme, subgrid simulations at high Reynolds numbers; Boundary conditions for complex geometries.

7. Introduction to LB models beyond hydrodynamics:
   - Relativistic fluid dynamics; flows with phase transitions.

### Prerequisites / notice
The course addresses mainly graduate students (MSc/Ph D) but BSc students can also attend.
The students should become familiar with the fundamentals and with application examples of chemically reactive processes in energy conversion (combustion engines in particular) as well as the synthesis of new materials.

Objective
The students should become familiar with the fundamentals and with application examples of chemically reactive processes in energy conversion (combustion engines in particular) as well as the synthesis of new materials. The lecture is part of the focus "Energy, Flows & Processes" on the Bachelor level and is recommended as a basis for a future Master in the area of energy. It is also a facultative lecture on Master level in Energy Science and Technology and Process Engineering.

Content

Lecture notes
HANDBOUTS are EXCLUSIVELY IN GERMAN ONLY; however recommendations for English text books will be provided.

Literature
TEACHING LANGUAGE IN CLASS is German OR English (ON DEMAND).

**151-0911-00L Introduction to Plasmonics**

**Abstract**
This course provides fundamental knowledge of surface plasmon polaritons and discusses their applications in plasmonics.

**Objective**
Electromagnetic oscillations known as surface plasmon polaritons have many unique properties that are useful across a broad set of applications in biology, chemistry, physics, and optics. The field of plasmonics has arisen to understand the behavior of surface plasmon polaritons and to develop applications in areas such as catalysis, imaging, photovoltaics, and sensing. In particular, metallic nanoparticles and patterned metallic interfaces have been developed to utilize plasmonic resonances. The aim of this course is to provide the basic knowledge to understand and apply the principles of plasmonics. The course will strive to be approachable to students from a diverse set of science and engineering backgrounds.

**Content**
Fundamentals of Plasmonics
- Basic electromagnetic theory
- Optical properties of metals
- Surface plasmon polaritons on surfaces
- Surface plasmon polariton propagation
- Localized surface plasmons
Applications of Plasmonics
- Waveguides
- Extraordinary optical transmission
- Enhanced spectroscopy
- Sensing
- Metamaterials

**Lecture notes**
Class notes and handouts

**Literature**

**Prerequisites / notice**
Physics I, Physics II

**151-0917-00L Mass Transfer**

**Abstract**
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

**Objective**
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore the application of these principles to important engineering problems is demonstrated.

**Content**
Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Reynolds- and Chilton-Colburn analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogenous and heterogenous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogenous reaction. Applications.

**Lecture notes**

**Literature**

**Prerequisites / notice**
Three tests are offered for practicing the course material. Participation is voluntary.

**151-0927-00L Rate-Controlled Separations in Fine Chemistry**

**Abstract**
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life sciences in particular, fine chemistry and biotechnology.

**Objective**
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life sciences in particular, fine chemistry and biotechnology.

**Content**
The class covers separation techniques that are central in the purification and downstream processing of chemicals and biopharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Liquid-liquid extraction; 2) Adsorption and chromatography; 3) Membrane processes; 4) Crystallization and precipitation.

**Lecture notes**
Handouts during the class

**Literature**
Recommendations for text books will be covered in the class

**Prerequisites / notice**
Requirements: Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

**151-0951-00L Process Design and Safety**

**Abstract**
Process design and safety deals with the fundamentals of process apparatus, plant design and safety. The goal of the lecture is to expound design characteristics of systems for process engineering applications.
Content
Fundamentals of plant and apparatus design; materials in the process industries, mechanical design and design rules of main components; pumps and fans; piping and armatures, safety in process industry

Lecture notes
Script is available, English slides will be distributed

Literature

---

Practica in Process Engineering I
Prerequisites: “Einführung in Verfahrenstechnik” (151-0973-00L) and further process engineering courses.

Abstract
Practical training at pilot facilities for fundamental processing steps, typical laboratory and pilot facility experiments.

Objective
Getting acquainted with unit operations, measuring tools and data processing

Content
6 practica in total (2 from Prof. Norris, 4 from Prof. Rudolf von Rohr), details on dates are available at the beginning of the semester in ML H 14 and on our website

Mixing in Batch reactors
Rudolf von Rohr

Heat transfer
Rudolf von Rohr

Thin film evaporator
Rudolf von Rohr

Residence time distribution
Rudolf von Rohr

Process Simulation and Flowsheeting
W 7 credits 3G E. Capón García, K. Hungerbühler

Overview of process simulation and flowsheeting
- Definition and fundamentals
- Classification: stationary (steady-state) versus dynamic (transient state) systems
- Fields of application
- Case studies

Process modeling
- Modeling strategies of process systems
- Mass conservation
- Species balance
- Energy conservation
- Momentum balance
- Multiphase-systems: equilibrium & non-equilibrium models
- Process system model

Process simulation
- Process specification
- Introduction to process specification
- Classification of mathematical models: AMS, DOE, DAE, PDE
- Model validation
- Software tools
- Solution methods for process flowsheeting
- Simultaneous methods
- Sequential methods
- Dynamic simulation
- Numerical solution: explicit and implicit methods
- Continuous-discrete simulation: handling of discontinuities

Process optimization and analysis
- Classification of optimization problems
- Linear programming
- Non-linear programming
- Dynamic programming
- Optimization methods in process flowsheeting
- Sequential methods
- Simultaneous methods

Commercial software for simulation: Aspen Plus
- Thermodynamic property methods
- Reaction and reactors
- Separation / columns
- Convergence & debugging
The course will teach fundamental concepts of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in engineering and life sciences. Exploitation of massively parallel computing is becoming important with the increased computational demand in the field of high performance computing, software tools, and HPC clusters. Students will be exposed to a variety of high-throughput computational methods and tools for the analysis and quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. The course aims at equipping students with the necessary skills to perform quantitative uncertainty analysis for the design and operation of industrial and biomedical systems. Successful students will be able to select for a given biotechnological product a suitable set of purification operations and judge on process economy.

**Literature**

An exemplary literature list is provided below:

**Prerequisites / notice**

A basic understanding of material and energy balances, thermodynamic property methods and typical unit operations (e.g., reactors, flash separations, distillation/absorption columns etc.) is required.

---

### 636-0001-00L Separations in Biotechnology and Bioprocess Economy

#### Abstract

Separations play an integral part of any biotechnological process. This course aims at enabling students specifically with a chemistry/biology background to select and roughly design suitable separation processes for typical biotechnological products such as monoclonal antibodies, antibiotics, and fine chemicals and at providing a basic set of purification operations & judge on process economy.

#### Objective

Students should be able to select for a given biotechnological product a suitable set of purification operations and judge on process economy.

#### Content

- Introduction
- Membrane operations
- Adsorption and chromatography
- Crystallization
- Overall process economics

#### Handouts during course

- Copies of the slides presented.

---

### 626-0007-00L Microbial Biotechnology Economy

#### Abstract

Introduction into the field of microbial biotechnology, covering possible products, fermentation and downstream technology.

#### Objective

The student should be able to identify opportunities for microbial bioprocesses and to go through basic and advanced design procedures for microbial bioprocesses.

#### Content

- Students will obtain a thorough overview over microbial biotech products and the elements of bioprocess design: cellular growth and its modelling; mass transfer in fermentation; bioreactor engineering; bioreactors; downstream processing

#### Handout in class

- Handout: Microbial Biotechnology

---

### 151-0185-00L Radiation Heat Transfer Economy

#### Abstract

Advanced course in radiation heat transfer

#### Objective

Fundamentals of radiative heat transfer for high-temperature applications. Examples are combustion and solar thermal/thermochemical processes, and other applications in the field of energy conversion and material processing.

#### Content

#### Literature

---

### 151-0104-00L Uncertainty Quantification for Engineering & Life Sciences Economy

#### Abstract

Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

#### Objective

The course will teach fundamental concepts of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

#### Content

- Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.
- The course will largely be based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

#### Literature

1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes
3. Class Notes

---

### 151-0509-00L Microscale Acoustofluidics Economy

#### Abstract

In this lecture the basics as well as practical aspects (from modelling to design and fabrication ) are described from a solid and fluid mechanics perspective with applications to microsystems and lab on a chip devices.

#### Objective

Understanding acoustophoresis, the design of devices and potential applications

#### Content

- Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity, Gorkov potential, numerical modelling, acoustic streaming, applications from ultrasonic microfluidics to surface acoustic wave devices

#### Literature

---

Abstract
The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program. Tutors propose the subject of the project, elaborate the project plan, and define the roadmap together with their students, as well as monitor the overall execution.

Objective
The semester project is designed to train the students in the solution of specific engineering problems. This makes use of the technical and social skills acquired during the master's program.

Abstract
The main objective of the 12-week internship is to expose master's students to the industrial work environment. During this period, students have the opportunity to be involved in on-going projects at the host institution.

Objective
The main objective of the 12-week internship is to expose master's students to the industrial work environment.

Compulsory Electives in Humanities, Social and Political Sciences

Recommended GESS compulsory elective courses (Type B) for D-MAVT.

Abstract
Master's programs are concluded by the master's thesis. The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem. The subject of the master's thesis, as well as the project plan and roadmap, are proposed by the tutor and further elaborated with the student.

Objective
The thesis is aimed at enhancing the student's capability to work independently toward the solution of a theoretical or applied problem.

Abstract
Current topics in Biomedical Engineering presented by speakers from academia and industry. Getting insight into actual areas and problems of Biomedical Engineering an Health Care.
The goal of the lecture is to convey a basic knowledge in the area of FV materials as well as their construction and production processes and to empower the students to apply the knowledge gained to address current problems in research and practice. Students attend and give research presentations for the research they plan to do and at the end of the semester they defend their results and answer questions from research scientists. Familiarize the students with the latest in this field.

**Objective**

Students attend and give research presentations for the research they plan to do and at the end of the semester they defend their results and answer questions from research scientists. Familiarize the students with the latest in this field.

**Abstract**

Research colloquium

**Objective**

See how statistical methods are applied in practice.

**Content**

There will be about 5 talks on how statistical methods are applied in practice.

**Prerequisites / notice**

This is no lecture. There is no exam and no credit points will be awarded. The current program can be found on the web: http://stat.ethz.ch/events/zukost

Course language is English or German and may depend on the speaker.
