The first semester focuses on the organismal biology aspects of genetics, evolution and diversity of life in the Campbell chapters 12-34.

Week 1-7 by Alex Widmer, Chapters 12-25
12 Cell biology Mitosis
13 Genetics Sexual life cycles and meiosis
14 Genetics Mendelian genetics
15 Genetics Linkage and chromosomes
20 Genetics Evolution of genomes
21 Evolution How evolution works
22 Evolution Phylogenetic reconstructions
23 Evolution Microevolution
24 Evolution Species and specialization
25 Evolution Macroevolution

Week 8-14 by Oliver Martin, Chapters 26-34
26 Diversity of Life Introduction to viruses
27 Diversity of Life Prokaryotes
28 Diversity of Life Origin & evolution of eukaryotes
29 Diversity of Life Nonvascular&seedless vascular plants
30 Diversity of Life Seed plants
31 Diversity of Life Introduction to fungi
32 Diversity of Life Overview of animal diversity
33 Diversity of Life Introduction to invertebrates
34 Diversity of Life Origin & evolution of vertebrates

The lecture is the first in a series of two lectures given over two semesters for students with biology as a basic subject.

Abstract:

- **Biology III: Essentials of Ecology**
  This lecture presents an introduction to ecology. It includes basic ecological concepts and the most important levels of complexity in ecological research. Ecological concepts are exemplified by using aquatic and terrestrial systems; corresponding methodological approaches are demonstrated. In a more applied part of the lecture threats to biodiversity and the appropriate management are discussed.

- **Environmental Systems I**
  The lecture provides a science-based exploration of environmental aspects from three research fields: earth, climate, and health sciences. The students are able to explain important properties of the three environmental systems, to discuss critical drivers, trends and conflicts of their use, and to compare potential solutions.

- **Principles of Economics**
  This course covers the bases for understanding micro- and macroeconomic issues and theories. Participants are given the tools to argue in economic and political terms and to evaluate the corresponding measures. Group and individual exercises deepen the knowledge gained.

Objective:

- **Biology III: Essentials of Ecology**
  The objective of this lecture is to teach basic ecological concepts and the different levels of complexity in ecological research: the individual, the population, the community and the ecosystem level. The students should learn ecological concepts at these different levels in the context of concrete examples from terrestrial and aquatic ecology. Corresponding methods for studying the systems will be presented.

- **Environmental Systems I**
  A further aim of the lecture is that students achieve an understanding of biodiversity, why it is threatened and how it can be managed.

- **Principles of Economics**
  Students are able to
  - describe fundamental micro- and macroeconomic issues and theories.
  - apply suitable economic arguments to a given theme.
  - evaluate economic measures.

Content:

- **Biology III: Essentials of Ecology**
  - Einfluss von Umweltfaktoren (Temperatur, Strahlung, Wasser, Nährstoffe etc.) auf Organismen; Anpassung an bestimmte Umweltbedingungen
  - Populationsdynamik: Ursachen, Beschreibung, Vorhersage und Regulation
  - Interaktionen zwischen Arten (Konkurrenz, Koexistenz, Prädation, Parasitismus, Nahrungsnetze)
  - Lebensgemeinschaften: Struktur, Stabilität, Sukzession
  - Ökosysteme: Kompartimente, Stoff- und Energieflusse
  - Biodiversität: Variation, Ursachen, Gefährdung und Erhaltung
  - Aktuelle Naturschutzprobleme und -massnahmen
  - Evolutionäre Ökologie: Methodik, Spezialisierung, Koevolution

- **Environmental Systems I**
  - Overview of aquatic and terrestrial environments with their inhabitants

- **Principles of Economics**
  Supply and demand behaviour of firm and households; market equilibrium and taxation; national income and indicators; inflation; unemployment; growth; macroeconomic policies

Lecture notes:

- **Biology III: Essentials of Ecology**
  Unterlagen, Vorlesungsspreiten und relevante Literatur sind in der Lehrdokumentenablage abrufbar. Die Unterlagen für die nächste Vorlesung stehen jeweils spätestens am Freitagmorgen zur Verfügung.

- **Environmental Systems I**

- **Principles of Economics**
World Food System

The classification and analysis of natural and artificial compounds is a key subject of this course. It aims to equip students with the knowledge to comprehend the complex global food system (WFS) and its implications on global food security. The course will explore the dynamics of the WFS, addressing the four pillars of global food security: food production and processing, food access, food use, and food sustainability. It will be taught in German, with English as the primary language of instruction.

### Objective

Attending this course, the students will recognize the elements of the World Food System (WFS) approach and the problems it is supposed to treat. They will especially comprehend the four pillars of global food security, namely (I) food availability (including sustainable production and processing), (II) access to food (physical and monetary), (III) food use (including quality and safety as well as the impact on human health and well-being), and (IV) resilience to the boundary conditions (environmental, economic, and political). This insight will make them aware of the global driving forces behind our ETH research on food security and is expected to alleviate motivation and understanding for the association of subsequent specific courses within a general context. The course equivalently implements agricultural and food sciences, thus supporting the interdisciplinary view on the WFS scope.

### Content

Case studies on certain foods of plant and animal origin serve to demonstrate the entire food value chain from the production of raw material to processed food and its corresponding aspects for developed and developing countries. Emerging and developing countries are demonstrated, by use of engineering as well as natural and social science approaches.

### Lecture notes

Handouts and links are provided online.

### Prerequisites/notice

The course shall particularly elucidate the cross section of Agro- and Food Sciences in the context of important global problems to be solved. Furthermore, the students in the first year of studies shall be given some insight and outlook supporting the development of their views and interests in agricultural and food sciences further.

The course is part of the block exam after the first study year. Paper copies can be used ("Open Book") during the on-line exam, but no other means are not allowed. The course is taught in German.

### Additional First Year Courses

#### Course: Elementary Chemical Techniques

This course provides an overview of experimental chemical methods. The experiments cover a wide range of techniques, including analytical and synthetic techniques (e.g., investigation of soil and water samples or the preparation of simple compounds). Furthermore, the handling of gaseous substances is practised.

### Objective

The classification and analysis of natural and artificial compounds is a key subject of this course. It provides an introduction to elementary laboratory techniques, and the experiments cover a wide range of analytic and synthetic tasks.

- Selected samples (e.g., soil and water) will be analysed with various methods, such as titrations, spectrophotometry, or ion chromatography. The chemistry of aqueous solutions (acid-base equilibria and solvation or precipitation processes) is studied.
- The synthesis of simple inorganic complexes or organic molecules is practised.
- Furthermore, the preparation and handling of environmentally relevant gaseous species like carbon dioxide or nitrogen oxides is a central subject of the Praktikum.

### Literature

- Gerhard Wanner: Mikroskopisch-Botanisches Praktikum, Georg Thieme Verlag, Stuttgart.
- Anatomical adaptations to different environments.
- Special features of plant cells: Plastids, vacuole, cell wall. Anatomy of seed plants: From cells to organs. Anatomy and function of various plant tissues (epidermis, vascular tissue, wood, etc.).

### Prerequisites/notice

Groups of a maximum of 25 students.
This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

701-0071-00L | Mathematics III: Systems Analysis | O | 4 | 2V+1U | N. Gruber, D. Byrne |
| Abstract  | The objective of the systems analysis course is to deepen and illustrate the mathematical concepts on the basis of a series of very concrete examples. Topics covered include: linear box models with one or several variables, non-linear box models with one or several variables, time-discrete models, and continuous models in time and space. |
| Objective | Learning and applying of concepts (models) and quantitative methods to address concrete problems of environmental relevance. Understanding and applying the systems-analytic approach, i.e., Recognizing the core of the problem - simplification - quantitative approach - prediction. |
| Content   | http://www.up.ethz.ch/education/systems-analysis.html |
| Lecture notes | Overhead slides will be made available through Ilias. |

701-0255-00L | Biochemistry | O | 2 | 2V | H.-P. Kohler |
| Abstract  | Building on the biology courses in the 1st and 2nd semesters, this course covers basic biochemical knowledge in the areas of enzymology and metabolism. Those completing the course are able to describe and understand fundamental cellular metabolic processes. |
| Objective | Students are able to understand - the structure and function of biological macromolecules - the kinetic bases of enzyme reactions - thermodynamic and mechanistic basics of relevant metabolic processes Students are able to describe the relevant metabolic reactions in detail |
Content
Introduction, basics, composition of cells, biochemical units, repetition of relevant organic chemistry
Structure and function of proteins
Carbohydrates
Lipids an biological membranes
Enzymes and enzyme kinetics
Catalytic strategies
Metabolism: Basic concepts and design. Repetition of basic thermodynamics
Glycolysis, fermentation
The citric acid cycle
Oxidative phosphorylation
Fatty acid metabolism

Lecture notes
Horton et al. (Pearson) serves as lecture notes.

Prerequisites /
Basic knowledge in biology and chemistry is a precondition.

701-0501-00L  Pedosphere  O  3 credits  2V  R. Kretzschmar
Abstract
Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

Objective
Introduction to the formation and properties of soils as a function of parent rock, landscape position, climate, and soil organisms. Complex relationships between soil forming processes, physical and chemical soil properties, soil biota, and ecological soil properties are explained and illustrated by numerous examples.

Content
Definition of the pedosphere, soil functions, rocks as parent materials, minerals and weathering, soil organisms, soil organic matter, physical soil properties and functions, chemical soil properties and functions, soil formation, principles of soil classification, global soil regions, soil fertility, land use and soil degradation.

Prerequisites /
Prerequisites: Basic knowledge in chemistry, biology and geology.

752-6003-00L  Introduction to Nutritional Science  O  2 credits  1.5V  M. B. Zimmermann, C. Wolfrum
Abstract
This course introduces basic concepts of micro- and macronutrient nutrition. Micronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fat and carbohydrates.

Objective
To introduce the students to the both the macro- and the micronutrients.

Content
The lectures on micronutrients are given by Prof. Zimmermann and the lectures on macronutrients are given by Prof. Wolfrum. Prof. Zimmermann discusses the micronutrients, including fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. Prof. Wolfrum introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism.

Literature

751-1101-00L  Finances and Accounting System  O  2 credits  2G  M. Dumondel
Abstract
To understand accounting as a component of the complex system of the enterprise

Objective
To understand accounting not as an isolated discipline, but as a part of the complex system of the enterprise

Content
Accounting system as a part of management economics.

The different steps for scheduling and evaluation of the accountancy will be studied. The main part of the lecture is dedicated to the financial accounting nevertheless the fundamentals of the internal cost-accounting will also be presented. The lecture will also include the clarification of concrete cases and the calculation of practical exercises.

Literature
Course documentation and specified educational books

751-1551-00L  Ressourcen- und Umweltökonomie  O  3 credits  2V  L. Breitschger, A. Müller
Abstract
Relationship between economy and environment, market failure, external effects and public goods, contingent valuation, internalisation of externalities; economics of non-renewable resources, economics of renewable resources, cost-benefit analysis, sustainability, and international aspects of resource and environmental economics.
Objective: Understanding of the basic issues and methods in resource and environmental economics; ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

Topics are:
- Introduction to resource and environmental economics
- Importance of resource and environmental economics
- Main issues of resource and environmental economics
- Normative basis
- Utilitarianism
- Fairness according to Rawls
- Economic growth and environment
- Externalities in the environmental sphere
- Governmental internalisation of externalities
- Private internalisation of externalities: the Coase theorem
- Free rider problem and public goods

Types of public policy:
- Efficient level of pollution
- Tax vs. permits
- Command and Control Instruments

Empirical data on non-renewable natural resources
- Optimal price development: the Hotelling-rule
- Effects of exploration and Backstop-technology
- Effects of different types of markets.
- Biological growth function
- Optimal depletion of renewable resources
- Social inefficiency as result of over-use of open-access resources
- Cost-benefit analysis and the environment
- Measuring environmental benefit
- Measuring costs
- Concept of sustainability
- Technological feasibility
- Conflicts sustainability / optimality
- Indicators of sustainability
- Problem of climate change
- Cost and benefit of climate change
- Climate change as an international ecological externality
- International climate policy: Kyoto protocol
- Implementation of the Kyoto protocol in Switzerland

Content:
- Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

Lecture notes: The script and lecture material are provided at: https://moodle-app2.let.ethz.ch/course/view.php?id=140

Abstract:

#### Plant Nutrition I

The aim of these lectures is to present the processes controlling the uptake and transport of nutrients and water by the plant, the assimilation of nutrients in the plant, the effect of nutrients on crop yield and quality, the role of the soil as a source of nutrients for crops, and the basic principles of fertilization of different crop types using mineral and organic fertilizers.

Objective:

At the end of the lecture, students know how mineral nutrients and water are taken up through roots and circulate in the plants and what their roles in plants are. They understand the importance of nutrients for yield formation and for crop product quality. They are able to propose fertilization plans adapted for field crops growing under Swiss conditions.

Content:

A general introduction explains the needs of appropriately managing nutrients in plant production. Afterwards, we will study the physiology of plant nutrition (nutrient uptake by roots; water and nutrient transports in the plant; physiological roles of nutrients in the plant). Then the role of nutrients for yield formation and their effects on crop quality is dealt with. Finally, the bases of crop fertilization are taught (availability of nutrient in soil; N, P and K fertilization; different types of fertilizers).

Lecture notes:

We will distribute a script for the part dealing with the physiology of plant nutrition. For the part on fertilization we will use the booklet of ACW and ART presenting the recommendations for the fertilization of crops and grassland in Switzerland (GRUDAF/DBF).

Literature:

- Schubert S 2006 Pflanzenernährung Grundwissen Bachelor Ulmer UTB
  http://www.tll.de/visuplant/vp_idx.htm
At the end of this course in Applied Entomology, students will have (1) an overview on herbivore insects (pests) and their natural antagonists in agroecosystems, combined with an insight into ongoing research, and (2) an in-depth understanding of population dynamics and damage development based on selected examples from the areas of plant, animal and public health.

**Objective**

The student gets an overview over Area Planning in Switzerland with legal aspects, instruments and the actual state of the art. Awareness rising for complex regional planning and developing questions. Introduction in regional development and politics, based on existing and future regulations and their effects on different political levels.

**Content**

Area Planning:
- Basics of area planning
- Overview over existing regulations in Switzerland
- State of the art in Switzerland
- Links between area planning and environmental protection

regional development:
- Basics for a successful regional development based on personal field experience
- Discussion of the different instruments
- Stake holders and their role in regional politics
- Case studies for developing strategies (in small study groups)

**Prerequisites / notice**

German spoken (with translation of french and italian technical terms)

**Agricultural and Natural Sciences**

1 credit

**Focus Agricultural Natural Sciences**

**5. Semester**

**Focus Agricultural Natural Sciences**
This course is an introduction into forage cropping and grassland sciences. Topics include: extensive/intensive use, grassland evaluation, grassland maintenance, management using fertilization, cutting, etc. Relationships between site, vegetation composition and management will be explored.

Die Studierenden werden verschiedenen Methoden und Pflanzenmengen in mitteleuropäischen Graslandökosystemen kennengelernt, kausal und aktuelle Arbeiten der Bestandesökologie kennen, in der Lage sein, den Einfluss von Umweltfaktoren und Bewirtschaftung nicht nur auf Einzelpflanzen, sondern auf Pflanzengesellschaften und die Erträge abzuschätzen, und ein wissenschaftliches Thema schriftlich prägnant zusammenzufassen.

In diesem Kurs werden die verschiedenen Typen des Futterbaus und die wichtigsten Mischungen, aber auch natürliche Pflanzenmengen in Mitteleuropa vorgestellt (Bestandesbeurteilung). Basiierend auf der Ökophysiologie von Einzelarten wird die Ökophysiologie von Pflanzenbeständen erarbeitet. Es werden verschiedene Arten der Bewirtschaftung vorgestellt (z. B. Bestandeslenkung durch Düngung, Beweidung, Schnitterminen, etc.) und ihre Auswirkungen auf die Bestandeszusammensetzung und auf die Erträge diskutiert. Feedback-Mechanismen zwischen Umwelt und Futterbausystemen werden angesprochen.

Handouts werden auf dem Netz zur Verfügung gestellt.

In this course, students acquire essential knowledge on agriculturally relevant aspects of crop biology. Via lectures and hands-on teaching elements, differences between species as well as common aspects of different species will be experienced. Thereby, the foundation will be laid for a more intense examination of alternative crops, cropping systems and of procedures to characterize geno- and phenotype.

Overview on horticulture (international and national), insights into principles of practical fruit production (pre- and post-harvest), viticulture (incl. some hints on wine making), berry production and vegetable production in Switzerland.

The relevance of horticulture at the international level will be treated in the first block.

During the semester in autumn (Horticultural Crops I), post harvest aspects in fruit production are discussed in 2 blocks of 4h. Following on this, viticulture (incl. some aspects of wine making) will be looked at in 3 blocks of 4h. During the spring semester (Horticultural Crops II), 3 blocks of 4h deal with vegetable production, and 2 blocks of 4h are addressing berry production.

Presentations of the central crops of our regions (cereals, oil and fibre plants, legumes, root and tuber plants) with respect to their biology, site requirements, reaction to environmental conditions and farming practice. A few crops of other regions will be discussed for these aspects as well.

The students get an introduction on the mechanisms of weed management in different farming systems and crops.

The relevance of horticulture at the international level will be treated in the first block.

Handouts will be provided by each lecturer when starting his part of the lecture.

Course will be given in German. Course builds on the Ertrags- und Ökophysiologie lecture and provides the basics for the Graslandsysteme.

The basics of planning of feeding and formulation of diets incl. the implications on nutrient cycles and balances are taught. In the part dealing with ruminants, forage-based diets and the application of feed formulation programs are central and exercised on-farm. With pigs and poultry, the basics of energy and nutrient requirements are deepened through practical examples.

The focus will be on the basic principles of biology and ecology of weeds, crop-weed interactions and basic knowledge of chemical, physical and biological weed control with their respective (dis-) advantages. Furthermore students will get an introduction on the mechanisms of weed management in different farming systems and crops.

The focus is on the potential to assess strategies and tactics of pest management, taking into account the demands from the economy, the environment and the society. Significant agricultural approaches will be explained using practical examples, including prevention using natural resources, surveillance and forecasting, resistance management, as well as product registration, incl. ecotoxicology.

The students get an introduction on the mechanisms of weed management in different farming systems and crops.

The basics of planning of feeding and formulation of diets incl. the implications on nutrient cycles and balances are taught. In the part dealing with ruminants, forage-based diets and the application of feed formulation programs are central and exercised on-farm. With pigs and poultry, the basics of energy and nutrient requirements are deepened through practical examples.

The basics of planning of feeding and formulation of diets incl. the implications on nutrient cycles and balances are taught. In the part dealing with ruminants, forage-based diets and the application of feed formulation programs are central and exercised on-farm. With pigs and poultry, the basics of energy and nutrient requirements are deepened through practical examples.

Language and script: German or French, maybe selected parts in English.
The knowledge of the nutrition of ruminants and of the feeds used is deepened. Particular emphasis is put on the variety of home-grown feeds, their production and conservation and their application in the nutrition of dairy cows, cattle and small ruminants. Finally, information on specific problems of animal nutrition is communicated.

Purchase of basic skills in agricultural livestock nutrition.

Script is available in German language and will be provided by each lecturer when starting his part the lecture.

Eine Literaturliste ist im Skript enthalten.

Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1
No Lecture: First day of autumn semester

Week 2
The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nematode attack strategies and types of damage.

Week 3

Week 4

Week 5
Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6
Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7
Pisatin and pisatin demethylase. Local and systemic acquired resistance, signal molecules.

Week 8
Pathogen effects on food quality and safety.

Week 9
Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 10
Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11
Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELISA, PCR, rDNA and rep-PCR.

Week 12
Strategies for minimizing disease risks: principles of disease control and management.

Week 13
Disease control strategies: economic thresholds, physical control methods.

Week 14
Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.
Learn and exercise strategic concepts in the Agri-Food chain, i.e. theories of economics based decision making combined with entrepreneurial practice.

**Objective**
The main objective is to understand strategic decisions along the value chain in the Agri-Food Chain.

**Content**
- Basics of strategy & strategic concepts
- Classic process of strategy process
- Selected alternative processes
- Case studies

**Literature**
Dokuments will be distributed per lecture.

**752-2120-00L Consumer Behaviour I**

**Abstract**
Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior.

**Objective**
Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior.

**Literature**

**751-8001-00L Agricultural Engineering I**

**Abstract**
Presentation of basics in planning of agricultural buildings, work economics. This lecture forms the basis for the Agrartechnik II course (indoor and outdoor work processes).

**Objective**
Main objectives: The students acquire comprehensive functional knowledge about agricultural engineering systems (including construction) enabling them to plan and assess the use of those systems in practice.

**Subobjectives:**
Basics in agricultural construction will show that a professional implementation of functional, animal-friendly, environmentally sound (and economically advantageous) construction of buildings is feasible.

Profound knowledge of planning tools based on work economics will help the students to correctly plan the substitution of agricultural work by efficient technical solutions.

**Content**
Part 1: Agricultural building
- Basics of structural engineering. Dimensioning of simple supported and cantilevered beams and roof structures. Tension, compression, bending.
- Evaluation of typical roof structures in agricultural buildings.
- Loads: snow, wind, dead and live loads
- Physical properties of building materials: timber, steel, concrete.
- Reinforcement of concrete
- Housing systems for cattle, pigs, poultry, horses
- Storage plants for slurry, manure, feed.
- Planning. Space and functioning programme, building concepts, financing, permit of building, detailed plans, contractors
- Planning and designing exercise.

P.S.: Indoor work processes: 'Agrartechnik II' spring term 2009

Part 2: Work economics
- work-economics-related guiding figures (time measurements, statistical processing, data recording using a work diary, sources of work-economics-related planning data, application for 'Agroscope FAT' machine costs lists, 'LBL' planning basics, etc.)
- working time models (work and production process level, process comparisons, process optimisation through growth and/or specialisation of farm, cooperation with others, work productivity) including PROOF model to calculate time consumption off different procedures
- 'Agroscope FAT' (agricultural research station in Tänikon) work budget (integration of modules in entire farm, available field work days and weather risk, farm management-related work and special tasks, use of a detailed or global work budget, comparison of target and actual situation in terms of work economics

P.S.: Outdoor mechanisation: 'Agrartechnik II' spring term 2009

<tr>
<td><strong>Abstract</strong></td>
<td>Introduction in to optimization of agricultural production systems with linear and non-linear programming models. Students will be able to a) solve linear and non-linear optimization problems in the context of agricultural production; b) properly interpret the results; and c) critically discuss the economic implications. The course is an application of Operations Research (OR). First, the theory and application of linear programming (LP) is presented. Students will learn the underlying principles (Optimization, Duality, Simplex) and solve exercises in the context of agricultural production. In the second part of the course, the foundation of non-linear programming (NLP) is introduced (Lagrange, Kuhn-Tucker) and illustrated with various examples. <strong>Lecture notes</strong> Handed out during lecture <strong>Literature</strong> Kaiser, H. Microeconomics of the Agriculture and Food Sector

Abstract
In dieser Vorlesung sollen Mikroökonomische Zusammenhänge am Fallbeispiel des Agrar- und Ernährungsektors vermittelt werden. Ziel ist das Verständnis theorietischer mikroökonomischer Methoden und deren Anwendbarkeit auf den Ernährungssektor

Objective
Zunächst sollen ökonomische Charakteristika des Lebensmittelsektors herausgearbeitet und gegenüber anderen Industriesektoren differenziert werden. Daraufhin sollen theoretische mikroökonomische Modelle und Indikatoren erlernt werden. Insbesondere soll deren Anwendung auf reale Fälle der Schweizer und EU Lebensmittelindustrie vermittelt werden.

Content
- Der EU Lebensmittelsektor
- Preiselastizitäten von Angebot und Nachfrage im Ernährungssektor (Marktmacht, Lancaster Modell)
- Gewinnmaximierung
- Wettbewerbsangebot
- Monopol/ Monopolistischer Wettbewerb/ Monopson
- Oligopol (Stackelberg, Cournot, Bertrand)
- Preisbildung/ Preisdiskriminierung
- Kartei
- Dominante Firma
- Technischer Fortschritt

Literature
- Pindyck und Rubinfeld, Mikroökonomie, 7. Aufl., Pearson Studium.

Prerequisites / notice
Empfohlene Vorkenntnisse:
- Grundkenntnisse der Ökonomie/Agrarökonomie
- Vorlesung Einführung in die Mikroökonomie

Abstract
This course is an introduction into forage cropping and grassland sciences. Topics include: extensive/intensive use, grassland evaluation, grassland maintenance, management using fertilization, cutting, etc. Relationships between site, vegetation composition and management will be explored.

Objective
Die Studierenden werden wichtige Mischungen und Pflanzengemeinschaften mitteleuropäischer Grasslandökosysteme kennen, klassische und aktuelle Arbeiten der Bestandesökophysiologie kennen, in der Lage sein, den Einfluss von Umweltfaktoren und Bewirtschaftung nicht nur auf Einzelpflanzen, sondern auf Pflanzenbestände und ihre Erträge abzuschätzen, und üben, ein wissenschaftliches Thema schriftlich prägnant zusammenzufassen.

Lecture notes

Handschriften werden auf dem Netz zur Verfügung gestellt.

Literature

Wird in der Veranstaltung angesprochen.

Prerequisites / notice

Course will be given in German. Course builds on the Ertrags- und Ökophysiologie lecture and provides the basics for the Graslandsysteme.

751-4101-00L Crops W 2 credits 2G A. Walter, F. Liebsch, W. Richner

Abstract

Presentation of the central crops of our regions (cereals, oil and fibre plants, legumes, root and tuber plants) with respect to their biology, site requirements, reaction to environmental conditions and farming practice. A few crops of other regions will be discussed for these aspects as well.

Objective

During this course, students acquire essential knowledge on agriculturally relevant aspects of crop biology. Via lectures and hands-on teaching elements, differences between species as well as common aspects of different species will be experienced. Thereby, the foundation will be laid for a more intense examination of alternative crops, cropping systems and of procedures to characterize geno- and phenotype.

751-4201-00L Horticulture I W 2 credits 2V L. Bertschinger, A. Bühlmann, J.-L. Spring

Abstract

Overview on horticulture (international and national), insights into principles of practical fruit production (pre- and post-harvest), viticulture (incl. some hints on wine making), berry production and vegetable production in Switzerland.

Objective

Insights into fruit production (world and Switzerland), particularly ...
- Main production areas (international & national)
- Relevance (international & national)
- Key aspects of production (Switzerland), i.e. selected aspects referring to varieties, production techniques incl. physiology and plant protection, economics
- Key challenges (Switzerland)
- Selected interesting research and development projects

Content

The relevance of horticulture at the international level will be treated in the first block. During the semester in autumn (Horticultural Crops I), past harvest aspects in fruit production are discussed in 2 blocks of 4h. Following on this, viticulture (incl. some aspects of wine making) will be looked at in 3 blocks of 4h. During the spring semester (Horticultural Crops II), 3 blocks of 4h deal with vegetable production, and 2 blocks of 4h are addressing berry production.

Lecture notes

Delivered during the lectures by the different teachers, ELBA upload.

Literature

Not needed, maybe specific literature is specified by the different teachers.

Prerequisites / notice

Language and script: German or French, maybe selected parts in English.

751-4801-00L System-Oriented Management of Herbivore Insects I W 2 credits 2G D. Mazzi

Abstract

The focus is on the potential to assess strategies and tactics of pest management, taking into account the demands from the economy, the environment and the society. Significant agricultural approaches will be explained using practical examples, including prevention using natural resources, surveillance and forecasting, resistance management, as well as product registration, incl. ecotoxicology.

Objective

The students gain a good understanding of fundamental aspects of pest management in agroecosystems. They will have the ability to assess options for action in view of requirements from the economy; the ecology and the society. Further, they will learn to perform searches on relevant issues in pest management, and to critically evaluate case studies.

Abstract

The basics of planning of feeding and formulation of diets incl. the implications on nutrient cycles and balances are taught. In the part dealing with ruminants, forage-based diets and the application of feed formulation programs are central and exercised on-farm. With pigs and poultry, the basics of energy and nutrient requirements are deepened through practical examples.

Objective

The students are able, based on the knowledge they obtain in this course, to deal with problems in the nutrition of ruminants, pigs and poultry on farm.

Content

- Programmteil Wiederkäuer: Einführung in die Winterfütterungsplanung für Milchkühe, Betriebsbesuch (Erfassung aller notwendigen Daten inkl. Futterprobenentnahme für eine konkrete Planung auf einem Praxisbetrieb), Besonderheiten der Milchviehfütterung (Laktationsverlauf, Jahreszeit, etc.); Einführung in den LBL-Fütterungsplan, Möglichkeiten der Futterbeurteilung und -bewertung mit praktischer Beurteilung der gesammelten Proben, Berechnungen und Besprechung Fütterungsplan, Aufstellung der Mineralstoffbilanz, Vorführung von PC-Software zur Fütterungsplanung Vorstellen und diskutieren des Fütterungsplanes auf dem Praxisbetrieb durch die Gruppe.
- Programmteil Nicht-Wiederkäuer: Der Energie- und spezifische Nährstoffbedarf beim Schwein und Geflügel; Besonderheiten der Fütterung in den verschiedenen Produktionsphasen; Fütterungsempfehlungen und -hinweise. Rationalengestaltung und -rezeptoptimierung für Mischfuttermittel anhand verschiedener Beispiele: Einsatzgrenzen von Futtermittel; technologische Futterbearbeitung.

Lecture notes

Handouts in German language will be provided by each lecturer when starting his part of the lecture.

Literature

Die Dozierenden geben in der Lehrveranstaltungen die relevante Literatur bekannt.

Prerequisites / notice

Blockkurs in Halbtagesform; eingeschlossen sind Betriebsbesuche. Fach mit benoteter Semesterleistung.

751-5003-00L Sustainable Agroecosystems II W 2 credits 2V J. Six, A. Hofmann

Abstract

This class is intended to convey methods of agroecological research through selected case studies from current research projects and hands-on exercises. Students will gain an overview on actors in the field of sustainable agricultural development.

Objective

(1) Get to know methods for field and laboratory investigations in agroecology, (2) Analyze case studies from current agroecological research, (3) Place institutions and related projects into the context of sustainable agricultural development

Literature

Prerequisites / notice

Prior participation in the lecture Nachhaltige Agrarökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (in spring semester) recommended; classes taught mostly in English.

751-4504-00L Plant Pathology I W 2 credits 2G B. McDonald

Abstract

Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Objective

Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  No Lecture: First day of autumn semester

Week 2  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nematode attack strategies and types of damage.

Week 5  Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6  Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7  Pisatin and pisatin demethylase. Local and systemic acquired resistance, signal molecules.

Week 8  Pathogen effects on food quality and safety.

Week 9  Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 10  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11  Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELISA, PCR, rDNA and rep-PCR.

Week 12  Strategies for minimizing disease risks: principles of disease control and management.

Week 13  Disease control strategies: economic thresholds, physical control methods.

Week 14  Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

Lecture notes

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

Abstract

Die Studierenden kennen die Grundlagen und die Konventionen des wissenschaftlichen Schreibens in den Naturwissenschaften, können wissenschaftliche Literatur suchen und verwalten sowie wissenschaftliche Publikationen analysieren. Sie setzen das Gelernte beim Schreiben eines eigenen Textes um.

Objective

Die Studierenden kennen die Grundlagen und die Konventionen des wissenschaftlichen Schreibens in den Naturwissenschaften. Sie setzen das Gelernte beim Schreiben eines kritischen Literaturberichtes in deutscher Sprache zu einem agrarwissenschaftlichen Thema ihrer Wahl um. Die Lehrveranstaltung bereitet die Studierenden auf weitere schriftliche Arbeiten im Studium der Agrarwissenschaften vor, beispielsweise auf die Bachelor-Arbeit.

Lecture notes

Es wird ein Skript abgegeben.
Tentative Programme:
1. Introduction
2. Data acquisition, data organization, data storage, working with data
3. Graphical presentations I - Spreadsheets
5. Correct and problematic graphical data displays
6. Introduction to 'R'
7. Data import and graphical presentation
8. Statistical distribution and confidence intervals
9. Statistical tests - Repetition and hands-on applications
10. Linear regressions
11./12. Analysis of Variance
13. ANOVA - Discussion of results with Prof. E. Frossard

Last week of semester: examination (Leistungskontrolle)

Mainly German (with some English passages from text books)

Theoretical background in ensemble statistics from the mandatory course in the 4th semester; students should have cleared the examination of that fundamental course to be able to follow

Abstract
Das agrarwissenschaftliche Praktikum besteht aus dem Betriebsaufenthalt, der Betriebsaufnahme (Betriebsheft) und der agronomischen Fachaufgabe. Die Leistungskontrolle erfolgt über die Rückmeldung zu den einzelnen Bestandteilen des Praktikums.

Objective
The farm placement aims to motivate students towards a system oriented approach to agricultural science, connecting science and practice.

Lecture notes
Das Betriebsheft zur Betriebsaufnahme und weitere Dokumente werden vom Praktikantendienst nach Anfrage zur Verfügung gestellt.

Literature
Merkblätter, Lehrbücher und Software stehen den Studierenden beim Praktikantendienst Agrarwissenschaft zur Verfügung.

This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

Objectives:
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice:
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

851-0242-07L Human Intelligence W 1 credit 1S E. Stern, P. Edelsbrunner, B. Rütsche
- Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).
- Number of participants limited to 30.
- This course unit can only be enrolled after successful participation in, or during enrollment in the course “Human Learning (EW 1)”.  

Abstract:
The focus will be on the book “Intelligenz: Grosse Unterschiede und ihre Folgen” by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objective:
- Understanding research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

851-0242-08L Research Methods in Educational Science W 1 credit 1S P. Edelsbrunner, B. Rütsche, E. Stern, E. Ziegler
- Literature from the learning sciences is critically discussed with a focus on research methods.
- At the first meeting, working groups will be assembled and meetings with those will be set up.
- In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

Objective:
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

851-0240-16L Colloquium on the Science of Learning and Instruction W 1 credit 1K E. Stern, P. Greutmann, further lecturers
- In the colloquium we discuss scientific projects concerning the teaching in mathematics, computer science, natural sciences and technology (STEM). The colloquium is conducted by the professorships participating in the Competence Center EducETH (ETH) and in the Institute for Educational Sciences (UZH).

Objective:
- Understand pedagogically relevant findings from the empirical educational sciences

851-0240-22L Coping with Psychosocial Demands of Teaching (EW4 W DZ) W 2 credits 3S A. Deiglmayr, P. Greutmann, U. Markwalder
- Number of participants limited to 20.
- The successful participation in EW1 (“Human Learning”) and EW2 (“Designing Learning Environments for School”) is recommended, but not a mandatory prerequisite.

Abstract:
In this class, students will learn concepts and skills for coping with psychosocial demands of teaching

Objective:
- Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.
- (1) They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents);
- (2) They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions).

Subject Didactics and Professional Training

</tbody>
</table>

In the colloquium, we discuss research methods used in the empirical educational sciences.

Objective:
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Die Themen für die beiden Prüfungslektionen am Schluss des Praktikums erfahren die Studierenden in der Regel eine Woche vor dem Prüfungstermin. Sie erstellen eine Vorbereitung gemäß Anleitung und reichen sie bis am Vortrag um 12 Uhr den beiden Prüfungsexperten (Fachdidaktiker/-in, Departementsvertreter/-in) ein. Die gehaltenen Lektionen werden kriteriumsbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltenen Lektionen im Rahmen eines kurzen Kolloquiums.

</tbody>
</table>

**Abstract**

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

**Objective**

The aim is for the students
- to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
- To try out different options for specialist further training in their profession.

<td>4G</td>
<td>M. Kreuzer, M. C. Härdi-Landerer, E. Hillmann, U. Witschi</td>
</tr>
</tbody>
</table>

### Abstract

The course provides the scientific basis of the central aspects of reproduction, husbandry and nutrition physiology of ruminants, and of the implications for animal welfare, product quality, breeding programs, and organic livestock systems. Means of knowledge transfer include interdisciplinary approaches, disciplinary parts, web-based learning and self-study.

### Objective

At the end of the course the students are able to apply, by a comprehensive understanding of the underlying mechanisms, their knowledge in various fields of ruminant science. They will be able to develop and recommend best strategies for breeding programs, feed formulation, improving forage quality, increasing animal health and welfare etc. They will be trained to carry out interdisciplinary and disciplinary research at the highest level. The course Ruminant Science (FS) offered in spring has a similar structure but is complementary to this course.

### Content

**Fields (contact hours)**
- Introduction: 2 h
- Special topics: 12 h
  - Lameness
  - Fertility in Cows
  - Food Intake of Ruminants
- Disciplinary topics: 36 h
  - Ruminant Husbandry: 16 h
  - Ruminant Nutrition Physiology: 10 h
  - Reproduction in Ruminants: 8 h
- Lectures held by the students: 4 h

**In summary**
- Contact hours: 52 h
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)
- Self-study in semester break: 38 h
Total: 120 h

### Literature

Information on books and other references will be communicated during the course.

### Prerequisites / notice

The specialty of this course is that for the first time the animal science disciplines are unified. This is realised with a particular emphasis on interdisciplinary special topics and new forms of teaching. At the same time the essential basics in the central fields are communicated.

The field of Ruminant Science will also be a part of the spring semester (special topics: Organic Ruminant Systems, Tropical Ruminant Systems, Mastitis; disciplinary courses: Cattle, Sheep and Goat Breeding, Ruminant Diseases and Prophylaxis, Ruminant Nutrition and the Environment). However both courses are organized independently.

### Conditions for successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as optional courses in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.

The control of performance will consist of:
- an own lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details

### 751-6601-00L Pig Science (HS) W+ 3 credits 3V E. Hillmann, M. C. Härdi-Landerer

### Abstract

The overall goal of the course is to provide the essential scientific knowledge of the genetic, physiological and special nutritional aspects of pigs metabolism, animal health and behaviour, and of the implications for environment, product quality, housing and animal welfare, and breeding programs.

### Objective

Students will
- understand the complex interactions of nutrition, quality traits of products, breeding and reproduction, health management, behaviour and husbandry;
- be trained to understand interdisciplinary and disciplinary research.
- be able to critically analyze published research data.
- be able to present precise scientific reports in oral and written form.

### Content

Four main topics in Pig Science:

**HS**
- Behaviour and Husbandry of pigs: behavioral needs, husbandry related behavioral disorders, design and construction of housing systems in accordance with welfare requirements and legal regulations.
- Planning of reproductive cycle in practice
- Welfare monitoring in practice
- Pigs in organic farming
- Animal Health and Diseases: animal hygiene, immunology/vaccinations, metabolic diseaeses, diarrhoe, legisalation, thermoregulation, important infections, prophylaxis.
- Poster, exam and evaluation

**FS**
- Special Physiology of Pig Nutrition: food intake; growth; metabolism and digestion at different growth stages; energy and specific nutritional requirements; feeding systems; environmental aspects, efed.
- Genetics: Breeding systems, reproductive techniques, performance tests and recording, etc.
- Oral presentation, exam, evaluation

### Lecture notes

Handouts/scripts are distributed by the the lecturers.

Specific literature is indicated by the lecturers.

</tbody>
</table>
Objective
- overview the distribution and endangerment of animal genetic resources on national and international level and they know, where to find the relevant information.
- can explain, what value can be assigned to biodiversity and name reasons, why biodiversity should be conserved.
- know the national and international efforts of the present and the past to conserve biodiversity in the livestock sector.
- can explain what is important concerning the management of small populations.
- can explain differences between species and breeds concerning biodiversity conservation.
- can describe different conservation activities, in particular in situ and ex situ conservation
- can describe current national and international conservation programmes for species and breeds.

751-6305-00L Livestock Breeding and Genomics

Abstract
Methods for analysing livestock data, in particular for the estimation of breeding values: principles of selection index, introduction to BLUP, application of common models used, relationship matrix, methods for the estimation of variance components, basics of breeding programs. The material will be illustrated via exercises and assignments.

Objective
The students are able to set up design matrices, the relationship matrix and its inverse as well as the Mixed Model equations to estimate BLUP breeding values for smaller examples.

Content
- Selection index (various sources of information, one trait, multiple traits)
- Relationship matrix and its inverse
- BLUP: one trait, repeated observations, multiple traits, economic indices
- Introduction to methods for the estimation of variance components
- Assignments

Lecture notes
Copies of the slides are available on the net.

Literature
To be announced in the lectures.

Methodology Competences

Methods for Scientific Research

Number Title Type ECTS Hours Lecturers

751-6241-00L Laboratory Practical in Molecular Animal Genetics and Inherited Diseases W+ 3 credits 3P S. Neuenschwander, A. Bratus-Neuenschwander, C. Schelling

Abstract
Technologies of molecular animal-, immuno- and biochemical genetics will be shown and applied to selected domestic and farm animals. The students will perform laboratory tests for genome analysis (identification of gene loci, gene mapping), gene expression (mRNA, proteins), diagnostics (analysis of hereditary diseases) and verification of animals and animal products (parentage control, forensics).

Objective
Get to know and apply the basic laboratory methods to systematically identify loci controlling important performance and disease traits and analysis of the molecular nature of variation at the loci. At the end of the course the students are able to understand the underlying mechanisms influencing genetic variations and to analyze gene variants in the laboratory. The students know the importance of the technologies for animal breeding, animal health and quality of animal products in Switzerland and internationally. The matter is illustrated on practical examples.

Content
- Introduction to the course (aims, program, written examination)
- Porcine E.coli test. Determination of the mutation in FUT1
- Sequencing of DNA
- Marker-/microsatellite analyses
- Forensics
- Cytogenetics
- Cell cultures
- Inheritance of coat colour
- Gene expression and animal biotechnology

Contact hours: 42 h
Self-study (preparation for courses and examination): additionally

Lecture notes
Handouts/scripts will be distributed by the lecturers.

Literature

Specific literature will be indicated individually by the lecturers.

751-3801-00L Experimental Design and Applied Statistics in Agroecosystem Science

Abstract
In this course, different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem sciences. Both manipulative (field and laboratory) experiments and surveys are addressed and students work with a selection of basic techniques and methods to analyse data using a hands-on approach. Methods range from simple t-tests to multi-factorial analysis.

Objective
Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 20 of 1570
Content

The course program uses a learning-by-doing approach ("hands-on minds-on"). New topics are introduced in the lecture hall, but most of the work is done in the computer lab to allow for the different speeds of progress of the student while working with data and analyzing results. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contains the following topics:

- Introduction To Experimental Design and Applied Statistics
- Introduction to R / Revival of R Skills
- Designs of Field and Growth Chamber Experiments
- Nonlinear Regression Fits
- Multivariate Techniques: Principle Component Analysis, Canonical Correlation Analysis (CCA), Cluster Analysis
- ANOVA using linear and mixed effect models
- Error Analysis, Error Propagation and Error Estimation
- Introduction to autoregression and autocorrelations in temporal and spatial data and how to consider them in ANOVA-type analysis

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

Lecture notes

Handouts will be available (in English)

Literature

A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture.

Prerequisites / notice

This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor’s course “Wissenschaftliche Datenanalyse und Datenpräsentation” (751-0441-00L)

Abstract

In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.

Objective

The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

1. Orally Presented: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturers are the audience.

2. Scientific writing: Option 1: preparation of a short scientific type of paper from a result table offered by the lecturers; Option 2: preparation of an abstract with limited word count from a scientific paper; Option 3: writing of a critical review of a paper. The students have to select 2 of the three options each. There will be a discussion be a discussion in small groups and they also head the discussion. The remaining students and lecturers are the audience.

Element 1. Oral Presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturers are the audience.

Element 2. Scientific writing: Option 1: preparation of a short scientific type of paper from a result table offered by the lecturers; Option 2: preparation of an abstract with limited word count from a scientific paper; Option 3: writing of a critical review of a paper. The students have to select 2 of the three options each. There will be a discussion be a discussion in small groups at two dates.

Introductions to both forms of presentation will be offered by lecturers.

The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

Prerequisites / notice

Requirements for allocation of the two credit points:

- Theatre presentation (with handout) at the forum
- Delivery of written documents of sufficient quality
- Active participation during the presentations by the other participants

The students will learn the conceptual and methodological background of research in the animal science groups of the Institute of Plant, Animal and Agroecosystem Science. In addition to teaching the theoretical background, the major aim of the course is to integrate the students into the research groups (on job training), and, hence, to focus on the practical application of the knowledge.

Objective
- Introduction into the conceptual and methodological basis of research
- Integration of the students into the research groups (on job training)
- Application of the gained knowledge

Content
The students will be integrated into the research groups day-to-day work and will thus deal with all aspects of scientific work. This comprises the planning (conceptually and logistically), execution (data collection, laboratory analyses) and evaluation (statistics, data presentation) of experiments as well as the basics of scientific writing (aim: later publication, Master thesis). The research topics and the range of methodologies vary between the animal science research groups in the Institute of Plant, Animal and Agroecosystem Sciences.

Lecture notes
None

Literature
Specific readings after enlisting in a particular research group.

Prerequisites / notice
The number of training slots in the various groups is limited. It is therefore highly recommended to contact the group leaders early enough (first come first serve).

The full integration in a research group often means to work on weekends. The full integration in a research group often means to work on weekends. The total time budget is equivalent to about 180 hours. Active participation in group meetings (discussion, presentation) and short written reports about the work conducted are required for the 6 credit points. There are no grades, it is only pass or fail.

The educational objectives cover both thematic competences and soft skills:

**Objective**

The course is designed for a maximum of 15 Master students and 10 PhD students (advertised and recruited via the Zurich-Basel Plant Science Center). For full and active participation, a total of 2 credit/ECTS points will be provided.

**Lecture notes**

Seminar abstracts

**Literature**

Peer-reviewed research articles, selected according to the selected topic/area.

**Prerequisites / notice**

Participation in the BSc course ‘Pflanzenzüchtung’ is strongly recommended, a completed course in ‘Molecular Plant Breeding’ is highly advantageous.

**Abstract**

5 minutes discussion) covering their specific question/aspect. Participation on that afternoon will be mandatory.

End of January (January 31, 2017), a one-day seminar on the selected topic will be organized. After one to two keynote speakers (international experts), four invited talks will link the selected topic to practical plant breeding. In the afternoon, the four to six students groups will present and discuss with the experts their specific questions on the selected topic/area. These presentations will be evaluated by the lecturers. The seminar will be public and serve as an annual meeting of the SSA working group for plant breeding, bringing together the experts in plant breeding.

The course is designed for a maximum of 15 Master students and 10 PhD students (advertised and recruited via the Zurich-Basel Plant Science Center). For full and active participation, a total of 2 credit/ECTS points will be provided.

**Abstract**

This is an introductory course in insect ecology. Students will learn about the ways in which insects interact with and adapt to their abiotic & biotic environments and their roles in diverse ecosystems. The course will entail lectures, outside readings, and critical analysis of contemporary literature.

**Objective**

Students completing this course should become familiar with the application of ecological principles to the study of insects, as well as major areas of inquiry in this field. Highlighted topics will include insect behavior, chemical and sensory ecology, physiological responses to biotic and abiotic stressors, plant-insect interactions, community and food-web dynamics, and disease ecology. The course will emphasize insect evolution and adaptation in the context of specific interactions with other organisms and the abiotic environment. Examples from the literature incorporated into lectures will highlight the methods used to study insect ecology.

**Lecture notes**

Provided to students through ILIAS

**Literature**

Selected required readings (peer reviewed literature, selected book chapters). Optional recommended readings with additional information.

<td>N. Buchmann, L. Hörttagl</td>
</tr>
</tbody>
</table>

**Abstract**
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

**Objective**
Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small (interdisciplinary) teams.

**Content**
Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

**Lecture notes**
Handouts will be available on the webpage of the course.

**Literature**
Will be discussed in class.

**Prerequisites / notice**
Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Course will be taught in English.

<td>751-3405-00L</td>
<td>Radio-Isotopes in Plant Nutrition</td>
<td>W+</td>
<td>3</td>
<td>2G</td>
<td>E. Frossard</td>
</tr>
</tbody>
</table>

**Abstract**
The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine element availability. Finally, published studies from other groups will be analyzed and presented by the students.

**Objective**
At the end of this course the students are familiar with the principles on which radioisotope works are based and they have learned from case studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotope work.

**Content**
Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, radionuclides) within a given system and to assess the importance of processes controlling these fluxes (e.g. exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.).

The course will first present the principles, the basic assumptions and the theoretical framework that underlay the work with radioisotopes. It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g. number and size of compartments). Secondly, case studies on isotopic dilution and tracer work will be presented for instance on the isotopic exchange kinetics method to determine nutrients or pollutants availability. The case studies will be adapted to the ongoing research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.

**Lecture notes**
Documents will be distributed during the lecture

**Literature**
Will be given during the lecture

**Prerequisites / notice**
The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at: http://www.pe.ipw.agrl.ethz.ch/about/reach

</tr>
</tbody>
</table>

**Number of participants limited to 18.**

**Prerequisites:** Only students who have passed the courses 751-3401-00L Pflanzenenernährung I and 751-3402-00L Pflanzenenernährung II - Integriertes Nährstoffmanagement can be admitted to this course.

**Abstract**
This course is about the physical, chemical, and biological processes in the rhizosphere and their effect on plant growth. Effects of intercropping, companion plants, and microbial symbions, and other microbes on nutrient cycling and plant uptake are discussed. An experiment in the glasshouse is used as a model to check for rhizosphere effects on plant growth and mineral nutrition.

**Objective**
To gain a holistic understanding of resource-driven and regulatory processes in agricultural and natural ecosystems. Develop skills on the critical analysis of scientific papers. Define explanatory hypotheses, identify knowledge gaps for further investigations. Carry out a multi-disciplinary experiment that involves aspects of soil, (micro-)biology, plant physiology, pathology, and ecology. Develop manual skills in the set up of a glasshouse experiment, in soil and plant analyses, and in isolation and DNA-based characterisation of rhizobia. Gain insights on basic methods to analyse (bio-)chemical, molecular genetic, and graphical data. Discuss and interpret data in the context of the literature. Prepare a research report in the format of a scientific paper and a poster in the format of a conference paper, partially alone and partially in small groups, using data obtained from the glasshouse experiment.
This course is designed to stimulate thinking and promote critical analysis of important processes that occur in the rhizosphere. As part of this course, the knowledge will be used for analysing and interpreting experimental data, as well as, preparing a scientific report and conference-type poster.

The course will cover the relative importance of spatial scales and various physicochemical and microbiological dynamics as influenced by roots. We will discuss root traits and activities that influence the immediately root-surrounding soil and thereby contribute to mineral nutrient mobilization and immobilization. An overview of the most relevant root-microbe symbioses for agroecosystems will be provided and root and microbial traits discussed, which could be of use in efforts towards utilization of intercropping and bioinoculants as a possible means of reducing energetically expensive inputs to farming systems. A special emphasis will be given to the importance of physicochemical features of soils and the chemical forms (= species) of elements important for plant uptake.

Practical experience will be gained with setting up a glasshouse experiment, soil and root sampling, basic soil and plant analyses, isolation of rhizobia, determination of the number of colony forming units (CFU), assays to screen for phosphorus and zinc solubilizing bacteria, DNA extraction, PCR amplification, and restriction fragment length polymorphism analysis (RFLP) of host range determining symbiosis-specific genes.

In short, the processes dealt with in this course occur on a small-scale and are generally (bio)chemical and microbiological in nature. Furthermore, they are generally not taken into account using current methods of agronomic management for plant production. However, they are increasingly being recognized as a potentially useful means of obtaining a resource-efficient and hence, economically and environmentally sustainable agricultural system, including for ecosystem restoration. Therefore, the course will invite for critical reflections and exemplary challenges in translating knowledge from scientific studies and ecology into application for plant production.

Lecture notes

For documentation, lecture slides and laboratory protocols will continuously be uploaded to the directory ‘751-5123-00L Rhizosphere Ecology’ on the electronic document exchange platform ILIAS, LDA-ELBA: https://ilias-app2.let.ethz.ch/illias.php?ref_id=109651&cmd=view&cmdClass=ilobjcourseseq&cmdNode=ef:tv&baseClass=ilRepositoryGUl

Ecological understanding (Second Edition)

Stable Isotope Ecology of Terrestrial Ecosystems will be discussed in class. The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available.

Lecturers: R. A. Werner, N. Buchmann, A. Gessler

This course guides students in analyzing and comprehending tropical agroecosystems. Students gain practical knowledge of field methods, intensive laboratory sessions, short presentations by students and computer exercises. Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods. Students will solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.

Content: The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Literature: Handouts will be available on the webpage of the course.

Prerequisites / notice: This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

751-5201-00L Tropical Soils and Land Use

Abstract: This course guide students in analyzing and comprehending tropical agroecosystems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in southern Ethiopia, which is co-organized with Arba Minch University (Ethiopia) and KU Leuven (Belgium).

Objective: Lectures and exercises:
(1) Introduction to international soil classification with focus on tropical soils
(2) Soil suitability (chemical, physical and biological fertility) for tropical crops
(3) Soil conservation practices and stakeholder involvement
(4) Approaches to analyzing tropical agroecosystems

Field project:
(5) Overview of the major land use systems in the South Ethiopian Rift Valley
(6) Analysis of agricultural production systems in the Gamo-Gofa region in southern Ethiopia
(7) Hands-on training on the use of field methods, diagnostic tools and survey methods
(8) Collaboration in international student teams (MSc students from Switzerland, Belgium and Ethiopia)

Prerequisites / notice: The number of participants is limited to 12 students due to capacity limitations for the field project in Ethiopia. Selection of participants will be based on (1) the student's motivation statement, (2) successful participation in the BSc lectures "Sustainable Agroecosystems I + II" and (3) related topic for BSc thesis/ tentative topic for MSc thesis. The motivation statement is due in the first week of the semester.

Methodology Competences
Seminar in Plant Sciences

751-4805-00L Recent Advances in Biocommunication

Abstract: Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods.

Objective: Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods. Students will engage in discussion and critical analyses of relevant papers and present their evaluations in a seminar setting.

751-5001-00L Agroecologists without Borders

The number of participants is limited to 25. Selection of participants will be based on the student's motivation statement, successful participation in the BSc lectures "Sustainable Agroecosystems I + II" and related topic for BSc thesis/ tentative topic for MSc thesis. The motivation statement is due in the first week of the semester.

Seminar in Plant Sciences
In this seminar students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

Objective

1. Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
2. Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
4. Students develop their science communication skills by producing science communication materials in the context of the given case study.

Prerequisites / notice

Students signing up for this class should have a strong interest in tropical agriculture and science communication.

751-5115-00L Current Aspects of Nutrient Cycle in Agro-Ecosystems W+ 2 credits 1S E. Frossard, A. Oberson Dräyer

Abstract

The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. It offers to deepen the knowledge on a specific theme related to nutrients. It is composed by presentations of national and international speakers and by an excursion. The students write a report where they compile the obtained information, relate it to their own knowledge and include literature.

Objective

Listen and understand expert’s presentations. Ask questions and contribute to the discussion during the talk sessions and the excursion.

Link the information obtained during the seminar with knowledge from previous lessons and with literature searched to complement the matter. Expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem.

751-4003-01L Current Topics in Grassland Sciences (HS) W+ 2 credits 2S N. Buchmann

Abstract

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Objective

Students will be able to understand and evaluate experimental design and data interpretation of on-going studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

Content

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Lecture notes

none

Prerequisites / notice

Prerequisites: Basic knowledge of plant ecophysiology, terrestrial ecology and management of agro- and forest ecosystems. Course will be taught in English.

Design, Analysis and Communication of Science

Number Title Type ECTS Hours Lecturers

Abstract

In this course, different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem sciences. Both manipulative (field and laboratory) experiments and surveys are addressed and students work with a selection of basic techniques and methods to analyse data using a hands-on approach. Methods range from simple t-tests to multi-facotria

Objective

Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.

Content

The course program uses a learning-by-doing approach ("hands-on minds-on"). New topics are introduced in the lecture hall, but most of the work is done in the computer lab to allow for the different speeds of progress of the student while working with data and analyzing results. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contain the following topics:

- Introduction To Experimental Design and Applied Statistics
- Introduction to ‘R’ / Revival of ‘R’ Skills
- Designs of Field and Growth Chamber Experiments
- Nonlinear Regression Fits
- Multivariate Techniques: Principle Component Analysis, Canonical Correpondence Analysis (CCA), Cluster Analysis
- ANOVA using linear and mixed effect models
- Error Analysis, Error Propagation and Error Estimation
- Introduction to autoregression and autocorrelations in temporal and spatial data and how to consider them in ANOVA-type analysis

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

Lecture notes

Handouts will be available (in English)

Literature

A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture.

Prerequisites / notice

This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor’s course "Wissenschaftliche Datenauswertung und Datenpräsentation" (751-0441-00L)

Major in Agriculture Economics

Disciplinary Competences

Decision Making and Management

Number Title Type ECTS Hours Lecturers
363-0403-00L Introduction to Marketing W+ 3 credits 2G F. von Wangenheim

The course is designed to convey a profound understanding of marketing's role in modern firms, its interactions and interfaces with other disciplines, its main instruments and recent trends. Particular attention is given to emerging marketing concepts and instruments, and the role of marketing in technology firms.
After taking the lecture, students should have knowledge on

1) The definition and role of marketing (marketing basics)
2) Creating marketing insights - understanding customer behavior
   - Theoretical concepts in customer behavior (customer behavior)
   - Analytical means to extend knowledge on customer behavior (marketing research)
   - Strategic tools to quantify customer behavior (CLV, CE)
3) Strategic marketing - translating marketing insights into actionable marketing strategies
   - Segmentation, Targeting, and Positioning
   - Attracting customers (marketing mix, 4Ps)
   - Maintaining profitable customer relations (CRM)

The course is designed to convey a profound understanding of marketing’s role in modern firms, its interactions and interfaces with other disciplines, its main instruments and recent trends. Particular attention is given to emerging marketing concepts and instruments, and the role of marketing in technology firms.

The lecture features a short tutorial that is held at irregularly spaced intervals throughout the semester (approximately every third week). The tutorial is embedded within the lecture and consists of short sessions of about 30 minutes. It serves to illustrate theoretical and methodological concepts from the lecture by walking students through the analysis of real-world data from the telecommunications industry. The case data will be provided so that students practice and apply the concepts of the lecture on their own. The tutorial is held jointly by two Teaching Assistants (Zhiying Cui and Jana Gross) and the professor (Prof. F. v. Wangenheim).

Weekly readings, distributed in class (via Moodle)

751-2205-00L Advanced Management in the Agri-Food-Chain W+ 2 credits 2G M. Weber
Abstract Advanced Management in the Agri-Food-Chain (Vorlesung wird in deutscher Sprache abgehalten.)

Objective
After the lecture the students ... 

- know the characteristics and consequences of complexity in the organizational world,
- know and can apply selected comprehensive models for managing in complex situations,
- know possible practical applications and examples of the treated contents to organizations in the Agri-Food Chain and ... are able to deepen the relevant topics in an autonomous way.

Content
In the lecture the following contents will be treated:
- State, reasons and effects of complexity in the organizational world.
- A basic framework for shaping and governing intelligent organizations.
- Selected contemporary models for managing in the complex organizational world.
- Transfer and adaption of the models to organizations in the Agri-Food Chain.

Lecture notes Reader with selected contents.
Prerequisites / notice
- Vorlesung “Management” in D-USYS
- Vorlesung “Managerial Economics Agri-Food Chain: Strategische Konzepte” in D-USYS

752-2122-00L Food and Consumer Behaviour W+ 2 credits 2V M. Siegrist, C. Hartmann
Abstract
This course focuses on food consumer behavior, consumer’s decision-making processes and consumer's attitudes towards food products.

Objective
The course provides an overview about the following topics: Factors influencing consumer's food choice, food and health, attitudes towards new foods and food technologies, labeling and food policy issues

Resource Economics and Agricultural Policy

751-2903-00L Evaluation of Agricultural Policies W+ 3 credits 2G M. Stolze, S. Mann
Abstract
The course focuses on agricultural economic research with particular focus on policy evaluation. We impart insights in the issue of policy evaluation as part of agricultural economics research.

Objective
Focus: Policy Evaluation

- The students are to...
  - have a critical look at different angles of agri-economic research
  - study scientific literature of the focus theme
  - consider strengths, weaknesses and the application of research approaches
  - apply knowledge gained from other courses with respect to the focus thetter
  - get insights in agricultural economic research of the national research institutions by visiting Agroscope and the Research Institute of Organic Agriculture (FiBL)
  - be capable to conduct evaluations and critically reflect evaluation results

Content
Unit: Subject
- 01: Introduction in the issue of policy evaluation
- 02: The normative frame for policy evaluation
- 03: Evaluation of public policies
- 04: Context and use of evaluations
- 05: Quantitative policy evaluation
- 06: Qualitative policy evaluation
- 07: Group work
- 08: Agricultural Economics Research at ART
- 09: Agricultural Economics Research at FiBL
- 10: Examination, Feedback

Lecture notes
Handouts (power point presentations)

Literature
1) Bussmann Werner, Klüti Ulrich und Knoepfel Peter, 2004 (Hrsg). Einführung in die Politikevaluation. Helbling&Lichtenhahn. In German language. Will be provided by the lectures in unit 01.

Prerequisites / notice
Unit 08: 1 day course at Agroscope in Tänikon, 8356 Ettenhausen, www.agroscope.admin.ch
Unit 09: 1 day course at FiBL in 5070 Frick, www.fibl.org

701-1651-00L Environmental Governance W 3 credits 2G E. Lieberherr, G. de Buren

Abstract
The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.
To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

To analyze the evolution as well as the key elements of environmental governance.

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a framework from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of 'environmental governance' and how legitimate and effective are these approaches in addressing persistent environmental challenges?

We will mostly work with readings from the following books:

A detailed course schedule will be made available at the beginning of the semester.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)

| 851-0626-01L | International Aid and Development | W+    | 2    | 2V    | I. Günther |
| Content | The course gives economic and empirical foundations for a sound understanding of the instruments, prospects and limitations of international development aid. |
| Objective | Students have a methodologically sophisticated way; (2) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems. |
| Literature | Articles and book abstracts will be uploaded to a course website. |
Content

This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

Assignment

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Lecture notes

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link Registered students, please click here for course materials, at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike Hudecheck <michaehu@student.ethz.ch>). All assigned papers must be read ahead of the respective meeting. Following the course on the basis of on-line slides and papers alone is not sufficient. Physical presence in the classroom is essential. Many books and journals covering international environmental policy issues can be found at the D-GESS library at the IFW building, Haldeneggsteig 4, B-floor, or in the library of D-USYS.

Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link Registered students, please click here for course materials, at top of that page). Content

Intermediate Econometrics

The idea of this course is to familiarize students with instrumental variables estimation of linear regression models and the estimation of models with limited dependent variables as well as of nonlinear regression models. While most of the material covered will pertain to cross-sectional data, we will also work on selected issues with panel data.

Objective

- Ability to formulate research questions and designing an appropriate study
- Ability to collect and analyze data using a variety of methods
- Ability to critically assess the quality of empirical research in management
- Applied knowledge of empirical methods through out-of-class assignments

Content

1) Introduction to empirical management research
2) Research designs: exploratory, descriptive, experimental
3) Measurement and scaling
4) Data collection and sampling
5) Data analysis methods
6) Reporting and presenting empirical research

Prerequisites / notice

Assignments and projects: This course includes out-of-class assignments and projects to give students some hands-on experience in conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Students will have at least one week to work on each assignment. Students are expected to work on these assignments individually. Duplicate answers will receive no credit and will be subject to a disciplinary review. Assignments will be graded and need to be turned-in on time.

Class participation: Class participation is encouraged and can greatly improve students' learning in this class. In this spirit, students are expected to attend class regularly and come to class prepared.

Intermediate Econometrics

The idea of this course is to familiarize students with instrumental variables estimation of linear regression models and the estimation of models with limited dependent variables as well as of nonlinear regression models. While most of the material covered will pertain to cross-sectional data, we will also work on selected issues with panel data.

Objective

I will provide STATA programs and show the execution thereof. After having participated in this course, students will be able to carry out simple research projects and understand the basics of intermediate econometrics. In particular, they will be able to write simple programs in STATA and to qualify their own and others' regression output relating to problems covered.

Risk Analysis and Risk Management in Agriculture

Agricultural production is exposed to various risks which are important for decisions taken by farmers and other actors in the agri-food sector. Moreover, risk management is indispensable for all actors. This course introduces modern concepts on decision making under risk and recent developments in risk management. The focus of this course is on agricultural economics.

Objective

- to develop a better understanding of decision making under uncertainty and risk;
- to gain experience in different approaches to analyze risky decisions;
- to develop an understanding for different sources of risk in agricultural production;
- to understand the crucial role of subjective perceptions and preferences for risk management decisions;
- to get an overview on risk management in the agricultural sector, with a particular focus on insurance solutions

Content

- Quantification and measurement of risk
- Risk preferences, expected utility theory and alternative models of risk behavior
- Concepts on the decision making under risk
- Production, investment and diversification decisions under risk
- Risk management in agriculture

Dynamic Simulation in Agricultural and Regional Economics

Students in this class develop a dynamic simulation model that represents the basic mechanisms underlying food security in developing countries in a highly aggregated way. Students then proceed to extending the simulation model with one policy to improve food security and they analyze the dynamic impacts of this policy on production and environmental outcomes.

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 30 of 1570
Objective
- Students learn the basic theory and practice of dynamic simulation
- Students can develop, analyze and extend a dynamic simulation model and interpret its results.
- By applying the developed simulation model, students gain insights into food security issues. They also learn to recognize the benefits and pitfalls of dynamic simulation, both from a theoretical and an applied perspective.

</tr>
</tbody>
</table>

Objective
A successful participant of the course is able to:
- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyse the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics

Content
- Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical systems dynamics, nonlinear dynamics and macroeconomic modeling.
- The course is structured along three main tasks:
  1. Finding solutions
  2. Implementing solutions
  3. Controlling solutions

PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Lecture notes Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM.

The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture

Prerequisites / notice Self-study tasks (discussion exercises, Vensim exercises) are provided as home work. Weekly exercise sessions (45 min) are used to discuss selected topics. Regular participation in the exercises is an efficient way to understand the concepts relevant for the final exam.

**752-2122-00L**
**Food and Consumer Behaviour**

**Abstract**
This course focuses on food consumer behavior, consumer's decision-making processes and consumer's attitudes towards food products.

**Objective**
The course provides an overview about the following topics: Factors influencing consumer's food choice, food and health, attitudes towards new foods and food technologies, labeling and food policy issues

**751-2103-00L**
**Socioeconomics of Agriculture**

**Abstract**
The main part of this lecture will examine constellations where hierarchies, markets or cooperation have been observed and described in the agricultural sector. On a more aggregated level, different agricultural systems will be evaluated in terms of main socioeconomic parameters like social capital or perceptions.

**Objective**
Students should be able to describe the dynamics of hierarchies, markets and cooperation in an agricultural context.

**Content**
- Groups, identities and utility maximization & some conceptual foundations
- Micro-Socioeconomics: Hierarchy, cooperation and markets
- Macro-Socioeconomics: Varieties of Capitalism
- Agricultural Administration: Path dependencies and efficiency issues
- Causes and Impacts of farm succession
- Occupational Choice in the farming sector
- System Choice and segregation (organic, GMO etc.)
- The economics of rural areas
- Common Resource Management in Alpine Farming
- Agricultural Cooperatives
- Societal perceptions of agriculture
- Perceptions of farming from within
- Varieties of agricultural systems and policies

**Lecture notes**

**Literature**
see script

**Prerequisites / notice**
Basic economic knowledge is expected.

751-0423-00L Risk Analysis and Risk Management in Agriculture W 3 credits 2G R. Finger
Abstract
Agricultural production is exposed to various risks which are important for decisions taken by farmers and other actors in the agri-food sector. Moreover, risk management is indispensable for all actors. This course introduces modern concepts on decision making under risk and recent developments in risk management. The focus of this course is on agricultural applications.

Objective
- To develop a better understanding of decision making under uncertainty and risk;
- To gain experience in different approaches to analyze risky decisions;
- To develop an understanding for different sources of risk in agricultural production;
- To understand the crucial role of subjective perceptions and preferences for risk management decisions;
- To get an overview on risk management in the agricultural sector, with a particular focus on insurance solutions.

Content
- Quantification and measurement of risk
- Risk preferences, expected utility theory and alternative models of risk behavior
- Concepts on the decision making under risk
- Production, investment and diversification decisions under risk
- Risk management in agriculture

Lecture notes
- Handouts will be distributed in the lecture and available on the moodle.

Prerequisites / notice
- Knowledge of basic concepts of probability theory and microeconomics

363-0305-00L Empirical Methods in Management W 3 credits 2G A. Scherer
Abstract
Evidence-based management requires valid empirical research. In this course, students will learn the basics of research design, fundamentals of data collection and statistical methods to analyze the data acquired in social science research. Students are expected to apply their knowledge in class discussions and out-of-class assignments.

Objective
- Ability to formulate research questions and designing an appropriate study
- Ability to collect and analyze data using a variety of methods
- Ability to critically assess the quality of empirical research in management
- Applied knowledge of empirical methods through out-of-class assignments

Content
1) Introduction to empirical management research
2) Research designs: exploratory, descriptive, experimental
3) Measurement and scaling
4) Data collection and sampling
5) Data analysis methods
6) Reporting and presenting empirical research

Prerequisites / notice
Assignments and projects: This course includes out-of-class assignments and projects to give students some hands-on experience in conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Students will have at least one week to work on each assignment. Students are expected to work on these assignments individually. Duplicate answers will receive no credit and will be subject to a disciplinary review. Assignments will be graded and need to be turned in on time.

Class participation: Class participation is encouraged and can greatly improve students' learning in this class. In this spirit, students are expected to attend class regularly and come to class prepared.

Agriculture and Environment

751-5101-00L Biogeochemistry and Sustainable Management W 2 credits 2G N. Buchmann, L. Höftnagl

Abstract
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Objective
Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small (interdisciplinary) teams.

Content
Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regards to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Lecture notes
Handouts will be available on the webpage of the course.

Prerequisites / notice
Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Course will be taught in English.

751-3405-00L Radio-Isotopes in Plant Nutrition W 3 credits 2G E. Frossard

Abstract
The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine element availability. Finally, published studies from other groups will be analyzed and presented by the students.

Objective
At the end of this course the students are familiar with the principles on which radioisotope works are based and they have learned from case studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotope work.
Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, radionuclides) within a given system and to assess the importance of processes controlling these fluxes (e.g. exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.). The course will first present the principles, the basic assumptions and the theoretical framework that underlay the work with radioisotopes. It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g. number and size of compartments). Secondly, case studies on isotopic dilution and tracer work will be presented for instance on the isotopic exchange kinetics method to determine nutrients or pollutants availability. The case studies will be adapted to the ongoing research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.

Lecture notes
Documents will be distributed during the lecture

Literature
Will be given during the lecture

Prerequisites / notice
The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at: http://www.pe.ipw.agri.ethz.ch/about/reach

751-5123-00L  Rhizosphere Ecology
Number of participants limited to 18.

Prerequisites: Only students who have passed the courses 751-3401-00L Pflanzenernährung I and 751-3402-00L Pflanzenernährung II - Integriertes Nährstoffmanagement can be admitted to this course.

Abstract
This course is about the physical, chemical, and biological processes in the rhizosphere and their effect on plant growth. Effects of fertilisers, companion plants, and microbial symbionts, and other microbes on nutrient cycling and plant uptake are discussed. An intercropping experiment in the glasshouse is used as a model to check for rhizosphere effects on plant growth and mineral nutrition.

Objective
To gain a holistic understanding of resource-driven and regulatory processes in agricultural and natural ecosystems.
Define explanatory hypotheses, identify knowledge gaps for further investigations.
Carry out a multi-disciplinary experiment that involves aspects of soil, (micro-)biology, plant physiology, pathology, and ecology.
Develop manual skills in the set up of a glasshouse experiment, in soil and plant analyses, and in isolation and DNA-based characterisation of rhizobia.
Gain insights on basic methods to analyse (bio-)chemical, molecular genetic, and graphical data.
Discuss and interpret data in the context of the literature.
Prepare a research report in the format of a scientific paper and a poster in the format of a conference paper, partially alone and partially in small groups, using data obtained from the glasshouse experiment.

Content
This course is designed to stimulate thinking and promote critical analysis of important processes that occur in the rhizosphere. As part of this course, the knowledge acquired will be used for analysing and interpreting experimental data, as well as, preparing a scientific report and conference-type poster.

The course will cover the relative importance of spatial scales and various physicochemical and microbiological dynamics as influenced by roots. We will discuss root traits and activities that influence the immediately root-surrounding soil and thereby contribute to mineral nutrient mobilization and immobilization. An overview of the most relevant root-microbe symbioses for agroecosystems will be provided and root and microbial traits discussed, which could be of use in efforts towards utilization of intercropping and bioinoculants as a possible means of reducing energetically expensive inputs to farming systems. A special emphasis will be given to the importance of physicochemical features of soils and the chemical forms (= species) of elements important for plant uptake.

Practical experience will be gained with setting up a glasshouse experiment, soil and root sampling, basic soil and plant analyses, isolation of rhizobia, determination of the number of colony forming units (CFU), assays to screen for phosphorus and zinc solubilizing bacteria, DNA extraction, PCR amplification, and restriction fragment length polymorphism analysis (RFLP) of host range determining symbiosis-specific genes.

In short, the processes dealt with in this course occur on a small-scale and are generally (bio)chemical and microbiological in nature. Furthermore, they are generally not taken into account using current methods of agronomic management for plant production. However, they are increasingly being recognized as a potentially useful means of obtaining a resource-efficient and hence, economically and environmentally sustainable agricultural system, including for ecosystem restoration. Therefore, the course will invite for critical reflections and exemplify challenges in translating knowledge from scientific studies and ecology into application for plant production.

Lecture notes
For documentation, lecture slides and laboratory protocols will continuously be uploaded to the directory '751-5123-00L Rhizosphere Ecology' on the electronic document exchange platform ILIAS, LDA-ELBA: https://ilias-app2.let.ethz.ch/ilias.php?ref_id=109651&cmd=view&cmdClass=ilobjcoursegui&cmdNode=ef:tv&baseClass=ilRepositoryGUI

Ecological understanding (Second Edition)
Prerequisites / notice
We ask all course attendees of the agricultural sciences to have passed the exams at the end of the lectures Plant Nutrition I and II (Nutrient cycling in agroecosystems) by Prof. E. Frossard. All others, have to have successfully worked through the e-learning module Plant Nutrition I by Prof. E. Frossard. We ask all course attendees of the agricultural sciences to have passed the exams at the end of the lectures Plant Nutrition I and II (Nutrient cycling in agroecosystems) by Prof. E. Frossard. All others, have to have successfully worked through the e-learning module Plant Nutrition I by Prof. E. Frossard: https://moodle-app2.let.ethz.ch/course/view.php?id=279
Remark: The course is designed to be complementary to those on Radioisotopes in Plant Nutrition (751-3404-00L), and Nutrient Fluxes in Soil-Plant Systems (751-3404-00L), although some thematic overlaps cannot be avoided. Special emphasis is given to plant-microbe-soil interactions and an appreciation of whole plant functioning in the ecological context. You will familiarize yourself with bacterial isolation, cultivation, enumeration, as well as, molecular detection, discrimination and identification techniques for rhizosphere and root-associated microbes.
Marking will consider the efforts and outcome of work by the individual participant as well as results of work in small groups. Activities for the course will result in posters and reports in the format of a conference and scientific paper. Reports will be due on Friday January 6, 2017.
Maximum number of participants: 18 (Attention: Admission will be on a first come first served basis, inscribe early!).
Students of D-USYS will be reimbursed via bank transfer for train and bus tickets of the zones 121 and 122 (Please send all tickets with the bank details to Christiane Gujan (http://www.plantnutrition.ethz.ch/the-group/people-a-z/person-detail.html?persid=85593).

Abstract
This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and water 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.
The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

Handouts will be available on the webpage of the course.

This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

Insect Ecology

Abstract
This is an introductory course in insect ecology. Students will learn about the ways in which insects interact with and adapt to their abiotic & biotic environments and their roles in diverse ecosystems. The course will entail lectures, outside readings, and critical analysis of contemporary literature.

Objective
Students completing this course should become familiar with the application of ecological principles to the study of insects, as well as major areas of inquiry in this field. Highlighted topics will include insect behavior, chemical and sensory ecology, physiological responses to biotic and abiotic stressors, plant-insect interactions, community and food-web dynamics, and disease ecology. The course will emphasize insect evolution and adaptation in the context of specific interactions with other organisms and the abiotic environment. Examples from the literature incorporated into lectures will highlight the methods used to study insect ecology.

Lecture notes
Provided to students through ILIAS

Literature
Selected required readings (peer reviewed literature, selected book chapters). Optional recommended readings with additional information.

Alien Organisms in Agriculture

Abstract
The course focuses on alien organisms in agriculture as well as the scientific assessment and regulatory management of their effects on the environment and agricultural production.

Objective
Students will understand the consequences arising from the unintentional or deliberate introduction of alien organisms into agricultural systems. They will be able to understand the concept of environmental risk assessment and be able to evaluate risk management options.

Content
Alien organisms in agriculture is a topic that receives an increasing awareness among farmers, agricultural scientists, regulators and the general public. Students of this course will learn about the nature of alien organisms such as invasive species, biocontrol organisms and genetically modified organisms. With a particular focus on arthropods, plants and their interactions we will look at the potential threats the novel organisms pose, the benefits they provide and how both of these effects can be scientifically assessed. Students will learn how the topic of alien organisms in agriculture is intrinsically tied to policy making and regulation and get to know current examples and future challenges in research. In the last part of the course students will be able to apply the acquired knowledge in a practical exercise (case study).

Lecture notes
Material will be distributed during the course

Seminar in Evolutionary Ecology of Infectious Diseases

Abstract
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Objective
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content
A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Lecture notes
Publications and class notes can be downloaded from a web page announced during the lecture.

Language
Papers will be assigned and downloaded from a web page announced during the lecture.

Functioning of Soil Systems

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---
751-5001-00L | Agroecologists without Borders | W | 2 credits | 2S | C. Decock, A. Hofmann, J. Six

Abstract
In this seminar students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

Objective
(1) Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
(2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
(3) Students articulate complexity and challenges in agricultural development interventions.
(4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

Prerequisites / notice
Students signing up for this class should have a strong interest in tropical agriculture and science communication.

751-5201-00L | Tropical Soils and Land Use | W | 2 credits | 2G | J. Six, A. Hofmann

Abstract
This course guides students in analyzing and comprehending tropical agroecosystems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in southern Ethiopia, which is co-organized with Arba Minch University (Ethiopia) and KU Leuven (Belgium).

Objective
Lectures and exercises:
(1) Introduction to international soil classification with focus on tropical soils
(2) Soil suitability (chemical, physical and biological fertility) for tropical crops
(3) Soil conservation practices and stakeholder involvement
(4) Approaches to analyzing tropical agroecosystems

Field project:
(5) Overview of the major land use systems in the South Ethiopian Rift Valley
(6) Analysis of agricultural production systems in the Gamo-Gofa region in southern Ethiopia
(7) Hands-on training on the use of field methods, diagnostic tools and survey methods
(8) Collaboration in international student teams (MSc students from Switzerland, Belgium and Ethiopia)
The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of a radioisotope into a system can be done so as to get some information on the structure of the system. Case studies will be presented to determine element availability. The course will first present the principles, the basic assumptions and the theoretical framework that underlay the work with radioisotopes.

Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small interdisciplinary teams.

At the end of this course the students are familiar with the principles on which radioisotope works are based and they have learned from research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students.

The cases studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotope work.

**751-5101-00L Biogeochemistry and Sustainable Management**

*W 2 credits 2G N. Buchmann, L. Hörtnagl*

**Abstract**

This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

**Objective**

Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small interdisciplinary teams.

**Content**

Biogeochemistry and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

**751-5115-00L Current Aspects of Nutrient Cycle in Agro-Ecosystems**

*W 2 credits 1S E. Frossard, A. Oberson Dräayer*

**Abstract**

The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. It offers to deepen the knowledge on a specific theme related to nutrients. It is composed by presentations of national and international speakers and an excursion. The students write a report where they compile the obtained information, relate it to their own knowledge and include literature.

**Objective**

Listen and understand expert presentations. Ask questions and contribute to the discussion during the talk sessions and the excursion. Link the information obtained during the seminar with knowledge from previous lessons and with literature searched to complement the matter. Expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem.

**751-3405-00L Radio-Isotopes in Plant Nutrition**

*W 3 credits 2G E. Frossard*

**Abstract**

The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine element availability. Finally, published studies from other groups will be analyzed and presented by the students.

**Objective**

At the end of this course the students are familiar with the principles on which work with radioisotopes are based and they have learned from published studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotope work.

**Content**

Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, radionuclides) within a given system and to assess the importance of processes controlling these fluxes (e.g. exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.).

The course will first present the principles, the basic assumptions and the theoretical framework that underlay the work with radioisotopes.

It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g. number and size of compartments). Secondly, case studies on isotopic dilution and tracer work will be presented for instance on the isotopic exchange kinetics method to determine nutrients or pollutants availability. The case studies will be adapted to the ongoing research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.

**Lecture notes**

Documents will be distributed during the lecture.

**Literature**

The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at: http://www.pe.ipw.agr.ethz.ch/about/reach

**751-5123-00L Rhizosphere Ecology**

*W 4 credits 4G H. A. Gamper, T. I. McLaren*

**Abstract**

This course is about the physical, chemical, and biological processes in the rhizosphere and their effect on plant growth. Effects of fertilisers, companion plants, and microbial symbionts, and other microbes on nutrient cycling and plant uptake are discussed. An intercropping experiment in the glasshouse is used as a model to check for rhizosphere effects on plant growth and mineral nutrition.
Objective

To gain a holistic understanding of resource-driven and regulatory processes in agricultural and natural ecosystems.

Develop skills on the critical analysis of scientific papers.

Define explanatory hypotheses, identify knowledge gaps for further investigations.

Carry out a multi-disciplinary experiment that involves aspects of soil, (micro-)biology, plant physiology, pathology, and ecology.

Develop manual skills in the set up of a glasshouse experiment, in soil and plant analyses, and in isolation and DNA-based characterisation of rhizobia.

Gain insights on basic methods to analyse (bio-)chemical, molecular genetic, and graphical data.

Discuss and interpret data in the context of the literature.

Prepare a research report in the format of a scientific paper and a poster in the format of a conference paper, partially alone and partially in small groups, using data obtained from the glasshouse experiment.

Content

This course is designed to stimulate thinking and promote critical analysis of important processes that occur in the rhizosphere. As part of this course, the knowledge acquired will be used for analysing and interpreting experimental data, as well as, preparing a scientific report and conference-type poster.

The course will cover the relative importance of spatial scales and various physicochemical and microbiological dynamics as influenced by roots. We will discuss root traits and activities that influence the immediately root-surrounding soil and thereby contribute to mineral nutrient mobilization and immobilization. An overview of the most relevant root-microbe symbioses for agroecosystems will be provided and root and microbial traits discussed, which could be of use in efforts towards utilization of intercropping and bioinoculants as a possible means of reducing energetically expensive inputs to farming systems. A special emphasis will be given to the importance of physicochemical features of soils and the chemical forms (= species) of elements important for plant uptake.

Practical experience will be gained with setting up a glasshouse experiment, soil and root sampling, basic soil and plant analyses, isolation of rhizobia, determination of the number of colony forming units (CFU), assays to screen for phosphorus and zinc solubilizing bacteria, DNA extraction, PCR amplification, and restriction fragment length polymorphism analysis (RFLP) of host range determining symbiosis-specific genes.

In short, the processes dealt with in this course occur on a small-scale and are generally (bio)chemical and microbiological in nature. Furthermore, they are generally not taken into account using current methods of agronomic management for plant production. However, they are increasingly being recognized as a potentially useful means of obtaining a resource-efficient and hence, economically and environmentally sustainable agricultural system, including for ecosystem restoration. Therefore, the course will invite for critical reflections and exemplify challenges in translating knowledge from scientific studies and ecology into application for plant production.

Lecture notes

For documentation, lecture slides and laboratory protocols will continuously be uploaded to the directory '751-5123-00L Rhizosphere Ecology' on the electronic document exchange platform ILIAS, LDA-ELBA:
Objective

Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.

Abstract

This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and water 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Prerequisites / notice

We ask all course attendees of the agricultural sciences to have passed the exams at the end of the lectures Plant Nutrition I and II (Nutrient cycling in agroecosystems) by Prof. E. Frossard. All others, have to have successfully worked through the e-learning module Plant Nutrition I by Prof. E. Frossard. All others, have to have successfully worked through the e-learning module Plant Nutrition I by Prof. E. Frossard:

https://moodle-app2.let.ethz.ch/course/view.php?id=279

Remark: The course is designed to be complementary to those on Radiotopes in Plant Nutrition (751-3405-00L), and Nutrient Fluxes in Soil-Plant Systems (751-3404-00L), although some thematic overlaps cannot be avoided. Special emphasis is given to plant-microbe-soil interactions and an appreciation of whole plant functioning in the ecological context. You will familiarize yourself with bacterial isolation, cultivation, enumeration, as well as, molecular detection, discrimination and identification techniques for rhizosphere and root-associated microbes.

Marking will consider the efforts and outcome of work by the individual participant as well as results of work in small groups. Activities for the course will result in posters and reports in the format of a conference and scientific paper. Reports will be due on Friday January 6, 2017.

Maximum number of participants: 18 (Attention: Admission will be on a first come first served basis ¿ inscribe early!).

Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

701-0533-00L Soil Chemistry

Abstract
This course discusses chemical and biogeochemical processes in soils and their influence on the behavior and cycling of nutrients and pollutants in terrestrial systems. Approaches for quantitative modeling of the processes are introduced.

Objective
Understanding of important chemical soil properties and processes and their influence on the behavior (e.g., speciation, bioavailability, mobility) of nutrients and pollutants.

Content
Important topics include the structure and properties of clays and oxides, the chemistry of the soil solution, gas equilibria, dissolution and precipitation of mineral phases, cation exchange, surface complexation, chemistry of soil organic matter, redox reactions in flooded soils, soil acidification and soil salinization.

Lecture notes
Handouts in lectures.

Literature

701-0535-00L Environmental Soil Physics/Vadose Zone Hydrology

Abstract
The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

Objective
Students are able to:
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media.
- quantify driving forces and resulting fluxes of water, solute, and heat in soils.
- apply modern measurement methods and analytical tools for hydrological data collection
- conduct and interpret a limited number of experimental studies
- explain links between physical processes in the vadose-zone and major societal and environmental challenges

Content
Weeks 1 to 3: Physical Properties of Soils and Other Porous Media
Units and dimensions, definitions and basic mass-volume relationships
Additional topics:
- Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; estimation of thermal properties; engineering applications.
- Biological Processes in the Vadose Zone - An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.

Objective

During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

Literature

Documents handed out during the case studies.

Prerequisites / notice

The course builds on basic knowledge delivered in 'Horticultural Crops I' and 'Horticultural Crops II'. If these courses have not been followed by interested participants, equivalent knowledge and experience will greatly support a successful and productive participation of the participating student.

Language: spoken E, G or F. Documents: Preferably English, G/F possible.

</table>

Objective

During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

Literature

Documents handed out during the case studies.

Prerequisites / notice

The course builds on basic knowledge delivered in 'Horticultural Crops I' and 'Horticultural Crops II'. If these courses have not been followed by interested participants, equivalent knowledge and experience will greatly support a successful and productive participation of the participating student.

Language: spoken E, G or F. Documents: Preferably English, G/F possible.

Abstract

The course focuses on alien organisms in agriculture as well as the scientific assessment and regulatory management of their effects on the environment and agricultural production.

Objective

Students will understand the consequences arising from the unintentional or deliberate introduction of alien organisms into agricultural systems. They will be able to understand the concept of environmental risk assessment and be able to evaluate risk management options.

Content

Alien organisms in agriculture is a topic that receives an increasing awareness among farmers, agricultural scientists, regulators and the general public. Students of this course will learn about the nature of alien organisms such as invasive species, biocontrol organisms and genetically modified organisms. With a particular focus on arthropods, plants and their interactions we will look at the potential threats the novel organisms pose, the benefits they provide and how both of these effects can be scientifically assessed. Students will learn how the topic of alien organisms in agriculture is intrinsically tied to policy making and regulation and get to know current examples and future challenges in research. In the last part of the course students will be able to apply the acquired knowledge in a practical exercise (case study).

Lecture notes

Material will be distributed during the course

701-0263-01L

Seminar in Evolutionary Ecology of Infectious Diseases

Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Objective

This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content

A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Lecture notes

Material will be distributed during the course

715-01-00L

Biogeochemistry and Sustainable Management

This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Objective

Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small (interdisciplinary) teams.

Content

Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Lecture notes

Handouts will be available on the webpage of the course.

Literature

Papers will be assigned and downloaded from a web page announced during the lecture.

Prerequisites / notice

Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Course will be taught in English.

715-3405-00L

Radio-Isotopes in Plant Nutrition

The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine element availability. From other groups will be analyzed and explained by the students.

Objective

At the end of this course the students are familiar with the principles on which radioisotope work is based and they have learned from case studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotope work.

Content

Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, radionuclides) within a given system and to assess the importance of processes controlling these fluxes (e.g. exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.).

The course will first present the principles, the basic assumptions and the theoretical framework that underlay the work with radioisotopes. It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g. number and size of compartments). Secondly, case studies on isotopic dilution and tracer work will be presented for instance on the isotopic exchange kinetics method to determine nutrients or pollutants availability. The case studies will be adapted to the ongoing research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.

Lecture notes

Documents will be distributed during the lecture

Literature

Will be given during the lecture

Prerequisites / notice

The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at: http://www.pe.ipw.agr.ethz.ch/about/reach

715-5125-00L

Stable Isotope Ecology of Terrestrial Ecosystems

This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and water 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Objective

Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small project, to practice to search and analyze literature as well as to give an oral presentation.

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 43 of 1570
The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

Lecture notes
Handouts will be available on the webpage of the course.

Literature
Will be discussed in class.

Prerequisites / notice
This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

751-4805-00L Recent Advances in Biocommunication

Abstract
Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods.

Objective
Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods. Students will engage in discussion and critical analyses of relevant papers and present their evaluations in a seminar setting.

751-5001-00L Agroecologists without Borders

Abstract
In this seminar students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

Objective
(1) Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
(2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
(3) Students articulate complexity and challenges in agricultural development interventions.
(4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

Prerequisites / notice
Students signing up for this class should have a strong interest in tropical agriculture and science communication.

751-5115-00L Current Aspects of Nutrient Cycle in Agro-Ecosystems

Abstract
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. It offers to deepen the knowledge on a specific theme related to nutrients. It is composed by presentations of national and international speakers and by an excursion. The students write a report where they compile the obtained information, relate it to their own knowledge and include literature.

Objective
Listen and understand experts’ presentations. Ask questions and contribute to the discussion during the talk sessions and the excursion. Link the information obtained during the seminar with knowledge from previous lessons and with literature searched to complement the matter. Expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem.

751-4003-01L Current Topics in Grassland Sciences (HS)

Abstract
Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Objective
Students will be able to understand and evaluate experimental design and data interpretation of on-going studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

Content
Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Lecture notes
none

Prerequisites / notice
Prerequisites: Basic knowledge of plant ecophysiology, terrestrial ecology and management of agro- and forest ecosystems. Course will be taught in English.

751-3801-00L Experimental Design and Applied Statistics in Agroecosystem Science

Abstract
In this course, different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem sciences. Both descriptive (field and laboratory) experiments and surveys are addressed and students work with a selection of basic techniques and methods to analyse data using a hands-on approach. Methods range from simple t-tests to multi-fac toria

Objective
Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.

Content
The course program uses a learning-by-doing approach ("hands-on minds-on"). New topics are introduced in the lecture hall, but most of the work is done in the computer lab to allow for the different speeds of progress of the student while working with data and analyzing results. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule containst the following topics:
Introduction To Experimental Design and Applied Statistics
Introduction to ‘R’ / Revival of ‘R’ Skills
Designs of Field and Growth Chamber Experiments
Nonlinear Regression Fits
Multivariate Techniques: Principle Component Analysis, Canonical Correpondence Analysis (CCA), Cluster Analysis
ANOVA using linear and crossed effect models
Error Analysis, Error Propagation and Error Estimation
Introduction to autoregression and autocorrelations in temporal and spatial data and how to consider them in ANOVA-type analysis

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

Lecture notes
Handouts will be available (in English)
A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture. This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor's course "Wissenschaftliche Datenauswertung und Datenpräsentation" (751-0441-00L).

#### 751-6901-00L | Niches in Animal Production | W | 1 | 1G | M. Kreuzer, M. Buchmann |
| Abstract | This course deals with unconventional animals or production forms and specific aspects of for keeping them in Europe or, more specifically, in Switzerland. This includes e.g. rare breeds, wild cattle, deer, camelids, ostrich and fish. Particular emphasis will be given to the regulations and the problems occurring with import, housing and marketing of the products. |
| Objective | At the end of the course the students are able to describe the conditions of keeping unconventional livestock and to develop recommendations for farmers intending to include niche production into the farm enterprise. |
| Content | The contact hour part of the course (16 h) is conceptually a block course which is subdivided into one day of lecture and one day of excursion. |
| Lecture notes | The non-contact hour part (14 h) is to comprehend the information given and to prepare for the examination. |
| Literature | A documentation will be provided at the start of the course. |
| Prerequisites / notice | Will be communicated at the start of the course. |
| The lecture and excursion have the same weight with respect to time allocation. |

#### 751-6243-00L | Conservation of Animal Genetic Resources | W | 1 | 1V | H. Signer-Hasler, C. Flury |
| Abstract | Conservation of Animal Genetic Resources overviews the distribution, endangerment and conservation of farm animal genetic resources in Switzerland and abroad. The theory is illustrated with numerous examples and the knowledge is deepened in exercises. |
| Objective | The students - overview the distribution and endangerment of animal genetic resources on national and international level and they know, where to find the relevant information. - can explain, what value can be assigned to biodiversity and name reasons, why biodiversity should be conserved. - know the national and international efforts of the present and the past to conserve biodiversity in the livestock sector. - can explain what is important concerning the management of small populations. - can explain differences between species and breeds concerning biodiversity conservation. - can describe different conservation activities, in particular in situ and ex situ conservation - can describe current national and international conservation programmes for species and breeds. |

#### 751-6001-00L | Forum: Livestock in the World Food System | W | 2 | 1S | M. Kreuzer, S. Bauersachs, |
This forum is a platform for the critical reflection of highly relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.

The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

Element 1. Oral Presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturers are the audience.

Element 2. Scientific writing: Option 1: preparation of a short scientific type of paper from a result table offered by the lecturers; Option 2: preparation of an abstract with limited word count from a scientific paper; Option 3: writing of a critical review of a paper. The students have to select 2 of the three options each. There will be a discussion be a discussion in small groups at two dates.

Introductions to both forms of presentation will be offered by lecturers. The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

The aim of this course is to know and understand animal production systems in the different zones of the tropics taking into consideration the local and social structure of the population. We will deal with different aspects of animal nutrition in the tropics. We are dealing with animal resources in a wide range of aspects, from scientific basis to production systems, environmental aspects and to the acceptance by society. The exchange is operated by scientific writing and presentation.

The students are divided into groups of three. Each group prepares one topic from the tropical animal nutrition and describes the topic in several different aspects.

The course will be divided in two parts:

1. Experimental part:
   - Isolation of leukocytes from blood and milk (cattle)
   - Culture of isolated cells and stimulation, e.g., with LPS
   - Extraction of RNA
   - Quantification and quality control of RNA (Nanodrop, Fluorometer, Bioanalyzer)
   - Analysis of gene expression by the use of quantitative real-time RT-PCR

2. Theoretical part:
   - Principles of primary cell culture and transcriptional regulation, methods for analytical detection
   - Bioinformatics (scientific databases, sequence analysis, biostatistics)
   - Presentations by the students (e.g. techniques for analysis of physiological regulatory processes, application examples)

The students will present their results in the form of a short scientific paper or a scientific presentation. The presentations take place in the form of a forum with the students as lecturers. The remaining students and lecturers are the audience.

Requirements for allocation of the two credit points:
- Theatre presentation (with handout) at the forum
- Delivery of written documents of sufficient quality
- Active participation during the presentations by the other participants

The practical course will be divided in two parts:

1. Theoretical part:
   - Analysis of gene expression by the use of quantitative real-time RT-PCR
   - Quantification and quality control of RNA (Nanodrop, Fluorometer, Bioanalyzer)
   - Extraction of RNA
   - Culture of isolated cells and stimulation, e.g., with LPS

2. Experimental part:
   - Isolation of leukocytes from blood and milk (cattle)
   - Principles of primary cell culture and transcriptional regulation, methods for analytical detection
   - Bioinformatics (scientific databases, sequence analysis, biostatistics)
   - Presentations by the students (e.g. techniques for analysis of physiological regulatory processes, application examples)
In this practical course the students will achieve a comprehensive understanding of molecular physiology in livestock research. A cell culture experiment using blood and milk leucocytes under pathogen-associated treatment will be performed and the analysis of differential gene expression undertaken. The primary cell culture study will give insights into the laboratory work undertaken in animal physiology research. It will include the general discussion of strategies for an appropriate experimental setup in livestock research and possible methods and tools for the analysis. Hands-on cell culture and harvesting, preanalytical sample preparation and measurement implementation as well as the analysis of differential gene expression, data analysis and statistical evaluation using bioinformatics will be performed. In addition, the students will present talks based on state-of-the-art primary literature about related topics to prepare for the course and to complement the provided information. The course will enable the students to design, perform and evaluate laboratory in vitro investigations of physiological regulatory processes on a cellular level.

| 751-6127-00L | Practical course in Microscopy of Functional Histology | W | 3 credits | 6P | S. E. Ulbrich |

### Ruminant Science

**Number** 751-6501-00L

**Title** Ruminant Science (HS)

**Type** W

**ECTS** 4 credits

**Hours** 4G

**Lecturers** M. Kreuzer, M. C. Härdi-Landerer, E. Hillmann, U. Witschi

**Abstract**

The course provides the scientific basis of the central aspects of reproduction, husbandry and nutrition physiology of ruminants, and of the implications for animal welfare, product quality, breeding programs, and organic livestock systems. Means of knowledge transfer include interdisciplinary approaches, disciplinary parts, web-based learning and self-study.

**Objective**

At the end of the course the students are able to apply, by a comprehensive understanding of the underlying mechanisms, their knowledge in various fields of ruminant science. They will be able to develop and recommend best strategies for breeding programs, feed formulation, improving forage quality, increasing animal health and welfare etc. They will be trained to carry out interdisciplinary and disciplinary research at the highest level. The course Ruminant Science (FS) offered in spring has a similar structure but is complementary to this course.

**Content**

Fields (contact hours)
- Introduction: 2 h
- Special topics: 12 h
- Lameness
- Fertility in Cows
- Food Intake of Ruminants
- Disciplinary topics: 36 h
- Ruminant Husbandry: 16 h
- Ruminant Nutrition: 10 h
- Reproduction in Ruminants: 8 h
- Lectures held by the students: 4 h

In summary
- Contact hours: 52 h
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)
- Self-study in semester break: 38 h
- Total: 120 h

**Lecture notes**

Documentations, links and other materials will be provided at the start of the course

**Literature**

Information on books and other references will be communicated during the course

**Prerequisites / notice**

The specialty of this course is that for the first time the animal science disciplines are unified. This is realised with a particular emphasis on interdisciplinary special topics and new forms of teaching. At the same time the essential basics in the central fields are communicated.

The field of Ruminant Science will also be a part of the spring semester (special topics: Organic Ruminant Systems, Tropical Ruminant Systems, Mastitis; disciplinary courses: Cattle, Sheep and Goat Breeding, Ruminant Diseases and Prophylaxis, Ruminant Nutrition and the Environment). However both courses are organized independently.

Conditions for successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as optional courses in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.

The control of performance will consist of:
- an own lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details

| 751-7211-00L | Ruminal Digestion | W | 1 credit | 1G | A. Schwarm |

**Abstract**

This course broadens the knowledge in one of the most important aspects of ruminant nutrition: the microbial digestion in the rumen (and in the hindgut). For a comprehensive understanding of the rumen microbial ecosystem, the mechanisms of nutrient fermentation and the synthesis of microbial protein, thorough basics are provided. Apart from lectures, group and laboratory exercises are included.

**Objective**

The course enables students to understand in detail how ruminal digestion works and how this knowledge can be applied to design optimal feeding diets using highly fibrous forages and a variety of other feeds. The students also are able to show how to modify the most important rumen microbes beneficially by nutritional means.
Structure of the contact hour part of the course (14 h):

2 h Introduction and blackboard exercise

8 h Basic topics in ruminal digestion, lectures and group exercises:
- Systematics of the microbes involved in microbial digestion
- Measurement of microbial digestion
- Interactions of microbes and epithelium of the digestive tract
- Differences between ruminal and hindgut microbial digestion
- Microbial nutrient degradation and its modification
- Efficiency of microbial protein synthesis
- Manipulation of the ruminal digestion

2 h Laboratory exercise with a rumen fistulated cow and the Rumen Simulation Technique

2 h Final seminar

Lecture notes
The non-contact hour part is to comprehend the information given and to prepare either the written report or the oral presentation (cf. "Besonderes")

Lecture notes are provided via Moodle.

Literature
Will be communicated at the start of the course.

Prerequisites / notice
The course is a balanced mixture of blackboard exercise, laboratory exercise, group exercise, lecture and student seminar presentation.

Credit point associated with grade of either a written report or an oral presentation in the final seminar (both on a self-chosen related topic)

Abstract
This forum is a platform for the critical reflection of highly relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

Objective
In the Forum "Livestock in the World Food System": a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.

Content
The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

Element 1. Oral Presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturers are the audience.

Element 2. Scientific writing: Option 1: preparation of a short scientific type of paper from a result table offered by the lecturers; Option 2: preparation of an abstract with limited word count from a scientific paper; Option 3: writing of a critical review of a paper. The students have to select 2 of the three options each. There will be a discussion be a discussion in small groups at two dates.

Introductions to both forms of presentation will be offered by lecturers.

The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

Lecture notes
no scriptum

Prerequisites / notice
Requirements for allocation of the two credit points:
- Theatre presentation (with handout) at the forum
- Delivery of written documents of sufficient quality
- Active participation during the presentations by the other participants

751-4203-00L Horticultural Science: Case Studies (HS)

Abstract
Lectures address 2 horticultural cropping systems and value chains, each one in 4 2h-lecture blocks. Afterwards, the students split in 2 groups for addressing a case study focusing on one of the cropping systems treated before. An excursion to a research site might be included. In a final colloquium, each group presents a report on their case study and their conclusions.
Achieve a deepened understanding of horticultural value chain challenges relating to ecological intensification, resource efficiency, climate change and healthy and safe food, and the problem solution strategies and scientific principles behind. Deliver in a team effort a report and a presentation providing a comprehensive insight into a problem of the horticultural value chain and its science-based solution strategy.

In the autumn semester, the two addressed cropping systems and value chains are fruit-production and viticulture. In the spring semester, the two addressed cropping systems and value chains are vegetable-production- and berry-production or glasshouse-horticulture. The selected topics address challenges with regard to ecological intensification, resource efficiency or climate change and branch into ongoing research and development projects.

As provided by the case study leaders.

The course builds on basic knowledge delivered in 'Horticultural Crops I' and 'Horticultural Crops II'. If these courses have not been followed by interested participants, equivalent knowledge and experience will greatly support a successful and productive participation of the participating student.

Language: spoken E, G or F, Documents: Preferably English, G/F possible.

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 49 of 1570
Abstract

The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines. Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.

Objective

At the end of the course students should:

Know:
- Function, purpose and algorithm of a selected number of transdisciplinary methods

Understand:
- Functional application in case studies and other problem oriented projects

Be able to reflect on:
- Potential, limits, and necessity of transdisciplinary methods

Be prepared for:
- Transdisciplinary Case Study 2017

Content

The lecture is structured as follows:

- Overview of concepts and methods of inter-/transdisciplinary integration of knowledge, values and interests (approx. 20%)
- Analysis of a selected number of transdisciplinary methods focusing problem framing, problem analysis, and impact (approx. 50%)
- Practical application of the methods in a broader project setting (approx. 30%)

Lecture notes

Handouts are provided by the lecturers

Literature

Selected scientific articles and book-chapters

Prerequisites / notice

This course is recommended and helpful for students participating in the Transdisciplinary Case Study 2017.
Fields (contact hours)

- Introduction: 2 h
- Special topics: 12 h
  - Lameness
  - Fertility in Cows
  - Food Intake of Ruminants
- Disciplinary topics: 36 h
  - Ruminant Husbandry: 16 h
  - Ruminant Nutrition Physiology: 10 h
  - Reproduction in Ruminants: 8 h
- Lectures held by the students: 4 h

In summary

- Contact hours: 52 h
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)
- Self-study in semester break: 38 h
Total: 120 h

In summary

- Contact hours: 52 h
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)
- Self-study in semester break: 38 h
Total: 120 h

Lecture notes

- Documentations, links and other materials will be provided at the start of the course

Literature

- Information on books and other references will be communicated during the course

Prerequisites / notice

- The specialty of this course is that for the first time the animal science disciplines are unified. This is realised with a particular emphasis on interdisciplinary special topics and new forms of teaching. At the same time the essential basics in the central fields are communicated.
- The field of Ruminant Science will also be a part of the spring semester (special topics: Organic Ruminant Systems, Tropical Ruminant Systems, Mastitis; disciplinary courses: Cattle, Sheep and Goat Breeding, Ruminant Diseases and Prophylaxis, Ruminant Nutrition and the Environment). However both courses are organized independently.
- Conditions for successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as "optional courses" in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.
- The control of performance will consist of:
  - an own lecture
  - a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details
- The non-contact hour part is to comprehend the information given and to prepare either the written report or the oral presentation (cf. "Besonderes")
- The course is a balanced mixture of blackboard exercise, laboratory exercise, group exercise, lecture and student seminar presentation.
- Credit point associated with grade of either a written report or an oral presentation in the final seminar (both on a self-chosen related topic)

Non-Ruminant Science

- The overall goal of the course is to provide the essential scientific knowledge of the genetic, physiological and special nutritional aspects of pigs metabolism, animal health and behaviour, and of the implications for environment, product quality, housing and animal welfare, and breeding programs.
- Students will
  - understand the complex interactions of nutrition, quality traits of products, breeding and reproduction, health management, behaviour and husbandry.
  - be trained to understand interdisciplinary and disciplinary research.
  - be able to critically analyze published research data.
  - be able to present precise scientific reports in oral and written form.

Data: 08.05.2017 12:41

Autumn Semester 2016
Four main topics in Pig Science:
- Behaviour and Husbandry of pigs: behavioral needs, husbandry related behavioral disorders, design and construction of housing systems in accordance with welfare requirements and legal regulations.
- Planning of reproductive cycle in practice
- welfare monitoring in practice
- pigs in organic farming
- Animal Health and Diseases: animal hygiene, immunology/vaccinations, metabolic diseases, diarrhoe, legisalation, thermoregulation, important infections, prophylaxis.
- poster, exam and evaluation

FS
- Special Physiology of Pig Nutrition: food intake; growth; metabolism and digestion at different growth stages; energy and specific nutritional requirements; feeding systems; environmental aspects, effed.
- Genetics: Breeding systems, reproductive techniques, performance tests and recording, etc.
- oral presentation, exam, evaluation

Handouts/scripts are distributed by the the lecturers.
Specific literature is indicated by the lecturers.
The lecture corresponds with the lecture "Ruminant Science" and knowledge in animal health, nutrition and breeding as well as applied ethology and animal welfare are recommended.
The lecture usually is in German, but there is always the possibility to change to English.

Livestock Breeding and Genomics

Abstract
Methods for analysing livestock data, in particular for the estimation of breeding values: principles of selection index, introduction to BLUP, application of common models used, relationship matrix, methods for the estimation of variance components, basics of breeding programs. The material will be illustrated via exercises and assignments.

Objective
The students are able to set up design matrices, the relationship matrix and its inverse as well as the Mixed Model equations to estimate BLUP breeding values for smaller examples.

Content
- Selection index (various sources of information, one trait, multiple traits)
- Relationship matrix and its inverse
- BLUP: one trait, repeated observations, multiple traits, economic indices
- Introduction to methods for the estimation of variance components
- Assignments

Lecture notes
Copies of the slides are available on the net.

Literature
To be announced in the lectures.

Conservation of Animal Genetic Resources

Abstract
Conservation of Animal Genetic Resources overviews the distribution, endangerment and conservation of farm animal genetic resources in Switzerland and abroad. The theory is illustrated with numerous examples and the knowledge is deepened in exercises.

Objective
The students
- overview the distribution and endangerment of animal genetic resources on national and international level and they know, where to find the relevant information.
- can explain, what value can be assigned to biodiversity and name reasons, why biodiversity should be conserved.
- know the national and international efforts of the present and the past to conserve biodiversity in the livestock sector.
- can explain what is important concerning the management of small populations.
- can explain differences between species and breeds concerning biodiversity conservation.
- can describe different conservation activities, in particular in situ and ex situ conservation
- can describe current national and international conservation programmes for species and breeds.

Endocrinology and Biology of Reproduction

Abstract
Endokrinologie und Reproduktionsbiologie der Säugetiere und des Menschen (Anatomie, Morphologie, Physiologie, Regelmechanismen) Die Systematik der Reproduktionshormone und der Hormonrezeptoren wird erläutert, die Wirkungsmechanismen (Bildung; orale Bioverfügbarkeit; Elimination) erklärt. Mit diesen Grundlagen wird das Verständnis der Regulation der Fortpflanzung umfassend erörtert.

Objective
Die Studierenden erlangen das grundlegende theoretische Verständnis und Fachwissen zur Endokrinologie der Reproduktion und zur weiblichen und männlichen Reproduktionsbiologie. Sie können darüber hinaus pathologische Situationen (Fortpflanzungsstörungen) und deren vielfältige Ursachen in den physiologischen Kontext einordnen.

Methodology Competences

Methods in Animal Science

Number | Title | Type | ECTS | Hours | Lecturers
--- | --- | --- | --- | --- | ---

Abstract
- Assignment of the students into the research groups day-to-day work and will thus deal with all aspects of scientific work. This comprises the planning (conceptually and logistically), execution (data collection, laboratory analyses) and evaluation (statistics, data presentation) of experiments as well as the basics of scientific writing (aim: later publication, Master thesis). The research topics and the range of methodologies vary between the animal science research groups in the Institute of Plant, Animal and Agroecosystem Sciences.
A. Hund, E. Hillmann, The course program uses a learning-by-doing approach ("hands-on minds-on"). New topics are introduced in the lecture hall, but most of the time budget is equivalent to about 180 hours. Active participation in group meetings (discussion, presentation) and short written reports about the work conducted are required for the 6 credit points. There are no grades, it is only pass or fail.

**Lecture notes** None

**Literature** Specific readings after enlisting in a particular research group.

**Prerequisites** The number of training slots in the various groups is limited. It is therefore highly recommended to contact the group leaders early enough (first come first serve).

**Objective**

- Introduction into the conceptual and methodological basis of research
- Integration of the students into the research groups (on job training)
- Application of the gained knowledge

**Content**

The students will be integrated into the research groups day-to-day work and will thus deal with all aspects of scientific work. This comprises the planning (conceptually and logistically), execution (data collection, laboratory analyses) and evaluation (statistics, data presentation) of experiments as well as the basics of scientific writing (aim: later publication, Master thesis). In this practical course the students will achieve a comprehensive understanding of molecular physiology in livestock research. A cell culture experiment using blood and milk leucocytes under pathogen-associated treatment will be performed and the analysis of differential gene expression undertaken. The primary cell culture study will give insights into the laboratory work undertaken in animal physiology research. It will include the general discussion of strategies for an appropriate experimental setup in livestock research and possible methods and tools for the analysis. Hands-on cell culture and harvesting, preanalytical sample preparation and measurement implementation as well as the analysis of differential gene expression, data analysis and statistical evaluation using bioinformatics will be performed. In addition, the students will present talks based on state-of-the-art primary literature about related topics to prepare for the course and to complement the provided information. The course will enable the students to design, perform and evaluate laboratory in vitro investigations of physiological regulatory processes on a cellular level.

</tbody>
</table>

#### Abstract

Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.

#### Objective

During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

### Current Challenges in Plant Breeding

#### Abstract

The seminar ‘Current challenges in plant breeding’ aims to bring together national and international experts in plant breeding to discuss current activities, latest achievements and future prospective of a selected topic/area in plant breeding. The topic this year will be: ‘Genome editing: potential and challenges for plant breeding’.

#### Objective

The educational objectives cover both thematic competences and soft skills:

- **Thematic competences:**
  - Deepening of scientific knowledge in plant breeding
  - Critical evaluation of current challenges and new concepts in plant breeding
  - Promotion of collaboration and Master thesis projects with practical plant breeders

- **Soft skills:**
  - Independent literature research to get familiar with the selected topic
  - Critical evaluation and consolidation of the acquired knowledge in an interdisciplinary team
  - Establishment of a scientific presentation in an interdisciplinary team
  - Presentation and discussion of the teamwork outcome
  - Establishing contacts and strengthening the network to national and international plant breeders and scientist

#### Content

Interesting topics related to plant breeding will be selected in close collaboration with the working group for plant breeding of the Swiss Society of Agronomy (SSA). For this year, the topic ‘Genome editing: potential and challenges for plant breeding’ was selected.

In the fall semester (November 29, 2016), the enrolled students will meet with the lecturers as well as four to six tutors, selected according to their expertise in the selected topic (one afternoon, for about three hours). After an input talk by the lecturers, four to six specific questions/aspects will be identified and phrased. The tutors and the enrolled students will be assigned to four to six different groups, to critically evaluate one question/aspect of the selected topic. The students, guided by tutors, will prepare a presentation of 15 minutes (plus 5 minutes discussion) covering their specific question/aspect. Participation on that afternoon will be mandatory.

End of January (January 31, 2017), a one-day seminar on the selected topic will be organized. After one to two keynote speakers (international experts), four invited talks will link the selected topic to practical plant breeding. In the afternoon, the four to six students groups will present and discuss with the experts their specific questions on the selected topic/area. These presentations will be evaluated by the lecturers. The seminar will be public and serve as annual meeting of the SSA working group for plant breeding, bringing together the experts in plant breeding.

The course is designed for a maximum of 15 Master students and 10 PhD students (advertised and recruited via the Zurich-Basel Plant Science Center). For full and active participation, a total of 2 credit/ECTS points will be provided.

#### Literature

Peer-reviewed research articles, selected according to the selected topic/area.

### Crop Health
Agriculture and Environment

Number | Title | Type | ECTS | Hours | Lecturers |
--- | --- | --- | --- | --- | --- |
751-5101-00L | Biogeochemistry and Sustainable Management | W+ | 2 credits | 2G | N. Buchmann, L. Höftnagel |

Abstract
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Objective
Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. They will be able to understand the concept of environmental risk assessment and be able to evaluate risk management options.

Content
Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Lecture notes
Handouts will be available on the webpage of the course.

Prerequisites / notice
Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Course will be taught in English.

751-5115-00L | Current Aspects of Nutrient Cycle in Agro-Ecosystems | W+ | 2 credits | 1S | E. Frossard, A. Oberson Dräayer |

Abstract
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. It offers to deepen the knowledge on a specific theme related to nutrients. It is composed by presentations of national and international speakers and by an excursion. The students write a report where they compile the obtained information, relate it to their own knowledge and include literature.

Objective
Listen and understand expert’s presentations. Ask questions and contribute to the discussion during the talk sessions and the excursion. Link the information obtained during the semester with knowledge from previous lessons and with literature searched to complement the matter. Expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem.

751-4003-01L | Current Topics in Grassland Sciences (HS) | W+ | 2 credits | 2S | N. Buchmann |

Abstract
Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.
Objective
Students will be able to understand and evaluate experimental design and data interpretation of ongoing studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

Content
Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Lecture notes
none

Prerequisites / notice
Prerequisites: Basic knowledge of plant ecophysiology, terrestrial ecology and management of agro- and forest ecosystems. Course will be taught in English.

751-5001-00L
Agroecologists without Borders
In this seminar students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems Group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

Objective
(1) Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
(2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
(3) Students articulate complexity and challenges in agricultural development interventions.
(4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

Prerequisites / notice
Students signing up for this class should have a strong interest in tropical agriculture and science communication.

751-5201-00L
Tropical Soils and Land Use
This course guides students in analyzing and comprehending tropical agroecosystems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in southern Ethiopia, which is co-organized with Arba Minch University (Ethiopia) and KU Leuven (Belgium).

Objective
Lectures and exercises:
(1) Introduction to international soil classification with focus on tropical soils
(2) Soil suitability (chemical, physical and biological fertility) for tropical crops
(3) Soil conservation practices and stakeholder involvement
(4) Approaches to analyzing tropical agroecosystems

Field project:
(5) Overview of the major land use systems in the South Ethiopian Rift Valley
(6) Analysis of agricultural production systems in the Gamo-Gofa region in southern Ethiopia
(7) Hands-on training on the use of field methods, diagnostic tools and survey methods
(8) Collaboration in international student teams (MSc students from Switzerland, Belgium and Ethiopia)

Literature

Prerequisites / notice
The number of participants is limited to 12 students due to capacity limitations for the field project in Ethiopia. Selection of participants will be based on (1) the student’s motivation statement, (2) successful participation in the BSc lectures "Sustainable Agroecosystems I + II" and (3) related topic for BSc thesis/ tentative topic for MSc thesis. The motivation statement is due in the first week of the semester.

Plant Pathology III
W
2
2G
U. Merz, M. Maurhofer Bringolf

Abstract
Identification based on host, symptoms and micro-morphology, completed with life cycles and related control measures of the most important fungal diseases and their causal pathogens of annual and perennial crops with agricultural significance.

Objective
The students will learn and train preparation skills for microscopy, acquire knowledge of selected diseases (identification, biology of pathogen, epidemiology) and understand the corresponding integrated control measures practiced in Swiss agriculture.

Content
The course will partly be an e-learning excercise (with computers).

Lecture notes
A script will be used on annual and perennial crops and their most important diseases. It will be updated stepwise

Prerequisites / notice
The course will be in German (spec. nomenclature)

751-4805-00L
Recent Advances in Biocommunication
W+
2
2S
C. De Moraes

Number of participants limited to 25

Abstract
Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods.

Objective

751-3405-00L
Radio-Isotopes in Plant Nutrition
W+
3
2G
E. Frossard

Abstract
The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine element availability. Finally, published studies from other groups will be analyzed and presented by the students.

Objective
At the end of this course the students are familiar with the principles on which radioisotope works are based and they have learned from case studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotope work.
Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, radionuclides) within a given system and to assess the importance of processes controlling these fluxes (e.g. exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.). The course will first present the principles, the basic assumptions and the theoretical framework that underlay the work with radioisotopes. It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g. number and size of compartments). Secondly, case studies on isotopic dilution and tracer work will be presented for instance on the isotopic exchange kinetics method to determine nutrients or pollutants availability. The case studies will be adapted to the ongoing research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.

Lecture notes: Documents will be distributed during the lecture

Literature: Will be given during the lecture

Prerequisites / notice: The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at:

http://www.pe.ipw.agrl.ethz.ch/about/reach

751-5123-00L Rhizosphere Ecology

Number of participants limited to 18.

Prerequisites: Only students who have passed the courses 751-3401-00L Pflanzennährung I and 751-3402-00L Pflanzennährung II - Integriertes Nährstoffmanagement can be admitted to this course.

Abstract: This course is about the physical, chemical, and biological processes in the rhizosphere and their effect on plant growth. Effects of fertilisers, companion plants, and microbial symbionts, and other microbes on nutrient cycling and plant uptake are discussed. An intercropping experiment in the glasshouse is used as a model to check for rhizosphere effects on plant growth and mineral nutrition.

Objective: To gain a holistic understanding of resource-driven and regulatory processes in agricultural and natural ecosystems.

- Develop skills on the critical analysis of scientific papers.
- Define explanatory hypotheses, identify knowledge gaps for further investigations.
- Carry out a multi-disciplinary experiment that involves aspects of soil, (micro-)biology, plant physiology, pathology, and ecology.
- Develop manual skills in the set up of a glasshouse experiment, in soil and plant analyses, and in isolation and DNA-based characterisation of rhizobia.
- Gain insights on basic methods to analyse (bio-)chemical, molecular genetic, and graphical data.
- Discuss and interpret data in the context of the literature.
- Prepare a research report in the format of a scientific paper and a poster in the format of a conference paper, partially alone and partially in small groups, using data obtained from the glasshouse experiment.

Content: This course is designed to stimulate thinking and promote critical analysis of important processes that occur in the rhizosphere. As part of this course, the knowledge acquired will be used for analysing and interpreting experimental data, as well as, preparing a scientific report and conference-type poster.

The course will cover the relative importance of spatial scales and various physicochemical and microbiological dynamics as influenced by roots. We will discuss root traits and activities that influence the immediately root-surrounding soil and thereby contribute to mineral nutrient mobilization and immobilization. An overview of the most relevant root-microbe symbioses for agroecosystems will be provided and root and microbial traits discussed, which could be of use in efforts towards utilization of intercropping and bioinoculants as a possible means of reducing energetically expensive inputs to farming systems. A special emphasis will be given to the importance of physicochemical features of soils and the chemical forms (= species) of elements important for plant uptake.

Practical experience will be gained with setting up a glasshouse experiment, soil and root sampling, basic soil and plant analyses, isolation of rhizobia, determination of the number of colony forming units (CFU), assays to screen for phosphorus and zinc solubilizing bacteria, DNA extraction, PCR amplification, and restriction fragment length polymorphism analysis (RFLP) of host range determining symbiosis-specific genes.

In short, the processes dealt with in this course occur on a small-scale and are generally (bio)chemical and microbiological in nature. Furthermore, they are generally not taken into account using current methods of agronomic management for plant production. However, they are increasingly being recognized as a potentially useful means of obtaining a resource-efficient and hence, economically and environmentally sustainable agricultural system, including for ecosystem restoration. Therefore, the course will invite for critical reflections and exemplify challenges in translating knowledge from scientific studies and ecology into application for plant production.

Ecological understanding (Second Edition)

Prerequisites / notice
We ask all course attendees of the agricultural sciences to have passed the exams at the end of the lectures Plant Nutrition I and II (Nutrient cycling in agroecosystems) by Prof. E. Frossard. All others, have to have successfully worked through the e-learning module Plant Nutrition I by Prof. E. Frossard. https://moodle-app2.let.ethz.ch/course/view.php?id=279

Remark: The course is designed to be complementary to those on Radioisotopes in Plant Nutrition (751-3405-00L), and Nutrient Fluxes in Soil-Plant Systems (751-3404-00L), although some thematic overlaps cannot be avoided. Special emphasis is given to plant-microbe-soil interactions and an appreciation of whole plant functioning in the ecological context. You will familiarize yourself with bacterial isolation, cultivation, enumeration, as well as, molecular detection, discrimination and identification techniques for rhizosphere and root-associated microbes.

Marking will consider the efforts and outcome of work by the individual participant as well as results of work in small groups. Activities for the course will result in posters and reports in the format of a conference and scientific paper. Reports will be due on Friday January 6, 2017.

Maximum number of participants: 18 (Attention: Admission will be on a first come first served basis, please inscribe early!).

Students of D-USYS will be reimbursed via bank transfer for train and bus tickets of the zones 121 and 122 (Please send all tickets with the bank details to Christiane Gujan (http://www.plantnutrition.ethz.ch/the-group/people-a-z/person-detail.html?persid=85593).

751-5125-00L Stable Isotope Ecology of Terrestrial Ecosystems W+ 2 credits 2G R. A. Werner, N. Buchmann, A. Gessler

Abstract
This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and water 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.
The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

Handouts will be available on the webpage of the course.

Design, Analysis and Communication of Science

<table>

Objective

Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.

The course program uses a learning-by-doing approach ("hands-on minds-on"). New topics are introduced in the lecture hall, but most of the work is done in the computer lab to allow for the different speeds of progress of the student while working with data and analyzing results. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

Introduction to Experimental Design and Applied Statistics

- Designs of Field and Growth Chamber Experiments
- Nonlinear Regression Fits
- Multivariate Techniques: Principle Component Analysis, Canonical Correpondence Analysis (CCA), Cluster Analysis
- ANOVA using linear and mixed effect models
- Error Analysis, Error Propagation and Error Estimation
- Introduction to autoregression and auto correlations in temporal and spatial data and how to consider them in ANOVA-type analysis

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

Only for Agricultural Sciences MSc

Objective

- Die Studierenden kennen die Aufgaben und Termine des Berufspraktikums
- können wissenschaftliche Poster gestalten und wirkungsvoll präsentieren
- sind sich im Hinblick auf ihre Praktikumsbewerbung ihrer fachlichen und überfachlichen Kompetenzen bewusst und kommunizieren diese in Bewerbungsunterlagen und Vorstellungsgespräch
- können konstruktives Feedback zur Postergestaltung und -präsentation sowie zu den Bewerbungsunterlagen geben und annehmen

Arbeitsunterlagen werden in der Vorlesung abgegeben

Environmental and Resource Use Economics

Number Title Type ECTS Hours Lecturers
701-1651-00L Environmental Governance W+ 3 credits 2G E. Lieberherr, G. de Buren, R. Schweizer
Number of participants limited to 30.
Abstract
The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.
To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

To analyze the evolution as well as the key elements of environmental governance.

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of 'environmental governance' and how legitimate and effective are these approaches in addressing persistent environmental challenges?

We will mostly work with readings from the following books:

A detailed course schedule will be made available at the beginning of the semester.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy).

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

751-2103-00L Socioeconomics of Agriculture W+ 2 credits 2V S. Mann

Abstract
The main part of this lecture will examine constellations where hierarchies, markets or cooperation have been observed and described in the agricultural sector. On a more aggregated level, different agricultural systems will be evaluated in terms of main socioeconomic parameters like social capital or perceptions.

Objective
Students should be able to describe the dynamics of hierarchies, markets and cooperation in an agricultural context.

Content
Groups, identities and utility maximization of some conceptual foundations Micro-Socioeconomics: Hierarchy, cooperation and markets Macro-Socioeconomics: Varieties of Capitalism Agricultural Administration: Path dependencies and efficiency issues Causes and Impacts of farm succession Occupational Choice in the farming sector System Choice and segregation (organic, GMO etc.) The economics of rural areas Common Resource Management in Alpine Farming Agricultural Cooperatives Societal perceptions of agriculture Perceptions of farming from within Varieties of agricultural systems and policies

Lecture notes Literature
We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy).

851-0594-00L International Environmental Politics W 3 credits 2V T. Bernauer

Abstract
This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

Objective
The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.

Content
This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

Lecture notes Literature
Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link > Registered students, please click here for course materials; at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike.Hudecheck@student.ethz.ch). All assigned papers must be read ahead of the respective meeting. Following the course on the basis of on-line slides and papers alone is not sufficient. Physical presence in the classroom is essential. Many books and journals covering international environmental policy issues can be found at the D-GESS library at the IFW building, Haldeneggstrasse 4, B-floor, or in the library of D-USYS.

Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link > Registered students, please click here for course materials; at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike.Hudecheck@student.ethz.ch).

**Abstract**
The course focuses on agricultural economic research with particular focus on policy evaluation. We impart insights in the issue of policy evaluation as part of agricultural economics research.

**Objective**
Focus: Policy Evaluation

- The students are to...
  - have a critical look at different angles of agri-economic research
  - study scientific literature of the focus theme
  - consider strengths, weaknesses and the application of research approaches
  - apply knowledge gained from other courses with respect to the focus theme
  - get insights in agricultural economic research of the national research institutions by visiting Agroscope and the Research Institute of Organic Agriculture (FiBL)
  - be capable to conduct evaluations and critically reflect evaluation results

**Content**
Unit: Subject

1: Introduction in the issue of policy evaluation
2: The normative frame for policy evaluation
3: Evaluation of public policies
4: Context and use of evaluations
5: Quantitative policy evaluation
6: Qualitative policy evaluation
7: Group work
8: Agricultural Economics Research at ART
9: Agricultural Economics Research at FiBL
10: Examination, Feedback

**Abstract**
In this course, different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem sciences. Both manipulative (field and laboratory) experiments and surveys are addressed and students work with a selection of basic techniques and method to analyse data using a hands-on approach. Methods range from simple t-tests to multi-factorial analyses.

**Objective**
Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.

**Content**
The course program uses a learning-by-doing approach ("hands-on minds-on"). New topics are introduced in the lecture hall, but most of the work is done in the computer lab to allow for the different speeds of progress of the student while working with data and analyzing results. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contains the following topics:

- Introduction To Experimental Design and Applied Statistics
- Introduction to 'R' / Revival of 'R' Skills
- Designs of Field and Growth Chamber Experiments
- Nonlinear Regression Fits
- Multivariate Techniques: Principle Component Analysis, Canonical Correpondence Analysis (CCA), Cluster Analysis
- ANOVA using linear and mixed effect models
- Error Analysis, Error Propagation and Error Estimation
- Introduction to autoregression and autocorrelations in temporal and spatial data and how to consider them in ANOVA-type analysis

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

**Lecture notes**
Handouts will be available (in English)

**Literature**
A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture.

**Prerequisites / notice**
This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor's course "Wissenschaftliche Datenauswertung und Datenpräsentation" (751-0441-00L)
Finding solutions: what is complexity, problem solving cycle.

Implementing solutions: project management, critical path method, quality control feedback loop.

Controlling solutions: Vensim software, feedback cycles, control parameters, instabilities, chaos, oscillations and cycles, supply and demand, production functions, investment and consumption

A successful participant of the course is able to:
- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyse the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics

Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical systems dynamics, nonlinear dynamics and macroeconomic modeling.

The course is structured along three main tasks:
1. Finding solutions
2. Implementing solutions
3. Controlling solutions

PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM. The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advanced lecture on basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, network flows, knapsack problem, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

Information about relevant literature will be given in the lecture.

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advanced lecture on basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

Agricultural production is exposed to various risks which are important for decisions taken by farmers and other actors in the agri-food sector. Moreover, risk management is indispensable for all actors. This course introduces modern concepts on decision making under risk and recent developments in risk management. The focus of this course is on agriculture applications.

-to develop a better understanding of decision making under uncertainty and risk;
-to gain experience in different approaches to analyze risky decisions;
-to develop an understanding for different sources of risk in agricultural production;
-to understand the crucial role of subjective perceptions and preferences for risk management decisions;
-to get an overview on risk management in the agricultural sector, with a particular focus on insurance solutions

Quantification and measurement of risk
Risk preferences, expected utility theory and alternative models of risk behavior
Concepts on the decision making under risk
Production, investment and diversification decisions under risk
Risk management in agriculture

Handouts will be distributed in the lecture and available on the Moodle.

Students in this class develop a dynamic simulation model that represents the basic mechanisms underlying food security in developing countries in a highly aggregated way. Students then proceed to extending the simulation model with one policy to improve food security and they analyze the dynamic impacts of this policy on production and environmental outcomes.

Students can develop, analyze and extend a dynamic simulation model and interpret its results.
By applying the developed simulation model, students gain insights into food security issues. They also learn to recognize the benefits and pitfalls of dynamic simulation, both from a theoretical and an applied perspective.

Slides (will be provided during the class)
To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and tools. The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of ‘environmental governance’ and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Lecture notes
We will mostly work with readings from the following books:
We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)

### 752-2122-00L Food and Consumer Behaviour
- **Objective**: This course focuses on food consumer behavior, consumer's decision-making processes and consumer's attitudes towards food products. The course provides an overview about the following topics: Factors influencing consumer's food choice, food and health, attitudes towards new food and food technologies, labeling and food policy issues.

### 751-2903-00L Evaluation of Agricultural Policies
- **Objective**: Focus: Policy Evaluation
  - The students are to...
    - have a critical look at different angles of agri-economic research
    - study scientific literature of the focus theme
    - consider strengths, weaknesses and the application of research approaches
    - apply knowledge gained from other courses with respect to the focus theme
    - get insights in agricultural economic research of the national research institutions by visiting Agroscope and the Research Institute of Organic Agriculture (FiBL)
    - be capable to conduct evaluations and critically reflect evaluation results

### 751-2205-00L Advanced Management in the Agri-Food-Chain
- **Objective**: After the lecture the students...
  - know the characteristics and consequences of complexity in the organizational world,
  - know and can apply selected comprehensive models for managing in complex situations,
  - know possible practical applications and examples of the treated contents to organizations in the Agri-Food Chain and
  - are able to deepen the relevant topics in an autonomous way.

### 751-5001-00L Agroecologists without Borders
- **Objective**: (1) Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
  (2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
  (3) Students articulate complexity and challenges in agricultural development.
  (4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

### 851-0594-00L International Environmental Politics
- **Objective**: The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.

---

**Autumn Semester 2016**

Data: 08.05.2017 12:41
This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Lecture notes

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link Registered students, please click here for course materials at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike Hudecheck <michaelh@student.ethz.ch>). All assigned papers must be read ahead of the respective meeting. Following the course on the basis of on-line slides and papers alone is not sufficient. Physical presence in the classroom is essential. Many books and journals covering international environmental policy issues can be found at the D-GESS library at the IFW building, Haldeneggsteig 4, B-floor, or in the library of D-USYS.

Literature

Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link Registered students, please click here for course materials at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike Hudecheck <michaelh@student.ethz.ch>).

### Environmental Crop Physiology

| Content | Alien organisms in agriculture is a topic that receives an increasing awareness among farmers, agricultural scientists, regulators and the general public. Students of this course will learn about the nature of alien organisms such as invasive species, biocontrol organisms and genetically modified organisms. With a particular focus on arthropods, plants and their interactions we will look at the potential threats the novel organisms pose, the benefits they provide and how both of these effects can be scientifically assessed. Students will learn how the topic of alien organisms in agriculture is intrinsically tied to policy making and regulation and get to know current examples and future challenges in research. In the last part of the course students will be able to apply the acquired knowledge in a practical exercise (case study).

| Lecture notes | Material will be distributed during the course |

This course is designed to stimulate thinking and promote critical analysis of important processes that occur in the rhizosphere. As part of the current aspects of nutrient cycle in agro-ecosystems, students will gain a holistic understanding of resource-driven and regulatory processes in agricultural and natural ecosystems. Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems. Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Handouts will be available on the webpage of the course.

Will be discussed in class.
Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.

**Prerequisites / notice**

We ask all course attendees of the agricultural sciences to have passed the exams at the end of the lectures Plant Nutrition I and II (Nutrient cycling in agroecosystems) by Prof. E. Frossard. All others, have to have successfully worked through the e-learning module Plant Nutrition I by Prof. E. Frossard:

https://moodle-app2.let.ethz.ch/course/view.php?id=279

Remark: The course is designed to be complementary to those on Radioisotopes in Plant Nutrition (751-3405-00L), and Nutrient Fluxes in Soil-Plant Systems (751-3404-00L), although some thematic overlaps cannot be avoided. Special emphasis is given to plant-microbe-soil interactions and an appreciation of whole plant functioning in the ecological context. You will familiarize yourself with bacterial isolation, cultivation, enumeration, as well as, molecular detection, discrimination and identification techniques for rhizosphere and root-associated microbes.

Marking will consider the efforts and outcome of work by the individual participant as well as results of work in small groups. Activities for the course will result in posters and reports in the format of a conference and scientific paper. Reports will be due on Friday January 6, 2017.

Maximum number of participants: 18 (Attention: Admission will be on a first come first served basis ¿ inscribe early!).

Students of D-USYS will be reimbursed via bank transfer for train and bus tickets of the zones 121 and 122 (Please send all tickets with the bank details to Christiane Gujan (http://www.plantnutrition.ethz.ch/the-group/people-a-z/person-detail.html?persid=85593)).

**Literature**

**Prerequisites / notice**

We ask all course attendees of the agricultural sciences to have passed the exams at the end of the lectures Plant Nutrition I and II (Nutrient cycling in agroecosystems) by Prof. E. Frossard. All others, have to have successfully worked through the e-learning module Plant Nutrition I by Prof. E. Frossard:

https://moodle-app2.let.ethz.ch/course/view.php?id=279

Remark: The course is designed to be complementary to those on Radioisotopes in Plant Nutrition (751-3405-00L), and Nutrient Fluxes in Soil-Plant Systems (751-3404-00L), although some thematic overlaps cannot be avoided. Special emphasis is given to plant-microbe-soil interactions and an appreciation of whole plant functioning in the ecological context. **Abstract**

This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and water 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.
The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

Lectures will be available on the webpage of the course.

This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

Data: 08.05.2017 12:41
Autumn Semester 2016
Page 71 of 1570
Objective

Students are able to
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media,
- quantify driving forces and resulting fluxes of water, solute, and heat in soils.
- apply modern measurement methods and analytical tools for hydrological data collection
- conduct and interpret a limited number of experimental studies
- explain links between physical processes in the vadose-zone and major societal and environmental challenges

Content

Weeks 1 to 3: Physical Properties of Soils and Other Porous Media
- Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior

Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:
- Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.
- Part 2 - Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.

Midterm exam

Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.

Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.

Part 3 - Use of Hydrus model for simulation of unsaturated flow

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evaportranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils
- Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.

Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:
- Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

Biological Processes in the Vadose Zone
- An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.

Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller (available at the beginning of the semester)
http://www.step.ethz.ch/education/active-courses/vadose-zone-hydrology

Supplemental textbook (not mandatory) - Environmental Soil Physics, by: D. Hillel

751-5101-00L Biogeochemistry and Sustainable Management

W+ 2 credits 2G N. Buchmann, L. Hörnagl

Abstract

This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Objective

Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small (interdisciplinary) teams.

Content

Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climates, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Lecture notes

Handouts will be available on the webpage of the course.

Literature

Will be discussed in class.

Prerequisites / notice

Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Course will be taught in English.

751-5115-00L Current Aspects of Nutrient Cycle in Agro-Ecosystems

W+ 2 credits 1S E. Frossard, A. Oberson Dräyer
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. It offers to deepen the knowledge on a specific theme related to nutrients. It is composed by presentations of national and international speakers and by an excursion. The students write a report where they compile the obtained information, relate it to their own knowledge and include literature.

Objective

Listen and understand expert's presentations. Ask questions and contribute to the discussion during the talk sessions and the excursion.

Link the information obtained during the seminar with knowledge from previous lessons and with literature searched to complement the matter. Expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem.

751-5123-00L Rhizosphere Ecology

Objective

To gain a holistic understanding of resource-driven and regulatory processes in agricultural and natural ecosystems.

Develop skills on the critical analysis of scientific papers.

Define explanatory hypotheses, identify knowledge gaps for further investigations.

Carry out a multi-disciplinary experiment that involves aspects of soil, (micro-)biology, plant physiology, pathology, and ecology.

Develop manual skills in the setup of a glasshouse experiment, in soil and plant analyses, and in isolation and DNA-based characterisation of rhizobia.

Gain insights on basic methods to analyse (bio-)chemical, molecular genetic, and graphical data.

Discuss and interpret data in the context of the literature.

Prepare a research report in the format of a scientific paper and a poster in the format of a conference paper, partially alone and partially in small groups, using data obtained from the glasshouse experiment.

Content

This course is designed to stimulate thinking and promote critical analysis of important processes that occur in the rhizosphere. As part of this course, the knowledge acquired will be used for analysing and interpreting experimental data, as well as, preparing a scientific report and conference-type poster.

The course will cover the relative importance of spatial scales and various physicochemical and microbiological dynamics as influenced by roots. We will discuss root traits and activities that influence the immediately root-surrounding soil and thereby contribute to mineral nutrient mobilization and immobilization. An overview of the most relevant root-microbe symbioses for agroecosystems will be provided and root and microbial traits discussed, which could be of use in efforts towards utilization of intercropping and bioinoculants as a possible means of reducing energetically expensive inputs to farming systems. A special emphasis will be given to the importance of physicochemical features of soils and the chemical forms (= species) of elements important for plant uptake.

Practical experience will be gained with setting up a glasshouse experiment, soil and root sampling, basic soil and plant analyses, isolation of rhizobia, determination of the number of colony forming units (CFU), assays to screen for phosphorus and zinc solubilizing bacteria, DNA extraction, PCR amplification, and restriction fragment length polymorphism analysis (RFLP) of host range determining symbiosis-specific genes.

In short, the processes dealt with in this course occur on a small-scale and are generally (bio)chemical and microbiological in nature. Furthermore, they are generally not taken into account using current methods of agronomic management for plant production. However, they are increasingly being recognized as a potentially useful means of obtaining a resource-efficient and hence, economically and environmentally sustainable agricultural system, including for ecosystem restoration. Therefore, the course will invite for critical reflections and exemplify challenges in translating knowledge from scientific studies and ecology into application for plant production.

Lecture notes

For documentation, lecture slides and laboratory protocols will continuously be uploaded to the directory '751-5123-00L Rhizosphere Ecology' on the electronic document exchange platform ILIAS, LDA-ELBA:

https://ilias-app2.let.ethz.ch/llias.php?ref_id=109651&cmd=view&cmdClass=llobjcoursogui&cmdNode=el:fv&baseClass=llRepositoryGUI
The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

Handouts will be available on the webpage of the course.

Lectures and exercises:
This course guides students in analyzing and comprehending tropical agroecosystems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in southern Ethiopia, which is co-organized with Arba Minch University (Ethiopia) and KU Leuven (Belgium).

This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

Lectures address 2 horticultural cropping systems and value chains, each one in 4 2h-lecture blocks. Afterwards, the students split in 2 groups for addressing a case study focusing on one of the cropping systems treated before. An excursion to a research site might be included. In a final colloquium, each group presents a report on their case study and their conclusions.

Students signing up for this class should have a strong interest in tropical agriculture and science communication.

The number of participants is limited to 12 students due to capacity limitations for the field project in Ethiopia. Selection of participants will be based on (1) the student's motivation statement, (2) successful participation in the BSc lectures "Sustainable Agroecosystems I + II" and (3) related topic for BSc thesis/ tentative topic for MSc thesis. The motivation statement is due in the first week of the semester.

Field project:
(1) Introduction to international soil classification with focus on tropical soils
(2) Soil suitability (chemical, physical and biological fertility) for tropical crops
(3) Soil conservation practices and stakeholder involvement
(4) Approaches to analyzing tropical agroecosystems

Lectures and exercises:
(6) Analysis of agricultural production systems in the Gamo-Gofa region in southern Ethiopia
(7) Hands-on training on the use of field methods, diagnostic tools and survey methods
(8) Collaboration in international student teams (MSc students from Switzerland, Belgium and Ethiopia)

The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at:
http://www.pe.ipw.agrl.ethz.ch/about/reach

The lecture notes will be given during the lecture

Lectures address 2 horticultural cropping systems and value chains, each one in 4 2h-lecture blocks. Afterwards, the students split in 2 groups for addressing a case study focusing on one of the cropping systems treated before. An excursion to a research site might be included. In a final colloquium, each group presents a report on their case study and their conclusions.

The course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.
Achieve a deepened understanding of horticultural value chain challenges relating to ecological intensification, resource efficiency, climate change and healthy and safe food, and the problem solution strategies and scientific principles behind. Deliver in a team effort a report and a presentation providing a comprehensive insight into a problem of the horticultural value chain and its science-based solution strategy.

In the autumn semester, the two addressed cropping systems and value chains are fruit-production and viticulture. In the spring semester, the two addressed cropping systems and value chains are vegetable-production and berry-production or glasshouse-horticulture. The selected topics address challenges with regard to ecological intensification, resource efficiency or climate change and branch into ongoing research and development projects.

Documents handed out during the case studies.

As provided by the case study leaders.

The course builds on basic knowledge delivered in 'Horticultural Crops I' and 'Horticultural Crops II'. If these courses have not been followed by interested participants, equivalent knowledge and experience will greatly support a successful and productive participation of the participating student.

Language: spoken E, G or F, Documents: Preferably English, G/F possible.

</table>

Element 1. Oral Presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturers are the audience.

Element 2. Scientific writing: Option 1: preparation of a short scientific type of paper from a result table offered by the lecturers; Option 2: preparation of an abstract with limited word count from a scientific paper; Option 3: writing of a critical review of a paper. The students have to select 2 of the three options each. There will be a discussion be a discussion in small groups at two dates.

Introductions to both forms of presentation will be offered by lecturers. The preparation of the oral and written presentations takes place to a small part during the 2-hour blocks and mainly outside of this time.
**Lecture notes**

- no scriptum

**Prerequisites / notice**

- Requirements for allocation of the two credit points:
  - Theatre presentation (with handout) at the forum
  - Delivery of written documents of sufficient quality
  - Active participation during the presentations by the other participants

---

**751-6305-00L  Livestock Breeding and Genomics**  
**W** 3 credits  3G  P. von Rohr

**Abstract**

Methods for analysing livestock data, in particular for the estimation of breeding values: principles of selection index, introduction to BLUP, application of common models used, relationship matrix, methods for the estimation of variance components, basics of breeding programs.

**Objective**

The students are able to set up design matrices, the relationship matrix and its inverse as well as the Mixed Model equations to estimate BLUP breeding values for smaller examples.

**Content**

- Selection index (various sources of information, one trait, multiple traits)
- Relationship matrix and its inverse
- BLUP: one trait, repeated observations, multiple traits, economic indices
- Introduction to methods for the estimation of variance components
- Assignments

**Lecture notes**

Copies of the slides are available on the net.

---

**751-6601-00L  Pig Science (HS)**  
**W** 3 credits  3V  E. Hillmann, M. C. Härdf-Landerer

**Abstract**

The overall goal of the course is to provide the essential scientific knowledge of the genetic, physiological and special nutritional aspects of pigs, metabolism, animal health and behaviour, and of the implications for environment, product quality, housing and animal welfare, and breeding programs.

**Objective**

Students will understand the complex interactions of nutrition, quality traits of products, breeding and reproduction, health management, behaviour and husbandry, be trained to understand interdisciplinary and disciplinary research, be able to critically analyze published research data, be able to present precise scientific reports in oral and written form.

**Content**

Four main topics in Pig Science:

- HS  
  - Behaviour and Husbandry of pigs: behavioral needs, husbandry related behavioral disorders, design and construction of housing systems in accordance with welfare requirements and legal regulations.
  - Planning of reproductive cycle in practice
  - Welfare monitoring in practice
  - Pigs in organic farming
  - Animal Health and Diseases: animal hygiene, immunology/vaccinations, metabolic diseases, diarrhoe, legisalation, thermoregulation, important infections, prophylaxis.
  - Poster, exam and evaluation

- FS  
  - Special Physiology of Pig Nutrition: food intake; growth; metabolism and digestion at different growth stages; energy and specific nutritional requirements; feeding systems; environmental aspects, etc.
  - Genetics: Breeding systems, reproductive techniques, performance tests and recording, etc.
  - Oral presentation, exam, evaluation

**Lecture notes**

Handouts/scripts are distributed by the lecturers.

**Literature**

Specific literature is indicated by the lecturers.

---

**751-7703-00L  Tropical Animal Nutrition**  
**W** 1 credit  1G  S. Marquardt

**Abstract**

Farm animals play an important role in most agro/eco - systems, but conditions for a successful management and nutrition in the tropics are diverse. In this course a wide range of aspects are examined.

**Objective**

The aim of this course is to know and understand animal production systems in the different zones of the tropics taking into consideration the local and social structure of the population. We will deal with different aspects of animal nutrition in the tropics.

**Content**

- Introduction to the tropics
- Special problems and challenges in tropical regions
- Importance of livestock in the tropics
- Animal production and livestock production systems in the tropics
- Special challenges for livestock in the tropics
- Feeds available in the tropics
- Tropical pasture systems and their characteristics
- Quality of feed in the tropics
- Problems and challenges in animal nutrition in the tropics

---

**751-6113-00L  Endocrinology and Biology of Reproduction**  
**W** 3 credits  2V  S. E. Ulbrich

**Abstract**

Die Systematik der Reproduktionshormone und der Hormonrezeptoren wird erläutert, die Wirkungsmechanismen (Bildung; orale Bioverfügbarkeit; Elimination) erklärt. Mit diesen Grundlagen wird das Verständnis der Regulation der Fortpflanzung umfassend erörtert.

**Objective**

Die Studierenden erlangen das grundlegende theoretische Verständnis und Fachwissen zur Endokrinologie der Reproduktion und zur weiblichen und männlichen Reproduktionsbiologie. Sie können darüber hinaus pathologische Situationen (Fortpflanzungsstörungen) und deren vielfältigen Ursachen in den physiologischen Kontext einordnen.

751-6001-00L  Forum: Livestock in the World Food System  
**W** 2 credits  1S  M. Kreuzer, S. Bauersachs, E. Hillmann, S. Neuenschwander

**Abstract**

This forum is a platform for the critical reflection of highly relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.
In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basics to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.

The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

Element 1. Oral Presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturers are the audience.

Element 2. Scientific writing: Option 1: preparation of a short scientific type of paper from a result table offered by the lecturers; Option 2: preparation of an abstract with limited word count from a scientific paper; Option 3: writing of a critical review of a paper. The students have to select 2 of the three options each. There will be a discussion be a discussion in small groups at two dates.

Introductions to both forms of presentation will be offered by lecturers.

The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

Introduction to methods for the estimation of variance components
- BLUP: one trait, repeated observations, multiple traits, economic indices
- Relationship matrix and its inverse
- Assignments

Information on books and other references will be communicated during the course.

Methods for analysing livestock data, in particular for the estimation of breeding values: principles of selection index, introduction to BLUP, application of common models used, relationship matrix, methods for the estimation of variance components, basics of breeding programs.

The material will be illustrated via exercises and assignments.

The students are able to set up design matrices, the relationship matrix and its inverse as well as the Mixed Model equations to estimate BLUP breeding values for smaller examples.

The course provides the scientific basis of the central aspects of reproduction, husbandry and nutrition physiology of ruminants, and of the implications for animal welfare, product quality, breeding programs, and organic livestock systems. Means of knowledge transfer include interdisciplinary approaches, disciplinary parts, web-based learning and self-study.

At the end of the course the students are able to apply, by a comprehensive understanding of the underlying mechanisms, their knowledge in various fields of ruminant science. They will be able to develop and recommend best strategies for breeding programs, feed formulation, improving forage quality, increasing animal health and welfare etc. They will be trained to carry out interdisciplinary and disciplinary research at the highest level. The course Ruminant Science (FS) offered in spring has a similar structure but is complementary to this course.

The specialty of this course is that for the first time the animal science disciplines are unified. This is realised with a particular emphasis on interdisciplinary special topics and new forms of teaching. At the same time the essential basics in the central fields are communicated.

The field of Ruminant Science will also be a part of the spring semester (special topics: Organic Ruminant Systems, Tropical Ruminant Systems, Mastitis; disciplinary courses: Cattle, Sheep and Goat Breeding, Ruminant Diseases and Prophylaxis, Ruminant Nutrition and the Environment). However both courses are organized independently.

Criteria for successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as ¿optional courses¿ in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.

The control of performance will consist of:
- an own lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details
- an own lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details
- an own lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details
- The control of performance will consist of:
- an own lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details

This course broadens the knowledge in one of the most important aspects of ruminant nutrition: the microbial digestion in the rumen (and in the hindgut). For a comprehensive understanding of the rumen microbial ecosystem, the mechanisms of nutrient fermentation and the synthesis of microbial protein, thorough basics are provided. Apart from lectures, group and laboratory exercises are included.
Objective
The course enables students to understand in detail how ruminal digestion works and how this knowledge can be applied to design optimal feeding diets using highly fibrous forages and a variety of other feeds. The students also are able to show how to modify the most important rumen microbes beneficially by nutritional means.

Content
Structure of the contact hour part of the course (14 h):

2 h Introduction and blackboard exercise

8 h Basic topics in ruminal digestion, lectures and group exercises:
- Systematics of the microbes involved in microbial digestion
- Measurement of microbial digestion
- Interactions of microbes and epithelium of the digestive tract
- Differences between ruminal and hindgut microbial digestion
- Microbial nutrient degradation and its modification
- Efficiency of microbial protein synthesis
- Manipulation of the ruminal digestion

2 h Laboratory exercise with a rumen fistulated cow and the Rumen Simulation Technique

2 h Final seminar

The non-contact hour part is to comprehend the information given and to prepare either the written report or the oral presentation (cf. "Besonderes")

Lecture notes
Lecture notes are provided via Moodle.

Literature
Will be communicated at the start of the course.

Prerequisites / notice
The course is a balanced mixture of blackboard exercise, laboratory exercise, group exercise, lecture and student seminar presentation.

Credit point associated with grade of either a written report or an oral presentation in the final seminar (both on a self-chosen related topic)

751-7703-00L Tropical Animal Nutrition W 1 credit 1G S. Marquardt

Abstract
Farm animals play an important role in most agro/eco - systems, but conditions for a successful management and nutrition in the tropics are diverse. In this course a wide range of aspects are examined.

Objective
The aim of this course is to know and understand animal production systems in the different zones of the tropics taking into consideration the local and social structure of the population. We will deal with different aspects of animal nutrition in the tropics.

Content
- Introduction to the tropics
- Special problems and challenges in tropical regions
- Importance of livestock in the tropics
- Animal production and livestock production systems in the tropics
- Special challenges for livestock in the tropics
- Feeds available in the tropics
- Tropical pasture systems and their characteristics
- Quality of feeds in the tropics
- Problems and challenges associated of animal nutrition in the tropics

751-6113-00L Endocrinology and Biology of Reproduction W 3 credits 2V S. E. Ulbrich

Abstract
Endokrinologie und Reproduktionsbiologie der Säugetiere und des Menschen (Anatomie, Morphologie, Physiologie, Regelmechanismen) Die Systematik der Reproduktionshormone und der Hormonrezeptoren wird erläutert, die Wirkungsmechanismen (Bildung; orale Bioverfügbarkeit; Elimination) erklärt. Mit diesen Grundlagen wird das Verständnis der Regulation der Fortpflanzung umfassend erörtert.

Objective
Die Studierenden erlangen das grundlegende theoretische Verständnis und Fachwissen zur Endokrinologie der Reproduktion und zur weiblichen und männlichen Reproduktionsbiologie. Sie können darüber hinaus pathologische Situationen (Fortpflanzungsstörungen) und deren vielfältigen Ursachen in den physiologischen Kontext einordnen.

751-1555-00L Applied Food Industrial Organisation W+ 3 credits 2G to be announced

Abstract
Concepts of microeconomics and Industrial Organization and their application to the European food sector. Aspects include industry structure as well as strategic and performance of food sector firms.

Objective
Understanding and application of theoretical concepts along the Structure-Conduct-Performance paradigm. Ability to apply theory to empirical settings; understand and critically evaluate empirical industrial organization research and to replicate the results of such research using econometric methods

Content
- Introduction IO
  - Relevant topics for the food sector
  - high competition and market saturation
  - low R&D intensity
  - bargaining power of retailers
  - Private label introduction
- Theoretical Approaches
  - Structure Conduct Performance
  - Market Based View
  - Porters Five Forces
  - Resource Based View
  - Knowledge Based View
- Empirical Issues (Based on published research papers)
  - Competition / Concentration
  - Profitability
  - Impact of Innovation / R&D
  - Efficiency
  - Market power
  - Econometric Approaches

Literature
Several theoretical and empirical IO related research papers

752-2122-00L Food and Consumer Behaviour W 2 credits 2V M. Siegrist, C. Hartmann

Abstract
This course focuses on food consumer behavior, consumer’s decision-making processes and consumer’s attitudes towards food products.

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 79 of 1570

**Objective:** The course provides an overview about the following topics: Factors influencing consumer’s food choice, food and health, attitudes towards new foods and food technologies, labeling and food policy issues.

**Abstract:**
- Lecture course with an interdisciplinary approach for the evaluation of nutritional aspects of changes in food composition due to processing.
- Students should be able to:
  - describe and compare the major concepts/criteria used for the evaluation of the nutritional quality of food.
  - apply these criteria when assessing the effects of selected processing technologies on nutritional quality.
- Evaluate recent formulation strategies aimed to achieve additional physiological benefits for targeted population groups (i.e., functional foods).

**Content:**
- The course gives insights on compositional changes in food due to processing (with focus on thermal/chilling, enzymatic, chemical, emerging technologies) or new formulation strategies. Possible evaluation methods for these changes (e.g., nutritional profile) will be addressed.

**Lecture notes:**
- There is no script. Powerpoint presentations and relevant scientific articles will be available on-line for students. A selection of recommended readings will be given at the beginning of the course.

**Prerequisites / notice:**
- The course is open to Master and MAS students in food and science and nutrition or related. Basic knowledge of food chemistry and nutrition is expected, as well as an understanding of food processing.

**Objective:**
- Achieve a deepened understanding of horticultural value chain challenges relating to ecological intensification, resource efficiency, climate change and healthy and safe food, and the problem solution strategies and scientific principles behind.
- Deliver in a team effort a report and a presentation providing a comprehensive insight into a problem of the horticultural value chain and its science-based solution strategy.

**Content:**
- In the autumn semester, the two addressed cropping systems and value chains are fruit-production and viticulture.
- In the spring semester, the two addressed cropping systems and value chains are vegetable-production and berry-production or glasshouse-horticulture.

**Lecture notes:**
- Documents handed out during the case studies.

**Prerequisites / notice:**
- The course builds on basic knowledge delivered in ‘Horticultural Crops I’ and ‘Horticultural Crops II’. If these courses have not been followed by interested participants, equivalent knowledge and experience will greatly support a successful and productive participation of the participating student.

**Language:** spoken E, G or F. Documents: Preferably English, G/F possible.

**Objective:**
- Achieve a deepened understanding of livestock food chain challenges relating to ecological intensification, resource efficiency, climate change and healthy and safe food, and the problem solution strategies and scientific principles behind.
- Achieve a deepened understanding of livestock food chain challenges relating to ecological intensification, resource efficiency, climate change and healthy and safe food, and the problem solution strategies and scientific principles behind.

**Content:**
- Achieve a deepened understanding of livestock food chain challenges relating to ecological intensification, resource efficiency, climate change and healthy and safe food, and the problem solution strategies and scientific principles behind.
- Achieve a deepened understanding of livestock food chain challenges relating to ecological intensification, resource efficiency, climate change and healthy and safe food, and the problem solution strategies and scientific principles behind.

**Lecture notes:**
- As provided by the case study leaders.

**Prerequisites / notice:**
- Requirements for allocation of the two credit points:
  - Theatre presentation (with handout) at the forum
  - Delivery of written documents of sufficient quality
  - Active participation during the presentations by the other participants

**Abstract:**
- This is a platform for the critical reflection of highly relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

**Objective:**
- In the Forum “Livestock in the World Food System”, a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society).

**Content:**
- The Forum “Livestock in the World Food System” will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:
  - Element 1. Oral Presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturers are the audience.
  - Element 2. Scientific writing: Option 1: preparation of a short scientific type of paper from a result table offered by the lecturers; Option 2: preparation of an abstract with limited word count from a scientific paper; Option 3: writing of a critical review of a paper. The students have to select 2 of the three options each. There will be a discussion be a discussion in small groups at two dates.

**Lecture notes:**
- Introductions to both forms of presentation will be offered by lecturers.

**Prerequisites / notice:**
- The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

**Abstract:**
- This course will increase basic knowledge on biotechnological constructions and application of genetically modified organisms (GMO) which are used worldwide in food production systems. The course discusses health issues, the legislation frame and food safety aspects of GMO applications in agriculture, food production and consumption in Switzerland and EU-countries.

**Objective:**
- This course will provide knowledge and biological background on genetically modified organisms (GMO) and food produced with the help of GMO, especially on the molecular basis of GMO constructions with emphasis on genetically modified food in Switzerland and the EU.

**Content:**
- Overview on application in gene technology, the gene transfer potential of bacteria, plants and other organisms and the mostly used transgenes in food as well as on GMO used for food production and their detection technologies in food; food safety assessment of GMO food; information on the legislation in Switzerland and EU-countries

**Lecture notes:**
- Copies of slides from lectures will be provided.

**Literature:**
- Actual publications from literature will be provided

**Prerequisites / notice:**
- Good knowledge in biology, especially in microbiology and molecular biology are prerequisites.
- Some contents will be provided by registered students who will individually or as a group present an actual publication.

**Objective:**
- Participate in this course. This also applies to ETH Zurich.

**Abstract:**
- This course is open to Master and MAS students in food and science and nutrition or related. Basic knowledge of food chemistry and nutrition is expected, as well as an understanding of food processing.

**Content:**
- The course gives inputs on compositional changes in food due to processing (with focus on thermal/chilling, enzymatic, chemical, emerging technologies) or new formulation strategies. Possible evaluation methods for these changes (e.g., nutritional profile) will be addressed.

**Lecture notes:**
- There is no script. Powerpoint presentations and relevant scientific articles will be available on-line for students. A selection of recommended readings will be given at the beginning of the course.

**Prerequisites / notice:**
- The course is open to Master and MAS students in food and science and nutrition or related. Basic knowledge of food chemistry and nutrition is expected, as well as an understanding of food processing.

**Abstract:**

</table>

Abstract
- The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines.

Objective
- Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.

Know:
- Function, purpose and algorithm of a selected number of transdisciplinary methods

Understand:
- Functional application in case studies and other problem oriented projects

Be able to reflect on:
- Potential, limits, and necessity of transdisciplinary methods

Be prepared for:
- Transdisciplinary Case Study 2017

Content
- Overview of concepts and methods of inter-/transdisciplinary integration of knowledge, values and interests (approx. 20%)
- Practical application of the methods in a broader project setting (approx. 50%)
- Overview of concepts and methods of inter-/transdisciplinary integration of knowledge, values and interests (approx. 20%)

Lecture notes
- Handouts are provided by the lecturers

Literature
- Selected scientific articles and book-chapters

Prerequisites / notice
- This course is recommended and helpful for students participating in the Transdisciplinary Case Study 2017.

Abstract
- The course deals with the concepts and methodologies for the analysis and assessment of sustainable development. A special focus is given to the social dimension and to social justice as a guiding principle of sustainability as well as to trade-offs between the three dimensions of sustainability.

Objective
- The course is seminar-like, interactive.

Know:
- core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

Content
- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;
- Trade-offs in selected examples.

Lecture notes
- Handouts.

Literature
- Selected scientific articles and book-chapters

Master's Thesis

Only students who fulfill the following criteria are allowed to begin with their master thesis:
- successful completion of the bachelor programme;
- fulfilling of any additional requirements necessary to
gain admission to the master programme.
The Master thesis is an independent scientific work. Normally the subject is selected among the topics of the core subject. It is written under the guidance of a agricultural sciences professor.

Objective
The independent writing of a scientific paper/thesis

**Abstract**

**Objective**

Knowledge of construction principles and its history. Cognition of correlation between concept, buildings structure, material and form.

**Content**

In the triad of typology, topology and tectonics, the latter is the primary focus of the theoretical discourse. The series of lectures identifies the most disparate tectonic principles which transcend time and geography, and elucidates the reciprocally generative parameters of construction, technology and form. The lectures themes convey fundamental concrete constructional and practical knowledge and concentrate on the guidance of the basic exercises (Architectural Technology I + II).

**Abstract**

The course is an introduction to structural design using graphical methods and structural models, with a focus on a creative approach rather than repetitive calculations. Cable and membrane structures, arch and shell structures and combined arch and cable systems will be used to demonstrate these methods.

**Objective**

**Content**

After a general introduction of basic concepts, structural systems such as cable and arch structures will be analyzed with the help of graphic statics. The students will learn to understand the flow of forces in a structural system in relation to the system's form. They will be able to modify this force flow and give dimension to the structural components.

Building Materials - Structure, Quality, Usage

- concrete and other mineral materials
- metals, wood, glass and polymers
- ecological aspects

**Objective**

The lecture describes the fundamental properties of the most important construction materials: concrete and other mineral materials, metals, wood, glass and polymers. Furthermore, the content includes the relevant ecological aspects such as availability of raw materials, effort for production, emission of hazardous substances, disposal and recycling are treated as well.

**Content**

**Abstract**

Sociology I investigates the relation between social developments and the production of the built environment from a macro-sociological point of view. It examines central aspects of social change, historical and present-day forms of urbanization, and typical examples of models of urbanization.

**Objective**

This series of lectures should enable students to comprehend architecture in its social context. It approaches the architectural profession from two different angles: macro-sociological and micro-sociological.
Sociology I deals with the macro-sociological point of view, and investigates the relation between social developments and the production of the built environment. In the first part some central aspects of social change are examined in particular the transition from Fordism to Postfordism and from Modernism to Postmodernism, and the interlinked processes of globalization and regionalization. The second part deals with historical and present-day forms of urbanization. Among other aspects treated here are the changed significance of urban-rural contrasts, the processes of suburbanization and periurbanization, the formation of global cities and metropolitan regions, the growth of new urban configurations in centres (gentrification) and on urban peripheries (edge city, exopolis). In the third part these general processes are illustrated by typical models of urbanization.

<tr>
<td>Objective</td>
<td>Acquisition of basic knowledge of the history of art and architecture, resp. of methodical basic knowledge of historical working.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The history of art and architecture is part of our reality: it confronts us in the historically shaped environment of the city and plays an essential role in the creation of architecture. The historical lectures are therefore part of the fundamental courses of the undergraduate programme in architecture. On the basis of cultural and art-historical research the courses impart knowledge about architecture and art from ancient times to the present. At the same time they sharpen the perception for the conditions and capabilities of building activity in history. Moreover, they convey methodical knowledge and technical language skills and are meant as a preparation for the independent handling of historical sources and scientific literature. The first one-year course aims at these goals in the form of exemplary epoch representations which through light upon the historical continuities. The main focus will be laid on the architecture of the Greco-Roman antiquity, the Middle Ages, the Renaissance and the era between Baroque, Enlightenment, and Modernity.</td>

Abstract
Artistic thinking and working is developed in the dialog through the actual completion of individual projects. The focal point lies in the formulation of a personal objective and the individual, artistic approach to this view which is discussed in joint corrective dialogues.

Objective
Competence in independent artistic thought and practice. Development of the criteria of theory and practice in the visual arts.

Content
Artistic thinking and working is developed in the dialog through the actual completion of individual projects. The focal point lies in the formulation of a personal objective and the individual, artistic approach to this view which is discussed in joint corrective dialogues.

051-0129-00L | Architectural Design I (2-Sem.-Course, Exercise) | O    | 0    | 6U    | C. Kerez, D. Budik, C. E. Scheidegger |

Abstract
During the two semesters HS16/FS17 different aspects of the architectonic space and its possibilities for transposition into divers medias will be examined.

Objective
Training of conscious perception of the architectonic space and the development of concepts of its basic definition.

Content
During the two semesters HS16/FS17 different aspects of the architectonic space and its possibilities for transposition into divers medias will be examined.

051-0131-00L | Architectural Technology I (2-Semester Course, Exercise) | O    | 0    | 6U    | A. Spiro                  |

Abstract
Finding, analysing, testing and refining basic construction principles. In the focus are the interaction of architecture, technology and structure and the creative dialogue with other works of art and architecture.

Objective
Empirical and analytical acquisition of basic construction principles. Cognition of correlation between structure and form, between architecture, technology and buildings structure.

Content
In a series of creatively designed exercises, various terms related to the subject area of Material - Structure - Space are made sensually tangible and are dealt with conceptually. Their interdependence will become apparent in the process and the relationship between tectonics and visual expression will be studied.
In addition, the influence of materials and their properties, of construction principles and their specific application as well as of planning and production processes on the form as the end result will be elaborated theoretically in a series of lectures.

Abstract
The lectures discuss determining factors in architectural design based on the basic terms place, structure, shell, program and materiality. The lectures aim at conveying an integral understanding of architecture: its development, its determining factors, and the influence of its societal context.

Objective
The lectures discuss significant determining factors in architectural design based on five basic terms: place, structure, shell, program and materiality. Several architectural examples are being examined within their specific societal context with an emphasis on the interrelation of architecture, science, culture and art.

Content

Lecture notes

051-0159-00L | Urban Design I                                    | O    | 1    | 2V    | H. Klumpner, A. Brillemburg |

Abstract
The lecture series will introduce tools for reading contemporary urban conditions, urban models and operational modes. Urban development will be deciphered, presented as operational tools, extracted from cities where they have been tested and became exemplary samples, most relevant for providing the understanding of how urban landscape has taken shape as well as inspiration for future practice.

Objective
How can a glossary of tools be used as a basis for reading cities and recognizing in them current trends and urban phenomena? The lecture series will produce a glossary of operational urban tools with collected urban knowledge that provides students with an 'improved' manual to navigate theories. Urban Stories is a lecture series that aims to amplify your repertoire of urban instruments and empowers you to read cities and to critically reflect on the urban environment. The course will approach a series of case studies, employing an analytical, research-based model for crosscutting scale, political, economical and social components. Through this lens, and with our toolbox, we aim to tell the fundamental story of our cities from today and provide information, analysis and knowledge to help students prepare for justifiable own contributions and interventions in the future. Also the aspect of knowledge transfer will be considered in order to sensibilize the students to understand how to operate in an international context.

Content
How did cities develop into the cities we live in now? Which urban plans, instruments, visions, political decisions, economic reasonings, cultural inputs and social organization have been used to operate in urban settlements in specific moments of change? Which cities are exemplary in illustrating how these instruments have been implemented and how they have shaped urban environments? Can these instruments be transcribed into urban operational tools that we recognize within existing tested cases in contemporary cities across the globe? Urban form cannot be reduced to the physical space. Cities are the result of social construction, under the influence of technologies, ecology, culture, the impact of experts and accidents. Urban unconsidered processes respond to political interests, economic pressure, cultural inclinations, along with the imagination of architects and planners and the informal powers at work in complex adaptive systems. Current urban phenomena are the result of an urban evolution. The facts stored in urban environments include contributions from its entire lifecycle. That is true for the physical environment, but also for non-physical aspects, the imaginary city that exists along with its potential problems and with the conflicts that have evolved over time. Knowledge and understanding along with a critical observation of the actions and policies are necessary to understand the diversity and instability present in the contemporary city and to understand how urban form evolved to its current state. This lecture series will introduce urban knowledge and the way it has introduced urban models and operational modes within different concrete realities, therefore shaping cities. Urban knowledge will be translated into operational tools, extracted from cities where they have been tested and become exemplary samples, most relevant for providing the understanding of how urban landscape has taken shape. Case studies will be identified to compile documents and an archive, that we use as templates to read the city and to critically reflect upon it. The presented contents are meant to serve as inspiration for positioning in future professional life as well as to provide instruments for valuable contributions and interventions.

Prerequisites / notice

**EXERCISE**

After each lecture, students are asked to produce an exercise based on the presented tools. The format of the exercise is an A3 or an A4, according to the given template. Each student has one week to prepare each exercise, and it should be delivered, in form of a physical copy, in the next lecture. (Language: preferably English, German).

The Exercise tasks are a valuable preparation for the Exam (Exam only relevant for the "Jahreskurs" students) therefore it is highly recommendable to finalize all weekly Exercise tasks, as an individually conducted piece of work.

"Jahreskurs" (semester course) students from other departments or students taking this lecture as GESS / Studium Generale course as well as exchange students must submit a research paper, which will be subject to the performance assessment. "Bestanden" (pass) or "Nicht bestanden" (failed) as the performance assessment type, for "Urban Design I: Urban Stories" taken as a semester course, is categorized as "unbenotete Semesterleistung" (ungraded semester performance).

#### Examination Block 2

Students are free to take the exam either in German or in French. They may choose between 851-0710-00L Introduction to Law for Civil Engineering and Architecture or 851-0709-00L Introduction to Civil Law (French).

#### Objective

The two-semester course offers an introduction to the history and theory of architecture from the industrial revolution up to now. Based on current questions a variety of case studies will be discussed.

#### Content

- The subject of this lecture course is the history and theory of architecture since the beginning of the 19th century up to now. It examines the architectural answers to the changing technical inventions and social practices. Consequently, the focus will be less on individual architects or buildings than on various themes that determined the architecture of the period.

#### Prerequisites / Notice

- The lectures are accompanied by a script (two semesters of the bachelor studies), that can be purchased at the chair for the history of urban design (HIL D 75.2) at the price of CHF 30.-. The script serves as an auxiliary means to the attended lecture compiling the most important illustrations showed and the names and dates of the buildings and its builders along with a short introductory note.

#### Literature

- Further recommended literature to consult is listed within the script.
- History of Urban Design from antiquity to the 19th century
Historic buildings are historic documents testifying to the living conditions and mindset of our ancestors. They complement other historic sources such as written documents and pictorial records. They are important testimony to the history of art, science, and social conditions. Furthermore, historic monuments constitute important landmarks. Every generation develops its own attitude towards their artistic expression. In western civilizations, there is a general consensus on the preservation of historic architecture.

The architect is often at the forefront of interventions in the immediate context of historic buildings, both as a designer of new buildings adjacent to historic ones and as a conservationist. The present lecture strives to enable him to cope with these tasks competently and adequately.

Part I of the lecture series deals with constructions in natural and artificial stone as well as concrete: stoneworking, masonry, arches, vaults, foundations.

### Examination Block 4

</table>

| 051-0155-00L | Architectural Technology V                  | O    | 2    | 2V    | M. Peter |
| Abstract     | The lecture series explores the correlation among intentions of design, architectonic expression and construction premises. These critical areas or aspects of study, which are presented with selected projects, their respective theoretical backgrounds and historical development, are pluralistically associated and brought into relation with varying contemporary opinion. |
| Objective    | The final part of the lecture series Konstruktion V/VI aims to analyse (structural) construction techniques and their formal appearance and expression in their interrelation. The different themed parts of structural design, building shell and knowledge of material get connected with architectural design in practice and reflected in the wider context of architectural theory. The intention is to consolidate the understanding of the connection between structure, process and formal appearance and expression in the architecture of the 20th century. |
| Content      | The lecture series in the course entitled Architecture and Construction explores the correlation among intentions of design, architectonic expression and construction premises. Each lecture is focused on individual themes, as for example, the application of certain materials (glass, or natural stone), of particular construction systems (tectonic, hybrid) or design generators (grids, series) and alternatively the search for a definable, tangible architectural expression (vernacular architecture, ready-mades). These critical areas or aspects of study, which are presented with their respective theoretical backgrounds and historical development, are pluralistically associated and brought into relation with varying contemporary opinion. The yearlong lecture cycle is comprised of twenty individual lectures, in which the majority of projects being analyzed date from the last few decades. |
| Literature   | list of literature per lecture             |      |      |       |             |
| Prerequisites / notice | General remarks (on exam as well as exam preparation) | | | | |
| The comprehensive notes of the lectures are the subject matter of the exam. The lectures are scheduled for a full year (Konstruktion V/VI) and therefore the knowledge of the subject matter of the running as well as of the preceding semester is required. To improve your chances to pass the examination at first try, we strongly recommend you to take the exam after having visited the lecture during two semesters. If you are an exchange student, or a student from a different department and wish to take a partial examination covering only the subject matter of the last semester (Konstruktion V or VI), you need to contact the chair in advance. |
| The brochures published by the chair offer additional help. Knowledge of these brochures and their key subjects is recommended for the exam. The brochures can be ordered at the chair after the last lecture before the exam. However, the subject matters of the brochures and the lectures are not identical, the brochures provide information for a deeper understanding of the lectures. Apart from additional articles written by the chair, the brochures are composed of three modules: Project documentation, crucial texts on the work reception as well as theoretical articles about the particular thematic priorities by various authors. Concerning their content these anthologies allow insights into a wide range of theories, lines of reasoning and fields of research up to diverging point of views of specific problems. |

| 051-0615-00L | Design and Strategies in Urban Space I      | O    | 1    | 2V    | K. Christiaanse, M. Wagner |
| Abstract     | Means and potentials of urban design are depicted from different perspectives to illustrate how the city can be designed as a sustainable and humane environment. For this purpose general basic principles and specific methods of urban design are going to be presented. The lectures will be given by members of the chair and invited speakers. |
| Objective    | This lecture series imparts advanced expertise in urban planning. The main focus is to illustrate the complex manner in which various themes are embedded in the everyday practice of planning and design by addressing pressing questions of contemporary urban design practice and theory. The goal is to communicate a broad-based systemic knowledge base, which helps enable students to synthesize and evaluate complex urban design and planning problems. |
| Content      | The fall semester introduces the notion of strategic design and imparts further knowledge about the structure and models of the contemporary city. It is structured in two parts: |
| Part 1: Strategic Design |
| The first part of the lecture series imparts general basics to understand the city and the field of urban design. Different approaches and methods of analysis are presented, the dealing with uncertainty in planning is addressed and practical methods of urban design are identified. |
| Part 2: Structures and Models |
| Urban space is shaped on different levels. The city ground plan, the relationship between public and private space, the infrastructure and mobility needs as well as various spatially relevant stakeholders offer the basic means to steer the development. The second part of the lecture series is dedicated to these structures of the city and to the models describing them. |
| Lecture notes | There is no script accompanying the lecture series. At the end of the semester the lecture slides and at the end of the 3rd year course a reader with secondary literature will be available for download on the homepage of the chair of architecture and urban design: http://www.christiaanse.arch.ethz.ch |
| Literature   | At the end of the 3rd year course a reader with secondary literature will be available for download on the homepage of the chair of architecture and urban design: http://www.christiaanse.arch.ethz.ch |
Building Process I

**Abstract**
The building process is the main focus of this lecture series. The process is understood as a sequence of criteria in time. These criteria are created by architectural means. In the early twentieth century, modernism supplanted Classical architectural theory and attempted to replace it with the methods and axioms of the most cutting-edge branches of science, including engineering and psychology. Modernism's own principles were, however, soon condemned and rejected by its discontents. From the early 1970s onward, a variety of approaches have dominated architecture, none of them able to become its primary theory. Today, architectural theories no longer prescribe the rules of design. Instead, they offer solutions to the different problems that society poses for architecture, relying on methods and approaches of fields of inquiry that directly relate to these problems. In the course of the semester, we will seek to delineate this elusive space of contemporary architectural theory within the various intellectual contexts in which it operates in order to understand its role in architectural practice. The readings will introduce architectural theories written at different historic periods, while the lectures will situate them both theoretically and historically.

**Objective**
Understanding of the historic development and critical discussion of various intellectual contexts of architectural theory.

**Content**
Architectural theory emerged as a product of the Renaissance worldview, which was both holistic and critical. Having developed alongside science, it shared the former's principles and premises. It aimed to explain the objective laws of beauty and to develop rules for their creation by architectural means. In the early twentieth century, modernism supplanted Classical architectural theory and attempted to replace it with the methods and axioms of the most cutting-edge branches of science, including engineering and psychology. Modernism's own principles were, however, soon condemned and rejected by its discontents. From the early 1970s onward, a variety of approaches have dominated architecture, none of them able to become its primary theory. Today, architectural theories no longer prescribe the rules of design. Instead, they offer solutions to the different problems that society poses for architecture, relying on methods and approaches of fields of inquiry that directly relate to these problems. In the course of the semester, we will seek to delineate this elusive space of contemporary architectural theory within the various intellectual contexts in which it operates in order to understand its role in architectural practice. The readings will introduce architectural theories written at different historic periods, while the lectures will situate them both theoretically and historically.

**Literature**
All the required readings will be uploaded online. In addition, it is recommended to consult the following sources:

Landscape Architecture I

**Abstract**
Introduction to the history and theory of garden design and landscape architecture. Analysis of the design of historical gardens and landscapes within the cultural background.

**Objective**
The course covers the basic history and theory of garden design and landscape architecture from its beginnings to the 21st century. The course aims to raise awareness of a changing perception of nature and landscape.

**Content**
The lecture series on History and Theory of Garden Design and Landscape Architecture deals with the historical development of designed nature, from the beginnings of cultural landscapes and gardens to 21st century landscape architecture. In the analysis of each era, the focus is on the spatial and cultural relationship between the garden, the city and the landscape, as well as the changing perceptions of nature and its representation.

**Literature**
Handouts and a reading list will be provided.

**Prerequisites / notice**
General Information for the final exam:
Bachelor students: The content of the lectures as well as texts and exam-relevant literature provided by the Chair make up the basis for preparing for the exam. The lecture series is conceived as a yearlong course. Since the written session examination will test knowledge from both semesters, it is necessary to fully attend the lectures of both courses "Landscape Architecture I" and "Landscape Architecture II". The themes of the examination will be announced at the end of the semester. The Chair will provide literature and texts available for download as pdfs. These allow a more in-depth understanding of the lecture material.

Exchange students or students from other departments: Students, who are attending only one semester, may pass the oral end-of-semester examination. Test-relevant literature will also be made available for download for this purpose.

The students are requested to get in touch by email with the Chair.
Architectural Design III: From the City to the House (D. Eberle)

Abstract
The design course is built on various exercises. During Fall Term, the students are concerned with the conversion and densification of existing building structures at three different sites in Zurich.

Objective
Conveying a way of thinking that is also able to understand complex contexts and act on various levels is one of the focuses of the chair. This networked thinking relates to praxis and educates the students to be competent architects.

Achieving this goal requires a method that teaches a clearly structured, precisely formulated approach and communicates the simultaneity of complex tasks and processes.

Content
The design course is built on four exercises. Based on the existing buildings, the themes Place, Structure and Shell are being examined first separately and then combined in a final project. The extension and densification of existing building structures are being carried out at three different sites in Zurich; the new use is planned for work and living.

The exercises are divided into a City Level and a House Level. At the City Level a group of students examines the three building sites according to each theme. At the House Level the students develop designs addressing the themes in groups of two.

Architectural Design III: Constructed Nature (T. Emerson)

Abstract
Exercises will involve design and construction, from the definition of a concept to the execution of the detailed work. Work will include procedural methods for spatial designs through form, function, technology, and materials. To promote interdisciplinarity through integrated teaching.

Objective
Achieving the goal of competent architects requires a method that teaches a clearly structured, precisely formulated approach and communicates the simultaneity of complex tasks and processes.

Content
Exercises will involve design and construction, from the definition of a concept to the execution of the detailed work. Work will include procedural methods for spatial designs through form, function, technology, and materials. To promote interdisciplinarity through integrated teaching.

Architectural Design III: Housing (A. Deplazes)

Abstract
Systematic and methodical design and construction development. Full range from concept to detail. Fall semester highlights fundamentals on "collective housing", under the specific aspect of building depth. Discusses relations with current interdisciplinary sets of problems.

Objective
The target of the design work is to improve and widen the basic knowledge of domestic architecture and housing and also to get to the bottom of former ideas.

Content
At the beginning of our investigation, based on different depths of buildings (6 to 21m), we formulate first basic rules of supporting-, room- and local public infrastructure for apartments. Based hereon and still without context we design a idealtypic apartment building with apartments of different size. Only after catching the rules of the building systematically, the urbanistic context and the front of the building will be introduced into the design process. This approach to the design task allows a self-supporting research of structural and living specific questions, this without being distracted rashly from outer inherent necessities.

Architectural Design V-IX: Creating Places XV - The Ensemble (G.A. Caminada)

Abstract
These days architecture is affected by increasingly similar images. We want to turn to another reality - the place. The strengthening of the architectural singularity of each place is the promise for an overall more differentiated living space.

In this semester we concentrate on the «ensembles» in the village of Malans in Graubünden. We seek to reinforce them through new houses and functional buildings.

Objective
Architecture requires a fine perception of the existing and a brave vision for the future. The condition for both is a firm attitude coming out of a living collective.

The aim of the course is to reinforce the sensibility for such a broad attitude and at the same time to develop the skills for its application. To deal with the reality of construction and material is thereby an important concern.

Prerequisites / notice
Arbeitsort: Atelier Gisel, Streulistrasse 74a, 8032 Zürich
Anzahl Studierende: 16
Unterrichtssprache: Deutsch
Arbeitsweise: Einzelarbeit
Aufgabentyp: Entwurf
Ausführliches Semesterprogramm: www.caminada.arch.ethz.ch
This studio will be conducted one single time in Fall 2016 as a collaboration between the Chilean architect Smiljan Radic and Christian Kerez.

Burda (from Wikipedia, the free encyclopedia, 2016) Burda Style (formerly: Burda Moden) is a fashion magazine published in 17 different languages and distributed in over 99 countries. It was founded in 1950 by Aenne Burda and is published today by Hubert Burda Media. The magazine appears monthly and contains patterns to sew women's and children's clothes, at time also mens clothes.

burda (from Williams diccionario español-inglés inglés-español, 1991) burdo -da: adj coarse, clumsy, rough; f (naut.) backstay

Both contradictory notions of 'burda' will guide us through a semester that regards itself as a search for the textile, raw, ephemeral, adaptable, and sensual space. The students participating in the atelier will design three autonomous projects in various scales.

051-1107-16L Architectural Design V-IX: Open (Gastdozentur) W 13 credits 16U to be announced

Abstract To follow

Objective To follow

Content To follow

Abstract In the studio we will move between a landscape of ideas and the actual built landscape in East Germany, between visions and shrinking cities, between different social systems and layers of time with the goal of recovering interesting concepts from failed plans.

Objective Develop various analytical and notation techniques for understanding culturally/ideologically molded architectural landscape: theoretical discussion of the social and architectural types of socialism with visionary potential; critical evaluation of compiled instruments; designing relevant architecture through examination of East Germany.

Content "Draw from the heavens to the drawing board", this quote η, the title of an essay collection by East German architect Hermann Henselmann η, speaks of the euphoria, the optimism of progress, and the belief in the messianic potential of architecture and city planning characteristic of the early years of the GDR (1). Particularly when it was a young socialist state, the hope reigned that a better and more equal society could be developed through urban planning and architecture. The many socialist utopias are products of this revolutionary thinking. As the state actually developed, however, an ever-greater disillusionment grew instead. The initial hope dimmed in the face of authoritarian government and economic mismanagement. Since reunification, consensus has been that the GDR's system and its social visions have failed η, a condemnation that is now being questioned.

In the studio we will pursue the assumption that many of the hopeful utopian approaches and social attitudes upon which the socialist types were based could still be of interest today. In this sense, we will move between a landscape of ideas and the actual built landscape, between visions and shrinking cities, between different social systems and layers of time with the goal of recovering interesting concepts from failed plans.

The first step will be an archaeological investigation of the utopian fragments within the ruins of former visions, assembling an inventory of projects and socialist types with visionary potential. In a critical reflection from a contemporary perspective, the content of the architectural imprint of socialism is to be explored in order to find tools for dealing with today's territories of emigration and economic collapse.

In this way, could it be possible to develop a future for East Germany and elsewhere that doesn't put a false 'heaven' of growth and repopulation back on the drawing board, but rather, considerably and critically continues the past trajectory in a new light? Could we develop both visionary and pragmatic architectural interventions that enliven the landscape without actually imagining that it flourishes? (2)

Abstract Designing Architecture, which sounds the potential of its usage, its location, the city, the society and its culture and transforms these into a coherent spatiality and materiality by a distinct concept.

Objective Capability to develop a design from an idea, a concept to an advanced project, to question the intermediate stages in a self-critical way, thereby finding an individual design method and attitude.

Content Design work in different fields of architecture and urbanism with integration of the knowledge acquired in the first years of studies, supported by experts in related sciences (e.g. structural engineering, landscape architecture, history of art and architecture, historic preservation etc.)

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 92 of 1570
This semester we will be designing a future-oriented, sustainable accommodation complex on the rural west coast of Greece. The ambition of the project Living Lab Hotel is to test how our future lives could be led in a world without consumption and destruction of natural resources. It is expected that the outcome of the studio will be realized by the client. You will develop the project based on your own definition of sustainability. The availability of resources, craftsmanship and talents as well as the climatic, ecological and economic conditions shall be integrated into the design of an innovative architectural project. The issue of contemporary tourism and its accompanying economic model will influence and inform your spatial concept. We will work together with local partners to develop a strategy to implement the project. The scheme should consist of several pavilions, a lobby, administration building, educational facilities, as well as an infrastructural system for deliveries, supplies and sustainable disposal. You will be expected to work across a variety of scales, resolving individual buildings details as well as masterplanning.

To begin the semester we will travel to Zakynthos from September 15 to 19 to investigate the site and understand its relationship the local context. We invite you to participate in this trip and ask you to reserve the dates. Additionally, we offer a seminar week to Venice to visit the 15th architecture biennale, “Reporting from the Front”, where explorations into future-oriented architecture as envisaged by young and innovative protagonists are exhibited within one of the most sophisticated cityscapes of Europe. Participation in both the site visit and the seminar week is strongly recommended but not mandatory.

The chair offers the integrated discipline Construction within the course. Additionally, the integrated disciplines Architecture and Urban Design are offered under chairs Arno Schlüter and Philippe Block respectively. The course Life Cycle Assessment is also offered in collaboration with Roland Hischier (EMPA). You may select a maximum of two integrated disciplines. A seminar week is offered on this subject to interested students. Participation is strongly recommended but not mandatory. The designs created include material-specific, architectural as well as constructive investigations, drawings and models.

The politics and economics of renewable energy are society’s contemporary topicality par excellence; a market-driven urgency around which some of the most unabashed politicized lobbying is performed.

However, the technological savvy of wind, solar, hydro, tidal, geothermal, and biomass energy hold - without exception - no fundamental spatial intelligence. These technologies are commonly applied onto the most efficient territories or structures available. The spatial output is residual and secondary. The juxtaposition of all these individual decisions clutters exponentially the limited space at hand. Moreover policy guidelines related to the spatial application of renewable energy are chiefly defensive, passive and reluctant in their ambition. Behind this political lassitude lies - amongst others - a fundamental shortage of spatial and architectural imagination on how these new technologies can strengthen and steer near-future metropolitan landscapes.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Abstract Architectural design based on place, category, modification and built form.

Objective This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).

Content A new cable car will connect the public transport hub Stettbach directly with the new terminal station of the number 5 and 6 trams to the zoo. This calls for the design of a new type of terminal building with additional commercial spaces that can serve as attractive center for every day and recreational activities.

The outdoor and landscape design includes arrival, parking and common spaces.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Abstract This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).

Objective Qualification to control the design process increasingly independent and with sole responsibility and to find to an individual design methodology and attitude.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Abstract Each student individually designs a space as an alternative environment apart from the ordinary and the daily routine. The intervention reflects on the dramaturgy of the topography, on the verge between the sacred buildings of the hermitage like the Chapel of St. Verena or the St. Martin’s Chapel and the secular buildings in the existing context of a beautiful gorge.

Objective The aim of this term is to enable and assist students to take charge of their own design process. Our thematical focus lies on sacral and secular structures and on the integration of a project in the landscape. A small sized building or construction should be technically developed.

Content For as long as there has been civilization, there have been people who want to get away from it. A hermitage usually refers to a place where a person lives for religious or ideological reasons in seclusion from society. In contrast to that way of life the idea of the ‘ornamental hermits’ or the ‘garden hermits’ enjoyed growing popularity in the English landscape gardens of the 18th century where they served mainly as entertainment to the high society.

In this semester we want to consider the role of the hermitage in a post-metaphysical world in order to reflect about nowadays retreats. We will work in the St.Verena Schlucht, a gorge that connects the city of Solothurn to the village of Rüttenen at the southern foot of the first Jura chain. The actual hermitage is an enclosed space at the end of an 800m long scenic pathway that leads through a gorge filled with pastoral romance typical for the late 18th century French romantic landscape gardening. Until this day the St. Verena Schlucht, with its steep forest slopes and its slow-flowing ditch, offers to tourists, to excursionists as well as to inhabitants of Solothurn a place for recreation in a landscape where borders between nature and architecture are vanishing.

051-1133-16L Architectural Design V-IX: Topic (N.N. Professor) W 13 credits 16U to be announced

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Abstract To follow

Objective To follow

Content The semester will start with the development of an urban vision in groups of six, which will then evolve into a proposition for a master-plan.

The latter will be the base for individual projects, developed in groups of two. Working with references will be an important aspect of the studio: the typological collection of buildings gathered by the chair will provide the raw material for the own projects. Model photography will be the primary design tool, which will be professionally assisted be the photograph Roman Keller. A workshop will take place in Brussels during the second studio week, from the 22nd to the 24th of September. The trip and accommodation costs will be taken in charge by the chair.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Abstract The Alps as Common Ground

With each design semester the Chair of Professor Vogt is working its way around the Alpine arc with the thesis that it can be read as an urban Common Ground. The task of each design semester is to verify this thesis by focusing on a metropolitan region and enquiring as to its specific relationship with the Alps.
Objective
Independent thinking and acting.

Content
The Alps as Common Ground

With each design semester the Chair of Professor Vogt is working its way around the Alpine arc with the thesis that it can be read as an urban Common Ground. The task of each design semester is to verify this thesis by focusing on a metropolitan region and enquiring as to its specific relationship with the Alps.

In the coming semester we shall be working with the urban territory of Ljubljana, which covers besides the high alpine landscapes (the Julian Alps, the Karavanks, the Kamnik Alps) three more alpine regions: the Dinarides (Karst), the Pannonian Basin and the Mediterranean Coast. Geographically almost the whole territory of Slovenia could be seen a part of Alps.

Though this supposed ubiquity of the Alps, the correlation to Ljubljana remains diffuse. This is linked to the geopolitical location of the region, which was constantly changing its territorial belonging to the neighboring great powers throughout history. Moreover, the emerging industrialization in the beginning of the century and the development of the transit axis were leading to population decrease in the high alpine area. This weakened their position compared to the lower districts considerably. Looking at major infrastructure projects that are planned like the Connecting Europe Facility (CEF), it may be assumed that this trend will continue. As a consequence, economic and living areas in Slovenia’s high Alps will soon disappear (Werner Bätz).

The task of the semester consists of the redefinition of the meaning and use of the alpine landscape ranging between extensification (landscape as a museum) and intensification (e.g., tourism, agriculture or energy production) with the purpose to establish a productive relation to the region of Ljubljana.

We understand design not as an end product but as a process. Our first step is to investigate Ljubljana’s large-scale relationships. A six-day long field trip complements this analytical gaze with a personal take on the area. Students then develop an individual programme as the foundation for their design. The proposed interventions can vary between urban planning and landscape scenarios and concrete architectural proposals.

Lecture notes
The Workbook is released in the first week.

Literature
The relevant literature is included in the workbook.

051-1137-16L Architectural Design V-IX: High-Rise and Public Space W 13 credits 16U X. De Geyer

(GD X. De Geyer)
Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Abstract
The first aim of the studio is to allow a shift of focus on architecture, to see the buildings from the outside and their relation both to the exterior and to the public interest. This displacement opens new fields of possibilities for architecture.

Objective
The first aim of the studio is to allow a shift of focus on architecture, to see the buildings from the outside and their relation both to the exterior and to the public interest. This displacement opens new fields of possibilities for architecture. It is also about providing the students with the necessary understanding to consider public space as an architectural project itself in order to liberate the same creative process that they already have considered for building design.

Content
The studio will focus on the design of a university campus building and its immediate surrounding, the architecture will result from the dialogue and relationship to the campus and the urban environment. The aim of the project will be to investigate concepts of campus buildings including their public space. The designs will not necessarily concern an entire building, depending on the situation; students will possibly elaborate a critical part of the campus building such as a lobby, a roof, a basement, a plaza or an interior circulation. One of three campus situations can be chosen: one in ‘splendid isolation’, one submerged in the city fabric and one dominating a small town. After a short-exercise (1 week) and a masterplan conducted in groups (4 weeks), the project will be developed individually (10 weeks). The production will include models, collages and drawings, amongst others medias.

051-1139-16L Architectural Design V-IX: Port of Havana W 13 credits 16U A. Brillembourg, H. Klumpner

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Abstract
Working directly with the Havana city government and local institutions, students will design alternative architectural typologies and inclusive urban visions that challenge conventional approaches of urban development characterized by privatization, fragmentation and gentrification.

Objective
With an end to the U.S. embargo in sight, fifty-six years after the Cuban Revolution, Havana is confronted with probably the most challenging opportunity for urban development in the Americas. At the heart of this development -- and the site of our studio -- is Havana's recently decommissioned harbor, consisting of 1000 hectares of state-owned land currently lacking any comprehensive plan. Working directly with the Havana city government and local institutions, students will design alternative architectural typologies and inclusive urban visions that challenge conventional approaches of urban development characterized by privatization, fragmentation and gentrification.

Students will propose architectural projects that react to the existing built legacy, absorb the influx of capital investment, and connect the surrounding neighborhoods to the waterfront, while generating an overall urban vision that tackles issues related to tourism, infrastructure, preservation, environment, mobility, and resource.

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 95 of 1570
Havana is a unique urban case study. Its strategic location in the Gulf of Mexico made Cuba one of the most important trading hubs of the Americas, a key node between the New and the Old World. At the center of the city is Havana's harbor. Through the centuries, it remained a crossroad of cultural exchange, generating wealth and a cosmopolitan flavor. With the imposition of the US embargo in 1960, however, as well as the economic difficulties that flowed from the dissolution of the Soviet bloc, international trade suffered immensely. The harbor transitioned slowly into a vast area lined with vacant factories, abandoned piers, and rusted cranes.

Today, with the relocation of all industrial activities to the newly opened port of Mariel on the outskirts of the city, and the possibility of the U.S. blockade being lifted at any moment, a wealth of investment is being directed at the port of Havana presenting a new challenge for this vast stretch of latent land in the center of the city. Because the political system means that the state owns all of the land, the direction of the development is up to them. Struggling between globalization, modernization, and the country's revolutionary socialist tradition, an alternative solution to the global commercially driven development is needed.

Can the city accept and direct this global investment while preserving its local cultural ideals? Will it learn from its specific experiences and develop its own creative urban solutions for a sustainable growth? Or will it replicate the usual mistakes of rapid urban development seen in many cities of today? Can we define this new urban agenda, together?

The development of this studio will benefit from the findings of our "Learning from Havana" summer school, which will be held from 22 August to 2 September, developed in close partnership with Prof. Christian Schmid (Chair of Sociology at D-ARCH ETH) and Prof. Jorge Peña Díaz (Faculty of Architecture of CUJAE, La Habana) who have been mapping and studying Havana over the past ten years.

A series of lectures, screenings, readings and discussions will accompany the design program. Workshops and in-studio tutorials will also be provided to train students in effective methods of representing complex ideas through visual media. These will be given by selected experts from the fields of architecture, urbanism, landscape, building technologies and associated disciplines, as well as experts from the Urban-Think Tank Chair.

Students will undertake research by studying existing test cases, formulating their design hypothesis, planning individual urban scenarios, modeling their designs through various formats, and communicating their intentions in a series of critiques and reviews. Students will be encouraged to develop an individual and critical position on the potential role of the architect to guide a design process within broader social, political and economic systems.

A series of lectures, screenings, readings and discussions will accompany the design program. Workshops and in-studio tutorials will also be provided to train students in effective methods of representing complex ideas through visual media. These will be given by selected experts from the fields of architecture, urbanism, landscape, building technologies and associated disciplines, as well as experts from the Urban-Think Tank Chair.

The class material can be downloaded from the student-server.

For more information on this studio, please refer to our Chair's website: [www.u-tt.com/teaching/fall2016studio](http://www.u-tt.com/teaching/fall2016studio)

The seminar week to Havana, Cuba is not obligatory but highly recommended.

Integrative Discipline: Planning
Language: English / German
Work: Groups (2 per)
Location: ONA, E25

Chair: Prof. Brillembourg & Prof. Klumpner

Assistant: Danny Wills, Hans-Christian Rufer

<tr>
<td>Content</td>
<td>This semester we will attempt to develop models for the future of these villages. Beautiful and apparently integrated with their setting, these places are actually very fragile with diminishing populations and constrained economical potential. We will start by closely surveying their physical state at the same time as trying to understand the historical and social conditions that caused them to develop in these ways. We will then develop proposals for working with, and adding to these places, proposals that will be physical as well as programmatic. At the end of the semester we would like to have an idea about how these places could become whole and coherent again. We would like to find new architectures that support a renewed and dynamic social structure. The semester will be taught in collaboration with Professor Christian Schmid whose chair will provide support that will enable our study to be both physical and social.</td>

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 96 of 1570
The studio series European Countryside investigates the terra incognita of the countryside, and its mutations. During the HS16 we will focus on Lac Léman and the concept of Metropolitan Countryside, investigating the possibilities of bringing the countryside and the metropolis closer together.

Students will work in groups of two. All projects will compose a common vision for Lac Léman. The work will be represented in the form of drawings, physical models, and a book. All projects will be made public on Architecture of Territory website.

European territory has become completely urbanised. The countrysides in the traditional sense have disappeared, the distinctions between the town and the country have been blurred. In contrast to the unambiguous urban transformations of cities, the processes of urban change in the countryside are massive, yet often unnoticed. Away from the public eye and professional scrutiny, these processes have created new urban identities and configurations in the formerly rural realm of Europe. The studio series European Countryside will explore the terra incognita of the countryside, and its radical mutations. The project aims to reinvent contemporary countrysides as legitimate and critical subject of architecture profession.

Lac Léman and its urban areas surrounding the lake and extending from the lakesides into the Rhone valley and up the slopes of Jura and Alps, will serve as the blueprint for the investigation of the Metropolitan Countryside. This is a territory where the high quality metropolitan living is embedded into the scenic landscapes of agricultural land and nature: the lake, the vineyards and the mountain slopes are not just a scenic urban background, but the key ingredients of the metropolis. The two poles of the "Léman City", Geneva and Lausanne, define one of the most desirable international metropolitanes in the world, which owns its attractiveness to international institutions and businesses, and its high quality of life, precisely to the unique, countryside-like attributes of its urban landscape. Intrigued by this apparently productive contradiction, Architecture of Territory initiates a two-semester investigation on the area of Lac Léman. For autumn semester 2016, we will study the concept of Metropolitan Countryside, investigating the possibilities of bringing the countryside and the metropolis closer together:

What are the benefits and potentials of agricultural land and nature for the contemporary metropolis? What are the new concepts of urban living, not only in the city, but in the extended metropolitan setting?

Investigative journey constitutes the core of the project. The field research will be organised in form of several group and individual excursions. The mandatory group trip will take place from 8-12 October 2016. Students who have obligatory courses on Monday, October 10, are required to organize their substitution or dispensation, in order to enrol. Additional 2-3 day individual trip to the research site will be required, and planned with the teaching team depending on the project task. Cost frame B.

Architecture of Territory is looking for avid travellers and team workers with high motivation and independent position.
This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g., building structures, landscape architecture, history of architecture, monuments conservation etc.).

**Objective**

Qualification to control the design process increasingly independent and with sole responsibility and to find to an individual design methodology and attitude.

**Content**

**Abstract**

- Built Territories Añana explores the complementary relationship between territory and urban context, prompting students to create efficient structures for visitors and residents of Añana, but more importantly to engage in an ongoing discussion on how the construction of architecture informs cultural, social and physical landscapes.

**Objective**

1. Identify and analyze research resources that are adequate for the development of the project.
2. Acknowledge theoretical issues in order to develop a critical posture related to the design process.
3. Acknowledge the needs of inhabitants and translate them into a creative and sensible proposal.
4. Demonstrate advanced knowledge in representing architecture according to challenging existing conventions.
5. Defend creative proposals in reference to various contextual issues informing architectural design.

**Content**

The idea that humans are the main geological agent on Earth has been around for some time now, especially since in 2000 the atmospheric chemist Paul Crutzen coined the term Anthropocene to refer to the influence of human behavior on Earth’s lithosphere in recent centuries.

The Salt Flats of Añana, in Northern Spain, were naturally formed in the Triassic Period as a result of a process known as diapiro, a type of geologic intrusion in which a more mobile and deformable material is forced into overlying rocks, allowing the salty water of the sea to emerge in this inland valley of the Basque Country.

Romans are believed to have operated this landscape industrially, though the first documented use dates back to 822, when Añana was started to be used with economic purposes. The landscape commenced then to be transformed in order to maximize the surface area exposed to the sun, turning the valley into a territory of platforms, subtly supported underneath by an architecture of timber-frame structures. At the time of maximum splendor, there were in the valley more than five thousand platforms for evaporation, occupying an area of 95.233m². Adjacent to the exploitation, the village of Añana was progressively built as a satellite rather than as a center, turning the salt flats into the very civic space of the valley.

**Thematic and methodic focus:**

- Design architectural landscapes taking into account a wide range of urban, socio-cultural, economic and historical issues that are inherently connected with architectural practices.
- Recognize environmental and landscape issues that are relevant to contemporary architectural agendas.
- Consider and negotiate structural, material, functional, interior and exterior space aspects as well as all urban issues that concern the project simultaneously.
- Represent idea(s) appropriately using effective means of presentation, including digital tools.

**Objective**

- As a didactic target a profound debate on supporting structure, on construction and on room creation is declared.
- In consequence of the historic fact that the builder's profession has been divided into the professions of an engineer and an architect, a binary vision of fields came up which reflects in the various types of building tasks. Hence, nowadays engineers realize a number of structures without considering an architect's expertise.
- However, the professional expertise of the engineers should be merged with the design ideas of architects. That opens a field between freedom of design and functional/technical requirements.
- Such buildings characterize our environment exceedingly and represent a substantial part of it, a high sophisticated design is very important for our society.

**Content**

Therefore structural aspects are evaluated to their spatial and tectonic qualities. For this reason the course does not deal with classic architectural design tasks. The focus is on engineering structures.

**Integrated Discipline Construction**

The integrated Discipline Construction can also be completed as "additional integrated Discipline", but the integrated Discipline Construction must be chosen at least once.

This new situation transforms the possibilities and thus the professional scope of the architect.</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
We use the term digital materiality to describe an emergent transformation in the expression of architecture. Materiality is increasingly being enriched with digital characteristics, which substantially affect architectures physis. Digital materiality evolves through the interplay between digital and material processes in design and construction. The synthesis of two seemingly distinct worlds—the digital and the material—generates new, self-evident realities. Data and material, programming and construction are intertwined. This synthesis is enabled by the techniques of digital fabrication, which allows the architect to control the manufacturing process through design data. Material is thus enriched by information; material becomes informed. In the future, architects ideas will permeate the fabrication process in its entirety. This new situation transforms the possibilities and thus the professional scope of the architect.

051-1227-16L Integrated Discipline Information Architecture (G. Schmitt) W 3 credits 2U  G. Schmitt

Abstract
This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).

Objective
Apart from learning about and experiencing Information Architecture, the course also introduces research and management skills that will distinguish the future trained ETH architect.

Content
This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).

051-1231-16L Integrated Discipline Sociology (C. Schmid) W 3 credits 2U  C. Schmid

Abstract
This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates sociological questions and research methods.

Objective
To consider the social context in the design process!

Content
The content is related to the design process and is defined accordingly to the individual project.

051-1233-16L Integrated Discipline Architecture and Urban Design (C. Christiaanse) Enrolment only with contemporaneous enrolment of the design course of Prof. Christiaanse

Abstract
The integrated focal work has to accompany the design, though the focal work has to be an autonomous work. The formal framework needs to be discussed with the assistants.

Objective
An urban design case study with a clear topic and a clear formulation of a question. The findings and the discoveries shall be part of the base of the design.

Content
The integrated focal work has to accompany the design, though the focal work has to be an autonomous work. The formal framework needs to be discussed with the assistants.

051-1235-16L Integrated Discipline Landscape Architecture (G. Vogt) Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php)

Abstract
Subject by arrangement

Objective
Learning objectives: introduction into landscape architectural issues and design approaches; designing in urban planning dimensions.

Content
Subject by arrangement

051-1237-16L Integrated Discipline Landscape Architecture (C. Girot) W 3 credits 2U  C. Girot

Abstract
Design concepts ranging from architectural objects to urban planning are developed together with the discipline of landscape architecture. Dependent on the task at hand different themes are investigated. The goal of the integrated discipline is to develop design solutions of a specific topic in landscape architecture, which have to be incorporated into the overall design submission.

Objective
Students gain an insight into the integrated disciplines of design in architecture together with landscape architecture.

Content
Design concepts ranging from architectural objects to urban planning are developed together with the discipline of landscape architecture. Dependent on the task at hand different themes are investigated. The goal of the integrated discipline is to develop design solutions of a specific topic in landscape architecture, which have to be incorporated into the overall design submission.

Prerequisites / notice
In order to complete the subject Integrated Discipline it is necessary that students apply at the Chair of C. Girot within the first three weeks of the semester. Thereafter no applications will be processed.

Learning aids: Pamphlets Design of the Chair of Prof. Girot. www.girot.arch.ethz.ch

051-1245-16L Integrated Discipline Structural Construction (P. Block) Implementation into architectural design of the gained structural construction knowledge, in order to find best possible and holistic solutions for a construction task.

Abstract
The integrated course achievement is allocated to the design course and is fulfilled under the supervision of professionals out of the field of structural teaching. The main focus, the form and the scope of the thesis are specified in agreement with the chair.

Objective
The integrated course achievement is shown within the design course and is performed under conducted cooperation of structure teaching experts. The work's focus, it's form and scope are up to the agreement with the chair.

Content
The integrated course achievement is shown within the design course and is performed under conducted cooperation of structure teaching experts. The work's focus, it's form and scope are up to the agreement with the chair.

Prerequisites / notice
Die Anzahl Plätze ist beschränkt!

Abstract
In the integrated discipline the architectural design will be juxtaposed by artistic thinking and working. The conceptional approach will in particular be rendered more precise in the dialogue between architectural and artistic methods. There is also a focus on the technique of describing the context precisely.

Objective
Art ist das discipline that is constantly creating new realities of terminology and perception. The purpose of the integrated discipline is to use this knowledge, that is produced by art, and to concern it by making design decisions.

Content
A systematic procedure for every step in the design will be supported in the integrated discipline, from the generation of new ideas through to detailing and up to presentation. Reflections on method flow into the design in an integrated manner. There will also be an emphasis on giving expression to the results of the design process using artistic means. In addition a publication should be compiled, presenting the conceptual steps developing the design.

Prerequisites / notice
Application for the coursework with the lecuturer: Nikolai von Rosen, vonrosen@arch.ethz.ch

051-1251-16L Integrated Discipline Life Cycle Analysis W 3 credits 2U  R. Hischier, D. Hebel

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 101 of 1570
Abstract
The Integrated Discipline LCA is based on the core idea of the overall design task - the thinking of a project within its complete life cycle. The method of LCA allows to quantify the environmental sustainability of different life stages of a building (raw materials - construction - operation - decommissioning) and thus recognize their relevance to each other as well as present them clearly.

Objective
Introduction to the topic of sustainability and teaching of fundamental method of life cycle assessment as well as its application in architecture and construction. Practical use of these method in a simplified form to assess your own planning activities within the parameters of the design studio.

Content
The Integrated Discipline LCA is divided into two phases - the first phase will convey the methods of LCA through a mix of lectures, examples and an exercise, in order to be applied in the second phase in a simplified, yet meaningful manner in close connection with the central task of the design studio. In the center of the 2nd exercise is the specific design and constructive approach of the individual student group. Building on there design, the results of exercise 2 should be prepared so that they are suitable for integration into the final presentation wall. For this exercise should be seen as part of the overall task and relevant input for the whole semester.

Abstract
This course analyzes the history of urban architecture primarily in its existing three dimensional form as a complex human artefact. It also explores the inspirations that prompted the creation of this artefact: philosophical and religious concepts, social conditions, property relationships and the mechanisms that exploit the economics of real estate and the influence of building technology. Intellectual, literary or artistic modes of thought will also be assessed with regard to their impact on urban development. Urbanism has its own distinctive approach as a discipline, but it is also clearly responsive to the influence of related disciplines. Study is made of actual cities and urban expansion plans which are in the process of implementation, as well as unrealized projects and visions of the future. These projects sometimes illustrate ways of thinking that are equal to, or clearer than, actual urban situations.

Objective
Work on a current or a passed design project in a large scale.

Content
The lecture which will be hold only in one semester includes the developments of the 20th century

1. Le Corbusier: theories, visions and clearcuts in the name oft he autorité
2. The United States in the Jazz Age: Between Metropolis of Tomorrow and Broadacre City
3. Italy in the Fascist Era: Monumental ensembles and new town between assiduousness of modernization and obsession of representation
4. Urban design under totalitarian regimes: The architects of the "Tausendjährige Reich" and the "engineers of luck" of the Soviet Union of Stalin
5. Coming to terms with the past and the Cold War: Reconstruction in the two German states
6. The myth of the human scale: the 1950s in Spain, Great Britain, Scandinavia and Italy
7. Postwar Experiments: Rationalistic classicism in France
8. Two new towns in the 20th century: Chandigarh and Brasilia
9. Fictions and visions: The international utopia of the city
10. The second conquest of the North American territorium: The automobile and the city in the USA
11. Analysis, analogy and renewal: The adventure of the typological city

Lecture notes
To each lecture an overview is listet within a script, that can be purchased at the chair for the history of urban design (HIL D 75.2) at the price of CHF 25,-. The script serves as an auxiliary means to the attended lecture compiling the most important illustrations showed and the names and dates of the buildings and its builders along with a short introductory note.

Literature
Further recommended literature to consult is listet within the script.

066-0427-00L | Design and Building Process MBS | W    | 2 credits | 2V    | A. Paulus |

Abstract
“Design and Building Process MBS” is a brief manual for prospective architects and engineers covering the competencies and the responsibilities of all involved parties through the design and building process. Lectures on twelve compact aspects gaining importance in a increasingly specialised, complex and international surrounding.

Objective
Participants will come to understand how they can best navigate the design and building process, especially in relation to understanding their profession, gaining a thorough knowledge of rules and regulations, as well as understanding how involved parties¿ minds work. They will also have the opportunity to investigate ways in which they can relate to, understand, and best respond to their clients¿ wants and needs. Finally, course participants will come to appreciate the various tools and instruments, which are available to them when implementing their projects. The course will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship.
Design and Building Process MBS is a brief manual for prospective architects and engineers covering the competencies and the responsibilities of involved parties through the design and building process. Twelve compact aspects regarding the establish building culture are gaining importance in an increasingly specialised, complex and international surrounding. Lectures on the topics of profession, service model, organisation, project, design quality, coordination, costing, tendering and construction management, contracts and agreements, life cycle, real estate market, and getting started will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship. The course introduces the key figures, depicts the criteria of the project and highlights the provided services of the consultants. In addition to discussing the basics, the terminologies and the tendencies, the lecture units will refer to the studies as well as the practice: Teaching-based case studies will compliment and deepen the understanding of the twelve selected aspects. The course is presented as a moderated seminar to allow students the opportunity for individual input: active collaboration between the students and their tutor therefore required.

Content
The idea of the future not as a divinely predetermined, but as a designable space in time, was developed since the early modern period. The discovery of the future opened a rich field of activity also for architects: beyond traditional building tasks, dealing with future designs such as "The House of the Future" and "The City of the Future" have become leitmotifs of architectural production. Beginning in the Renaissance the lecture uses case studies to retrace the appropriation of the principle of the future by architects. Besides well-known designs for homes of the future, as of Alison and Peter Smithson (1956), "The House of Tomorrow", Chicago, (1933), the creation and transformation of the concept of future will be discussed, that, as in the case of the Italian Futurism (1909-1944), was decisive for certain phases of Western cultural history.

063-0315-16L

**History of Art and Architecture V: America**

| W | 1 credit | 1V | P. Ursprung |

**Abstract**
America plays a key role in the European imagination since the 18th century. The lecture follows this issue in discussing examples of American art, architecture, film and literature.

**Objective**
The lecture aims to focus on some of the concepts of the recent architecture and art history that have an ongoing influence on contemporary architecture.

**Content**
Art and Architecture of the United States.

**Prerequisites / notice**
The lecture is held in English.

063-0353-16L

**Construction History: Bâtir la ville du 19ème siècle: Paris**

| W | 4 credits | 3G | S. Holzer |

**Abstract**
Construction history of a nineteenth century metropolis, Paris. From urban planning and infrastructure development to innovative architecture in new materials such as iron, glass and concrete.

**Objective**
The participants will acquire an in-depth understanding of 19th century construction history, between neo-classical and classical modernism, from contemporary treatises to preserved monuments, and including modern challenges of preservation.

**Content**
Paris is the 19th century metropolis par excellence. There is hardly any city with a more abundant architectural, urban and infrastructural development in the 19th century, and hardly anywhere more monuments of his period have been preserved. Furthermore, an outstanding amount of contemporary scientific and architectural discussion has been published which allows us to reconstruct the details of the design and planning processes. The variety of preserved monuments includes late examples of classical French construction highlights such as the Opéra Garnier, innovative uses of traditional materials like timber (timber vaults of the neo-classical churches following Saint-Philippe-du-Roule, de l'Orme roofs inspired by the Halle au Blé, etc), experimental iron architecture (roofs of Bourse and Bibliothèque Sainte-Geneviève, iron churches of Saint-Eugène and Notre-Dame-du-Travail), extensive infrastructural developments (Belgrand's water supply and sewer systems) and historicist architecture with hidden technical innovations (Sainte-Trinité, Opéra). All these projects have been discussed extensively in contemporary monographs and journal articles.

The lecture will cover all these projects and provide a general introduction to 19th century construction history, including the echoes of French ideas in neighbouring countries such as Prussia. The lecture will include a seminar week dedicated to the on-site study of surviving monuments (including access to monuments not normally open to the public).

063-0371-16L

**History and Methods in Building Research**

| W | 4 credits | 3U | S. Holzer |

**Abstract**
No course in HS16.

**Objective**
No course in HS16.

**Content**
No course in HS16.

063-0417-16L

**Architecture and Structure**

| W | 2 credits | 2G | J. Schwartz |

**Abstract**
The focus is on structural and statical issues with respect to realization. Exemplary buildings are analyzed using graphic statics and specific properties of different materials discussed.

**Objective**
The course is centered around a design exercise where the form should be the result of a structural design implemented in an architectural design, combined with a deep knowledge of architectural space.

**Content**
Understanding of structural design as translation of structural concepts into building materials with respect to design concepts.

063-0419-16L

**Experimental Explorations on Space and Structure**

| W | 3 credits | 3S | J. Schwartz, J. J. Castellón González, P. D'Acunto |

**Abstract**
Introduction into an experimental approach to architectural design based on the application of methods that integrate structural and spatial parameters.

**Objective**
Basic understanding of the experimentation with design methods in architecture. Ability to build up models throughout digital and physical exploration integrating space and structure.

**Content**
In recent decades, new methodologies have emerged in architectural design that exploits the implementation of different parameters as generators of the design concept. Building on the programmatic ideas of the Chair of Structural Design of reconciliation of the disciplines of engineering and architecture, the course experiments with the application of design methods that integrate structural and spatial principles from the early stages of the design process. These methods are based on simple geometrical rules that relate spatial and structural parameters. The experimental process will be carried out through the development and construction of physical and digital models. This will allow for the exploration of the permeability of the boundary between the physical and the digital realm.

**Prerequisites / notice**
Enrolment on agreement with the lecturer only.

063-1357-16L

**Digital Urban Simulation**

| W | 4 credits | 4G | E. Tapia Pedraza |

**Abstract**
In this teaching unit architectural and urban design are analyzed by current computational methods. Based on these analyses the effects of planning can be simulated and understood. An important focus of this course is the interpretation of the analysis and simulation results and the application of these correspondent methods in early planning phases.

**Objective**
In a series of theory lectures we explore how the design and planning of cities can be evidence based by using scientific methods. By various exercises the students are equipped with skills in modern software systems. In an integral project work knowledge in state-of-the-art and emerging spatial analysis and simulation methods is deepened. Based on the imparted methods the effects of planning and design interventions can be simulated and understood. An important focus of this course is the interpretation of the analysis and simulation results and the application of the correspondent computational methods in early planning phases.

063-0311-16L

**Transitional Periods: Political Iconology - Architecture in Central Europe 1450-1800**

| W | 1 credit | 1V | M. Gnehm |

**Abstract**
The lecture course discusses issues of architecture as a bearer of political meaning in central Europe from 1450 to 1800. Understanding of political contingencies in architecture and its history.
The notion "central Europe" is a highly politicised geographical term in historiography. During the period in question (1450-1800) the history of central Europe is primarily the history of the Holy Roman Empire and the House of Habsburg. Although the huge area was shaped by the Habsburg idea of empire, it was characterized by the particularistic sovereignty of the many territorial lords. Religious wars further complicated the situation. The lecture course analyses with regard to political and historical changes to what extent secular and sacred buildings in Germany, the Czech Republic, Croatia, Poland, Hungary, Switzerland, and Austria could assume functions as a bearer of political meaning.

851-0252-08L Cognition in Studio Design - Analytic Tools for Evidence-Based Design
W 3 credits 2S B. Emo Nax, M. Brösamle, C. Hölscher

Abstract
How can Behavioral and Cognitive Science inform architecture? In this project-oriented course, students are introduced to cognitive and analytical methods to evaluate their design projects. Existing theories are introduced and complemented with hands-on sessions, in which students learn how to implement a range of methods. The course is tailored for students from relevant design studios.

Objective
Taking the perspectives of the end user (occupants and visitors) is vital for a human-centered design approach. Students will learn about relevant theory and methods in cognitive science and environmental psychology that can be used to address human cognitive and behavioral needs in built environments. The foundations of environmental psychology and human spatial cognition will be introduced. A focus of the course will be on how people perceive their surroundings and orient in space. Students will learn about a range of methods including real-world observation, and methods of architectural analysis such as space syntax. Students will also be exposed to behavior simulation in design, virtual reality experiments, and eye-tracking. Students will reflect the roles of designers and other stakeholders with respect to human-centered design as well as an evidence-based design perspective. The course is tailored for students from a relevant design studio. Upon registering, students should send an email about their design studio to b.emo@gess.ethz.ch. As an alternative to obtaining D-GESS credit, architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".

051-0317-16L History of Art and Architecture: Architecture and Climate Change (P. Ursprung)
W 4 credits 3G E. E. Scott

Abstract
This seminar will investigate intersections between architecture and climate change, one of the defining phenomena of our age. We will begin to map out the spectrum of manners in which architecture already engages with this vast and highly unsettling topic as well as how they might be more fully interrogated, invented, and instituted.

Objective
Students should come away with a clearer sense of the stakes of climate change for architecture and of architecture for climate change, as well as a deepened familiarity with relevant projects from the present and recent past.

Content
The discipline of architecture has been slow to engage with the vast and highly unsettling topic of climate change in ways beyond the technical (e.g., new materials, efficiency standards) despite the fact that issues of a social, political, economic, ethical, and even existential order are also, if not foremost, at root and at stake. Our own class discussions will indeed wrangle with a set of unwieldy and interrelated questions, including: At what scales does architecture intersect with climate change? Are planetary and highly local scales newly intertwined and, if so, how might architecture respond to and elucidate this condition? Which skills do architects bring to the table, and what is their revised role, in light of this accelerating and encompassing phenomenon? Does climate change demand a reimagining of the field? What would architecture look like that, rather than sheltering us from our surroundings, instead served as an interface between the two—orienting itself toward the human and nonhuman at the same time?

With a focus on the contemporary but eye to the recent past, we will begin to map out the spectrum of manners in which architecture has already engaged with climate change as well as how these might be more fully interrogated, invented, and instituted.

Class will meet for three hours each week, comprising a lecture, discussion, and student presentations. Over the course of the semester, there will also be multiple inputs by guest speakers, a field trip, and graded exam.

Lecture notes
A syllabus, required readings, and other course materials will be published/downloadable from the website of Professor Ursprung's chair at the beginning of the semester.

Literature
For further information, including literature, see: http://www.ursprung.arch.ethz.ch/lehre/veranstaltungen

Prerequisites / notice
All lectures, readings and discussions will be held in English. If you wish to participate in the course, attendance at this first meeting is compulsory. For any questions, please contact Dr. Emily Etza Scott (emily.scott@gta.arch.ethz.ch).

103-0569-00L European Aspects of Spatial Development
W 3 credits 2G A. Peric

Abstract
Following the insight into historical perspective and contemporary models of governance and planning, the course focuses on the international dimension of spatial planning in Europe. This includes a discussion of how European spatial policy is made and by whom, how planners can participate in such process and how they can address transnational challenges of spatial development cooperatively.

Objective
Keeping the general aim of exploring the European dimension of spatial planning in mind, the specific course learning objectives are as follows:
- to interpret the history of spatial planning at the transnational scale
- to understand and explain the content of the European spatial policy agenda
- to describe and analyse the role of territorial cooperation in making European spatial development patterns and planning procedures
- to discuss the changing role of planners and evaluate the ways of their engagement in European spatial policy-making

Content
- European spatial policy agenda: introduction and basic directives
- governance models
- planning models; collaborative planning model (main concepts & critics)
- post-positivist approach to spatial planning
- transnational spatial planning in Europe; questioning the European spatial planning; spatial development trends in Europe
- EU as a political system: EU institutions & non-EU actors
- planning families in Europe; the European spatial planning agenda
- spatial planning strategies and programmes on territorial cooperation
- the notion of planning culture and planning system; planning cultures in Europe
- basic characteristics of planning systems in Europe
- the relevance of European transnational cooperation for spatial planning
- European transnational initiatives: CODE 24 (Rotterdam-Genoa), Orient/east-Med corridor (Hamburg-Athens), Danube region

Lecture notes
The documents for the lecture will be provided at the moodle, https://moodle-app2.let.ethz.ch/course/view.php?id=2298.
The examination of filmic space situations and performance discloses new perceptions of architecture which will be studied on behalf of

Planning models:

EU as a political context:

Territorial cooperation in Europe:

Planning families and cultures:

Planning systems in Europe:

Prerequisites / notice

Only for master students, otherwise a special permission by the lecturer is required.

Architecture / Design

Seminar Architectural Criticism: Can Images Build Cities? Development Zones in the Limmatvalt

Abstract
The course investigates the potential and the limitations of architectural criticism. The course comprises theoretical reflection, discussions of architectural objects, as well as work on texts.

Objective
The objective of the course is twofold: On the one hand, students will get to know and to apply a critical approach to architecture by means of such media as oral discourse, written reviews, and the image as a tool of criticism. On the other hand, the practice of architectural criticism itself shall be reflected upon by reading and discussing theoretical and historical texts on the subject.

Content
The seminar is structured in three sections. In a first step, theoretical foundations will be established based on reading and discussing seminal texts, as well as guest lectures by established critics. A second phase will include site visits of selected buildings in order to develop a critical vocabulary based on immediate spatial experience. The third part will be devoted to the craft of writing; students will be authoring their own arguments and hold a public discussion.

Lecture notes
Will be handed out at the beginning of the semester.

Spatial Concepts in Film and Architecture (Prof A.Gigon/M.Guyer)

Abstract
The course deals with spatial phenomena at the interface of film and architecture. The alternating influence of such media as oral discourse, written reviews, and the image as a tool of criticism will be integrated into a development of cultural history and leads towards a conception which goes beyond the limits of architecture and stimulates new processes of design.

Objective
The examination of filmic space situations and performance discloses new perceptions of architecture which will be studied on behalf of film analyses and experimental topics. During the course space-effective creative means such as editing or framing will be introduced and discussed under perceptive aspects. Mediality within spatial perception can thus be integrated into a development of cultural history and leads towards a conception which goes beyond the limits of architecture and stimulates new processes of design.

Content
New perceptions of architecture are studied on behalf of film analyses and experimental topics. During the course space-effective creative means such as editing or framing will be introduced and discussed under perceptive aspects. Mediality within spatial perception can thus be integrated into a development of cultural history and leads towards a conception which goes beyond the limits of architecture and stimulates new processes of design.

Performance and Intervention

Abstract
The medium of performance art is the human being, whose voice and body send out messages into surrounding society. Performance art attempts to create an awareness of how such messages are sent and received. We will examine the significance of speech, posture, clothing and movement using selected examples from performance art.

Objective
Interpersonal relationships are regulated by political, legal, economic and cultural structures which are given representative physical form by architecture. Intervention art critiques the relationship between social structure and built-up space. We seek to develop ways of intervening in situations in which we ourselves are implicated, raising questions about the relationship between architecture and social environment.
Kritik und Theorie  ●  W 2 credits 2S  K. Sander

Against the background of my self-developed ten-line-format we are going to discover thematically partly fee, partly architecture related topics, by writing.

Objective
Structure and/or strengthening of the capability to express oneself in writing on a journalist level - effortlessly, flexibly and easily, thus primarily on special guidelines with regard to a tight text volume (i.e. blurbs on books or short contributions in magazines).

Content
Against the background of my self-developed ten-line-format we are going to discover thematically partly fee, partly architecture related topics, by writing.

The seminar enables students to work out concise and coherent texts of high linguistic expression to various topics within very short time.

Literature
Mohafez, Sudabeh: das zehn-zeilen-buch; Dresden 2016 (2010)
Queeneau, Raymond: Stiitungen; Frankfurt am Main 1990 (1947)

Prerequisites / notice
Enrolment on agreement with the Assistant, Ms. Sudabeh Mohafez mohafez@arch.ethz.ch.

Photography  ●  W 2 credits 2U  K. Sander

Limited number of participants. Enrolment by agreement with the lecturer - Motivation letter to be sent to eydel@arch.ethz.ch by 2nd September 2016 at the latest.

Abstract
The aim of the course is to reach a higher competence level of the media through applying cultural techniques of photography. Through critical discussions and analyses of the medium, participants will develop their concept of photography and confront its theoretical and practical challenges.

Content
Participants will analyze the motivations, strategies, and technical methods of artists and photographers. These analyses will also include the effectiveness and the history of reception of the given work or artist. Based on practical examples, theories of photography will be applied, i.e. through discussing reference, reproducibility, Image time, etc.

Prerequisites / notice
Places are limited. Enrolment by agreement with the lecturer. Please Motivation letter to be sent until 10.9.2015 an Wirz Mirjam <wirz@arch.ethz.ch>

Architecture and Photography  ●  W 2 credits 2S  T. Wootton

Number of participants limited to 15.

A motivation letter is to send to wootton@arch.ethz.ch until Friday 16th September 2016, 12 h.

Abstract
Since the mid 19th century the representation of architecture is inextricably linked to photography. Many buildings are being discussed on the basis of photographs. The artist and photographer Tobias Wootton (HfG Karlsruhe) will teach the students the various techniques (large scale, medium format, small format, digital photography).

Objective
Knowledge of architectural photography

Content
History, theory and practice in architectural photography

Prerequisites / notice
For participation a motivation letter has to be handed in until Friday 16th September 2016, 12:00 noon, to send to Mr. T. Wootton, Email: wootton@arch.ethz.ch.

3D Scanning and Freeform Modeling  ●  W 2 credits 2U  K. Sander

Limited number of participants. Enrolment in agreement with the lecturer only.

Abstract
Digital Sculpture. Experimental use of a system for digitalizing and modeling 3D objects.

Objective
Experimentation with digital tools and various design processes of 3D forms in fine arts, design and architecture. Practicing and playing with dimensionality and sense of space.

Content
The department of Architecture and Fine Arts has a 3D-Bodyscanner available for the digitalization of persons and objects, and is complimented by a special software for modeling the 3D data. After a period of training and practice, participants are asked to develop ideas and concepts for their own projects. These concepts should be used to lead and expand the system and the possibilities of its application. The process of readjustment and its realization will be a continual part of developing the individual projects.

Prerequisites / notice
The number of participants is limited to 14 students and enrolments need the lecturer's allowance! We Works with a 3D Touch Mouse, see Youtube https://www.youtube.com/watch?v=NF7nfktet2Q

Proficiency in Windows systems is a precondition for participation. To enroll in the course, please consult the lecturer: Adi Grüninger: grueninger@arch.ethz.ch

Artistic and Conceptual Thinking and Working  ●  W 2 credits 2S  S. Keller Roca

We approach the prelinguistic space of artistic thinking and agency from its context, which supports, mediates, criticizes, sells and preserves its artworks. We listen to the various protagonists of this space - cultural agents in civil service institutions, art mediators, critics, curators, gallerists, custodians; for in this space surrounding the prelinguistic one, nothing is left to chance.

Objective
This seminar aims at providing access to the prelinguistic space of artistic thinking and agency, in order to be able to observe the artists in artistic practices potentially contradicting our own.

Content
The seminar, of course, with its claim to teach the critical faculty to be astonished, is also part of these layers of mediation. We will measure this paradox of art directly up against our own ambitions. A productive tension will be established within us when we open up to artistic practices potentially contradicting our own.

We will approach the prelinguistic space of artistic thinking and agency from its context, which supports, mediates, criticizes, sells and preserves its productions - the artworks. We will listen to the various protagonists of this space - cultural agents in civil service institutions, art mediators, critics, curators, gallerists, custodians; for in this space surrounding the prelinguistic one, nothing is left to chance.

Literature
Brian O’Doherty: Inside the White Cube. The Ideology of the Gallery Space. When these essays first appeared in Artforum in 1976, their impact was immediate. They were discussed, annotated, cited, collected, and translated, the three issues of Artforum in which they appeared have become nearly impossible to obtain. Having Brian O’Doherty’s provocative essays available again is a signal event for the art world. This edition also includes “The Gallery as Gesture,” a critically important piece published ten years after the others.

Prerequisites / notice
The number of participants is limited.

Free Drawing  ●  W 2 credits 2U  Z. Leutenegger Küng

Application for the course with the lecuturer also via e-mail: stefan.keller@arch.ethz.ch.
Drawing is used to ascertain and develop the artistic ideas and abilities of students. Different techniques and methods will be tested. The focus of the drawings are determined in the study of architectural references as: figure, plasticity, body, space, light, atmosphere, etc. The goal of the Wahlfach is to learn basic approaches to designing with the knowledge about digital fabrication techniques and their development of individual expression in the realm of drawing; artistic flexibility and skill in the areas of working strategy and aesthetic impact.

051-0227-16L
Architectural Drawing

Number of participants limited to 136

W 2 credits 2G R. Fässer

Abstract
With the architectural drawing we can refer to one of the most important and primary design tools. Imaginations, ideas, as also the observation of important scenarios and impressions could be visualized with the appropriate technique.

Objective
Based on the process of the concrete, practical drawing, we can sensitize our perception and enhance also the interaction between head and hand. Also the digital drawing with Wacom tablet (if available) should not be missed out as an additional challenge.

Content
The focus of the drawings are determined in the study of architectural references as: figure, plasticity, body, space, light, atmosphere, etc.

Prerequisites / notice
The number of participants is limited.
Application for the course with the lecuter also via e-mail: Zilla Leutenegger <leutenegger@arch.ethz.ch>

051-0235-16L
Theory of Architecture: Curating 1917 - The Architecture of Russian Revolution (a.i. Moravanzyk)

W 2 credits 2S A. Vronskaya

Abstract
In the course of this seminar, we will collectively prepare the exhibition "The Architecture of Russian Revolution" (included in the "gta 50" exhibition series, to be open in February 2017).

Objective
To commemorate the 100-year anniversary of the Russian revolution (1917), this seminar examines the impact of the political revolution upon architectural education. We focus on teaching architecture at Moscow Higher Art and Technical Studios (VKhUTEMAS; 1920-1927), a school that rivalled the Bauhaus as one of the earliest and most important "avant-garde" pedagogical institutions. This experimental-format seminar will serve as a preparation for the exhibition "The Architecture of Russian Revolution," which will open in February 2017 a part of the series of exhibitions devoted to the 50th anniversary of the gta (Institute for the History and Theory of Architecture at ETH). The exhibition's particular focus will be on the importance of VKhUTEMAS legacy for architectural pedagogy (especially, at ETHZ today).

Content
The Russian Revolution (1917) dramatically changed not only political system, but also the lifestyle and culture in the country, including approaches to architectural education. Student protests against old, academic system of education followed the revolution, leading to a creation, in 1920, of one of the earliest "avant-garde" architectural institutions, the Higher Art and Technical Studios (VKhUTEMAS) in Moscow. Instead of the old practice of moving from drawing details to smaller buildings and finally finishing their education by designing a large building, the students now started by analyzing formal elements important for different arts: "Color" served an introduction to painting, "Volume"-to sculpture, "Space"-to architecture, and "Drawing" (that is, line) as an introduction to graphic design. The most developed of these introductory courses, Ladovskii's course "Space," analyzed three-dimensional reality as a combination of "elements of sensation": the basic physical, geometrical, and spatial properties of form, such as mass, volume, gravity, or dynamics. This course will be at a particular focus of our attention. We will approach it from a variety of contexts: the political situation in the aftermath of the Revolution; the changes in Russian culture and society; the developments in science (in particular, experimental psychology) and the new concept of the human that they entailed; the emergence of modernist approaches to architecture and its pedagogy; the challenges that these changes and developments posed for architectural education. As a result of our study, we will develop the concept of an exhibition on VKhUTEMAS and its importance for architectural pedagogy today.

Prerequisites / notice
This is not a lecture course. Attendance and active participation is required. There will be weekly mandatory reading and creative assignments (expect circa two hours per week of homework).
Enrollment limited to 20.

051-0621-16L
Architecture and Digital Fabrication

W 4 credits 4G F. Gramazio, M. Kohler

Abstract
Advance in technology revolutionizes design and fabrication processes within architecture. Digital fabrication allows immediate production from design data. The architect as author of these data takes a key role in this development. This course focuses on strategies for architectural production by means of algorithmic design tools and computer controlled fabrication methods.

Objective
The goal of the Wahlfach is to learn basic approaches to designing with the knowledge about digital fabrication techniques and their creative application within a specific task.

Content
We use the term digital materiality to describe an emergent transformation in the expression of architecture. Materiality is increasingly being enriched with digital characteristics, which substantially affect architectures physis. Digital materiality evolves through the interplay between digital and material processes in design and construction. The synthesis of two seemingly distinct worlds - the digital and the material generates new, self-evident realities. Data and material, programming and construction are interwoven. This synthesis is enabled by the techniques of digital fabrication, which allows the architect to control the manufacturing process through design data. Material is thus enriched by information; material becomes informed. In the future, architects ideas will permeate the fabrication process in its entirety. This new situation transforms the possibilities and thus the professional scope of the architect.

Lecture notes
The script is provided by the teaching chair and can be purchased the day the elective course starts.

Prerequisites / notice
Limited places (enrolment on lecturer's acceptance only).

051-0731-16L
CAAD Theory: A Quantum City - How to Think About Cities

W 2 credits 2G L. Hovestadt

Abstract
What if cities are not connected in space and time? You easily can talk to them. Just by taking a phone for example. But they are species in parallel universes.

Objective
This course will explore the role of computational power and information technologies in the creation of our imaginaries around the city. We will show you how models and theories, emerging mainly during the 19th and 20th centuries, present leaping correspondences with more ancient conceptions of the city, when observed from an informational perspective.
All documents for certification labels as well as detail plans of the buildings will be available for the students. The students learn to link both historical and theoretical architectural themes with their own creative design process.

Computers and computer networks provide today a new kind of mobile and instant operability; a user’s reach of action increases dramatically by having access to a computer online. Computer networks emit, receive, store and process information at the speed of light, in vast quantities, and regardless of the content.

This course will explore the role of computational power and information technologies in the creation of our imaginaries around the city. We will show you how models and theories, emerging mainly during the 19th and 20th centuries, present leapfrogging correspondences with more ancient conceptions of the city, when observed from an informational perspective. We will establish a refreshing dialogue in times where we seem to be overwhelmed by the wide range of possibilities that technology and the abundance of information are opening up. We are bored by the overused debates around urbanization as a threat, energy crisis, climate change, smart cities; the same problematic is elucidated, no matter which city you are looking at. Instead, we will explore the possibilities that the digital has to offer to us, the world citizens. Such transformations have taken place since the very inception of cities, and this is why we are convinced that each era including our own has to reinvent its City within its corresponding cultural galaxies.

ECTS

Lecturers

1. Introduction in hardware and software (getting to know technologies and context, administer tests)
   W L. Hovestadt, M. Angélil

CAAD Practice: Bots, Characters & Architecture

Three buildings case study will be presented.

No lecture notes will be provided.

W Basics of 3D-scanning of rooms and bodies, individual scan projects, 3D-visualizations and animations. Working alone and in groups, A. Wieser

Architecture VII

Student learn to link both historical and theoretical architectural themes with their own creative design process.

Lecture notes

No lecture notes will be provided. Attendance is compulsory and will be controlled.

Objective

Understanding of 3D-technologies, handling positive and negative spaces, handling hardware and software, processing 3D-data (registering of scans, precision, interconnecting, filtering, visualizations and animations), interpretation of the generated data.

Content

1. Introduction in hardware and software (getting to know technologies and context, administer tests)
2. Project development within the group (idea, concept, target, intention, election of methods, strategies)
3. Project implementation within the group (possible results, videos, pictures, prints, publications, web, blog, forum etc.)
4. Project presentation (exhibition incl. critiques, discussions)

Objective

Basics of 3D-scanning of rooms and bodies, individual scan projects, 3D-visualizations and animations. Working alone and in groups.

Content

Number of participants limited to 25

― 360° - Reality to Virtuality

Number of participants limited to 25

Objective

Building labels are used to certify buildings and neighbourhoods in term of sustainability. Many different labels have been developed and can be used in Switzerland (LEED, DGNB, SNBS, MINERGIE). In this course the differences between the certification labels and its application on 3 emblematic case study buildings will be discussed.

Objective

After this course, the students are able to understand and use the different certification labels. They have a clear view of what the labels take into consideration and what they don't.

Content

Different certification schemes, including LEED (American standard), DGNB (German Standard with Swiss adaptation), SNBS, MINERGIE-ECO and 2000-Watt-Society (Swiss standards) will be presented and explained by experts.

After this overall general presentation and in order to have a closer look to specific aspects of sustainability, students will work in groups and assess during one or two weeks this specific criteria on one of the case studies presented before. This practical hands on the label will end with a presentation and a discussion where we will highlight differences between the labels.

This alternation of working session on one specific focus location for one specific building followed by a group presentation and discussion to compare labels is repeated for the different focus point (operation energy, mobility, daylight, indoor air quality).

Lecture notes

The slides from the presentations will be made available.

Literature

All documents for certification labels as well as detail plans of the buildings will be available for the students.

Literatur
The comparative analysis of built constructions serves as a basis for further development of hypothetical future constructions.
D. Mettler
In this sense, the course is also intended for civil / structural engineering students and presents a possible bridge between the two careers to find their own strategies and approaches to design and to be aware of them. And so, according to the advice of Pier Luigi Nervi : "At every stage of his training, the future architect should be constantly and methodically guided to search for essential elements in each problem, be it large or small. The study of the architectural works of the past should consist in the critical examination of their functional and structural needs.” [P.L. Nervi: Costruire correttamente, Milano 1955; English version titled "Structures", 1956, p.28].
Excercise:
New formulation of a future konstrutive point as a result of a diagnostic work.

Experience, know-how and interest are the basis to explore a material and develop new ways to construct and form architecture. The objective of this course aims at exploring the correlation between material, construction and architectural expression.
Conservation and Building Research (NF Hassler)
The Meisterkurs Konstruktion is seeking a critical discussion on relevant constructive (and energetic) questions of our time. Alternating each semester, one of the typical construction methods will be examined: masonry, concrete, steel, woodwork and curtain wall facades. In the autumn semester 2016 we'll focus on contemporary steel constructions.

**Objectives**

The prospective architect shall develop necessary skills to be able to think construction in its complex relationships and to face future discussions in practice competently.

**Content**

The structure of the course contains:
1. Impartation of basic knowledge of construction
2. Seminar / exercises on the state of technology / research
3. Integration of practical case studies and problems

**Prerequisites / notice**

Enrolment on agreement with lecturer only.

**Abstract**

The focus of the seminar is to understand the urban history of Zurich through selected case studies.

**Objective**

The aim of the seminar is to discuss the selected Zurich case studies against the background of the history of urban design.

**Content**

The City of Zurich rises there where Celtic tribes settled and the Romans founded a the city. In the past two millennia authorities, planners of different disciplines, merchants and craftsmen, institutions and investors have shaped the city upon the Limmat. The physical outcome of these interventions stand in close relationship with the knowledge of the time and reflect the prevailing positions and theories, which were thought, published and built elsewhere. For that matter, the history of urban design of Zurich can be well understood as a branch of the history of European urban design, as well as the individual steps of development are offsprings of international reflexions and tendencies. Presentations in the seminar room and the visit of the selected ensembles in Zurich will help to tell the story of the urban development from the Middle Ages up to today. With this basic knowledge gained in the seminar and the walks the students will have to discuss the historical theories and developments as well as the urban qualities of the ensembles.

This will help the students not only to better understand the city but will also allow them to sample different urban situations and gather spatial experiences, which can also facilitate their design process.

**Prerequisites / notice**

The number of participants is limited to 24 persons.

**Abstract**

We will map the landscape above the new Gotthard Base Tunnel with sound recorders and photo cameras, and landscape interventions. Back in our AudioVisual Lab, we will work with audio editing tools, spatial sound design and photographic processing in order to compose a collective multisensory map of the Gotthard.

**Objective**

The goal of this elective course is to explore the perception, use and representation of landscape through the use audiovisual tools. In this process, spatial, dynamic and cultural aspects are highlighted.

**Content**

Above the new high-speed Gotthard Base Tunnel lies a fascinating mountain landscape steeped in myths and stories. On an alpine walking tour, we will trace the tunnel's course and mark points a hundred meters higher: alpine pastures, rugged mountains, deep forests, clear lakes, weekend cottages.

We will discover the audiovisual qualities of the mountain landscape, map our overground "tunnel journey" with sound recorders and photo cameras, and intervene in the environment at vertical points of intersection. How is our perception on the surface shaped through the awareness of the tunnel below? How do we experience the vast and lonesome mountain area at a walking pace instead of rushing through it in a secure enclosure? Using techniques from sound art, land art and "strollology", we want to examine the Gotthard, understood as both archaic nature and cultivated alpine landscape, a hightech transit area and a pre-modern refuge, the "center of Europe" and the periphery of Switzerland.

Back in our AudioVisual Lab, we will work with audio editing tools, spatial sound design and photographic processing in order to explore new ways of perceiving and portraying landscape. Through audiovisual journeys and mixed media installations we will compose a collective multisensory map of the Gotthard.

**Prerequisites / notice**

The course will be limited to 16 students. Participation on all dates of the course is mandatory. The costs for the excursion (traveling, overnight stay, food and drinks, ca. 200 CHF) are asked to be paid by the participants. Basic trekking experience and equipment are required (latter can be rented for ca 30 CHF).

Introduction: 22.09.2016, 12:45h, AudioVisual Lab (HIL H 40.9 / 40.5).
Weekly course dates: on Thursdays, 12:45-14:30h.
Weekend Workshop/Exkursion: 8./9.10.2016 (further information and costs will follow).
Final Crt: 1.12.2016 (End of the course)
No course: 27.10.2016 (Seminar Week)

For further details see website:
http://girot.arch.ethz.ch/blog/
### Topology: Scales of Power (Ch. Girot)

**Abstract**

ETH Students for the first time will investigate the Naharayim Site as a point cloud model. They will work through a series of precise sections: elevations revealing the site and the hydroelectric power station on the border of Jordan and Israel from 1928. Students will look at the site and its specific organization through various architectural and landscape elements (zero-canal, dam, hydroelectric power plant, bridges). The work will be developed in a condensed workshop.

**Objective**

Until now this site has not been documented. The goal is to produce material for a publication and exhibition on the theme of the architecture of power in this region. Students will look at the site and its specific organization through various architectural and landscape elements (zero-canal, dam, hydroelectric power plant, bridges). The work will be developed in a condensed weekend workshop.

**Content**

At the end of the elective, we offer the possibility to extend the work of the Elective Course with a Thesis Elective ("Wahlfacharbeit" 6 ECTS). The work will finalize the study done previously towards a publication and exhibition. The thesis elective will be conducted in the form of a 2-week workshop in January 2017. The elective course is compulsive to do the thesis elective.

**Lecture notes**

A reader will provide the theoretical framework.

**Prerequisites / notice**

- Introduction: 22.09.2016, 15:00h HIL H40.9 (Foyer)
- Lectures are given 15-17h in HIL H40.8 (LVML)
- The course is limited to 22 participants
- The lectures will be in English, assistance in E/D/F
- Further information is available on www.girot.arch.ethz.ch

### Pairi-Daeza: Water

**Number of participants limited to 12.**

**Abstract**

Enrolment in agreement with the lecturer only.

The elective course serves as an introduction to landscape architectural design on various scales including the topics of border, threshold, water, vegetation, topography, choreography, and metaphor. Architecture students develop a project based on the perception of place, knowledge of landscape-architectonc typologies, and conception of public space. They become familiar with GIS as an analytical tool, model building as a design methodology and the representation of landscape through plans. The design process is accompanied by workshops, lectures, excursions, critiques and a workbook.

**Objective**

The elective course serves as an introduction to landscape architectural design on various scales including the topics of border, threshold, water, vegetation, topography, choreography, and metaphor. Architecture students develop a project based on the perception of place, knowledge of landscape-architectonc typologies, and conception of public space. They become familiar with GIS as an analytical tool, model building as a design methodology and the representation of landscape through plans. The design process is accompanied by workshops, lectures, excursions, critiques and a workbook.

**Content**

The term ‘paradise’ and its religious implications originate from ‘pairi-daeza’, Old Persian for ‘a wall surrounding a garden’. Pairi-daeza is the point of origin for an elective series addressing basic elements and typologies of landscape architecture. This semester, students will deal with the appropriation of landscape as a common resource in Ljubljana and design a metropolitan park for the capital of Slovenia.

**Lecture notes**

The course is accompanied by a workbook with texts and background information.

**Prerequisites / notice**

The participation in the course is subject to the following three conditions:
1) The course is limited to 12 students. The restriction follows the time of the inscription according to the first-come-first-served-principle.
2) A two-days trip to Ljubljana from the 7th to the 9th of October is mandatory for all students.
3) The contribution to expenses will be 200.- CHF per student.

### Urban Food: The Alps as Common Ground: Ljubljana

**Limited number of participants. The course is fully booked!**

**Abstract**

Enrolment in agreement with the lecturer only: Roland Shaw shaw@arch.ethz.ch

The term ‘Urban Food’ implicitly questions how the production, processing, distribution, consumption and disposal of food influence the relationship between city and countryside.

**Objective**

Specific knowledge about relation and various processes in cities and countrysides, with regard to production, handling, logistics, consumption habits and disposal of foodstuff.

**Content**

The production, processing, distribution, consumption, and disposal of food have perpetually affected the relationship between city and countryside. In that sense, the industrialization and globalization of food systems contributed to the urbanization of the landscape. On the other hand, logistic systems and consumer behavior are strongly affected by processes of urbanization, which shows that the city and its food system have a mutual influence on each other.

**Prerequisites / notice**

Enrolment after Agreement only!

THE COURSE IS FULLY BOOKED!

Introduction to the workshop week in February 2017:
5th December 2016, 6 pm, HIL H 40.9.

Workshop week: 6th to 14th February 2017:
Trip to Ljubljana: 6th to 9th February 2017;
Final critics: 14th February 2017.

### Case Studies in Urban Design - Urban Planning

**Theory: Texts, Positions, Discourse**

**Abstract**

In this seminar we will take a journey through different positions concerning form in the urban design discourse of the last decades with special regard to the role of utopian visions in the achievement of the “good city form”.

**Objective**

The aim of the reading seminar is to gain deeper understanding of themes, positions and discourses within the field of urban design.
“What is the ideal city (...) that best expresses the power and beauty of modern technology and the most enlightened ideas of social justice?” 2g asks Robert Fishman in his opus, Urban Utopias in the Twentieth Century (1977). For Fishman, Ebenezer Howard's Garden City (1898), Le Corbusier's Ville Radieuse (1924) and Frank Lloyd Wright's Broadacre City (1932) stand out among utopian projects for their radically original urban designs, their revolutionary program for social change, and their authors' sustained personal commitment to realize the plans. Besides these ideal cities, Fishman suggests that utopian projects fall into two further categories: they are either utopian romances, that is, technical exercises without explicit social agenda, such as the technological utopias of Archigram or Yona Friedman; or urban ideologies, that is, projects that might bear social content but could still be carried out without revolutionary social change, as they tend to preserve an already powerful class. Such are designs produced by totalitarian regimes or dictated by powerful market conditions.

Following Fishman's theoretical grid, we will read excerpts from each of his rubrics, while considering utopian design thinking within a broader and more fundamental discussion about the means and ends of urban design. Kevin Lynch asserts that the purpose of urban design is the 'good city' (1981). What is then the role of utopias in achieving this goal? While exploring this question, we will also confront utopias with critical approaches that could be described as pragmatic. Jane Jacobs, for example, argues that utopias demand totalitarian control, whereas urban neighborhoods should be developed and rejuvenated employing bottom-up approaches.

We will ultimately link the studied concepts with various urban forms, such as the megastructure in relation to technological utopias or the Manhattan block in Rem Koolhaas' interpretation. In his book Finding Lost Space (1986) Roger Trancik identifies three major approaches to theories of urban form: the figure-ground, linkage, and place theories. We will classify each of the discussed forms into the above three categories. Thus, we will wrap up with a basic grid on form theories after having started it with another one regarding utopian visions.

After an introductory lecture, we will discuss one edited text each week, and confront the different positions they represent with each other. Accordingly, participants will be expected to read one text and write a half-page response each week, to once prepare and hold a 15-minute presentation of a text (including a compact handout), and to actively participate in the discussions. Optionally, 10 to 15-page position papers can be written after the semester as elective theses, honored by additional credit points. A reader with selected texts and thematic introductions will be provided.

Systematic Principles of Urban Design: Learn from the European City
W 2 credits 2G V, Magnago Lampugnani, H. Stühlinger

Abstract
Urban Ensembles of the Modern City. Strategies for Dealing with the Twentieth-Century City

Objective
The seminar will focus on studies in order to reveal strategies for dealing with the modern city. Built urban-development ensembles from the twentieth century will be embedded in their architectural and historical context, studied with an eye to their constitutive elements and discussed in connection with current urban-planning projects. In addition to various forms of methodological engagement with urban contexts, students will experience how the disciplines of urban-planning history and urban development can be considered in a more integrated way. Moreover, they will receive feedback on how to present the result of their analyses in concise, well-structured talks and in drawings.

Content
The approach to urban-planning ensembles of the twentieth-century city is characterized by their enormous quantity - which also makes dealing with them more difficult. The building stock dating from this era is immense. There is little discussion currently of how larger spatial contexts - housing estates, neighbourhoods, entire cities - can be not just designed and planned but also continuously developed as overall ensembles. Moreover, strategies, instruments and procedures for dealing with the vestiges of twentieth-century urban planning have yet to be established. In the seminar we will discuss how specific approaches to analysing, assessing and further developing of specific case studies have been formulated and explored recently as well as the extent to which they are experimental and deviate from traditional means for preserving and developing the city. Any discussion of an example of urban planning from the previous century must begin with precise analysis: taking up its original urban-planning principles in their historical dimension and all of the features that affect urban planning. The seminar will emphasise this sort of contextual discussion of modern urban space.

Lecture notes
There will be no script handed out.

051-0723-16L
Information Architecture and Future Cities: Smart Cities
W 2 credits 1V G. Schmitt

Abstract
What are SMART CITIES and how do they emerge? What is the role of architects and urban designers in this process? How do data turn into information as a building material for the future city? The course covers conceptual methods and techniques in design, simulation and communication of cities. The goal is to learn principles and preconditions for the design of sustainable and smart cities.

Objective
Students gain insight into the next generation of design processes for architects and urban designers, and into concepts of the Information Architecture of SMART CITIES, including the influence of Big Data. They learn about the expanded roles of information and of architecture: information and simulation in architecture as means to make the invisible visible, and architecture as a metaphor and ordering system to structure the immense amounts of data of the Information Society. The seminar is highly interactive and discusses visionary case studies in Europe and Asia and new techniques in Big Data informed smart urban design. Apart from learning about and experiencing Information Architecture and SMART CITIES, the course also introduces research and management skills that will distinguish the future ETH architect.

Content
SMART CITIES - What will happen when cities change from static configurations into responsive and dynamic structures? What does it mean for buildings that undergo the same changes? What is the impact on architectural and urban design education? How can citizens influence this development? The SMART CITIES course will answer these questions and supply you with the necessary skills and understanding to understand design such dynamic structures. The intelligent use of data and information are at the core of this course. Data and information are new building materials of future cities. Citizens produce increasing amounts of data in their daily life, with stationary sensors and mobile smartphones. Using those data, citizens will be influenced to change the design of the city and the redesign of existing ones. The course will be a first step towards the emerging citizen design science and cognitive design computing. Those will be the next generation of participatory design and design computing.

Lecture notes
iBook INFORMATION CITIES

Literature
The necessary texts will be found on the Chair's website at: http://www.ia.arch.ethz.ch. We specifically recommend the consultation of the Future Cities Website at: http://www.futurecities.ethz.ch during the entire course. The iBook INFORMATION CITIES is available in the iBooks Store for free.

Prerequisites / notice
Interactive seminar including 3 exercises

051-0725-16L
Digital Urban Visualization: People as Flows
W 2 credits 2U G. Schmitt

Abstract
We examine patterns of crowd-flows in an extraordinary urbanisation phenomena: festivals.

Objective
The course participants will learn how to program simulations using Processing/Java. Previous programming knowledge is not necessary. Furthermore they will gain insights into other analysis methods and learn about their significance, strengths and weaknesses.
Content
We will look at those patterns from two sides. One being the view of a planer asking to find bottle necks or the ideal place for amenities such as booths, toilets etc. Another being the view of visitors. We will program different behaviours that should compete against each other in order to compare their different strategies. As a case study we will use the Caliente Festival in Zurich.

For deepening the learnt in a semester thesis we offer to optimise the created simulations to make them available in interactive planning workshops. Additionally they could be converted into interactive web apps.

<td>ACTION! On the Real City: Wunderkammer</td>
<td>2</td>
<td>2</td>
<td>T. Guthknecht</td>
</tr>
<tr>
<td>Abstract</td>
<td>A full urban block in the center of Opfikon's Glattpark area is the site of intervention for this semester's elective. Students will learn how to develop and realize ideas for rapid change in context of both existing initiatives and future plans. They will negotiate, edit, intervene, and explore the relationship between visionary goals, planning regulations and operational possibilities.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Learning from previously successful projects in Zürich and case studies from around the world, the course will share insight into how temporary action can ignite cumulative urban regeneration and influence future development. How can we increase urban value through an open and inclusive process? And how can we improve upon current planning paradigms via active experimentation?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The course will begin with a voluntary trip to the renaissance castle of Ambras to experience a Wunderkammer firsthand. This will be followed by a guided site visit during which students will be introduced to Glattpark, its recent developments and the Wunderkammer project's ambitions. The first exercise will be to document the potential and hidden qualities of the area. Then, after defining a collective design charter, students will work towards developing on-site physical interventions as decision-making tools. The goal of the studio is to define a more grounded process for community driven design and trigger incremental change. To continue investment in the site, students' work will be showcased at a concluding exhibition and event.</td>

<td>Planning Strategies for Complex Buildings Using the Example of Health Facilities</td>
<td>2</td>
<td>2</td>
<td>T. Guthknecht</td>
</tr>
<tr>
<td>Abstract</td>
<td>Independently written scientific paper concerning a subject of planning of complex buildings - such as health facility planning and design - with special focus upon the dynamic changes in this context and the related planning and building reactions to them.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The objective is that the students engage in a debate of a differentiated functional planning as a basis for complex buildings which are to be successful functionally, operationally and in design. On the basis of a given scope of themes the students carry out research aiming for possible improvements for example in health facility planning. The scope of subjects is announced at the beginning of each semester.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Complex buildings such as health care buildings are subject to constant change. In a new hospital building 60% of the diagnostic and treatment areas are subject to building changes within the first 10 years of operation. Architecture has to develop concepts which accommodate this level of dynamics into the building structure in a better way. In the coming years this need for adaptability is going to be challenges even further by the even more reducing health care resources. The paper should discuss in this context a specific question in detail by analysing problems and developing and discussing potential planning solutions.</td>

<td>Sand: an (in)finite Resource? - Engineering for Development (EAD) Summer School</td>
<td>4</td>
<td>9</td>
<td>D. Hebel</td>
</tr>
<tr>
<td>Abstract</td>
<td>The programme revolves around the depleting resource sand and the question of how to develop alternative building materials for future cities. The course is for 30 master and doctoral students from ETH Zurich and other academic institutions (from different disciplines related to the topic), joined by faculty members and external experts from fields of expertise related to the winter school topic.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The EAD summer school 2016 aims to develop an integrated vision to a global challenge of today's construction industry. The programme revolves around the depleting resource sand and the question of how to develop alternative building materials for future cities. Led by different experts from around the world, students will not only learn the theoretic background of this resource but experiment with current and future technologies to transform sand and building waste. In the workshops the acquired knowledge will be tested and applied. The summer school presents three areas that could mobilise sand alternatives for construction and other applications: (i) I. Biologically induced Calcite Precipitation (MICP), (ii) Chemical Crystallization Processes and (iii) 3D printing.</td>
<td></td>

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 116 of 1570
Sand is the most commonly used raw material for the production of goods on our planet. It is found in concrete, glass, computers, detergents and toothpaste. Sand is the megastar of the industrial and digital era - our culture is literally built upon this resource. But sand is not equal to sand: the construction industry requires grain sizes and rough shapes that are only found in river beds, lakes and the oceans. Mining of aquatic sand comes at high environmental and social costs; its growing demand cannot be met sustainably. Sand is mostly composed of quartz, a mineral form of silicon dioxide. Silicon is one of the most abundant materials. These properties make it valuable to various industries. Since a few years demand for sand has risen exponentially. Alternatives for sand for construction have yet to be developed.

Sustainability is often referred to as an interaction of social, cultural, economic, and ecological aspects. In the construction industry sustainability has been perceived as the optimisation of existing material and energy uses, yet the fundamental energetic and material character of these base resources has not been questioned. The speed of consumption of these resources increases constantly due to demographic pressure and resulting construction, as seen around the world and in particular in developing and emerging countries. A fundamental understanding of metabolic processes is required to frame the question of material and energetic sustainability. At the same time the definition of resources expands to include previously undervalued materials and waste. Finally, advances in digital technology and science have opened new avenues for alternative materials and processes.

The summer school presents three areas that could mobilise sand alternatives for construction and other applications:

I. Microbiologically Induced Calcite Precipitation (MICP): Also known as bio-cementation it is a process utilised in self-healing concrete and soil stabilisation. The application to sand will produce naturally grown structural sand bricks. This workshop will compare MICP for various sand types, building wastes and bacterial cultures.

II. Chemical Crystallization Processes: Based on material computation experiments pioneered by architect and engineer Frei Otto, this workshop combines form finding properties of sand with structural and thinking and chemical crystalization processes.

III. 3D Printing: 3D printing with sand and building waste, finally, explores the potential of sand as a substrate within a binding agent. In combination with a robotic arm, 3D printing of sand is an in situ digitally controlled construction process. It overcomes the need for traditional form-work and transportation of material, thereby reducing the grey energy.

Prerequisites / notice

Taking place from 4 to 22 July 2016 at the TU Delft in The Netherlands.

Costs: CHF 500, including board and accommodation. All participants are responsible for organising and financing their own domestic or international travel to Delft, The Netherlands.

The Engineering for Development (E4D) Winter School 2016 will invite 30 master and doctoral students from different disciplines related to the topic of the summer school. Applicants will be selected based on their academic record and previous work experiences. Applicants must send a one-page CV and one-page letter of motivation in PDF format stating their interest, to Ms. María Ubierna Aparicio (ubierna@fibu.baug.ethz.ch).

Deadline: 31 March 2016

Notification: 15 April 2016
Summer School: Learning from Havana

M. Menendez, C. Schmid

Abstract
The course will function as an inter-disciplinary think-tank exploring the requisites for sustainable urban development of the Old Havana Port (UNESCO World Heritage site) through the lens of architecture, engineering, and social sciences. The challenge is to work in an intensive cross-cultural setting and develop solutions in a complex, real-life context with local practitioners and stakeholders.

Objective
You will receive full support on-site from the Polytechnic University José Antonio Echeverría, La Habana (PUJAE) and ETH tutors from your discipline. In developing the scenarios you will work side by side with young professionals with a grounded knowledge of the field, and be joined by a wide variety of local stakeholders.

The program will combine site visits, expert lectures and workshops to allow you to develop the following skills:
- The capacity to work to address urban challenges in an inter-disciplinary team;
- Conduct your own research within a limited time frame and through quantitative and qualitative analysis;
- Apply Scenario Analysis technique to structure and integrate knowledge from various fields;
- Cross cultural understanding and skills in an international collaboration;
- Mechanisms to collaborate and communicate with practitioners and stakeholders;
- Developing integrated and sustainable urban development strategies.

Content
Cities on the border or an outpost of Western European influence, struggling between globalization, modernization and local traditions, are characterized by great social and spatial disparity. Havana is a characteristic case of such a city, which is currently undergoing rapid urbanization and experiences a critical moment of transition.

At this very moment, the political and economical situation is changing rapidly, with a contradictory process of economic and social opening that becomes now more and more visible in the streets of Havana, with new businesses, restaurants and street activities, announcing further changes in everyday life. How can such fragmented conditions within cities be tackled by integrated and inclusive solutions, rather than fragmented interventions that exclude the challenged local communities?

Moreover, the lack of resources in cities of the Global South often prevents the gathering of modern, digitalized data, while the unstable political structures prevent the implementation of durable planning strategies. These cities need a rapid assessment procedure, in order to identify relevant priorities and potentials. How can we create a comprehensive understanding of the system and propose appropriate solutions, while using quantitative and qualitative data?

The summer school will build on the current "Atlas Urbano de La Habana - Urban Atlas of Havana" and on the project SeDUT (Seminario Internacional de Desarrollo Urbano y Transporte), a three-year Swiss-Cuban cooperative research project on the urban development of Havana and its mobility potentials. The SeDUT project involved many academic, governmental and private stakeholders, such as the Polytechnic University José Antonio Echeverría, the Centro de Estudios Urbanos de La Habana, the Instituto de Planificación Física, the Dirección Provincial de Planificación Física de la Ciudad de La Habana and the design office of Metron AG. Together they represent an important expertise and a high degree of accumulated knowledge.

In a team, you will produce alternative urban scenarios for the planned redevelopment of the Old Port of Havana. You will contribute your expertise and unpack the realities of sustainable development in a tropical climate. How can knowledge from the ETH be combined with Cuban research and translated to a Caribbean context? Through debate, controversy and collaboration it is expected you produce scenarios that integrate your different disciplines and question the preconceptions of sustainable urban development.

This immersive summer school will be structured in three interlocking modules:

In the first module you will investigate the Old Port and gain a strong understanding of the social, environmental and built context in Havana. You will employ analytical mapping to integrate and synthesize different disciplinary knowledge, ranging from quantitative data to subjective observation.

In the second module, you will develop a series of scenarios for the Old Port, proposing alternatives for its sustainable future. You will build on the research from the first module, and explore the potential of your ideas with local stakeholders and professionals from your field. You will document these scenarios using creative and varied representational methods.

In the final module you will pitch your scenarios to decision makers. During this event you will measure their preferences, debate the associated trade-offs, and provide a series of orientations for those planning the future of Havana.

Who should apply?
Enthusiastic students currently enrolled in a masters program in ETH Zurich and PUJAE Havana. A balanced group of 15 ETH master students from the D-ARCH, D-BAUG, D-GESS and D-USYS departments will be selected. They will be joined by 15 Cuban students from our partner university.

Applicants should have a strong interest in sustainable urban development and transdisciplinary collaborative research. They should be able to demonstrate their academic strength, motivation, interest and expertise. Knowledge of Spanish is welcome but not obligatory.

Dates in Cuba: 21 August to 1st of September.
Contact: Marie Grob at grob@arch.ethz.ch, enrollment procedure on our webpage.

Summer School: Summer Chantier Valparaiso Chile

A. Spiro

Abstract
This program serves to guide the project at its origins. During the summer, and in the intervening school year, groups and students and faculty respond to the existing conditions with tests and interventions that develop the project. This development is also influenced by poetic acts that take place on the project site that open up or introduce new prerogatives or potentials into the work.

Objective
An alternative, experiential approach to architectural education; a humanistic understanding of architecture’s relationship to language; a direct relationship to site where drawing and observation are used as practical tools; a direct contact with materials, fabrication and assembly that draws on “low-tech”, handson construction methods and their poetic potential; these are the main objectives and principal achievements of the Building Cultures_Summer Chantier program.
Site: La Ciudad Abierta (the Open City)

Founded in 1970, the Open City occupies a 300 hectare parcel of land on the Pacific Ocean, 1 hour north of Valparaiso, Chile and 20 minutes north of Concon. The land comprises diverse ecosystems including wetlands, dunes and temperate forests and is divided in two by a busy two-lane highway. Founded by teachers from the School of Architecture and Design of the Pontifical Catholic University of Valparaiso (e[adj]PUCV) as a place to explore the humanistic potential of architecture - as a poetic space making discipline and as a means to propose new forms of community. The Open City is home to 14 families who live there on a permanent-basis and is also the site of weekly classes and activities for students and faculty from the e[adj]PUCV. The structures nestled in the landscape have been developed and built by students and faculty over the course of the Open City's history.

Project: El Portico de los Huéspedes

El Portico de los Huéspedes is the first permanent structure to be proposed in the Open City in nearly 12 years and was begun through the collaboration between Summer Chantier and the e[adj]PUCV in the summer of 2014. An initial program for the structure was developed by the Open City members and responds to a need within the community for permanent space for both the administrative secretary of the Open City and for guests conducting research. In addition, the program responded to a desire to create a space large enough for the entire e[adj]PUCV community to assemble within the Open City itself. This program is not a set of fixed guidelines but served, and serves, to guide the project at its origins. Similarly, el Portico de los Huéspedes has no fixed plan or finality. During the summer, and in the intervening school year, groups and students and faculty respond to the existing conditions with tests and interventions that develop the project. This development is also influenced by poetic acts that take place on the project site that open up or introduce new prerogatives or potentials into the work.

Project History 2014/15:

Poetic act defining the amplitude of the necessary site;
Definition of the site location, development of principal structure based on a study of Gunnar Asplund's Woodland chapel;
Replacement of wooden pile foundations with concrete foundations;
Poetic Act defining points within the site that became manifested through flexible form-work columns;
Development of secondary structure in wood and brick plazas on northeast and south west corner of site.

Program Outline:

Lausanne Week (late July): The Lausanne week is an intense period of analysis of the existing site conditions. This first encounter with the Open City and el Portico de los Huéspedes is supplemented with lectures that introduce students to some of the ideas defining practice and pedagogy at the Open City: the role of poetry and poiesis, observation and the open-ended project. Site analysis is done through drawing (by hand with tools supplied by the workshop) and model making. Work-days finish with informal critiques where findings are discussed. During the week there will also be an introduction to the working and safety issues related to the chantier and to living near the Open City. Students will work in teams and one of the goals of the week is to already to create a group spirit that will develop throughout the workshop.

Open City (August): The first days of the chantier is meant as a practical introduction to some of the ideas encountered during the Lausanne week. Lectures and events by members of the Open City community introduce students to some of the ideas defining practice and pedagogy at the Open City: the role of poetry and poiesis, observacion and the open-ended project. Site analysis is done through drawing (by hand with tools supplied by the workshop) and model making. Work-days finish with informal critiques where findings are discussed. During the week there will also be an introduction to the working and safety issues related to the chantier and to living near the Open City. Students will work in teams and one of the goals of the week is to already to create a group spirit that will develop throughout the workshop.

Applications should be sent via email to summerchantier@epfl.ch and should comprise a brief letter that describes why you are interested in the project and expectations for the Summer Chantier. All candidates will also be interviewed as part of the selection process.

Summer Chantier is looking for self-motivated students who are interested in an experience that provides human, intellectual and physical challenges.

Applications will be expected until 18th March with interviews conducted in early April and decisions made shortly afterwards.

Abstract

Travellers is a series of five lectures and conversations about ways of perceiving, studying and portraying urban territories. Each of the guest speakers is a traveler - a person who places the direct observation and experience of urban landscapes in the core of their practice. During the autumn of 2016, we will investigate the ocean as a territory.

Objective

The architectural ways of looking, concepts and techniques are unstable at large territorial scales, and yet, urban territories can be seen as crucial contexts for the production of architecture. Seeing an extended urban territory as part of the city - its mirror - can reflect back in the ways we see the city itself, and its architectures.

Once a year in autumn, with students and invited guests, we will consider: How can architects look at, study and design urban territories or the "city's constitutive outside": the periphery, the agglomeration, the countryside and the hinterland? What are the motives (aesthetic, political) architects can have in engaging with these territories? The aim is to discuss concepts and techniques for territorial investigations and projects.

During the autumn of 2016, we will investigate the ocean as a territory through the lens of artists, researchers and architects focusing on mapping maritime geopolitics, migration and global trade.
Content
What is the ocean as a territory? Once imagined as a boundless space, largely untouched by human activity, are oceans still a common horizon bringing together the cities and peoples along their shores? Can the open nature of the sea resist the transformative forces of the carved and conflicted earthly masses it is enclosing? Is the ocean space shaped by the strategic control of resources and trade routes? What is the role of the architects in investigating, describing and visualising the urban dynamic of the ocean space? Can ocean territories be designed?

Taking different perspectives, from history, to activism, geopolitics, and design, travellers who have been crossing the global ocean following refugee migrations, onboard container ships and along ancient maritime routes, contribute elements for an urban portrait of ocean territories.

Prerequisites / notice
Not eligible as a Compulsory GESS Elective for students of D-ARCH.
The turn of the 19th century is defining Zurich still today. Even though the older core of the town overlooking the Limmat with its two cathedrals is likewise shaping image and perception, it was through major architectural and structural interventions of the waning 19th century such as the train station, Bahnhofstrasse, Seeufer and larger constructions as the Opera House and Tonhalle, office and commercial buildings, residential quarters and administration and infrastructure buildings that the major city of today was accomplished. Lectures will provide a first introduction into construction activities of these years, forecasted by property inspections that will investigate the preserved historism of Zurich and its restorations. In brief statements, the students will present literature, inventories or single prominent buildings such as the Zurich Stadthaus, but also the large-scale urban planning concepts. A further emphasis of the seminar is set on the constructional and technical developments of the period.

**051-0367-16L** Seminar History of Urban Design: Elements of Urban Space

*Abstract*  
Within our series «Elements of the urban space» we will focus on urban housing. In the parishes Niederdorf, Stihlfeld, Unterstrass, Fluntern und Hirslanden, we will look at numerous housing types on the level of the metropolis, the neighborhood, the building and the urban detail. In doing so, we aim to gather criteria, that are fundamental to an urban living situation.

*Objective*  
The aim of the seminar series is to provide a sound methodological approach in analyzing urban space on the scale of the metropolis, the neighborhood, the building and the urban detail. Through a series of neighborhood walks and excursions to the four major city archives, our students gain a methodological approach to city analysis. In the discourse of the seminar, we will gain fundamental criteria for the design of urban situations.

*Lecture notes*  
Our students will be provided with all material in digital form.

*Literature*  
We will provide our students with a selection of literature and all necessary planning documents in digital form.

*Prerequisites / notice*  
The number of students is limited to 60. After the introduction on 22/09 between 14.45-16.30 we will meet on 29/9 (city walk), 6/10. (discussion of the analysis results), 13/10. (consultation - doodle), 3/11 (excision plan archives), 10/11 and 1/12 (consultation - doodle) and final presentation on 8/12.

**051-0783-16L** Special Questions in History of Art and Architecture: Making of the gta

*Abstract*  
In this seminar we will document with video interviews how the Institute for the History and theory of architecture (gta) has studied and shaped the Swiss and international history of architecture and its debates in the past fifty years.

*Objective*  
We will explore the history of the gta as well as the historical and theoretical dimensions of the interview as a research and documentary tool while also developing practical interview skills.

*Content*  
Interviews with architects and artists are popular and versatile. They are a means of research as well as mediation in books and exhibitions. In this seminar we will discuss the many forms and functions of interviews. The occasion is the jubilee of the Institute for the History and Theory of Architecture (gta), which was founded in 1967. We will interview the protagonists who shaped its formation and development. The video interviews we will conduct will be present at the jubilee exhibition in 2017. We will explore how the gta studied and shaped the Swiss and international history of architecture and its debates. We will further discuss different formats of video in exhibitions and develop our own practice.

*Lecture notes*  
The relevant texts will be available for download.

**051-0779-16L** History of Architecture: Colonialism, Architecture & Urbanism in Africa (P.Ursprung)

*Abstract*  
In the 19th and 20th centuries Belgium, Britain, France, Germany, Italy, Portugal, and Spain invaded and colonized the great majority of the African continent. This was coupled with the invention of an unprecedented European modern architecture that was expected to face Africa's climates and to satisfy colonial administrators, military officers, settlers, tourists, and in rare cases Africans.

*Objective*  
The course examines the multifaceted relationships between colonialism, architecture, and urbanism in Africa under European rule. The aim is to explore and discuss European production, transfer, adaptation, transformation, and exchange of modern architecture and urbanism within and among African colonies and protectorates ruled by the various European powers. Specific examples will be drawn from across the African continent in order to examine the formal, spatial, social, and political characteristics and impacts of new towns, villages, buildings, and elements designed by European architects and planners.

*Content*  
The course is delivered through a series of weekly lectures, discussions of assigned readings, and student presentations, which are centered around key themes and specific contexts. Students will be expected to complete one reading per week and one presentation per semester. Each student is invited to choose a town, a building, a personage, a construction material, or an aspect of colonialism in Africa and present it to the class.

*Literature*  
All readings will be available on the course website at the beginning of the semester. http://www.ursprung.arch.ethz.ch/lehrveranstaltungen

*Prerequisites / notice*  
All lectures, readings, presentations, and discussions will be held in English. Those who wish to participate in the course must attend the first introductory lecture on 22 September 2016.

|         | *Abstract*  
How can behavioral and cognitive science inform architecture? This project-oriented seminar investigates contributions of cognitive science to architectural design with an emphasis on orientation and navigation in complex buildings and urban settings. It includes theories on spatial memory and decision-making as well as hands-on observations of behavior in real and virtual reality. |
|         | *Objective*  
Taking the perspectives of building users (occupants and visitors) is vital for a human-centered design approach. Students will learn about relevant theory and methods in cognitive science and environmental psychology that can be used to understand human behavior in built environments. The foundations of environmental psychology and human spatial cognition will be introduced. A focus of the seminar will be on how people perceive their surroundings, how they orient in a building, how they memorize the environment and how they find their way from A to B. Students will also learn about a range of methods including real-world observation, virtual reality experiments, eye-tracking and behavior simulation for design. Students will reflect on the roles of designers and other stakeholders with respect to human-centered design and an evidence-based design perspective. The seminar is geared towards a mix of students from architecture / planning, engineering, computer science and behavioral science as well as anybody interested in the relation between design and cognition. Architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach" |
| 051-0165-16L | Housing                       | W    | 2 credits | 2G    | to be announced       |
|         | *Abstract*  
Module 1: Suburban Housing  
Module 2: Urban Housing |
|         | *Objective*  
Students should be able to recognise and place in context the characteristic features of suburban and urban housing. They will get to know the architectural, socio-cultural aspects of suburban and urban housing. |
Housing considered in context: architectural, cultural, social, technical and economic conditions and processes influence housing and modes of habitation. To what extent have they changed in the last century? The construction and renovation of domestic space is a cultural process. What forces construct that space, and according to which criteria? What are the constructional and organizational solutions with which they confront the diversity and metamorphosis of contemporary modes of habitation? How can postulates concerning a sustainable development be implemented? Insights culled from housing research and practice, podium discussions with guests and current examples of innovative housing are included.

Within three elective courses the students need to fulfill an elective work (seminar work). Elective works serve the independent way of dealing with the contents of the according elective course.

**Objective**
The goal is to develop a framework of questions within the field of the history and theory of architecture as well as cultural history and to discuss it in a text that will form a scientific thesis. Personal viewpoints and arguments should be based on historical and theoretical sources and literature, and should be presented with reference to the source.

**Content**
The contents of these elective studies are expected to link to the subject matter of the attended course.

**063-0173-16L**
**Spatial Concepts in Film and Architecture (Thesis Elective)**

- **Objective**
The aim of the Thesis Elective is an independent engagement with the subjects of the related Elective Course.

- **Content**
The contents of these elective studies are expected to link to the subject matter of the attended course.

**063-0187-16L**
**Procedures in Design - Techniques of Construction (Thesis Elective)**

- **Objective**
The aim of the Thesis Elective is an independent engagement with the subjects of the related Elective Course.

- **Content**
The contents of these elective studies are expected to link to the subject matter of the attended course.

**063-0193-16L**
**Performance and Intervention (Thesis Elective)**

- **Objective**
  Creative Experience: Definition of one's own interests and realization of an artistic project. Development of an advanced concept of performance and intervention.

- **Content**
The contents of these elective studies are expected to link to the subject matter of the attended course.

**063-0195-16L**
**Criticism and Theory (Thesis Elective)**

- **Objective**
The aim of the Thesis Elective is an independent engagement with the subjects of the related Elective Course.

- **Content**
The contents of these elective studies are expected to link to the subject matter of the attended course.

**063-0197-16L**
**Photography (Thesis Elective)**

- **Objective**
  Creative Experience: Definition of one's own interests and realization of an artistic project based on photography. Development of an advanced concept of photography.

- **Content**
The contents of these elective studies are expected to link to the subject matter of the attended course.

**063-0201-16L**
**3D Scanning and Freeform Modeling (Thesis Elective)**

- **Objective**
  Experimental research for expanded usage of these tools.

- **Content**
The contents of these elective studies are expected to link to the subject matter of the attended course.

**063-0219-16L**
**Artistic and Conceptual Thinking and Working (Thesis Elective)**

- **Objective**
  Creative Experience: Definition of one's own interests, development, and realization of an artistic project. The ideas, questions, and above all the actual (partial) results of the artistic project will be discussed collectively. Input sessions are organized according to individual requirement.

- **Content**
The contents of these elective studies are expected to link to the subject matter of the attended course.

**063-0223-16L**
**Free Drawing (Thesis Elective)**

- **Objective**
  An elective project in drawing is an assignment with the characteristics of research. A topic, a graphic assignment or problem, selected by the student is furthered through independent work and its evolution documented.

- **Content**
The contents of these elective studies are expected to link to the subject matter of the attended course.

**063-0227-16L**
**Architectural Drawing - Image Lab (Thesis Elective)**

- **Objective**
  The architectural visualization, from the first sketch to the substantial image, establishes itself as an important "decision-maker" for the progress of the design project. The essential intensity, technique and experimental keen, as the search for new forms of representations should be sought.

- **Content**
The students determine themselves the content of their work.
Theory of Architecture (Thesis Elective) | W | 6 credits | 11A | A. Vronskaya

Abstract
An elective master thesis in architectural theory is a written student assignment of an architectural problem or question, which is to be elaborated into a scientific paper in consultation with the advisors of the chair. The examination of a specific problem asks for a conscious and critical reflection of interdisciplinary approaches and methods.

Objective
Within the framework of an elective master thesis the student can enhance the acquired knowledge in architectural theory in written form. The thesis is in accordance with the master thesis of scientific methods, the derivation, development and verbalization of conclusions and the contextualization within a theoretical setting. In a broader sense it serves the training of verbal skills, the development of a critical verbal, cognitive and imaginary access to problems in the realm of architecture and its neighboring disciplines in the humanities.

Content
The contents of these elective studies are expected to link to the subject matter of the attended course.

Prerequisites / notice
Consultation for the individual elective thesis will be available during semester as well as during the free period. The oral examination at the end of the semester break is based on the written thesis, handed in before the the examination (watch the deadline in summer/winter). Appointments for consultation with the junior faculty by arrangement.

History of Art and Architecture (Thesis Elective) | W | 6 credits | 11A | P. Ursprung

Abstract
Independent and scientific thesis on a monographic or thematic topic within the scope of the history of art and architecture.

Objective
The objective is to write an independent thesis on a monographic or thematic topic within the scope of the history of art and architecture.

Content
The focus is to thus exemplify a comprehensive view of the approach and methods towards the modern history of art.

Abstract
Essay on a Subject from the Field of Architectural History

Objective
Independent preparation of a scholarly essay on a topic from the field of architectural history.

Content
The aim of the elective course paper is to discuss a topic freely selected from the field of architectural history, in agreement with the assistant lecturer(s). In addition to original ideas, positions taken in the history of research on the subject should also be discussed. It is important to use the correct scholarly format and clear language. The paper should be approximately 40'000 characters in length and should also include as much pictorial material as needed.

Preservation of Cultural Heritage (Thesis Elective) | W | 6 credits | 11A | S. Holzer

Abstract
The Elective Subject Degree Tests are meant to enable a deeper level of individual engagement with the contents of the elective subjects. Topics of electives can be elaborated into elective degree tests.

Objective
The general aim of this intensification is teaching competency in analysis and interpretation in the following areas: knowledge of artifacts, dynamics of systems, historical contexts, history of knowledge and theory as well as an approach to scholarly work.

Content
Contents depend on the specific curriculum of each semester and will be determined in consultation with the faculty advisor. Independent study is possible, however, only after consultation.

History of Urban Design (Thesis Elective) | W | 6 credits | 11A | V. Magnago Lampugnani

Abstract
Within three elective courses the students need to fulfill an elective work (seminar work). Elective works serve the independent way of dealing with the contents of the according elective course.

Objective
The aim of this seminar work is to learn how to write a small thesis on a case study. This work should include a creative text, but also to obey certain rules, which turn a regular text into a scientific one.

Content
The contents of these elective studies are expected to link to the subject matter of the attended course.

Abstract
Feminine theory of urban design (18th-21st century). The task of this seminar is working with texts about the city written by women. The texts will be analysed, compared and examined employing different scientific methods.

Objective
The main aim of this seminar is learning the scientific handling of theoretical texts on the city. These texts range from pamphlets, to commentaries and literary products.

Content
The contents of these elective studies are expected to link to the subject matter of the attended course.

Trial of Structural Forms: History of Structural Design (Elective Thesis) | W | 6 credits | 11A | J. Schwartz, M. Rinke

Abstract
The efforts for entanglements of architectonic and constructive concepts had resulted in wide discussions and in unique buildings during different time periods (i.e. ferroconcrete in the nineteen-thirtees and nineteen-fifties), furthermore to architectonic and technical enrichments.

Objective
Getting to know important critical figures between architecture and engineering as well as their attitudes and concepts and the most distinguished buildings.

Content
Seminar to the studies and for discussion of important texts and buildings of the most famous construction engineers and architects by listening to reviews, presentations and models, input lectures and guest speeches, films and joint surveys.

Building Physics (Thesis Elective) | W | 6 credits | 11A | J. Carmeliet

Prerequisites for Urban Physics: successful termination of "Building Physics IV: Urban Physics". For Building Physics in general: Knowledge in the relevant field.

Abstract
Within three elective courses the students need to fulfill an elective work (seminar work). Elective works serve the independent way of dealing with the contents of the according elective course.

Objective
The aim of the elective work is to gain comprehensive insight in specific issues related to urban physics and low-energy buildings. These issues may concern: wind & thermal comfort in the built environment, heat islands, cross-ventilation, driving rain, pollution dispersion, new technologies for low-energy buildings, design of building systems, optimal control. The work may include computational modelling and prototype testing in laboratory.

Content
The contents of these elective studies are expected to link to the subject matter of the attended course.

<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The goal of the Wahlfacharbeit is in depth analysis of a topic in the field of digital design and fabrication. The students should develop a personal, algorithmic design system till fabrication. A theoretic placement of the work within the current research discourse is desirable.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>We use the term digital materiality to describe an emergent transformation in the expression of architecture. Materiality is increasingly being enriched with digital characteristics, which substantially affect architectures physis. Digital materiality evolves through the interplay between digital and material processes in design and construction. The synthesis of two seemingly distinct worlds - the digital and the material generates new, self-evident realities. Data and material, programming and construction are interwoven. This synthesis is enabled by the techniques of digital fabrication, which allows the architect to control the manufacturing process through design data. Material is thus enriched by information; material becomes informed. In the future, architects ideas will permeate the fabrication process in its entirety. This new situation transforms the possibilities and thus the professional scope of the architect.</td>

<td>Abstract</td>
<td>The term &quot;pair-daeza&quot;, Persian for &quot;a wall surrounding a garden&quot;, is the point of origin for an elective series addressing basic elements of landscape architecture. This semester, students will deal with the topic 'Threshold', developing a design for a metropolitan park in Lyon.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The term 'paradise' and its religious implications originate from 'pair-daeza', Old Persian for 'a wall surrounding a garden'. Pair-daeza is the title of an elective course series addressing basic elements of landscape architecture within the context of public space in European Metropolis, including the topics of border, threshold, water, vegetation, topography, choreography, and metaphor. The elective course serves as an introduction to landscape architectural design. Architecture students develop a project based on the perception of place, cognitive of landscape-architectonic typologies, and conception of public space. They become familiar with model building as a design methodology as well as with representation in plan form. The design process is accompanied by workshops, lectures, excursions, critiques, and a workbook.</td>

</table>
The students can explore an ongoing subject from teaching or research of the chair "Information Architecture" in detail. In consultation with the chair individual topics are possible, too. At the moment important topics are for example: Visualisation of complex information in the context of urban systems, simulation of energy criteria of urban and architectural structures, as well as the analysis of spatial configurations.

Please note the course starts at 14:45 pm.

A. Spiro  
6 credits  11A  
T. Guthknecht

Abstract  
Independently written scientific paper concerning a subject in the area of health facility planning and design with special focus upon the dynamic changes in health care services and the according planning and building reactions to them.

Objective  
The objective is that the students engage in a debate of a differentiated functional planning as a basis for health care buildings which are to be successful medicinally, operationally and in design.

On the basis of a given scope of themes the students carry out research aiming for possible improvements in health facility planning. The scope of subjects is announced at the beginning of each semester.

Content  
Health care buildings are subject to constant change. In a new hospital building 60% of the diagnostic and treatment areas are subject to building changes within the first 10 years of operation. Architecture has to develop concepts which accommodate this level of dynamics into the building structure in a better way.

In the coming years this need for adaptability is going to be challenges even further by the even more reducing health care resources. The paper should discuss in this context a specific question in detail by analysing problems and developing and discussing potential planning solutions.

063-0823-16L Material-Lab (Thesis Elective)  
A. Spiro  
6 credits  11A

Abstract  
The elective works serve an in depth case study through the construction of a 1:1 mock-up.

Objective  
Independent in depth study and examination of the contents according to the elective course.

Content  
Content and output of the study to be agreed with the lecturer of the elective course.

063-0855-16L Master Class Construction (Thesis Elective)  
C. Vogt  
6 credits  11A

Abstract  
Within three elective courses the students need to fulfill an elective work (seminar work). Elective works serve the independent way of dealing with the contents of the according elective course.

Objective  
The aim of the Thesis Elective is an independent engagement with the subjects of the related Elective Course.

Content  
The contents of these elective studies are expected to link to the subject matter of the attended course

063-0763-16L New Focal Points of Construction (Thesis Elective)  
D. Mettler, D. Studer  
6 credits  11A

Abstract  
This self-dependent elective thesis refers to the course “New focal points of construction” demands a rethinking of the learning matter. Hence, a consequent argumentation with regard to the base, the wall, the chamber, the roof etc. follow.

Objective  
Target of this self-dependent thesis is to rethink the constructive points base, wall, chamber, roof etc. on the basis of the newly acquired skills. A structurally engineered, well-founded hypothesis is formulated, thus serving as a initial position for the conception of future constructions.

Content  
In the elective thesis “New focal points of constructions” constructive points as base, wall, chamber, roof etc. are rethought reflecting the latest learning matters. A structurally engineered, well-founded hypothesis is formulated, thus serving as a initial position for the conception of future constructions.

063-0827-16L Sand: an (in)finite Resource? - Engineering for Development (E4D) Summer School (Thesis Elective)  
D. Hebel  
6 credits  150A

Abstract  
Due to didactic reasons, the number of participants is limited to 30.

All interested students are invited to apply for this course by sending a one-page motivation letter until 14.9.16 to Florian Rittiner (frittiner@ethz.ch).

Additionally please enroll via mystudies. Places will be assigned after the first lecture on the basis of your motivation letter and commitment for the class.

Objective  
The goal of this course is to engage students in a multidisciplinary collaboration to tackle real world problems. Following a design thinking approach, students will work in teams to solve a set of design challenges that are organized as a one-week, a three-week, and a final six-week project in collaboration with an external project partner.

see GESS Science in Perspective: Language Courses ETH/UZH

Information and application: www.sparklabs.ch/ethz
The purpose of this course is to equip the students with methods and tools to tackle a broad range of problems. Following a Design Thinking approach, the students will learn how to observe and interact with key stakeholders in order to develop an in-depth understanding of what is truly important and emotionally meaningful to the people at the center of a problem. Based on these insights, the students ideate on possible solutions and immediately validate them through quick iterations of prototyping and testing using different tools and materials. The students will work in multidisciplinary teams on a set of challenges that are organized as a one-week, a three-week, and a final six-week project with an external project partner. In this course, the students will learn about the different Design Thinking methods and tools that are needed to generate deep insights, to engage in collaborative ideation, rapid prototyping and iterative testing.

Design Thinking is a deeply human process that taps into the creative abilities we all have, but that get often overlooked by more conventional problem solving practices. It relies on our ability to be intuitive, to recognize patterns, to construct ideas that are emotionally meaningful as well as functional, and to express ourselves through means beyond words or symbols. Design Thinking provides an integrated way by incorporating tools, processes and techniques from design, engineering, the humanities and social sciences to identify, define and address diverse challenges. This integration leads to a highly productive collaboration between different disciplines.

For more information and the application visit: http://sparklabs.ch/ethz

Prerequisites / notice
Class attendance and active participation is crucial as much of the learning occurs through the work in teams during class. Therefore, attendance is obligatory for every session. Please also note that the group work outside class is an essential element of this course, so that students must expect an above-average workload.

Only students who fulfill the following criteria are allowed to begin with their master thesis:

- a. successful completion of the bachelor programme;
- b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract
The Master-Thesis contains a written proposal due to a given master-programme within the work-field of an architect.

Objective
The Master-Thesis has to be an individual work by the students and be proof of the ability to independent design work.

### Course Units for Additional Admission Requirements

The courses below are only available for MSc students with additional admission requirements.

Dynamics of large-scale atmospheric flow

This course will be designed as a reading course in 1-2 small groups of 8 students maximum. It will be based on the textbook below. The learning objective of this course is that students understand the formation of clouds and precipitation and can apply learned principles to interpret atmospheric observations of clouds and precipitation.

Prerequisites / notice

Number of participants limited to 16.

Atmospheric Compoosition and Cycles

Aerosols I: Physical and Chemical Principles

Aerosols I deals with basic physical and chemical properties of aerosol particles. The importance of aerosols in the atmosphere and in other fields is discussed.

Target group: Master students in Atmosphere and Climate

Atmospheric and Climate Science Master

Modules

Weather Systems and Atmospheric Dynamics

Abstract

Dynamic, synoptic Meteorology

Objective

Understanding the dynamics of large-scale atmospheric flow

Content

Dynamical Meteorology is concerned with the dynamical processes of the earth’s atmosphere. The fundamental equations of motion in the atmosphere will be discussed along with the dynamics and interactions of synoptic system - i.e. the low and high pressure systems that determine our weather. The motion of such systems can be understood in terms of quasi-geostrophic theory. The lecture course provides a derivation of the mathematical basis along with some interpretations and applications of the concept.

Lecture notes

Dynamics of large-scale atmospheric flow

Literature

- Pichler H., Dynamik der Atmosphäre, Bibliographisches Institut, 456 pp. 1997

Prerequisites / notice

Physics I, II, Environmental Fluid Dynamics

Climate Processes and Feedbacks

Cloud Microphysics

Clouds are a fascinating atmospheric phenomenon central to the hydrological cycle and the Earth’s climate. Interactions between cloud particles can result in precipitation, glaciation or evaporation of the cloud depending on its microstructure and microphysical processes.

Lecture notes

This course will be designed as a reading course in 1-2 small groups of 8 students maximum. It will be based on the textbook below. The students are expected to read chapters of this textbook prior to the class so that open issues, fascinating and/or difficult aspects can be discussed in depth.

Literature

Target group: Master students in Atmosphere and Climate

Land-Climate Dynamics

The purpose of this course is to provide fundamental background on the role of land surface processes (vegetation, soil moisture dynamics, land energy and water balances) for the climate system. The course consists of 2 contact hours per week, including 2 computer exercises.

Abstract

The students can understand the role of land processes and associated feedbacks for the climate system.

Powerpoint slides will be made available

Prerequisites / notice

Atmospheric Composition and Cycles

<table>

Abstract

Aerosols I deals with basic physical and chemical properties of aerosol particles. The importance of aerosols in the atmosphere and in other fields is discussed.

Objective

Knowledge of basic physical and chemical properties of aerosol particles and their importance in the atmosphere and in other fields is discussed.

Content

physical and chemical properties of aerosols, aerosol dynamics (diffusion, coagulation...), optical properties (light scattering, -absorption, - extinction), aerosol production, physical and chemical characterization.
The lecture provides an introduction to the formation of air pollutants by technical processes, the emission of these chemicals into the atmosphere and their impact on air quality. The second part covers different strategies and techniques for emission reduction. The basic knowledge of today's society concerning the air quality into their engineering work.

Objective

The students gain general knowledge of the factors resulting in air pollution and the techniques used for air pollution control. The students can identify major air pollution sources and understand the methods for measurement, data collection and analysis. The students can evaluate possible control methods and equipment, design a control system and estimate the efficiency and cost.

Content

Part 1 Emission, Immission, Transmission
- Fluxes of pollutants and their environmental impact
- Physical and chemical processes leading to emission of pollutants
- Mass and energy of processes
- Emission measurement techniques and concepts
- Quantification of emissions from individual and aggregated sources
-Extent and development of the emissions (Switzerland and global)
- Propagation and transport of pollutants (transmission)
- Meteorological parameters influencing air pollution dispersion
- Deterministic and stochastic models, describing the air pollution dispersion
- Dispersion models (Gaussian model, box model, receptor model)
- Measurement concepts for ambient air (immission level)
- Extent and development of ambient air mixing ratios
- Goal and instrument of air pollution control

Part 2 Air Pollution Control Technologies
- The reduction of the formation of pollutants is done by modifying the processes (pro-cress-integrated measures) and by different engineering operations for the cleaning of waste gas (downstream pollution control). It will be demonstrated, that the variety of these procedures can be traced back on the application of a few basic principles of physical chemistry.
- Procedures for the removal of particles (inertial separator, filtration, electrostatic precipitators, scrubbers) with their different mechanisms (field forces, impaction and diffusion processes) and the modelling of these mechanisms.
- Procedures for the removal of gaseous pollutants and the description of the driving forces involved, as well as the equilibrium and the kinetics of the relevant processes (absorption, adsorption as well as thermal, catalytic and biological conversions).
- Discussion of the technical possibilities to solve the actual air pollution problems.

Lecture notes:
- Brigitte Buchmann, Air pollution control, Part I
- Peter Hofer, Air pollution control, Part II
- Lecture slides and exercises

Literature:
- List of literature included in script
- Lecture notes on basic physics, chemistry and mathematics

Prerequisites:

College lectures on basic physics, chemistry and mathematics

701-1233-00L Stratospheric Chemistry W 4 credits 2V+1U T. Peter, A. Stenke

Abstract

Objective

The lecture gives an overview on the manifold reactions which occur in the gas phase, in stratospheric aerosol droplets and in polar cloud particles. The focus is on the chemistry of stratospheric ozone and its influence through natural and anthropogenic effects. Especially the intercontinental air traffic and the ozone depletion caused by FCKW CFC in the mid-latitude and the polar regions as well as coupling with the greenhouse effect.

Content

Short presentation of thermodynamical and kinetic basics of chemical reactions: bi- and ter thermo molecular reactions, photo-dissociation. Introduction to the chemical family concept: active species, their source gases and reservoir gases. Detailed treatment of the pure oxygen family (odd oxygen) according to the Chapman chemistry. Radical reactions of the oxygen species with nitric oxide, active halogens (chlorine and bromine) and odd hydrogen. Ozone depletion cycles. Methane depletion and ozone production in the lower stratosphere (photo-smog reactions). Heterogeneous chemistry on the background aerosol and its significance for heavy air traffic. Chemistry and dynamics of the ozone hole: Formation of polar stratospheric clouds and chloride activation.

Lecture notes:

Documents are provided in the contact hours.

Literature:

Prerequisites:

Prerequisites: Basics in physical chemistry are required and an overview equivalent to the bachelor course in atmospheric chemistry (lecture 701-0471-01) is expected.

701-1233-00 V starts in the first week of the semester. The exercises 701-1233-00 U will start only in the 2nd week of the semester.
The following approaches will be discussed in detail: major and trace element modelling of magmas, with application to igneous systems; methods and statistics for calculation of isochrons and model ages; reservoir dynamics and one-dimensional modelling of ocean chemistry; modelling speciation in aqueous (hydrothermal, fresh water sea water) fluids.

We will discuss how these methods are applied in a range of Earth Science fields, from cosmochemistry, through mantle and crustal geochemistry, volcanology and igneous petrology, to chemical oceanography. A special emphasis will be put on dealing with geochemical problems through modeling. Where relevant, software packages will be introduced and applied to real geochemical data.

Lecture notes

Slides of lectures will be available.

Prerequisites / notice

Pre-requisite: Geochemistry (651-3400-00L), Isotope Geochemistry and Geochronology (651-3501-00L).

Abstract

The course "Climate history and paleoclimatology gives an overview on climate through geological time and it provides insight into methods and tools used in paleoclimate research.

Objective

The student will have an understanding of evolution of climate and its major forcing factors -orbital, atmosphere chemistry, tectonics- through geological time. He or she will understand interaction between life and climate and he or she will be familiar with the use of most common geochemical climate "proxies", he or she will be able to evaluate quality of marine and terrestrial sedimentary palaeoclimatic archives. The student will be able to estimate rates of changes in climate history and to recognize feedbacks between the biosphere and climate.

Content

Geological system and earth history - climate forcing factors and feedback mechanisms of the geosphere, biosphere, and hydrosphere.

Climate through geological time: "lessons from the past"

Cretaceous greenhouse climate

The Late Paleocene Thermal Maximum (PETM)

Cenozoic Cooling

Onset and Intensification of Southern Hemisphere Glaciation

Onset and Intensification of Northern Hemisphere Glaciation

Pliocene warmth

Glacial and Interglacials

Millennial-scale climate variability during glaciations

The last deglaciation(s)

The Younger Dryas

Holocene climate - climate and societies

</tr>
</tbody>
</table>

Abstract

The course will focus on biological and chemical aspects of sedimentation in marine environments. Marine sedimentation will be traced from coast to deep-sea. The use of stable isotopes palaeoceanography will be discussed. Neritic, hemipelagic and pelagic sediments will be used as proxies for environmental change during times of major perturbations of climate and oceanography.

Objective

- You will understand chemistry and biology of the marine carbonate system
- You will be able to relate carbonate mineralogy with facies and environmental conditions
- You will be familiar with cool-water and warm-water carbonates
- You will see carbonate and organic-carbon rich sediments as part of the global carbon cycle
- You will be able to recognize links between climate and marine carbonate systems (e.g. acidification of oceans and reef growth)
- You will be able to use geological archives as source of information on global change
- You will have an overview of marine sedimentation through time

Content

- carbonates,; chemistry, mineralogy, biology
- carbonate sedimentation from the shelf to the deep sea
- carbonate facies
- cool-water and warm-water carbonates
- organic-carbon and black shales
- C-cycle, carbonates, Corg : CO2 sources and sink
- Carbonates: their geochemical proxies for environmental change: stable isotopes, Mg/Ca, Sr
- marine sediments through geological time
- carbonates and evaporites
- lacustrine carbonates
- economic aspects of limestone

Lecture notes

no script. scientific articles will be distributed during the course

Literature

We will read and critically discuss scientific articles relevant for "biological and chemical processes in marine and lacustrine systems"

Prerequisites / notice

The grading of students is based on in-class exercises and end-semester examination.
The students can understand the role of land processes and associated feedbacks for the climate system. Additional literature is presented during the course.

### Analysis of Climate and Weather Data

**Objective**

The course presents advanced hydrological analyses of rainfall-runoff processes. The course is given in English.

**Content**

Observation networks and numerical climate and forecasting models deliver large primary datasets. The use of this data in practice and in research requires specific techniques of statistical data analysis. This lecture introduces a range of frequently used techniques, and enables students to apply them to properly interpret their results.

**Lecture notes**

Parts of the script for "Hydrology II" are used. Also available are the overhead transparencies used in the lectures. The semester project consists of a two part instruction manual.

**Literature**

Additional literature is presented during the course.

### Boundary Layer Meteorology

**Objective**

The Planetary Boundary Layer (PBL) constitutes the interface between the atmosphere and the Earth's surface. Theory on transport processes in the PBL, and their dynamics is provided. This course treats theoretical background and idealized concepts. These are contrasted to real world applications and current research issues.

**Content**

- Introduction
- Turbulence
- Statistical treatment of turbulence, turbulent transport
- Conservation equations in a turbulent flow
- Closure problem and closure assumptions
- Scaling and similarity theory
- Spectral characteristics
- Concepts for non-ideal boundary layer conditions

**Lecture notes**

**Literature**

**Prerequisites / notice**

Prerequisites: Atmospäre, Mathematik IV: Statistik, Anwendungsnahes Programmieren.

**Electives**

The students are free to choose individually from the entire course offer of ETH Zürich and the universities of Zürich and Bern.

#### Weather Systems and Atmospheric Dynamics

Courses are only offered in FS.

#### Climate Processes and Feedbacks

Two additional courses are offered in HS by University of Berne.

Dynamical Meteorology is concerned with the dynamical processes of the earth's atmosphere. The fundamental equations of motion in the atmosphere will be discussed along with the dynamics and interactions of synoptic system - i.e. the low and high pressure systems that determine our weather. The motion of such systems can be understood in terms of quasi-geostrophic theory. The lecture course provides a derivation of the mathematical basis along with some interpretations and applications of the concept.

Lecture notes
Dynamics of large-scale atmospheric flow

Literature
- Pichler H., Dynamik der Atmosphäre, Bibliographisches Institut, 456 pp. 1997

Prerequisites / notice
Physics I, II, Environmental Fluid Dynamics

651-4057-00L Climate History and Palaeoclimatology
W 3 credits 2G S. Bernasconi, B. Ausin Gonzalez, C. Fernandez Bremer, A. Gilli

Abstract
The course "Climate history and palaeoclimatology gives an overview on climate through geological time and it provides insight into methods and tools used in paleoclimate research.

Objective
The student will have an understanding of evolution of climate and its major forcing factors -orbital, atmosphere chemistry, tectonics-through geological time. He or she will understand interaction between life and climate and he or she will be familiar with the use of most common geochemical climate "proxies", he or she will be able to evaluate quality of marine and terrestrial sedimentary paleoclimate archives. The student will be able to estimate rates of changes in climate history and to recognize feedbacks between the biosphere and climate.

Content
Climate system and earth history - climate forcing factors and feedback mechanisms of the geosphere, biosphere, and hydrosphere.
Geological time, stratigraphy, geological archives, climate archives, paleoclimate proxies
Climate through geological time: "lessons from the past"
Cretaceous greenhouse climate
The Late Paleocene Thermal Maximum (PETM)
Cenozoic Cooling
Onset and Intensification of Southern Hemisphere Glaciation
Onset and Intensification of Northern Hemisphere Glaciation
Pliocene warmth
Glacial and Interglacials
Millennial-scale climate variability during glaciations
The last deglaciation(s)
The Younger Dryas
Holocene climate - climate and societies

— Atmospheric Composition and Cycles —

Number Title Type ECTS Hours Lecturers
701-1235-00L Cloud Microphysics W 4 credits 2V+1U U. Lohmann, Z. H. A. Kanji

Number of participants limited to 16.

Abstract
Clouds are a fascinating atmospheric phenomenon central to the hydrological cycle and the Earth’s climate. Interactions between cloud particles can result in precipitation, glaciation or evaporation of the cloud depending on its microstructure and microphysical processes.

Objective
The learning objective of this course is that students understand the formation of clouds and precipitation and can apply learned principles to interpret atmospheric observations of clouds and precipitation.

Content
see: http://www.iac.ethz.ch/edu/courses/master/modules/cloud-microphysics.html

Lecture notes
This course will be designed as a reading course in 1-2 small groups of 8 students maximum. It will be based on the textbook below. The students are expected to read chapters of this textbook prior to the class so that open issues, fascinating and/or difficult aspects can be discussed in depth.

Literature

Target group: Master students in Atmosphere and Climate

651-4053-05L Boundary Layer Meteorology W 4 credits 3G M. Rotach, P. Calanca

Abstract
The Planetary Boundary Layer (PBL) constitutes the interface between the atmosphere and the Earth's surface. Theory on transport processes in the PBL and their dynamics is provided. This course treats theoretical background and idealized concepts. These are contrasted to real world applications and current research issues.

Objective
Overall goals of this course are given below. Focus is on the theoretical background and idealised concepts.
Students have basic knowledge on atmospheric turbulence and theoretical as well as practical approaches to treat Planetary Boundary Layer flows. They are familiar with the relevant processes (turbulent transport, forcing) within, and typical states of the Planetary Boundary Layer. Idealized concepts are known as well as their adaptations under real surface conditions (as for example over complex topography).

Content
- Introduction
- Turbulence
- Statistical treatment of turbulence, turbulent transport
- Conservation equations in a turbulent flow
- Closure problem and closure assumptions
- Scaling and similarity theory
- Spectral characteristics
- Concepts for non-ideal boundary layer conditions

Lecture notes

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 134 of 1570
Objective

Students are able to
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media.
- quantify driving forces and resulting fluxes of water, solute, and heat in soils.
- apply modern measurement methods and analytical tools for hydrological data collection
- conduct and interpret a limited number of experimental studies
- explain links between physical processes in the vadose-zone and major societal and environmental challenges

Content

Weeks 1 to 3: Physical Properties of Soils and Other Porous Media
- Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior.

Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity.

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:
- Part 1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.
- Part 2: Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.
- Midterm exam

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils - Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.

Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:
- Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.
- Biological Processes in the Vadose Zone - An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.

Lab notes
- Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller (available at the beginning of the semester)
- http://www.step.ethz.ch/education/active-courses/vadose-zone-hydrology

Literature
- Supplemental textbook (not mandatory) - Environmental Soil Physics, by: D. Hillel

Prerequisites

The definition of prerequisites is part of the admission procedure for the master studies. You are informed by the admission office as to what courses of the section «prerequisites» you have to catch up with. You are accredited for these courses in the electives block of the master studies.

Number Title Type ECTS Hours Lecturers
701-0471-01L Atmospheric Chemistry 3 2 W M. Ammann, D. W. Brunner

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 135 of 1570
Content - Origin and properties of the atmosphere: structure, large scale dynamics, UV radiation
- Thermodynamics and kinetics of gas phase reactions: enthalpy and free energy of reactions, rate laws, mechanisms of bimolecular and
termmolecular reactions.
- Tropospheric photochemistry: Photolysis reactions, photochemical O3 formation, role and budget of HOx, dry and wet deposition
- Aerosols and clouds: chemical properties, primary and secondary aerosol sources
- Multiple phase chemistry: heterogeneous kinetics, solubility and hygroscopicity, N2O5 chemistry, SO2 oxidation, secondary organic aerosols
- Air quality: role of planetary boundary layer, summer- versus winter-smog, environmental problems, legislation, long-term trends
- Stratospheric chemistry: Chapman cycle, Brewer-Dobson circulation, catalytic ozone destruction cycles, polar ozone hole, Montreal
protocol
- Global aspects: global budgets of ozone, methane, CO and NOx, air quality - climate interactions

Lecture notes Prerequisites / notice Vorlesungsunterlagen (Folien) werden laufend während des Semesters jeweils mind. 2 Tage vor der Vorlesung zur Verfügung gestellt.

Attendance of the lecture "Atmosphäre" LV 701-0023-00L or equivalent is a pre-requisite.

Abstract This lecture introduces the theoretical principles and the observational and analytical methods of atmospheric dynamics. Based on these principles, the following aspects are discussed: the energetics of the global circulation, the basic synoptic- and meso-scale flow phenomena, in particular the dynamics of extratropical cyclones, and the influence of mountains on the atmospheric flow.

Objective The students are able to:
- explain up-to-date meteorological observation techniques and the basic methods of theoretical atmospheric dynamics
- to discuss the mathematical basis of atmospheric dynamics, based on selected atmospheric flow phenomena
- to explain the basic dynamics of the global circulation and of synoptic- and meso-scale flow features
- to explain how mountains influence the atmospheric flow on different scales

Content Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer

Abstract This course covers the basics of atmospheric physics, which consist of: cloud and precipitation formation, thermodynamics, aerosol physics, radiation as well as the impact of aerosols and clouds on climate and artificial weather modification.

Objective Students are able to:
- to explain the mechanisms of cloud and precipitation formation using knowledge of humidity processes and thermodynamics.
- to evaluate the signifcance of clouds and aerosol particles for climate and artificial weather modification.

Content Moist processes/thermodynamics; aerosol physics; cloud formation; precipitation processes, storms; importance of aerosols and clouds for climate and weather modification, clouds and precipitation

Lecture notes Powerpoint slides and script will be made available

Prerequisites / notice 50% of the time we use the concept of "flipped classroom" (en.wikipedia.org/wiki/Flipped_classroom), which we introduce at the beginning.

We offer a lab tour, in which we demonstrate with some instruments how some of the processes, that are discussed in the lectures, are measured.

There is an additional tutorial right after each lecture to give you the chance to ask further questions and discuss the exercises. The participation is recommended but voluntary.

Abstract This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

Objective This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

Content Classification of numerical problems, introduction to finite-difference methods, time integration schemes, non-linearity, conservative numerical techniques, an overview of spectral and finite-element methods. Examples and exercises from a diverse cross-section of Environmental Science.

Three obligatory exercises, each two hours in length, are integrated into the lecture. The implementation language is Matlab (previous experience not necessary: a Matlab introduction is given). Example programs and graphics tools are supplied.

Lecture notes Is provided (CHF 10.- per copy).

Literature List of literature is provided.

Course Catalogue of ETH Zurich

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 136 of 1570
### Abstract
We will explain the fundamentals of physics of glaciers which are necessary for treating applied problems. We will go into climate-glacier interactions, flow of glaciers, lake ice and hydrology of glaciers.

### Objective
To understand the fundamental physical processes in glaciology. To learn some basic numerical modelling techniques for glacier flow. To identify glaciological hazards and to learn some assessment and mitigation possibilities.

### Content
- Basics in physical glaciology
  - Dynamics of glaciers: deformation of glacier ice, role of water in glacier motion, reaction of glaciers to climate changes, glacier calving, surges
  - Ice falls, ice avalanches
  - Glacier floods
  - Lake ice and bearing capacity

### Lecture notes / Literature
Handouts are available

Relevant literature will be distributed during the lectures.

A list of relevant books and papers will be provided

### Prerequisites / notice
Für aktuelle Fallbeispiele werden risikobasierte Massnahmen bei glaziologischen Naturgefahren diskutiert.

Voraussetzungen: Es werden Grundkenntnisse in Mechanik und Physik vorausgesetzt.

---

**651-1401-00L: Physics of Glaciers**

**Objective**
After the course the students are able to understand and interpret measurements of ice flow, subglacial water pressure and ice temperature. They will have an understanding of glaciology-related physical concepts sufficient to understand most of the contemporary literature on the topic. The students will be well equipped to work on glacier-related problems by numerical modeling, remote sensing, and field work.

**Content**
The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a closer look at ice deformation, basal motion, heat flow and glacier hydraulics. The specific dynamics of tide water and calving glaciers is investigated, as is the reaction of glaciers to changes in mass balance (and therefore climate).

**Lecture notes / Literature**
http://people.ee.ethz.ch/~luethim/teaching.html

**Prerequisites / notice**
A list of relevant literature is available on the class web site.

Good high school mathematics and physics knowledge required.

---

**651-4077-00L: Quantification and Modeling of the Cryosphere: Dynamic Processes (University of Zurich)**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

**Objective**
Overview of the most important earth surface processes and landforms in cold regions (regions with glaciers and intense frost) with emphasis on high-mountain aspects. Discussion of present research challenges.

**Content**
Knowledge of the most prominent climate-related geomorphological processes and phenomena in high-mountain regions, understanding of primary research challenges.

**Lecture notes / Literature**
Glacial and periglacial geomorphodynamics in high-mountain regions. Ca. 100 pages.

**Prerequisites / notice**
Basic knowledge about geomorphology and glaciers/permafrost from corresponding courses at ETH/UZH or from the related lecture notes required.

---

**651-1581-00L: Seminar in Glaciology**

**Objective**

**Content**
Studium aktueller und klassischer Arbeiten der glaziologischen Forschung

**Lecture notes / Literature**
Benötigte Unterlagen werden im Verlauf der Veranstaltung abgegeben.

---

**Abstract**
The course introduces the scientific concepts and typical applications of tracers in biogeochemistry. The course covers stable and radioactive isotopes, geochemical tracers and biomarkers and their application in biogeochemical processes as well as regional and global cycles. The course provides essential theoretical background for the lab course "Isotopic and Organic Tracers Laboratory".

**Objective**
The course aims at understanding the fractionation of stable isotopes in biogeochemical processes. Students learn to know the origin and decay modes of relevant radiogenic isotopes. They discover the spectrum of possible geochemical tracers and biomarkers, their potential applications and get familiar with important applications

**Content**
- Geogenic and cosmogenic radionuclides (sources, decay chains);
- stable isotopes in biogeochemistry (natural abundance, fractionation);
- geochemical tracers for processes such as erosion, productivity, redox fronts; biomarkers for specific microbial processes.

**Lecture notes / Literature**
A list of relevant books and papers will be provided

**Prerequisites / notice**
Students should have a basic knowledge of biogeochemical processes (BSc course on Biogeochemical processes in aquatic systems or equivalent)

---

**Abstract**
The course addresses the biogeochemical classification and behavior of trace elements, including key processes driving the cycling of important trace elements in aquatic and terrestrial environments and the coupling of abiotic and biotic transformation processes of trace elements. Examples of the role of trace elements in natural or engineered systems will be presented and discussed in the course.
The students are familiar with the chemical characteristics, the environmental behavior and fate, and the biogeochemical reactivity of different groups of trace elements. They are able to apply their knowledge on the interaction of trace elements with geosphere components and on abiotic and biotic transformation processes of trace elements to discuss and evaluate the behavior and impact of trace elements in aquatic and terrestrial systems.

(i) Definition, importance and biogeochemical classification of trace elements. (ii) Key biogeochemical processes controlling the cycling of different trace elements (base metals, redox-sensitive and chalcophile elements, volatile trace elements) in natural and engineered environments. (iii) Abiotic and biotic processes that determine the environmental fate and impact of selected trace elements.

Selected handouts (lecture notes, literature, exercises) will be distributed during the course.

Students are expected to be familiar with the basic concepts of aquatic and soil chemistry covered in the respective classes at the bachelor level (soil mineralogy, soil organic matter, acid-base and redox reactions, complexation and sorption reactions, precipitation/dissolution reactions, thermodynamics, kinetics, carbonate buffer system).

This lecture is a prerequisite for attending the laboratory course "Trace elements laboratory".

The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. Natural processes, anthropogenic pollution, legislation of groundwater and surface water and of drinking water as well as water treatment will be discussed for industrialized and developing countries.

The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. The various water resources, particularly groundwater and surface water, are discussed as part of the natural water cycle influenced by anthropogenic activities such as agriculture, industry, urban water systems. Furthermore, legislation related to water resources and drinking water will be discussed. The lecture is focused on industrialized countries, but also addresses global water issues and problems in the developing world. Finally, unit processes for drinking water treatment (filtration, adsorption, oxidation, disinfection etc.) will be presented and discussed.

Handouts will be distributed

The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences.

The seminar is designed for students and researchers (MA, PhD, PostDoc) who use inter- and transdisciplinary elements in their projects. It is open to master students (minor "global change and sustainability") and further interested people, who preferably are preparing, or working on, a project/thesis.

The seminar is specifically suitable for PhD or PostDoc researchers. It is open to master students (minor "global change and sustainability") and further interested people, who preferably are preparing, or working on, a project/thesis.

The seminar is specifically suitable for PhD or PostDoc researchers. It is open to master students (minor "global change and sustainability") and further interested people, who preferably are preparing, or working on, a project/thesis.
The course is structured as follows:
- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;
- Trade-offs in selected examples.

<td>The lecture contains concepts, physics and components of building technologies for the efficient and sustainable energy supply and climatisation of buildings and their interaction with architecture and urban design. Using calculations, students learn to acquire relevant numbers and assess the performance of solutions.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Objective</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The lecture series focuses on the physical principles and technical components of relevant systems for an efficient and sustainable climatisation and energy supply of buildings. A special focus is on the interrelation of supply systems and architectural design and construction. Learning and practicing methods of quantifying demand and supply allows identifying parameters relevant for design.</td>

The purpose of the course is to give the participants an overview of the methods and tools used for energy systems analysis and how to use these in simple practical examples.

The course provides also an introduction to energy systems models for developing scenarios of future energy consumption and production. Bottom-up and Top-Down approaches are addressed and their features and applications discussed.

The course contains the following parts:
- Part I: Energy flows and energy statistics
- Part II: Environmental impacts
- Part III: Electric power systems
- Part IV: Energy in buildings
- Part V: Energy in transportation
- Part VI: Energy systems models

### Literature

### Prerequisites

Fundamentals of chemistry, physics and thermodynamics are a prerequisite for this course.

### Seminars and Colloquia

**Number** | **Title** | **Type** | **ECTS** | **Hours** | **Lecturers**

### Notice

- Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.

### Notice

- Attendance is mandatory.

### Notice

- In this seminar scientific project management is introduced and applied to your master project. The course concludes with a presentation of your project including an overview of the science and a discussion of project management techniques applied to your thesis project.

Only students who fulfill the following criteria are allowed to begin with their master thesis:

- a. successful completion of the bachelor programme;
- b. fulfilling of any additional requirements necessary to gain admission to the master programme.

The master thesis is under the supervision of a professor teaching in the module courses of the master programme. Please refer to the web page linked here for instructions and guidelines how to register for the master thesis ([http://www.iac.ethz.ch/education/master/curriculum/master thesis](http://www.iac.ethz.ch/education/master/curriculum/masterthesis)).

### Course Units for Additional Admission Requirements

The courses below are only available for MSc students with additional admission requirements.

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Objective

Introduction of the most important components of the climate systems and their interactions.

### Laboratory and Field Courses

The course in the category «lab and field work» are only offered in spring semester.

### Course taught in german, slides in english

### Course taught in german, slides in english

### Course taught in german, slides in english

### Course taught in german, slides in english

### Course taught in german, slides in english

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Objective

- Students have a basic understanding of the global energy balance, radiation budget, boundary, layer, atmosphere, ocean, biosphere, land-surface coupling, cryosphere, carbon cycle, climate variability, climate of the past and anthropogenic climate change, and they are able to apply this to solve simple quantitative problems and answer qualitative questions.

### Course taught in german, slides in english

Lecture notes

Copies of the slides are provided in electronic form.

Literature

A comprehensive list of references is provided in the class. Two books are particularly recommended:

Prerequisites / notice

Teaching: Reto Knutti, several keynotes to special topics by other professors.

### 701-0473-AAL Weather Systems
**Abstract**
The fundamental background of cloud and precipitation formation (including thermodynamics and aerosol physics) and their relevance for climate are discussed. The students can appreciate the processes leading to cloud and precipitation formation and their importance for climate.

**Objective**
This lecture is the prerequisite for the MSc lectures cloud microphysics and cloud dynamics.

**Content**
Moist processes/thermodynamics; aerosol physics; cloud formation; precipitation processes, storms; importance of aerosols and clouds for climate; measurements of clouds (radar and satellites)

**Lecture notes**
Powerpoint slides and script will be made available

**Literature**
Rogers and Yau, A Short Course in Cloud Physics, Pergamon Press, 1989; Wallace and Hobbs, Atmospheric Science: An Introductory Survey, Elsevier, 2006

### 701-0461-AAL Numerical Methods in Environmental Sciences
**Abstract**
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

**Objective**
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

**Content**
Classification of numerical problems, introduction to finite-difference methods, time integration schemes, non-linearity, conservative numerical techniques, an overview of spectral and finite-element methods. Examples and exercises from a diverse cross-section of Environmental Science.

**Lecture notes**
Is provided (CHF 10.- per copy).

**Literature**
List of literature is provided.

### 701-1901-AAL Systems Analysis
**Abstract**
Self study course in Systems Analysis to fulfill requirements for enrollment into the master program. Topics covered include linear box models with one and several variables; non-linear box models with one or several variables; discrete-time models; and continuous models in space and time.

**Objective**
The aim of this course is to develop an understanding of the dynamical behavior of environmental systems and how this behavior can be captured and understood using mathematical concepts.

**Lecture notes**
For English Speaking students:
John M. Wallace and Peter V. Hobbs, Academic Press

**Literature**

### 701-0106-AAL Mathematics V: Applied Deepening of Mathematics I - III
**Abstract**
Selected mathematical topics are presented for later use in more specialised lectures. Part of the topics were already discussed in the lectures Mathematics I-III. Here, they should be shortly recapitulated and most importantly applied to practical problems. If necessary, new mathematical concepts and methods will be introduced in order to solve challenging and inspiring problems from practice.

**Objective**
The aim of this lecture is to prepare the students for the more specialised lectures. They should become more familiar with the mathematical background, the mathematical concepts and most of all with their application and interpretation.

**Content**
Practical examples from the following areas will be discussed: ordinary differential equations; eigenvalue problems from linear algebra; systems of linear and nonlinear differential equations; partial differential equations (diffusion, transport, waves).

851-0242-08L Research Methods in Educational Science

Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

Abstract
Literature from the learning sciences is critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and meetings with those will be set up. In the small groups, students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

Objective
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

851-0240-03L Introduction to Test Theory and Test Construction in Educational Contexts (University of Zürich)

Objective
At the end of the seminar, participants will be in a position to:
- describe the scientific fundamentals of test theory and test structure,
- evaluate examples of scientifically-developed tests in their application context,
- if necessary, critically question the performance assessment that they employ in practice and professionalise it still further.

Prerequisites
- Knowledge of elementary statistics
- Knowledge of mathematics

Content
Die konkreten Inhalte des Seminars ergeben sich aufgrund der Präferenzen der Teilnehmenden und der daraus abgeleiteten Themenübersicht für Vorträge und Seminararbeiten. Im Rahmen der Startveranstaltung wird eine Liste mit möglichen Themen abgegeben und erläutert. Schwerpunkte der Themenvorschläge sind:
- Testentwicklung
- Gütekriterien von Tests
- Aufgabenkonstruktion
- Datenauswertung
- Rasch-Modell
- Internationale Vergleichstests
- Zulassungs tests

Lecture notes

Literature
Als Grundlagenliteratur werden folgende Werke empfohlen:
- Weitere Literatur wird in der Lehrveranstaltung genannt.

851-0240-00L Human Learning (EW1)

Objective
Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Content
- Thematische Schwerpunkte:
  - Lernen als Verhaltensänderung und als Informationsverarbeitung; Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzerwerb unter besonderer Berücksichtigung des Wissenstransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen: Intelligenztheorien, Geschlechtsunterschiede beim Lernen

Lecture notes
Foliendrucke werden zur Verfügung gestellt.

Educational Science Teaching Diploma

Number
851-0240-00L

Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

Abstract
This course is only apt for students who intend to enrol with Teaching Diploma or DC matriculation.

Objective
- Understand pedagogically relevant findings from the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

null

In individual or small-group sessions, Elisabeth Stern and the students will discuss how insights from learning research can inform classroom practice.</td>
</tr>
</tbody>
</table>
Objective
The focus of all classes on educational psychology is on scientific insights which help to reflect on instructional learning. In order to become professionals, teachers have to better understand students' behavior and achievement and thereby become aware of their scope of classroom practice. Students get a final opportunity to ask questions about psychological learning research.

Literature
Buch "Lernwirkuns unterrichten" (Felten/Stern)

Prerequisites / notice
Detailed information: http://www.ifvll.ethz.ch/studium/lehre/ew-5.html

851-0242-07L Human Intelligence
Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).
Number of participants limited to 30.
This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Abstract
The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

851-0242-09L Student Research Projects: Practical Research on Learning and Instruction
Number of participants limited to 20.
The successful completion of both course no. 851-0240-00L "Menschliches Lernen (EW 1)" and course no. 851-0239-01L "Unterstützung und Diagnose von Wissenserwerbsprozessen (EW 3)" is a necessary prerequisite for this course.

Abstract
In teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturers in this course. Basic conceptual and methodological issues are the topic of a series of plenary meetings; however, the major part of the work is done in small-group meetings with the advising researcher, and in self-directed research projects.

Objective
The course is targeted at advanced students who have taken an interest in gathering practical research experience in the field of Learning & Instruction. In teams of two, students conduct their own research projects (planning, conducting, analyzing, interpreting, and presenting research); thus, the course requires a high amount of self-directed working. Students are personally advised, and supported in their research project, by one of the researchers serving as lecturers in this course. During the first half the semester, relevant methodological knowledge and skills are practiced during plenary meetings and in students’ independent reading (e.g. generating and testing research questions, designing experiments, and analyzing data in the field of Learning and Instruction)

Learning goals include:
- Participants can illustrate and explain basic methods and concepts for research in the fields of Learning and Instruction, e.g. with the help of practical examples.
- Participants can generate testable research questions for a topic relevant in the fields of Learning and Instruction.
- Participants can design and conduct a study that is relevant for answering their research question.
- Participants can summarize and evaluate the main results from a study in the field of learning and Instruction, with regard to the research question being asked.

851-0242-06L Cognitively Activating Instructions in MINT Subjects
Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Abstract
This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

Objective
- To get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

851-0242-08L Research Methods in Educational Science
Number of participants limited to 30
This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Abstract
Literature from the learning sciences is critically discussed with a focus on research methods.
At the first meeting, working groups will be assembled and meetings with those will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

Objective
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

851-0250-05L Introduction to "Nature of Science" and "Scientific Inquiry"
Enrolment only possible with matriculation in Teaching Diploma (excluding Teaching Diploma Sport).
Number of participants limited to 20.

Abstract
This seminar will begin with a review of the literature on the teaching and learning of nature of science and scientific inquiry. It focuses on the development of adequate and functional understandings of nature of science and scientific inquiry.

Objective
Student teachers will develop an understanding of the concepts of nature of science and scientific inquiry. They will design a variety of instructional materials for teaching students about these concepts.

Mind the enrolment deadlines at UZH:

http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
In this seminar, students establish the scientific fundamentals of performance measurement and educational diagnostics and study them on the basis of different current issues.

Objective
At the end of the seminar, participants will be in a position to

- describe the scientific fundamentals of test theory and test structure,
- evaluate examples of scientifically-developed tests in their application context,
- if necessary, critically question the performance assessment that they employ in practice and professionalise it still further.

Content
Die konkreten Inhalte des Seminars ergeben sich aufgrund der Präferenzen der Teilnehmenden und der daraus abgeleiteten Themenübersicht für Vorträge und Seminaraufgaben. Im Rahmen der Startveranstaltung wird eine Liste mit möglichen Themen abgegeben und erlärtet. Schwerpunkte der Themenvorschläge sind:

- Testentwicklung
- Gütekriterien von Tests
- Aufgabenkonstruktion
- Datenauswertung
- Rasch-Modell
- Internationale Vergleichstests
- Zulassungstests

Lecture notes
Im Verlaufe des Semesters werden einzelne Unterlagen in den Veranstaltungen abgegeben. Dazu gehören auch die Handouts der verschiedenen, studentischen Vorträge.

Literature
Als Grundlagenliteratur werden folgende Werke empfohlen:

- Weitere Literatur wird in der Lehrveranstaltung genannt.

Prerequisites / notice
Die Leistungsanforderungen richten sich im Umfang nach der Zahl zu erwerbender ECTS-Punkte, wobei 1 ECTS-Punkt einem Zeitaufwand von ca. 30 Arbeitsstunden entspricht. ETHZ-Studierende können im Rahmen dieser Veranstaltung 3 ECTS-Punkte erwerben. Dazu sind folgende Leistungen zu erbringen:

- Präsenz und aktive mündliche Mitarbeit in der Lehrveranstaltung (MA)
- Pflichtlektüre entsprechend den Angaben in der Lehrveranstaltung
- Referat (RE)
- Schreiben einer schriftlichen Arbeit

Weitere Angaben zu den Leistungsanforderungen werden im Rahmen der Startveranstaltung abgegeben und erläutert.

| 851-0240-16L | Colloquium on the Science of Learning and Instruction | W | 1 credit | 1K | E. Stern, P. Greutmann, further university lecturers |

Abstract
In the colloquium we discuss scientific projects concerning the teaching in mathematics, computer science, natural sciences and technology (STEM). The colloquium is conducted by the professorships participating in the Competence Center EducETH (ETH) and in the Institute for Educational Sciences (UZH).

Objective
Participants are exemplarily introduced to different research methods used in research on learning and instruction and learn to weigh advantages and disadvantages of these approaches.

| 851-0242-06L | Cognitively Activating Instructions in MINT Subjects | W | 2 credits | 2S | R. Schumacher |

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

Abstract
This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

Objective
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

| 851-0242-07L | Human Intelligence | W | 1 credit | 1S | E. Stern, P. Edelsbrunner, B. Rütsche |

Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Number of participants limited to 30.

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".
Abstract
The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Moreover, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

851-0242-08L Research Methods in Educational Science

<table>
<thead>
<tr>
<th>W</th>
<th>1 credit</th>
<th>1S</th>
</tr>
</thead>
</table>

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)"

Abstract
Literature from the learning sciences is critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and meetings with those will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

Objective
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

851-0242-09L Student Research Projects: Practical Research on Learning and Instruction

<table>
<thead>
<tr>
<th>W</th>
<th>2 credits</th>
<th>2S</th>
</tr>
</thead>
</table>

The successful completion of both course no. 851-0240-00L "Menschliches Lernen (EW 1)" and course no. 851-0238-01L "Unterstützung und Diagnose von Wissenserwerbsprozessen (EW 3)" is a necessary prerequisite for this course.

Abstract
In teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturers in this course. Basic conceptual and methodological issues are the topic of a series of plenary meetings; however, the major part of the work is done in small-group meetings with the advising researcher, and in self-directed research projects.

Objective
The course is targeted at advanced students who have taken an interest in gathering practical research experience in the field of Learning & Instruction. In teams of two, students design research projects based on their own research interests (planning, conducting, analyzing, interpreting, and presenting research); thus, the course requires a high amount of self-directed working. Students are personally advised, and supported in their research project, by one of the researchers serving as lecturers in this course. During the first half the semester, relevant methodological knowledge and skills are practiced during plenary meetings and in students’ independent reading (e.g. generating and testing research questions, designing experiments, and analyzing data in the field of Learning and Instruction).

Learning goals include:
- Participants can illustrate and explain basic methods and concepts for research in the fields of Learning and Instruction, e.g. with the help of practical examples.
- Participants can generate testable research questions for a topic relevant in the fields of Learning and Instruction.
- Participants can design and conduct a study that is relevant for answering their research question.
- Participants can summarize and evaluate the main results from a study in the field of learning and Instruction, with regard to the research question being asked.

851-0250-05L Introduction to "Nature of Science" and "Scientific Inquiry"

<table>
<thead>
<tr>
<th>W</th>
<th>1 credit</th>
<th>1S</th>
</tr>
</thead>
</table>

Enrolment only possible with matriculation in Teaching Diploma (excluding Teaching Diploma Sport).

Abstract
This seminar will begin with a review of the literature on the teaching and learning of nature of science and scientific inquiry. It focuses on the development of adequate and functional understandings of nature of science and scientific inquiry.

Objective
Student teachers will develop an understanding of the concepts of nature of science and scientific inquiry. They will design a variety of instructional materials for teaching students about these concepts.

851-0594-00L International Environmental Politics

<table>
<thead>
<tr>
<th>W</th>
<th>3 credits</th>
<th>2V</th>
</tr>
</thead>
</table>

Particularly suitable for students of D-ITET, D-USYS

Abstract
This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

Lecture notes
Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link “Registered students, please click here for course materials”) at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike.Hudecheck@student.ethz.ch). All assigned papers must be read ahead of the respective meeting. Following the course on the basis of on-line slides and papers alone is not sufficient. Physical presence in the classroom is essential. Many books and journals covering international environmental policy issues can be found at the D-GESS library at the IFW building, Haldeneggsteig 4, B-floor, or in the library of D-USYS.

Our society faces a serious ecological crisis. Of what historical dimension is this crisis? How have human societies already in earlier times changed their environment, and, consequently, perhaps also ours? What were the main ecological challenges for societies and how did they change over time? And how did societies adapt to changing environmental conditions?

For a better understanding of present-day challenges, we will introduce environmental history. We will discuss the long-term development of human-nature-interactions and analyze the significance and limits of empirical, mathematical and logical methods as well as problems and ethical issues raised by the use of science in society.

Philosophy of Science

The lecture explores various strands in philosophy of science in a critical way, focusing on the notion of rationality in science, especially with regards to environmental research. It addresses the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

Topics discussed include the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

Environmental History - Introduction and Overview

The aim of the lecture is to impart a well-founded scientific understanding of social influence processes in individuals, groups, organizations, and social settings.

The participants should develop competencies in the structuring of communication, interaction, and management processes.

The lecture covers the following main topics: Social perception and interpersonal judgement; attitudes; group dynamics and group performance; leadership behavior and leadership styles.

Philosophy of Science

Students learn to engage with problems in the philosophy of science and to relate them to natural and environmental sciences, thus developing their skills in critical thinking about science and its use. They know the most important positions in philosophy of science and the objections they face. They can identify, structure and discuss the issues raised by the use of science in society.

The lecture is offered as a course in the Autumn Semester 2016. Further optional exercises accompany the lecture and offer the opportunity for an in-depth discussion of selected texts from the reader. Students receive an additional credit point. They have to sign up separately for the exercises for the course 701-0701-01 U.

http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
Students are familiarised with the subjects taught at high-school level I (the first three years of the full-length high school, or the first year of the reduced-length high school). The central contents of geometry, arithmetic and algebra, and also written mathematical problems are explained.

Objective
In the teaching given at high-school level I (the first three years of the full-length high school or the first year of the reduced-length high school), central concepts and approaches adopted in mathematics are introduced and observed in greater depth. These include variables, function, proof. This calls for a careful didactic analysis on the part of the teacher, requiring them to study and reflect on the prerequisites for the pupils and the requirements in terms of mathematics and cognitive psychology.

Content
Beispiele von Schülerarbeiten geben in diesem Seminar einen Einblick in die mathematische Denkwelt der Schülerinnen und Schüler. Vielfältige Aufgaben zum Einsatz im Unterricht werden vorgestellt, selber gelöst und diskutiert.

- Arithmetik und Algebra: Zahlbereiche, Form und Inhalt in der Algebra
- Geometrie: Konstruieren-Berechnen-Beweisen, dynamische Geometrie (Geogebra)
- Sachrechnen: Funktionsbegriff, mathematische Modellierung
- Aktuelle mathematikdidaktische Aspekte wie Lernprozesse, Grundvorstellungen, Kompetenzen, offene Aufgaben

Lecture notes
Zahlreiche begleitende Unterlagen werden abgegeben.

**Abstract**
Professors from national and international universities, technical experts from the industry as well as research associates of the institute of structural engineering (IBK) are invited to present recent research results and specific projects from the practice. This colloquium is addressed to members of universities, practicing engineers and interested persons in general.

**Objective**
Learn about recent research results in structural engineering.

**ECTS**
European Credit Transfer and Accumulation System

- Special students and auditors need special permission from the lecturers.
### Linear Algebra and Numerical Analysis

**Basics:** Position of a material point, velocity, kinematics of rigid bodies, forces, reaction principle, mechanical power.

The understanding of the fundamentals of statics for engineers and their application in simple settings.

As Lernsprachen werden Pascal und Matlab verwendet.

### Analysis I

**Content:**
1. Linear systems of equations
2. Vector and matrix calculus
3. Subspaces and bases
4. The Euclidean space Rn
5. Numerical linear algebra with MATLAB
6. Linear mappings [optional]
7. Diagonalization (eigenproblems)

**Objective:**
- Mathematical tools for the engineer
- Enhanced capability for abstract and algorithmic thinking based on mathematical concepts and models.
- Ability to select appropriate numerical linear algebra methods, to apply them properly and to implement them efficiently in MATLAB.

**Literature**
- Tilo Arens et al., "Mathematik", Springer; online verfügbar unter: [link](http://link.springer.com/book/10.1007/978-3-642-44919-2/page/1)
- Urs Stammbach, "Analysis III" (erhältlich im ETH Store); [link](https://people.math.ethz.ch/~stammb/analysisskript.html)

---

### Linear Algebra and Numerical Analysis

**Abstract**
- Introduction to Linear Algebra and Numerical Analysis with emphasis on both abstract concepts and algorithms.

**Objective**
- To acquire basic knowledge of Linear Algebra and Numerical Methods.
- Enhanced capability for abstract and algorithmic thinking, based on mathematical concepts and models.
- Ability to select appropriate numerical linear algebra methods, to apply them properly and to implement them efficiently in MATLAB.

**Content**
1. Linear systems of equations
2. Vector and matrix calculus
3. Subspaces and bases
4. The Euclidean space Rn
5. Numerical linear algebra with MATLAB
6. Linear mappings [optional]
7. Diagonalization (eigenproblems)

**Literature**
- K. Nipp, D. Stoffer, Lineare Algebra, VdF Hochschulverlag ETH
- G. Strang, Lineare Algebra, Springer

---

### Computer Science I

**Abstract**
The course covers the basic concepts of computer programming.

**Objective**
- Basic understanding of programming concepts. Students will be able to write and read simple programs and to modify existing programs.

**Content**
- Variables, Types, Control instructions, Procedures and Functions, Scoping, Recursion, Dynamic Programming, Vectorized Programming, Efficiency.

**Literature**
- Sayir, M.B., Dual J., Kaufmann S., Ingenieurmechanik 1: Grundlagen und Statik, Teubner
- Written session examination in "Mechanics 1" and "Mechanics 2" for D-MAVT Students, Students in Human Movement Sciences and Sport and all other Students, who take "Mechanics 1" and "Mechanics 2":
  
  **Part 1:** 20 minutes: Neither notes nor calculators allowed right afterwards:
  
  **Part 2:** 50 minutes: 3 self-written A4 pages. No calculator.

---

### Geology and Petrography

**Abstract**
Simple Mathematical models in engineering.

**Objective**
Mathematical formulation of technical and scientific problems.

**Content**
- Basics: Position of a material point, velocity, kinematics of rigid bodies, forces, reaction principle, mechanical power.
- Statics: Groups of forces, moments, equilibrium of rigid bodies, reactions at supports, parallel forces, center of gravity, statics of systems, principle of virtual power, trusses, frames, forces in beams and cables, friction.
- Statics: Aequivalenz and Reduktion von Kräftegruppen; Ruhe und Gleichgewicht, Hauptsatz der Statik; Lagerbindungen und Lagerkräfte, Lager bei Balkenträgern und Wellen, Vorgehen zur Ermittlung der Lagerkräfte; Parallele Kräfte und Schwerpunkt; Statik der Systeme, Behandlung mit Hauptsatz, mit Prinzip der virtuellen Leistungen, statisch unbestimmte Systeme; Statisch bestimmte Fachwerke, ideale Fachwerke, Pendelstützen, Knotengleichgewicht, räumliche Fachwerke; Reibung, Haftreibung, Gleitreibung, Gelenk und Lagerreibung, Rollreibung; Seilstatik; Beanspruchung in Stabtragern, Querkraft, Normalkraft, Biege- und Torsionsmoment

**Literature**
- Urs Stammbach, "Analysis III" (erhältlich im ETH Store); [link](https://people.math.ethz.ch/~stammb/analysisskript.html)

This course gives an overview of the basic concepts of geology and petrography and shows some links to the application of these concepts. The course consists of lectures and exercises in groups. The lectures cover all aspects of the dynamic earth, from the history of the earth, to the formation of rocks, mountains, and oceans, and the degradation processes shaping the uppermost earth's crust.

**Objective**
This course gives an overview of the basic concepts of geology and petrography and shows some links to the application of these concepts.

**Content**

Übungen zum Gesteinsbestimmen und Lesen von geologischen, tektonischen und geotechnischen Karten, einfache Konstruktionen.

**Lecture notes**
The course is based on the book Dynamic Earth from Press & Siever

**Literature**
Press, F.; Siever, R.: Allgemeine Geologie, Spektrum Akademischer Verlag, Heidelberg

### Literature

**851-0703-03L**
Introduction to Law for Civil Engineering

**W** 2 credits 2V G. Hertig

*Only for Civil Engineering BSc, Geomatic Engineering and Planning BSc, Environmental Engineering BSc and Spatial Development and Infrastructure Systems MSc*

**Abstract**
Students who have attended or will attend the lecture "Introduction to Law for Architecture" (851-0703-01L) cannot register for this course unit.

**Objective**
Introduction to fundamental questions of public and private law which serves as a foundation for more advanced law classes.

**Content**
1. Public Law
   - Constitutional law: sources of law, organization of the state, fundamental rights. Administrative law: administrative decisions, organization of the administration, enforcement of administrative decisions, procedural law, basics of police, environmental and zoning law.
   - 2. Private law

**Lecture notes**
There are ‘Lecture Notes’ (in German) for this course.

**Literature**

---

### Literature

**851-0709-00L**
Introduction to Civil Law

**W** 2 credits 2V H. Peter

**Abstract**
The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

**Objective**

**Content**
Le cours de droit civil porte notamment sur le droit des obligations (droit des contrats et responsabilité civile) et sur les droits réels (propriété, gages et servitudes). De plus, il est donné un bref aperçu du droit de la procédure et de l’exécution forcée.

**Literature**
Editions officielles récentes des lois fédérales, en langue française (Code civil et Code des obligations) ou italienne (Codice civile e Codice delle obbligazioni), disponibles auprès de la plupart des librairies.

Sont indispensables:
- le Code civil et le Code des obligations;
- Sont conseillés:
  - Nef, Urs Ch.: Le droit des obligations à l’usage des ingénieurs et des architectes, trad. Bovay, J., éd. Payot, Lausanne
  - Boillod, J.-P.: Manuel de droit, éd Slátkine, Genève

**Prerequisites / notice**

- Le cours de droit civil et le cours de droit public (2e sem.) sont l’équivalent des cours “Recht I” et “Recht II” en langue allemande et des exercices y relatifs.
- Les examens peuvent se faire en français ou en italien.
- Examen au 1er propédeutique; convient pour travail de semestre.

---

### Optional Colloquia

---

### Compulsory Courses 3. Semester

#### Examination Block 1

**Number** 401-0243-00L
**Title** Analysis III

**Type** O 3 credits

**ECTS** 2V+1U

**Hours**

**Lecturers** M. Larsson
We will model and solve scientific problems with partial differential equations. Differential equations which are important in applications will be classified and solved. Elliptic, parabolic and hyperbolic differential equations will be treated. The following mathematical tools will be introduced: Laplace and Fourier transforms, Fourier series, separation of variables, methods of characteristics.

Classification of partial differential equations

Study of the Heat equation general diffusion/parabolic problems using the following tools:
* Separation of variables
* Fourier series
* Fourier transform
* Laplace transform

Study of the wave equation and general hyperbolic problems using similar tools and the method of characteristics.

Accompanying material will be posted on the course website throughout the semester.

We will loosely follow the following books:

- Stanley J. Farlow - Partial Differential Equations for Scientists and Engineers (a Dover reprint and can be bought for less than 20 CHF)
- Chapters 11 and 12 of E. Kreyszig, Advanced Engineering Mathematics.

Two good sources in German are:

- Norbert Hungerbühler, "Einführung in die partiellen Differentialgleichungen"

Analysis I and II, in particular, knowing how to solve ordinary differential equations is an important prerequisite.

This course will cover the basic topics in Physics and will show/display/explain with a variety of experiments the most important physical effects. The course will address classical as well as modern physics, and the interplay between basic research and applications.

The course teaches the basics of hydromechanics, relevant for civil and environmental engineers. 

Familiarization with the basics of hydromechanics of steady state flows.

The course teaches the basics of hydromechanics, relevant for civil and environmental engineers. 

Script and collection of previous problems

Manuskript und Übungsblätter

Hans J. Paus, Physik in Experimenten und Beispielen, Carl Hanser Verlag München Wien (als unterrichtsbegleitendes und ergänzendes Lehrbuch)

This course teaches the basics of hydromechanics relevant for civil and environmental engineers.

The course teaches the basics of hydromechanics, relevant for civil and environmental engineers.

This course teaches the basics of hydromechanics relevant for civil and environmental engineers.

Script and collection of previous problems

Bollrich, Technische Hydromechanik 1, Verlag Bauwesen, Berlin

This course covers Bachelor students of mechanical engineering with fundamental knowledge of kinematics and dynamics of mechanical systems. By studying motion of a single particle, systems of particles and rigid bodies, we introduce essential concepts such as work and energy, equations of motion, and forces and torques. Further topics include stability of equilibria and vibrations. Examples presented in the lectures and weekly exercise lessons help students learn basic techniques that are necessary for advanced courses and work on engineering applications.

1. Motion of a single particle || Kinematics: trajectory, velocity, acceleration, inertial frame, moving frames - Forces and torques. Active- and reaction forces. - Linear momentum principle, angular momentum principle, work-energy principle - Equations of motion;
2. Motion of systems of particles || Internal and external forces - Linear momentum principle, angular momentum principle, work-energy principle - Rigid body systems of particles; conservative systems
3. 3D motion of rigid bodies || Kinematics: angular velocity, velocity transport formula, instantaneous center of rotation - Linear momentum principle, angular momentum principle, work-energy principle - Parallel axis theorem. Angular momentum transport formula

Hand-written slides will be downloadable after each lecture.

Typed course notes from the previous year

Please log in to moodle (https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php), search for "Dynamics", and join the course there. All exercises sheets, lecture materials etc. will be uploaded there.
The course explores the fundamental principles of Geomechanics and Geotechnical Engineering, with the following objectives:

- Understanding the response of elastic beam and frame structures
- Ability to correctly apply the equilibrium conditions
- Ability to determine elastic deformations
- Ability to apply the force (flexibility) method for statically indeterminate structures

Introduction
Reactions, internal forces and moments
Arches and cables
Trusses
Influence lines
Stresses and deformations
Principle of virtual work
Flexure and axial force, shear, torsion
Deflections, work equation
Statically indeterminate systems

Lecture notes

Handouts etc. available at:

Literature
**101-0031-01L Systems Engineering**

**Objective**
- to gain competency in methods used to plan and analyse systems
- to gain the ability to formulate, analyse and solve complex problems
- to gain competency in the methods used for the evaluation of multiple solutions

**Content**
- Introduction
- System development
- System analysis
- Networks
- Decision theory
- Economic analysis
- Cost-benefit analysis

**Lecture notes**
Script and transparencies as well as additional material via Moodle.

**102-0293-00L Hydrology**

**Abstract**
The course introduces the students to engineering hydrology. It covers first physical hydrology, that is the description and the measurement of hydrological processes (precipitation, interception, evapotranspiration, runoff, erosion, snow), and it introduces then the basic mathematical models of the single processes and of the rainfall-runoff transformation, thereby including flood analysis.

**Objective**
Know the main features of engineering hydrology. Apply methods to estimate hydrological variables for dimensioning hydraulic structures and managing water resources.

**Content**
- Der hydrologische Kreislauf: globale Wasserressourcen, Wasserbilanz, räumliche und zeitliche Dimension der hydrologischen Prozesse.
- Interzession: Messung und Schätzung.
- Evaporation und Evapotranspiration: Prozesse, Messung und Schätzung, potentielle und effektive Evapotranspiration, Energiebilanzmethode, empirische Methode.
- Infiltration: Messung, Horton-Gleichung, empirische und konzeptionelle Methoden, F-index und Prozentuale Methode, SCS-CN Methode.
- Schnee und Eis: Schneegeignenschaften und -messungen Schätzung des Schneeschmelzprozesses durch die Energiebilanzmethode, Abfluss aus Schneeschmelze, Temperatur-Indext- und -Grad-Tag-Verfahren.

**Lecture notes**
Ein internes Skript steht zur Verfügung (günstigen, nur Herstellungskosten)

**Literature**

**Prerequisites / notice**
Vorbereitende zu Hydrologie I sind die Vorlesungen in Statistik. Der Inhalt, der um ein Teil der Übungen zu behandeln und um ein Teil der Vorlesungen zur Verstehen notwendig ist, kann zusammengefasst werden, wie hintereinander es beschrieben wird:
- Elementare Datenverarbeitung: Hydrologische Messungen und Daten, Datenreduzierung (grafische Darstellungen und numerische Kenngrössen).

**Exam Block 4**

**101-0125-00L Structural Concrete I**

**Abstract**
Contents: Introduction, historical development of structural concrete, materials and material behaviour (cement, concrete, reinforcing steel, prestressing steel), linear members (axial force, flexure and axial force, compression members and columns, shear, bending and shear, torsion and combined actions), strut-and-tie models and simple stress fields, detailing, basic aspects of membrane elements.

**Objective**
- Understanding the response of typical structural members;
- Knowing elementary models and ability to apply them to practical problems;
- Ability to correctly dimension and detail simple structures.

**Content**
- Introduction, historical development of structural concrete, materials and material behaviour (cement, concrete, reinforcing steel, prestressing steel), linear members (axial force, flexure and axial force, compression members and columns, shear, bending and shear, torsion and combined actions), strut-and-tie models and simple stress fields, detailing.

Bachelor Studies (Programme Regulations 2010)
Bachelor's Thesis

Only for Civil Engineering BSc, Programme Regulations 2010.

Abstract
The Bachelor Programme concludes with the Bachelor Thesis. This project is supervised by a professor. Writing up the Bachelor Thesis encourages students to show independence and to produce structured work.

Objective
Encourages students to show independence, to produce scientifically structured work and to apply engineering working methods.

Content
The contents base upon the fundamentals of the Bachelor Programme. Students can choose from different subjects and tasks. The thesis consists of both a written report and an oral presentation.

Electives

The entire course programs of ETH Zurich and the University of Zurich are open to the students to individual selection.

Abstract
Introduction to computer aided design and drafting in 2D and 3D with examples from structural engineering.

Objective
Having followed the course, students are able to develop a 2D-structure (formwork drawing) and they know the principle of a reinforcement module. They have also got an introduction to a 3D program (reinforcement in 3D).

They are therefore better prepared for:
- the bachelor thesis in the 6th semester,
- an eventual internship between bachelor and master course,
- the project works in the master course,
- the master thesis.

Above all they practice spatial sense and acquire contextual knowledge as future superiors of draftsmen and designers.

Lecture notes
CAD für Bauingenieure

Prerequisites / notice
Spezialbewilligung der Dozierenden notwendig.
Für Studierende im 5. Semester während 10 Wochen gemäss speziellem Programm; Arbeit ausschliesslich am eigenen Laptop. Die rechtzeitige Installation der Software ist Bedingung für die Teilnahme. Eine Anleitung zur Installation wird ausgegeben.

Abstract
Procurement of consistent procedures to solve typical problems of civil engineering. Consolidation of the knowledge of the bachelor courses; integration of bachelors of other universities. Practice of the holistic approach of conceptual design, parallel and iterative operations on varying levels of detailing. Integration of different fields of knowledge and experiences.

Objective
Procurement of consistent procedures to solve typical problems of civil engineering. Consolidation of the knowledge of the bachelor courses; integration of bachelors of other universities. Practice of the holistic approach of conceptual design, parallel and iterative operations on varying levels of detailing. Integration of different fields of knowledge and experiences.

Content
Basic tools:
- Literature research, quotations
- Technical report and presentations
- Basics of graphical representation

Elements of the design process:
- Service criteria and respective agreement
- Design requirements and design boundary conditions
- Design alternatives
- Preliminary dimensioning
- Cost effectiveness
- Optimization
- Detailing

Exemplary consolidations:
- Geotechnical basics of retaining walls
- Conceptual design and shaping of retaining walls
- Drainage of structures
- Case study conceptual bridge design

Implementation with a planning tutorial:
- Presentation of the objects
- Survey and inventory
- Design options
- Intermediate review
- Final presentation

101-0579-00L "Infrastructure Maintenance Processes" will be offered from FS17 on with new title 101-0579-00L "Infrastructure Management 2: Evaluation Tools".

Abstract
This course provides an introduction to the tools that can be used to evaluate infrastructure. In particular tools:
- to measure the level of service being obtained from infrastructure,
- to predict slow changes in infrastructure over time, and
- to predict fast changes in infrastructure over time from monitoring.

Objective
To equip students with tools to be used to evaluate infrastructure and the level of service being provided from infrastructure.

Content
Introduction
- Levels of service
- Reliability of infrastructure
- Availability and maintainability of infrastructure
- Mechanistic-empirical models
- Regression analysis
- Event trees
- Fault trees
- Markov chains
- Neural networks
- Bayesian networks
- Conclusion

Lecture notes
All necessary materials (e.g. transparencies and hand-outs) will be distributed before class.

Literature
Appropriate reading material will be assigned when necessary.
Building Physics: Theory and Applications

Abstract

Principles of heat and mass transport, hygro-thermal performance, durability of the building envelope and interaction with indoor and outdoor climates, applications.

Objective

The students will acquire in the following fields:
- Indoor and outdoor climate and driving forces.
- Hygro-thermal properties of building materials.
- Building envelope solutions and their construction.
- Hygrothermal performance and durability.

Content

Principles of heat and mass transport, hygro-thermal performance, durability of the building envelope and interaction with indoor and outdoor climates, applications.

Renewable Energy Technologies I

The lectures Renewable Energy Technologies I (529-0193-00L) and Renewable Energy Technologies II (529-0191-01L) can be taken independently from one another.

Abstract

Scenarios for world energy demand and CO2 emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry). Wind and ocean energy, heat pumps, geothermal energy, energy from waste. CO2 sequestration.

Objective

Scenarios for the development of world primary energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO2 emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

Content

Lecture notes

Lecture notes will be distributed electronically during the course.

Literature

Prerequisites / notice

Fundamentals of chemistry, physics and thermodynamics are a prerequisite for this course.

Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.

Design and Building Process MBS

"Design and Building Process MBS" is a brief manual for prospective architects and engineers covering the competencies and the responsibilities of all involved parties through the design and building process. Lectures on twelve compact aspects gaining importance in a increasingly specialised, complex and international surrounding.

Objective

Participants will come to understand how they can best navigate the design and building process, especially in relation to understanding their profession, gaining a thorough knowledge of rules and regulations, as well as understanding how involved parties wants work. They will also have the opportunity to investigate ways in which they can relate to, understand, and best respond to their clients wants and needs. Finally, course participants will come to appreciate the various tools and instruments, which are available to them when implementing their projects. The course will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship.

Content

"Design and Building Process MBS" is a brief manual for prospective architects and engineers covering the competencies and the responsibilities of involved parties through the design and building process. Twelve compact aspects regarding the establishe building culture are gaining importance in an increasingly specialised, complex and international surrounding. Lectures on the topics of profession, service model, organisation, project, design quality, coordination, costing, tendering and construction management, contracts and agreements, life cycle, real estate market, and getting started will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship. The course introduces the key figures, depicts the criteria of the project and highlights the proveded services of the consultants. In addition to discussing the basics, the terminologies and the tendencies, the lecture units will refer to the studios as well as the practice: Teaching-based case studies will compliment and deepen the understanding of the twelve selected aspects. The course is presented as a moderated seminar to allow students the opportunity for individual active collaboration between the students and their tutor therefore required.

System and Network Planning

Public transports in the context of the transport systems; customer needs in the transport market; service planning processes for regular public transport services; long distance, regional and urban public transport service strategies; access to public transport and the last mile

Objective

Students will develop a basic knowledge of all the public transport planning process from market demand to service planning; they will understand the most relevant planning methods and will be able to use them

Content

(1) Fundamentals of system and network planning: Mobility and transport systems; public transport systems; customer needs versus supply characteristics of regular services. (2) System and network planning in public passenger services: Goals of the system and network planning; generic planning process; demarcation, analysis of the situation, setting of targets; design of public transport services; evaluation and optimization; system planning. (3) Public transport services: long distance service offers; suburban and urban service offers; regional and local service offers; access to public transport and the last mile

Lecture notes

A script in German will be provided for the course. The slides are made available.

Literature

References to technical literature will be included in the course script. An additional list of literature will be given during the course.

No remarks.

Project Management: Project Execution to Closeout

The course will give Engineering students a comprehensive overview and enduring understanding of the techniques, processes, tools and terminology to manage the Project Triangle (time, cost Quality) and to organize, analyze, control and report a complex project from start of Project Execution to Project Completion. Responsibilities will be detailed in each phase of the execution.

Objective

A student after completing the course will have the understanding of the Project Management duties, responsibilities, actions and decisions to be done during the Execution phase of a complex project.
Content

Execution Phase of the Project
Engineering Management: Scope, EV Measurement, Reporting and Organization
Procurement and Transportation: Scope, EV Measurement, Reporting and Organization
Civil Construction and Erection: Scope, EV Measurement, Reporting and Organization
Financial Reporting and forecasting
Risk & Opportunity Identification Assessment and Quantification during Execution
Team Organization and Leadership
Risk and opportunity identification and quantification
Contract Claims and Delays
Execution Quality

Environmental Health and safety during execution

Literature

Required and suggested reading will be uploaded on weekly basis.

101-0517-01 G

Prerequisite for this course is course Project Management: Pre-Tender to Contract Execution number 101-0517-01 G, unless otherwise approved by the lecturer.

101-0521-00L

Project Management for Construction Projects

Abstract
This course is designed to lay down the foundation of the different concepts, techniques, and tools for successful project management of construction projects.

Objective
The goal is that at the end of this course students should have a good understanding of the different project management knowledge areas, the phases required for successful project management, and the role of a project manager. To demonstrate this, students will work in groups in different case studies to apply the concepts, tools and techniques presented in the class.

Content
The main content of the course is summarized in the following topics:
- Project and organization structures
- Project scheduling
- Resource management
- Project estimating
- Project financing
- Risk management
- Interpersonal skills

Lecture notes
The slides for the class will be available for download from Moodle at least one day before each class. Copies of all necessary documents will be distributed at appropriate times.

Literature
Relevant readings will be recommended throughout the course (and made available to the students via Moodle).

101-0520-00L

Introduction to Construction Information Management & Modelling

Abstract
This course will provide both a theoretical background and a pragmatic project work (case studies) on current trends and developments of information modeling and management in the construction industry around the world and in Switzerland. The course will include external lecturers from engineering and construction companies in Switzerland.

Objective
Students enrolled in this course are expected to become familiar with current information modeling and management technologies and their applications to the construction industry, and to get a good understanding of new project delivery systems and technologies for integrated practice.

Content
The content of the course is summarized in the following topics:
- Introduction to information modeling and management technologies
- Integrated Project Delivery (IPD) (vs. traditional delivery methods)
- Information model execution plan
- Information modeling tools and parametric modeling
- Interoperability
- Standards and foundations
- Implications for engineers and the construction industry
- Implications for owners and facility managers
- Information Modeling and Prefabrication
- Construction Analysis and Planning (4D modeling)
- Quantity Takeoff and Cost Estimating (5D modeling)

Lecture notes
The slides for the class will be available for download from Moodle at least one day before each class. Copies of all necessary documents will be distributed at appropriate times.

Literature
Relevant readings will be recommended throughout the course and made available to the students via Moodle.

Prerequisites / notice
There are no pre-requisites to enroll in this course.

101-0522-00L

Infrastructure Management 1: Process

Abstract
The course provides an introduction to the steps included in the infrastructure management process. The lectures are given by a mixture of external people in German and internal people in English.

Objective
Upon completion of the course, students will
- understand the steps required to manage infrastructure effectively,
- understand the complexity of these steps, and
- have an overview of the tools that they can use in each of the steps.

Content
- The infrastructure management process and guidelines
- Knowing the infrastructure - Dealing with data
- Establishing goals and constraints
- Establishing organization structure and processes
- Making predictions
- Selecting strategies
- Developing programs
- Planning interventions
- Conducting impact analysis
- Reviewing the process

Lecture notes
Appropriate reading / and study material will be handed out during the course.

Literature
Appropriate literature will be handed out when required.

Prerequisites / notice
The courses will be given half in English and half in German. Students should have a minimum of level B2 in both to register for the course.

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 163 of 1570

| 101-0357-00L | **Theoretical and Experimental Soil Mechanics** | W+ | 6 credits | 4G | I. Anastasopoulos, R. Herzog |
| **Prerequisites**: Mechanics I, II and III. |
| **Objective** | Extend knowledge of theoretical approaches that can be used to describe soil behaviour to enable students to carry out more advanced geotechnical design and to plan the appropriate laboratory tests to obtain relevant parameters for coupled plasticity models of soil behaviour. A further goal is to give students the wherewithal to be able to select an appropriate constitutive model and set up insitu stress conditions in preparation for subsequent numerical modelling (e.g. with finite elements). |
| **Lecture notes** | Printed script with web support. Exercises. |
| **Literature** | http://geotip.igt.ethz.ch/ |
| **Prerequisites / notice** | Lectures will be conducted as Problem Based Learning within the framework of a case history. Virtual laboratory in support of 'hands-on' experience of selected laboratory tests. Pre-requisites: Basic knowledge in soil mechanics as well as knowledge of advanced mechanics. Laboratory equipment will be available for 60 students. First priority goes to those registered for the geotechnics specialty in the Masters, 2nd year students then first year students, doctoral students qualifying officially for their PhD status and then 'first come, first served'. |

| 101-0307-00L | **Design and Construction in Geotechnical Engineering** | W | 4 credits | 3G | I. Anastasopoulos, A. Marin, A. Zafeirakos |
| **Abstract** | This lecture deals with the practical application of the knowledge gained in the fundamental lectures from the Bachelor degree. The basics of planning and design of geotechnical structures will be taught for the main topics geotechnical engineers are faced to in practice. |
| **Objective** | Transfer of the fundamental knowledge taught in the Bachelor degree to practical application. Ability to plan and design geotechnical structures based on the state of the art. |
| **Lecture notes** | Script in the form of chapters and powerpoint overheads with web support (http://geotip.igt.ethz.ch). Exercises. |
| **Literature** | Relevant literature will be stated during the lectures. |
| **Prerequisites / notice** | Pre-condition: Successful examinations (pass) in the geotechnical studies (soil mechanics and ground engineering, each 5 credits) in the Bachelor degree of Civil Engineering (ETH), or equivalent for new students. The lecture contains at least one presentation from practice. |

| 101-0369-00L | **Forensic Geotechnical Engineering** | W | 3 credits | 2G | A. Puzrin |
| **Prerequisites**: successful participation in "Geotechnical Engineering" (101-0315-00L) or an equivalent course. |
| **Abstract** | In this course selected famous geotechnical failures are investigated with the following purpose: (a) to deepen understanding of the geotechnical risks and possible solutions; (b) to practice design and analysis methods; (c) to learn the techniques for investigation of failures; (d) to learn the techniques for mitigation of the failure damage. |

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 164 of 1570

Failure due to the loading history
Failure due to the creeping landslides
Failure due to excessive settlements
Failure due to the leaning instability
Failure due to tunnelling
Bearing capacity failure
Excavation failure

The course is given in the first MSc semester.

Prerequisite: Basic knowledge in Geotechnical Engineering (Course content of "Grundbau" or similar lecture).

#### Objective

Enhanced understanding of the load-deformation response of beam and frame structures. Systematic treatment of elementary and combined load carrying mechanisms of elastic beams, cables, arches and rings.

#### Content

Axially loaded members, shear deformation of girders, torsion, beams, cables, arches and rings, shear walls and frames, combined cable and flexural action.

#### Literature

The course is given in the first MSc semester.

Prerequisite: Basic knowledge in Geotechnical Engineering (Course content of "Grundbau" or similar lecture).

<td>Structural Reliability and Risk Analysis</td>
<td>W</td>
<td>3</td>
<td>2G</td>
<td>B. Sudret</td>
</tr>
<tr>
<td>Abstract</td>
<td>Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. After this course the students will have refreshed their knowledge of probability theory and statistics to model uncertainties in view of engineering applications. They will be able to analyze the reliability of a structure and to use risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. When designing new structures and systems, the design codes such as SIA or Euro-codes usually provide a framework that guarantees safety and reliability. However, the level of safety is not quantified explicitly, which does not allow the analyst to properly choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first-order-second moment method (FORM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and pre-post risk assessment methods are presented.

The course also includes a tutorial using the UQLab software dedicated to real world structural reliability analysis.

### Lecture notes

Slides of the lectures are available online every week. A printed version of the full set of slides is proposed to the students at the beginning of the semester.

### Literature

S. Marelli, R. Schöbi, B. Sudret, UQLab user manual - Structural reliability (rare events estimation), Report UQLab-v0.92-107.

### Prerequisites / notice

Basic course on probability theory and statistics

---

### Content

#### 101-0157-01L Structural Dynamics and Vibration Problems

- **Abstract**: Fundamentals of structural dynamics are presented. Computing the response of elastic and inelastic single-DOF, continuous-mass and multiple-DOF structural systems subjected to harmonic, periodic, pulse, impulse, and random excitation is discussed. Practical solutions to vibration problems in flexible structures excited by humans, machinery, wind and explosions are developed.

- **Objective**: After successful completion of this course the students will be able to:
  1. Explain the dynamic equilibrium of structures under dynamic loading.
  2. Use second-order differential equations to theoretically and numerically model the dynamic equilibrium of structural systems.
  4. Compute the dynamic response of structural system to harmonic, periodic, pulse, impulse and random excitation using time-history and response-spectrum methods.
  5. Apply structural dynamics principles to solve vibration problems in flexible structures excited by humans, machines, wind or explosions.
  6. Use dynamics of structures to identify the basis for structural design code provisions related to dynamic loading.

- **Content**: This is a course on structural dynamics, an extension of structural analysis for loads that induce significant inertial forces and vibratory response of structures. Dynamic responses of elastic and inelastic single-degree-of-freedom, continuous-mass and multiple-degree-of-freedom structural systems subjected to harmonic, periodic, pulse, impulse, and random excitation are discussed. Theoretical background and engineering guidelines for practical solutions to vibration problems in flexible structures caused by humans, machinery, wind or explosions are presented. Laboratory demonstrations of single- and multi-degree-of-freedom system dynamic response and use of viscous and tuned-mass dampers are conducted.

- **Lecture notes**: The electronic copies of the learning material will be uploaded to ILIAS and available through myStudies. The learning material includes: lecture presentations, additional reading material, and exercise problems and solutions.

- **Prerequisites / notice**: Knowledge of the fundamentals in structural analysis, and in structural design of reinforced concrete, steel and/or wood structures is mandatory. Working knowledge of matrix algebra and ordinary differential equations is required. Familiarity with Matlab and with structural analysis computer software is desirable.

---

### Content

#### 051-0551-00L Energy- and Climate Systems I

- **Abstract**: The lecture contains concepts, physics and components of building technologies for the efficient and sustainable energy supply and climatisation of buildings and their interaction with architecture and urban design. Using calculations, students learn to acquire relevant numbers and assess the performance of solutions.

- **Objective**: The lecture series focuses on the physical principles and technical components of relevant systems for an efficient and sustainable climatisation and energy supply of buildings. A special focus is on the interrelation of supply systems and architectural design and construction. Learning and practicing methods of quantifying demand and supply allows identifying parameters relevant for design.

- **Content**: 1. Introduction 2. Heating and cooling 3. Active and passive ventilation 4. Electricity in buildings

- **Lecture notes**: The Slides from the lecture serve as lecture notes and are available as download.

- **Literature**: A list of relevant literature is available at the chair.

---

### Content

#### 101-0177-00L Moisture Physics: Moisture and Durability

- **Abstract**: Moisture transport and related degradation processes in building and civil engineering materials and structures; concepts of poromechanics and multiscale analysis; analysis of damage cases.

- **Objective**: - Basic knowledge of moisture transport and related degradation processes in building and civil engineering materials and structures - Introduction to concepts of poromechanics and multiscale analysis - Application of knowledge by the analysis of damage cases

---

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 166 of 1570
1. Introduction

Knowledge of characteristic properties of wood as an anisotropic and porous material and their consideration in structural timber design.

2. Moisture Transport

- Description of moisture transport
- Determination of moisture transport properties
- Hysteresis
- Transport in cracked materials
- Damage and moisture transport in cracked media

3. Poromechanics

- Moisture and mechanics: poro-elasticity
- Poro-elasticity and salt crystallisation
- Poro-elasticity and damage
- Case studies

4. Multiscale analysis

- Problem statement
- Multiscale transport model
- Multiscale coupled transport - damage model

101-0167-01L Fibre Composite Materials in Structural Engineering

Abstract

1) Lamina and Laminate Theory
2) FRP Manufacturing and Testing Methods
3) Design and Application of Externally Bonded Reinforcement to Concrete, Timber, Masonry, and metallic Structures
4) FRP Reinforced Concrete, All FRP Structures
5) Measurement Techniques and Structural Health Monitoring

Objective

At the end of the course, you shall be able to
1) Design advanced FRP composites for your structures,
2) To consult owners and clients with necessray testing and SHM techniques for FRP structures,
3) Continue your education as a phd student in this field.

Content

Fibre Reinforced Polymer (FRP) composites are increasingly being used in civil infrastructure applications, such as reinforcing rods, tendons and FRP profiles as well as wraps for seismic upgrading of columns and repair of deteriorated structures. The objective of this course is on one hand to provide new generation of engineering students with an overall awareness of the application and design of FRP reinforcing materials for internal and external strengthening (repair) of reinforced concrete structures. The FRP strengthening of other structures such as metallic, timber and masonry will also be shortly discussed. On the other hand the course will provide guidance to students seeking additional information on the topic. Many practical cases will be presented analysed and discussed. An ongoing structural health monitoring of these new materials is necessary to ensure that the structures are performing as planned, and that the safety and integrity of structures is not compromised. The course outlines some of the primary considerations to keep in mind when designing and utilizing structural health monitoring technologies. During the course, students will have the opportunity to design FRP strengthened concrete beams, apply the FRP by themselves, and finally test their samples up to failure.

Lecture notes

1) Power Point Printouts
2) Handouts

Literature

2) fib bulletin 14, Externally Bonded FRP Reinforcement for RC Structures, 2001
4) S. Pakzad, Structural Reinforcement using Composite Materials, Large Scale Testing of Structural Components, 2001
5) M. Fontana, R. Steiger

101-0190-06L Topics on Signal Processing and Identification

Abstract

In this course some fundamental topics on digital signal processing will be reviewed. This includes an introduction to digital signals in time, frequency and z-domain, as well as sampling theory and digital filter design. We will then discuss the state space model of dynamic systems and introduce methods of identification of such systems, with an emphasis on using data from mobile sensors.

Objective

The students will be able to analyse digital signals and systems in time-, z-, and frequency domains, and create, implement, and identify digital systems. The examples and sample data are measured from civil structures.

101-0637-01L Wood and Wood Composites

Abstract

Knowledge of characteristic properties of wood as a anisotropic and porous material and their consideration in structural timber design.

Objective

Knowledge about history, ecology, structure of timber, drying, material properties, influence of moisture and creep. Durability and grading. Solid timber, glued laminated timber and wood composites.

Content

- Fire behaviour and fire design.
- Characteristic properties of wood as a anisotropic and porous material and their consideration in structural timber design.
- History, ecology, structure of timber, drying, material properties, influence of moisture and creep, grading, Durability.
- Material properties and field of applications of solid timber, glued laminated timber and wood composites.
- Fire safety and fire design.

Prerequisites / notice

Die Vorlesung ist mit einer halbtägigen Excursion verbunden.

Voraussetzungen: Grundkenntnisse der Baustoffkunde
**Objective**

Students will develop a basic knowledge of all stages of the public transport planning process from market demand to service planning; they will understand the most relevant planning methods and will be able to use them.

**Content**

(1) Fundamentals of system and network planning: Mobility and transport systems; public transport systems; customer needs versus supply characteristics of regular services. (2) System and network planning in public passenger services: Goals of the system and network planning; generic planning process; demarcation, analysis of the situation, setting of targets; design of public transport services; evaluation and optimization; system planning. (3) Public transport services: Long distance service offers; suburban and urban service offers; regional and local service offers; access to public transport and the last mile.

**Literature**

A script in German will be provided for the course. The slides are made available.

**Notice**

Special permission from the instructor can be requested if the student has not taken Verkehr III

---

**Objective**

The course provides the necessary knowledge to develop models supporting the solution of given planning problems. This is done by dividing the forecasting problem into sub-problems.

The course is composed of a lecture part, providing the theoretical knowledge, and a applied part, in which students develop their own models.

**Content**

- Knowledge of methods and algorithms commonly used in transport planning
- Ability to independently develop a transport model able to solve / answer the given problem / questions
- Understanding of algorithms and their implementations commonly used in transport planning

**Literature**

**Major in Hydraulic Engineering and Water Resources Management**

**Abstract**
The course explains main principles of air transport in general and elaborates on simple interdisciplinary topics. Since working on broad topics like aerodynamics, manufacturers, airport operation, business aviation, business models etc. the students gets a good overview in Air Transportation.

**Objective**
Understand and explain basics, principles and contexts in the broader air transport industry. Lay the foundation of working in or with the air transport industry. Ideal foundation for Aviation II - Management of Air Transport.

**Content**
Weekly: 1h independent preparation; 2h lectures and 1 h training with an expert in the respective field

**Concept**
This course will be taught as Aviation I. A subsequent course is under evaluation.

**Lecture notes**
Slides are provided prior to each class

**Literature**
Literature will be provided by the lecturers respective there will be additional Information upon registration

**Prerequisites / notice**
We will also use English papers

---

**101-0491-01L** Agent Based Modeling in Transportation (Additional JAVA Exercises)

**Abstract**
This course provides the basic concepts of high level programming languages to students without previous programming training. The programming language used is Java. Since this course is preparatory for the course Agent Based model in Transportation, the same simulation software, MATSim, will be used for several excercises.

**Objective**
The objective of this course is to make the students familiar with some basic concepts of object oriented programming and to give a short introduction to the Multi-agent transport simulation (MATSim) which will be used in the lecture (Agent Based Modeling in Transportation) following this one. The programming language used in the course is Java. This course, therefore, has the main goal of providing the students without previous programming training the skills necessary for the successful completion of the Agent Based Modeling in Transportation course.

**Content**
The main Java concepts explained in the course are:
1) Types, Variables, Operators
2) Methods, Conditionals, Loops, Arrays
3) Objects and Classes
4) Access control, Class scope, Packages, Java API
5) Design, Debugging, Interfaces
6) Inheritance, Exceptions, File I/O

MATSim will be introduced on a basic level and its basic functionalities will be explained. Weekly excercises will be focused on building Java knowledge through various examples using the MATSim environment.

**Prerequisites / notice**
Keine

---

**101-0247-00L** Hydraulic structures II

**Abstract**
Hydraulic structures and their function within a hydraulic scheme are explained. The basic concepts of their layout and design with regard to economy and safety are provided.

**Objective**
Knowledge of hydraulic structures and their function within a hydraulic scheme. Skills for the layout and design of hydraulic structures with regard to economy and safety.

**Content**

**Lecture notes**
manuscript and further documentation

**Literature**
is specified in the lecture and in the manuscript
Prerequisites / notice

Information: Enrolment of Hydraulic Engineering II is not recommended without having attended Hydraulic Engineering (101-0206-00L) previously since Hydraulic Engineering II is strongly based on Hydraulic Engineering (101-0206-00L).

<td>The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated. All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as Hydraulic Systems and HEC RAS for non-steady flows are used.</td>

The lecture addresses the fundamentals to quantitatively describe the flow of water, the transport of sediments and morphological changes like erosion or deposition in watercourses. Further addressed are the design and dimensioning of river engineering works to create and ensure sufficient capacity, channel stability as well as to ensure the ecological functions of the watercourse.

- The students shall:
  - be able to describe the interrelation between discharge, sediment transport and channel evolution quantitatively
  - know the fundamentals and be able to apply the approaches and methods to treat river engineering problems associated with flood protection and river restoration
  - be capable to design and dimension river engineering works needed to influence the processes in watercourses

The lecture notes contain a comprehensive list of references for further reading.

Lecture notes:
Lecture notes "River Engineering" (in German, 470 pages, including list of references)

Prerequisites:
Hydrology (102-0293-AAL), Hydraulics I (101-0203-01L) and Hydraulic Engineering (101-0206-00L)

A practical exercise (voluntary, unmarked) is offered to deepen the learned subjects. This exercise bases on field data, which are partly collected by the students on a river in nature. Besides the collection of fundamentals and field data, the exercise comprehends the calculation of the stage-discharge relationship, of the critical discharges for initiation of bed load transport and bed erosion and of the annual sediment load in a given river reach.

Content

Based on the lecture 'Werkstoffe I' students receive deep concrete technology training. A comprehensive knowledge of the most important properties of conventional concrete and the current areas of research in concrete technology will be presented. The course covers various topics.

The content of the course is:
- concrete components
- concrete properties
- concrete mix design
- production, transport, casting
- demoulding, curing and additional protective measures
- durability
- standards
- high performance concretes
  1. high strength and ultra high strength concrete
  2. fiber reinforced concrete
- self compacting concrete
- shotcrete
- light weight concrete
- low shrinkage concrete
- low heat concrete for mass structures
- frost and wear resistant concrete
- concrete for low and high ambient temperatures

Lecture notes

Slides provided for download.

101-0177-00L Building Physics: Moisture and Durability W 3 credits 2G J. Carmeliet, T. Defraeye

Abstract

Moisture transport and related degradation processes in building and civil engineering materials and structures; concepts of poromechanics and multiscale analysis; analysis of damage cases.

Objective

- Basic knowledge of moisture transport and related degradation processes in building and civil engineering materials and structures
- Introduction to concepts of poromechanics and multiscale analysis
- Application of knowledge by the analysis of damage cases

Content

1. Introduction
   Moisture damage: problem statement
   Durability

   2. Moisture Transport
   Description of moisture transport
   Determination of moisture transport properties
   Hysteresis
   Transport in cracked materials
   Damage and moisture transport in cracked media

   3. Poromechanics
   Moisture and mechanics: poro-elasticity
   Poro-elasticity and salt crystallisation
   Poro-elasticity and damage
   Case studies

   4. Multiscale analysis
   Problem statement
   Multiscale transport model
   Multiscale coupled transport - damage model

101-0648-00L Metallic Materials and Corrosion W 3 credits 2G B. Elsener

Abstract

Metals in civil engineering (steels, high strength steel, Al-alloys, stainless steels). Mechanisms to improve the mechanical properties, plastic deformation (dislocations), mechanical tests. Corrosion, stress corrosion. The goal is the understanding of the relation between chemical composition, microstructure and mechanical properties and durability (corrosion) of metallic materials. Case studies.

Objective

Knowledge and comprehension of the fundamentals of material science of metallic materials such as the relation between chemical composition, microstructure and properties of metallic materials. Ability to critically select the appropriate materials for application in civil engineering (fixation elements, reinforcement for concrete structures, high-strength steels).

Content

Fundamentals of metallic materials, crystal structure of metallic materials, defects, solidification,

Properties of metallic materials, physical (electrical, magnetic), mechanical (strength, deformation, fracture), chemical (corrosion resistance),

Most important alloys (steels, aluminium alloys, stainless steels)

Examples of application

Lecture notes

Lecture notes (in german) are distributed at the beginning of the course.

Reprints for selected topics.

Abstract

Basic knowledge in public and private law of civil engineering. Examples of the subjects treated: space management, protection of the environment, legal procedures, standards for building technology and contracts.

Objective

Part 1: The students shall acquire basic knowledge of the public law concerning civil engineering: space management, conception of buildings, protection of the environment, procedures
Part 2: The students shall acquire basic knowledge of the private law concerning civil engineering
Content

Teil 1: Jede Lektion behandelt für ein bestimmtes Stadium des Projekts ein Thema des öffentlichen Baurechts wie Bau- und Zonenordnungen, Quartierpläne, Umweltverträglichkeitsprüfungen, Baubewilligungsverfahren etc.,

Lecture notes

D. Trümpy: Tafeln zu den Grundzügen des schweizerischen Bauvertragsrechts (Vorlesungsunterlage)
H. Briner: Tafeln zu den Grundzügen des öffentlichen Baurechts wie Bau- und Umweltrechts (Vorlesungsunterlage)

Literature

- Gauch, Peter, Werkvertrag, 5. Auflage, Schulthess 2011

Prerequisites / notice

Die Teilnehmer sollen stets ein Exemplar der SIA-Norm 118, der SIA-LHO 103 sowie die Gesetzesausgaben von OR und ZGB bei sich haben.

101-0577-00L An Introduction to Sustainable Development in the Built Environment

Objective

At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environment aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

Content

The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development
- Case Study 1: Sustainable construction, the role of construction industry (national/international)
- Case Study 2: Cities, forms of settlements
- Case Study 3: Material resources, scenarios, energy, construction materials, urban metabolism
- Case Study 4: Buildings, heating/cooling, consumers, prosumers and other stakeholder, cooperations
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Economics for sustainable construction
- Method 3: Construction, flexibility, modularity
- Synthesis 1: Climate Change mitigation and adaptation in cities
- Synthesis 2: Transition to sustainable development

Lecture notes

All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature

A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

101-0587-00L Workshop on Sustainable Building Certification

Abstract

Building labels are used to certify buildings and neighbourhoods in term of sustainability. Many different labels have been developed and can be used in Switzerland (LEED, DGNB, SNBS, Minergie). In this course the differences between the certification labels and its application on 3 emblematic case study buildings will be discussed.

Objective

After this course, the students are able to understand and use the different certification labels. They have a clear view of what the labels take into consideration and what they don't.

Content

Three buildings case study will be presented.

Different certification schemes, including LEED (American standard), DGNB (German Standard with Swiss adaptation), SNBS, MINERGIE-EEO and 2000-Watt-Society (Swiss standards) will be presented and explained by experts.

After this overall general presentation and in order to have a closer look to specific aspects of sustainability, students will work in groups and assess during one or two weeks this specific criteria on one of the case studies presented before. This practical hands on the label will end with a presentation and where we will highlight differences between the labels.

Lecture notes

The slides from the presentations will be made available.

Literature

All documents for certification labels as well as detail plans of the buildings will be available for the students.

101-0439-00L Introduction to Economic Analysis - A Case Study Approach with Cost Benefit Analysis in Transport

W+ 3 credits 2G 4G K. W. Axhausen, R. Schubert

This year the UN Conference in Paris will shape future world objectives to tackle climate change. All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

G. Habert

The slides from the presentations will be made available.

All documents for certification labels as well as detail plans of the buildings will be available for the students.

H. Briner: Tafeln zu den Grundzügen des öffentlichen Baurechts wie Bau- und Umweltrechts (Vorlesungsunterlage)

D. Kellenberger
The course presents cost benefit analysis and related evaluation methods in transport and introduces the survey methods used to derive the monetary values of non-market goods.

**Objective**
Familiarity with the essential methods of project appraisal

**Content**
Cost-Benefit-Analysis; multi-criteria analysis; European guidelines; stated response methods; travel cost approach and others; Valuation of travel time savings; valuation of traffic safety

**Lecture notes**
Handouts

**Literature**

### 101-0419-00L Railway Construction and Maintenance

**Abstract**
Track geometry including calculation and measuring as well as related data systems; interaction between track and vehicles, vehicle dynamics, stress; track construction including special features of railway bridges and tunnels; track diagnostics and forecast; track maintenance and related methods

**Objective**
The lecture gives a deeper insight into track geometry, the interaction between track and vehicles as well as in construction and dimensioning of the track. Methods for the diagnosis of the state of the track and its forecast are shown. State-of-the-art maintenance strategies and technologies are presented.

**Content**
Track geometry including calculation and measuring as well as related data systems; interaction between track and vehicles, vehicle dynamics, stress; track construction including special features of railway bridges and tunnels; track diagnostics and forecast; track maintenance and related methods

**Lecture notes**
The slides will be made available.

**Literature**
A list with related technical literature will be handed out.

**Prerequisites / notice**
The lecture Railway Infrastructures (Transportation II) is recommended.

**Abstract**
Introduction of basic knowledge about problems with contaminated sites, investigation of this sites, risk management, remediation and reclamation techniques as well as monitoring systems. Introduction in landfill design and engineering with focus on barrier- and drainage systems and lining materials, evaluation of geotechnical problems, e.g. stability

**Objective**
Introduction of basic knowledge about problems with contaminated sites, investigation of this sites, risk management, remediation and reclamation techniques as well as monitoring systems. Introduction in landfill design and engineering with focus on barrier- and drainage systems as wellas lining materials, evaluation of geotechnical problems, e.g. stability

**Content**
Definition of contaminated sites, site investigation methods, historical research and technical investigation, risk assessment, contamination transport, remediation, clean-up and retaining techniques (e.g. bioremediation, incineration, retaining walls, pump-and-treat, permeable reactive barriers), monitoring, research projects and results

**Lecture notes**
Dr. R. Hermanns Stengele, Dr. M. Plötze: Environmental Geotechnics (german) digital

**Prerequisites / notice**
Prerequisite: BSc course “Tunnelling”, MSc courses “Tunnelling I” and “Tunnelling II”.

101-0387-00L Geotechnical Engineering in Transportation
W 3 credits 2G C. Rabaiotti
Abstract
Road design criteria, technology of road construction materials, geotechnical testing methods in Laboratory and in situ, Planning,
monitoring and interpretation of soil field tests, Soil classification for traffic construction, Compaction of road structures and dams, Frost
characteristics of soil materials, soil stabilization
Objective
Aim of the course is to teach students the most important aspects of the road structure, its building and design methods. An essential part
of the course is devoted to understand the influence of the insitu conditions: soil, underground, climate, water, as well as of the characteristics of building materials and of road surface on the durability of the pavement.
Content
Road design criteria, Technology of road construction materials, geotechnical testing methods in Laboratory and in situ, Planning,
monitoring and interpretation of soil field tests, Soil classification for traffic construction, Compaction of road structures and dams, Frost
characteristics of soil materials, soil stabilization

101-0119-00L Structural Masonry
W 3 credits 2G N. Mojsilovic
Abstract
Knowledge of the engineering properties of materials for masonry construction.
Technical understanding of the structural behaviour of load-bearing masonry structures subjected to in-plane forces and combined actions.
Develop a technical competence for design procedures for load-bearing masonry structures by means of exercises.
Objective
Knowledge of the engineering properties of materials for masonry construction.
Technical understanding of the structural behaviour of load-bearing masonry structures subjected to in-plane forces and combined actions.
Develop a technical competence for design procedures for load-bearing masonry structures by means of exercises.

101-0129-00L Existing Structures
W 3 credits 2G T. Vogel
Abstract
Treatment of the topic primarily from the perspective of a consulting engineer dealing with a single object.
Elaboration of a systematic procedure for respective projects. Consolidation for concrete structures and extension to other construction
methods.
Objective
Uncovering of interfaces between owners, architects, contractors and specialists.
Content
Systematics of existing structures, examination (condition survey, condition examination, recommendation of remedial measures), non-destructive testing methods, natural stone masonry, strengthening methods (esp. plate bonding)

101-0149-00L Plate and Shell Structures
W 3 credits 2G T. Vogel, S. Fricker
Abstract
Basic load bearing behaviour of plate and shell structures
Comprehension of basic load bearing behaviour of plate and shell structures; knowledge of typical applications of different materials, ability
to reasonably interpret and check results of numerical calculations; establish access to technical literature.

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 175 of 1570

Method of Finite Elements II

W 3 credits 2G E. Chatzi

Abstract

Basic theoretical and procedural concepts of the method of finite elements (FE) for the analysis of nonlinear & dynamic systems are introduced. Kinematic and material nonlinear effects and the dynamic analysis of structures in terms of modal and time domain analysis are described.

The course is complemented by Homework Sessions using computing tools and FE software such as MATLAB, ABAQUS & ANSYS.

Objective

Basic theoretical and procedural concepts of the method of finite elements (FE) for the analysis of nonlinear & dynamic systems are introduced. Kinematic and material nonlinear effects and the dynamic analysis of structures in terms of modal and time domain analysis are described.

The course is complemented by Homework Sessions using computing tools and FE software such as MATLAB, ABAQUS & ANSYS.

Content

Introduction to finite element nonlinear analysis in structural engineering.

Formulation and solution of nonlinear problems.

Nonlinear constitutive relations.

Dynamic finite element analysis.

Solution of eigen value problems.

Practical application of the finite element nonlinear and/or dynamic analysis

Problem solution using MATLAB, ABAQUS and ANSYS

Literature

Timber Structures II

W 3 credits 2G A. Frangi, R. Jockwer, R. Steiger

Prerequisites: Timber Structures I (101-0168-00L)

Abstract

Basic knowledge of structural timber design including material behaviour especially anisotropy, moisture and long duration effects and their consideration in structural analysis and detailing. Design, detailing and structural analysis of timber roof structures, buildings and bridges.

Comprehension and application of basic knowledge of structural timber design including material behaviour especially anisotropy, moisture and long duration effects and their consideration in structural analysis and detailing. Design, detailing and structural analysis of timber roof structures, buildings and bridges.

Field of application of timber structures; Timber as building material (wood structure, physical and mechanical properties of wood and wood-based products); Durability; Principles of design and dimensioning; Connections (dowels, nails, screws, glued connections); Timber components and assemblies (mechanically jointed beams, trusses); Design and detailing of timber roof structures, buildings and bridges.

Timber Structures I

Seismic Design of Structures II

W 3 credits 2G B. Stojadinovic

The following advanced topics are covered: 1) behavior and non-linear response of structural systems under earthquake excitation; 2) seismic behavior and design of moment frame, braced frame, shear wall and masonry structures; 3) fundamentals of seismic isolation; and 4) assessment and retrofit of existing buildings. These topics are discussed in terms of performance-based seismic design.

After successfully completing this course the students will be able to:
1. Use the knowledge of nonlinear dynamic response of structures to interpret the design code provisions and apply them in seismic design structural systems.
2. Explain the seismic behavior of moment frame, braced frame and shear wall structural systems and successfully design such systems to achieve the performance objectives stipulated by the design codes.
3. Determine the performance of structures under earthquake loading using modern performance assessment methods and analysis tools.

This course completes the series of two courses on seismic design of structures at ETHZ. Building on the material covered in Seismic Design of Structures I, the following advanced topics will be covered in this course: 1) behavior and non-linear response of structural systems under earthquake excitation; 2) seismic behavior and design of moment frame, braced frame and shear wall structures; 3) fundamentals of seismic isolation; and 4) assessment and retrofit of existing buildings. These topics will be discussed from the standpoint of performance-based design.

Lecture notes

The electronic copies of the learning material will be uploaded to ILIAS and available through myStudies. The learning material includes the lecture presentations, additional reading, and exercise problems and solutions.

Literature

Earthquake Engineering: From Engineering Seismology to Performance-Based Engineering, Yousef Borzorgnia and Vitelmo Bertero, Eds., CRC Press, 2004

Prerequisites / notice

ETH Seismic Design of Structures I course, or equivalent. Students are expected to understand the seismological nature of earthquakes, to characterize the ground motion excitation, to analyze the response of elastic single- and multiple-degree-of-freedom systems to earthquake excitation, to use the concept of response and design spectrum, to compute the equivalent seismic loads on simple structures, and to perform code-based seismic design of simple structures. Familiarity with structural analysis software, such as SAP2000, and general-purpose numerical analysis software, such as Matlab, is expected.
101-0179-00L

Probabilistic Seismic Risk Analysis and Management

for Civil Systems

W 3 credits 2G

B. Stojadinovic, M. Broccardo, S. Esposito, P. Galanis

Abstract

Advances topics covered in this course are: 1) probabilistic seismic hazard analysis; 2) probabilistic seismic risk analysis; 3) seismic risk management using structural and financial engineering means; and, time permitting, 4) advanced topics in systemic probabilistic risk evaluation.

Objective

After successfully completing this course the students will be able to:

1. Gather the necessary data and conduct a probabilistic seismic hazard analysis for a site.
2. Gather the necessary data and conduct a probabilistic vulnerability analysis of a building or an element of a civil infrastructure system at a site.
3. Design structural and/or financial engineering solutions to mitigate the seismic risk at a site.

Content

This course extends the series of two courses on seismic design of structures at ETHZ and introduces the topic of probabilistic seismic risk analysis and seismic risk management for the build environment and civil infrastructure systems. The following advanced topics will be covered in this course: 1) probabilistic seismic hazard analysis; 2) probabilistic seismic risk analysis; 3) seismic risk management using structural and financial engineering means; and, time permitting, 4) advanced topics in systemic probabilistic risk evaluation.

Lecture notes

The electronic copies of the learning material will be uploaded to ILIAS and available through myStudies. This will include the lecture notes, additional reading, and exercise problems and solutions. There is no textbook for this course.

Wood and Wood Composites

W 3 credits 2G

A. Frangi, I. Burgert, G. Fink, M. Fontana, R. Steiger

Abstract

Knowledge of characteristic properties of wood as an anisotropic and porous material and their consideration in structural timber design. History, ecology, structure of timber, drying, material properties, influence of moisture and creep, Durability and grading. Solid timber, glued laminated timber and wood composites. Fire behaviour and fire design.

Objective

Knowledge of characteristic properties of wood as an anisotropic and porous material and their consideration in structural timber design. Knowledge about history, ecology, structure of timber, drying, material properties, influence of moisture and creep, durability and grading. Knowledge about material properties and field of applications of solid timber, glued laminated timber and wood composites. Design of timber in fire.

Content

Lecture notes

Power Point slides. Further literature.

Topics on Signal Processing and Identification

W 2 credits 2V

S. Pakzad

Abstract

In this course some fundamental topics on digital signal processing will be reviewed. This includes an introduction to digital signals in time, frequency and z-domain, as well as sampling theory and digital filter design. We will then discuss the state space model of dynamic systems and introduce methods of identification of such systems, with an emphasis on using data from mobile sensors.

Objective

The students will be able to analyse digital signals and systems in time-, z-, and frequency domains, and create, implement, and identify digital systems. The examples and sample data are measured from civil structures.

| Objective | Comprehension of the transport and administrative policy as well as of the regulation of public transport companies. To develop a full understanding of the three important public transport system operations management processes: (1) Business management; (2) Marketing; (3) Quality control. The course will teach essential working techniques in each of these processes.
(1) Transport and administrative policy: Goals of the state related to public transports, governmental activities in public transport, regulation.
(2) Business management in public transport enterprises: goals of public transport companies, goals of the business management; management of public transport on the different management levels, business organization. (3) Marketing, advertising and pricing: Fundamentals and goals; marketing strategies and concepts in public transports; marketing tools; putting marketing into action. (4) Quality control: Quality in transport systems; goals of quality management; structuring quality control measures; collecting quality data in an operating service; use of quality control systems for service optimization.

Agent Based Modeling in Transportation

Objectives:
- To equip students with tools to be used to evaluate infrastructure and the level of service being provided from infrastructure.

Content:
- The infrastructure management process and guidelines
- Reviewing the process
- Conducting impact analysis
- Planning interventions
- Developing programs
- Selecting strategies
- Making predictions
- Establishing goals and constraints
- Establishing organization structure and processes
- Knowing the infrastructure - Dealing with data
- Transparencies will be handed out at the beginning of each class.
- All necessary materials (e.g. transparencies and hand-outs) will be distributed before class.
- Appropriate reading material will be assigned when necessary.

Infrastructure Management 1: Process

Objectives:
The course provides an introduction to the steps included in the infrastructure management process. The lectures are given by a mixture of external people in German and internal people in English.

Content:
- The infrastructure management process and guidelines
- Reviewing the process
- Conducting impact analysis
- Planning interventions
- Developing programs
- Selecting strategies
- Making predictions
- Establishing goals and constraints
- Establishing organization structure and processes
- Knowing the infrastructure - Dealing with data
- Transparencies will be handed out at the beginning of each class.
- All necessary materials (e.g. transparencies and hand-outs) will be distributed before class.
- Appropriate reading material will be assigned when necessary.

Infrastructure Maintenance Processes

Objectives:
1) Introduction to the agent-based paradigm and overview on existing agent-based models in transportation, including MATSim
2) Learn how to setup MATSim for policy analysis
3) Learn about the interfaces available to enhance the software (includes Java programming)
4) Create, run and analyse a policy study

Content:
The main topics of the lecture are:
1) Introduction to the agent-based paradigm and overview on existing agent-based models in transportation, including MATSim
2) Learn how to setup MATSim for policy analysis
3) Learn about the interfaces available to enhance the software (includes Java programming)
4) Create, run and analyse a policy study

The objective of this course is to make the students familiar with agent-based models and in particular with the software MATSim. They will learn the pros and cons of this type of approach versus traditional transport models and will learn to use the simulation. They will design a policy study and run simulations to evaluate the impacts of the proposed policies.
The main topics are:
1) Introduction to the agent-based paradigm and overview on existing agent-based models in transportation, including MATSim
2) Introduction of basic building blocks of simulation approaches (random numbers generation, experimental design, variance control, response surface construction)
3) Revision of the key submodels and their parameters and concepts (value of time, Wardrop (Nash) equilibrium, etc.)
4) Learn how to setup MATSim for policy analysis
5) Create, run and analyse a policy study

Agent-based modeling in general

MATSim
(http://www.matsim.org/the-book)

Additional relevant readings, mostly scientific articles, will be recommended throughout the course.

Simulation of Traffic Operations
Abstract
The course introduces basics of microscopic traffic simulation, including model development, calibration, validation, data analysis, identification of strategies for improving traffic performance, and evaluation of such strategies. The modelling software used is VISSIM.

Objective
The objective of this course is to introduce basic concepts in microscopic traffic simulation and conduct a realistic traffic engineering project from beginning to end. The students will first familiarize themselves with microscopic traffic simulation models. They will then use a simulation for modeling and analyzing the traffic operations. The emphasis is not only on building the simulation model, but also understanding of the models behind and logically evaluating results. The final goal is to make valid and concrete engineering proposals based on the simulation model.

Content
In this course the students will first learn some microscopic simulation concepts and then complete a traffic engineering project with microscopic traffic simulator VISSIM.

Microscopic simulation concepts will include:
1) Car following models
2) Lane change models

Specific tasks for the project will include:
1) Building a model with the simulator VISSIM in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/extending the model to improve the traffic performance.

Lecture notes
The lecture notes and additional handouts will be provided before the lectures.

Literature
Additional literature recommendations will be provided at the lectures.

Prerequisites / notice
There are no strict preconditions in terms of which lectures the students should have previously attended. However, it is expected that the students have some experience with some high level programming language (i.e. C, C++, Fortran or Java). If this is not the case, attending the additional java exercises (101-0491-00U) is strongly encouraged.

Selected Topics on Hydraulic Engineering
Prerequisites: 101-0247-01L Hydraulic Engineering II or equivalent course.

Abstract
The lecture focuses on selected topics in hydraulic engineering, water management and aquatic ecology relating to hydropower and flood protection projects.

Objective
To deepen knowledge on special aspects in hydraulic engineering and to understand the procedures and the planning sequence of hydropower projects.

Content
Different selected topics in hydraulic engineering will be focused on, e.g. dam safety, possible problems at reservoirs like sedimentation or natural hazards by impulse waves, the hydraulics of river flows, spillways and intake structures at dams and weirs, hydropower and ecology like fish-ecological aspects at low-head hydropower plants and eco-hydraulics like flow-vegetation interaction. Another focus will be put on typical approaches and procedures in the planning process of hydropower projects.

Lecture notes
Lecture notes/handouts will be available online.

Literature
is specified in the lecture.

Prerequisites / notice
External speakers will present current topics and projects in Switzerland and abroad.

Applied Glaciology
Abstract
We will explain the fundamentals of physics of glaciers which are necessary for treating applied problems. We will go into climate-glacier interactions, flow of glaciers, lake ice and hydrology of glaciers.

Objective
To understand the fundamental physical processes in glaciology.
To learn some basic numerical modelling techniques for glacier flow.
To identify glaciological hazards and to learn some assessment and mitigation possibilities.

Content
Basics in physical glaciology
Dynamics of glaciers: deformation of glacier ice, role of water in glacier motion, reaction of glaciers to climate changes, glacier calving, surges
Ice falls, ice avalanches
Glacier floods
Lake ice and bearing capacity

Lecture notes
Handouts are available

Literature
Relevante Literatur wird während der Vorlesung angegeben.

Prerequisites / notice
Für aktuelle Fallbeispiele werden risikobasierte Massnahmen bei glaziologischen Naturgefahren diskutiert.

Voraussetzungen: Es werden Grundkenntnisse in Mechanik und Physik vorausgesetzt.

Abstract
Hydraulic fundamentals are applied to hydraulic structures for wastewater, flood protection and hydropower. Typical case studies from engineering practice are further described.

Objective
Understanding and quantification of fundamental hydraulic processes with particular focus on hydraulic structures for wastewater, flood protection and hydropower

Content
1. Introduction & Basic equations
2. Losses in flow & Maximum discharge
3. Uniform flow & Critical flow
4. Hydraulic jump & Stilling basins
5. Backwater curves
6. Weirs/End overfalls & Venturi
7. Mobile discharge measurements & Culverts/ restrictors/ inverted siphons
8. Fall manholes & Vortex drop
9. Conjunctions & Shock waves at abrupt wall deflections
10. Air/ water flows and bottom outlets
11. Driftwood retention racks
12. Vegetated flows - Introduction
13. Vegetated flows - Application
14. Summary & questions/ preparations for examination

102-0215-00L Urban Water Management II W 3 credits 2G M. Maurer, P. Staufer

Abstract

Objective
Consolidation of the basic procedures for design and operation of technical networks in water engineering.

Content
Demand Side Management versus Supply Side Management
Optimierung von Wasserverteilnetzen
Druckstösse
Kalkausfällung, Korrosion von Leitungen
Hygiene in Verteilsystemen
Siedlungshydrologie: Niederschlag, Abflussbildung
Instationäre Strömungen in Kanalisationen
Stofftransport in der Kanalisation
Einleitbedingungen bei Regenwetter
Versickerung von Regenwasser
Generelle Entwässerungsplanung (GEP)

Lecture notes
Written material and copies of the overheads will be available.

Prerequisites / notice
Prerequisite: Introduction to Urban Water Management

101-0619-00L Mechanics of Building Materials W 3 credits 2G F. Wittel

Abstract
Material models comprise our knowledge on the physical behavior of materials. Based on a short introduction to solid mechanics, 3D material laws for elastic, visco-elastic behavior, plasticity and damage mechanics are discussed. We focus on material laws for concrete, metals, wood and other composites, how to obtain parameters from mechanical tests and their application in FEM calculations.

Objective
This introductory course aims to bridge the gap between phenomenological, qualitative comprehension of processes in building materials, their characterization in mechanical testing and the ability to apply those for practical design purposes via constitutive models.

Upon completion of the course you should be able to:
- classify different material behavior (e.g. linear/non-linear elastic, elasto-plastic, creep) with respect to types of constitutive material models (total/incremental strain models, damage/plasticity models, linear visco-elasticity),
- review how incremental strain models (e.g. elasto-plastic) are algorithmically implemented in Finite Element software (UMat of Abaqus),
- formulate the main approach and assumptions to the most import models for building materials and discuss their limitations,
- propose experimental campaigns for obtaining relevant material parameters for non-linear material models.

Content
- Introduction to constitutive models for materials
- Fundamentals of mechanics of materials
- Cauchy- hyper- and hypoelastic material descriptions
- Constitutive Models for Concrete (non-linear elastic)
- Introduction to metal and concrete plasticity
- Introduction to ABAQUS UMAT Programming
- Damage continuum mechanics
- Linear visco-elastic materials

Lecture notes
Will be provided during the lecture.

101-0639-01L Science and Engineering of Glass and Natural Stone in Construction W 3 credits 2G F. Wittel, T. Wangler

Abstract
The course offers an overview of relevant practical issues and present technological challenges for glass and natural stones in constructions. Students gain a good knowledge of the basics of glasses and natural stones, their potential as engineering materials and learn to apply them in the design of civil engineering constructions and to evaluate concepts.
Glass is increasingly used in constructions to ease the construction process, as functional insulation barrier, even for structural applications of impressive size. While everyone has experienced the innovation potential of glass in the last decade, products from natural stone suffer from an unjustified traditional image that often originates from a lack of understanding of the material and its combination with other materials. Culturally important structures often are made from natural stone and their conservation demands an understanding of their deterioration mechanisms, the concept of which can be applied to other civil engineering materials. Designers and engineers need the knowledge to reconcile materials and system behavior with the entire processing, handling, integration and life time in mind.

In this module students are taught a broad fundamental as well as practice-oriented education on glass and natural stone in civil engineering applications. Present and future construction and building concepts demand for such materials with optimized properties. Based on the fundamentals from the Bachelor course in materials by the end of this module, you should be able to:

- recognize and choose specific applications from the broad overview you were provided with,
- relate processing technologies to typical products and building applications and recognize (and explain typical damage related to wrong material choice or application,
- explain the nature of glassy and crystalline materials and interpret their physical behavior against this background,
- explain the major deterioration mechanisms in natural stone and how this relates to durability,
- analyze material combinations and appraise their application in future products as well as integration in existing constructions,
- summarize with appropriate guidance publications on a related topic in an oral presentation and short report.

Lecture 1: An introduction to science and engineering of glass and natural stone in construction (FW/TW)

Lecture 2: Glass chemistry including historical development of glass composition, use of raw materials, melts, chemical stability and corrosion. (FW)

Lecture 3: Geology and mineralogy of stones used in construction. Formation processes, chemistry, crystal structure. (TW)

Lecture 4: Microscopic models for glassy materials. Physics of glass transition. From microscopic physical models to thermodynamics, rheology and mechanics of glassy materials. (FW)

Lecture 5: Stone properties and behavior: microstructure, density, porosity, mechanical properties (FW)

Lecture 6: Glass physics: Optical properties (transmission, reflection, emission, refraction, polarization and birefringence, testing methods); Mechanical properties (density, thermal, mechanical, electric properties, glass testing) (FW)

Lecture 7: Stone properties and durability: transport, moisture and thermal cycling (FW)

Lecture 8: Forming and processing of glass: (plate and molded glass, drawing, slumping, profiling etc.; Processing: Cutting, mechanical processing, tempering, gluing, bending, laminating of glass Surface treatments: coating, sputtering, enameling, printing, etching, chemical pre-stressing.) (FW)

Lecture 9: Durability: Salt crystallization, freezing, biodeterioration (FW)

Lecture 10: Glass products for civil engineering applications: (Molded glasses, fiber glass, foam glass, plate glass); construction glass (insulation glass, structural glass, protective glass, intelligent glass, codes); (FW)

Lecture 11: Conservation: Consolidation, cleaning, and other treatments (FW). Practical aspects (guest lecturer)

Lecture 12: Glass in constructions. (modelling, application and regulation, typical damage in glass) (FW)

Lecture 13: Student presentations; exam questions (FW/TW)

Will be handed out in the lectures

Werkstoffe II script (download via the IFB homepage). Rest will be handed out in the lectures

Werkstoffe I/II of the bachelor studies or equivalent introductory materials lecture.

Reinforced concrete combines the good compressive strength of concrete with the high tensile strength of steel and has proven to be successful in terms of structural performance and durability. However, there are instances of premature failure of reinforced concrete and prestressed concrete components due to corrosion of the reinforcing steel with very high economic implications of such damage. This course focuses on the chloride and carbonation induced corrosion of steel in concrete, presenting transport mechanisms and electrochemical concepts. The main emphasis lies on design and execution aspects related to durability of new and existing structures. New methods and materials for preventative measures, condition assessment and repair techniques are discussed. The course is a point of reference for engineers and materials scientists involved in research and practice of corrosion protection, rehabilitation and maintenance of reinforced concrete structures and components.

### Content of the course in detail:

#### Lecture 1
Administrative issues, literature, what do students expect to learn? Introduction (economic relevance of durability, transition from building to maintenance). Fundamentals of corrosion and durability / Passivity and pitting corrosion

#### Lecture 2
Reinforced concrete / Corrosion protection / Degradation mechanism corrosion (chlorides/carbonation) / electrochemical mechanism / controlling parameters / cracks and spalling on surface, danger of localized corrosion

#### Lecture 3
Other degradation mechanisms: sulphate attack, ASR, frost attack
Various examples, frequency of occurrence of individual deterioration mechanisms

#### Lecture 4
Service life: initiation stage & propagation stage. Durability design: prescriptive approach, constructive detailing, importance of moisture for almost all degradation mechanisms. Performance based approach, simple diffusion approach for chloride ingress, Critical chloride content (influencing parameters)

#### Lecture 5
Stainless steel as reinforcing steel for concrete / different types of stainless steels / mechanical properties / corrosion resistance, passivity / coupling with black reinforcing steel / examples of application / life-cycle-costs

#### Lecture 6
Inspection and condition assessment I: visual inspection / destructive testing (chloride profiles, carbonation depth, thin section analysis, etc.)

#### Lecture 7
Inspection and condition assessment II: non-destructive testing (potential mapping, cover depth measurement, resistivity measurement). Potential mapping: measurement principle / effect of carbonated cover zone / effect of moisture / examples

#### Lecture 8
Post-tensioned structures / problem with existing structures: no NDT method / approach for protection (multiple barrier) / new systems with polymer ducts / electrically isolated tendons / fib guidelines / Swiss guideline / Monitoring techniques / Applications

#### Lecture 9
Repair methods I: conventional repair / coatings / inhibitors / limitations

#### Lecture 10
Repair methods II: electrochemical repair methods (ECR, ER, CP) / principles / electrochemical chloride removal (theory and examples) / electrochemical realalkalization (theory and examples) / when can these methods be applied? / cost aspects

#### Lecture 11
Repair methods III: cathodic protection (theory, technical solutions, anode systems, etc and examples). Monitoring of CP.

#### Lecture 12
New cements, issue of CO2 reduction. Effects of fly ash, slag, limestone on workability, diffusion coefficient, resistivity, pH (including a discussion of the pozzolanic reaction and its consequences with respect to pH buffering Portlandite reserve), Discuss products on the Swiss market.

#### Lecture 13
Summary of most important points of this course given by the students. Open discussion about durability design, use of new cements, new materials and repair methods. Expected consequences for practice? Course evaluation and time for asking questions.

### Literature

Backbone of the course: Corrosion of Steel in Concrete - Prevention diagnosis repair (WILEY 2013) by L. Bertolini, B. Elsener, P. Pedeferrri and R. Polder

### Prerequisites / notice
Students are encouraged to actively participate during the lectures. Students are expected to work on all the exercises (four). For one exercise a detailed written solution of the exercise has to be delivered (after the discussion).

Students should have passed the exams on Werkstoffe I and II.

**Abstract**
Introduction into special aspects of the mechanical and chemo-physical properties as well as the structure and application of bituminous materials for road and waterproofing application considering also new R&D trends

**Objective**
Introduction into special aspects of the mechanical and chemo-physical properties as well as the structure and application of bituminous materials for road and waterproofing application considering also new R&D trends

**Content**
Concrete is generally viewed as a durable construction material. However, the long-term performance of a concrete structure can be greatly compromised by early-age cracking. This course will explain how shrinkage of concrete leads to cracking and how control of shrinkage allows increasing the expected durability of a concrete structure.

This course will begin with a brief introduction about hydration and microstructure development in cement paste and concrete. The students will learn the main causes of cracking at early ages, namely plastic, drying, thermal and autogenous shrinkage, with special emphasis on the driving mechanisms. The importance of concrete curing, especially in the first few days after casting, will be explained. Building on the knowledge of the driving forces of shrinkage, the way of action of shrinkage-reducing admixtures will be clarified and different applications illustrated. As an extension of external curing, the students will become familiar with internal water curing by means of saturated lightweight aggregate and superabsorbent polymer.

Most concrete members are restrained by adjacent structures. When shrinkage is restrained, cracks may develop. The students will learn how to apply different criteria for assessing concrete cracking and how to retrieve the mechanical properties of the concrete, especially stiffness and creep, relevant for the calculations.

In addition to macroscopic cracks, microcracking may occur in the cement paste due to inner restraint offered by the aggregates. Both macroscopic cracks and diffuse microcracking within a concrete may facilitate the ingress of harmful substances (e.g. chloride and sulfate ions) into the concrete; these may react with the concrete or with the reinforcement and create further deterioration. The students will acquire an understanding of the mechanisms of transport through cracked concrete, with special focus on experimental evidence and on techniques able to visualize the transport process and follow it in time.

As a final outcome of the course, the students will be able to estimate the impact of cracking on the expected durability of concrete structures and to implement different types of measures to reduce the extent of cracking. Specific topics covered by the course:

- Hydration and microstructure development
- Plastic shrinkage
- Development of mechanical properties
- Thermal deformation
- Autogenous deformation
- Drying shrinkage
- Curing
- Shrinkage-reducing admixtures
- Internal curing: saturated lightweight aggregate and superabsorbent polymer
- Fracture and microcracking
- Transport in cracked concrete
- Impact of cracking on concrete durability

The lecture comprises two written exercises and one literature exercise with short presentation that are requested to be done.

Copy of one to two research papers relevant to the topic of each lecture will be provided to the students as supportive information.

A basic knowledge of concrete technology is preferable.

The lecture material is covered by the script and further literature is referenced in there.
The goal of the lecture is to provide the students with the fundamentals of the non linear Finite Element Method (FEM). The lecture focuses on the principles of the nonlinear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Methods are simulations of:

- Crash
- Collapse of structures
- Materials in Biomechanics (soft materials)
- General forming processes

Special attention will be paid to the modeling of the nonlinear material behavior, thermo-mechanical processes and processes with large plastic deformations. The ability to independently create a virtual model which describes the complex non linear systems will be acquired through accompanying exercises. These will include the Matlab programming of important model components such as constitutive equations.

Content:
- Fundamentals of continuum mechanics to characterize large plastic deformations
- Elasto-plastic material models
- Updated-Lagrange (UL), Euler and combined Euler-Lagrange (ALE) approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- Modeling of crack propagation
- Introduction of advanced FE-Methods

Lecture notes: yes

Literature:

Prerequisites / notice:
If we will have a large number of students, two dates for the exercises will be offered.

101-0637-10L Structures of Wood and Function
Number of participants limited to 15.

Abstract:
The lecture Wood structure and function conveys basic knowledge on the microstructure of softwoods and hardwoods as well as general and species-specific relationships between growth processes, wood properties and wood function in the living tree.

Objective:
Learning target is a basic understanding of the anatomy of wood and the related impact of endogenous and exogenous factors. The students can learn how to distinguish common central European wood species at the macroscopic and microscopic level. A deeper insight will be given by wood identification exercises for softwood species. Further the students will gain insight into the relationships between tree growth and wood properties with a specific focus on the wood function in the living tree.

Content:
In an introduction to wood anatomy, the general structural features of softwoods and hardwoods will be explained and factors of diversity and variability will be discussed. A specific focus is laid on common central European tree species with relevance in the wood sector, which will be studied in macro-and microstructural investigations. For softwoods, exercises for the identification of species will be conducted. In the following, relationships between wood structure, properties and function in the living tree will be the focus of the lecture. Topics covered are mechanical stability and water transport, branches, reaction wood formation (compression wood, tension wood), spiral growth, growth stresses as well as adaptive growth of trees.

101-0637-20L Fundamentals of Wood Elaboration and Woodmachining

Abstract:
The lecture Wood processing conveys knowledge on technological properties of wood and wood-based materials as well as on industrial processes for the fabrication of a vast variety of wood products.

Objective:
Learning target is a fundamental understanding of the dominating wood machining processes, which are applied to fabricate common wood products. Students will be introduced to the economic relevance of the renewable resource wood and are trained in its technological properties. The students will learn to identify the relationships between wood species and their properties as well as the suitable wood machining processes to fabricate targeted wood products.

Content:
The general introduction shows the economic relevance of the resource wood in a global, European and Swiss context and reflects aspects of sustainability in wood production and certification. In terms of bulk wood products a specific focus in laid on sawn timber production and drying processes. With regard to wood veneer production, steam, veneer cutting and assembly to veneer lumber products are presented. Further the common technologies for the production of particle boards and fibre boards as well as paper will be discussed. In the following, the topics are related to wood gluing and protection as well as potentials and limitations in the application of wood and wood-based products. At the end of the lecture an excursion to a Swiss wood manufacturer is planned, in order to facilitate practical experience.

151-0735-00L Dynamic Behavior of Materials and Structures

Abstract:
Lectures and computer labs concerned with the modeling of the deformation response and failure of engineering materials (metals, polymers and composites) subject to extreme loadings during manufacturing, crash, impact and blast events.

Objective:
Students will learn to apply, understand and develop computational models of a large spectrum of engineering materials to predict their dynamic deformation response and failure in finite element simulations. Students will become familiar with important dynamic testing techniques to identify material model parameters from experiments. The ultimate goal is to provide the students with the knowledge and skills required to engineer modern multi-material solutions for high performance structures in automotive, aerospace and naval engineering.

Content:
Topics include viscoelasticity, temperature and rate dependent plasticity, dynamic brittle and ductile fracture; impulse transfer, impact and wave propagation in solids; computational aspects of material model implementation into hydrocodes; simulation of dynamic failure of structures;

Lecture notes:
Various books will be recommended covering the topics discussed in class

Literature:
Slides of the lectures, relevant journal papers and users manuals will be provided.

Prerequisites / notice:

151-0513-00L Mechanics of Soft Materials and Tissues

Abstract:
An introduction to concepts for the constitutive modelling of highly deformable materials with non-linear properties is given in application to rubber-like materials and soft biological tissues. Related experimental methods for materials characterization and computational methods for simulation are addressed.
Objective

The objective of the course is to provide an overview of the wide range of non-linear mechanical behaviors displayed by soft materials and tissues together with a basic understanding of their physical origin, to familiarize students with appropriate mathematical concepts for their modelling, and to illustrate the application of these concepts in different fields in mechanics.

Content

- Soft solids: rubber-like materials, gels, soft biological tissues
- Non-linear continuum mechanics: kinematics, stress, balance laws
- Mechanical characterization: experiments and their interpretation
- Constitutive modeling: basic principles
- Large strain elasticity: hyperelastic materials
- Rubber-elasticity: statistical vs. phenomenological models
- Biomechanics of soft tissues: composites, anisotropy, heterogeneity
- Dissipative behavior: examples and the concept of internal variables.

Lecture notes

Accompanying learning materials will be provided or made available for download during the course.

Literature

- Recommended text:

Prerequisites / notice

A good knowledge base in continuum mechanics, ideally a completed course in non-linear continuum mechanics, is recommended.

Abstract

- In line with the approach of P.L. Nervi's book, our study is based on factors that, outlined by him, are still today all the more relevant as a lesson for architecturally and structurally justified buildings. We will observe selected buildings both of our time and of the past for their space, architecture and construction, understand them and interpret them according to universal values of design.
Constructing Correctly, the 1955 book published by Pier Luigi Nervi, covers crucial factors for building that, outlined by him, are still today all the more relevant as a lesson for architecturally and structurally justified buildings. His thoughts represent valuable criteria and indispensable tools for observation and carrying out investigations of the built environment. Lessons learned from this can enrich the design work of today’s and tomorrow’s architects. All of these (see abstract) i.e. analyses, observances, hypotheses, groupings and cross-section comparisons, will help the students in their careers to find their own strategies and approaches to design and to be aware of them. And so, according to the advice of Pier Luigi Nervi: “...At every stage of his training, the future architect should be constantly and methodically guided to search for essential elements in each problem, be it large or small. The study of the architectural works of the past should consist in the critical examination of their functional and structural solutions and of the relation between these and form, in order to show that form is a consequence and not a determinant of functional and structural needs.” [P.L. Nervi: Costruire correttamente, Milano 1955; English version titled “Structures”, 1956, p.28].

The main thread of this course, that runs over two semesters (*), are buildings of all ages that could be categorised under notions such as “most viewed”, “most technically daring”, “most unknown”, “most discussed” or “most worthy of discussion”, and carry instructive aspects of the teachings of Pier Luigi Nervi (“costruire correttamente”). In the lecture, these buildings will be investigated on-the-spot, described from the designers’ point-of-view and will be commented on with reference to any redesign resulting from the interplay of architectural and structural concepts. Harmonies and discords should be discovered. Occasionally there will be guest lectures. These people, who were directly involved with a certain building, will portray the emergence and development of the project. In this sense, the course is also intended for civil / structural engineering students and presents a possible bridge between the two prospective project partners - architect and engineer.

(*) Begins in the autumn semester. Entry into the course in the spring is possible.

Objective

- All interested students are invited to apply for this course by sending a one-page motivation letter until 14.9.16 to Florian Rittiner (frittiner@ethz.ch).
- Additionally please enroll via mystudies. Places will be assigned after the first lecture on the basis of your motivation letter and commitment for the class.

Abstract

The goal of this course is to engage students in a multidisciplinary collaboration to tackle real world problems. Following a design thinking approach, students will work in teams to solve a set of design challenges that are organized as a one-week, a three-week, and a final six-week project in collaboration with an external project partner.

<td>Economics of Urban Transportation</td>
<td>W 3 credits 2G</td>
<td>A. Russo</td>
</tr>
</tbody>
</table>

Objective

The main objective of this course is to provide students with some basic tools to analyze transport policy decisions from an economic perspective. Can economics help us reduce road congestion problems? Should drivers be asked to pay for using urban roads? Should public transport tariffs depend on how roads are priced? How should the investment in transport infrastructure be financed? These are some of the questions that students should be able to tackle after completing the course.

Prequisites / notice

Class attendance and active participation is crucial as much of the learning occurs through the work in teams during class. Therefore, attendance is obligatory for every session. Please also note that the group work outside class is an essential element of this course, so that students must expect an above-average workload.

For more information and the application visit: http://sparklabs.ch/ethz
COURSE OUTLINE (preliminary):

1. Introduction
2. Travel demand:
   a. travel cost and value of time
   b. mode choice
3. Road congestion and first-best pricing
   a. Static congestion model
   b. Dynamic congestion models
   c. Examples: London Congestion Charge, Stockholm Congestion Charge
4. Second-best pricing
   a. Pricing roads with unpriced alternatives. Examples: tolled and toll-free highways
   b. Public transport: pricing with road congestion and with (or without) road tolls
5. Investment in infrastructure: public transport and roads
   a. Roads: Investment with and without pricing
   b. induced demand
   c. Economies of scale/density in public transport
6. Topics:
   a. Political economy of road pricing: why do we see road pricing in so few cities (London, Stockholm...) and not in many other
cities (NYC, Manchester, Paris...)?
   b. What are the alternatives to road pricing to reduce congestion? Parking tariffs, traffic regulation (speed bumps, low emission
zones), road space reduction. Examples: Zurich, San Francisco (SF Park), Paris.
   c. Transport and land use: value of housing and transport services. Road congestion, transport subsidies and urban sprawl.

Lecture notes
Course slides will be made available to students prior to each class.

Literature
SYLLABUS (preliminary):

Additional material:
Part 1 to 5: textbook: Small and Verhoef (The economics of urban transportation, 2007).
Part 6: Topics to be covered on research papers/case studies.

Master’s Thesis

Number                  Title                                                                 Type    ECTS    Hours    Lecturers
101-0010-00L            Master’s Thesis ■ Only students who fulfill the following criteria are allowed to begin with their master thesis:
                        a. successful completion of the bachelor programme;
                        b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract
The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 16 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

Objective
To work independently and to produce a scientifically structured work.

Content
The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 189 of 1570
This course introduces/explores the complex relationship between physical activity, sedentary behavior and health. It will discuss the physical activity and sedentary behavior recommendations, physical activity and all cause morbidity and mortality, physical activity and brain health, physical activity and sedentary behavior recommendations, population prevalence of physical activity and sedentary behavior, physical activity policies, and physical activity assessment.

Objective
1. knowledge of and critical awareness of the role of physical activity and sedentary behavior in the maintenance of health and the aetiology, prevention and treatment of disease.
2. thorough knowledge and critical awareness of current recommendations for physical activity, and current prevalence and trends of physical activity and associated diseases
3. awareness of current national and international physical activity policies and how these impact on global challenges

Content
Introduction to Physical Activity for Health, including sedentary behavior
Physical activity epidemiology; concepts principles and approaches
Physical activity and all cause morbidity and mortality
Physical activity and chronic disease; Coronary heart disease, diabetes, bone health, cancer and obesity
Physical activity and brain health
Physical activity and sedentary behavior recommendations
Population prevalence of physical activity and sedentary behavior
Physical activity policies
Physical activity assessment

Literature
Core texts for this course are:

Prerequisites / notice
From the BSc-course the following book is recommended: Essentials of strength training and conditioning, T. Baechle, R. Earle (3rd Edition)

376-1033-00L
History of Sports
Comprehension for development and changes of sports from the ancient world to the present. Description of sports in services of national idea, from education and health promotion from the middle of the 18th century till this day.

Objective
Understanding the development and adaptation of sports from the ancient world to present times.

Content

Lecture notes
Ein Skript für die aktuelle Veranstaltung wird abgegeben.

Literature

376-1107-00L
Sport Pedagogy
Central aspects of Sport related pedagogy will be handled in these lectures. These aspects cover, amongst others, the subject and tasks of Sport related pedagogy. Furthermore, the general and sports relevant foundations of Sport related pedagogy will be covered.

Objective
To gain basic knowledge of sports pedagogy and to recognize starting points for applied sports pedagogical intervention in schools.
### Content

Inhaltliche Schwerpunkte der Vorlesung sind:

- Einführung in die Sportpädagogik und die pädagogische Psychologie des Sportunterrichts
- Bedeutung des Sports im Jugendalter
- Zeitgemäßer Sportunterricht
- Sport und Leistung
- Heterogenität im Sportunterricht
- Sport und Gesundheit
- Geschlechterfragen im Sport
- Soziale und moralische Entwicklung im Sportunterricht

### Lecture notes

Unterrichtsmaterialien zu den einzelnen Veranstaltungen werden den Studierenden zur Verfügung gestellt.

### 376-1117-00L

**Sport Psychology**

| W | 2 credits | 2V | H. Gubelmann |

**Abstract**

This lecture is intended as an introduction to sport psychology and imparts knowledge on selected areas of the subject.

**Objective**

Students are given insight into different work areas of sport psychology. In order to understand what «sport psychology» is, it is necessary to explain the essence and tasks of sport psychology and what it relates to, and to work out an underlying basis for key topics, such as cognition and emotions. Students’ expertise is furthered by presenting and providing more in-depth treatment of additional topics of sport psychology. Selected intervention forms are intended to provide insight into applied sport psychology and ensure that mental processes and their impact in sport can be recognised. Case studies and practical exercises (e.g. objective training) are intended to prompt students to reflect to a greater extent on the forms in which sport psychology can be applied in their practice of sports and to integrate these in their teaching.

**Content**

Main Topics

- Introduction to sport psychology
- Cognitions in sports: mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

### Literature

### 376-1127-00L

**Sociology of Sport**

| W | 2 credits | 2V | M. Lamprecht |

**Abstract**

These lectures deal with the current changes in society and sport and provide an overview of the many different problems and perspectives of sport sociology.

**Objective**

The lectures set out to:

- present the different dimensions, functions and interrelationships of present-day sport
- provide an introduction to the central theories and models of (sport) sociology
- show how far sport reflects society and how it changes and becomes more differentiated in the process
- take current examples from newspapers, magazines and television to highlight the sociological view of sport.

**Content**

Sport and social change: developments and trends

The economy and the media: dependencies, consequences, scandals

Social inequalities and distinctions: gender differences and group behavior

Conflicts and politics: sports organizations, doping, violence

### Literature

A detailed program with additional references will be delivered at the beginning of the lecture.

### 376-1155-00L

**The Musculoskeletal System and Work**

| W | 3 credits | 2V | T. Läubli |

**Abstract**

Consolidated findings of movement sciences concerning deterioration, overload and regeneration of the musculoskeletal system are an important basis for an ergonomic working environment. The following topics are covered: Muscle fatigue during the 8-hour day, use of the computer mouse, backaches, Tendinitis, nerve compression, epidemiology, prevention, rehabilitation, laws, measuring procedures.

**Objective**

Goal of the course is the activation of physiological and patho-physiological insights for the understanding of loads of the musculoskeletal system during work. Prevention and rehabilitation of work related musculoskeletal disease will be discussed with the help of a bio-psycho-social model. Furthermore, evidence based methods for a healthy work design will be presented.

**Content**

Insights of human movement sciences concerning wear, overstraining and regeneration of the musculoskeletal system form an important base for an ergonomic work design. The following topics will be covered: Muscle fatigue in an 8-hours-day, mouse appliance, back pain, insertion tendinitis, nerve compression, epidemiology, prevention, rehabilitation, laws, and measurement methods.

**Lecture notes**

Skript und Folien auf NETZ als PDF-Datei zur Verfügung

**Prerequisites / notice**

### 376-1305-00L

**Development of the Nervous System**

| W | 3 credits | 2V | E. Stoeckli, further lecturers |

**Abstract**

The course covers the development of the nervous system (NS) with a focus on neurogenesis and migration, axon growth, synapse formation, mol. & cell. mechanisms, and diseases of the developing NS.

**Objective**

The aim is to give a deepened insight on the normal development, of the nervous system based on molecular, cellular and biochemical approaches.

**Content**

The main focus is on the development of the NS: Early development of the NS, cellular processes, nerve fiber growth, building of synapses and neuronal networks.

**Lecture notes**

Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz/ as BIO344

**Literature**

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

**Prerequisites / notice**

Auxiliary tools: None. Bring something to write and your student ID

### 376-1305-01L

**Structure, Plasticity and Repair of the Nervous System**

| W | 3 credits | 2V | M. E. Schwab, L. Filli, K. A. Martin, further lecturers |

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 191 of 1570
The course covers the structure, plasticity and regeneration of the adult nervous system (NS) with focus on: sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.

The aim is to give a deepened insight into the structure, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

The main focus is on the structure, plasticity and regeneration of the NS: biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle / OLAT.

Students will acquire the ability to independently load, plot, and process kinematic, kinetic and electromyographical data using the MATLAB computing environment.

The combining of training and coaching as in the example of sport analysis, which has an effect on youth training and athlete development

The members are able to transform the knowledge from the previous courses in practical situations of Sports and Exercise Therapy. They will be able to observe athletes in case studies, make judgments and conclusion.

The combining of training and coaching as in the example of sport analysis, which has an effect on youth training and athlete development.

The members are able to observe athletes in case studies, make judgments and conclusion.

Intensive discussion concerning complications of a spinal cord injury and their consequences on trainability and exercise performance of persons sitting in a wheelchair. Overview on the clinical application of exercise testing as well as on the implementation of sport scientific findings to optimise performance of spinal cord injured subjects in rehabilitation and elite sports.

**Objective**
Knowledge of the pathophysiology and the concomitant complications of a spinal cord injury and the consequences for physical exercise and trainability during rehabilitation as well as in recreational and elite sport.

**Content**
The following issues will be discussed: Epidemiology and etiology of spinal cord injury; complications and consequences of spinal cord injury; trainability/exercise physiology and spinal cord injury; history and organisation of wheelchair sports; elite sport and spinal cord injury.

<tr>
<td><strong>Abstract</strong></td>
<td>Every day humans interact with various systems. Strategies of interaction, individual needs, physical &amp; mental abilities, and system properties are important factors in controlling the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction &amp; overall performance.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.</td>

The course is divided into two parts. The lectures on micronutrients are given by Prof. Zimmermann and the lectures on macronutrients will be provided by the individual lecturers, at their discretion.

Biomechanics of Sports Injuries and Rehabilitation

This course introduces basic concepts of micro- and macronutrient nutrition. Micronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fat and carbohydrates. Special attention is given to nutrient digestion, bioavailability, metabolism and excretion with some focus on energy metabolism.

Epidemiology and Prevention

To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health. The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.
Nutrition and Performance

The course introduces basic concepts of the interaction between nutrition and exercise and cognitive performance.

Practical Training II

S. Lorenzetti

15 credits

Type

Kinematics, dynamics and oscillations:
- Motion of a single particle
- Motion of systems of particles
- 2D and 3D motion of rigid bodies

3-months practical work with topics from the major exercise in movement and training doctrines.

Leadership I

F. Kernic

3 credits

Type

W

The lectures "Leadership I" (WS) and "Leadership II" (SS) have been designed as a two-semester lecture series, but may also be followed independently of one another or in reverse order. "Leadership I" covers the following fields: leadership basics, leadership theories and leadership styles, the concept of leadership responsibility and the role of communication in practical leadership.

Practical Training I

6-months research study with topics from the major exercise in movement and training doctrines.

Clinical and Movement Biomechanics

E. de Bruin

3-months practical work with topics from the major exercise in movement and training doctrines.

Master's Thesis

E. de Bruin

30 credits

Type

O

The master thesis can only be started after the Bachelor Degree was obtained and the Vertiefungsleiter has approved the study.

Major in Biomechanics

Compulsory Subjects

Clinical and Movement Biomechanics

S. Lorenzetti, R. List, N. Singh

4 credits

Type

O

Measurement and modeling of the human movement during daily activities and in a clinical environment.

Dynamics

G. Halier, P. Tiso

6 credits

Type

W

Kinematics, dynamics and oscillations:
- Motion of a single particle
- Motion of systems of particles
- 2D and 3D motion of rigid bodies

Electives

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 195 of 1570
Objective
This course provides Bachelor students of mechanical engineering with fundamental knowledge of kinematics and dynamics of mechanical systems. By studying motion of a single particle, systems of particles and rigid bodies, we introduce essential concepts such as work and energy, equations of motion, and forces and torques. Further topics include stability of equilibria and vibrations. Examples presented in the lectures and weekly exercise lessons help students learn basic techniques that are necessary for advanced courses and work on engineering applications.

Content
1. Motion of a single particle || Kinematics: trajectory, velocity, acceleration, inertial frame, moving frames - Forces and torques. Active- and reaction forces. - Linear momentum principle, angular momentum principle, work-energy principle - Equations of motion;
2. Motion of systems of particles || Internal and external forces - Linear momentum principle, angular momentum principle, work-energy principle - Rigid body systems of particles; conservative systems
3. 3D motion of rigid bodies || Kinematics: angular velocity, velocity transport formula, instantaneous center of rotation - Linear momentum principle, angular momentum principle, work-energy principle - Parallel axis theorem. Angular momentum transport formula

Lecture notes
Typed course notes from the previous year

Literature
Hand-written slides will be downloadable after each lecture.

Prerequisites / notice
Please log in to moodle (https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php), search for "Dynamics", and join the course there. All exercises sheets, lecture materials etc. will be uploaded there.

227-0385-10L Biomedical Imaging W 6 credits 5G S. Kozerke, K. P. Prüßmann, M. Rudin

Abstract
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

Objective
To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

Content
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

Lecture notes
Lecture notes and handouts

Literature
Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011

Prerequisites / notice
Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

227-0386-00L Biomedical Engineering W 4 credits 3G J. Vörös, S. J. Ferguson, S. Kozerke, U. Moser, M. Rudin, M. P. Wolf, M. Zhenobi-Wong

Abstract
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Objective
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

Content

Lecture notes
Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino

Literature

Prerequisites / notice
Prerequisites:
- Ultrasound/Doppler imaging
- Magnetic resonance imaging
- Computed tomography
- Positron emission tomography
- Single photon emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging
- Linear and non-linear filters

227-0447-00L Image Analysis and Computer Vision W 6 credits 3V+1U L. Van Gool, O. Gökse, E. Konukoglu

Abstract

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content
The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Lecture notes
Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C. The course language is English.

227-1051-00L Systems Neuroscience (University of Zurich) W 6 credits 2V+1U D. Kiper

#### Technology Entrepreneurship

**Abstract**

Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding. This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

**Objective**

This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

**Content**

See course website: http://www.entrepreneurship.ethz.ch/sresources/courses/tech-entrepreneurship.html

#### Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions

**Abstract**

Rehabilitation Engineering is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

**Objective**

Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

**Content**

Introduction, problem definition, overview
- Rehabilitation of visual function
  - Anatomy and physiology of the visual sense
  - Technical aids (glasses, sensor substitution)
- Retina and cortex implants
- Rehabilitation of hearing function
  - Anatomy and physiology of the auditory sense
  - Hearing aids
  - Cochlea Implants
- Rehabilitation and use of kinesthetic and tactile function
  - Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
- Rehabilitation of vestibular function
  - Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
- Rehabilitation of vegetative Functions
  - Cardiac Pacemaker
  - Phrenic stimulation, artificial breathing aids
  - Bladder stimulation, artificial sphincter
- Brain stimulation and recording
  - Deep brain stimulation for patients with Parkinson, epilepsy, depression
  - Brain-Computer Interfaces

Selected Journal Articles and Web Links:

VideoTact, ForeThought Development, LLC. http://my.execpc.com/?dwysocki/videotac.html

Prerequisites / notice

Target Group:
Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST

- Biomedical Engineering, Robotics, Systems and Control

- Medical Faculty, University of Zurich

Students of other departments, faculties, courses are also welcome

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

</table>

Abstract
Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Objective
The class consists of three parts:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

Content
Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

Lecture notes
Handouts can be accessed online.
This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented. The lecture provides an introduction to the basic principles of trauma biomechanics.

Trauma biomechanics is an interdisciplinary research field investigating the biomechanics of injuries and related subjects such as prevention. This lecture serves as an introduction to the field of trauma biomechanics. Emphasis is placed on the interdisciplinary nature of impact biomechanics, which uses the combination of fundamental engineering principles and advanced medical technologies to develop injury prevention measures. Topics include: accident statistics and accident reconstruction, biomechanical response of the human to impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations using multi-body and finite element modelling techniques, aspects of passive safety of vehicles (focusing on restraint systems and vehicle compatibility). Real world examples mainly from automobile safety are used to augment lecture material.

Handouts will be made available.

**Objective**

Getting insight into actual areas and problems of biomechanics.

**Literature**

Current topics in biomechanics presented by speakers from academia and industry.

**Rules**

Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by getting insight into actual areas and problems of biomechanics.

**Prerequisites**

Understanding of basic principles of mechanics and physics is recommended.

**Literature**

- Biomechanics of Sports Injuries and Rehabilitation: K.-U. Schmitt, J. Goldhahn
- Current topics in biomechanics presented by speakers from academia and industry.
- Handouts will be made available.

**Practical Work**

A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

</table>
This course provides hands-on experience with measurement and analysis methods relevant for Humans Systems Neuroscience and Motor control (nerve/brain stimulation, EMG, EEG, psycho-physical paradigms etc). Students read scientific material, set up experiments, perform measurements in the lab, analyse data, apply statistics and write short reports or essays.

This course will prepare students for experimental work as it is typically done during the master thesis. The goal is to gain hands-on experience with measurement and analysis methods relevant for Humans Systems Neuroscience and Motor control (for example peripheral nerve stimulation, electrical and magnetic brain stimulation, EMG, EEG, psycho-physical paradigms etc). Students will learn how to perform small scientific projects in this area. Students will work individually or in small groups and solve scientific problems which require them to perform measurements in human participants, extract relevant readouts from the data, apply appropriate statistics and interpret the results. They will also be required to write small essays and reports and they will get feedback on their writing throughout the course. Students are required to have successfully completed the course "Neural control of movement and motor learning" and to have basic knowledge of applied statistics. Self-study material about applied statistics will be available at the beginning of the course and statistical knowledge will be tested (central element) in the second course week. Passing this test is a requirement for continuing the course. Students will have to solve scientific problems, requiring them to independently study scientific material, apply statistics and report their results in the form of written reports and essays. Assessments will be made on the basis of the completed theoretical and practical work that will be performed either in small groups or individually.

**Abstract**

This course introduces/explores the complex relationship between physical activity, sedentary behavior and health. It will discuss the evolution of current physical activity recommendations. It will examine the current evidence base that has informed physical activity recommendations and that identified physical activity as a key modifiable lifestyle behavior contributing to disease and mortality.

**Objective**

On completion of this course students will be able to demonstrate:
1. knowledge of and critical awareness of the role of physical activity and sedentary behavior in the maintenance of health and the aetiology, prevention and treatment of disease.
2. thorough knowledge and critical awareness of current recommendations for physical activity, and current prevalence and trends of physical activity and associated diseases
3. awareness of current national and international physical activity policies and how these impact on global challenges

**Content**

Introduction to Physical Activity for Health, including sedentary behavior
Physical activity epidemiology; concepts principles and approaches
Physical activity and all cause morbidity and mortality
Physical activity and chronic disease; Coronary heart disease, diabetes, bone health, cancer and obesity
Physical activity and brain health
Physical activity and sedentary behavior recommendations
Population prevalence of physical activity and sedentary behavior
Physical activity policies
Physical activity assessment

**Literature**

Core texts for this course are:

Selective journal articles from relevant journals such as Journal of Physical Activity and Health, Journal of Aging and Physical Activity and Physical Therapy Review.
Main Topics
- Introduction to sport psychology
- Cognitions in sports: mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

Content

376-1127-00L Sociology of Sport

Abstract
These lectures deal with the current changes in society and sport and provide an overview of the many different problems and perspectives of sport sociology.

Objective
The lectures set out to:
- present the different dimensions, functions and interrelationships of present-day sport
- provide an introduction to the central theories and models of (sport) sociology
- show how far sport reflects society and how it changes and becomes more differentiated in the process
- take current examples from newspapers, magazines and television to highlight the sociological view of sport.

Content
- Sport and social change: developments and trends
- The economy and the media: dependencies, consequences, scandals
- Social inequalities and distinctions: gender differences and group behavior
- Conflicts and politics: sports organizations, doping, violence

376-1155-00L The Musculoskeletal System and Work

Abstract
Consolidated findings of movement sciences concerning deterioration, overload and regeneration of the musculoskeletal system are an important basis for an ergonomic working environment. The following topics are covered: Muscle fatigue during the 8-hour day, use of the computer mouse, backaches, Tendinitis, nerve compression, epidemiology, prevention, rehabilitation, laws, measuring procedures.

Objective
Goal of the course is the activation of physiological and patho-physiological insights for the understanding of loads of the musculoskeletal system.

Content
- Insights of human movement sciences concerning wear, overstretching and regeneration of the musculoskeletal system form an important basis for an ergonomic work design. The following topics will be covered: Muscle fatigue in an 8-hours-day, mouse appliance, back pain, insertion tendinitis, nerve compression, epidemiology, prevention, rehabilitation, laws, and measurement methods.

376-1177-00L Human Factors I

Abstract
Every day humans interact with various systems. Strategies of interaction, individual needs, physical & mental abilities, and system properties are important factors in controlling the quality and performance in interacting the world. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction & overall performance.

Objective
The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

Content
- Physiological, physical, and cognitive factors in sensation and perception
- Body spaces and functional anthropometry, Digital Human Models
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

Literature
- Gurven, Michael D., Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students
- Further textbooks are introduced in the lecture
- Brochures, checklists, key articles etc. are uploaded in ILIAS

376-1305-00L Development of the Nervous System

Abstract
Cybernetics systems have been studied and applied in various research fields, such as applications in the ergonomics domain. Research interests include the man-machine interaction (MMI) topic which involving the performance in multi-model interactions, quantification in gestalt principles in product development; or the information processing matter.

Objective
To learn and practice cybernetics principles in interface designs and product development.

Content
- Fitt's law applied in manipulation tasks
- Hick-Hyman law applied in design of the driver assistance systems - Vigilance applied in quality inspection
- Accommodationvergence crosslink function
- Cross-link models in neurobiology- the ocular motor control system
- Human performance in optimization of production lines

Literature
Abstract
The course covers the development of the nervous system (NS) with a focus on neurogenesis and migration, axon growth, synapse functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.

Objective
The main focus is on the development of the NS: Early development of the NS, cellular processes, nerve fiber growth, building of synapses and neuronal networks.

Content
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

Prerequisites / notice
None. Bring something to write and your student ID

Abstract
The course covers the structure, plasticity and regeneration of the adult nervous system (NS) with focus on: sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.

Objective
The aim is to give a deepened insight into the structure, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

Content
The main focus is on the structure, plasticity and regeneration of the NS: biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

Literature
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle / OLAT.

Abstract
The combining of training and coaching as in the example of sport analysis, which has an effect on youth training and athlete development

Objective
-To develop basics for a differentiate analyses of sports (model)
-To develop a profile of requirements for specific sports
-To develop competencies of training with youth and talents
-To develop the basics of talent training in theory and practice
-To observe athletes in case studies, make judgments and conclusion

Abstract
Basics of Exercise Therapy:
A: diagnostic, anamnesis, diagnostic of movement and funktion, assessments in exercise therapy, diagnostic of experience and behavior in relation to movement
B: biological-medical basics, pathophysiological Basics (internal, orthopedic and psychological deseases.
C: didactic knowledge, Reha-didactic

Objective
Students learn the assessments to plan an exercise-therapy-treatment. They are able to use them. They're able to integrate biological and medical basics. They are able to prepare a therapy-session

Application of MATLAB in the Human Movement

This lectures introduces the basic principles of injury mechanics and rehabilitation focussing on sports injuries. Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

Lecture notes

Coursework

Literature

Prerequisites / notice

Possible from the 5th semester on. Requirement:"Introduction of Exercise Therapy" passed.

Students will learn to import, process and graphically present experimental data using the MATLAB computing environment. Both the data and the methods of analysis will be typical for experiments in Human Movement Science (i.e. kinematics, kinetics and electromyography).

Students will acquire the ability to independently load, plot, and process kinematic, kinetic and electromyographical data using the MATLAB computing environment.

Students will need to import, process and graphically present experimental data using MATLAB. Course-specific scripts will be provided by the lecturer.

A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

2 credits

Number of participants limited to 30.

The members are able to transform the knowledge from the previous courses in practical situations of Sports and Exercise Therapy. They learn basic aspects to design therapy lessons.

The members are able to transform the knowledge from the previous courses in practical situations of Sports and Exercise Therapy. They learn basic aspects to design therapy lessons.

The courses "Introduction in Sports and Exercise Therapy" and has been completed successfully.

A Laptop with MATLAB installed (v2009 or higher) and wireless internet access is mandatory. Two students can share a laptop if necessary. A MATLAB student version can be obtained at Stud-IDES for free.

Voraussetzung/Vorlesung Anatomie/Physiologie besucht!

752-6001-00L  Introduction to Nutritional Science  W  3 credits  2V  M. B. Zimmermann, C. Wolfrum

Abstract
This course introduces basic concepts of micro- and macronutrient nutrition. Macronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fats and carbohydrates. Special attention is given to nutrient digestion, bioavailability, metabolism and excretion with some focus on energy metabolism.

Objective
To introduce the students to the both macro- and micronutrients in relation to food and metabolism.

Content
The course is divided into two parts. The lectures on micronutrients are given by Prof. Zimmermann and the lectures on macronutrients are given by Prof. Wolfrum. Prof. Zimmermann discusses the micronutrients, including fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. Prof. Wolfrum introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism. The nutrients are described in relation to digestion, absorption and metabolism. Special aspects of homeostasis and homeothermy are emphasized.

Lecture notes
There is no script. Powerpoint presentations will be made available.

752-6105-00L  Epidemiology and Prevention

Information for UZH students: Enrolment to this course unit only possible at ETH. No enrolment to module CS16_101 at UZH.

Abstract
To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Objective
To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

Content
The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Lecture notes
There is no script. Powerpoint presentations will be made available on-line to students.

Literature
To be provided by the individual lecturers, at their discretion.

Prerequisites / notice
No compulsory prerequisites, but prior completion of Human Nutrition I + II (Humanernährung I+II) is strongly advised.

752-6151-00L  Public Health Concepts

Abstract
The module "public health concepts" offers an introduction to key principles of public health. Students get acquainted with the concepts and methods of epidemiology. Students also learn to use epidemiological data for prevention and health promotion purposes. Public health concepts and intervention strategies are presented, using examples from infectious and chronic diseases.

Objective
At the end of this module students are able:
- to interpret the results of epidemiological studies
- to critically assess scientific literature
- to know the definition, dimensions and determinants of health
- to plan public health interventions and health promotion projects

Content
Concepts of descriptive and analytical epidemiology, study designs, measures of effect, confounding and bias, screening, surveillance, definition of health and health promotion, health dimensions and health determinants, prevention strategies, public health interventions, public health action cycle, epidemiology and prevention of infectious and chronic diseases (HIV, Tuberculosis, Obesity, Public health nutrition).

Lecture notes
Handouts are provided to students in the classroom.

Prerequisites / notice
Language of the course is English
Leadership I

The students should obtain practical experience of 3 month length in possible job environments. The selected places (internal or external) should be as close as possible by the major exercise physiology.

Abstract

The aim of this lecture is to give students an introductory overview of relevant topics regarding leadership research and practice, thus enabling them to gain a deeper understanding of the leadership phenomenon. Students should understand different concepts of leadership in the complex interaction between individuals, groups, organisation, context and situation. They should be informed about the evolution of the understanding of mankind in relation to working processes and its impact on organizations and the understanding of leadership theory in the past 100 years. They should grasp the concept of leadership responsibility (leadership ethics) and be able to derive consequences for leadership in practical situations. They should recognize the fundamental importance of communication in leadership situations and receive input which enables them to communicate adequately in specific situations.

Prerequisites / notice

The 1-hour written exam will take place during the last lecture in the semester.

Uncertainty Quantification for Engineering & Life Sciences

Number of participants limited to 60.

Abstract

Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective

The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content

Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Lecture notes

The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Literature

1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes
3. Class Notes

Prerequisites / notice

Fundamentals of Probability, Fundamentals of Computational Modeling

Practical Training

Number | Title | Type | ECTS | Hours | Lecturers
---|---|---|---|---|---
557-3010-00L | Practical Training I | O | 15 credits | 15P | C. Spengler

Abstract

3-months practical experience with topics from the major exercise physiology.

Objective

The students should obtain practical experience of 3 month length in possible job environments. The selected places (internal or external) should be as close as possible by the major exercise physiology.

Content

The content of the practica is determined by the supervisor together with the student.

Practices can be combined with the master thesis. In such a case, it can only be started after the Bachelor Degree was obtained and the Vertiefungsleiter has approved the study.

557-3011-00L | Practical Training II | O | 15 credits | 15P | C. Spengler

Abstract

3-months practical work with topics from the major exercise physiology.

Objective

The students should obtain practical experience of 3 month length in possible job environments. The selected places (internal or external) should be as close as possible by the major exercise physiology.

Content

The content of the practical work is determined by the supervisor together with the student.

Practices can be combined with the master thesis. In such a case, it can only be started after the Bachelor Degree was obtained and the Vertiefungsleiter has approved the study.

Master's Thesis

Number | Title | Type | ECTS | Hours | Lecturers
---|---|---|---|---|---
557-3100-00L | Master's Thesis | O | 30 credits | 30D | C. Spengler

Only students who fulfill the following criteria are allowed to begin with their master thesis:

a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract

6-months research study with topics from the major exercise physiology.

Objective

The student will apply his basic knowledge in a practical scientific study. He/she will be confronted with the requirements of scientific working. He/she must master this requirements.

Content

The content of the master thesis is determined by the supervisor together with the student. The thesis can begin only after the approval Vertiefungsleiter.

Prerequisites / notice

The master thesis can only be started after the Bachelor Degree was obtained and the Vertiefungsleiter has approved the study.

|              | 6) Glia and Blood-Brain-Barrier                                       |      |      |      |                                  |
|              | 7) Somatosensory and Motor System                                     |      |      |      |                                  |
|              | 8) Visual System                                                      |      |      |      |                                  |
|              | 9) Auditory System                                                   |      |      |      |                                  |
|              | 10) Circuits underlying Emotion                                       |      |      |      |                                  |
|              | 11) Modeling of Neural Circuits                                       |      |      |      |                                  |

**Prerequisites / Notice**

For doctoral students of the Neuroscience Center Zurich (ZNZ).

| 376-1795-00L | Advanced Course in Neurobiology I (Functional Anatomy of the Rodent Brain) (University of Zurich) | Z Dr | 2 credits | 2V   | J.-M. Fritschy, H. U. Zeilhofer |
| Abstract     | The course is in Neurobiology is to provide students with a broader knowledge in several important areas of neurobiology. The course consists of four parts: Part I deals with various topics in developmental neurobiology. Part II is devoted to aspects of signal transduction. Part III focuses on synaptic transmission. Part IV gives deeper insights into systems neuroscience. |      |      |      |                                  |
| Objective    | The course is in Neurobiology is to provide students with a broader knowledge in several important areas of neurobiology. |      |      |      |                                  |

**Prerequisites / Notice**

For Doktorierende des Zentrums für Neurowissenschaften Zürich. Nicht für Master-Studierende geeignet.

| 551-1159-00L | Molecular Systems Biology                                             | Z Dr | 0 credits | 1K   | U. Sauer, R. Aebersold          |
| Abstract     | Seminar series on current research topics in systems biology         |      |      |      |                                  |
| Objective    | An overview of systems biology research                              |      |      |      |                                  |
| Content      | Seminar series on current research topics in systems biology         |      |      |      |                                  |

none

| 701-0265-00L | Ecology and Evolution                                                | Z Dr | 1 credit | 2S   | E. Postma, J. Jokela            |
| Abstract     | A course dedicated to the reading and discussion of the relevant literature. The actual list of theme papers will be proposed anew for every year. Students then choose a topic and prepare themselves for a general discussion with their colleagues and peers. In the process, current and controversial topics will be discussed and studied. |      |      |      |                                  |
| Objective    | To become proficient in reading scientific literature, to understand how to look at publications, to understand them and to be able to put them in context. The course also trains the skills needed for the presentation of scientific contributions and the ability to put things into a broader context. Training in how to participate in a scientific discussion, how to make an argument and how to listen to arguments of others. |      |      |      |                                  |
| Content      | All topics focus on themes from ecology and evolution, notably so on studies on adaptation of organisms, their evolutionary history, or on questions of current methodology. |      |      |      |                                  |

**Lecture notes**

none
The actual content, i.e. the theme papers, will be determined and allocated to the participants at the start of the course each year. Takes place at Uni Irchel. Please refer to notes on board or ask secretary Mrs. Rita Jenny (Rita.Jenny@env.etzh.ch).

Requirements: Knowledge of ecology and evolution, e.g., lectures during basic and advanced study period. The course is meant for advanced and PhD students.

I. Ethics & the Process of Ethical Inquiry

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

Integrity in Research & Research Misconduct
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 Rs (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access;
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

376-1581-00L Cancer: Fundamentals, Origin and Therapy Z 2 credits 2G H. Nägeli

Abstract
Objective
Students are able to describe selected chemicals, biological and molecular processes that occur in cells spontaneously or after physical or chemical exposure and resulting in a tumor. They are able to list important cancer-inducing agents and explain the respective mechanism of action. They have knowledge of significant risk factors for cancer diseases. They are confronted with the basics of toxicology and they can explain the principle of the most common therapeutic strategies.

Content
The lecture deals with problems of tumor epidemiology (causes, mortality, incidence). Cancer is delineated as a multi-step process. Classes of chemical compounds that induce cancer are discussed as well as the reactive metabolites that may be built from. Covalent binding to DNA is discussed and different types of mutations resulting thereof. A selection of proto-oncogenes and tumor suppressor genes is presented. Their function will be discussed as well as the changes which are found in these genes in tumor cells, starting from single nucleotide exchanges up to large deletions.

The reason for genetic predisposition to cancer will be discussed as well as cancer relevant aspects of cell cycle regulation. Phenomenons like angiogenesis and metastasis are presented as well as the mechanisms that protect the genome from mutagenic damage. Further subjects address old and new strategies of cancer treatment. Personalised cancer treatment.

Lecture notes
Handouts with reproductions of all presented transparencies will be distributed.

Literature

Additional informations are given during the lecture

Prerequisites / notice
The lecture requires an active participation of the students. All students will participate in individual or group work focussing on specific subject of the lecture. Students will have ample time for preparation during lecture time.

551-0530-00L Repair, Recombination, Replication

Abstract
Several research groups from University, ETH, Basel, Bern and Konstanz meet once per month and present their work related to DNA-repair, recombination, replication, and cancer.

Objective
Discussion of current topics in DNA-repair, recombination, replication, and cancer.

Content
Discussion of current topics in DNA-repair, recombination, replication, and cancer.

Lecture notes
No script

551-1109-00L Seminars in Microbiology

Abstract
Seminars by invited speakers covering selected microbiology themes.

Objective
Discussion of selected microbiology themes presented for invited speakers.

501-0620-00L Statistical Consulting

Abstract
The Statistical Consulting service is open for all members of ETH, including students, and partly also to other persons. Advice for analyzing data by statistical methods.

Objective
We highly recommend to contact the consulting service when planning a project, not only towards the end of analyzing the resulting data!

Content
This is not a course, but a consulting service. There are no exams nor credits.

Prerequisites / notice
Contact: beratung@stat.math.ethz.ch. Tel. 044 632 2223. See also http://stat.ethz.ch/consulting

Requirements: Knowledge of the basic concepts of statistics is desirable.

551-0512-00L Current Topics in Molecular and Cellular Neurobiology

Abstract
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Objective
You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

Content
You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Lecture notes
Presentations will be made available after the seminars.

Prerequisites / notice
You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

551-0737-00L Experimental Ecology: Evolution and Ecology

Abstract
Interaction seminar. Student-mediated presentations, guests and discussions on current themes in ecology, evolutionary and population biology.

Objective
Getting familiar with scientific arguments and discussions. Overview of current research topics. Making contacts with fellow students in other groups.

Content
Scientific talks and discussions on changing subjects.

Lecture notes
None

Literature
None

Prerequisites / notice
For information and details: http://www.eco.ethz.ch/news/zis or contact: Lehre-eve@env.ethz.ch

551-0509-00L Current Immunological Research in Zürich
Abstract
This monthly meeting is a platform for Zurich-based immunology research groups to present and discuss their ongoing research projects. At each meeting three PhD students or Postdocs from the participating research groups present an ongoing research project in a 30 min seminar followed by a plenary discussion.

Objective
The aim of this monthly meeting is to provide further education for master and doctoral students as well as Postdocs in diverse topics of immunology and to give an insight in the related research. Furthermore, this platform fosters the establishment of science- and technology-based interactions between the participating research groups.

Content
Presentation and discussion of current research projects carried out by various immunology-oriented research groups in Zurich.

Lecture notes
none

551-1405-00L Electron Cryomicroscopy Seminar
Z Dr 0 credits 0.5S M. Pilhofer, further lecturers

Abstract
Intergroup seminar for scientists and students interested in electron cryomicroscopy

Objective
The goal of the seminar is to provide an exchange forum for anyone interested in electron cryomicroscopy (tomography and single particle).

Prerequisites / notice
The first ~10 minutes are used for exchange on instrument status and technical issues, followed by a ~30 min presentation and discussion of a specific project.

Presented project data are confidential. Sign-up for seminar announcements by emailing pilhofer@biol.ethz.ch.

551-1106-00L Progress Reports in Microbiology and Immunology
Dr 0 credits 3S M. Aebi, H.-M. Fischer, W.-D. Hardt, A. Oxenius, J. Vorholt-Zambelli

Abstract
Presentation and discussion of current research results in the field of Microbiology and Infection Immunology

Objective
Precise and transparent presentation of research findings in relation to the current literature, critical discussion of experimental data and their interpretation, development and presentation of future research aims

551-0209-00L Sustainable Plant Systems (Seminar)
Z Dr 2 credits 2S M. Paschke, further lecturers

Abstract
Participants will be able to discuss and understand sustainability in the context of plant science research

Objective
Key objectives for the seminar are that (1) participants will be able to discuss issues of sustainability in the context of plant science research topics, e.g. how a specific research topic is important for understanding and advancing sustainability of plant systems and that (2) participants will be able to phrase their own visions for sustainability in plant sciences, their group work topic and their own MSc or PhD project. Plant science research topics will be on conservation agriculture, agro-ecology, plant breeding for orphan crops and methane emissions from wetland ecosystems.

551-1121-00L Progress Reports in Microbial Glycobiology and Fungal Defense Mechanisms
Dr 0 credits 3S M. Aebi

Abstract
Presentation and discussion of current research results in the field of Microbial Glycobiology and Fungal Defense Mechanisms

Objective
Precise and transparent presentation of research findings in relation to the current literature, critical discussion of experimental data and their interpretation, development and presentation of future research aims

**Abstract**

Mathematics I/II is an introduction to one- and multidimensional calculus and linear algebra emphasizing on applications.

**Objective**

Students understand mathematics as a language for modeling and as a tool for solving practical problems in natural sciences. Students can analyze models, describe solutions qualitatively or calculate them explicitly if need be. They can solve examples as well as their practical applications manually and using computer algebra systems.

**Content**

Einführung in die Differential- und Integralechnung von Funktionen einer Variablen und Anwendungen:

**Literature**

**Abstract**

Students learn to apply selected concepts and tools from computer science for working on interdisciplinary projects.

The following topics are covered: modeling and simulations, introduction to programming, visualizing multi-dimensional data, introduction matrices, managing data with lists and tables and with relational databases, universal methods for algorithm design.

**Objective**

The students learn to

- understand the role of computer science in science,
- to control computer and automate processes of problem solving by programming,
- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study.
- handle the complexity of real-world data,
- know universal methods for algorithm design.

**Content**

1. The role of computer science in science
2. Introduction to Programming with Python
3. Modeling and simulations
4. Introduction to Matrices with Matlab
5. Visualizing multidimensional data
6. Data management with lists and tables
7. Data management with a relational database
8. Universal methods for algorithm design

**Lecture notes**

All materials for the lecture are available at www.gdi.ethz.ch

**Prerequisites / notice**

This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

**Abstract**

The course provides an introduction to the basics of molecular- and cell biology and genetics.

**Objective**

Introduction to modern biology and to principal biological concepts.

**Content**

The course is divided into several chapters:

1. Basic principles of Evolution.
2. Chemistry of Life: Water; Carbon and molecular diversity; biomolecules
3. The cell: structure; membrane structure and function, cell cycle
4. Metabolism: Respiration; Photosynthesis; Fermentation
5. Inheritance: meiosis and sexual reproduction; Mendelian genetics, chromosomal basis of inheritance, molecular basis of inheritance, from gene to protein, regulation of gene expression; genomes and their evolution

**Lecture notes**

None.

**Literature**

The text-book "Biology" (Campbell, Reece) (10th edition) is the basis of the course.

The structure of the course is largely identical with that of the text-book.

**Prerequisites / notice**

Certain sections of the text-book must be studied by self-instruction.

**Abstract**

The lecture deals with a number of basic chemistry concepts. These include (amongst others) chemical reactions, energy transfer during chemical reactions, properties of ionic and covalent bonds, Lewis structures, properties of solutions, kinetics, thermodynamics, acid-base equilibria, electrochemistry, and properties of metal complexes.

**Objective**

The course is designed to provide an understanding of the basic principles and concepts of general and inorganic chemistry.
The lecture deals with a number of basic chemistry concepts. These include (amongst others) chemical reactions, energy transfer during chemical reactions, properties of ionic and covalent bonds, Lewis structures, properties of solutions, kinetics, thermodynamics, acid-base equilibria, electrochemistry and properties of metal complexes.

**Literature**
The goal of this course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

**Objective**
The focus is animal cells and the development of multicellular organisms with a clear emphasis on the molecular basis of cellular structures and phenomena. The topics include biological membranes, the cytoskeleton, protein sorting, energy metabolism, cell cycle and division, viruses, extracellular matrix, cell signaling, embryonic development and cancer research.

**Content**
Topics include the structure-function relationship of proteins / nucleic acids, protein folding, enzymatic catalysis, cellular pathways involved in bioenergetics and the biosynthesis and breakdown of amino acids, glycerics, nucleotides, fatty acids and phospholipids, and steroids. There will also be a discussion of DNA replication and repair, transcription, and translation.

**Lecture notes**
None

**Literature**

**Prerequisites / notice**
Some of the lectures are given in the English language. Certain sections of the text-book must be studied by self-instruction.

---

**551-1003-00L Methods of Biological Analysis**

**Abstract**
Principles of the most important separation techniques and the interpretation of molecular spectra.

**Objective**
The course will teach the basis and typical applications of methods for the analysis of nucleic acid sequences, mass spectrometric analysis of proteins and proteomes and advanced light and fluorescent imaging methods.

**Content**
Knowledge of the necessary basics and the possibilities of application of the relevant spectroscopical and separation methods in analytical chemistry.

**Lecture notes**
A comprehensive script is available in the HCI-Shop. A summary of the part "Spektroskopie" defines the relevant material for the exam.

**Prerequisites / notice**
Some of the lectures are given in the English language.

---

**401-0643-13L Statistics II**

**Abstract**
Vertiefung von Statistikmethoden. Nach dem detaillierten Fundament aus Statistik I liegt nun der Fokus auf konzeptueller Breite und konkreter Problemlösungsfähigkeit mit der Statistiksoftware R.

**Objective**

---

**401-1000-00 Methods of Biological Analysis**

**Abstract**
Methods of Biological Analysis

**Objective**
Principles of the most important separation techniques and the interpretation of molecular spectra.

**Content**
Knowledge of the necessary basics and the possibilities of application of the relevant spectroscopical and separation methods in analytical chemistry.

**Lecture notes**
A comprehensive script is available in the HCI-Shop. A summary of the part "Spektroskopie" defines the relevant material for the exam.

**Prerequisites / notice**
Some of the lectures are given in the English language.

**Abstract**

This course introduces important questions about the evolutionary processes involved in the generation and maintenance of biological diversity across all domains of life and how evolutionary science investigates these questions.

**Objective**

This course introduces important questions about the evolutionary processes involved in the generation and maintenance of biological diversity across all domains of life and how evolutionary science investigates these questions. The topics covered range from different forms of selection, phylogenetic analysis, population genetics, life history, the evolution of sex, social evolution to human evolution. These topics are important for the understanding of a number of evolutionary problems in the basic and applied sciences.

**Content**

Topics likely to be covered in this course include research methods in evolutionary biology, adaptation, evolution of sex, evolutionary transitions, human evolution, infectious disease evolution, life history evolution, macroevolution, mechanisms of evolution, phylogenetic analysis, population dynamics, population genetics, social evolution, speciation and types of selection.

**Literature**

Textbook: Evolutionary Analysis

Scott Freeman and Jon Herron

**Prerequisites / notice**

The exam is based on lecture and textbook.

**Abstract**

Lecture: The lecture provides an overview of animal diversity. Using key selected groups, phylogenetic, morphological and ecological aspects are addressed. Two priority topics are the arthropods and the vertebrates (including vertebrate fauna of Switzerland).

Practice:

Knowledge of selected animal groups and their characteristics (supplementing the lecture) and of the basic methods.

**Objective**

Lecture: The systematic classification of animals and the characteristics of the most important animal groups, basic animal body plans.

Practice:

Examples of selected animal groups and their characteristics; acquire the relevant skills: simple preparations, dissection, microcopy, drawing, protocols.

**Content**

Lecture: Body plans, characteristics, diversity and phylogenetic position of the main groups of Protozoa, Invertebrates, and Vertebrates, with a special focus on Arthropods and Vertebrates (including vertebrate fauna of Switzerland).

Practice:

Macroscopic and microscopic study of selected Protozoa, Invertebrates (especially insects) and Vertebrates: morphology and anatomy; behaviour, mainly locomotion, feeding, and reproduction.

**Lecture notes**

A script for the course will be sold in the lecture, and additional material will be handed out (particularly in the practical).

**Literature**

No further literature required. The script contains suggestions for further reading.

**Abstract**

The lecture gives an introduction into the field of Mycology. It provides an overview of the fungal lifestyle (hyphal growth/mycelium; reproductive cycles; ecology of the fungi; use of fungi).

**Objective**

Understanding the fungal life form.

Knowledge of the specific properties of the fungal cell

Knowledge of the different reproductive cycles in all fungal phyla

Knowledge of the different nutritional modes of the fungi; correlation with habitat and ecology

Knowledge of the application of fungi in food production and biotechnology

**Content**

The lecture focuses on the following topics within Mycology:

1. The fungal lifestyle
2. Differentiation processes of the Mycelium
3. Reproductive cycles and systematic grouping of fungi
4. Ecology of the fungi
5. Use of fungi

**Lecture notes**

**Abstract**

Analytical part: basic operations for the separation of mixtures of organic compounds (recrystallization, distillation, extraction, chromatography)

Synthetic part (main part): at least 8 synthetic steps (one- or two-step syntheses).
Learn the basic techniques for the preparation and purification of organic compounds. Deeper understanding of reaction mechanisms.

Analytical part: basic operations for the separation of mixtures of organic compounds (recrystallisation, distillation, extraction, chromatography).

Synthetic part (main part): at least 8 synthetic steps (one- or two-step syntheses).

Introduction to database searches (Reaxys, SciFinder).

Documentation will be handed out at the beginning of the course.

The basic reactions of Organic Chemistry and their mechanisms should be known (cf. course 529-1012-00L Organic Chemistry II for Students of Biology, Pharmaceutical Sciences, and Health Sci. and Tech.).

As a prerequisite, all participants need to pass the "Safety Test HCI Chemie_V2 English" (see https://moodle-app2.let.ethz.ch). A printout of the certificate generated by the system needs to be presented to the teaching assistants prior to starting lab work.
Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytics.

Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.
### Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalization of biochemical processes. Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

### Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biolog.ethz.ch)

### Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

### Abstract
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNA; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.

### Objective
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNA; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.

### Content
Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNA; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.

### Literature
Mainly based on recent original literature, a detailed list will be distributed during the first lecture.

### Prerequisites / notice
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien".

Kuby, Immunology, 7th edition, Freeman, Co., New York, 2009

Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung".

### Abstract
Introduction into structural and functional aspects of the immune system.

### Objective
Introduction into structural and functional aspects of the immune system.

### Content
- Basic knowledge of the mechanisms and the regulation of an immune response.
- Introduction and historical background
- Innate and adaptive immunity. Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histocompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

### Literature
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien".

Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung".

### Abstract
Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

### Objective
Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

### Content
Bioinformatics I will cover the following topics:
- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

### Abstract
Development of the nervous system (NS): the adult NS, plasticity and regeneration, sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, diseases of the NS.
Objective
Overview of normal development, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

Content
Development: Early development of the nervous system, cellular level, nerve fiber growth, building of neuronal networks; biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

Lecture notes
Structure, Plasticity and Repair of the Nervous System (376-1305-01L): Lecture notes will be provided on Moodle https://moodle-app2.let.ethz.ch/course/view.php?id=694
Password will be provided at the beginning of the lecture.

Literature
Development of the Nervous System (376-1305-00L): Lecture notes will be provided on OLAT https://www.olat.uzh.ch/olat/dmz/

| Number      | Biological Information Mining                     | W    | 6    |    | K. Bärenfaller, J. Füterer          |
| Number of participants limited to 8. | |      |      |       |                                    |
| Abstract    | Students will use lists of genes obtained in real experiments and learn how to obtain gene-centered information from literature and databases. They will use tools for gene function prediction and visualization of protein-protein interaction networks. The work will lead to a more meaningful annotation of co-detected genes and generate a hypothesis about their functional relationship. |      |      |       |                                    |
Many new biological analysis methods result in lists of genes or proteins related to biological structures, functions, or processes. The information available about the genes or proteins is often scattered in multiple databases and publications, making it difficult to extract and uncover common features or relationships among the biological molecules.
In the course students will use lists of genes or proteins from ongoing experiments in the laboratory and learn how to find and assemble gene-centered information in the literature, different databases and with analysis tools. The training and research will lead to a better and more meaningful annotation of co-detected genes members and generate a hypothesis about their functional relationship.
The work will be done exclusively using a computer. Students will work independently but with close supervision by experienced scientists. Daily discussions of the work will ensure progress. The computer work will be accompanied by lectures on theoretical and practical aspects of databases, gene networks and the project context of the gene lists that will be analyzed. Students will present their results and hypotheses at the end of the block course.

551-0347-00L
Molecular Mechanisms of Cell Growth and Polarity
Number of participants limited to 12.

Abstract
Introduce to the principles and molecular mechanisms of cell polarity, using animal cells and fungi as model systems.

Objective
The students learn to describe the principles and molecular mechanisms of cell polarity, using different model systems as examples:
- Animal cells during epithelial and neuronal differentiation
- Fungi during morphogenesis and aging

Based on lectures, literature reading, discussions, presentations and practical lab work the students will be able to compare experimental strategies in different model systems, and to develop open questions in the field of cell polarity. Students will also know about the mechanisms and consequences of asymmetric cell division such as those performed by stem cells and asymmetric protein functions during morphogenesis and aging.

Content
During this Block-Course, the students will learn to
(1) describe and compare the principles and molecular mechanisms of cell polarity in fungi and animal cells,
(2) apply, evaluate and compare experimental strategies in the different model systems, and
(3) select the best model system to answer a particular question.

Students - in groups of 2 or max 3- will be integrated into a research project connected to the subject of the course, within one of the participating research groups.

Lecture notes
There will be optional papers to be read before the course start. They serve as framework orientation for the practical parts of this block course and will be made accessible to you shortly before the course starts on the relevant Moodle site.

Literature
Documentation and recommended literature (review articles) will be provided during the course.

Block Courses in 2nd Quarter of the Semester
From 13.10.2016 08:00 hr to 4.11.2016 17:00 hr

551-0345-00L
Mechanisms of Bacterial Pathogenesis
Number of participants limited to 9.

Abstract
Research laboratory class in small groups. Research projects on current topics in cellular microbiology and bacterial pathogenesis are assigned to each student.

Objective
Introduction to a current topic in cellular microbiology and/or molecular genetics of a bacterial pathogen. Experimental work in the research lab and introduction to the current lab techniques. Work with the current research literature in bacterial pathogenesis. Writing of a research protocol.

Requirement for obtaining the credit points: oral presentation of the research project and evaluation of the research protocol.

Content
Research projects on the model pathogen Salmonella.

Lecture notes
none.

Literature
Lecture notes will be selected with reference to the assigned research project.

551-0421-00L
Biology and Ecology of Fungi in Forests
Number of participants limited to 10.

Abstract
Introduction of the biological and ecological basics of fungi in forests. Focusing on mycorrhizal, saprobic, and pathogenic fungi and their functional relevance in the forest ecosystems. To get to know current methodological research approaches on the basis of selected examples with practical works in forest and lab as well as excursions and lectures.

Objective
Knowledge of the fungi of forest and its ecological significance. Knowing of current methodological research approaches. Self-reliant and deepened activities of selected topics of fungi from forests.

Erreichbarkeit mit Tram 14 bis Triemli, danach PTT-Bus 220 oder 350 bis Birmensdorf Sternen/WSL, oder mit S9 bis Birmensdorf SBB und mit PTT-Bus eine Station in Richtung Zürich bis Birmensdorf Sternen/WSL.
**Content**

**Practical courses:**
- Experiments within ongoing phytopathological research projects
- Macro- and microscopic diagnostic of plant diseases

**Theoretical courses:**
- Fundamentals of phytopathology, e.g., interaction between plants and plant-pathogenic microorganisms, morphology and lifecycles of plant-pathogenic fungi, biological control of plant diseases

**Lecture notes**

**529-0739-01L**

**Biological Chemistry B: New Enzymes from Directed Evolution Experiments**

**Number of participants limited to 12.**

**Abstract**
During the block course in the fall semester, we will carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. By working in parallel, teams of 2 participants each will generate a variety of different variants of a chorismate mutase. Individual enzyme catalysts will be purified and subsequently characterized using several different spectroscopic methods. The detailed chemical-physical analyses include determination of the enzymes' kinetic parameters, their molecular mass, and the integrity of the protein structure. The results obtained from the individual evolution experiments will be compared and discussed at the end of the class in a final seminar. We expect that during this lab course we will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalyst.

**Objective**
All technologies used for the experiments will be explained to the students in theory and in practice with the goal that they will be able to independently apply them for the course project and in future research endeavors. After the course, an individual report about the results obtained has to be prepared.

**Content**
The class deals with a specifically designed and genuine research project. We intend to carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. By working in parallel, teams of 2 participants each will generate a variety of different variants of a chorismate mutase. Individual enzyme catalysts will be purified and subsequently characterized using several different spectroscopic methods. The detailed chemical-physical analyses include determination of the enzymes' kinetic parameters, their molecular mass, and the integrity of the protein structure. The results obtained from the individual evolution experiments will be compared and discussed at the end of the class in a final seminar. We expect that during this lab course we will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalyst.

**Lecture notes**
A script will be distributed to the participants on the first day of the course.

**Literature**
General literature to "Directed Evolution" and chorismate mutases, e.g.:

Further literature will be indicated in the distributed script.

**Prerequisites / notice**
This laboratory course will involve experiments that require a tight schedule and (sometimes) long (!) working days. The maximum number of participants for the laboratory class is limited, but surplus applicants may contact P. Kast directly to have their names added to a waiting list. A valid registration is considered a commitment for attendance of the entire course, as involved material orders and experimental preparations are necessary and, once the class has started, the flow of the experiments must not be interrupted by individual absences. In case of an emergency, please immediately notify P. Kast. For more information, see also http://www.protein.ethz.ch/kast/praktikum.html

**551-0336-00L**

**Methods in Cellular Biochemistry**

**Number of participants limited to 20.**

**Abstract**
Students will learn about biochemical approaches to analyze cellular functions. The course consists of practical projects in small groups, lectures and literature discussions. The course concludes with the presentation of results at a poster session.

**Objective**
Students will learn to design, carry out and assess experiments using current biochemical and cell biological strategies to analyze cellular functions in a wide range of model systems. In particular they will learn novel imaging techniques along with biochemical approaches to understand fundamental cellular pathways. Furthermore, they will learn to assess strengths and limitations of the different approaches and be able to discuss their validity for the analysis of cellular functions.

**Literature**
Documentation and recommended literature (review articles and selected primary literature) will be provided during the course.

**Prerequisites / notice**
This course will be taught in English.

**551-1515-00L**

**Insulin Signaling**

**Number of participants limited to 15.**

**Abstract**
Introduction to the physiological and biochemical action of insulin signaling and its role in the fasting/feeding response and in obesity and diabetes.

**Objective**
The students will obtain an overview about the current topics of research in insulin signaling and how it impacts on growth, metabolism and cell differentiation. They will learn to design experiments and use techniques necessary to analyze different aspects of insulin signaling, including physiological actions in whole animals as well as in tissue culture. Through lectures and literature seminars, they will learn about the open questions of insulin signaling research and discuss approaches to address these questions experimentally.

In practical lab projects the students will perform physiological in vivo studies as well as biochemical experiments. Finally, they will learn how to present and discuss their data. Student assessment is a graded semester performance based on individual performance in the laboratory, a written exam and the lab data presentation.

**752-4020-00L**

**Experimental Food Microbiology for Biologists**

**Number of participants limited to 20.**

**Prerequisites:** It is recommended to attend the course Lebensmittel-Mikrobiologie (752-4005-00L) as a preparation.

**Abstract**
Teaching of basic experimental knowledge for detection and identification of microorganisms in food. Practical experiments were accompanied by theoretical introductions. Students become acquainted with classical and state-of-the-art molecular techniques for the rapid detection of foodborne pathogens and experiments in dependence on current research topics of the Laboratory of Food Microbiology.

**Objective**
Introduction of methods and techniques of food microbiology

**Content**
Teaching of basic experimental knowledge for detection and identification of foodborne pathogens by applying state-of-the-art techniques as well as modern molecular techniques for the rapid identification of relevant foodborne pathogens.

**Lecture notes**
Handouts were provided at the start of the course

- Krämer: "Lebensmittel-Mikrobiologie" (Ulmer; UTB)
- Süssmuth et al.: "Mikrobiologisch-Biochemisches Praktikum" (Thieme)
Prerequisites / notice
Important information!
During the course we will work with the food-borne pathogen Listeria monocytogenes. Listeria monocytogenes represents a particular threat to pregnant women. Due to biosafety reasons participation is not allowed in case of pregnancy.

551-0363-00L Complex Carbohydrates - Biosynthesis, Structure & Function
Number of participants limited to minimum 2 and maximum 8.
Abstract
In vitro & in vivo experiments will introduce current research on the biosynthesis, structure & function of protein-bound glycans in different pro- and eukaryotic microorganisms.
Objective
Participans are familiar with the biosynthesis, structure and function of N-glycans in microorganisms and with the methods for their analysis.
Content
- Topics: biosynthesis of asparagine-linked glycans in pro- and eukaryotes; structure of glycans in different organisms; methods to analyse the structure of glycans; function of glycans in protein quality control
- Introductory lectures
- Seminar with presentation and discussion of recent publications
- Experiments that exemplify the current research done in the group

551-0117-00L Plant Volatiles in Plant Insect Interactions
Number of participants limited to 16.
Abstract
During the course students will become familiar with methods for the collection and analysis of plant-derived volatile organic compounds and explore the role of these compounds in mediating plant-insect interactions.
Objective
The course will cover six main topics that will be connected throughout the experimental phase:
1) Plant volatile biosynthesis and classification
2) Insect olfactory physiology
3) Volatile-mediated plant-herbivore interactions
4) Volatile-mediated multitrrophic interactions
5) Manipulation of plant volatile emission by vector- borne disease agents
6) Methods for volatile collection and analysis
The lab practical will be performed in a system consisting of the cabbage butterfly Pieris brassicae, its host plant Brassica oleracea (Brussels sprouts), and the parasitoid wasp Cotesia glomerata (natural enemy of P. brassicae).
Students will collect volatiles from herbivore-damaged and undamaged plants and learn how to identify and quantify these compounds through gas chromatography coupled with mass spectrometry and flame ionization detection (GC-MS-FID). Afterwards, they will be able to compare volatile emissions from herbivore-damaged and undamaged plants and identify important volatile compounds associated with herbivory. Finally, students will evaluate the effect of herbivore-induced volatile compounds on the behavior of the herbivore (P. brassicae) and its natural enemy (C. glomerata), using different behavioral assays, including Y-tube olfactometers and wind tunnels.

Lecture notes
No script
Literature
The recommended literature, including reviews and primary research articles, will be provided during the course.

551-0361-00L Biology of Bryophytes and Ferns
Number of participants limited to 20.
Abstract
Bryophytes: Basic knowledge on the morphology, ecology, biogeography and endangerment of bryophytes; knowledge of common species; skills in the determination of bryophytes; field trip.
Ferns: basic knowledge on the life cycle, evolution and ecology of ferns; identification of Swiss ferns; field trips.
Objective
Bryophytes: Basic knowledge on the morphology, ecology, biogeography and endangerment of bryophytes; knowledge of common species; skills in the determination of bryophytes.
Ferns: basic knowledge on the life cycle, evolution and ecology of ferns; identification of Swiss ferns.
Content
Bryophytes: Systematics and morphology of hornworts, liverworts and mosses and special themes such as ecology, biogeography, diversity and endangerment of bryophytes; one full-day field trip.
Ferns: Life cycle; evolutionary groups of ferns and fern allies; breeding systems; micro- and macroevolution; ecology; full-day and half-day field trips.

Lecture notes
Hand-outs are available.
Literature
Prerequisites / notice
Students have to present a poster on a special theme.
Grade according to poster presentation and contributions during the course.
Requirements: First and second year courses in Botany and Evolution.

551-1309-00L RNA-Biology
Number of participants limited to 20.
Abstract
Introduction to the diversity of current RNA-research at all levels from structural biology to systems biology using mainly model systems like S. cerevisiae (yeast), mammalian cells.
Objective
The students will obtain an overview about the diversity of current RNA-research. They will learn to design experiments and use techniques necessary to analyze different aspects of RNA biology. Through lectures and literature seminars, they will learn about the burning questions of RNA research and discuss approaches to address these questions experimentally. In practical lab projects the students will work in one of the participating laboratories. Finally, they will learn how to present and discuss their data in an appropriate manner. Student assessment is a graded semester performance based on individual performance in the laboratory, the written exam and the poster presentation.

Literature
Documentation and recommended literature will be provided at the beginning and during the course.
Prerequisites / notice
The course will be taught in English.

551-1511-00L Parallels Between Tissue Repair and Cancer
Number of participants limited to 20.
Abstract
This course aims at the understanding of the cellular and molecular mechanisms underlying tissue repair processes in response to different insults. The focus will be on repair of the skin and the liver. In addition, we will highlight the parallels and differences between tissue repair and cancer.
Objective
To learn the cellular and molecular principles underlying tissue repair processes, in particular in the skin and in the liver, and the parallels and differences to cancer. To learn modern technologies in Molecular and Cellular Biology as well as Histology and to use these technologies to study questions related to mechanisms underlying tissue repair and cancer.

Content
This course aims at the understanding of the cellular and molecular mechanisms underlying tissue repair processes in response to different insults. The focus will be on repair of the skin and the liver. In addition, we will highlight the parallels and differences between tissue repair and cancer. Experimental approaches include biochemical studies, molecular and cellular studies using cultured cell lines and primary cells, as well as analysis of murine and human tissues.

The course combines practical work with lectures, discussions, project preparations and presentations.

Lecture notes
siehe Lernmaterialien

551-0371-00L Growth Control: Insights from Yeast and Flies  W  6 credits  7G  H. Stocker, R. C. Dechant, E. Halten, M. Peter

Abstract
All organisms have to control their growth in accordance with environmental conditions. This course focuses on the analysis of growth regulation in the model organisms yeast and Drosophila. The participants will perform experiments in small teams to study insulin/TOR signaling as a key regulator of cellular growth. A particular focus will be the discussion of current research.

Objective
The aims of the block course are that participants

(i) understand the function and evolution of insulin/TOR signaling
(ii) learn how genetic approaches in different organisms contribute to the understanding of human diseases such as cancer
(iii) will get familiarized with reading and discussing research articles
(iv) get a first exposure to current research.

Content
The block course consists of

(i) experiments:
Teams of two students each will join research labs to work on current projects focusing on growth regulation in both single-cell eukaryotes (yeast) and multicellular animals (Drosophila). The students will present their projects and results to their colleagues.

(ii) lectures on growth regulation in yeast and Drosophila.

(iii) journal clubs to discuss recent literature.

Lecture notes
Lecture handouts

Literature
Original research articles will be discussed during the course.

551-1403-00L Imaging Bacterial Cells in a Native State by Electron Cryotomography  W  6 credits  7G  M. Pilhofer

Abstract
The goal is to acquire the techniques to image bacteria by electron cryotomography, resolving their structure in a native state, in 3D, and to macromolecular resolution. In a small group, students will perform wet lab experiments, data collection with stat-of-the-art equipment, data processing and analyses. The key method and its application in bacterial cell biology will be introduced by lectures

Objective
Students will acquire the skills to cultivate bacteria, plunge-freeze samples for cryotomography, collect data using an electron cryomicroscope, process raw data, analyze tomograms, perform subtomogram averaging, model structures of interest, and generate movies for visualization.

https://www.mol.biol.ethz.ch/groups/pilhofer_group/

Block Courses in the 1st Half of the Semester
From 20.09.2016 13:00 hr to 4.11.2016 17:00 Uhr.

Abstract
This course combines Limnology (the study of inland waters in its broad sense) with ecological and evolutionary concepts. It deals with rivers, groundwater and lakes. This course contains a lecture part, an experimental part, two determination courses (aquatic invertebrates and algae) as well as excursions.

Objective
During this course you will get an overview of the world's typical continental aquatic ecosystems. After this course you will be able to understand how aquatic organisms have adapted to their habitat, and how the interactions (e.g. food web) between organisms work. During the experimental part of this course you will learn the principles of doing research to observe interrelations in aquatic ecosystems. You will measure and interpret biological and physical data (e.g. during experiments, field work) and present the collected knowledge. After this course you will know the most important aquatic species groups (macroinvertebrates, microinvertebrates and cryptogames) in Switzerland and the most important identification traits.

Content
The course contains a lecture part, an experimental part, two determination courses (aquatic invertebrates and algae) and field excursions.

Lecture:
The lecture part covers ecology and evolution of aquatic organisms in lentic and lotic waters. Topics include: Adaptations, distribution patterns, biotic interactions, and conceptual paradigms in freshwater ecosystems. Important aspects regarding ecosystem metabolism and habitat properties of freshwaters. Applied case studies and experiments testing ecological and evolutionary processes in freshwaters.

Practical part:
The practical part includes excursions to Greifensee, to the river Sense (natural river system) and to the river Töss (groundwater). Additionally, you will perform in small groups an independent experiment in a research group at Eawag.

The taxonomic part will cover macroinvertebrates (e.g. Crustacean, aquatic insects), microinvertebrates and algae. The goal is to get to know the most common aquatic taxa in Switzerland, to identify them with commonly used identification literature, and to get an idea how these organisms are used in research and practice. (language: German, translation of the most important things during the course possible)

Lecture notes
Course notes and power point presentations provided during the course.

Prerequisites / notice
The maximal participating number of biology students is 14.

Block Courses during Semester Break

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 226 of 1570
Students actively participate in ongoing research projects on the analysis of human T and B cell response to pathogens and vaccines. They will be tutored in small groups by doctoral students and postdocs. In a lecture series, the theoretical background for the projects will be provided and the students will have the opportunity to present their projects and discuss recent publications.

Objective
To learn current methodologies in human immunology through experimental work in the lab. To learn current concepts through lectures and discussion of original papers. Requirement for obtaining the credit points: oral presentation of the research project in a ppt format.

Content
The students will be tutored in their experimental work by doctoral or postdoctoral students from the Glockshuber or Weber-Ban group. In addition, the course includes specific lectures that provide the theoretical background for the experimental work, as well as exercises on the numeric evaluation of biophysical data, and literature work.

Participation in one of the following projects will be possible:

Projects of the Glockshuber group:
- Purification, biophysical characterization and structure determination of enzymes required for disulfide bond formation in the periplasm of Gram-negative bacteria.
- Identification of intermediates in the aggregation of the human Abeta peptide

Experimental work on these projects involves:
- Molecular cloning, recombinant protein production in E. coli and protein purification
- Protein crystallization
- Thermodynamic and kinetic characterization of conformational changes in proteins and protein-ligand interactions by fluorescence and circular dichroism spectroscopy
- Analysis of rapid reactions by stopped-flow fluorescence
- Negative-stain electron microscopy
- Light scattering

Projects of the Weber-Ban group:
- Generation and purification of site-directed variants of the E. coli ClpA/P protease and chaperone-proteasome complexes from other organisms, their biophysical characterization, including rapid kinetics by stopped-flow methods, ATPase activity measurements, negative-stain electron microscopy and light scattering

Lecture notes
No script

Literature
Literature related to the individual projects will be provided on the first day of the course.

Prerequisites / notice
Attendance of the concept course “Biomolecular Structure and Mechanism I: Protein Structure and Function” (551-0307-00L) in the autumn semester is highly recommended for acquiring the theoretical background to this block course.

Abstract

The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objective

- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

Abstract

Literature from the learning sciences is critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and meetings with those will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

Objective

- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

Abstract

In teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturers in this course. Basic conceptual and methodological issues are the topic of a series of plenary meetings; however, the major part of the work is done in small-group meetings with the advising researcher, and in self-directed research projects.

Objective

- The course is targeted at advanced students who have taken an interest in gathering practical research experience in the field of Learning & Instruction. In teams of two, students conduct their own research projects (planning, conducting, analyzing, interpreting, and presenting research); thus, the course requires a high amount of self-directed working. Students are personally advised, and supported in their research project, by one of the researchers serving as lecturers in this course. During the first half the semester, relevant methodological knowledge and skills are practiced during plenary meetings and in students’ independent reading (e.g. generating and testing research questions, designing experiments, and analyzing data in the field of Learning and Instruction)

Learning goals include:

- Participants can illustrate and explain basic methods and concepts for research in the fields of Learning and Instruction, e.g. with the help of practical examples.
- Participants can generate testable research questions for a topic relevant in the fields of Learning and Instruction.
- Participants can design and conduct a study that is relevant for answering their research question.
- Participants can summarize and evaluate the main results from a study in the field of learning and instruction, with regard to the research question being asked.

★★ Subject Didactics in Biology

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 229 of 1570
Eine kurze Anleitung zur mentorierten Arbeit in Fachdidaktik wird zur Verfügung gestellt. Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

Mentored Work Subject Didactics Biology A

- In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

- The objective is for the students:
  - to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
  - to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

- Content
  - Themenwahl nach Vereinbarung.
  - Reflexion über Themen aus allen biologiestzüchtigen Bereichen des Unterrichts.

- Literature
  - Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

- Prerequisites / notice
  - Beginn nach Absprache jederzeit möglich, jedoch erst nach Abschluss der Fachdidaktik I und II und nach der Absolvierung allfälliger fachwissenschaftlicher Voraussetzungen.

Die Arbeit sollte vor Beginn des Unterrichtspraktikums abgeschlossen werden.

Allfällige fachwissenschaftliche Auflagen müssen alle erfüllt sein, bevor mit der Mentorierten Arbeit begonnen werden kann.

Mentored Work Subject Didactics Biology B

- In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

- The objective is for the students:
  - to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
  - to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

- Content
  - Thematische Schwerpunkte

- Literature
  - Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

- Prerequisites / notice
  - Beginn nach Absprache jederzeit möglich, jedoch erst nach Abschluss der Fachdidaktik I und II und nach der Absolvierung allfälliger fachwissenschaftlicher Voraussetzungen.

Die Arbeit sollte vor Beginn des Unterrichtspraktikums abgeschlossen werden.

Allfällige fachwissenschaftliche Auflagen müssen alle erfüllt sein, bevor mit der Mentorierten Arbeit begonnen werden kann.

Subject Didactics Biology I

- Simultaneous enrolment in Introductory Internship Biology
  - course 551-0968-00L - is compulsory.

- Abstract
  - Basic conditions for tuition (MAR - recognition of Matura certificates - curricula, standards), selection of topics and reduction of the complexity of topics.
  - Application of teaching methods and techniques from educational science in biology classes.
  - Planning and preparation of lessons.

- Objective
  - Students can discuss and put into practice in their teaching work the conditions and objectives set out in the regulations governing the school-leaving examination (Matura), the framework curriculum and the conditions and objectives specified by their school.
  - They are in a position to select learning objectives and formulate these on the basis of the target level model. They can plan and prepare lessons and can also develop appropriate learning assignments.
  - Students can reconstruct specialist contents in didactic terms and develop teaching modules suitable for the different levels from these on the basis of the subject structure and learner requirements.
  - They can reduce the complexity of subject-based specialist contents and present them in such a way that they are comprehensible and meaningful for learners.
  - They can select appropriate media for their work (e.g. school books) and use these. They can employ appropriate experiments.
  - The students can use different forms of examination for monitoring performance.
  - Students are in a position to implement and discuss the concepts of biology teaching and learning on the basis of specific topics covered in school biology.

- Content

- Lecture notes
  - Wird laufend in der Vorlesung abgegeben.
Die Studierenden erfahren das Lektionsthema in der Regel 10 Tage vor dem Prüfungstermin. Von der zuständigen Lehrperson erhalten sie die Lektionen und können sie vor dem Prüfungstermin besuchen.

Die Praktikumslehrperson legt Beobachtungs- und Reflexionsaufträge und die Themen der zu erteilenden Lektionen fest. Die schriftlich dokumentierten Ergebnisse der Arbeitsaufträge sind Bestandteil des Portfolios des/der Studierenden. Anlässlich der Hospitationen erläutert die Praktikumslehrperson ihre fachlichen, fachdidaktischen und pädagogischen Überlegungen, auf deren Basis sie den Unterricht geplant und tautscht sich mit dem/der Studierenden aus.

In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

On the basis of a specified topic, the candidate shows that they are in a position
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Die gehaltene Lektion wird kriteriernbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/ der Kandidatin über die gehaltene Lektion im Rahmen eines kurzen Kolloquiums.

Lecturers
E. Hafen, J. Egli, M. Zwicky

Objective
Performance Assessment:
- to analyse controversial topics and to give factual explanations for these.
- to explain biological concepts and principles, as well as the way they fit together.
- to call up more in-depth specialist knowledge of biology, covering a wide range of topics, and to impart this to others.

Lecture notes
Urbanlagen für den Unterricht werden online mit Hilfe der e-learning Plattform OLAT abgegeben.

Prerequisites / notice
Die Studierenden führen alle ausgearbeiteten Experimente selber durch. Aufwändig Ausgestalten. Anleiten der Mitstudierenden.

Content
2. Die Studierenden führen alle ausgearbeiteten Experimente selber durch.

Performance is assessed during the course of the entire modul, with a final test. Active participation in the colloquia and group seminars is required. The thesis report and an oral presentation have to be completed.

In case of overbooking of the course, students enrolled in the Teaching Diploma in Biology will have priority for registration.

The course is organized jointly with the University of Zurich (Fachbereich Biologie) and is held at the Life Science Zurich Learning Center of the ETH Zürich and the University of Zurich.

Dokument: Schriftliche Vorbereitung für Prüfungslektionen.
Demanding biological topics are dealt with under consideration of the special needs of persons involved in teaching. The module:

1) Lecture (Tues. 08.00-09.45 hrs)
2) Colloquium (every second Tues. 10.15-12.00 hrs., begins on first lecture day)
3) Seminar with presentation (every second Tues. 10.15-12.00 hrs., begins in second lecture week)
4) Semester thesis in a research group (3.5 weeks)

Lecture notes
None.

Literature
Specific references will be made available for the individual projects.

Prerequisites / notice
The program of this course represents one half (6 CP) of that of the Specialized Biology Course with an Educational Focus (551-0963-00, 12 CP).

### Compulsory Elective Courses

Further course offerings from the category Educational Science are listed under "Programme: Educational Science for Teaching Diploma and TC".

Abstract
This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

Objective
The main goal of this course is to enhance the student’s ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.
Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

Integrity in Research & Research Misconduct
- What is “integrity” in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 Rs (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks;
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.
The seminar covers the following topics:

1. Theories and concepts of inter- and transdisciplinary research
2. The specific challenges of inter- and transdisciplinary research
3. Involving stakeholders
4. Collaborating disciplines
5. Exploration of tools and methods
6. Analysing participants' projects to improve inter- and transdisciplinary elements

At the end of the course, students should be able to:

- Understand and reflect on the challenges of trade-offs between the different goals of sustainable development and the respective impacts on individual and societal decision-making.
- Know the core concepts of sustainable development.
- Know the concept of social justice - normatively and empirically - as a core element of social sustainability.
- Understand empirical methods for the analysis and assessment of local / regional sustainability issues.

The course is structured as follows:

- Overview of rationale, objectives, concepts and origins of sustainable development.
- Importance and application of sustainability in science, politics, society, and economy.
- Sustainable (local / regional) development in different national / international contexts.
- Analysis and evaluation methods of sustainable development with a focus on social justice.
- Trade-offs in selected examples.

We recommend that students have:

- Three-years BSc education of a technical university.
- Successfully completed Bachelor or Master introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and familiar with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy).

The seminar is specifically suitable for PhD or PostDoc researchers. It is open to master students (minor "global change and sustainability") and further interested people, who preferably are preparing, or working on, a project/thesis.

The seminar will be made available to the participants.

The block course will only take place with a minimum of 10 participants.

The course is seminar-like, interactive.

At the end of the course, students should:

- Understand and reflect on the challenges of trade-offs between the different goals of sustainable development and the respective impacts on individual and societal decision-making.
- Know the core concepts of sustainable development.
- Know the concept of social justice - normatively and empirically - as a core element of social sustainability.
- Understand empirical methods for the analysis and assessment of local / regional sustainability issues.

The course is structured as follows:

- Overview of rationale, objectives, concepts and origins of sustainable development.
- Importance and application of sustainability in science, politics, society, and economy.
- Sustainable (local / regional) development in different national / international contexts.
- Analysis and evaluation methods of sustainable development with a focus on social justice.
- Trade-offs in selected examples.

This course represents an introduction to recent research into student learning on the conceptual foundations of modern biology, together with pedagogical methods associated with effective instruction and its valuation. Students will be involved in active research into conceptual and practical issues involved in biology education and methods to discover student preconceptions.

Provides an overview on student's learning and shows ways to make the classroom experience more engaging and effective for students. Students will learn to produce a research-based paper on a project they work on during the course.
### Biology as Second Subject

#### Subject Didactics in Biology

**Abstract**
- Basic conditions for tuition (MAR - recognition of Matura certificates - curricula, standards), selection of topics and reduction of the complexity of topics.
- Application of teaching methods and techniques from educational science in biology classes.
- Planning and preparation of lessons.

**Objective**
- Students can discuss and put into practice in their teaching work the conditions and objectives set out in the regulations governing the school-leaving examination (Matura), the framework curriculum and the conditions and objectives specified by their school.
- They are in a position to select learning objectives and formulate these on the basis of the target level model. They can plan and prepare lessons and can also develop appropriate learning assignments.
- Students can reconstruct specialist contents in didactic terms and develop teaching modules suitable for the different levels from these on the basis of the subject structure and learner requirements.
- They can reduce the complexity of subject-based specialist contents and present them in such a way that they are comprehensible and meaningful for learners.
- They can select appropriate media for their work (e.g. school books) and use these. They can employ appropriate experiments. The students can use different forms of examination for monitoring performance.
- Students are in a position to implement and discuss the concepts of biology teaching and learning on the basis of specific topics covered in school biology.

**Content**

**Lecture notes**
Wird laufend in der Vorlesung abgegeben.

**Prerequisites / notice**
Studierende müssen LE zusammen mit dem Einführungspraktikum - LE 551-0968-00L - belegen.

**Abstract**
In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

**Objective**
- The objective is for the students:
  - to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
  - to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

**Content**
Themenwahl nach Vereinbarung.

**Lecture notes**
Eine kurze Anleitung zur mentorierten Arbeit in Fachdidaktik wird zur Verfügung gestellt.

**Prerequisites / notice**
Beginn nach Absprache jederzeit möglich, jedoch erst nach Abschluss der Fachdidaktik I und II und nach der Absolvierung allfälliger fachwissenschaftlicher Voraussetzungen.

Die Arbeit sollte vor Beginn des Unterrichtspraktikums abgeschlossen werden.

**Allfällige fachwissenschaftliche Auflagen müssen alle erfüllt sein, bevor mit der Mentorierten Arbeit begonnen werden kann.**

</table>

**Abstract**

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

- They are able to assess the significance of tuition topics from the subject of different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

**Content**

Die Themen für die beiden Prüfungslektionen am Schluss der Praktikumsrahmen und die Studierenden in der Regel eine Woche vor dem Prüfungstermin. Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie bis am Vortrag um 12 Uhr den beiden Prüfungsexperten. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltenen Lektionen im Rahmen eines kurzen Kolloquiums.

**Lecture notes**

Dokument: schriftliche Vorbereitung für Prüfungslektionen.

**Literature**

Wird von der Praktikumslehrperson bestimmt.

**Abstract**

Genetics, fossil remains, comparative anatomy and behavioral research prove the affiliation of humans to primates. This mammalian order represents variations of a single theme.

The main adaptations and the critical steps of phylogeny are presented.

**Objective**

Upon successfully completing of the module the students can:
- interpret the main features of primates and especially of fossil hominids in the evolutionary and functional context;
- explain the genetic, phenetic and cultural diversity of modern human populations as the result of evolutionary processes;
- recognize similarities and differences in the behavior and the cognitive lines from humans and animals, in particular monkeys;
- explain why cultural evolution occurs only in humans;
- discuss the question "What are human beings?" from an evolutionary biological perspective.

**Literature**

**Abstract**

Basic knowledge of the anatomy and physiology of tissues, of the embryonal and postnatal development, of the basic terminology of pathology, the neuro-muscular system, the cardiovascular system and the respiratory system.

**Objective**

Basic knowledge of human anatomy and physiology and basics of clinical pathophysiology.
Short overview of human anatomy, physiology and general pathology.

Anatomy and Physiology I (fall term):
- Basics of cytology, histology, embryology, general pathology; nervous system, muscles, cardiovascular system, respiratory system

Anatomy and Physiology II (spring term):
- Digestive system, kidney and urinary tract, endocrine system, skin, thermoregulation, sensory organs, male and female reproductive system, pregnancy and child birth.

ECTS
- European Credit Transfer and Accumulation System
- Special students and auditors need special permission from the lecturers.
The focus is on the potential to assess strategies and tactics of pest management, taking into account the demands from the economy, the environment and the society. Significant agricultural approaches will be explained using practical examples, including prevention using natural resources, surveillance and forecasting, resistance management, as well as product registration, incl. ecotoxicology. Students gain a good understanding of fundamental aspects of pest management in agroecosystems. They will have the ability to search on relevant issues in pest management, and to critically evaluate case studies.

### Handouts and Literature

- General knowledge of plant systematics
- Basic knowledge of plant sytems
- General ecological concepts

### Prerequisites

- General knowledge of plant biology
- Basic knowledge of plant systematics
- General ecological concepts

---

---

**Abstract**

The concept course ‘Evolutionary Genetics’ consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

**Objective**

The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

**Content**

Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.

Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher’s fundamental theorem.

Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation.

**Lecture notes**

Handouts

**Library**

**Prerequisites / notice**

There will be 5 optional extra sessions for the population genetics part (following lectures 2-6) for computer simulations, designed to help understand the course material.

---

**Abstract**

This class focuses on ecological processes involved with plant life, mechanisms of plant adaptation, plant-animal and plant-soil interactions, plant strategies and implications for the structure and function of plant communities. The discussion of original research examples familiarises students with research questions and methods; they learn to evaluate results and interpretations.

**Objective**

Students will be able to:

- propose methods to study ecological processes involved with plant life, and how these processes depend on internal and external factors;
- analyse benefits and costs of plant adaptations;
- explain plant strategies with relevant traits and trade-offs;
- explain and predict the assembly of plant communities;
- explain implications of plant strategies for animals, microbes and ecosystem functions;
- evaluate studies in plant ecology regarding research questions, assumptions, methods, as well as the reliability and relevance of results.

**Content**

Plants represent the matrix of natural communities. The structure and dynamics of plant populations drives the function of ecosystems. This course presents essential processes and plant traits involved with plant life. We focus on research questions that have been of special interest to plant ecologists as well as current topical questions. We use original research examples to discuss how ecological questions are studied and how results are interpreted.

- Growth: what determines the production of a plant?
- Nutrients: consumption or recycling; opposite strategies and feedbacks on soils;
- Clonality: collaboration and division of labour in plants;
- Plasticity: benefits and costs of plant intelligence;
- Flowering and pollination: how expensive is sex?
- Seed types, dispersal, seed banks and germination: strategies and trade-offs in the persistence of plant populations;
- Development and structure of plant populations;
- Stress, disturbance and competition as drivers of different plant strategies;
- Herbivory: plant-animal feedbacks and functioning of grazing ecosystems
- Fire: impacts on plants, vegetation and ecosystems.
- Plant functional types and rules in the assembly of plant communities.

**Lecture notes**

Handouts and further reading will be available electronically at the beginning of the semester.
### 701-1441-00L Alpine Ecology and Environments

**Abstract**
The online course ALPECOL provides a global overview of the complex ecosystems of mountain regions, and of their great diversity of habitats and organisms. The course is interdisciplinary and the various approaches are designed to help understand the past, present and future of mountain ecosystems.

**Objective**
Knowledge of alpine environments worldwide and their ecology

**Content**
The online course is subdivided into:
- 5 lessons on abiotic factors: geology, soils and their forming processes, climate, and disturbance factors
- 12 lessons on plants: diversity, patterns and processes, tree lines, water & nutrients, carbon cycle, atmospheric influences, sexual and clonal reproduction, and one specific lesson on aquatic environments
- 5 lessons on animals: habitats and adaptations, origin of species, food ecology and impact of domestic livestock
- 3 lessons on landscape evolution: quaternary paleoenvironments, methods like radiocarbon dating, pollen records, dendrochronology, stable isotopes, and historical data
- 1 lesson on global change

Students can also follow a virtual walk through alpine areas where context-based information on alpine environments can be accessed. Moreover, all major alpine areas of the world can be selected on a map and then informative pictures of those landscapes and faunistic and fluvial inhabitants will be shown.

**Prerequisites / notice**
Online exercises and tests allow to test the learned matter.

**Literature**
Selected required readings (peer reviewed literature, selected book chapters). Optional recommended readings with additional information.

---

### 701-0301-00L Applied Systems Ecology

**Abstract**
This course provides the ecological systems' knowledge needed to question applied solutions to current environmental issues. Our central aim is to balance participants' respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

**Objective**
Knowledge of agro-ecosystems and urban ecosystems; their origin, ecosystem services, mechanisms and importance for the maintenance of biodiversity.

---

### 401-0625-01L Applied Analysis of Variance and Experimental Design

**Abstract**

**Objective**
Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.

**Content**

**Literature**

**Prerequisites / notice**
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software R, for which an introduction will be held.

---

### 401-0649-00L Applied Statistical Regression

**Abstract**
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life.

**Objective**
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

**Content**
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

**Literature**
Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

**Prerequisites / notice**
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

---

### 751-5121-00L Insect Ecology

**Abstract**
This is an introductory course in insect ecology. Students will learn about the ways in which insects interact with and adapt to their abiotic & biotic environments and their roles in diverse ecosystems. The course will entail lectures, outside readings, and critical analysis of contemporary literature.

**Objective**
Students completing this course should become familiar with the application of ecological principles to the study of insects, as well as major areas of inquiry in this field. Highlighted topics will include insect behavior, chemical and sensory ecology, physiological responses to biotic and abiotic stressors, plant-insect interactions, community and food-web dynamics, and disease ecology. The course will emphasize insect evolution and adaptation in the context of specific interactions with other organisms and the abiotic environment. Examples from the literature incorporated into lectures will highlight the methods used to study insect ecology.

**Literature**
Provided to students through ILIAS

**Prerequisites / notice**
Students prepare for the seminar by working through particular lessons. Each student has to present some special aspect of one lesson. The seminar contribution is part of the performance assessment.

---

### 2V+1U ALPECOL

**Objective**
The online course ALPECOL provides a global overview of the complex ecosystems of mountain regions, and of their great diversity of habitats and organisms. The course is interdisciplinary and the various approaches are designed to help understand the past, present and future of mountain ecosystems.

**Objective**
Knowledge of alpine environments worldwide and their ecology

**Content**
The online course is subdivided into:
- 5 lessons on abiotic factors: geology, soils and their forming processes, climate, and disturbance factors
- 12 lessons on plants: diversity, patterns and processes, tree lines, water & nutrients, carbon cycle, atmospheric influences, sexual and clonal reproduction, and one specific lesson on aquatic environments
- 5 lessons on animals: habitats and adaptations, origin of species, food ecology and impact of domestic livestock
- 3 lessons on landscape evolution: quaternary paleoenvironments, methods like radiocarbon dating, pollen records, dendrochronology, stable isotopes, and historical data
- 1 lesson on global change

Students can also follow a virtual walk through alpine areas where context-based information on alpine environments can be accessed. Moreover, all major alpine areas of the world can be selected on a map and then informative pictures of those landscapes and faunistic and fluvial inhabitants will be shown.

**Prerequisites / notice**
Online exercises and tests allow to test the learned matter.

**Literature**
Selected required readings (peer reviewed literature, selected book chapters). Optional recommended readings with additional information.

### Prerequisites / notice

The course combines elements of a classic lecture, group discussions and problem based learning. It is helpful, but not essential to be familiar with the "seven stages" method (see e.g. course 701-0352-00L "Analysis and Assessment of Environmental Sustainability" by Christian Pohl et al.).

### Literature

Case descriptions, commented glossary and a list of literature and further resources per case.

### Lecture notes

It is not essential to borrow/buy the following books. We will continuously provide excerpts and other literature during the course.

- A. Drewek, A. J. Papritz
  - Using R for Data Analysis and Graphics (Part II)
  - 1 credit
  - A. Drewek, A. J. Papritz
  - An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

<td>The students will be able to use the software R for simple data analysis.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>The course provides the first part an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Part I of the course covers the following topics:**

- **What is R?**
- **R Basics:** reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- **Types of data:** numeric, character, logical and categorical data, missing values;
- **Simple (statistical) functions:** summary, mean, var, etc., simple statistical tests;
- **Writing simple functions**;
- **Introduction to graphics:** scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

**The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio:** www.rstudio.org

**Note:** Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

**Lecture notes**

An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

**Prerequisites / notice**

The course resources will be provided via the Moodle web learning platform E-Phase login (with your ETH (or other University) username-password) at https://moodle-app2.let.ethz.ch/enrol/users.php?id=1145

Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

**Lecture notes**

An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Objective

Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1 No Lecture: First day of autumn semester

Week 2 The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nemate attack strategies and types of damage.

Week 5 Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6 Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7 Pisatin and pisatin demethylase. Local and systemic acquired resistance, signal molecules.

Week 8 Pathogen effects on food quality and safety.

Week 9 Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 10 Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11 Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELISA, PCR, rDNA and rep-PCR.

Week 12 Strategies for minimizing disease risks: principles of disease control and management.

Week 13 Disease control strategies: economic thresholds, physical control methods.

Week 14 Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

636-0017-00L Computational Biology W 4 credits 3G T. Stadler, C. Magnus

Abstract

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective

Attendees will learn which information is contained in genetic sequencing data and how to extract information from them using computational tools. The main concepts introduced are:

* stochastic models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

* epidemiology
* pathogen evolution
* macroevolution of species

Content

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze this alignment (such as BLAST algorithm, GWAS approaches). Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phyloodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes Slides of the lecture will be available online.

https://www.bsse.ethz.ch/cevo/education/cb-materials.html

Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

https://moodle-app2.let.ethz.ch/enrol/users.php?id=1145

Prerequisites / notice

Basic knowledge of R equivalent to "Using R .. (part 1)" ( = 401-6215-00L ) is a prerequisite for this course.

The course resources will be provided via the Moodle web learning platform. Please login (with your ETH (or other University) username-password) at https://moodle-app2.let.ethz.ch/ or ask your lecturer. For the registration of the course "Using R for Data Analysis and Graphics" please choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Some programming experience will be useful for the exercises, but is not required. Programming skills will not be tested in the examination.

**701-1419-00L Analysis of Ecological Data**

**W 2 credits 2G S. Güsewell**

**Abstract**
This class provides students with an overview of techniques for data analysis used in modern ecological research, as well as practical experience in running these analyses with R and interpreting the results. Topics include linear models, generalized linear models, mixed models, model selection and randomization methods.

**Objective**
- choose appropriate techniques for given problems and types of data
- evaluate assumptions and limitations
- implement the analyses in R
- represent the relevant results in graphs, tables and text
- interpret and evaluate the results in ecological terms

**Content**
- Linear models for experimental and observational studies
- Model selection
- Introduction to likelihood inference and Bayesian statistics
- Analysis of counts and proportions (generalised linear models)
- Models for non-linear relationships
- Grouping and correlation structures (mixed models)
- Randomisation methods

**Literature**

**Prerequisites / notice**
- Basic statistical training (e.g. Mathematik IV in D-USYS): Data distributions, descriptive statistics, hypothesis testing, linear regression, analysis of variance
- Basic experience in data handling and data analysis in R

**Lecture notes**
Lecture notes and additional reading will be available electronically a few days before the course.

**Number of participants limited to 20.**

**701-1471-00L Ecological Parasitology**

**W 3 credits 1V+1P O. E. Seppälä, H. Hartikainen, T. N. Yu**

**Abstract**
Course focuses on the ecology and evolution of macroparasites and their hosts. Through lectures and practical work, students learn about diversity and natural history of parasites, adaptations of parasites, ecology of host-parasite interactions, applied parasitology, and human macroparasites in the modern world.

**Objective**
1. Identify common macroparasites in aquatic organisms.
2. Understand ecological and evolutionary processes in host-parasite interactions.
3. Conduct parasitological research.

**Content**
- Diversity and natural history of parasites (i.e. systematic groups and life-cycles).
- Adaptations of parasites (e.g. evolution of life-cycles, host manipulation).
- Ecology of host-parasite interactions (e.g. parasite communities, effects of environmental changes).
- Applied parasitology (e.g. aquaculture and fisheries).
- Human macroparasites (schistosomiasis, malaria).

**Lectures:**
- 1. Examination of parasites in fish (identification of species and description of parasite communities).
- 2. Examination of parasites in molluscs (identification and examination of host exploitation strategies).
- 3. Examination of parasites in amphipods (identification and examination of effects on hosts).

**701-1427-00L Experimental Evolution**

**W 4 credits 2S G. Velicer, A. Hall, S. Wielgoss, Y.**

**Abstract**
Students will analyze experimental evolution literature covering a wide range of questions, species and types of analysis and will lead discussions of this literature. Students will develop a written project proposal for a novel evolution experiment (or a novel analysis of a published experiment) to address an unanswered question and will also deliver an oral presentation of the project proposal.

**Objective**
- become familiar with a diverse sample of experimental evolution literature,
- gain understanding of the strengths and limitations of experimental evolution for addressing evolutionary questions relative to other forms of evolutionary analysis, and
- gain the ability to effectively design and analyze evolution experiments that address fundamental or applied questions in evolutionary biology.
Experimental evolution is a powerful and increasingly prominent approach to investigating evolutionary processes. Students will analyze experimental evolution literature covering a diverse range of topics, species and types of analysis and will lead discussions of this literature. Students will develop a written project proposal for a novel evolution experiment (or a novel analysis of a published experiment) to address an unanswered question and will also deliver an oral presentation of the project proposal. Evaluation will be based on a combination of participation in and leadership of literature discussions, in-class exams, and oral and written presentations of the project proposal.

**Literature**
Primary research papers and review articles.

**Prerequisites / notice**
701-0245-00 Introduction to Evolutionary Biology (or equivalent).

**Abstract**
Storage, handling, and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

**Objective**
Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

**Content**
Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

**Abstract**
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Objective**
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Content**
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Lecture notes**
Updated handouts will be provided during the class.

**Literature**
Current literature references will be provided during the lectures.

**Prerequisites / notice**
English
The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

**Abstract**
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective**
This course focuses on the concepts of classical and modern genetics and genomics.

**Content**
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**
Scripts and additional material will be provided during the semester.

**Prerequisites / notice**
This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UZH Irchel.

<td>Abstract</td>
<td>Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division &amp; growth, and cell migration.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The full-year course (551-0319-00 &amp; 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.</td>

<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.</td>

Thirteen major areas of research have been selected, which cover the key concepts that have led to our current ideas of how the nervous system is built and functions. We will read both original papers and explore the conceptual links between them and discuss the 'sociology' of science, the pursuit of basic science questions over a century of research.

It is a commonplace that scientists rarely cite literature that is older than 10 years and when they do, they usually cite one paper that serves as the representative for a larger body of work that has long since been incorporated anonymously in textbooks. Worse than that, many authors have not even read the papers they cite in their own publications. This course, Foundations of Neuroscience is one antidote.

Thirteen major areas of research have been selected, which cover the key concepts that have led to our current ideas of how the nervous system is built and functions. Unusually, we will explore these areas of research by reading the original publications, instead of reading someone else's digested summary from a textbook or review. By doing this, we will learn how the discoveries were made, what instrumentation was used, how the scientists interpreted their own findings, and how their work, often over many decades and linked together with related findings from many different scientists, generate the current views of mechanism and structure of the nervous system.

To give one concrete example, in 1890 Roy and Sherrington showed that there was a neural activity-dependent regulation of blood flow in the brain. One hundred years later, Ogawa discovered that they could use Nuclear Magnetic Resonance (NMR) to measure a blood oxygen-level dependent (BOLD) signal, which they showed was neural activity-dependent. This discovery led to the development of human functional Magnetic Resonance Imaging (fMRI), which has revolutionized neuropsychology and neuropsychiatry. We will read both these original papers and explore the conceptual links between them and discuss the sociology of science, which in this case, the pursuit of basic science questions over a century of research, led to an explosion in applications. We will also explore the personalities of the scientists and the context in which they made their seminal discoveries. Each week the course members will be given original papers to read for homework, they will have to write a short abstract for each paper. We will then meet weekly with the course leader (KACM) and an assistant for an hour-or-so long interactive seminar. An intimate knowledge of the papers will be assumed so that the discussion does not center simply on an explication of the contents of the papers. Assessment will in the form of a written exam in which the students will be given a paper and asked to write a short abstract of the contents.

It is a commonplace that scientists rarely cite literature that is older than 10 years and when they do, they usually cite one paper that serves as the representative for a larger body of work that has long since been incorporated anonymously in textbooks. Worse than that, many authors have not even read the papers they cite in their own publications. This course, Foundations of Neuroscience is one antidote.

Each week the course members will be given original papers to read for homework, they will have to write a short abstract for each paper. We will then meet weekly with the course leader (KACM) and an assistant for an hour-or-so long interactive seminar. An intimate knowledge of the papers will be assumed so that the discussion does not center simply on an explication of the contents of the papers. Assessment will be done continuously as the individual students are asked to explain a figure, technique, or concept.

http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract

Thirteen major areas of research have been selected, which cover the key concepts that have led to our current ideas of how the nervous system is built and functions. We will read both original papers and explore the conceptual links between them and discuss the sociology of science, which in this case, the pursuit of basic science questions over a century of research.

Objective

It is a commonplace that scientists rarely cite literature that is older than 10 years and when they do, they usually cite one paper that serves as the representative for a larger body of work that has long since been incorporated anonymously in textbooks. Worse than that, many authors have not even read the papers they cite in their own publications. This course, Foundations of Neuroscience is one antidote.

Thirteen major areas of research have been selected, which cover the key concepts that have led to our current ideas of how the nervous system is built and functions. Unusually, we will explore these areas of research by reading the original publications, instead of reading someone else's digested summary from a textbook or review. By doing this, we will learn how the discoveries were made, what instrumentation was used, how the scientists interpreted their own findings, and how their work, often over many decades and linked together with related findings from many different scientists, generate the current views of mechanism and structure of the nervous system.

To give one concrete example, in 1890 Roy and Sherrington showed that there was a neural activity-dependent regulation of blood flow in the brain. One hundred years later, Ogawa discovered that they could use Nuclear Magnetic Resonance (NMR) to measure a blood oxygen-level dependent (BOLD) signal, which they showed was neural activity-dependent. This discovery led to the development of human functional Magnetic Resonance Imaging (fMRI), which has revolutionized neuropsychology and neuropsychiatry. We will read both these original papers and explore the conceptual links between them and discuss the sociology of science, which in this case, the pursuit of basic science questions over a century of research, led to an explosion in applications. We will also explore the personalities of the scientists and the context in which they made their seminal discoveries. Each week the course members will be given original papers to read for homework, they will have to write a short abstract for each paper. We will then meet weekly with the course leader (KACM) and an assistant for an hour-or-so long interactive seminar. An intimate knowledge of the papers will be assumed so that the discussion does not center simply on an explication of the contents of the papers. Assessment will be done continuously as the individual students are asked to explain a figure, technique, or concept.
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Some programming skills will be useful for the exercises, but is not required. Programming skills will not be tested in the examination.

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. ( Alicia.smith@bc.bioli.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 248 of 1570
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

This lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

- **Number of participants limited to 8.**

- **Abstract**: The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

- **Objective**: The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

- **Content**: You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

- **Lecture notes**: Presentations will be made available after the seminars.

- **Prerequisites / notice**: You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).
The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Emphasis is on processes that are specific to bacteria and archaea and that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest. Emphasis is on processes that are specific to bacteria and archaea and that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest.

List of topics:
- Eating sugars and letting them in: "Challenging: Aromatics, xenobiotics, and oil Complex: (Ligno-)Cellulose and in demand for bioenergy Living on a diet and the apnealeric provocation"

A script will be provided during the course.

Prerequisites / notice
The course is available in English. It will include the preparation of short essays (marked) about defined topics in Glycobiology.

Literature

Lecture notes
Handouts

Abstract
Structural principles, nomenclature and different classes of glycosylation. The different pathways of N- and O-linked protein glycosylation and glycolipid biosynthesis in prokaryotes and eukaryotes are discussed. Specific glycans binding proteins and their role in deciphering the glycan code are presented. The role of glycans in infectious diseases, antigen mimicry and autoimmunity are discussed.

Objective
Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glycochemistry, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

Content
- Structure and linkages; analytical approaches: N-linked protein glycosylation (ER, Golgi); glycan-assisted protein folding and quality control; O-linked protein glycosylation; glucosaminoglycans; glycolipids; prokaryotic glycosylation pathways; lectins; glycans and infectious disease

Abstract
Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.

Objective
Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion. The aim of this course is to confront students with current research topics and with scientific presentation. The course offers the opportunity to gain in depth knowledge about diverse topics which are often only briefly touched in the concept courses and to engage in discussion with experts in the field.

Content
- Immunology and infection biology. The specific topics are variable and depend each semester on the list of invited experts.

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolomic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Prerequisites / notice
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

Abstract
Milestones in Immunology: on old concepts and modern experiments The course will cover six grand topics in immunology (B cells, innate immunity, antigen presentation, tumor immunity, thymus and T cells, cytotoxic T cells and NK cells) and for each grand topic four hours will be allocated. During the first double hour, historical milestone papers will be presented by the supervisor providing an overview on the development of the conceptional framework and critical technological advances. The students will also prepare themselves for this double lecture by reading the historical milestone papers and contributing to the discussion. In the following lecture up to four students will present each a recent high impact research paper which emerged from the landmark achievements of the previously discussed milestone concepts.

Autumn Semester 2016
Page 250 of 1570
During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies. Students will work with experts towards a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to introduce, present, evaluate, critically discuss and write about recent scientific articles in the research area of cellular biochemistry. Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with occasional frontal presentations. Students will alternate as discussion leaders throughout the semester, with the student leader responsible to briefly summarize key general knowledge and context of the assigned primary research paper. Together with the faculty expert, all students will participate in discussion of the primary paper, including the foundation of the biological question, specific questions addressed, key methods, key results, remaining gaps and research implications.

The literature will be provided during the course. The course will be taught in English.

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 251 of 1570
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1   No Lecture: First day of autumn semester

Week 2   The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nematode attack strategies and types of damage.

Week 5   Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6   Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7   Pisatin and pisatin demethylase. Local and systemic acquired resistance, signal molecules.

Week 8   Pathogen effects on food quality and safety.

Week 9   Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including physiology, density, uniformity.

Week 10  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11  Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELISA, PCR, rDNA and rep-PCR.

Week 12  Strategies for minimizing disease risks: principles of disease control and management.

Week 13  Disease control strategies: economic thresholds, physical control methods.

Week 14  Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

Lecture notes

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

Abstract

Viral and non-Viral Vectors for Human Gene-Therapy - from Pathogens to Safe Medical Applications

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: BIO708

Mind the enrolment deadlines at UZH:

http://www.uzh.ch/studies/application/mobilitaet_en.html

Objective

Knowledge of important viral and non-viral vector systems.

Knowledge of application in human diseases.

Knowledge of limiting factors.

Abstract

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective

Attendees will learn what information is contained in genetic sequencing data and how to extract information from them using computational tools. The main concepts introduced are:

* stochastic models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

* epidemiology
* pathogen evolution
* macroevolution of species

Content

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze this alignment (such as BLAST algorithm, GWAS approaches). Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylogenetics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.
Lecture notes

Slides of the lecture will be available online.
https://www.bsse.ethz.ch/cevo/education/cb-materials.html

Literature

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
* Yang, Z. 2006. Computational Molecular Evolution.
* Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST

Prerequisites / notice

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Some programming experience will be useful for the exercises, but is not required. Programming skills will not be tested in the examination.

751-4805-00L Recent Advances in Biomcomunication

Number of participants limited to 25

Abstract

Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods.

Objective

Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods. Students will engage in discussion and critical analyses of relevant papers and present their evaluations in a seminar setting.

Abstract

This lecture is the first part of a one-year course. It offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

Objective

The lecture offers insights into the basics, practical consequences and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts, molds and protozoa in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

The focus of this first part of the lecture will be on the organisms, but also on the factors which determine spoilage and foodborne disease.

Content

1. History of Food Microbiology
   1.1. Short synopsis of foodborne microorganisms
   1.2. Spoilage of Foods
   1.3. Foodborne Disease
   1.4. Food Preservation
   1.5. VIP's of Food Microbiology
2. Overview of Microorganisms in Foods
   2.1 Origin of foodborne Microorganisms
   2.2. Bacteria
   2.3. Yeasts
   2.4. Molds
3. Microbial Spoilage of Foods
   3.1. Intrinsic and Extrinsic Parameters
   3.2. Meats, Seafoods, Eggs
   3.3. Milk and Milk Products
   3.4. Vegetable and Fruit Products
   3.5. Miscellaneous (baked goods, nuts, spices, ready-to-eat products)
   3.6. Drinks and Canned Foods
4. Foodborne Disease
   4.1. Significance and Transmission of Foodborne pathogens
   4.2. Staphylococcus aureus
   4.3. Gram-positive Sporeformers (Bacillus & Clostridium)
   4.4. Listeria monocytogenes
   4.5. Salmonella, Shigella, Escherichia coli
   4.6. Vibrio, Yersinia, Campylobacter
   4.7. Brucella, Mycobacterium
   4.8. Parasites
   4.9. Viruses and Bacteriophages
   4.10. Mycotoxins
   4.11. Bioactive Amines
   4.12. Miscellaneous (Antibiotic-resistant Bacteria, Biofilms)

Lecture notes

Electronic copies of the presentation slides (PDF) and additional material will be made available for download.

Literature

Recommendations will be given in the first lecture

551-1295-00L Introduction to Bioinformatics: Concepts and Applications

W 6 credits 4G W. Gruissem, K. Bärenfaller, A. Callisch, G. Capitani, J. Fütterer, M. Robinson, A. Wagner

Abstract

Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.
Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

**Abstract**
The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

**Objective**
The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

**Content**
Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.

Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher’s fundamental theorem.

Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation.

Lecture notes
- Handouts

Literature

Prerequisites / notice
- There will be 5 optional extra sessions for the population genetics part (following lectures 2-6) for computer simulations, designed to help understand the course material.

**Abstract**
The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates physiology and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.

**Objective**
The new course "Molecular Life of Plants" reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels.

The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.

**Content**
The course "Molecular Life of Plants" will cover the following topics in a developmental context:

- Plant genome organization
- Seed anatomy
- Food reserves and mobilization
- Seedling emergence
- Heterotrophic to autotrophic growth
- Chlorophyll biosynthesis, photoreceptors
- Integration of metabolism
- Hormones
- Cell cycle
- Cell differentiation and expansion
- Environmental interactions
- Environmental interactions
- Environmental interactions
- Embryos and plant development
- Flower development and fertilization
- Embryo and seed development
- Fruit development
- Senescence

**D-BIOL BSc students are obliged to take part I and part II**
Abstract
Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

Objective
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytics.

Lecture notes
Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

Literature
Basics:
- Crisponi, T.E.; Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

551-0309-00L Concepts in Modern Genetics

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Prerequisites / notice
This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UZH Irchel.

551-0319-00L Cellular Biochemistry (Part I)

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

529-0731-00L Nucleic Acids and Carbohydrates

Abstract
Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Objective
Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

pletive Major: Cell Biology

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 255 of 1570
Objective

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biological and physical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

551-0309-00L Concepts in Modern Genetics

Abstract

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective

This course focuses on the concepts of classical and modern genetics and genomics.

Content

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes

Scripts and additional material will be provided during the semester.

Prerequisites / notice

This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hönggerberg, and on Tuesday morning at UZH Irchel.

551-0317-00L Immunology I

Abstract

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

Objective

Introduction into structural and functional aspects of the immune system. Basic knowledge of the mechanisms and the regulation of an immune response.

Content

- Introduction and historical background
- Innate and adaptive immunity. Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- TH1 and TH2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes

Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien" - Kuby, Immunology, 7th edition, Freeman + Co., New York, 2009

Literature

Prerequisites / notice

Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung".

551-1295-00L Introduction to Bioinformatics: Concepts and Applications

Abstract

Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

Objective

Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.
Bioinformatics I will cover the following topics:

From genes to databases and information
BLAST searches
Prediction of gene function and regulation
RNA structure prediction
Gene expression analysis using microarrays
Protein sequence and structure databases
WWW for bioinformatics
Protein sequence comparisons
Proteomics and de novo protein sequencing
Protein structure prediction
Cellular and protein interaction networks
Molecular dynamics simulation

376-1305-10L Neurobiology W 6 credits 4V M. E. Schwab, E. Stoeckli, L. Filli, K. A. Martin, further lecturers

Abstract
Development of the nervous system (NS); the adult NS, plasticity and regeneration, sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, diseases of the NS.

Objective
Overview of normal development, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

Content
Development: Early development of the nervous system, cellular level, nerve fiber growth, building of neuronal networks; biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

Lecture notes
Structure, Plasticity and Repair of the Nervous System (376-1305-01L): Lecture notes will be provided on Moodle https://moodle-app2.let.ethz.ch/course/view.php?id=694
Password will be provided at the beginning of the lecture.

Literature
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures.

Abstract
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Objective
The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

Content
You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Prerequisites / notice
You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly analysed model organisms.

Objective
By the end of this module, each student should be able to

- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.

Key skills:
By the end of this module, each student should be able to

- present and discuss a relevant evolutionary topic in an oral presentation
- select and integrate key concepts in animal evolution from primary literature
- participate in discussions on topics presented by others

Abstract
The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Emphasis is on processes that are specific to bacteria and archaea and that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest.

Objective
The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms.
Important biochemical processes specific to bacteria and archaea will be presented that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest. Emphasis is on concepts of energy generation and assimilation.

List of topics:
- Eating sugars and letting them in
- Challenging: Aromatics, xenobiotics, and oil
- Complex: (Ligno-)Cellulose and in demand for bioenergy
- Living on a diet and the anaerobic provocation
- Of climate relevance: The microbial C1 cycle
- What are AMO and Anammox?
- 20 amino acids: the making of
- Extending the genetic code
- The 21st and 22nd amino acid
- Some exotic biochemistry: nucleotides, cofactors
- Ancient biochemistry? iron-sulfur clusters, polymers
- Secondary metabolites: playground of evolution

A script will be provided during the course.

### 551-1105-00L Glycobiology

**Abstract**
Structural principles, nomenclature and different classes of glycosylation. The different pathways of N- and O-linked protein glycosylation and glycolipid biosynthesis in prokaryotes and eukaryotes are discussed. Specific glycan binding proteins and their role in deciphering the glycan code are presented. The role of glycans in infectious diseases, antigen mimicry and autoimmunity are discussed.

**Objective**
Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glycobiology, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

**Content**
- Structure and linkages; analytical approaches; N-linked protein glycosylation (ER, Golgi); glycan-assisted protein folding and quality control; O-linked protein glycosylation; glucosaminoglycans; glycoproteins; prokaryotic glycosylation pathways; lectins; glycans and infectious disease

**Lecture notes**
handouts

**Literature**

**Prerequisites / notice**
The course will be in English. It will include the preparation of short essays (marked) about defined topics in Glycobiology.

### 551-1117-00L Cutting Edge Topics: Immunology and Infection Biology

**Abstract**
Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.

**Objective**
Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.

The aim of this course is to confront students with current research topics and with scientific presentation. The course offers the opportunity to gain in depth knowledge about diverse topics which are often only briefly touched in the concept courses and to engage in discussion with experts in the field.

**Content**
- Immunology and infection biology.
  - The specific topics are variable and depend each semester on the list of invited experts.

### 551-1153-00L Systems Biology of Metabolism

**Number of participants limited to 15.**

**Abstract**
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

**Objective**
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

**Content**
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

**Lecture notes**
Script and original publications will be supplied during the course.

**Prerequisites / notice**
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

### 551-1177-00L Immunology: from Milestones to Current Topics

**Abstract**
Milestones in Immunology: on old concepts and modern experiments

**Objective**
The course will cover six grand topics in immunology (B cells, innate immunity, antigen presentation, tumor immunity, thymus and T cells, cytotoxic T cells and NK cells) and for each grand topic four hours will be allocated. During the first double hour, historical milestone papers will be presented by the supervisor providing an overview on the development of the conceptional framework and critical technological advances. The students will also prepare themselves for this double lecture by reading the historical milestone papers and contributing to the discussion. In the following lecture up to four students will present each a recent high impact research paper which emerged from the landmark achievements of the previously discussed milestone concepts.

**Content**
- Milestones and current topics of innate immunity, antigen presentatin, B cells, thymus and T cells, cytotoxic T cells and NK cells, and tumor immunology.
- Original and review articles will be distributed by the lecturer.

**Literature**
Literaturunterlagen werden vor Beginn des Kurses auf folgender website zugänglich sein: Moodle Course https://moodle-app2.let.ethz.ch/course/view.php?id=1002

### 551-1303-00L Cellular Biochemistry of Health and Disease

**Number of participants limited to 15.**

**Abstract**
During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies.
Objective
Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to introduce, present, evaluate, critically discuss and write about recent scientific articles in the research area of cellular biochemistry.

Content
Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with occasional frontal presentations. Students will alternate as discussion leaders throughout the semester, with the student leader responsible to briefly summarize key general knowledge and context of the assigned primary research paper. Together with the faculty expert, all students will participate in discussion of the primary paper, including the foundation of the biological question, specific questions addressed, key methods, key results, remaining gaps and research implications.

Literature
The literature will be provided during the course

Prerequisites / notice
The course will be taught in English

701-1409-00L Research Seminar: Ecological Genetics

Minimum number of participants is 4.

Abstract
In this research seminar we will critically discuss current topics in Ecological Genetics using publications from the leading scientific journals in this field.

Objective
It is our aim that participants gain insight into the current research topics and knowledge available in Ecological Genetics and learn to critically assess and appreciate scientific publications in this field.

Lecture notes
none

Prerequisites / notice
Active participation in the discussions is a prerequisite for this course.

529-0733-00L Enzymes

Abstract
Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Objective
Overview of enzymes, enzyme-catalyzed reactions and metabolic processes.

Content
Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Lecture notes
A script will not be handed out.

Literature
General:

In addition, citations from the original literature relevant to the individual lectures will be assigned weekly.

551-1407-00L RNA Biology Lecture Series I: Transcription & Processing & Translation

Abstract
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Objective
The students should obtain an understanding of these processes, which are at work during gene expression.

Content
Transcription & 3'end formation ; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

Elective Major: Molecular Health Sciences

**Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with occasional frontal presentations. Students will alternate as discussion leaders throughout the semester, with the student leader responsible to briefly summarize key general knowledge and context of the assigned primary research paper. Together with the faculty expert, all students will participate in discussion of the primary paper, including the foundation of the biological question, specific questions addressed, key methods, key results, remaining gaps and research implications.**

- **Literature**
  - The literature will be provided during the course

- **Prerequisites / notice**
  - The course will be taught in English.

---

**551-0512-00L: Current Topics in Molecular and Cellular Neurobiology**

- **Number of participants limited to 8.**

- **Abstract**
  - The course is a seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

- **Objective**
  - The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

- **Content**
  - You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer).

- **Lecture notes**
  - Presentations will be made available after the seminars.

- **Prerequisites / notice**
  - You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

---

**551-1153-00L: Systems Biology of Metabolism**

- **Number of participants limited to 15.**

- **Abstract**
  - Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

- **Objective**
  - Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

- **Content**
  - The course will be given as a mixture of lectures, research studies, and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capacities/limits are. The problem areas range from metabolic networks regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

- **Lecture notes**
  - Script and original publications will be supplied during the course.

---

**551-1105-00L: Glycobiology**

- **Number of participants limited to 15.**

- **Abstract**
  - Structural principles, nomenclature and different classes of glycosylation. The different pathways of N- and O-linked protein glycosylation and glycolipid biosynthesis in prokaryotes and eukaryotes are discussed. Specific glycans binding proteins and their role in deciphering the glycan code are presented. The role of glycans in infectious diseases, antigen mimicry and autoimmunity are discussed.

- **Objective**
  - Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glycobiology, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

- **Content**
  - Structure and linkages; analytical approaches; N-linked protein glycosylation (ER, Golgi); glycan-assisted protein folding and quality control; O-linked protein glycosylation; glucosaminoglycans; glycolipids; prokaryotic glycosylation pathways; lectins; glycans and infectious disease.

- **Lecture notes**
  - Handouts

- **Prerequisites / notice**
  - The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

---

**551-1107-00L: Immunology: from Milestones to Current Topics**

- **Number of participants limited to 8.**

- **Abstract**
  - The course will cover six grand topics in immunology (B cells, innate immunity, antigen presentation, tumor immunity, thymus and T cells, cytotoxic T cells and NK cells) and for each grand topic four hours will be allocated. During the first double hour, historical milestone papers will be presented by the supervisor providing an overview on the development of the conceptional framework and critical technological advances. The students will also prepare themselves for this double lecture by reading the historical milestone papers and contributing to the discussion. In the following lecture up to four students will present each a recent high impact research paper which emerged from the landmark achievements of the previously discussed milestone concepts.

- **Content**
  - Milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells and NK cells, and tumor immunology.

- **Lecture notes**
  - Original and review articles will be distributed by the lecturer.

---

**752-6105-00L: Epidemiology and Prevention**

- **Abstract**
  - The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.
### 636-0003-00L

**Objective:**
The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware on how epidemiological facts are used in prevention, practice and politics.

**Content:**
The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples form nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

What is translational science and what is it not?

- Disease concepts and consequences for research
- Basics about incidence, prevalence etc., and orphan indications
- How to choose the appropriate research type and methodology
- Ethical considerations including ethics application
- Pros and cons of different types of research
- Coordination of complex approaches incl. timing and resources
- How to measure success?
- Outcome variables
- Improving the translational process
- Challenges of communication?
- How independent is translational science?
- Academic boundary conditions vs. industrial influences

Positive and negative examples will be illustrated by distinguished guest speakers.

551-1145-00L  Viral and non-Viral Vectors for Human Gene-Therapy - from Pathogens to Safe Medical Applications

ECTS: 2 credits

Objective
- Knowledge of important viral and non-viral vector systems.
- Knowledge of application in human diseases.
- Knowledge of limiting factors.

Content
- Basic aspects of virology, the viral mechanisms for transfer of genetic material into cells, different vector-systems and target cells, animal models, specific applications for inborn diseases of the immune system and of metabolism, adverse effects, and new developments of vector systems will be taught.

Abstract
- The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to introduce, present, evaluate, critically discuss and write about recent scientific articles in the research area of cellular biochemistry.

Prerequisites / notice
- No enrolment at ETH Zurich. Enrolment must be directly at UZH.
- No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.
- Lectures and seminars are taught in English.
- To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Objective
- The students should obtain an understanding of these processes, which are at work during gene expression.

Content
- Transcription & 3'end formation ; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

Prerequisites / notice
- Basic knowledge of cell and molecular biology.

Objective
- The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Content
- Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Lecture notes
- Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
- Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
- To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Objective
- Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to introduce, present, evaluate, critically discuss and write about recent scientific articles in the research area of cellular biochemistry.

Content
- Basic knowledge of cell and molecular biology.

Abstract
- The course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Prerequisites / notice
- The students should obtain an understanding of these processes, which are at work during gene expression.

Content
- Transcription & 3'end formation ; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

**Abstract**

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of euchromatic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective**

This course focuses on the concepts of classical and modern genetics and genomics.

**Content**

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of euchromatic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**

Scripts and additional material will be provided during the semester.

**Prerequisites / notice**

This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UZH Irchel.

**Abstract**

The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Emphasis is on processes that are specific to bacteria and archaee that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest.

**Objective**

The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms.
Important biochemical processes specific to bacteria and archaea will be presented that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest. Emphasis is on concepts of energy generation and assimilation.

List of topics:
- Eating sugars and letting them in
- Challenging: Aromatics, xenobiotics, and oil
- Complex: (Ligno-)Cellulose and in demand for bioenergy
- Living on a diet and the anaerobic fermentation
- Of climate relevance: The microbial C1 cycle
- What are AMO and Anammox?
- 20 amino acids: the making of
- Extending the genetic code
- The 21st and 22nd amino acid
- Some exotic biochemistry: nucleotides, cofactors
- Ancient biochemistry? Iron-sulfur clusters, polymers
- Secondary metabolites: playground of evolution

Lecture notes
A script will be provided during the course.

551-1153-00L Systems Biology of Metabolism

W 4 credits 2V U. Sauer, N. Zamboni, M. Zampieri

Number of participants limited to 15.

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics.

For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes
Script and original publications will be supplied during the course.

Prerequisites / notice
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

636-0001-00L Separations in Biotechnology and Bioprocess

Economy
W 6 credits 3G S. Panke

Abstract
Separations play an integral part of any biotechnological process. This course aims at enabling students specifically with a chemistry/biology background to select & roughly design suitable separation processes for typical biotechnological products such as monoclonal antibodies, antibiotics, and fine chemicals and at providing a basic set of purification operations & judge on process economy.

Objective
Students should be able to select for a given biotechnological product a suitable set of purification operations and judge on process economy.

Content
Introduction membrane operations adsorption and chromatography crystallization overall process economics

Lecture notes
Handouts during course

636-0007-00L Computational Systems Biology

W 6 credits 3+2U J. Stelling

Abstract
Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

Objective
The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

Content
Biomedicine has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

Lecture notes
https://www.ethz.ch/content/specialinterest/bsse/computational-systems-biology/en/education/lectures/csb/LectureMaterial.html

401-0649-00L Applied Statistical Regression

W 5 credits 2V+1U M. Dettling

Abstract
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

Objective
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Lecture notes
A script will be available.

Literature
- Faraway (2005): Linear Models with R
- Faraway (2006): Extending the Linear Model with R
- Draper & Smith (1998): Applied Regression Analysis
- Fox (2008): Applied Regression Analysis and GLMs
- Montgomery et al. (2006): Introduction to Linear Regression Analysis
Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

636-0003-00L

Biological Engineering and Biotechnology

Abstract
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Objective
1. Insight Into The Mammalian Cell Cycle. Cycling, The Balance Between Proliferation and Cancer - Implications For Biopharmaceutical Manufacturing.
2. The Licence To Kill. Apoptosis Regulatory Networks - Engineering of Survival Pathways To Increase Robustness of Production Cell Lines.

Lecture notes
Handout during the course.

529-0041-00L

Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics

Abstract
Modern mass spectrometry, hyphenated analytical methods, speciation, methods of surface analysis, chemometrics.

Objective
Comprehensive knowledge about the analytical methods introduced in this course, and their applications.

Content
Coupling of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: Time of flight and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Methods of surface analysis (ESCA, Auger, SIMS, raster microscopy methods). Employment of computer science for processing data in chemical analysis (chemometrics).

Lecture notes
lecture notes will be available in the lecture at production cost.

Literature
Information about relevant literature will be available in the lecture & in the lecture notes.

Prerequisites / notice
Exercises are an integral part of the lecture. Prerequisites:
529-0051-00 "Analytische Chemie I (3. Semester)"
529-0058-00 "Analytische Chemie II (4. Semester)"
(or equivalent)

551-1407-00L

RNA Biology Lecture Series I: Transcription & Processing & Translation

Abstract
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Objective
Transcription & 3'end formation ; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

Content
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytis.

Lecture notes
Scripts and additional material will be provided during the semester.

Concepts in Modern Genetics

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.

Abstract Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

Objective Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

Content Bioinformatics I will cover the following topics:

- From genes to databases and information BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

Abstract Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Objective Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines

Content Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccine

Lecture notes / literature no script

Mainly based on recent original literature, a detailed list will be distributed during the first lecture.

**Abstract**
The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates physiology and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.

**Objective**
The new course "Molecular Life of Plants" reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels.

The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.

**Content**
The course "Molecular Life of Plants" will cover the following topics in a developmental context:

- Plant genome organization
- Seed anatomy
- Food reserves and mobilization
- Seedling emergence
- Heterotrophic to autotrophic growth
- Chlorophyll biosynthesis, photoreceptors
- Integration of metabolism
- Hormones
- Cell cycle
- Cell differentiation and expansion
- Environmental interactions
- Environmental interactions
- Flower development and fertilization
- Embryo and seed development
- Fruit development
- Senescence

**Abstract**
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Objective**
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Content**
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Lecture notes**
Updated handouts will be provided during the class.

**Literature**
Current literature references will be provided during the lectures.

**Prerequisites / notice**
English
The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.
Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

551-1295-00L
Introduction to Bioinformatics: Concepts and Applications

Abstract
Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

Objective
Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics tools through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

Content
Bioinformatics I will cover the following topics:

From genes to databases and information
BLAST searches
Prediction of gene function and regulation
RNA structure prediction
Gene expression analysis using microarrays
Protein sequence and structure databases
WWW for bioinformatics
Protein sequence comparisons
Proteomics and de novo protein sequencing
Protein structure prediction
Cellular and protein interaction networks
Molecular dynamics simulation

701-2413-00L
Evolutionary Genetics

Abstract
The concept course ‘Evolutionary Genetics’ consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

Objective
The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

Content
Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.
Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding; effects on fitness; Fisher’s fundamental theorem.
Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 268 of 1570
Abstract
The focus is on the potential to assess strategies and tactics of pest management, taking into account the demands from the economy, the environment and the society. Significant agricultural approaches will be explained using practical examples, including prevention using natural resources, surveillance and forecasting, resistance management, as well as product registration, incl. ecotoxicology.

Objective
The students gain a good understanding of fundamental aspects of pest management in agroecosystems. They will have the ability to assess options for action in view of requirements from the economy, the ecology and the society. Further, they will learn to perform searches on relevant issues in pest management, and to critically evaluate case studies.

551-1105-00L Glycobiology
W 4 credits
2V M. Aebi, T. Hennet

Abstract
Structural principles, nomenclature and different classes of glycosylation. The different pathways of N- and O-linked protein glycosylation and glycolipid biosynthesis in prokaryotes and eukaryotes are discussed. Specific glycan binding proteins and their role in deciphering the glycan code are presented. The role of glycans in infectious diseases, antigen mimicry and autoimmunity are discussed.

Objective
Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glycobiology, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

Content
Structure and linkages; analytical approaches; N-linked protein glycosylation (ER, Golgi); glycan-assisted protein folding and quality control; O-linked protein glycosylation; glucosaminglycans; glycolipids; prokaryotic glycosylation pathways; lectins; glycans and infectious disease

Lecture notes
Handouts

Literature
Introduction to Glycobiology; M.E. Taylor, K. Drickamer, Oxford University Press, 2003

Prerequisites / notice
The course will be in English. It will include the preparation of short essays (marked) about defined topics in Glycobiology.

551-1103-00L Microbial Biochemistry
W 4 credits
2V J. Vorholt-Zambelli, J. Piel

Abstract
The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Emphasis is on processes that are specific to bacteria and archaea and that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest.

Objective
The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms.

Content
Important biochemical processes specific to bacteria and archaea will be presented that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest. Emphasis is on concepts of energy generation and assimilation.

List of topics:
Eating sugars and letting them in
Challenging: Aromatics, xenobiotics, and oil
Complex: (Ligno-)Cellulose and in demand for bioenergy
Living on a diet and the anaerobic provocation
Of climate relevance: The microbial C1 cycle
What are AMO and Anammox?
20 amino acids: the making of
Extending the genetic code
The 21st and 22nd amino acid
Some exotic biochemistry: nucleotides, cofactors
Ancient biochemistry: Iron-sulfur clusters, polymers
Secondary metabolites: playground of evolution

Lecture notes
A script will be provided during the course.

529-0733-00L Enzymes
W 7 credits
3G D. Hilvert

Abstract
Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Objective
Overview of enzymes, enzyme-catalyzed reactions and metabolic processes.

Content
Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Lecture notes
A script will not be handed out.

Literature
General:

In addition, citations from the original literature relevant to the individual lectures will be assigned weekly.

751-5121-00L Insect Ecology
W 2 credits
2V R. R. Kariyat Ramachandran, C. De Moraes, M. Mescher

Abstract
This is an introductory course in insect ecology. Students will learn about the ways in which insects interact with and adapt to their abiotic and biotic environments and their roles in diverse ecosystems. The course will entail lectures, outside readings, and critical analysis of contemporary literature.

Objective
Students completing this course should become familiar with the application of ecological principles to the study of insects, as well as major areas of inquiry in this field. Highlighted topics will include insect behavior, chemical and sensory ecology, physiological responses to biotic and abiotic stressors, plant-insect interactions, community and food-web dynamics, and disease ecology. The course will emphasize insect evolution and adaptation in the context of specific interactions with other organisms and the abiotic environment. Examples from the literature incorporated into lectures will highlight the methods used to study insect ecology.

Lecture notes
Provided to students through ILIAS

Literature
Selected required readings (peer reviewed literature, selected book chapters). Optional recommended readings with additional information.

551-1153-00L Systems Biology of Metabolism
W 4 credits
2V U. Sauer, N. Zamboni, M. Zampieri

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes
Script and original publications will be supplied during the course.
Prerequisites / notice

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

751-4504-00L Plant Pathology I  

| Abstract | Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies. |

| Objective | Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies. |

| Content | Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. |

Lecture Topics and Tentative Schedule

Week 1  No Lecture: First day of autumn semester

Week 2  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nematode attack strategies and types of damage.

Week 5  Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6  Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, performed chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7  Pisatin and pisatin demethylase. Local and systemic acquired resistance, signal molecules.

Week 8  Pathogen effects on food quality and safety.

Week 9  Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 10  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11  Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELISA, PCR, rDNA and rep-PCR.

Week 12  Strategies for minimizing disease risks: principles of disease control and management.

Week 13  Disease control strategies: economic thresholds, physical control methods.

Week 14  Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

Lecture notes

Recent Advances in Biocommunication  

| Number of participants limited to 25 |

| Abstract | Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods. |

551-1407-00L RNA Biology Lecture Series I: Transcription & Processing & Translation

| Abstract | This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation. |

| Objective | The students should obtain an understanding of these processes, which are at work during gene expression. |

| Content | Transcription & 3'end formation ; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover, signal transduction & RNA. |

551-0307-00L Molecular and Structural Biology I: Protein Structure and Function

| Abstract | Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology. |

#### Introduction to Bioinformatics: Concepts and Applications

- Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

- In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

- Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.
Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

**Elective Major: Systems Biology**

Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

**Abstract**

Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

**Objective**

The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

**Content**

- Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

- We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

<td>Spatio-Temporal Modelling in Biology</td>
<td>W</td>
<td>5 credits</td>
<td>3G</td>
<td>D. Iber</td>
</tr>
</tbody>
</table>

**Abstract**

This course focuses on modeling spatio-temporal problems in biology, in particular on the cell and tissue level. A wide range of mathematical techniques will be presented as part of the course, including concepts from non-linear dynamics (ODE and PDE models), stochastic techniques (SDE, Master equations, Monte Carlo simulations), and thermodynamic descriptions.

**Objective**

The aim of the course is to introduce students to state-of-the-art mathematical modelling of spatio-temporal problems in biology. Students will learn how to choose from a wide range of modelling techniques and how to apply these to further our understanding of biological mechanisms. The course aims at equipping students with the tools and concepts to conduct successful research in this area; both classical as well as recent research work will be discussed.

**Content**

1. Introduction to Modelling in Biology
2. Morphogen Gradients
3. Turing Pattern
4. Travelling Waves & Wave Pinning
5. Application Example 1: Dorso-ventral axis formation
6. Chemotaxis, Cell Adhesion & Migration
7. Introduction to Numerical Methods
8. Simulations on Growing Domains
9. Image-Based Modelling
10. Branching Processes
11. Cell-based Simulation Frameworks
12. Application Example 2: Limb Development
13. Summary

**Lecture notes**

All lecture material will be made available online.

https://www.bsse.ethz.ch/cobi/education/636-0706-00L_Spatio_Temporal_Modeling_in_Biology.html
The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Emphasis is on processes that are specific to bacteria and archaea and that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest.

List of topics:
- Eating sugars and letting them in
- Challenging: Aromatics, xenobiotics, and oil
- Complex: (Ligno-)Cellulose and in demand for bioenergy
- Living on a diet and the anaerobic fermentation
- Of climate relevance: The microbial C1 cycle
- What are AMO and Anammox?
- 20 amino acids: the making of
- Extending the genetic code
- The 21st and 22nd amino acid
- Some exotic biochemistry: nucleotides, cofactors
- Ancient biochemistry? Iron-sulfur clusters, polymers
- Secondary metabolites: playground of evolution

A script will be provided during the course.

### Systems Biology of Metabolism

- **551-1153-00L**
  - **Title:** Systems Biology of Metabolism
  - **ECTS:** 4
  - **Hours:** 2V
  - **Lecturers:** U. Sauer, N. Zamboni, M. Zampieri

#### Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

#### Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

#### Content
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

#### Lecture notes
Script and original publications will be supplied during the course.

### Separations in Biotechnology and Bioprocess

- **551-0571-00L**
  - **Title:** From DNA to Diversity (University of Zurich)
  - **ECTS:** 2
  - **Hours:** 2V
  - **Lecturers:** A. Hajnal, D. Bopp, E. Hafen

#### Prerequisites / notice
The final presentation of the project is typically at the MIT (Cambridge, US). Other competing schools include regularly Imperial College, Cambridge University, Harvard University, UC Berkeley, Princeton University, CalTech, etc. This project takes place between end of Spring Semester and beginning of Autumn Semester. Registration in April.

Please note that the number of ECTS credits and the actual work load are disconnected.
The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly
analysed model organisms.

By the end of this module, each student should be able to
- recognize the universal principles underlying the development of different animal body plans,
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity,
- relate changes in gene structure or function to evolutionary changes in animal development.

Key skills:
By the end of this module, each student should be able to
- present and discuss a relevant evolutionary topic in an oral presentation
- select and integrate key concepts in animal evolution from primary literature
- participate in discussions on topics presented by others

636-0009-00L Evolutionary Dynamics

Abstract
Evolutionary dynamics is concerned with the mathematical principles according to which life has evolved. This course offers an introduction
to mathematical modeling of evolution, including deterministic and stochastic models.

Objective
The goal of this course is to understand and to appreciate mathematical models and computational methods that provide insight into the
evolutionary process.

Content
Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we
observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the
context of different biological systems, focusing on asexual populations. Viruses and cancer cells provide the most prominent examples of
such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population
genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts
which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies
equation, evolution of HIV, evolutionary game theory, birth-death processes, evolutionary stability, evolutionary graph theory, somatic
evolution of cancer, stochastic tunneling, cell differentiation, hematopoietic tumor stem cells, genetic progression of cancer and the speed
of adaptation, diffusion theory, fitness landscapes, neutral networks, branching processes, evolutionary escape, and epistasis.

Lecture notes
No.

Literature

Prerequisites / notice
Prerequisites: Basic mathematics (linear algebra, calculus, probability)

Elective Major: Structural Biology and Biophysics

Elective Compulsory Concept Courses

See D-BIOL Master Studies Guide

Cellular Biochemistry (Part I)

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and
regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and
signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of
cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular
characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and
 genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.
The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal
regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into
complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and
 cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and
compartamentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular
transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.
This course focuses on the concepts of classical and modern genetics and genomics.

This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English.

The course takes place on Monday afternoon at ETH Hoengerberg, and on Tuesday morning at UZH Irchel.

**Abstract**

Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

**Objective**

Overview of enzymes, enzyme-catalyzed reactions and metabolic processes.

**Content**

Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

**Lecture notes**

A script will not be handed out.

**Literature**

General:

In addition, citations from the original literature relevant to the individual lectures will be assigned weekly.
Computer Simulation in Chemistry, Biology and Physics

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

529-0004-00L

**Abstract**

Molecular models, Force fields, Boundary conditions, Electrostatic interactions, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.

**Objective**

Introduction to computer simulation of (bio)molecular systems, development of skills to carry out and interpret computer simulations of biomolecular systems.

**Content**

Molecular models, Force fields, Spatial boundary conditions, Calculation of Coulomb forces, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.

**Lecture notes**

Available (copies of powerpoint slides distributed before each lecture)

**Literature**

See: www.csms.ethz.ch/education/CSCBP

**Prerequisites / notice**

Since the exercises on the computer do convey and test essentially different skills as those being convened during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam.

For more information about the lecture: www.csms.ethz.ch/education/CSCBP

401-0649-00L

**Applied Statistical Regression**

This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

**Objective**

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

**Content**

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

**Lecture notes**

A script will be available.

**Literature**

Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

**Prerequisites / notice**

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

401-6215-00L

**Using R for Data Analysis and Graphics (Part I)**

The course provides the first part an introduction to the statistical software R for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

**Objective**

The students will be able to use the software R for simple data analysis.

**Content**

The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

**Lecture notes**

An Introduction to R. http://stat.ethz.ch/Rman/doc/contrib/Lam-IntroductionToR_LHL.pdf

The course resources will be provided via the Moodle web learning platform

Please login (with your ETH (or other University) username+password) at https://moodle-app2.let.ethz.ch/enrol/users.php?id=1145

Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

401-0041-00L

**Modern Mass Spectrometry, Hypenphenated Methods, and Chemometrics**

Modern mass spectrometry, hyphenated analytical methods, speciation, methods of surface analysis, chemometrics.

**Objective**

Comprehensive knowledge about the analytical methods introduced in this course, and their applications. Coupling of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: Time of flight and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Methods of surface analysis (ESCA, Auger, SIMS, raster microscopy methods). Employment of computer science for processing data in chemical analysis (chemometrics).

**Lecture notes**

Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.
lecture notes will be available in the lecture at production cost. information about relevant literature will be available in the lecture & in the lecture notes.

Objective
The course discusses current topics and cutting edge research in the structural, molecular, and biochemical study of cellular macromolecules. Student participation is an essential component of the course and will contribute to the exam grade

Abstract
The course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Content
Transcription & 3'end formation; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

Objective
The goal is to discuss cutting edge research in the structural, molecular, and biochemical study of cellular macromolecules. Students will also have an opportunity to present and discuss recent breakthroughs relevant to the research fields presented by the faculty teaching the course (see http://www.mol.biol.ethz.ch/research.html for details on the topics).

Abstract
The course discusses current topics and cutting edge research in the structural, molecular, and biochemical study of cellular macromolecules. Student participation is an essential component of the course and will contribute to the exam grade.

529-0241-00L Advanced Methods and Strategies in Synthesis

Abstract
Advanced Modern Methods and Strategies in Synthesis

Objective
Knowledge of modern methods in asymmetric stereoccontrol, enantioselective catalysis, and organic reaction mechanisms.

Content
Current trends in methods for and approaches to synthesis of complex natural products, pharmaceuticals, and biological molecules; fragment coupling and protecting group strategies; chemical ligation and biomolecules synthesis; enantioselective catalysis including ligand design and optimization; cross coupling reactions from preactivated precursors; C-H activation and oxidation chemistry; building block synthesis with chiral auxiliaries and reagents; new concepts in asymmetric catalysis. Analysis of key primarily literature including identification of trends, key precendents, and emerging topics will be emphasized.

Lecture notes
will be provided in class and online

Literature
Suggesting Textbooks

529-0233-00L Organic Synthesis: Methods and Strategies

Abstract
The complex relation between structural analysis, methods leading to desired transformations, and insight into reaction mechanisms is exemplified. Relations between retrosynthetic analysis of target structures, synthetic methods and their combination in a synthetic strategy.

Objective
Extension and deepening of the knowledge in organic synthesis.

Content

Literature

529-0243-00L Reactive Intermediates

Abstract
Advanced physical organic chemistry. Methods for the elucidation of reaction mechanisms. Reactive intermediates, Thermochemistry; isotope labeling; cross-over experiments; kinetic isotope effects; thermodynamics-kinetics correlations; solvation and ion pairs; radical reactions; electron transfer; spectroscopic methods.

Objective
Methods for the elucidation of organic reaction mechanisms.

Content

Literature
A printed script are handed out in the course. This material is also available for download from the web page of the course (as pdf files).

Prerequisites / notice
A printed script are handed out in the course. This material is also available for download from the web page of the course (as pdf files).

529-0041-00L Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics

Abstract
Modern mass spectrometry, hyphenated analytical methods, speciation, methods of surface analysis, chemometrics.

Objective
Comprehensive knowledge about the analytical methods introduced in this course, and their applications.

Content
Coulping of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: Time of flight and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Methods of surface analysis (ESCA, Auger, SIMS, raster microscopy methods). Employment of computer science for processing data in chemical analysis (chemometrics).

Literature
lecture notes will be available in the lecture at production cost

Prerequisites / notice
information about relevant literature will be available in the lecture & in the lecture notes.

551-1407-00L RNA Biology Lecture Series I: Transcription & Processing & Translation

Abstract
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Objective
The students should obtain an understanding of these processes, which are at work during gene expression.

Content
Transcription & 3’end formation; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

Prerequisites / notice
Basic knowledge of cell and molecular biology.

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 281 of 1570
I. Ethics & the Process of Ethical Inquiry

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

Integrity in Research & Research Misconduct
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 Rs (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access;
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

**ECTS** European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
The course addresses basic science and engineering principles governing the nano domain. Special emphasis is placed on the emerging field of molecular electronic devices, their working principles, applications, and how they may be assembled. Special emphasis is placed on the emerging field of molecular electronic devices, their working principles, applications, and how they may be assembled.

Topics are treated in 2 blocks:

(I) From Quantum to Continuum
- From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.
- Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.
- Self-assembly and directed assembly of 2D and 3D structures.

(II) Interaction Forces on the Micro and Nano Scale
- Self-assembly and directed assembly of 2D and 3D structures.
- Special emphasis is placed on the emerging field of molecular electronic devices.

Familiarize students with basic science and engineering principles governing the nano domain.

The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics that are traditionally taught separately.

Prerequisites:
The lecture will be taught in English.

Lecture notes:
The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

Handouts (available online):

For more information on the course, please refer to the lecture notes and handouts provided online.
### Prerequisites / notice

**227-0385-10L** Biomedical Imaging

| W | 6 credits | 5G | S. Kozerke, K. P. Prüssmann, M. Rudin |

**Abstract**

Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

**Objective**

To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

**Content**

- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

**Lecture notes**

Lecture notes and handouts

**Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming**

---

**227-0386-00L** Biomedical Engineering

**Abstract**

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

**Objective**

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

**Content**

**227-0393-10L** Bioelectronics and Biosensors

| W | 6 credits | 2V+2U | J. Vörös, M. F. Yanik, T. Zambelli |

**New course. Not to be confounded with 227-0393-00L last offered in the Spring Semester 2015.**

**Abstract**

The course introduces the concepts of bioelectricity and biosensing. The sources and use of electrical fields and currents in the context of biological systems and problems are discussed. The fundamental challenges of measuring biological signals are introduced. The most important biosensing techniques and their physical concepts are introduced in a quantitative fashion.

**Objective**

During this course the students will:

- learn the basic concepts in biosensing and bioelectronics
- be able to solve typical problems in biosensing and bioelectronics
- learn about the remaining challenges in this field
L1. Bioelectronics history, its applications and overview of the field
- Volta and Galvani dispute
- BMI, pacemaker, cochlear implant, retinal implant, limb replacement devices
- Fundamentals of biosensing
- Glucometer and ELISA

L2. Fundamentals of quantum and classical noise in measuring biological signals

L3. Biomeasurement techniques with photons

L4. Acoustics sensors
- Differential equation for quartz crystal resonance
- Acoustic sensors and their applications

L5. Engineering principles of optical probes for measuring and manipulating molecular and cellular processes

L6. Optical biosensors
- Differential equation for optical waveguides
- Optical sensors and their applications
- Plasmonic sensing

L7. Basic notions of molecular adsorption and electron transfer
- Quantum mechanics: Schrödinger equation energy levels from H atom to crystals, energy bands
- Electron transfer: Marcus theory, Gerischer theory

L8. Potentiometric sensors
- Fundamentals of the electrochemical cell at equilibrium (Nernst equation)
- Principles of operation of ion-selective electrodes

L9. Amperometric sensors and bioelectric potentials
- Fundamentals of the electrochemical cell with an applied overpotential to generate a faraday current
- Principles of operation of amperometric sensors
- Ion flow through a membrane (Fick equation, Nernst equation, Donnan equilibrium, Goldman equation)

L10. Channels, amplification, signal gating, and patch clamp Y4

L11. Action potentials and impulse propagation

L12. Functional electric stimulation and recording
- MEA and CMOS based recording
- Applying potential in liquid 4 simulation of fields and relevance to electric stimulation

Literature
Plošney and Barr, Bioelectricity: A Quantitative Approach (Third edition)

Prerequisites / notice
Supervised exercises solving real-world problems. Some Matlab based exercises in groups.

227-0427-00L Signal and Information Processing: Modeling, Filtering, Learning
Module W 6 credits 4G H.-A. Loeliger

Abstract
Fundamentals in signal processing, detection/estimation, and machine learning.
I. Linear signal representation and approximation: Hilbert spaces, LMMSE estimation, regularization and sparsity.

Objective
The course is an introduction to some basic topics in signal processing, detection/estimation theory, and machine learning.

Lecture notes
Lecture notes.

Prerequisites / notice
Prerequisites:
- local bachelors: course "Discrete-Time and Statistical Signal Processing" (5. Sem.)
- others: solid basics in linear algebra and probability theory

227-1037-00L Introduction to Neuroinformatics
Module W 6 credits 2V+1U K. A. Martin, M. Cook, V. Mante, M. Pfeiffer

Abstract
The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

Objective
Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neuronal computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

Content
This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.
Biocompatible Materials

Abstract
Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Objective
The class consists of three parts:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

Content
Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Diffuse and local molecular applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explicated materials are discussed.

In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

Lecture notes
Handouts can be accessed online.

| 227-0447-00L | Image Analysis and Computer Vision | W    | 6 credits | 3V+1U | L. Van Gool, O. Göksel, E. Konukoglu |
Abstract

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content
The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention. Different methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Lecture notes
Course material, computer demonstrations, exercises and problem solutions

Prerequisites / notice
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C. The course language is English.

227-0468-00L Analog Signal Processing and Filtering

Suitable for Master Students as well as Doctoral Students.

Abstract
This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers.

Objective
This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers. The way the exam is done allows for the different interests of the two groups.

Content
At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during the whole term to analyze circuits and understand how signals propagate through them. The theory and CMOS implementation of active Filters is then discussed in detail using the example of Gm-C filters and active-RC filters. The ideal and nonideal behaviour of opamps, current conveyors, and inductor simulators follows. The link to the practical design of circuits and systems is done with an overview over different quality measures and figures of merit used in scientific literature and datasheets. Finally, an introduction to discrete-time and mixed-domain filters and circuits is given, including sensor read-out amplifiers, correlated double sampling, and chopping, and an introduction to sigma-delta A/D and D/A conversion on a system level.

Lecture notes
The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

227-0981-00L Cross-Disciplinary Research and Development in Medicine and Engineering

W 4 credits 2V+2A V. Kurtcuoglu, D. de Julien de Zelicourt, M. Meboldt, M. Schmid Daners, O. Ulrich

Abstract
Cross-disciplinary collaboration between engineers and medical doctors is indispensable for innovation in health care. This course will bring together engineering students from ETH Zurich and medical students from the University of Zurich to experience the rewards and challenges of such interdisciplinary work in a project-based learning environment.

Objective
The main goal of this course is to demonstrate the differences in communication between the fields of medicine and engineering. Since such differences become the most evident during actual collaborative work, the course is based on a current project in physiology research that combines medicine and engineering. For the engineering students, the specific aims of the course are to:

- Acquire a working understanding of the anatomy and physiology of the investigated system;
- Identify the engineering challenges in the project and communicate them to the medical students;
- Develop and implement, together with the medical students, solution strategies for the identified challenges;
- Present the found solutions to a cross-disciplinary audience.

Content
After a general introduction to interdisciplinary communication and detailed background on the collaborative project, the engineering students will receive tailored lectures on the anatomy and physiology of the relevant system. They will then team up with medical students who have received a basic introduction to engineering methodology to collaborate on said project. In the process, they will be coached both by lecturers from ETH Zurich and the University of Zurich, receiving lectures customized to the project. The course will end with each team presenting their solution to a cross-disciplinary audience.

Lecture notes
Handouts and relevant literature will be provided.

227-1033-00L Neuromorphic Engineering

W 6 credits 2V+3U T. Delbruck, G. Indiveri, S.-C. Liu

Abstract
This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Objective
Understanding of the characteristics of neuromorphic circuit elements.
Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulation of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

Physical Modelling and Simulation

This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

Objective

Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability (a) to develop own simple field simulation programs, (b) to select an appropriate field solver for a given problem, (c) to perform field simulations, (d) to evaluate the obtained results, and (e) to interactively improve the models until sufficiently accurate results are obtained.

Content

The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. After the introduction follows a detailed overview of the available numerical methods for solving electromagnetic, thermal and mechanical boundary value problems. This part of the course contains a general introduction into numerical methods, differential and integral forms, linear equation systems, Finite Difference Method (FDM), Boundary Element Method (BEM), Method of Moments (MoM), Multiple Multipole Program (MMP) and Finite Element Method (FEM). The theoretical part of the course finishes with a presentation of multiphysics simulations through several practical examples of HF-engineering such as coupled electromagnetic-mechanical and electromagnetic-thermal analysis of MEMS.

In the second part of the course the students will work in small groups on practical simulation problems. For solving practical problems the students can develop and use own simulation programs or chose an appropriate commercial field solver for their specific problem. This practical simulation work of the students is supervised by the lecturers.

Energy Conversion and Transport in Biosystems

Theory and application of thermodynamics and energy conversion in biological systems with focus on the cellular level.

Objective

Theory and application of energy conversion at the cellular level. Understanding of the basic features governing solutes transport in the principal systems of the human cell. Connection of characteristics and patterns from other fields of engineering to biofluidics. Heat and mass transport processes in the cell, generation of forces, work and relation to biomedical technologies.

Content

Mass transfer models for the transport of chemical species in the human organism. Organization and function of the cell membrane and of the cell cytoskeleton. The role of molecular motors in cellular force generation and their function in cell migration. Description of the functionality of these systems and of analytical experimental and computational techniques for understanding of their operation.

Lecture notes

Material in the form of hand-outs will be distributed.

Microscale Acoustofluidics

Number of participants limited to 30.

Objective

Understanding acoustophoresis, the design of devices and potential applications

Content

Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity. Gorkov potential, numerical modelling, acoustofluidic streaming, applications from ultrasonic microfluidics to surface acoustic wave devices

Lecture notes

Prerequisites / notice

Solid and fluid continuum mechanics. Notice: The exercise part is a mixture of presentation, lab session and hand in homework.

Frontiers in Nanotechnology

Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.

Objective

Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within mammade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

Content

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the-art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

Lecture notes

All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.
Sensory and Vegetative Functions

Abstract
Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Content
Introduction, problem definition, overview
- Rehabilitation of visual function
  - Anatomy and physiology of the visual sense
  - Technical aids (glasses, sensor substitution)
  - Retina and cortex implants
- Rehabilitation of hearing function
  - Anatomy and physiology of the auditory sense
  - Hearing aids
  - Cochlea Implants
- Rehabilitation and use of kinesthetic and tactile function
  - Anatomy and physiology of the kinesthetic and tactile sense
  - Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
- Rehabilitation of vestibular function
  - Anatomy and physiology of the vestibular sense
  - Rehabilitation strategies and devices (e.g. BrainPort)
- Rehabilitation of vegetative Functions
  - Cardiac Pacemaker
  - Phrenic stimulation, artificial breathing aids
  - Bladder stimulation, artificial sphincter
  - Brain stimulation and recording
  - Deep brain stimulation for patients with Parkinson, epilepsy, depression
  - Brain-Computer Interfaces

Literature
Introductory Books:

Selected Journal Articles and Web Links:
VideoTact, ForeThought Development, LLC. http://my.execpc.com/?dwysocki/videotac.html
Prerequisites / notice
Target Group: Students of higher semesters and PhD students of - D-MAVT, D-ITET, D-INFK, D-HEST - Biomedical Engineering, Robotics, Systems and Control - Medical Faculty, University of Zurich
Students of other departments, faculties, courses are also welcome
This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

376-1351-00L Micro/Nanotechnology and Microfluidics for W 2 credits 2V E. Delamarche

Abstract
This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard-disk technology for biosensing and scanning microfluidics for analyzing tissue sections are just a few examples of the covered topics.

Objective
The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having a background in the life sciences. The course should familiarize the students with the techniques used in micro/nanotechnology and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and medical applications. The second objective is to have life students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

Content
Mostly formal lectures (2 x 45 min), with a 2 hour visit and introduction to cleanroom and micro/nanotechnology instruments, last 3 sessions would be dedicated to the presentation and evaluation of projects by students (3 students per team).

376-1351-00L Micro/Nanotechnology and Microfluidics for W 2 credits 2V E. Delamarche

Prerequisites / notice
Nanotech center and lab visit at IBM would be mandatory, as well as attending the student project presentations.

529-0837-00L Biomicrofluidic Engineering W 7 credits 3G A. de Mello

Abstract
Microfluidics describes the behaviour, control and manipulation of fluids that are geometrically constrained within sub-microfluid environments. The use of microfluidic devices offers an opportunity to control physical and chemical processes with unrivalled precision, and in turn provides a route to performing chemistry and biology in an ultra-fast and high-efficiency manner.

Objective
In the course students will investigate the theoretical concepts behind micro/nanofluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis. A design workshop will allow students to develop new microscale flow processes by appreciating the dominant physics at the microscale. The application of these basic ideas will primarily focus on biological problems and will include a treatment of diagnostic devices for use at the point-of-care, advanced functional material synthesis, DNA analysis, proteomics and cell-based assays. Lectures, assignments and the design workshop will acquaint students with the state-of-the-art in applied microfluidics.

Content
Specific topics in the course include, but not limited to:

1. Theoretical Concepts
   - Features of mass and thermal transport on the microscale
   - Key scaling laws
2. Microfluidic Device Manufacture
   - Conventional lithographic processing of rigid materials
   - Soft lithographic processing of plastics and polymers
   - Mass fabrication of polymeric devices
3. Unit operations and functional components
   - Analytical separations (electrophoresis and chromatography)
   - Chemical and biological synthesis
   - Sample pre-treatment (filtration, SPE, pre-concentration)
   - Molecular detection
4. Design Workshop
   - Design microfluidic architectures for PCR, distillation & mixing
5. Contemporary Applications in Biological Analysis
   - Microarrays
   - Cellular analyses (single cells, enzymatic assays, cell sorting)
   - Proteomics
6. System integration
   - Applications in radiochemistry, diagnostics and high-throughput experimentation

Lecture notes
Lecture handouts, background literature, problem sheets and notes will be provided electronically.

636-0003-00L Biological Engineering and Biotechnology W 6 credits 3V M. Fussenegger

Abstract
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Objective
1. Insight Into The Mammalian Cell Cycle. Cycling, The Balance Between Proliferation and Cancer - Implications For Biopharmaceutical Manufacturing.
2. The Licence To Kill. Apoptosis Regulatory Networks - Engineering of Survival Pathways To Increase Robustness of Production Cell Lines.
5. From Target To Market. An Antibody's Journey From Cell Culture to Development of Biological Weapons?
7. Functional Food. Enjoy your Meal!

Lecture notes
Hands out during the course.

Number Title Type ECTS Hours Lecturer(s)
227-0399-10L Physiology and Anatomy for Biomedical Engineers I W 3 credits 2G H. Niemann

Abstract
This course offers an introduction into the structure and function of the human body, and how these are interlinked with one another. Focusing on physiology, the visualization of anatomy is supported by 3D-animation, Computed Tomography and Magnetic Resonance imaging.

Objective
To understand basic principles and structure of the human body in consideration of the clinical relevance and the medical terminology used in medical work and research.
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011
Silbernagl S., Despopoulos A. Color Atlas of Physiology; Thieme 2008
Faller A., Schuenke M. The Human Body; Thieme 2004
Netter F. Atlas of human anatomy; Elsevier 2014

ECTS Hours
X-ray imaging

The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

Lectures will include the following topics: DNA, chromosomes, RNA, protein, genetics, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer, development and stem cells.

In addition, three journal clubs will be held, where one/two publications will be discussed (part I: 1 Journal club, part II: 2 Journal Clubs). For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication. These written documents will be graded and count as 25% for the final grade.

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

The course language is English.

227-0965-00L Micro and Nano-Tomography of Biological Tissues

Abstract
The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

Content
Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

Abstract
This course is geared towards master and PhD students with a focus on bioimaging. It covers advanced topics in magnetic resonance imaging in biennial rotation, including the electrodynamics of MR signal detection, noise mechanisms, image reconstruction, radiofrequency pulse design, RF pulse trains, as well as advanced contrast mechanisms.

Objective
see above

Prerequisites / notice
Basic knowledge of computer vision would be helpful.

Number
227-0389-00L

Abstract
This is an introductory course on Terahertz (THz) technology and applications. Devices operating in THz frequency range (0.1 to 10 THz) have been increasingly studied in the recent years. Progress in nonlinear optical materials, ultrafast optical and electronic techniques has strengthened research in THz application developments. Due to unique interaction of THz waves with materials, applications with new capabilities can be developed. In theory, they can penetrate somewhat like X-rays, but are not considered harmful radiation, because THz energy level is low. They should be able to provide resolution as good or better than magnetic resonance imaging (MRI), possibly with simpler equipment. Imaging, very-high bandwidth communication, and energy harvesting are the most widely explored THz application areas. We will study the basics of THz generation, manipulation, and detection. Our emphasis will be on the physical principles and applications of THz in the domain of imaging, communication and energy harvesting.

Objective
This course will provide a solid foundation for understanding physical principles of THz applications. We will discuss various building blocks of THz technology - components dealing with generation, manipulation, and detection of THz electromagnetic radiation. We will introduce THz applications in the domain of imaging, communications, and energy harvesting.
INTRODUCTION

Computational Psychiatry

The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. After

APPLICATIONS

Prerequisites / notice

Whenever we deviate from the main material discussed in these books, softcopy of lectures notes will be provided.

227-0967-00L Computationsl Neuroimaging Clinic  W  3 credits  2V  K. E. Stephan

Prerequisite: Successful completion of course "Methods & Models for fMRI Data Analysis" (227-0969-00L).

Abstract

This seminar teaches problem solving skills for computational neuroimaging, based on joint analyses of neuroimaging and behavioural data. It deals with a wide variety of real-life problems that emerged from this seminar to the neuroimaging community at Zurich, e.g. mass-univariate and multivariate analyses of fMRI/EEG data, or generative models of fMRI, EEG, or behavioural data.

Objective

1. Consolidation of theoretical knowledge (obtained in the following courses: 'Methods & models for fMRI data analysis', 'Translational Neuroimaging', 'Computational Psychiatry') in a practical setting.

2. Acquisition of practical problem solving strategies for computational modeling of neuroimaging data.

Content

This seminar teaches problem solving skills for computational neuroimaging, based on joint analyses of neuroimaging and behavioural data. It deals with a wide variety of real-life problems that emerged from this seminar to the neuroimaging community at Zurich, e.g. mass-univariate and multivariate analyses of fMRI/EEG data, or generative models of fMRI, EEG, or behavioural data.

Prerequisites / notice

The participants are expected to have successfully completed at least one of the following courses: 'Methods & models for fMRI data analysis', 'Translational Neuroimaging', 'Computational Psychiatry'.

227-0969-00L Methods & Models for fMRI Data Analysis  W  6 credits  4V  K. E. Stephan

Abstract

This course teaches methods and models for fMRI data analysis, covering all aspects of statistical parametric mapping (SPM), incl. preprocessing, the general linear model, statistical inference, multiple comparison corrections, event-related designs, and Dynamic Causal Modelling (DCM), a Bayesian framework for identification of nonlinear neuronal systems from neurophysiological data.

Objective

To obtain in-depth knowledge of the theoretical foundations of SPM and DCM and of their application to empirical fMRI data.

Content

This course teaches methods and models for fMRI data analysis. It covers all aspects of statistical parametric mapping (SPM), incl. preprocessing, the general linear model, frequentist and Bayesian inference, multiple comparison corrections, and event-related designs, and Dynamic Causal Modelling (DCM), a Bayesian framework for identification of nonlinear neuronal systems from neurophysiological data. A particular emphasis of the course will be on methodological questions arising in the context of studies in psychiatry, neurology and neuroeconomics.

227-0971-00L Computational Psychiatry  W  3 credits  4S  K. E. Stephan

Abstract

This five-day course teaches state-of-the-art methods in computational psychiatry. It covers various computational models of cognition (e.g., learning and decision-making) and brain physiology (e.g., effective connectivity) of relevance for psychiatric disorders. The course not only provides theoretical background, but also demonstrates open source software in application to concrete examples.

Objective

This course aims at bridging the gap between mathematical modelers and clinical neuroscientists by teaching computational techniques in the context of clinical applications. The hope is that the acquisition of a joint language and tool-kit will enable more effective communication and joint translational research between fields that are usually worlds apart.

Content

This five-day course teaches state-of-the-art methods in computational psychiatry. It covers various computational models of cognition (e.g., learning and decision-making) and brain physiology (e.g., effective connectivity) of relevance for psychiatric disorders. The course not only provides theoretical background, but also demonstrates open source software in application to concrete examples.

227-2037-00L Physical Modelling and Simulation  W  5 credits  4G  C. Hafner, J. Leuthold, J. Smajic

Abstract

This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

Objective

Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability (a) to develop own simple field simulation programs, (b) to select an appropriate field solver for a given problem, (c) to perform field simulations, (d) to evaluate the obtained results, and (e) to interactively improve the models until sufficiently accurate results are obtained.

Content

The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. After the introduction follows a detailed overview of the available numerical methods for solving electromagnetic, thermal and mechanical boundary value problems. This part of the course contains a general introduction into numerical methods, differential and integral forms, linear equation systems, Finite Difference Method (FDM), Boundary Element Method (BEM), Method of Moments (MoM), Multiple Multipole Program (MMP) and Finite Element Method (FEM). The theoretical part of the course finishes with a presentation of multiphysics simulations through several practical examples of HF-engineering such as coupled electromagnetic-mechanical and electromagnetic-thermal analysis of MEMS.

In the second part of the course the students will work in small groups on practical simulation problems. For solving practical problems the students can develop and use own simulation programs or chose an appropriate commercial field solver for their specific problem. This practical simulation work of the students is supervised by the lecturers.

151-0105-00L Quantitative Flow Visualization  W  4 credits  2V+1U  T. Rösgen

Abstract

The course provides an introduction to digital image analysis in modern flow diagnostics. Different techniques which are discussed include image velocimetry, laser induced fluorescence, liquid crystal thermography and interferometry. The physical foundations and measurement configurations are explained. Image analysis algorithms are presented in detail and programmed during the exercises.

Objective

Introduction to modern imaging techniques and post processing algorithms with special emphasis on flow analysis and visualization. Understanding of hardware and software requirements and solutions. Development of basic programming skills for (generic) imaging applications.
Virtual Reality in Medicine

**Abstract**
Virtual Reality has the potential to support medical training and therapy. This lecture will derive the technical principles of multi-modal (audiovisual, haptic, tactile etc.) input devices, displays and rendering techniques. Examples are presented in the fields of surgical training, intra-operative augmentation, and rehabilitation. The lecture is accompanied by practical courses and excursions.

**Objective**
Provide theoretical and practical knowledge of new principles and applications of multi-modal simulation and interface technologies in medical education, therapy, and rehabilitation.

**Content**
Virtual Reality has the potential to provide descriptive and practical information for medical training and therapy while relieving the patient and/or the physician. Multi-modal interactions between the user and the virtual environment facilitate the generation of high-fidelity sensory impressions, by using not only visual and auditory modalities, but also kinesthetic, tactile, and even olfactory feedback. On the basis of the existing physiological constraints, this lecture will derive the technical requirements and principles of multi-modal input devices, displays, and rendering techniques. Several examples are presented that are currently being developed or already applied for surgical training, intra-operative augmentation, and rehabilitation. The lecture will be accompanied by several practical courses on graphical and haptic display devices as well as excursions to facilities equipped with large-scale VR equipment.

**Target Group:**
Students of higher semesters and PhD students of
- D-HEST, D-MAVT, D-ITET, D-INFK, D-PHYS
- Robotics, Systems and Control Master
- Biomedical Engineering/Movement Science and Sport
- Medical Faculty, University of Zurich
- Students of other departments, faculties, courses are also welcome!

**Language:**

**Prerequisites / Notice:**
The course language is English.
Basic experience in Information Technology and Computer Science will be of advantage.
More details will be announced in the lecture.

**Content**
- Fundamentals of optics, flow visualization and electronic image acquisition.
- Frequently used image processing techniques (filtering, correlation processing, FFTs, color space transforms).
- Image Velocimetry (tracking, pattern matching, Doppler imaging).
- Surface pressure and temperature measurements (fluorescent paints, liquid crystal imaging, infrared thermography).
- Laser induced fluorescence.
- (Digital) Schlieren techniques, phase contrast imaging, interferometry, phase unwrapping.
- Wall shear and heat transfer measurements.
- Pattern recognition and feature extraction, proper orthogonal decomposition.

**Prerequisites / Notice**
Prerequisites: Fluidodynamics I, Numerical Mathematics, programming skills.
Language: German on request.

**Literature**

**Prerequisites / Notice**
The course language is English.
Basic experience in Information Technology and Computer Science will be of advantage.
More details will be announced in the lecture.

**Content**
- From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.
- Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.
- Self-assembly and directed assembly of 2D and 3D structures.
- Special emphasis on the emerging field of molecular electronic devices.

**Objective**
Familiarize students with basic science and engineering principles governing the nano domain.

**Content**
The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics that are traditionally taught separately.

**Topics are treated in 2 blocks:**

(I) From Quantum to Continuum

From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale

Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.

Self-assembly and directed assembly of 2D and 3D structures.

**Literature**

**Prerequisites / Notice**
Course format:
Lectures and Mini-Review presentations: Thursday 10-13, ML F 36

**Homework:** Mini-Reviews
Students select a paper (list distributed in class) and expand the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper.

**Content**
- Computer Graphics

This course covers some of the fundamental concepts of computer graphics, namely 3D object representations and generation of photorealistic images from digital representations of 3D scenes.

**Objective**
At the end of the course the students will be able to build a rendering system. The students will study the basic principles of rendering and image synthesis. In addition, the course is intended to stimulate the students’ curiosity to explore the field of computer graphics in subsequent courses or on their own.
This course covers fundamental concepts of modern computer graphics. Students will learn about 3D object representations and the details of how to generate photorealistic images from digital representations of 3D scenes. Starting with an introduction to 3D shape modeling and representation, texture mapping and ray-tracing, we will move on to acceleration structures, the physics of light transport, appearance modeling and global illumination principles and algorithms. We will end with an overview of modern image-based image synthesis techniques, covering topics such as lightfields and depth-image based rendering.

The programming assignments will be in C++. This will not be taught in the class.

Physics in Medical Research: From Atoms to Cells

**Objective**

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

**Abstract**

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is extended to optical and electronic properties as well as to proteins and cells.

**Content**

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

**Prerequisites / notice**

Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++, Visual Computing course recommended.

**Literature**

- Physics in Medical Research: From Atoms to Cells
- G. Indiveri, S.-C. Liu
- T. Delbrück

**Registration in this class requires the permission of the instructors. Class size will be limited to available lab spots. Preference is given to students that require this class as part of their major.**

Neuromorphic Engineering I

**Objective**

Understanding the characteristics of neuromorphic circuit elements.

**Abstract**

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

**Content**

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

**Literature**

- S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

**Prerequisites / notice**

Particular: The course is highly recommended for those who intend to take the spring semester course ‘Neuromorphic Engineering II’, that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

**Prerequisites:** Background in basics of semiconductor physics helpful, but not required.

**Registration in this class requires the permission of the instructors. Class size will be limited to available lab spots. Preference is given to students that require this class as part of their major.**

Introduction to Neuroinformatics

**Objective**

Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, math, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enigmas and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

**Abstract**

The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.
This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

<td>The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.</td>

The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

### Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

### Content
Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

### Lecture notes
Available online

### Literature
Will be indicated during the lecture.

---

### Recommended Elective Courses

These courses are particularly recommended for the Biomechanics track. Please consult your track advisor if you wish to select other subjects.

### Abstract
- Theory and application of thermodynamics and energy conversion in biological systems with focus on the cellular level.
- Theory and application of energy conversion at the cellular level. Understanding of the basic features governing solutes transport in the principal systems of the human cell. Connection of characteristics and patterns from other fields of engineering to biofluidics. Heat and mass transport processes in the cell, generation of forces, work and relation to biomedical technologies.
- Mass transfer models for the transport of chemical species in the human cell. Organization and function of the cell membrane and of the cell cytoskeleton. The role of molecular motors in cellular force generation and their function in cell migration. Description of the functionality of these systems and of analytical experimental and computational techniques for understanding of their operation.
- Introduction to cell metabolism, cellular energy transport and cellular thermodynamics.
- Material in the form of hand-outs will be distributed.

### Lecture notes
- Lecture notes and references therein.
- The lecture deals with constitutive models that are relevant for design and calculation of structures. These include anisotropic linear elasticity, linear viscoelasticity, plasticity, viscoplasticity. Homogenization theories and laminate theory are presented. Theoretical models are complemented by examples of engineering applications and experiments.
- Basic theories for solving continuum mechanics problems of engineering applications, with particular attention to material models.
- The lecture will be taught in English.

263-5001-00L Introduction to Finite Elements and Sparse Linear System Solving W 4 credits 2V+1U P. Arbenz

Abstract
The finite element (FE) method is the method of choice for (approximately) solving partial differential equations on complicated domains. In the first third of the lecture, we give an introduction to the method. The rest of the lecture will be devoted to methods for solving the large sparse linear systems of equation that a typical for the FE method. We will consider direct and iterative methods.

Objective
Students will know the most important direct and iterative solvers for sparse linear systems. They will be able to determine which solver to choose in particular situations.
I. THE FINITE ELEMENT METHOD

(1) Introduction, model problems.
(2) 1D problems. Piecewise polynomials in 1D.
(3) 2D problems. Triangulations. Piecewise polynomials in 2D.
(4) Variational formulations. Galerkin finite element method.
(5) Implementation aspects.

II. DIRECT SOLUTION METHODS

(6) LU and Cholesky decomposition.
(7) Sparse matrices.
(8) Fill-reducing orderings.

III. ITERATIVE SOLUTION METHODS

(9) Stationary iterative methods, preconditioning.
(10) Preconditioned conjugate gradient method (PCG).
(11) Incomplete factorization preconditioning.
(12) Multigrid preconditioning.
(13) Nonsymmetric problems (GMRES, BiCGstab).
(14) Indefinite problems (SYMMLQ, MINRES).

Prerequisites / notice

Prerequisites: Linear Algebra, Analysis, Computational Science.
The exercises are made with Matlab.

376-1103-00L Frontiers in Nanotechnology

Abstract Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.

Objective Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within manmade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the-art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

Content Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what biospired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

Lecture notes All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

376-1219-00L Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions

Abstract Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.
Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
- Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

Literature
Introductory Books:

Practical books and monographs:

Selected Journal Articles and Web Links:

Prerequisites /notice
Target Group:
Students of higher semesters and PhD students of
- D-MAVT, D-ITET, D-INFK, D-HEST
- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich
- Students of other departments, faculties, courses are also welcome

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

376-1279-00L Virtual Reality in Medicine W 3 credits 2V R. Rienen

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 302 of 1570
Virtual Reality has the potential to support medical training and therapy. This lecture will derive the technical principles of multi-modal (audiovisual, haptic, tactile etc.) input devices, displays and rendering techniques. Examples are presented in the fields of surgical training, intra-operative augmentation, and rehabilitation. The lecture is accompanied by practical courses and excursions.

Target Group:
- Students of higher semesters and PhD students of - D-HEST, D-MAVT, D-ITET, D-INFK, D-PHYS
- Robotics, Systems and Control Master
- Biomedical Engineering/Movement Science and Sport
- Medical Faculty, University of Zurich

Students of other departments, faculties, courses are also welcome!

Abstract
Virtual Reality has the potential to provide descriptive and practical information for medical training and therapy while relieving the patient and/or the physician. Multi-modal interactions between the user and the virtual environment facilitate the generation of high-fidelity sensory impressions, by using not only visual and auditory modalities, but also kinesthetic, tactile, and even olfactory feedback. On the basis of the existing physiological constraints, this lecture will derive the technical requirements and principles of multi-modal input devices, displays, and rendering techniques. Several examples are presented that are currently being employed or already applied for surgical training, intra-operative augmentation, and rehabilitation. The lecture will be accompanied by several practical courses on graphical and haptic display devices as well as excursions to facilities equipped with large-scale VR equipment.

Prerequisites / notice

376-1714-00L
Biocompatible Materials
W 4 credits 3G K. Manirula, J. Möller, M. Zenobi-Wong

Abstract
Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Objective
- The class consists of three parts:
  1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
  2. The concept of biocompatibility.
  3. Introduction into methodology used in biomaterials research and application.

Content
Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

Lecture notes
Handouts provided during the classes and references therein.

Micro/Nanotechnology and Microfluidics for Biomedical Applications
W 2 credits 2V E. Delamarche

Abstract
This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard-disk technology for biosensing and scanning microfluidics for analyzing tissue sections are just a few examples of the covered topics.

Objective
- The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having a background in the life sciences. The course should familiarize the students with the techniques used in micro/nanotechnology and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and medical applications. The second objective is to have life students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

Content
Mostly formal lectures (2 × 45 min), with a 2 hour visit and introduction to cleanroom and micro/nanotechnology instruments, last 3 sessions would be dedicated to the presentation and evaluation of projects by students (3 students per team).

Prerequisites / notice
- Nanotech center and lab visit at IBM would be mandatory, as well as attending the student project presentations.

376-1720-00L
Application of MATLAB in the Human Movement Sciences
W 2 credits 2G R. van de Langenberg

Abstract
Students will learn to import, process and graphically present experimental data using the MATLAB computing environment. Both the data and the methods of analysis will be typical for experiments in Human Movement Science (i.e. kinematics, kinetics and electromyography).

Objective
- Students will acquire the ability to independently load, plot, and process kinematic, kinetic and electromyographical data using the MATLAB computing environment.

Content
- Drawbacks of Excel; Possibilities in MATLAB: Import of several data formats; Plot of one and more signals; Removing of an offset and filtering of data based on self-written functions; Normalisation and parametrisation of data; Reliability; Interpolation, Differentiation and Integration in MATLAB.

Literature
- During the lecture, several electronically available MATLAB introductions are indicated. Course-specific scripts will be provided by the lecturer.

Prerequisites / notice
- A Laptop with MATLAB installed (v2009 or higher) and wireless internet access is mandatory. Two students can share a laptop if necessary. A MATLAB student version can be obtained at Stud-IDES for free.

376-1974-00L
Colloquium in Biomechanics

Abstract
Current topics in biomechanics presented by speakers from academia and industry.
### 402-0341-00L  Biomechanics of Sports Injuries and Rehabilitation

**Abstract**
Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

**Objective**
Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure for the radiation exposure, medical imaging, and the consequences for tissue damage. Getting familiar with some fundamental physical concepts and allowing the students to understand how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

**Content**
The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the students to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy, and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

**Lecture notes**
A script will be provided.

### 402-0674-00L  Physics in Medical Research: From Atoms to Cells

**Abstract**
Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epileptiform growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

**Objective**
The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the size of the terraces of the (001) surface of the GaAs substrate and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

---

### 465-0953-00L  Biostatistics

**Abstract**
The course deals with simple quantitative and graphical as well as more complex methods of biostatistics. Contents: Descriptive statistics, probability theory and design of experiments, testing hypotheses, confidence intervals, correlation, simple and multiple linear regression, classification and prediction, diagnostic tests, measurement of agreement.

---

### 551-1295-00L  Introduction to Bioinformatics: Concepts and Applications

**Abstract**
Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.
Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical, and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics, and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

Bioinformatics I will cover the following topics:
- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

402-0341-00L Medical Physics I
| Objective | Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefit of patients and the society.
| Content | The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.
| Abstract | Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiologically and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulation.
| Lecturer | A. J. Lomax

402-0345-00L Introduction to Medical Physics
| Objective | It is the aim of this course to give bachelor and master level students an insight into the wide spectrum of medical applications of physics, and to provide some insight into the work of the medical physicist in clinics, industry and research.
| Content | The lecture series will begin with a short historical overview of medical physics and an overview of the lecture series (lecture 1). This will be followed by two lectures on the physics of medical imaging. Medical imaging is one of the most important areas of preventive medicine and diagnostics, and in these two lectures, we will summarise the physics aspects of all the most important medical imaging modalities (X-ray imaging, nuclear medicine, CT, MRI, Ultrasound imaging etc.). With lectures 4 and 5, we will move onto one of the other major areas of physics applied to medicine, radiotherapy. As the name implies, this is a physics-heavy discipline, being dependent as it is on both accelerator and particle physics. However, what is less well known is that this is also the second most successful treatment of cancer after surgery and a great success story for the application of physics to medicine. In lectures 6 and 7, we will then move on to a very different area, that of bio-photonics and bio-physics. Here we will look into the applications of lasers in medicine, from therapy to their use in particle acceleration for medical applications, as well as a variety of optical techniques for studying biological tissues, cells and structures.
| Abstract | Medical physics is a fascinating and worthwhile scientific discipline, providing many professional opportunities to apply physics to the care of patients, either in the clinic or in industry. It is also an area allowing for exciting, interesting and fulfilling areas of research.
| Lecturer | A. J. Lomax

227-0943-00L Radiobiology
| Objective | By the end of this course the participants will be able to:
| Content | a) interpret the 5 Rs of radiation oncology in the context of the hallmarks of cancer
| | b) understand factors which underpin the differing radiosensitivities of different tumors
| | c) follow rational strategies for combined treatment modalities of ionizing radiation with targeted agents
| | d) understand differences in the radiation response of normal tissue versus tumor tissue
| | e) understand different treatment responses of the tumor and the normal tissue to differential clinical-related parameters of radiotherapy (dose rate, LET etc.).
| Abstract | The purpose of this course is to impart basic knowledge in radiobiology in order to handle ionizing radiation and to provide a basis for predicting the radiation risk.
| Lecturer | M. Pruschy

227-0967-00L Medical Physics
| Objective | The lecture series will begin with a short historical overview of medical physics and an overview of the lecture series (lecture 1). This will be followed by two lectures on the physics of medical imaging. Medical imaging is one of the most important areas of preventive medicine and diagnostics, and in these two lectures, we will summarise the physics aspects of all the most important medical imaging modalities (X-ray imaging, nuclear medicine, CT, MRI, Ultrasound imaging etc.). With lectures 4 and 5, we will move onto one of the other major areas of physics applied to medicine, radiotherapy. As the name implies, this is a physics-heavy discipline, being dependent as it is on both accelerator and particle physics. However, what is less well known is that this is also the second most successful treatment of cancer after surgery and a great success story for the application of physics to medicine. In lectures 6 and 7, we will then move on to a very different area, that of bio-photonics and bio-physics. Here we will look into the applications of lasers in medicine, from therapy to their use in particle acceleration for medical applications, as well as a variety of optical techniques for studying biological tissues, cells and structures.
| Content | In the second half of the lecture series (lectures 8-13) the style changes somewhat, and we will concentrate on professional aspects of medical physics and the role of the medical physicist in various professional scenarios. As such, lectures 8-11 will cover the role of the clinical medical physicist in diagnostic radiology, MRI, nuclear medicine and radiotherapy, whilst the last two lectures will concentrate on their role in industry and research. For many of this second set of lectures, external experts in the various areas will be invited in order to give the student the best possible insight into the life of a professional medical physicist.
| Abstract | Einführung in die Strahlentherapie und in die Anwendungen der Strahlenbiologie. Allgemeine Grundlagen und Begrifflichkeiten; Mechanismen der biologischen Strahlentherapie; Strahlenwirkung auf Zielzellen; Gewebe und Organe; Strahlenbiologische Strahlenwirkung; Strahlentherapie; Chromosomenveränderungen, DNA-Defekte, Reparaturprozesse; Molekulare Strahlenbiologie; Bedeutung inter- und intrazellulärer Signalübermittlungsprozesse; Apoptose, Zellzyklus-Checkpoints; Strahlensensitive Strahlen; Krebsinduktion, Mutationen, Proliferation; Strahlenbiologische Grundlagen des Strahlenschutzes; Strahlentherapeutische Konzepte; Strahlentherapie; Strahlentherapie im Detail.
| Lecturer | M. Pruschy

227-0968-00L Clinical Physics
| Objective | The purpose of this course is to impart basic knowledge in radiobiology in order to handle ionizing radiation and to provide a basis for predicting the radiation risk.
| Content | a) interpret the 5 Rs of radiation oncology in the context of the hallmarks of cancer
| | b) understand factors which underpin the differing radiosensitivities of different tumors
| | c) follow rational strategies for combined treatment modalities of ionizing radiation with targeted agents
| | d) understand differences in the radiation response of normal tissue versus tumor tissue
| | e) understand different treatment responses of the tumor and the normal tissue to differential clinical-related parameters of radiotherapy (dose rate, LET etc.).
| Abstract | By the end of this course the participants will be able to:

Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

Other Elective Courses

These courses may be suitable for the Medical Physics track. Please consult your track advisor.

Abstract

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content
The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information necessary preprocessing steps of image analysis. These notions are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information necessary preprocessing steps of image analysis. These notions are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information necessary preprocessing steps of image analysis. These notions are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information necessary preprocessing steps of image analysis. These notions are introduced for that purpose.

Prerequisites / notice
Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites:
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.

The course language is English.

Abstract
The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

Content
Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanoscale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

**Abstract**
This course offers an introduction into the structure and function of the human body, and how these are interlinked with one another. Focusing on physiology, the visualization of anatomy is supported by 3D-animation, Computed Tomography and Magnetic Resonance imaging.

**Objective**
To understand basic principles and structure of the human body in consideration of the clinical relevance and the medical terminology used in medical work and research.

**Content**
- The Human Body: nomenclature, orientations, tissues
- Musculoskeletal system, Muscle contraction
- Blood vessels, Heart, Circulation
- Blood, Immune system
- Respiratory system
- Acid-Base-Homeostasis

**Abstract**
The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

**Objective**
After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

**Content**
Lectures will include the following topics: DNA, chromosomes, RNA, protein, genetics, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer, development and stem cells.

In addition, three journal clubs will be held, where one/two publications will be discussed (part I: 1 Journal club, part II: 2 Journal Clubs). For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication. These written documents will be graded and counted as 25% for the final grade.

**Lecture notes**
Scripts of all lectures will be available.

**Abstract**
Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.

**Objective**
Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within mammal and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the-art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

**Content**
Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health risk issues. Scientific aspects as well as the many of the emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

**Lecture notes**
All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

**Abstract**
Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

**Objective**
- 1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
- 2. The concept of biocompatibility.
- 3. Introduction into methodology used in biomaterials research and application.

**Content**
Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

**Lecture notes**
Handouts can be accessed online.
Parasite infection with Plasmodium vivax is a major global health problem. The goal of this course is to provide students with a wide general understanding of cell biology. The course deals with simple quantitative and graphical as well as more complex methods of biostatistics.

**Objective**

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced. The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

**Abstract**

**Physics in Medical Research: From Atoms to Cells**

**W 6 credits 2V+1U B. K. R. Müller**

**Abstract**

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

**Objective**

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced. The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. **Introduction to Bioinformatics: Concepts and Applications**

**W 6 credits 4G W. Gruissem, K. Bärenfaller, A. Callisch, G. Capitani, J. Fütterer, M. Robinson, A. Wagner**

**Abstract**

Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.
**Objective**

Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

**Content**

Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks

**Recommended Elective Courses**

*These courses are particularly recommended for the Molecular Bioengineering track. Please consult your track advisor if you wish to select other subjects.*

**Abstract**

Microinformatics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to fundamentals of this emerging field. Throughout the course students are expected to submit assignments. The course concludes with an end-of-semester examination.

**Objective**

The objective of this course is to expose students to the fundamental aspects of the emerging field of microinformatics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

**Content**

Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

**Lecture notes**

The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

**Prerequisites / notice**

The lecture will be taught in English.

**Abstract**

Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

**Objective**

To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.
### Content
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

### Literature
Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011

### Prerequisites / notice
Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

### 227-0386-00L Biomedical Engineering

|---|-----------|----|--------------------------------|

**Abstract**
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

**Objective**
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

**Abstract**
The course introduces the concepts of bioelectricity and biosensing. The sources and use of electrical fields and currents in the context of biological systems and problems are discussed. The fundamental challenges of measuring biological signals are introduced. The most important biosensing techniques and their physical concepts are introduced in a quantitative fashion.

**Objective**
During this course the students will:
- learn the basic concepts in biosensing and bioelectronics
- be able to solve typical problems in biosensing and bioelectronics
- learn about the remaining challenges in this field

**Content**
L1. Bioelectronics history, its applications and overview of the field
- Volta and Galvani dispute
- BMI, pacemaker, cochlear implant, retinal implant, limb replacement devices
- Fundamentals of biosensing
- Glucometer and ELISA

L2. Fundamentals of quantum and classical noise in measuring biological signals

L3. Biomeasurement techniques with photons

L4. Acoustics sensors
- Differential equation for quartz crystal resonance
- Acoustic sensors and their applications

L5. Engineering principles of optical probes for measuring and manipulating molecular and cellular processes

L6. Optical biosensors
- Differential equation for optical waveguides
- Optical sensors and their applications
- Plasmonic sensing

L7. Basic notions of molecular adsorption and electron transfer
- Quantum mechanics: Schrödinger equation energy levels from H atom to crystals, energy bands
- Electron transfer: Marcus theory, Gerischer theory

L8. Potentiometric sensors
- Fundamentals of the electrochemical cell at equilibrium (Nernst equation)
- Principles of operation of ion-selective electrodes

L9. Amperometric sensors and bioelectric potentials
- Fundamentals of the electrochemical cell with an applied overpotential to generate a faraday current
- Principles of operation of amperometric sensors
- Ion flow through a membrane (Fick equation, Nernst equation, Donnan equilibrium, Goldman equation)

L10. Channels, amplification, signal gating, and patch clamp Y4

L11. Action potentials and impulse propagation

L12. Functional electric stimulation and recording
- MEA and CMOS based recording
- Applying potential in liquid 2 simulation of fields and relevance to electric stimulation

L13. Neural networks memory and learning

<td>The course addresses undergraduate and graduate students interested in getting introduced into the basic concepts of biomineralization. The course aims to introduce the basic concepts of biomineralization and the underlying principles, such as supersaturation, nucleation and growth of minerals, the interaction of biomolecules with mineral surfaces, and cell biology of inorganic materials creation. An important part of this class is the independent study and the presentation of original literature from the field.</td>

Content

Biomineralization is a multidisciplinary field. Topics dealing with biology, molecular and cell biology, solid state physics, mineralogy, crystallography, organic and physical chemistry, biochemistry, dentistry, oceanography, geology, etc. are addressed. The course covers definition and general concepts of biomineralization (BM)/ types of biominerals and their function / crystal nucleation and growth / biological induction of BM / control of crystal morphology, habit, shape and orientation by organisms / strategies of compartmentalization / the interface between biomolecules (peptides, polysaccharides) and the mineral phase / modern experimental methods for studying BM phenomena / inter-, intra, extra- and epiecellular BM / organic templates and matrices for BM / structure of bone, teeth (vertebrates and invertebrates) and mollusk shells / calcification / siliication in diatoms, radiolaria and plants / calcium and iron storage / impact of BM on lithosphere and atmosphere/ evolution / taxonomy of organisms.

1. Introduction and overview
2. Biominerals and their functions
3. Chemical control of biomineralization
4. Control of morphology: Organic templates and additives
5. Modern methods of investigation of BM
6. BM in matrices: bone and nacre
7. Vertebrate teeth
8. Invertebrate teeth
9. BM within vesicles: calcite of coccoliths
10. silica
11. Iron storage and mineralization.

Lecture notes
Script with more than 600 pages with many illustrations will be distributed free of charge.

Literature

Prerequisites / notice
Each attendee is required to present a publication from the field. The selection of key papers is provided by the lecturer.

No special requirements are needed for attending. Basic knowledge in chemistry and cell biology is expected.

376-1622-00L Practical Methods in Tissue Engineering  W  5 credits  4P  K. Würtz-Kozak, M. Zenobi-Wong

Number of participants limited to 12.

Abstract
The goal of this course is to teach MSc students the necessary skills for doing research in the fields of tissue engineering and regenerative medicine.

Objective
Practical exercises and demonstrations on topics including sterile cell culture, light microscopy and histology, protein and gene expression analysis, and viability assays are covered. The advantages of 3D cell cultures will be discussed and practical work on manufacturing and evaluating hydrogels and scaffolds for tissue engineering will be performed in small groups. In addition to practical lab work, the course will teach skills in data acquisition/analysis.

402-0341-00L Medical Physics I  W  6 credits  2V+1U  P. Manser

Abstract
Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiological and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

Objective
Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of medical exposure. Getting familiar with methods to generate ionizing radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to teach that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

Content
The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiotherapy, radiology and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

Lecture notes
A script will be provided.

535-0423-00L Drug Delivery and Drug Targeting  W  2 credits  2V  J.-C. Leroux, D. Brambilla

Abstract
The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.

Objective
The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. This focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.

Content
The course covers the following topics: drug targeting and delivery principles, radiopharmaceuticals, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, delivery of active agents in tissue engineering, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices and novel trends in transdermal and nasal drug delivery.

Lecture notes
Selected lecture notes, documents and supporting material will be directly provided or may be downloaded using http://www.galenik.ethz.ch/teaching/drug_del_drug_targ

The website also displays additional information on peroral delivery systems, transdermal systems and systems for alternative routes (nasal, pulmonary) of delivery. These fields are covered in detail in the course Galenische Pharmazie II (Galenical Pharmacy II).

Literature

Further references will be provided in the course.

636-0507-00L Synthetic Biology II  W  4 credits  4A  S. Panke, Y. Benenson, J. Stelling

Abstract
7 months biological design project, during which the students are required to give presentations on advanced topics in synthetic biology (specifically genetic circuit design) and then select their own biological system to design. The system is subsequently modeled, analyzed, and experimentally implemented. Results are presented at an international student competition at the MIT (Cambridge).

Objective
The students are supposed to acquire a deep understanding of the process of biological design including model representation of a biological system, its thorough analysis, and the subsequent experimental implementation of the system and the related problems.

Content
Presentations on advanced synthetic biology topics (eg genetic circuit design, adaptation of systems dynamics, analytical concepts, large scale de novo DNA synthesis), project selection, modeling of selected biological systems, design space exploration, sensitivity analysis, conversion into DNA sequence (DNA synthesis external), analysis of results in form of scientific presentation and poster, presentation of results at the iGEM international student competition (www.igem.org).

Lecture notes
Handouts during course
Prerequisites / notice
The final presentation of the project is typically at the MIT (Cambridge, US). Other competing schools include regularly Imperial College, Cambridge University, Harvard University, UC Berkeley, Princeton University, CalTech, etc.

This project takes place between end of Spring Semester and beginning of Autumn Semester. Registration in April.

Please note that the number of ECTS credits and the actual work load are disconnected.

| Abstract       | This course is part I of a two-semester course. The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology. |
| Objective      | After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested. |
| Content        | Lectures will include the following topics: DNA, chromosomes, RNA, protein, genetics, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytokinetic cell cycle, cellular growth, apoptosis, autophagy, cancer, development and stem cells. |
| Lecture notes  | Scripts of all lectures will be available. |

Autumn Semester 2016
Page 314 of 1570
The course covers basic laboratory skills and safety, cell culture, protein analysis, RNA/DNA isolation, and RT-PCR. Each topic will be introduced, followed by practical work at the bench. Presence during the course is mandatory.

The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

* Topic 1: Structure of a Scientific Text (The Title, the author list, the abstract, State-of-the Art, the "in this paper" paragraph, the scientific part, the summary, Equations, Figures).

  * Topic 2: Power Point Presentations.

  * Topic 3: Citation Rules and Citation Software.

  * Topic 4: Guidelines for Research Integrity.

**Abstract**
The 4 hour lecture covers the basics of writing & presenting a scientific text. The focus will be on the structure and elements of a scientific text and not on the language. Citation rules, good practice of scientific writing and an overview on software tools will be part of the training.

**Objective**
Knowledge on structure and content of a scientific text. The course further is arranged to stimulate a discussion on how to properly write a legible scientific text versus writing an interesting novel. We will further discuss the practice of properly citing and critically reflect on recent plagiarism allegations.

**Content**

Abstract

Separations play an integral part of any biotechnological process. This course aims at enabling students specifically with a chemistry/biology background to select & roughly design suitable separation processes for typical biotechnological products such as monoclonal antibodies, and fine chemicals and at providing a basic set of purification operations & judge on process economy.

Objective

Students should be able to select for a given biotechnological product a suitable set of purification operations and judge on process economy.

Abstract

This lecture course is an introduction to systems biology. It explores how complex biological networks are experimentally studied and how the resulting data is mathematically evaluated in order to derive predictive models. The biology of selected cellular processes, ranging from protein interaction networks to gene controlling systems and signaling cascades will be discussed in detail.

Objective

The goal of this course is to learn how a detailed quantitative description of complex biological processes can be employed for a better understanding of molecular interactions, the power and efficiency of regulatory networks, and the evolution of biological complexity. Students will learn how to identify techniques producing quantitative data and how to develop mathematical models and efficient statistical inference algorithms to recognize patterns, molecular interrelationships and systems behavior.

Lecture notes

636-0011-00L Introduction to Biological Computers

Prerequisites: Synthetic Biology I (636-0002-00 L). Basic knowledge of molecular biology is assumed.
Abstract
Biological computers are man-made biological networks that interrogate and control biological hosts-cells and organisms-in which they operate. Their key features, inspired by computer science, are programmability, modularity and versatility. The course will show how to rationally design, implement and test biological computers using molecular engineering, DNA nanothechnology and synthetic biology.

Objective
The course has the following objectives:

* Familiarize students with parallels between theories in computer science and engineering and information-processing in live cells and organisms
* Introduce basic theories of computation
* Introduce approaches to creating novel biological computing systems in non-living environment and in living cells including bacteria, yeast and mammalian/human cells.

The covered approaches will include:
- Nucleic acids engineering
- DNA and RNA nanotechnology
- Synthetic biology and gene circuit engineering
- High-throughput genome engineering and gene circuit assembly

* Equip the students with computer-aided design (CAD) tools for biocomputing circuit engineering. A number of tutorials will introduce MATLAB SimBiology toolbox for circuit design and simulations

* Foster creativity, research and communication skills through semester-long "Design challenge" assignment in the broad field of biological computing and biological circuit engineering.
Note: the exact subjects can change, the details below should only serve for general orientation

Lecture 1. Introduction: what is molecular computation (part I)?
* What is computing in general?
* What is computing in the biological context (examples from development, chemotaxis and gene regulation)
* The difference between natural computing and engineered biocomputing systems

Lecture 2: What is molecular computation (part II) + State machines
1st hour
* Detailed definition of an engineered biocomputing system
* Basics of characterization
* Design challenge presentation

2nd hour
* Theories of computation: state machines (finite automata and Turing machines)

Lecture 3: Additional models of computation
* Logic circuits
* Analog circuits
* RAM machines

Basic approaches to computer science notions relevant to molecular computation. (i) State machines; (ii) Boolean networks; (iii) analog computing; (iv) distributed computing. Design Challenge presentation.

Lecture 4. Classical DNA computing
* Adleman experiment
* Maximal clique problem
* SAT problem

Lecture 5: Molecular State machines through self-assembly
* Tiling implementation of state machine
* DNA-based tiling system
* DNA/RNA origami as a spin-off of self-assembling state machines

Lecture 6: Molecular State machines that use DNA-encoded tapes
* Early theoretical work
* Tape extension system
* DNA and enzyme-based finite automata for diagnostic applications

Lecture 7: Introduction to cell-based logic and analog circuits
* Computing with (bio)chemical reaction networks
* Turing computation with ultrasensitivity and cooperativity
* Specific examples

Lecture 8: Transcriptional circuits I
* Introducing transcription-based circuits
* General features and considerations
* Guidelines for large circuit construction

Lecture 9: Transcriptional circuits II
* Large-scale distributed logic circuits in bacteria
* Toward large-scale circuits in mammalian cells

Lecture 10: RNA circuits I
* General principles of RNA-centered circuit design
* Riboswitches and sRNA regulation in bacteria
* Riboswitches in yeast and mammalian cells
* General approach to RNAi-based computing

Lecture 11: RNA circuits II
* RNAi logic circuits
* RNAi-based cell type classifiers
* Hybrid transcriptional/posttranscriptional approaches

Lecture 12: In vitro DNA-based logic circuits
* DNAzyme circuits playing tic-tac-toe against human opponents
* DNA brain

Lecture 13: Advanced topics
* Engineered cellular memory
* Counting and sequential logic
* The role of evolution
* Fail-safe design principles
Lecture notes

Lecture notes will be available online.

Literature

As a way of general introduction, the following two review papers could be useful:

Benenson, Y. Biocomputers: from test tubes to live cells. Molecular Biosystems 2009, 5:675:685

Prerequisites / notice

Compulsory attendance of (at least) 12 of 14 lectures. In addition, it is recommended that students take 636-0002-00 Synthetic Biology I prior to attending this course. Basic knowledge of molecular biology is assumed.

636-0013-00L Stem Cells: Biology and Therapeutic Manipulation W+ 6 credits 3G T. Schroeder

Abstract

Stem cells are central in tissue regeneration and repair, and hold great potential for therapy. We will discuss the role of stem cells in health and disease, and possibilities to manipulate their behavior for therapeutic application. Basic molecular cell biology, engineering and novel technologies relevant for stem cell research and therapy will be discussed.

Objective

Understanding of current knowledge, and lack thereof, in stem cell biology, regenerative medicine and required technologies. Theoretical preparation for practical laboratory experimentation with stem cells.

Content

We will use different diseases to discuss how to potentially model, diagnose or heal them by stem cell based therapies. This will be used as a guiding framework to discuss relevant concepts and technologies in cell and molecular biology, engineering, imaging, bioinformatics, tissue engineering, that are required to manipulate stem cells for therapeutic application.

Topics will include:
- Embryonic and adult stem cells and their niches
- Induced stem cells by directed reprogramming
- Relevant basic cell biology and developmental biology
- Relevant molecular biology
- Cell culture systems
- Cell fates and their molecular control by transcription factors and signalling pathways
- Cell reprogramming
- Disease modelling
- Tissue engineering
- Bioimaging, Bioinformatics
- Single cell technologies

636-0018-00L Data Mining I W 6 credits 3G K. M. Borgwardt

Abstract

Data Mining, the search for statistical dependencies in large databases, is of utmost importance in modern society, in particular in biological and medical research. This course provides an introduction to the key problems, concepts, and algorithms in data mining, and the applications of data mining in computational biology.

Objective

The goal of this course is that the participants gain an understanding of data mining problems and algorithms to solve these problems, in particular in biological and medical applications.

Content

The goal of the field of data mining is to find patterns and statistical dependencies in large databases, to gain an understanding of the underlying system from which the data were obtained. In computational biology, data mining contributes to the analysis of vast experimental data generated by high-throughput technologies, and thereby enables the generation of new hypotheses.

In this course, we will present the algorithmic foundations of data mining and its applications in computational biology. The course will feature an introduction to popular data mining problems and algorithms, reaching from classification via clustering to feature selection. This course is intended for both students who are interested in applying data mining algorithms and students who would like to gain an understanding of the key algorithmic concepts in data mining.

Tentative list of topics:
1. Distance functions
2. Classification
3. Clustering
4. Feature Selection

Lecture notes

Course material will be provided in form of slides.

Literature

Will be provided during the course.

Prerequisites / notice

Basic understanding of mathematics, as taught in basic mathematics courses at the Bachelor's level.

636-0020-00L Microtechnology and Microelectronics W+ 6 credits 3G A. Hierlemann

Prerequisites: Physics I and Physics II highly recommended

Abstract

Students are introduced to the basics of semiconductors, microelectronics, microtechnology, and silicon process technology. They will get to know the fabrication of silicon-based microdevices and -systems by a sequence of defined batch processing steps as well as dedicated microfabrication processes.

Objective

Students are introduced to the basics of semiconductors, microelectronics, microtechnology, and silicon process technology. They will get to know the different fabrication methods for various microdevices and systems.

Content

Introduction to semiconductors, microelectronics, microtechnology, and micro electro mechanical systems (MEMS):
- Fundamentals of semiconductors
- Basics of microelectronics: transistor and diode.
- Silicon processing and fabrication steps
- Silicon crystal structure and manufacturing
- Thermal oxidation
- Doping via diffusion and ion implantation
- Photolithography
- Thin film deposition: dielectrics and metals
- Wet etching & bulk micromachining
- Dry etching & surface micromachining
- Microelectronics processing and fabrication sequence
- Packaging

Lecture notes

Handouts in English
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

The class covers separation techniques that are central in the purification and downstream processing of chemicals and biopharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Liquid-liquid extraction; 2) Adsorption and chromatography; 3) Membrane processes; 4) Crystallization and precipitation.

Handouts during the class

Recommendations for text books will be covered in the class

Prerequisites / notice

Requirements: Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

This course focuses on the analysis of innovation as a pervasive process that cut across organizational and functional boundaries. It looks at the sources of innovation, at the tools and techniques that organizations deploy to routinely innovate, and the strategic implications of technical change.

This course intends to enable all students to:
- understand the core concepts necessary to analyze how innovation happens
- master the most common methods and tools organizations deploy to innovate
- develop the ability to critically evaluate the innovation process, and act upon the main obstacles to innovation

1. Inroduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

The class consists of three parts:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

Handouts can be accessed online.

Prerequisites / notice

No specific background in economics or management is required.

The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

The class covers separation techniques that are central in the purification and downstream processing of chemicals and biopharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Liquid-liquid extraction; 2) Adsorption and chromatography; 3) Membrane processes; 4) Crystallization and precipitation.

Handouts during the class

Recommendations for text books will be covered in the class

No specific background in economics or management is required.

A script will not be handed out. In addition, citations from the original literature relevant to the individual lectures will be assigned weekly.

529-0837-00L Biomicrofluidic Engineering W+ 7 credits 3G A. de Mello

Microfluidics describes the behaviour, control and manipulation of fluids that are geometrically constrained within sub-microliter environments. The use of microfluidic devices offers an opportunity to control physical and chemical processes with unrivalled precision, and in turn provides a route to performing chemistry and biology in an ultra-fast and high-efficiency manner.

In the course students will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis. A design workshop will allow students to develop new microscale flow processes by appreciating the dominant physics at the microscale. The application of these basic ideas will primarily focus on biological problems and will include a treatment of diagnostic devices for use at the point-of-care, advanced functional material synthesis, DNA analysis, proteomics and cell-based assays. Lectures, assignments and the design workshop will acquaint students with the state-of-the-art in applied microfluidics.

Specific topics in the course include, but not limited to:

1. Theoretical Concepts
2. Key scaling laws
3. Conventional lithographic processing of rigid materials
4. Soft lithographic processing of plastics and polymers
5. Mass fabrication of polymeric devices
6. Unit operations and functional components
7. Analytical separations (electrophoresis and chromatography)
8. Chemical and biological synthesis
9. Sample pre-treatment (filtration, SPE, pre-concentration)
10. Molecular detection

4. Design Workshop
11. Design of microfluidic architectures for PCR, distillation & mixing
12. Contemporary Applications in Biological Analysis
13. Microarrays
14. Cellular analyses (single cells, enzymatic assays, cell sorting)
15. Proteomics
16. System integration
17. Applications in radiochemistry, diagnostics and high-throughput experimentation

Lecture notes: Lecture handouts, background literature, problem sheets and notes will be provided electronically.

535-0030-00L Therapeutic Proteins W 3 credits 3G C. Halin Winter, D. Neri

Abstract

In this course, various topics related to the development, GMP production and application of therapeutic proteins will be discussed. Furthermore, students will expand their training in pharmaceutical immunology and will be introduced to the basics of pharmaceutical product quality management.

Objective

Students know and understand:
- basic mechanisms and regulation of the immune response
- the pathogenic mechanisms of the most important immune-mediated disorders
- the most frequently used expression systems for the production of therapeutic proteins
- the use of protein engineering tools for modifying different features of therapeutic proteins
- the mechanism of action of selected therapeutic proteins and their application
- basic concepts in the GMP production of therapeutic proteins

Content

The course consists of two parts:

In a first part, students will complete their training of pharmaceutical immunology (Chapter 13 - 16 Immunobiology VIII textbook). This part particularly focuses on the pathogenic mechanisms of immune-mediated diseases. Deepened knowledge of immunology will be relevant for understanding the mechanism of action of many therapeutic proteins, as well as for understanding one major concern related to the use of protein-based drugs, namely, immunogenicity.

The second part focuses on topics related to the development and application of therapeutic proteins, such as protein expression, protein engineering, reducing immunogenicity, and GMP production of therapeutic proteins. Furthermore, selected examples of approved therapeutic proteins will be discussed.

Lecture notes: Handouts to the lectures will be available for downloading under http://www.pharma.ethz.ch/scripts/index

Literature

- Chapters 13-16 of the Immunobiology VIII book (Janeway et al.)
- Lecture Handouts
- Paper References provided in the Scripts
- EMEA Dossier for Humira

535-0423-00L Drug Delivery and Drug Targeting W 2 credits 2V J.-C. Leroux, D. Brambilla

Abstract

The students gain an overview on current principles, methodologies and systems for controlled delivery and targeting of drugs. This enables the students to understand and evaluate the field in terms of scientific criteria.

Objective

The students dispose of an overview on current principles and systems for the controlled delivery and targeting of drugs. The focus of the course lies on developing a capacity to understand the involved technologies and methods, as well as an appreciation of the chances and constraints of their therapeutic usage, with prime attention on anticancer drugs, therapeutic peptides, proteins, nucleic acids and vaccines.

Content

The course covers the following topics: drug targeting and delivery principles, radiopharmaceuticals, macromolecular drug carriers, liposomes, micelles, micro/nanoparticles, gels and implants, administration of vaccines, delivery of active agents in tissue engineering, targeting at the gastrointestinal level, synthetic carriers for nucleic acid drugs, ophthalmic devices and novel trends in transdermal and nasal drug delivery.

Lecture notes: Selected lecture notes, documents and supporting material will be directly provided or may be downloaded using http://www.galenik.ethz.ch/teaching/drug_del drug_targ

The website also displays additional information on peroral delivery systems, transdermal systems and systems for alternative routes (nasal, pulmonary) of delivery. These fields are covered in detail in the course Galenische Pharmazie II (Galenical Pharmacy II).

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 322 of 1570

Further references will be provided in the course.

551-1105-00L Glycobiology  W  4 credits  2V  M. Aebi, T. Hennet

Abstract  Structural principles, nomenclature and different classes of glycosylation. The different pathways of N- and O-linked protein glycosylation and glycolipid biosynthesis in prokaryotes and eukaryotes are discussed. Specific glycan binding proteins and their role in deciphering the glycan code are presented. The role of glycans in infectious diseases, antigen mimicry and autoimmunity are discussed.

Objective  Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glycobiology, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

Content  Structure and linkages; analytical approaches; N-linked protein glycosylation (ER, Golgi); glycan-assisted protein folding and quality control; O-linked protein glycosylation; glucosaminoglycans; glycolipids; prokaryotic glycosylation pathways; lectins; glycans and infectious disease

Lecture notes  handouts

Prerequisites / notice  The course will be in English. It will include the preparation of short essays (marked) about defined topics in Glycobiology.

636-0015-00L An Introduction to Probability Theory and Stochastic Processes with Applications to Biology  W  4 credits  3G

Abstract  Biology is becoming increasingly quantitative and mathematical modeling is now an integral part of biological research. In many biological processes, ranging from gene-expression to evolution, randomness plays an important role that can only be understood using stochastic models. This course will provide the student with a theoretical foundation for developing such stochastic models and analyzing computational tools. The main concepts introduced are:

1. The mathematical representation of random phenomena: The probability space, properties of the probability measure, Independence of events, Conditional probability and Bayes formula, applications to parameter inference.
3. Convergence of Random Variables: Modes of convergence, Laws of large numbers, the central limit theorem, the law of the iterated logarithm, Applications to the analysis of cell population data.
7. Introduction to the theory of Martingales: Basic definitions, Martingale differences and Hoeffding's inequality, Martingale Convergence Theorem, Crossings and convergence, Stopping times and the optional sampling theorem, Doob's maximal inequalities, Applications to the analysis of stochastic biochemical reaction networks

Prerequisites / notice  The course will involve a healthy balance between mathematical rigor (theorem proving) and biological applications. Students are expected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.

636-0017-00L Computational Biology  W  4 credits  3G  T. Stadler, C. Magnus

Abstract  The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective  Attendees will learn which information is contained in genetic sequencing data and how to extract information from them using computational tools. The main concepts introduced are:
* stochastic models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics
Attendees will apply these concepts to a number of applications yielding biological insight into:
* epidemiology
* pathogen evolution
* macroevolution of species

Content  The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze the output of such a process such as BLAST algorithm, GWAS approaches. Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 323 of 1570
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Murray, Mathematical Biology, Springer
- Szallasi et al, System Modeling in Cellular Biology, MIT Press
- Kreyszig, Engineering Mathematics, Wiley
- Fall et al, Computational Cell Biology, Springer
- Wolkenhauer, Systems Biology
- Forsgacs and Newman, Biological Physics of the Developing Embryo, CUP
- Keener and Sneyd, Mathematical Physiology, Springer
- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST

Prerequisites / notice

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Some programming experience will be useful for the exercises, but is not required. Programming skills will not be tested in the examination.

636-0501-00L Advanced Immunology I
W 2 credits 2V external organisers

636-0503-00L Advanced Molecular Parasitology
W 2 credits 2V external organisers

636-0507-00L Synthetic Biology II
W+ 4 credits 4A S. Panke, Y. Benenson, J. Stelling

Abstract

7 months biological design project, during which the students are required to give presentations on advanced topics in synthetic biology (specifically genetic circuit design) and then select their own biological system to design. The system is subsequently modeled, analyzed, and experimentally implemented. Results are presented at an international student competition at the MIT (Cambridge).

Objective

The students are supposed to acquire a deep understanding of the process of biological design including model representation of a biological system, thorough analysis, and the subsequent experimental implementation of the system and the related problems.

Content

Presentations on advanced synthetic biology topics (eg genetic circuit design, adaptation of systems dynamics, analytical concepts, large scale de novo DNA synthesis), project selection, modeling of selected biological system, design space exploration, sensitivity analysis, conversion into DNA sequence, (DNA synthesis external) implementation and analysis of design, summary of results in form of scientific presentation and poster, presentation of results at the iGEM international student competition (www.igem.org).

Lecture notes
Handouts during course

Prerequisites / notice

The final presentation of the project is typically at the MIT (Cambridge, US). Other competing schools include regularly Imperial College, Cambridge University, Harvard University, UC Berkeley, Princeton University, CalTech, etc.

This project takes place between end of Spring Semester and beginning of Autumn Semester. Registration in April.

Please note that the number of ECTS credits and the actual work load are disconnected.

636-0508-00L Genomics in Drug Discovery Research
W 2 credits 2V external organisers

636-0511-00L Developmental Neuroscience (HS)

636-0515-00L Molecular Medicine I
W 2 credits 2V external organisers

636-0706-00L Spatio-Temporal Modelling in Biology
W 5 credits 3G D. Iber

Abstract

This course focuses on modeling spatio-temporal problems in biology, in particular on the cell and tissue level. A wide range of mathematical techniques will be presented as part of the course, including concepts from non-linear dynamics (ODE and PDE models), stochastic techniques (SDE, Master equations, Monte Carlo simulations), and thermodynamic descriptions.

Objective

The aim of the course is to introduce students to state-of-the-art mathematical modelling of spatio-temporal problems in biology. Students will learn how to chose from a wide range of modelling techniques and how to apply these to further our understanding of biological mechanisms. The course aims at equipping students with the tools and concepts to conduct successful research in this area; both classical as well as recent research work will be discussed.

Content

1. Introduction to Modelling in Biology
2. Morphogen Gradients
3. Turing Pattern
4. Travelling Waves & Wave Pinning
5. Application Example 1: Dorso-ventral axis formation
6. Chemotaxis, Cell Adhesion & Migration
7. Introduction to Numerical Methods
8. Simulations on Growing Domains
9. Image-Based Modelling
10. Branching Processes
11. Cell-based Simulation Frameworks
12. Application Example 2: Limb Development
13. Summary

Lecture notes

All lecture material will be made available online

https://www.bsse.ethz.ch/cob/education/636-0706-00L_Spatial_Modelling_in_Biology.html

Prerequisites / notice

The course builds on introductory courses in Computational Biology. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

752-4005-00L Food Microbiology I
W 3 credits 2V M. Loesnner

Abstract

For students of the study programme Biology BSc the course can only be selected as 4th concept course.

Objective

This lecture is the first part of a one-year course. It offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

The focus of this first part of the lecture will be on the organisms, but also on the factors which determine spoilage and foodborne disease.
1. History of Food Microbiology
  1.1. Short synopsis of foodborne microorganisms
  1.2. Spoilage of Foods
  1.3. Foodborne Disease
  1.4. Food Preservation
  1.5. VIP's of Food Microbiology

2. Overview of Microorganisms in Foods
  2.1. Origin of foodborne Microorganisms
  2.2. Bacteria
  2.3. Yeasts
  2.4. Molds
  3. Microbial Spoilage of Foods
  3.1. Intrinsic and Extrinsic Parameters
  3.2. Meats, Seafoods, Eggs
  3.3. Milk and Milk Products
  3.4. Vegetable and Fruit Products
  3.5. Miscellaneous (baked goods, nuts, spices, ready-to-eat products)
  3.6. Drinks and Canned Foods

4. Foodborne Disease
  4.1. Significance and Transmission of Foodborne pathogens
  4.2. Staphylococcus aureus
  4.3. Gram-positive Sporeformers (Bacillus & Clostridium)
  4.4. Listeria monocytogenes
  4.5. Salmonella, Shigella, Escherichia coli
  4.6. Vibrio, Yersinia, Campylobacter
  4.7. Brucella, Mycobacterium
  4.8. Parasites
  4.9. Viruses and Bacteriophages
  4.10. Mycotoxins
  4.11. Bioactive Amines
  4.12. Miscellaneous (Antibiotic-resistant Bacteria, Biofilms)

Lecture notes
Electronic copies of the presentation slides (PDF) and additional material will be made available for download.

Literature
Recommendations will be given in the first lecture
### Seminars, Colloquia and Additional Courses

<table>
<thead>
<tr>

<th>Type</th>
<th>ECTS</th>
<th>Hours</th>
<th>Lecturers</th>
</tr>
</thead>
</table>

**Abstract**
This seminar will feature invited lectures about recent advances and developments in systems biology, including topics from biology, bioengineering, and computational biology.

**Objective**
To provide an overview of current systems biology research.

**Content**
The final list of topics will be available at http://www.bsse.ethz.ch/education/.

### Course Units for Additional Admission Requirements

The courses below are only available for MSc students with additional admission requirements.

</tr>
</tbody>
</table>

*Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**
The course introduces concepts of bioinformatics starting from first principles: DNA sequence alignment, phylogenetic tree inference, genome annotation, protein structure and function prediction. Key methods and algorithms are covered, including dynamic programming, Markov and Hidden Markov models, and molecular dynamics simulations. Practical applications and limitations are discussed.

**Objective**
The course aims at introducing the fundamental concepts and methods of bioinformatics. Emphasis is given to a deep understanding of the methods' foundations and limitations to enable critical evaluations and applications of bioinformatics tools in areas such as biotechnology and systems biology.

**Content**
From "Understanding Bioinformatics":
- Chapter 4: Producing and Analyzing Sequence Alignments
- Chapter 5: Pairwise Sequence Alignment and Database Searching
- Chapter 6: Patterns, Profiles, and Multiple Alignments
- Chapter 7: Recovering Evolutionary History
- Chapter 8: Building Phylogenetic Trees
- Chapter 9: Revealing Genome Features
- Chapter 10: Gene Detection and Genome Annotation
- Chapter 11: Obtaining Secondary Structure from Sequence
- Chapter 12: Predicting Secondary Structures
- Chapter 13: Modeling Protein Structure
- Chapter 14: Analyzing Structure-Function Relationships

From "Biological Sequence Analysis":
- Sections 3.1, 3.2, 3.3, 4.1, 4.2, 4.4, 5.2, 5.3, 5.4, 6.5 (Markov Chains and Hidden Markov Models)

From "A First Course in Systems Biology":
- Chapter 1: Biological Systems

**Lecture notes**
Course material will be made available at: http://www.csb.ethz.ch

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**
This lecture course gives an in-depth view into molecular mechanisms controlling basic biological processes, ranging from genetic regulatory networks, the internal functional organization of a cell to the signaling events controlling cells in their social context. An additional focus is on methods and techniques used in molecular biology to solve problems in biotechnology and medicine.

**Objective**
The goal is to achieve a high level knowledge of basic biological processes, to learn the methodology to tackle questions in molecular biology and to interpret experimental molecular data. Emphasis is given to cellular processes amenable to studies in systems and synthetic biology.
Lecture notes
Use the respective end-of-chapter problems section ("Which statements are true?") to test your knowledge and prepare for exam.

Literature

Book Summary
As the amount of information in biology expands dramatically, it becomes increasingly important for textbooks to distill the vast amount of scientific knowledge into concise principles and enduring concepts. As with previous editions, Molecular Biology of the Cell, Sixth Edition accomplishes this goal with clear writing and beautiful illustrations. The Sixth Edition has been extensively revised and updated with the latest research in the field of cell biology, and it provides an exceptional framework for teaching and learning.

The entire illustration program has been greatly enhanced. Protein structures better illustrate structure-function relationships, icons are simpler and more consistent within and between chapters, and micrographs have been refreshed and updated with newer, clearer, or better images. As a new feature, each chapter now contains intriguing open-ended questions highlighting "What We Don't Know" introducing students to challenging areas of future research. Updated end-of-chapter problems reflect new research discussed in the text, and these problems have been expanded to all chapters by adding questions on developmental biology, tissues and stem cells, pathogens, and the immune system.

Prerequisites / notice
During the semester two half days will be offered to discuss the content and allow questions to the lecturer.

626-0007-AAL

Microbial Biotechnology

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction into the field of microbial biotechnology, covering possible products of enzyme and fermentation technology.

Objective
The student should be able to identify opportunities for microbial bioprocesses and to go through basic and advanced design procedures for microbial bioprocesses.

Content
Bioprocess development - An interdisciplinary challenge
Introduction to engineering calculations
Presentation and analysis of data
Material balances
Energy balances
Unsteady-state material and energy balances
Fluid flow
Mixing
Mass transfer
Homogeneous reactions
Heterogeneous reactions
Reactor engineering

Enrolment for this course unit: 4 credits (9R)
S. Panke

Autumn Semester 2016
There will be two opportunities for tutorials during the semester.

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 329 of 1570
Introduction to information retrieval with a focus on text documents and images. Main topics comprise extraction of characteristic features from documents, index structures, retrieval models, search algorithms, benchmarking, and feedback mechanisms. Searching the web, images and XML collections demonstrate recent applications of information retrieval and their implementation.

In depth understanding of managing, indexing, and retrieving documents with text, image and XML content. Knowledge about basic search algorithms on the web, benchmarking of search algorithms, and relevance feedback methods.

**Objective**

**252-0373-00L** Mobile and Personal Information Systems  
W 4 credits  2V+1U  M. Norrie

**Abstract**  
The course examines how traditional information system architectures and technologies have been adapted to support various forms of mobile and personal information systems. Topics to be covered include: databases of mobile objects; context-aware services; opportunistic information sharing; ambient information; pervasive display systems.

**Objective**

Students will be introduced to a variety of novel information services and architectures developed for mobile environments in order to gain insight into the requirements and processes involved in designing and developing such systems and learning to think beyond traditional information systems.

**Content**

Advances in mobile devices and communication technologies have led to a rapid increase in demands for various forms of mobile information systems where the users, the applications and the databases themselves may be mobile. Based on both lectures and breakout sessions, this course examines the impact of the different forms of mobility and collaboration that systems require nowadays and how these influence the design of systems at the database, the application and the user interface level. For example, traditional data management techniques have to be adapted to meet the requirements of such systems and cope with new connection, access and synchronisation issues. As mobile devices have increasingly become integrated into the users’ lives and are expected to support a range of activities in different environments, applications should be context-aware, adapting functionality, information delivery and the user interfaces to the current environment and task. Various forms of software and hardware sensors may be used to determine the current context, raising interesting issues for discussion. Finally, user mobility, and the varying and intermittent connectivity that it implies, gives rise to new forms of dynamic collaboration that require lightweight, but flexible, mechanisms for information synchronisation and consistency maintenance. Here, the interplay of mobile, personal and social context will receive special attention.

**Objective**

**252-0417-00L** Randomized Algorithms and Probabilistic Methods  
W 7 credits  3V+2U+1A  A. Steger, E. Welzl

**Abstract**

Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks.

**Objective**

After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.

**Content**

Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas.

**Lecture notes**

Yes.

**Literature**

**Objective**

**252-0437-00L** Distributed Algorithms  
W 4 credits  3V  F. Mattern

**Abstract**

Models of distributed computations, time space diagrams, virtual time, logical clocks and causality, wave algorithms, parallel and distributed graph traversal, consistent snapshots, mutual exclusion, election and symmetry breaking, distributed termination detection, garbage collection in distributed systems, monitoring distributed systems, global predicates.

**Objective**

Become acquainted with models and algorithms for distributed systems.

**Content**

Verteilte Algorithmen sind Verfahren, die dadurch charakterisiert sind, dass mehrere autonome Prozesse gleichzeitig Teile eines gemeinsamen Problems in kooperativer Weise bearbeiten und der dabei erforderliche Informationsaustausch ausschliesslich über Nachrichten erfolgt. Derartige Algorithmen kommen im Rahmen verteilter Systeme zum Einsatz, bei denen kein gemeinsamer Speicher existiert und die Übertragungszeit von Nachrichten i.a. nicht vernachlässigt werden kann. Da dabei kein Prozess eine aktuelle konsistente Sicht des globalen Zustands besitzt, führt dies zu interessanten Problemen.

Im einzelnen werden u.a. folgende Themen behandelt:

**Objective**

**252-0463-00L** Security Engineering  
W 5 credits  2V+2U  D. Basin

**Abstract**

Subject of the class are engineering techniques for developing secure systems. We examine concepts, methods and tools, applied within the different activities of the SW development process to improve security of the system. Topics: security requirements & risk analysis, system modeling & model-based development methods, implementation-level security, and evaluation criteria for secure systems

**Objective**

Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software.

Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

**Topics covered include**

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include
- security requirements & risk analysis,
- system modeling and model-based development methods,
- implementation-level security, and
- evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class
2. Requirements Engineering: Security Requirements and some Analysis
   - overview: functional and non-functional requirements
   - use cases, misuse cases, sequence diagrams
   - safety and security
   - FMEA, FTA, attack trees
3. Modeling in the design activities
   - structure, behavior, and data flow
   - class diagrams, statecharts
4. Model-driven security for access control (design)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience
5. Model-driven security (Part II)
   - Continuation of above topics
6. Security patterns (design and implementation)
7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks
8. Testing
   - overview
   - model-based testing
   - testing security properties
9. Risk analysis and management 1 (project management)
   - "risk": assets, threats, vulnerabilities, risk
   - risk assessment: quantitative and qualitative
   - safeguards
   - generic risk analysis procedure
   - The OCTAVE approach
10. Risk analysis: IT baseline protection
    - Overview
    - Example
11. Evaluation criteria
    - CMM
    - systems security engineering CMM
    - common criteria
12. Guest lecture
    - TBA

Literature
- Further relevant books and journal/conference articles will be announced in the lecture.

Prerequisites / notice
- Prerequisite: Class on Information Security

252-0535-00L Machine Learning W 8 credits 3V+2U+2A J. M. Buhmann
Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should at least have followed one previous course offered by the Machine Learning Institute (e.g., CIL or LIS) or an equivalent course offered by another institution.

### 252-0543-01L

**Computer Graphics**

| Objective | At the end of the course the students will be able to build a rendering system. The students will study the basic principles of rendering and image synthesis. In addition, the course is intended to stimulate the students' curiosity to explore the field of computer graphics in subsequent courses or on their own. |
| Content | This course covers fundamental concepts of modern computer graphics. Students will learn about 3D object representations and the details of how to generate photorealistic images from digital representations of 3D scenes. Starting with an introduction to 3D shape modeling and representation, texture mapping and ray-tracing, we will move on to acceleration structures, the physics of light transport, appearance modeling and global illumination principles and algorithms. We will end with an overview of modern image-based synthesis techniques, covering topics such as lightfields and depth-image based rendering. |

**Abstract**

This course covers some of the fundamental concepts of computer graphics, namely 3D object representations and generation of photorealistic images from digital representations of 3D scenes.

**Lecture notes**

No lecture notes, but slides will be made available on the course webpage.

**Literature**

**Prerequisites**

Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++, Visual Computing course recommended.

**Notice**

The programming assignments will be in C++. This will not be taught in the class.

### 252-0546-06L

**Physically-Based Simulation in Computer Graphics**

| Objective | This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application. |
| Content | The lecture covers topics in physically-based modeling, such as particle systems, mass-spring models, finite difference and finite element methods. These approaches are used to represent and simulate deformable objects or fluids with applications in animated movies, 3D games and medical systems. Furthermore, the lecture covers topics such as rigid body dynamics, collision detection, and character animation. |

**Abstract**

This course provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

**Prerequisites / notice**

Fundamentals of calculus and physics, basic concepts of algorithms and data structures, basic programming skills in C++. Knowledge on numerical mathematics as well as ordinary and partial differential equations is an asset, but not required.

### 252-1407-00L

**Algorithmic Game Theory**

| Objective | Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting. |
| Content | The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a particularly well-suited model for the behavior and interaction of such selfish users and programs. Classic game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good. This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth. |

**Abstract**

Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory.

**Outline**

- Introduction to classic game-theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- Speed of convergence of natural game playing dynamics such as best-response dynamics or regret minimization.
- Techniques for bounding the quality-loss due to selfish behavior versus optimal outcomes under central control (a.k.a. the Price of Anarchy).
- Design and analysis of mechanisms that induce truthful behavior or near-optimal outcomes at equilibrium.
- Selected current research topics, such as Google’s Sponsored Search Auction, the U.S. FCC Spectrum Auction, Kidney Exchange.

**Lecture notes**

No lecture notes.
Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing Big Data systems.

In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.

The first part of the lecture covers individual system aspects starting with tamperproof or tamper-resistant hardware in general over operating system related security mechanisms to application software systems such as network file system issues, software security (permissions / ACLs / network filesystem issues), IPC Security, mechanisms in more modern OS, such as capabilities and zones, libraries and software tools for security assurance, etc.

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security, logging and auditing (BSM audit, dtrace, ...), cryptographic support, and trustworthy computing (TCG, SGX).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

### 252-1414-00L System Security W 5 credits 2V+2U+2 S. Capkun, A. Perrig

**Abstract**

The first part of the lecture covers individual system’s aspects starting with tamperproof or tamper-resistant hardware in general over operating system related security mechanisms to application software systems such as host based intrusion detection systems. The main topics covered are: tamper resistant hardware, CPU support for security, protection mechanisms in the kernel, file system security (permissions / ACLs / network file system issues), IPC Security, mechanisms in more modern OS, such as capabilities and zones, libraries and software tools for security assurance, etc.

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security, logging and auditing (BSM audit, dtrace, ...), cryptographic support, and trustworthy computing (TCG, SGX).

### 252-1425-00L Geometry: Combinatorics and Algorithms W 6 credits 2V+2U+1A B. Gärtner, E. Welzl, M. Hoffmann, A. Pilk

**Abstract**

Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them algorithmically. The lecture addresses theoretical foundations concerning geometric structures. Central objects of interest are triangulations. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?)

**Objective**

The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to be able to model, analyze, and solve theoretical and practical problems in the area and in various application domains.

**Content**

Planar and geometric graphs, embeddings and their representation (Whitney’s Theorem, canonical orderings, DCEL), polygon triangulations and the art gallery theorem, convexity in Rd, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chan’s Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction), Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.

### 263-2800-00L Design of Parallel and High-Performance Computing W 7 credits 3V+2U+1A T. Hoefler, M. Püschel

**Abstract**

Advanced topics in parallel / concurrent programming.

Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large concurrent software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

### 263-3010-00L Big Data W 6 credits 2V+2U+1A G. Fourny

The key challenge of the information society is to turn data into information, information into knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations.
Objective
This combination of requirements, together with the technologies that have emerged in order to address them, is typically referred to as "Big Data." This revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm".

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it were and are still needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each business use case efficiently and consistently.

Content
This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. The material is organized along three axes: data in the large, data in the small, data in the very small. A broad range of aspects is covered with a focus on how they fit together in the big picture of the Big Data ecosystem.

- physical storage (HDFS, S3)
- logical storage (key-value stores, document stores, column stores, key-value stores, data warehouses)
- data formats and syntaxes (XML, JSON, CSV, XBRL)
- data shapes and models (tables, trees, graphs, cubes)
- an overview of programming languages with a focus on their type systems (SQL, XQuery, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing (MapReduce) and technologies (Hadoop, Spark)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

We will also host two guest lectures to get insights from the industry: UBS and Google.

Literature
Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 334 of 1570
Students are aware of current threats that Internet services and networked devices face and can explain appropriate countermeasures. Students can identify and assess known vulnerabilities in a software system that is connected to the Internet. Students know fundamental network security concepts. Students have an in-depth understanding of important security technologies. Students know how to configure a real firewall and know some penetration testing tools from their own experience. Risk management and the vulnerability lifecycle of software and networked services are discussed. Threats like denial of service, spam, worms, and viruses are studied in-depth. Fundamental security related concepts like identity, availability, authentication and secure channels are introduced. State of the art technologies like secure shell, network and transport layer security, intrusion detection and prevention systems, cross-site scripting, secure implementation techniques and more for securing the Internet and web applications are presented. Several case studies illustrate the dark side of the Internet and explain how to protect against current threats. A hands-on computer lab that accompanies the lecture gives a deep dive on firewalls, penetration testing and intrusion detection. This lecture is intended for students with an interest in securing Internet services and networked devices. Students are assumed to have knowledge in networking as taught in the Communication Networks lecture.

Due to recent changes in the Swiss law, ETH requires each student of this course to sign a written declaration that he/she will not use the information given in this for illegal purposes. This declaration will have to be signed and submitted no later than at the beginning of the second lesson.

**263-4650-00L** Specification and Proof of Probabilistic Programs with W 4 credits 2V+1U A. McIver, C. C. Morgan

**Applications to Security**

**Abstract**

The course will introduce participants to semantic models for probabilistic programs. The semantics will provide the fundamental model for deriving generic properties of probabilistic systems, and as a context for proving soundness and completeness of proof techniques. Students in this course will learn new ways to specify and reason about quantitative properties of probabilistic programs. Both probabilistic programs' functional behaviour and their information-flow properties are important aspects of modern systems building, complementing existing methods of abstraction, nondeterminism and refinement. This course's objective is to give the students the necessary intellectual skills for rigorous reasoning about building such systems.

**Content**

The first part of the course will concentrate on program-semantic foundations that support rigorous specification and reasoning about such quantitative programs. The second part of the course will demonstrate how these techniques can be used for analysing both qualitative- and quantitative information flow as they apply to leakage of secure information.

**Literature**

The course will follow the book "Abstraction, Refinement and Proof for Probabilistic Systems".

**Prerequisites / notice**

Knowledge in computer networking and Internet protocols (e.g. course Communication Networks (D-ITET) or Operating Systems and Networks (D-INFN)).

The course is intended for MSc and PhD students.

**263-4655-00L** Lattice Cryptography W 4 credits 2V+1U V. Lyubashevsky

**Objective**

The objective of the course is to bring the students up to a level where they should be able to read academic papers on state-of-the-art designs of lattice-based primitives.

**Content**

In this course, we will study lattice-based cryptography. We will cover the basic algorithms associated with integer lattices such as Gram-Schmidt orthogonalization, algorithms for finding short and near lattice vectors, as well as the critical algorithm for sampling lattice points according to a discrete Gaussian distribution. We will then proceed to build up a toolbox of lattice-based cryptographic primitives beginning from collision-resistant hash functions, then moving on to digital signatures, encryption, identity-based encryption, and fully-homomorphic encryption. Particular emphasis will be placed on concrete parameters and practical instantiations. For this purpose, we will also study cryptographic constructions based on the hardness of ideal lattices, which are ideals of polynomial rings.

**Prerequisites / notice**

There are no formal mathematical pre-requisites, but students should have "mathematical maturity", which entails dealing with abstract concepts and being comfortable with doing mathematical proofs. Some previous exposure to linear algebra, abstract algebra, and cryptography would be useful.

**263-5001-00L** Introduction to Finite Elements and Sparse Linear System Solving W 4 credits 2V+1U P. Arbenz

**Abstract**

The finite element (FE) method is the method of choice for (approximately) solving partial differential equations on complicated domains. In the first third of the lecture, we give an introduction to the method. The rest of the lecture will be devoted to methods for solving the large sparse linear systems of equation that a typical for the FE method. We will consider direct and iterative methods.

**Objective**

Students will know the most important direct and iterative solvers for sparse linear systems. They will be able to determine which solver to choose in particular situations.
I. THE FINITE ELEMENT METHOD

(1) Introduction, model problems.
(2) 1D problems. Piecewise polynomials in 1D.
(3) 2D problems. Triangulations. Piecewise polynomials in 2D.
(4) Variational formulations. Galerkin finite element method.
(5) Implementation aspects.

II. DIRECT SOLUTION METHODS

(6) LU and Cholesky decomposition.
(7) Sparse matrices.
(8) Fill-reducing orderings.

III. ITERATIVE SOLUTION METHODS

(9) Stationary iterative methods, preconditioning.
(10) Preconditioned conjugate gradient method (PCG).
(11) Incomplete factorization preconditioning.
(12) Multigrid preconditioning.
(13) Nonsymmetric problems (GMRES, BiCGstab).
(14) Indefinite problems (SYMMLQ, MINRES).

Literature

Prerequisites / notice

Prerequisites: Linear Algebra, Analysis, Computational Science.
The exercises are made with Matlab.

263-5200-00L Data Mining: Learning from Large Data Sets W 4 credits 2V+1U A. Krause

Abstract

Many scientific and commercial applications require insights from massive, high-dimensional data sets. This course introduces principled, state-of-the-art techniques from statistics, algorithms and discrete and convex optimization for learning from such large data sets. The course both covers theoretical foundations and practical applications.

Objective

Many scientific and commercial applications require us to obtain insights from massive, high-dimensional data sets. In this graduate-level course, we will study principled, state-of-the-art techniques from statistics, algorithms and discrete and convex optimization for learning from such large data sets. The course will both cover theoretical foundations and practical applications.

Content

Topics covered:
- Dealing with large data (Data centers; Map-Reduce/Hadoop; Amazon Mechanical Turk)
- Fast nearest neighbor methods (Shingling, locality sensitive hashing)
- Online learning (Online optimization and regret minimization, online convex programming, applications to large-scale Support Vector Machines)
- Multi-armed bandits (exploration-exploitation tradeoffs, applications to online advertising and relevance feedback)
- Active learning (uncertainty sampling, pool-based methods, label complexity)
- Dimension reduction (random projections, nonlinear methods)
- Data streams (Sketches, coresets, applications to online clustering)
- Recommender systems

Prerequisites / notice

Prerequisites: Solid basic knowledge in statistics, algorithms and programming. Background in machine learning is helpful but not required.

263-5210-00L Probabilistic Artificial Intelligence W 4 credits 2V+1U S. Tschiatschek

Abstract

This course introduces core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as sensor networks, robotics, and the Internet.

Objective

How can we build systems that perform well in uncertain environments and unforeseen situations? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as sensor networks, robotics, and the Internet. The course is designed for upper-level undergraduate and graduate students.

Content

Topics covered:
- Search (BFS, DFS, A*), constraint satisfaction and optimization
- Tutorial in logic (propositional, first-order)
- Probability
- Bayesian Networks (models, exact and approximative inference, learning) - Temporal models (Hidden Markov Models, Dynamic Bayesian Networks)
- Probabilistic planning (MDPs, POMDPs)
- Reinforcement learning
- Combining logic and probability

Prerequisites / notice

Solid basic knowledge in statistics, algorithms and programming

263-5902-00L Computer Vision W 6 credits 3V+1U+1A L. Van Gool, V. Ferrari, A. Geiger
The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Objective
The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Content
Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

Prerequisites / notice
It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

263-5903-00L Computational Regularity W 4 credits 2V+1U Y. Liu, M. R. Oswald
Objective
Computation forms the key component of this course which links theory and applications. Students will witness effective computational models with concrete applications in robotics, computer vision, computer graphics and medical image analysis. The emphasis is on hands-on computational experience and on producing state of the art, publishable research projects. During the semester, we shall start with intuition, learn the basic mathematical concepts and develop state of the art computer algorithms for real-world problems. Our goal is to build "bridges" connecting, symmetry, symmetry group theory, general and specific regularities and real-world applications.

Content
Regularity is an essential and ubiquitous concept in nature, science and art. Numerous biological, natural or man-made structures exhibit regularities, abstracted by symmetries, as a fundamental design principle or as an essential aspect of their function. Whether by evolution or by design, symmetry implies potential structural efficiencies that make it universally appealing. Much of our understanding of the world is based on the perception and recognition of recurring structures, and so is our sense of beauty. With increasing amount and variety of digitized data, seeking for patterns systematically has become increasingly pertinent and necessary. This course concentrates on rigorous theory, keen observations and computational discovery of patterns in various data forms in our daily life and research. We aim to develop effective computational treatments of regularity to capture real world regular or near-regular patterns in spite of uncertainty.

227-0778-00L Hardware/Software Codeign W 6 credits 2V+2U L. Theile
Objective
The course provides advanced knowledge in the design of complex computer systems, in particular embedded systems. Models and methods are discussed that are fundamental for systems that consist of software and hardware components.

Content
The course provides advanced knowledge in the design of complex computer systems, in particular embedded systems. Models and methods are discussed that are fundamental for systems that consist of software and hardware components.

Prerequisites / notice
Prerequisites for the course is a basic knowledge in the following areas: computer architecture, digital design, software design, embedded systems

401-0647-00L Introduction to Mathematical Optimization W 5 credits 2V+1U D. Adjiaashvili
Objective
The goal of this course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

Content
Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...)
- Basic combinatorial optimization problems (spanning trees, network flows, knapsack problem, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

Prerequisites / notice
This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics and more.

636-0007-00L Computational Systems Biology W 6 credits 3V+2U J. Stelling
Objective
The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

Content
Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label “Systems Biology”, focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

Literature
https://www.ethz.ch/content/specialinterest/bsse/computational-systems-biology/en/education/lectures/csb/LectureMaterial.html

636-0017-00L Computational Biology W 4 credits 3G T. Stadler, C. Magnus
Objective
The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.
Attendees will learn which information is contained in genetic sequencing data and how to extract information from them using computational tools. The main concepts introduced are:
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:
- epidemiology
- pathogen evolution
- macroevolution of species

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze this alignment (such as BLAST algorithm, GWAS approaches). Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. Finally, we introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Slides of the lecture will be available online.
https://www.bsse.ethz.ch/cevo/education/cb-materials.html

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Some programming experience will be useful for the exercises, but is not required. Programming skills will not be tested in the examination.

The reading list will be published on the course web site.

In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine learning.

The seminar “Advanced Topics in Machine Learning” familiarizes students with recent developments in pattern recognition and machine learning. Original articles have to be presented and critically reviewed. The students will learn how to structure a scientific presentation in English which covers the key ideas of a scientific paper. An important goal of the seminar presentation is to summarize the essential ideas of the paper in sufficient depth while omitting details which are not essential for the understanding of the work. The presentation style will play an important role and should reach the level of professional scientific presentations.

The seminar will cover a number of recent papers which have emerged as important contributions to the pattern recognition and machine learning literature. The topics will vary from year to year but they are centered on methodological issues in machine learning like new learning algorithms, ensemble methods or new statistical models for machine learning applications. Frequently, papers are selected from computer vision or bioinformatics - two fields, which rely more and more on machine learning methodology and statistical models.

The seminar covers various topics in information security, including network security, cryptography and security protocols. The participants are expected to read a scientific paper and present it in a 35-40 min talk. At the beginning of the semester a short introduction to presentation techniques will be given.

Selected Topics
- security protocols: models, specification & verification
- trust management, access control and non-interference
- side-channel attacks
- identity-based cryptography
- host-based attack detection
- anomaly detection in backbone networks
- key-management for sensor networks

In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine learning.

This seminar covers advanced topics in computer graphics, such as modeling, rendering, animation, real-time graphics, physical simulation, and computational photography. Each time the course is offered, a collection of research papers is selected and each student presents one paper to the class and leads a discussion about the paper and related topics.

The goal is to get an in-depth understanding of actual problems and research topics in the field of computer graphics as well as improve presentations and critical analysis skills.

Data: 08.05.2017 12:41  Autumn Semester 2016  Page 338 of 1570
This seminar covers advanced topics in computer graphics, including both seminal research papers as well as the latest research results. Each time the course is offered, a collection of research papers are selected covering topics such as modeling, rendering, animation, real-time graphics, physical simulation, and computational photography. Each student presents one paper to the class and leads a discussion about the paper and related topics.

All students read the papers and participate in the discussion.

Event: 08.05.2017 12:41 Autumn Semester 2016 Page 339 of 1570
Abstract
Develop an understanding of selected topics in the area of molecular algorithms, and the practice of scient

Objective
Study and understanding of selected topics of interest in molecular algorithms such as: Computational Power of Molecular Algorithms, Molecular Algorithms for Solving Fundamental Tasks (Majority, Leader Election, Counting), Complexity Lower Bounds, Implementations of Algorithms in DNA.

Content
This seminar will familiarize the students with current research on molecular algorithms, with a focus on algorithms executable in DNA. We will have an introductory lecture covering the basics of molecular computational models, and the underlying bio-chemical phenomena. Subsequently, we will read and present selected research papers, focusing on their algorithmic content.
No prior knowledge of biology or chemistry will be required.

Literature
Selected research articles.

Prerequisites / notice
The course will require a good understanding of Randomized Algorithms. Hence, you must have passed our “Randomized Algorithms” class (or have acquired equivalent knowledge, in exceptional cases). No prior knowledge of biology or chemistry will be assumed. The basics will be presented in an introductory lecture.

Abstract
In this seminar participating students present and discuss recent research papers in the area of distributed computing. The seminar consists of algorithmic as well as systems papers in distributed computing theory, peer-to-peer computing, ad hoc and sensor networking, or multi-core computing.

Objective
In the last two decades, we have experienced an unprecedented growth in the area of distributed systems and networks; distributed computing now encompasses many of the activities occurring in today's computer and communications world. This course introduces the basics of distributed computing, highlighting common themes and techniques. We study the fundamental issues underlying the design of distributed systems: communication, coordination, synchronization, uncertainty. We explore essential algorithmic ideas and lower bound techniques.

In this seminar, students present the latest work in this domain.

Seminar language: English

Content
Different each year. For details see: www.disco.ethz.ch/courses.html

Lecture notes
Slides of presentations will be made available.

<tr>
<td>Abstract</td>
<td>The course introduces basic concepts of the interaction between nutrition and exercise and cognitive performance.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition examples.</td>
<td></td>
<td></td>
<td></td>
<td></td>

<tr>
<td>Abstract</td>
<td>Gives the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Some basic knowledge in physiology is recommended for this course, which revisits important physiological topics, emphasizing their relation to nutrition. The aim is to give the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand. For students with a background in medicine, pharmacy or biology, the course is useful as a review of previously acquired knowledge. Major topics are basic neuroanatomy and neurophysiology; general endocrinology; the physiology of taste and smell; nutrient digestion and absorption; intermediary metabolism and energy homeostasis; and some aspects of cardiovascular physiology and water balance.</td>

**Abstract**
Principles and phenomena around radioactivity. Knowledge of the most important phenomena in relation with radioactivity. Knowledge of the principles of radiation protection. Ability to judge dangerous situations in handling radioactive materials, geopolitically as well as locally at ones own working place.

**Objective**
Additional topics may be suggested by the students.

**Content**
Structure and properties of atomic nuclei, mathematical description of the radioactive decay, decay types, interaction of radiation with matter, detectors for ionizing radiation, radiation protection, principles of isotope separation, nuclear power plants, major nuclear accidents.

**Lecture notes**
A script is available free of charge.

**Abstract**
The lecture provides a journey into the molecular world of scents from the chemical secrets behind Chanel N°5 to structure-odor relationships, industrial processes, and total synthesis of terpenoids. Each subunit is centered on one odorant family and highlights a certain class of chemical reactions, illustrated by prominent perfumery examples.

**Objective**
After completion of this lecture module the students know all the major perfumery materials of the important odor families with their academic and industrial syntheses, their olfactory properties, their usage, their historic perspective, and today's economic importance. The students can explain the significance of important building blocks and industrial transformations, and can estimate how attractive chemical processes are on large scale. They can retrosynthetically plan academic and industrial syntheses of fragrant compounds and terpenoids, and the acquired knowledge on structure-odor relationships enables them to predict and design new odorants. The students can approximate the conformational space of odorants and especially macrocycles on the basis of simple rules, and know how olfactophore models are used. The students understand and can explain the molecular mechanism of smell, the biosynthesis of terpenes, and the basics of perfumery composition. The latter enables them to further their education in perfumery at specialized Universities such as the ISIPCA in Versailles; yet, the student also knows about the links of Fragrance Chemistry with Pharmaceutical Chemistry and the Specialty Chemicals business in general.

529-0001-00L
Introduction to Computer Science
O 4 credits 2V+2U P. H. Hünenerberger

Abstract
Introduction to UNIX, data representation, introduction to C++ programming, errors, algorithms, computer architecture, sorting and searching, databases, numerical algorithms, types of algorithms, simulation, data communication & networks, chemical structures, operating systems, programming languages, software engineering.

For more information: www.csms.ethz.ch/education/infol

Objective
Discuss fundamentals of computer architecture, languages, algorithms and programming with an eye to their application in the area of chemistry, biology and material science.

Content
Minimal introduction to UNIX, Data representation and processing, algorithms and programming in C++, Errors, Programming guidelines, efficiency, computer architecture, algorithms for sorting and searching, databases, numerical algorithms, types of algorithms, simulation, data communication & networks, chemical structures, operating systems, programming languages, style, software engineering.

Lecture notes
Available (in English), distributed at first lecture

Literature
See: www.csms.ethz.ch/education/infol

Prerequisites / notice
Since the exercises on the computer do convey and test essentially different skills as those being conveyed during the lectures and tested at the written exam, the results of the exercises are taken into account when evaluating the results of the exam.

For more information about the lecture: www.csms.ethz.ch/education/infol

</tbody>
</table>

Information about the practical course will be given on the first day.

Abstract
Qualitative analysis (determination of cations and anions), acid-base-equilibria (pH-values, titrations, buffer), precipitation equilibria (gravimetry, potentiometry, conductivity), redox reactions (syntheses, redox-titrations, galvanic elements), metal complexes (syntheses, complexometric titration) analysis of measured values, states of aggregation (vapour pressure, conductivity, calorimetry)

Objective
Qualitative analysis (simple cation and anion separation process, determination of cations and anions), acid-base-equilibria (strengths of acids and bases, pH- and pKa-values, titrations, buffer systems, Kjeldahl determination), precipitation equilibria (gravimetry, potentiometry, conductivity), oxidation state and redox behaviour (syntheses, redox-titrations, galvanic elements), metal complexes (syntheses of complexes, ligand exchange reactions, complexometric titration) analysis of measured values (measuring error, average value, error analysis), states of aggregation (vapour pressure), characteristics of electrolytes (conductivity measurements), thermodynamics (calorimetry)

Content
The general aim for the students of the practical course in general chemistry is an introduction in the scientific work and to get familiar with simple experimental procedures in a chemical laboratory. In general, first experiences with the principal reaction behaviour of a variety of different substances will be made. The chemical characteristics of these will be elucidated by a series of quantitative experiments alongside with the corresponding qualitative analyses. In order to get an overview of classes of substances as well as some general phenomena in chemistry suitable experiments have been chosen. In the second part of the practical course, i.e. physical chemistry, the behaviour of substances in their states of aggregation as well as changes of selected physical values will be recorded and discussed.

Abstract
Complexes of the transition metals: structure, bonding, spectroscopic properties, and synthesis.

Objective
Introduction to the bonding theory in complexes of the transition metals. Interpretation of structure, bonding, and spectroscopic properties. General synthetic strategies.

Content
The chemical bond (overview). Symmetry and group theory. The chemical bond of coordination compounds (Valence Bond Theory, Crystal Field Theory, Molecular Orbital Theory (sigma- and pi-bonding), pi-Accepting ligands (CO, NO, olefins, dihydrogen, dioxygen, phosphines and phosphites). Electronic spectra of coordination compounds (Tanabe-Sugano diagrams). Coordination numbers and isomers in complexes. Dynamic phenomena (stereochemical nonrigidity). Complexes and kinetics.

Abstract
Chemical reactivity and classes of compounds. Eliminations, fragmentations, chemistry of aldehydes and ketones (hydrates, acetals, imines, enamines, nucleophilic addition of organometallic compounds, reactions with phosphorus and sulfur ylides; reactions of enolates as nucleophiles) and of carbonyl acid derivatives. Aldol reactions.

Objective
Acquisition of a basic repertoire of synthetic methods including important reactions of aldehydes, ketones, carboxylic acids and carboxylic acid derivatives, as well as eliminations and fragmentations. Particular emphasis is placed on the understanding of reaction mechanisms and the correlation between structure and reactivity. A deeper understanding of the concepts presented during the lecture is reached by solving the problems handed out each time and discussed one week later in the exercise class.

Content
Chemical reactivity and classes of compounds. Eliminations, fragmentations, chemistry of aldehydes and ketones (hydrates, acetals, imines, enamines, nucleophilic addition of organometallic compounds, reactions with phosphorus and sulfur ylides; reactions of enolates as nucleophiles) and of carbonyl acid derivatives. Aldol reactions.

Lecture notes
A pdf file of the printed lecture notes is provided online. Supplementary material may be provided online.

Literature
No set textbooks. Optional literature will be proposed at the beginning of the class and in the lecture notes.

## Examples of partial differential equations
- Classification of PDEs
- Superposition principle

## One-dimensional wave equation
- D'Alembert's formula
- Duhamel's principle

## Fourier series
- Representation of piecewise continuous functions via Fourier series
- Examples and applications

## Separation of variables
- Resolution of wave and heat equation
- Homogeneous and inhomogeneous boundary conditions, Dirichlet and Neumann boundary conditions

## Laplace equation
- Resolution of the Laplace equation on rectangle, disk and annulus
- Poisson formula
- Mean value theorem and maximum principle

## Fourier transform
- Derivation and Definition
- Inverse Fourier transformation and inversion formula
- Interpretation and properties of the Fourier transform
- Resolution of the heat equation

## Laplace transform
- Definition, motivation and properties
- Inverse Laplace transform of rational functions
- Application to ordinary differential equations

### Lecture notes
There are available some Lecture Notes in English and also in German of the Professor. These can be found following the links provided under the tab 'Lernmaterialien'.

### Literature
2) Y. Pinchover and J. Rubinstein, An Introduction to Partial Differential Equations, Cambridge University Press
3) E. Kreyszig, Advanced Engineering Mathematics, John Wiley & Sons (only Chapters 1,2,6,11)

### Prerequisites / notice
Prerequisites:
- Practical Course General Chemistry (1. Semester, 529-0011-04)
- Practical Course Inorg. and Org. Chemistry I (2. Sem., 529-0230)
- Attendance of Course Inorg. Chemistry 1 (3. Sem., 529-0121)
If necessary, access priority will be settled according to the results of the first-year examinations.

**Abstract**
Introduction to the experimental methods of Inorganic Chemistry

**Objective**
The teaching laboratory offers an insight into different aspects of Inorganic Chemistry, including solid state chemistry, organometallic chemistry, kinetics, etc. The synthesis, characterization and analysis of inorganic compound are a main topic. Emphasis is given to scientific writing (experiment reports).

**Content**
Inorganic chemistry part: Synthesis and analysis of elemento-organic compounds, metal complexes, and organometallic compounds. Introduction to Schlenk techniques, solid state synthesis, and kinetics. Introduction in the chemistry library: literature data banks and collections of spectra.

Organic synthesis with organometallic compounds and catalysts: Experiments in the framework of a selected specialised project. Possible projects: Rh catalysed asymmetric hydrogenation of enamides, Mn-catalysed epoxidation of olefins, Cu catalysed Diels-Alder reactions, synthesis of organo-boron compounds and Pd catalysed coupling with halides, Ru catalysed transfer hydrogenation.

**Lecture notes**
A manual is distributed in the teaching laboratory.

**Prerequisites / notice**
Prerequisites:
- Practical Course General Chemistry (1. Semester, 529-0011-04)
- Practical Course Inorg. and Org. Chemistry I (2. Sem., 529-0230)
- Attendance of Course Inorg. Chemistry 1 (3. Sem., 529-0121)
If necessary, access priority will be settled according to the results of the first-year examinations.

**Abstract**
Methods of Asymmetric Synthesis

**Objective**
Understanding of the basic principles of diastereoselective synthesis
Content
Conformational analysis: acyclic and cyclic systems; Diastereoselective sigmatropic rearrangements; Diastereoselective Carbonyl addition reactions; Cram- and Felkin-Anh models, carbonyl Lewis acid interactions, chelate controlled reactions; chemistry of enolates, selective formation; asymmetric enolate alkylation; aldol reactions, allyl- and cycrotyl-metal chemistry; cyclisations, Baldwin rules; Diastereoselective olefin functionalization: hydrogenation, dihydroxylation, epoxidation.

Literature

529-0432-00L Physical Chemistry IV: Magnetic Resonance

Number: 529-0432-00L
Title: Physical Chemistry IV: Magnetic Resonance
Type: O
ECTS: 4
Hours: 3G
Lecturers: B. H. Meier, M. Ernst, G. Jeschke

Abstract
Theoretical foundations of magnetic resonance (NMR, EPR) and selected applications.

Objective
Introduction to magnetic resonance in isotropic and anisotropic phase.

Content
The course gives an introduction to magnetic resonance spectroscopy (NMR and EPR) in liquid, liquid crystalline and solid phase. It starts from a classical description in the framework of the Bloch equations. The implications of chemical exchange are studied and two-dimensional exchange spectroscopy is introduced. An introduction to Fourier spectroscopy in one and two dimensions is given and simple 'pulse trickery' is described. A quantum-mechanical description of magnetic resonance experiments is introduced and the spin Hamiltonian is derived. The chemical shift term as well as the scalar, dipolar and quadrupolar terms are discussed. The product-operator formalism is introduced and various experiments are described, e.g. polarization transfer. Applications in chemistry, biology, physics and medicine, e.g. determination of 3D molecular structure of dissolved molecules, determination of the structure of paramagnetic compounds and imaging (MRI) are presented.

Lecture notes
handed out in the lecture (in english)

Laboratory Courses

Electives

Inorganic Chemistry

Number: 529-0141-00L
Title: Physical Methods for Inorganic Chemistry
Type: W
ECTS: 6
Hours: 3G
Lecturers: D. Günther, J. Koch, R. Verel, M. D. Wörle

Abstract
Introduction into the important methods for structural analysis (solid state NMR), crystal structure analysis and surface analysis techniques and their applications.

Objective
Knowledge in solid state NMR, crystal structure analysis and surface analytical techniques relevant for inorganic materials.

Content
This lecture course consists of three parts 1) Solid state NMR 2) Surface and direct solid analysis 3) Crystal structure analysis. Most important fundamentals of the individual methods will be presented and details will be explained on most relevant inorganic applications.

Analytical Chemistry

Number: 529-0041-00L
Title: Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics
Type: W
ECTS: 6
Hours: 3G
Lecturers: R. Ženobi, M. Badertscher, B. Hattendorf, P. Martinez-Lozano Sinues

Abstract
Modern mass spectrometry, hyphenated analytical methods, speciation, methods of surface analysis, chemometrics.

Objective
Comprehensive knowledge about the analytical methods introduced in this course, and their applications.

Content
Coupling of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: Time of flight and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods, Methods of surface analysis (ESCA, Auger, SIMS, raster microscopy methods), Employment of computer science for processing data in chemical analysis (chemometrics).

Analytical Chemistry

Number: 529-0041-00L

</table>

**Abstract**
An introduction to the principles of X-ray diffraction and crystal structure determination as it relates to Chemistry

**Objective**
To gain an understanding of the principles of crystal structure determination by X-ray diffraction.

**Content**
Basic crystallography concepts: Unit cells, Bravais lattices, Laue symmetry, crystal classes (point groups), space groups, crystal growth, instrumentation, diffraction of X-rays by crystals; physical and geometric basics, powder and single crystal methods, structure solution and modelling, interpretation of crystal structure data, internal coordinates for structure description: atom spacing, co-ordination polyhedra, bond angles, torsion angles; intermolecular interactions, absolute configuration determination. Overview of inorganic, organic and macromolecular databases.

**Lecture notes**
The script and exercises will be distributed weekly in loose form

## Computational Chemistry
### Algorithms and Programming in C++

**Number:** 529-0002-00L  
**Title:** Algorithms and Programming in C++  
**Type:** W  
**ECTS:** 6 credits  
**Hours:** 3G  
**Lecturers:** S. Riniker

**Abstract:**  
Introduction to algorithms (special focus on chemistry): Design of algorithms, data structures, search and sort algorithms, graphs, numerical algorithms, algorithms in cheminformatics, machine learning and cheminformatics  
Computer language: C++

**Objective:**  
Development of programming skills and craftsmanship in order to be able to deal with the complexity of computer applications in chemistry.

**Content:**  
Introduction to algorithms (special focus on chemistry): Design of algorithms, data structures, search and sort algorithms, graphs, numerical algorithms, algorithms in cheminformatics, machine learning and cheminformatics  
Computer language: C++

**Lecture notes:** Script (in English) will be available

**Literature:**  
C++ programming:  

**Prerequisites / notice:**  
Since the exercises on the computer do convey and test essentially different skills as those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam.

### Basic Polymer Synthesis

**Number:** 529-0947-00L  
**Title:** Basic Polymer Synthesis  
**Type:** W  
**ECTS:** 6 credits  
**Hours:** 3G  
**Lecturers:** A. D. Schlüter

**Abstract:**  
Please note that this course will be offered for the last time in the autumn semester of 2017.

Chain-growth polymerizations (anionic, cationic, Ziegler/Natta, ROMP, radical, NMP, ATRP), mechanistic details including how to render a polymerization “living”, recent developments, and important examples.

**Objective:**  
The students should gain an overview of important polymerization procedures, learn how to deal with chemical structures and reactivities, and be able to suggest reasonable synthetic pathways to a given polymer structure. Aspects like achievable molar masses in dependence of the method used and structure perfection play a role throughout.

**Content:**  
I. Anionic polymerization  
1. General  
2. Living polymerization  
3. Group transfer polymerization (GTP)  
4. Some recent developments

II. Cationic polymerization  
1. General  
2. Some applications (macromonomer and telechelics)

III. Ziegler/Natta- and metallocene polymerization  
1. General  
2. Mechanism  
3. Some applications

IV. Ring-opening metathesis polymerization  
1. Comments on history  
2. Monomers, catalysts, polymer structures  
3. Mechanism, direct NMR monitoring  
4. Termination  
5. Examples

V. Controlled radical polymerization  
1. Nitroxide mediated polymerization (NMP)  
2. Atom transfer radical polymerization (ATRP)

**Lecture notes:** A script will not be provided. For all projections shown, however, paper copies will be distributed.

**Literature:** There is no specific literature recommendation. Numerous references will be provided for an easy access to the original literature.

**Prerequisites / notice:**  
The course will be taught in English. Complicated expressions will be explained in German. Questions can be asked in both languages. The examination will be in English; answers are acceptable in both languages.  
PhD students who need recognized credit points are required to pass the written exam.

### Introduction to Environmental Chemistry and Ecotoxicology

**Number:** 529-0037-01L  
**Title:** Introduction to Environmental Chemistry and Ecotoxicology  
**Type:** W  
**ECTS:** 4 credits  
**Hours:** 3G  
**Lecturers:** K. Fenner, C. Bogdal, J. Hollender

**Abstract:**  
Production and use of chemicals also introduces them into the environment. This course introduces chemistry students to environmental chemistry, ecotoxicology and trace analysis. Partitioning behavior and reactions of organic pollutants in the environment. Biodegradation, bioavailability and bioaccumulation. Ecotoxicological effects at the molecular level. Aspects of chemical trace analysis.

**Objective:**  
Goals:  
* The students develop an understanding of the processes that govern the fate and effects of chemicals in the environment.  
* The students know a number of methods for estimating the fate and effect of environmental pollutants. They recognize the relevant processes affecting a given compound and know how to use appropriate estimation methods for their quantification.
Part I: Fate of Chemicals in the Environment:
Relevant environmental compartments and how chemicals reach the environment.
Partitioning in the environment:
- Meaning of vapor pressure, water solubility and air-water partition coefficient for environmental behavior
- Octanol-water partition coefficient as surrogate for partitioning into biological systems
- Influence of temperature and pH on partitioning
- Global distribution of semi-volatile chemicals
- Molecular interactions that govern partitioning
- Sorption to natural surfaces, partitioning into natural organic matter
Chemical and photochemical transformation reactions
Microbial transformation processes in the environment

Part II: Effects of chemicals in the environment
Biological test systems for assessing ecotoxicological effects
Endpoints of toxicity assessment:
- Acute and chronic toxicity, effects on reproduction
- Dose-response modeling
Bioavailability and bioaccumulation:
- Bioconcentration, biomagnification, food chain accumulation
- Active and passive uptake mechanisms
Toxicokinetics and toxicodynamics:
- Metabolism and transformation reactions of pollutants in organisms, phase I and II transformations
- Detoxification, active excretion
Molecular mechanisms of toxicity in cells:
- Baseline toxicity
- Specific toxicity (Examples: Inhibition of photosynthesis, neurotoxicity, including AchEsterase, ion channels etc.)
- Oxidative stress
- Genotoxicity

Part III: Specific aspects of trace analysis in the environment (soil, water, air)
Planning of analytical strategy and sampling
Enrichment procedures
Separation and detection
Quantification, screening for unknowns

Lecture notes
Copies of the slides and some articles are distributed

Literature

701-1233-00L Stratospheric Chemistry
4 credits
2V+1U
T. Peter; A. Stenke

Abstract

Objective
The lecture gives an overview on the manifold reactions which occur in the gas phase, in stratospheric aerosol droplets and in polar cloud particles. The focus is on the chemistry of stratospheric ozone and its influence through natural and anthropogenic effects. Especially the intercontinental air traffic and the ozone depletion caused by FCKW CFC in the mid-latitude and the polar regions as well as coupling with the greenhouse effect.

Content
Short presentation of thermodynamical and kinetic basics of chemical reactions: bi- and thermodisso natural reactions, photo-dissociation. Introduction to the chemical family concept: active species, their source gases and reservoir gases. Detailed treatment of the pure oxygen family (odd oxygen) according to the Chapman chemistry. Radical reactions of the oxygen species with nitric oxide, active halogens (chlorine and bromine) and odd hydrogen. Ozone depletion cycles. Methane depletion and ozone production in the lower stratosphere (photo-smog reactions). Heterogeneous chemistry on the background aerosol and its significance for heavy air traffic. Chemistry and dynamics of the ozone hole: Formation of polar stratospheric clouds and chloride activation.

Lecture notes
Documents are provided in the contact hours.

Literature

Prerequisites / notice
Prerequisites: Basics in physical chemistry are required and an overview equivalent to the bachelor course in atmospheric chemistry (lecture 701-0471-01) is expected.

701-1233-00 V starts in the first week of the semester. The exercises 701-1233-00 U will start only in the 2nd week of the semester.

**Abstract**

This focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

**Objective**

- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

**Abstract**

Literature from the learning sciences is critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and meetings with those will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

**Objective**

- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

**Abstract**

The successful completion of both course no. 851-0240-00L "Menschliches Lernen (EW 1)" and course no. 851-0238-01L "Unterstützung und Diagnose von Wissenserwerbsprozessen (EW 3)" is a necessary prerequisite for this course.

**Objective**

In teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturers in this course. Basic conceptual and methodological issues are the topic of a series of plenary meetings; however, the major part of the work is done in small-group meetings with the advising researcher, and in self-directed research projects.

**Learning goals include:**

- Participants can illustrate and explain basic methods and concepts for research in the fields of Learning and Instruction, e.g. with the help of practical examples.
- Participants can design and conduct a study that is relevant for answering their research question.
- Participants can summarize and evaluate the main results from a study in the field of learning and Instruction, with regard to the research question being asked.

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

**Objective**

The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

**Content**

Thematic Schwerpunkte

Die Gegenstände der mentorierten Arbeit in Fachdidaktik stammen in der Regel aus dem gymnasialen Unterricht.

**Lecture notes**

Eine kurze Anleitung zur mentorierten Arbeit in Fachdidaktik wird zur Verfügung gestellt.

**Literature**

Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

**Prerequisites / notice**

Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

**529-0950-00L**

**Subject Didactics Chemistry I**

4 credits 3G A. Baertsch

Simultaneous enrolment in Introductory Internship Chemistry - course 529-0966-00L - is compulsory.

**Abstract**

Implementing findings from research into teaching and learning for chemistry lessons and coverage of subject-specific teaching and learning specialities.

**Objective**

Among other things, students are put in a position where they can:
- divide up the subject matter into contents that can be learned by heart or accessed intellectually, and communicate these contents.
- break down technically complex contents to the right level for a class and still present these in a stringent, error-free manner in their simplified form.
- establish which subject matter can be presented with which teaching techniques and methods that have been recognised as efficient in teaching terms, and adapt these tools to the learning content in question.
- plan school experiments, incorporate them in lessons, perform them in accordance with all the rules of the art, and also evaluate them in a beneficial manner.
- assess pupils’ prior knowledge, clarify it in greater detail and take it into account for planning lessons.
- design a sequential curriculum suitable for the levels in question and put it into practice.
- reliably identify stumbling blocks in the contents and get round these.

**Content**

Schwerpunkte im ersten Studiensemester bilden die folgenden Themen:

- Auswahl gymnamsiumsrelevanter Lerninhalte
- Modellbegriff in den Naturwissenschaften, insbesondere der Chemie
- Sprache und Fachsprache im Chemieunterricht
- Wechselwirkungen zwischen Beobachtungen in der realen Welt und Deutungsversuchen auf der Modell-Ebene
- Interdisziplinarität mit Biologie, Mathematik und Physik
- Leistungserhebung und -beurteilung im Theorie- und Laborunterricht
- Atommodelle und chemische Bindung
- Mathematische Beschreibung chemischer Systeme (z.B. Stöchiometrie und Gleichgewichtssysteme)
- Auswahl, Konzeption, Einbettung, Vorbereitung, Durchführung, Nachbereitung und Auswertung von Demonstrations- und Schüler-Experimenten

**Lecture notes**

**Literature**

Prerequisites / notice

Der Chemieunterricht am Gymnasium soll einerseits dem zukünftigen Nichtnaturlwissenschaftler ein grundlegendes Rüstzeug an chemischen Kenntnissen und Fähigkeiten für den Alltag an die Hand geben, andererseits aber auch auf ein naturwissenschaftlich orientiertes Hochschulstudium vorbereiten können. Diese beiden Anforderungen sind im Unterricht gleichermaßen zu berücksichtigen.

Da viele Lerninhalte zudem zwingend sequentiell und einander benützend strukturiert sind, ist dem logischen und aus Schülerperspektive noch nicht vollziehbaren Aufbau des Unterrichts besonderes Augenmerk zu schenken. Dies bedingt eine besonders feine Abstimmung von fachlichen Inhalten unterschiedlicher Niveaus und der für ihre Vermittlung eingesetzten didaktischen Methoden und Techniken auf die kognitive Leistungsfähigkeit der Lernenden.

Anhand der Diskussion ausgearbeiteter und bewährter Beispiele, aber auch durch selbständiges Probieren und mit Hilfe selbst zu erstellender kleiner Unterrichtsbausteine soll die zukünftige Lehrkraft befähigt werden, einen den spezifischen Rahmenbedingungen angepassten eigenen Unterricht zu konzipieren und durchzuführen, der diesem hohen Qualitätsanspruch genügen kann.

**Professional Training in Chemistry**

**Important:** You can only enrol in the courses of this category if you have not more than 12 CP left for possible additional requirements.

</tbody>
</table>

**Abstract**

During the introductory teaching practice, the students sit in on five lessons given by the teacher responsible for their teaching practice, and teach five lessons themselves. The students are given observation and reflection assignments by the teacher responsible for their teaching practice.

**Objective**

Right at the start of their training, students acquire initial experience with the observation of teaching, the establishment of concepts for teaching and the implementation of teaching. This early confrontation with the complexity of everything that teaching involves helps students decide whether they wish to and, indeed, ought to, continue with the training. It forms a basis for the subsequent pedagogical and subject-didactics training.

</table>

**Abstract**

The teaching practice takes in 50 lessons: 30 are taught by the students, and the students sit in on 20 lessons. The teaching practice lasts 4-6 weeks. It gives students the opportunity to implement the contents of their specialist-subject, educational science and subject-didactics training in the classroom. Students also conduct work assignments in parallel to their teaching practice.

**Objective**

- Students use their specialist-subject, educational-sciences and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They acquire the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

**Abstract**

This course unit introduces students to the technique of conducting experiments in chemistry lessons. It covers didactic, technical, safety-related and presentation aspects.

**Objective**

Amongst other things, students are put in a position to
- appreciate whether experiments would make sense, or are even indispensable
- adapt experiments described in the literature to their own teaching situation
- develop experiments of their own
- plan and implement the incorporation of experiments in their tuition
- perform demonstration experiments in a technically correct and safe manner
- accompany pupils' experiments from the content, pedagogical and safety angles
- evaluate experiments together with the pupils
- observe the safety provisions

**Content**

Schwerpunkte im ersten Studiensemester bilden die folgenden Themen:
- Theoretische Einführung.
- Merkmale der sichere Experimentieren.
- Erstellen und Überarbeiten von Experimentiervorschriften.
- Vorführungen von Experimenten.
- Experimentierkurs mit praktischen Übungen für die Studierenden.
- Leitungserhebung und -beurteilung im Experimentalunterricht.
- Sensibilisierung für die Verantwortung des Experiments im Chemie-Unterricht.
- Aufbau einer persönlichen Experimente-Bibliothek.
- Befähigung zu eindrucksvollem Experimentieren.
- Einhaltung aller einschlägigen Sicherheitsbestimmungen.

**Title**
Fundamental Aspects of Chemistry with an Educational Focus B
Simultaneous enrolment in "Examination Lesson I Chemistry" (529-0968-01L) is compulsory.

**Abstract**
Students enrolled at UZH must register for this course and the corresponding exam at ETH.

**Objective**
Selected topics in general chemistry:
1) The language of chemistry
2) Chirality and stereochemistry
3) Oxidation of water
4) Chemistry of the atmosphere

**Content**
In this course, participants acquire extended and more in-depth knowledge of selected chemistry topics. The selection is based on a large extent on the partial aspects of chemistry that are typically taught at high school. By gaining a broader understanding, teachers are put in a position where they can comprehend the topics that are to be taught in a wider and, to some extent, unconventional context and critically process these in respect of their teachability and learnability. At the same time, interrelationships between the classical sub-disciplines of chemistry are highlighted, along with the unique features of chemistry as one of the central natural sciences.

**Literature**
Ausgewählte Artikel aus der Primärliteratur werden zur Verfügung gestellt.

**Prerequisites / notice**
FV A (gelesen im Frühjahrsemester) und FV B (gelesen im Herbstsemester) bauen nicht aufeinander. Die Reihenfolge der Belegung ist somit indifferent.
Subject with an Educational Focus Chemistry B

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

### Abstract

- The aim is for the students
- to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
- To try out different options for specialist further training in their profession.

**Abstract**
The course is for advanced students and covers selected topics from magnetic resonance spectroscopy. This year, the lecture will introduce and discuss relaxation theory and its applications in magnetic resonance.

**Objective**
The aim of the course is to familiarize the students with the basic concepts of magnetic resonance relaxation theory in liquids and solids. Starting from the mathematical description of spin dynamics, the effect of stochastic motional processes on the density operator will be analyzed. In the end students should understand the Redfield formulation of relaxation and be able to understand the effect of dynamics on magnetic resonance experiments.

OC I-IV
529-0443-00L Advanced Magnetic Resonance W 7 credits 3G B. H. Meier, M. Ernst

Abstract The course is for advanced students and covers selected topics from magnetic resonance spectroscopy. This year, the lecture will introduce and discuss relaxation theory and its applications in magnetic resonance.

Objective The aim of the course is to familiarize the students with the basic concepts of magnetic resonance relaxation theory in liquids and solids. Starting from the mathematical description of spin dynamics, the effect of stochastic motional processes on the density operator will be analyzed. In the end students should understand the Redfield formulation of relaxation and be able to understand the effect of dynamics on magnetic resonance experiments.

Content The aim of the course is to familiarize the students with the basic concepts of magnetic resonance relaxation theory in liquids and solids. Starting from the mathematical description of spin dynamics, the effect of stochastic motional processes on the density operator will be analyzed. In the end students should understand the Redfield formulation of relaxation and be able to understand the effect of dynamics on magnetic resonance experiments.

Lecture notes A script which covers the topics will be distributed in the lecture and will be accessible through the web page http://www.ssnmr.ethz.ch/education/

529-0445-00L Advanced Optics and Spectroscopy W 7 credits 3G R. Signorell

Abstract This course provides an introduction to the interaction of light with nano- and microparticles followed by an overview of applications of current interest. Examples range from nanoparticles for medical applications and sensing to the role of the interaction of solar radiation with aerosol particles and cloud droplets for the climate.

Objective The students will be introduced to the basic concepts of the interaction of light with nano- and microparticles. The combination of basic concepts with different applications will enable students to apply their knowledge to new problems in various fields where nanoscale objects play a role.

Content Light interacts surprisingly differently with small particles than with bulk or with gas phase materials. The first part of the course provides a basic but rigorous introduction into the interaction of light with nano- and microparticles. The emphasis is on the classical treatment of absorption and scattering of light by small particles. The strengths and limits of this conventional approach will be discussed. The second part of the course is devoted to a broad range of applications. Here topics include: Plasmon resonances in metallic systems, metallo-dielectric nanoparticles for medical applications, the use of lasers for optical trapping and characterization of single particles, vibrational excitons in dielectric nanoparticles, interaction of light with aerosol particles and cloud droplets for remote sensing applications and climate predictions, characterization of airborne aerosol particles by photoemission using velocity map imaging.

Lecture notes will be distributed during the course.

Literature Basics: Absorption and Scattering of Light by Small Particles, C. F. Bohren and D. R. Huffman, John Wiley & Sons, Inc.

Applications: References will be provided during the course.

529-0058-00 "Analytical Chemistry II (4. Semester)" (or equivalent)

529-0049-00L Analytical Methods for Characterization of Nanoparticles and Nanomaterials W 2 credits 2G C. Latkoczy

Abstract Introduction to modern analytical methods used to fully characterize and identify nano-engineered materials and systems.

Objective Understanding of analytical concepts used in nanotechnology, In-depth knowledge of most important methods used in industry and research. Introduction to selected industrial applications, Basic knowledge of production mechanisms of nano-engineered materials.

Content Nanotechnology is the basis of many main technological innovations of the 21st century. After more than twenty years of research, nanotechnologies are now increasingly employed for commercial use: they are used in hundreds of everyday consumer products, such as cosmetics, food, automotive, electronics and medical products. Nanoparticles can contribute to stronger, lighter, cleaner, smarter, better, etc. products. Besides these positive effects, relatively little is still known about potential health and environmental effects and risks of such small nano-sized particles. Therefore, a lot of different industry customers are forced nowadays to monitor and regulate the size and concentration of nanoparticles in their nano-enabled products.

Above and beyond these regulatory requirements, most industries employing nanoparticles need to be able to online measure nanoparticles to meet their requirements towards quality control and production efficiency. All these requirements demand new precise, accurate, fast and innovative analysis methods to fully characterize nanoparticles in real-time and during the manufacturing process.

Lecture notes Lecture notes will be provided

Prerequisites / notice Prerequisites: 529-0051-00 "Analytical Chemistry I (3. Semester)" , 529-0058-00 "Analytical Chemistry II (4. Semester)" (or equivalent)

#### Abstract
Scenarios for world energy demand and CO2 emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry). Wind and ocean energy, heat pumps, geothermal energy, energy from waste. CO2 sequestration.

#### Objective
Scenarios for the development of world primary energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO2 emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

#### Content

#### Literature

#### Prerequisites / notice
Fundamentals of chemistry, physics and thermodynamics are a prerequisite for this course.

Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.

#### Abstract
Advanced X-ray crystal structure analysis

#### Objective
To gain a deeper understanding of crystal structure determination principles and practice by X-ray diffraction and the evaluation of results. Review of principles of diffraction and instrumentation, unit cells, lattices, and symmetry. Inorganic structural chemistry: sphere packings, ionic crystals, covalent networks, intermetallic compounds. Overview of powder diffraction and application of crystal chemistry for structure analysis of polycrystalline phases. Working safely with X-rays, crystal growth, selection and mounting, data collection strategies, data reduction, corrections for absorption, extinction and Lp, advanced structure solution theory and techniques: Patterson function, heavy atom technique, Fourier methods, direct methods. Structure modeling and refinement, disorder, twinning, false symmetry, interpretation of anisotropic shift parameters. Determination of absolute configuration, interpretation of results and scope of chemically useful information, validation and publication of results, critical evaluation of published crystal structures.

#### Literature

#### Prerequisites / notice
Fundamentals of chemistry, physics and thermodynamics are a prerequisite for this course.

Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.
**Main references**

**Additional literature**

**Prerequisites / notice**

Students will conduct the computational exercises and examples of structure solution and refinement on personal computers.

**Abstract**

Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

**Objective**

1. Insight Into The Mammalian Cell Cycle. Cycling, The Balance Between Proliferation and Cancer - Implications For Biopharmaceutical Manufacturing.
2. The Licence To Kill. Apoptosis Regulatory Networks - Engineering of Survival Pathways To Increase Robustness of Production Cell Lines.
5. From Target To Market. An Antibody's Journey From Cell Culture to The Clinics.
6. Biology and Malign Applications. Do Life Sciences Enable the Development of Biological Weapons?
7. Functional Food. Enjoy your Meal!

**Lecture notes**

Handsout during the course.

**Abstract**

Advanced, but fundamental topics central to the understanding of theory in chemistry and for solving actual chemical problems with a computer. Examples are:

* Operators derived from principles of relativistic quantum mechanics
* Relativistic effects + methods of relativistic quantum chemistry
* Open-shell molecules + spin-density functional theory
* New electron-correlation theories

**Objective**

The aim of the course is to provide an in-depth knowledge of theory and method development in theoretical chemistry. It will be shown that this is necessary in order to be able to solve actual chemical problems on a computer with quantum chemical methods.

**Content**

1. Introductory lecture: basics of quantum mechanics and quantum chemistry
2. Einstein's special theory of relativity and the (classical) electromagnetic interaction of two charged particles
3. Klein-Gordon and Dirac equation; the Dirac hydrogen atom
4. Numerical methods based on the Dirac-Fock-Coulomb Hamiltonian, two-component and scalar relativistic Hamiltonians
5. Response theory and molecular properties, derivation of property operators, Breit-Pauli-Hamiltonian
6. Relativistic effects in chemistry and the emergence of spin
7. Spin in density functional theory
8. New electron-correlation theories: Tensor network and matrix product states, the density matrix renormalization group
9. Quantum chemistry without the Born-Oppenheimer approximation

**Lecture notes**

A set of detailed lecture notes will be provided, which will cover the whole course.

Prerequisites / notice

Strongly recommended (preparatory) courses are: quantum mechanics and quantum chemistry

529-0004-00L Computer Simulation in Chemistry, Biology and Physics

Abstract
Molecular models, Force fields, Spatial boundary conditions, Calculation of Coulomb forces, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.

For more information: www.csms.ethz.ch/education/CSCBP

Objective
Introduction to computer simulation of (bio)molecular systems, development of skills to carry out and interpret computer simulations of biomolecular systems.

Content
Molecular models, Force fields, Spatial boundary conditions, Calculation of Coulomb forces, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.

Lecture notes
Available (copies of powerpoint slides distributed before each lecture)

Literature
See: www.csms.ethz.ch/education/CSCBP

Prerequisites / notice
Since the exercises on the computer convey and test essentially different skills as those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam.

For more information about the lecture: www.csms.ethz.ch/education/CSCBP

Materials Science

course: Introduction to Macromolecular Chemistry (529-0941-00L) will be given in spring semester

Number Title Type ECTS Hours Lecturers
327-0703-00L Electron Microscopy in Material Science W 4 credits 2V+2U K. Kunze, R. Erni, S. Gerstl, F. Gramm, F. Krumeich

Abstract
A comprehensive understanding of the interaction of electrons with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

Objective
A comprehensive understanding of the interaction of electrons with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

Content
This course provides a general introduction into electron microscopy of organic and inorganic materials. In the first part, the basics of transmission- and scanning electron microscopy are presented. The second part includes the most important aspects of specimen preparation, imaging and image processing. In the third part, recent applications in materials science, solid state physics, structural biology, structural geology and structural chemistry will be reported.

529-0745-00L General and Environmental Toxicology W 7 credits 3V M. Arand, K. Hungerbühler, H. Nägeli, B. B. Stieger, I. Werner

Abstract
Toxicokinetic and toxicodynamic aspects of xenobiotic interactions with cellular structures and mechanisms. Toxic responses at the level of organs (immune-, neuro-, reproductive and genotoxicity) and organisms. Introduction into developmental toxicology and ecotoxicology.

Objective
Explanation of important interactions between xenobiotic chemicals and cellular structures such as membranes, enzymes, and nucleic acids. Relevance of intake, distribution, excretion, and biochemical transformation processes. Relevance of mixtures. Explanation of important modes of toxic action such as immuno toxicity, neurotoxicity, reproduction toxicity, genotoxicity based on examples of certain xenobiotics and their effects on important organs.

Literature
Textbooks of pharmacology and toxicology (cf. list in course material)

Prequisites / notice
Educational basis: basic chemistry, biology and biochemistry

529-0047-00L Risk Assessment of Chemicals W 7 credits 6A C. Bogdai, K. Hungerbühler, N. von Götz, Z. Wang

Abstract
Projects on chemical assessment with the focus on the analysis and assessment of basic substance data for selected chemical classes; analysis and modelling of technical processes; characterisation of environmental and health risks. Risk assessment on the basis of quality and protection goals. Estimation of model and parameter uncertainty. Precaution and safety measures.

<td>This class conducts and supports experiments for a specifically designed genuine research project. We will carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. The relevant technologies will be taught to the students, such as the preparation of competent cells, production and isolation of DNA fragments, transformation of gene libraries, and DNA sequencing. The course participants will generate a variety of different variants of a chorismate mutase. Individual enzyme catalysts will be purified and subsequently characterized using several different spectroscopic methods. The detailed chemical-physical analyses include determination of the enzymes' kinetic parameters, their molecular mass, and the integrity of the protein structure. The students will present the results obtained from their individual evolution experiments at the end of the semester. We expect that during this lab course we will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalyst.</td>

Further literature will be indicated in the distributed script. |
| **Prerequisites / notice** | - This laboratory course will involve experiments that require a tight schedule and (sometimes) long (!) working days.  
- The projects of this course are tightly linked to the ones of the Biology BSc course "Biological Chemistry B: New Enzymes from Directed Evolution Experiments", which takes place as a block course during the month of November. There will be joint lectures for the participants of both courses during that time. The teaching language is English.  
- The number of participants for the laboratory class is limited. It is mandatory to sign up for the course directly with P. Kast at the latest 2 weeks prior to the start of the fall semester. A valid registration is considered a commitment for attendance of the entire semester course, as involved material orders and experimental preparations are necessary and, once the class has started, the flow of the experiments must not be interrupted by individual absences. In case of an emergency, please immediately notify P. Kast.  
- For more information, see also http://www.protein.ethz.ch/kast/praktikum.html or contact P. Kast directly (HCI F 333, Tel. 044 632 29 08, kast@org.chem.ethz.ch). |
Analytical Chemistry I

In the Master thesis students prove their ability to independent, structured and scientific working. The Master thesis is usually carried out in a core or optional subject area as chosen by the student.

Duration of the Master's Thesis 16 weeks.

In the Master thesis students prove their ability to independent, structured and scientific working.

Course Units for Additional Admission Requirements

The courses below are only available for MSc students with additional admission requirements.

Master's Thesis

Only students who fulfill the following criteria are allowed to begin with their master thesis:

a. successful completion of the bachelor programme;

b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract

In the Master thesis students prove their ability to independent, structured and scientific working. The Master thesis is usually carried out in a core or optional subject area as chosen by the student.

Objective

In the Master Thesis students prove their ability to independent, structured and scientific working.

Recommended GESS Science in Perspective (Type B) for D-CHAB.

Analytical Chemistry I

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

Introduction into the most important spectroscopical methods and their applications to gain structural information.

Objective

Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications

Content

Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:

- Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.

Lecture notes

Script will be for the production price

Literature

- M. Hesse, H. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5. überarbeitete Auflage, Thieme, Stuttgart, 1995

Prerequisites / notice

Exercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounds" (4th semester) is recommended.

Inorganic Chemistry II

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

The lecture is based on Inorganic Chemistry I and addresses an enhanced understanding of the symmetry aspects of chemical bonding of molecules and translation polymers, i.e. crystal structures.

Objective

The lecture is based on Inorganic Chemistry I and addresses an enhanced understanding of the symmetry aspects of chemical bonding of molecules and translation polymers.

Content

Symmetry aspects of chemical bonding, point groups and representations for the deduction of molecular orbitals, energy assessment for molecules and solids, Sanderson formalism, derivation and understanding of band structures, densities of states, overlap populations, crystal symmetry, basic crystal structures and corresponding properties, visual representations of crystal structures.

Lecture notes

Abstract
Fundamental aspects of the organometallic chemistry of the transition elements. Mechanistic homogeneous catalysis including oxidative additions, reductive eliminations and insertion reactions. Catalytic hydrogenation, carbonylation, C-C bond-forming and related reactions.

Objective
Towards an understanding of the fundamental coordination-chemical and mechanistic aspects of transition-metal chemistry relevant to homogeneous catalysis.

Content
Fundamental aspects of the organometallic chemistry of the transition elements. Mechanistic homogeneous catalysis including oxidative additions, reductive eliminations and insertion reactions. Catalytic hydrogenation, carbonylation, C-C bond-forming and related reactions.

Literature
A relatively concise but excellent introduction to organometallic chemistry. Strong textbook character, available as E-book

A more comprehensive standard work on organometallic chemistry. Several chapters written by various authors, partly specialized review-article style.

**Abstract**  
Microfluidics describes the behaviour, control and manipulation of fluids that are geometrically constrained within sub-microliter environments. The use of microfluidic devices offers an opportunity to control physical and chemical processes with unrivalled precision, and in turn provides a route to performing chemistry and biology in an ultra-fast and high-efficiency manner.

**Objective**  
In the course students will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis. A design workshop will allow students to develop new microscale flow processes by appreciating the dominant physics at the microscale. The application of these basic ideas will primarily focus on biological problems and will include a treatment of diagnostic devices for use at the point-of-care, advanced functional material synthesis, DNA analysis, proteomics and cell-based assays. Lectures, assignments and the design workshop will acquaint students with the state-of-the-art in applied microfluidics.

**Content**  
Specific topics in the course include, but not limited to:

1. Theoretical Concepts  
   Features of mass and thermal transport on the microscale  
   Key scaling laws
2. Microfluidic Device Manufacture  
   Conventional lithographic processing of rigid materials  
   Soft lithographic processing of plastics and polymers  
   Mass fabrication of polymeric devices
3. Unit operations and functional components  
   Analytical separations (electrophoresis and chromatography)  
   Chemical and biological synthesis  
   Sample pre-treatment (filtration, SPE, pre-concentration)  
   Molecular detection
4. Design Workshop  
   Design of microfluidic architectures for PCR, distillation & mixing
5. Contemporary Applications in Biological Analysis  
   Microarrays  
   Cellular analyses (single cells, enzymatic assays, cell sorting)  
   Proteomics
6. System integration  
   Applications in radiochemistry, diagnostics and high-throughput experimentation

**Lecture notes**  
Lecture handouts, background literature, problem sheets and notes will be provided electronically.

**Abstract**  

**Objective**  
Introduce the students to the design of polymerization reactors for the production of polymers with molecular characteristics suitably tuned for specific applications. This includes the post-treatment of polymer latexes and the analysis of their colloidal behavior.

**Content**  
The aim of the course is to provide the tools needed for the understanding of the fundamental processes and the design of the industrial units involved in the production of polymeric materials and in the post-treatment of polymer colloids. In particular, the following topics are discussed:  
Aggregation kinetics and aggregate structure in conditions of diffusion and reaction limited aggregation. The role of shear conditions on aggregation and breakage kinetics and on the aggregate structure. Modeling and design of colloid aggregation processes.

**Lecture notes**  
Skripts are available on the 'Polymerization Reaction and Colloid Engineering' web page of the Morbidelli-group, vide the given link for details.

**Abstract**  
The 'Chemical Product Design' course teaches students quantitative concepts to analyze, select and transform theoretical concepts from chemistry and engineering into valuable real-world products. Basic chemistry and chemical engineering knowledge is required (Diffusion, Thermodynamics, Kinetics,...).

**Objective**  
This course starts with analyzing existing chemical needs and unmet technical challenges. We then develop the skills to critically analyze a specific chemical idea for a product, to rapidly test feasibility or chance for success and to eventually realize its manufacturing. The chemical engineering basics are then used to assess performance of products or devices with non-traditional functions based on dynamic properties (e.g. responsive building materials; personal medical diagnostics on paper strips). The course teaches the interface between laboratory and market with a specific focus on evaluating the chemical value of a given process or compound, and the necessary steps to pursue the resulting project within an entrepreneurial environment. We therefore extend the questions of process design ('how do we make something') to the question of 'what should we make?'
Content

Part A: The 'Chemical Product Design' course starts with discussing questions along, 'What is a chemical product, and why do people pay for it? How does a given compound in a specific setting provide a service?' We then learn how to translate new, often ill-defined wishes or ideas into quantifiable specifications.

Part B: Thermodynamic and kinetic data allow sharp selection criteria for successful products. We learn how to deal with insufficient data and development of robust case models to evaluate their technical and financial constraints. How can parameters of a running process in one industry be scaled into another industry? Can dimensionless engineering numbers be applied beyond traditional chemical processes?

Part C: Manufacturing of commodity products, devices and molecular products: Chemical reactors, separation and detection or isolation units as part of a toolbox. Planning of manufacturing and decisions based on hard data. Providing quantitative answers on potential value generated.

Students are expected to actively develop chemical products along the course. Contributions will be made individually, or in small groups, where a larger topic is studied.

Abstract

This course encompasses the theoretical principles of chemical process simulation, as well as its practical application in process analysis and optimization. The techniques for simulating stationary and dynamic processes are presented, and illustrated with case studies. Commercial software packages are presented as a key engineering tool for solving process flowsheeting and simulation problems.

Objective

This course aims to develop the competency of chemical engineers in process flowsheeting and simulation. Specifically, students will develop the following skills:

- Deep understanding of chemical engineering fundamentals: the acquisition of new concepts and the application of previous knowledge in the area of chemical process systems and their mechanisms are crucial to intelligently simulate and evaluate processes.
- Modeling of general chemical processes and systems: students have to be able to identify the boundaries of the system to be studied and develop the set of relevant mathematical relations, which describe the process behavior.
- Mathematical reasoning and computational skills: the familiarization with mathematical algorithms and computational tools is essential to be capable of achieving rapid and reliable solutions to simulation and optimization problems. Hence, students will learn the mathematical principles necessary for process simulation and optimization, as well as the structure and application of process simulation software. Thus, they will be able to develop criteria to correctly use commercial software packages and critically evaluate their results.

Content

Overview of process simulation and flowsheeting
- Definition and fundamentals
- Classification: stationary (steady-state) versus dynamic (transient state) systems
- Fields of application
- Case studies

Process modeling
- Modeling strategies of process systems
- Mass conservation
- Species balance
- Energy conservation
- Momentum balance
- Multiphase-systems: equilibrium & non-equilibrium models
- Process system model

Process simulation
- Process specification
- Introduction to process specification
- Classification of mathematical models: AMS, DOE, DAE, PDE
- Model validation
- Software tools
- Solution methods for process flowsheeting
- Simultaneous methods
- Sequential methods
- Dynamic simulation
- Numerical solution: explicit and implicit methods
- Continuous-discrete simulation: handling of discontinuities

Process optimization and analysis
- Classification of optimization problems
- Linear programming
- Non-linear programming
- Dynamic programming
- Optimization methods in process flowsheeting
- Sequential methods
- Simultaneous methods

Commercial software for simulation: Aspen Plus
- Thermodynamic property methods
- Reaction and reactors
- Separation / columns
- Convergence & debugging

Literature

An exemplary literature list is provided below:

Prerequisites / notice

A basic understanding of material and energy balances, thermodynamic property methods and typical unit operations (e.g., reactors, flash separations, distillation/absorption columns etc.) is required.
The course is focused on the design of Chemical Processes, with emphasis on the preliminary stage of the design approach, where process creation and quick selection among many alternatives are important. The main concepts behind more detailed process design and process simulation are also examined in the last part of the course.

Abstract
Basic elements of surface science important for materials and catalysis research. Physical and chemical methods important for research in surface science, material science and catalysis are considered and their application is demonstrated on practical examples.

Objective
Basic aspects of surface science. Understanding of principles of most important experimental methods used in research concerned with surface science, material science and catalysis.

Content
Methods which are covered embrace: Gas adsorption and surface area analysis, IR-Spectroscopy, X-ray diffraction, X-ray photoelectron spectroscopy, X-ray absorption, solid state NMR, Electron Microscopy and others.

Lecture notes The course material is based on own script, journal articles, and slides.

Prerequisites / notice
It is assumed that students selecting this course are familiar with general concepts of catalysis, reactor design, and transport phenomena.

Abstract
The purpose of the "Catalysis Engineering" course is to provide students with tools that enable the optimal design of catalytic materials and reactor engineering concepts favoring more sustainable manufacturing processes within the chemical industry.

Objective
The course aims at illustrating, from conception to implementation, the design of sustainable catalytic processes by integration of the microlevel (catalyst), mesolevel (reactor), and macrolevel (process). The word \( \text{\textit{sustainable}} \) implies intensified processes with an improved exploitation of raw materials, wider use of renewable feedstocks, reduction of energy consumption, and minimized environmental impact. By the use of modern case studies of industrial relevance, aspects of catalyst preparation and characterization, kinetics, mass and heat transport, and deactivation are discussed. Emphasis is put on understanding the interaction among these basic elements in order to select the optimal catalytic process. Since no textbooks covering this area are available at this time and the intention of this course is unique, the lectures will be based on own texts and journal articles. During the course, there will be specific topics addressed by industrial contributors.

Content
The following general aspects:
- Catalyst preparation and characterization
- Kinetics
- Mass and heat transport
- Selectivity
- Deactivation

will be demonstrated for modern catalytic materials and processes of industrial relevance such as:
- Chlorine recycling
- N2O abatement
- Chemoselective hydrogenations
- Hierarchical zeolite catalysts
- Syngas conversion
- Biomass to chemicals and fuels

Lecture notes The course material is based on own script, journal articles, and slides.

Prerequisites / notice
It is assumed that students selecting this course are familiar with general concepts of catalysis, reactor design, and transport phenomena.

Abstract
The methods of fluid dynamics play an important role in the description of a chain of events, involving the release, spreading and dilution of dangerous fluids in the environment. Tunnel ventilation systems and strategies are studied, which must meet severe requirements during normal operation and in emergency situations (tunnel fires etc.).

Objective
Generally applicable methods in fluid dynamics and gas dynamics are illustrated and practiced using selected current examples.

Content
Often experts fall back on the methodology of fluid dynamics when involved in the construction of environmentally friendly processing and incineration facilities, as well as when choosing safe transport and storage options for dangerous materials. As a result of accidents, but also in normal operations, dangerous gases and liquids may escape and be transported further by wind or flowing water. Therefore, there are many possible forms that the resulting damage may take, including fire and explosion when flammable substances are mixed. The topics covered include: Emissions of liquids and gases from containers and pipelines, evaporation from pools and vaporization of gases kept under pressure, the spread and dilution of waste gas plumes in the wind, deflagration and detonation of inflammmable gases, fireballs in gases held under pressure, pollution and exhaust gases in tunnels (tunnel fires etc.)

### Prerequisites / notice
- Requirements: successful attendance at lectures "Fluidodynamik I und II", "Thermodynamik I und II"
- Autumn Semester 2016
- Notice: Commercial software packages are presented as a key engineering tool for solving process flowsheeting and simulation problems.

### Course Descriptions
- **Turbulent Flows**
  - **Abstract**
    - Contents
      - Laminar and turbulent flows, instability and origin of turbulence - Statistical description: averaging, turbulent energy, dissipation, closure problem - Scalings: Homogeneous isotropic turbulence, correlations, Fourier representation, energy spectrum - Free turbulence: wake, jet, mixing layer - Wall turbulence: Channel and boundary layer - Computation and modelling of turbulent flows
  - **Objective**
    - Basic physical phenomena of turbulent flows, quantitative and statistical description, basic and averaged equations, principles of turbulent flow computation and elements of turbulence modelling
  - **Content**
    - Properties of laminar, transitional and turbulent flows.
    - Origin and control of turbulence. Instability and transition.
    - Statistical description, averaging, equations for mean and fluctuating quantities, closure problem.
    - Scalings, homogeneous isotropic turbulence, energy spectrum.
    - Turbulent free shear flows. Jet, wake, mixing layer.
    - Wall-bounded turbulent flows.
    - Turbulent flow computation and modeling.
  - **Lecture notes**
    - Lecture notes are available
  - **Literature**

- **Process Design and Safety**
  - **Abstract**
    - Process design and safety deals with the fundamentals of process apparatus, plant design and safety.
  - **Objective**
    - The goal of the lecture is to expound design characteristics of systems for process engineering applications.
  - **Content**
    - Fundamentals of plant and apparatus design; materials in the process industries, mechanical design and design rules of main components; pumps and fans; piping and armatures, safety in process industry
  - **Lecture notes**
    - Script is available, English slides will be distributed
  - **Literature**

- **Rate-Controlled Separations in Fine Chemistry**
  - **Abstract**
    - The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.
  - **Objective**
    - The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.
  - **Content**
    - The class covers separation techniques that are detailed in the purification and downstream processing of chemicals and bio-pharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Liquid-liquid extraction; 2) Adsorption and chromatography; 3) Membrane processes; 4) Crystallization and precipitation.
  - **Lecture notes**
    - Handouts during the class
  - **Literature**
    - Recommendations for text books will be covered in the class

- **Characterization of Catalysts and Surfaces**
  - **Abstract**
    - Basic elements of surface science important for materials and catalysis research. Physical and chemical methods important for research in surface science, material science and catalysis are considered and their application is demonstrated on practical examples.
  - **Objective**
    - Basic aspects of surface science. Understanding of principles of most important experimental methods used in research concerned with surface science, material science and catalysis.
  - **Content**
    - Methods which are covered embrace: Gas adsorption and surface area analysis, IR-Spectroscopy, X-ray diffraction, X-ray photoelectron spectroscopy, X-ray absorption, solid state NMR, Electron Microscopy and others.
  - **Lecture notes**
    - Scripts are available on the 'Polymerization Reaction and Colloid Engineering' web page of the Morbidelli-group, vide the given link for details.
  - **Literature**

- **Polymerization Reaction and Colloid Engineering**
  - **Abstract**
  - **Objective**
    - Introduce the students to the design of polymerization reactors for the production of polymers with molecular characteristics suitably tuned for specific applications. This includes the post-treatment of polymer latexes and the analysis of their colloidal behavior.
  - **Content**
    - The aim of the course is to provide the tools needed for the understanding of the fundamental processes and the design of the industrial units involved in the production of polymeric materials and in the post-treatment of polymer colloids. In particular, the following topics are discussed: Physico-chemical characterization of polymers and description of the polymerization processes. Kinetics of free-radical polymerization and use of population balance models. Production of homo- and co-polymers with controlled characteristics in terms of molecular weight distribution and chain composition distribution. Living polymerizations. Design of polymerization reactors and the thermal runaway problem. Kinetics and control of emulsion polymerization. The radical segregation problem. Surfactants and colloidal stability. Aggregation kinetics and aggregate structure in conditions of diffusion and reaction limited aggregation. The role of shear conditions on aggregation and breakage kinetics and on the aggregate structure. Modeling and design of colloid aggregation processes.
  - **Lecture notes**
    - Scripts are available on the 'Polymerization Reaction and Colloid Engineering' web page of the Morbidelli-group, vide the given link for details.
  - **Literature**

Chemical Product Design

W 7 credits 3G W. J. Stark

Prerequisites: Basic chemistry and chemical engineering knowledge (Diffusion, Thermodynamics, Kinetics, ...)

Abstract
The 'Chemical Product Design' course teaches students quantitative concepts to analyze, select and transform theoretical concepts from chemistry and engineering into valuable real-world products. Basic chemistry and chemical engineering knowledge is required (Diffusion, Thermodynamics, Kinetics, ...).

Objective
This course starts with analyzing existing chemical needs and unmet technical challenges. We then develop the skills to critically analyze a specific chemical idea for a product, to rapidly test feasibility or chance for success and to eventually realize its manufacturing. The chemical engineering basics are then used to assess performance of products or devices with non-traditional functions based on dynamic properties (e.g. responsive building materials; personal medical diagnostics on paper strips). The course teaches the interface between laboratory and market with a specific focus on evaluating the chemical value of a given process or compound, and the necessary steps to pursue the resulting project within an entrepreneurial environment. We therefore extend the questions of process design (‘how do we make something?’) to the question of ‘what should we make?’
Content

Part A: The 'Chemical Product Design' course starts with discussing questions along, 'What is a chemical product, and why do people pay for it? How does a given compound in a specific setting provide a service?' We then learn how to translate new, often ill-defined wishes or ideas into quantifiable specifications.

Part B: Thermodynamic and kinetic data allow sharp selection criteria for successful products. We learn how to deal with insufficient data and development of robust case models to evaluate their technical and financial constraints. How can parameters of a running process in one industry be scaled into another industry? Can dimensionless engineering numbers be applied beyond traditional chemical processes?

Part C: Manufacturing of commodity products, devices and molecular products: Chemical reactors, separation and detection or isolation units as part of a toolbox. Planning of manufacturing and decisions based on hard data. Providing quantitative answers on potential value generated.

Students are expected to actively develop chemical products along the course. Contributions will be made individually, or in small groups, where a larger topic is studied.

Specific topics in the course include, but not limited to:

1. Theoretical Concepts
   Features of mass and thermal transport on the microscale
   Key scaling laws
2. Microfluidic Device Manufacture
   Conventional lithographic processing of rigid materials
   Soft lithographic processing of plastics and polymers
   Mass fabrication of polymeric microfluidic devices
3. Unit operations and functional components
   Analytical separations (electrophoresis and chromatography)
   Chemical and biological synthesis
   Sample pre-treatment (filtration, SPE, pre-concentration)
   Molecular detection
4. Design Workshop
   Design of microfluidic architectures for PCR, distillation & mixing
5. Contemporary Applications in Biological Analysis
   Microarrays
   Cellular analyses (single cells, enzymatic assays, cell sorting)
   Proteomics
6. System integration
   Applications in radiochemistry, diagnostics and high-throughput experimentation

  - Textbooks of pharmacology and toxicology

### Project Thesis
- Project thesis on chemicals assessment; time frame totals ca. 80 hours.
Scenarios for world energy demand and CO2 emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry), Wind and ocean energy, heat pumps, geothermal energy, energy from waste, CO2 sequestration.

Abstract

Scenarios for the development of world primary energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO2 emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

Objective

Content

Students know the potential and limitations of renewable energies for reducing CO2 emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

Number of participants limited to 60.

Abstract
Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Emphasis is placed on developing computational models with quantifiable predictive capabilities, and on the application of Uncertainty Quantification and Propagation to problems in mechanics, control systems, and cell biology.

Objective
The course will teach fundamental concepts of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in engineering and life sciences. Emphasis will be placed on practical and computational aspects of UQ+P, including the implementation of relevant algorithms in a multi-disciplinary framework.

Content
Topics that will be covered include: Uncertainty quantification under parametric and non-parametric conditions, Bayesian inference with model-class assessment, Markov Chain Monte Carlo simulation, and prior and posterior reliability analysis.

Literature
1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes
3. Class Notes

Prerequisites / notice
Fundamentals of Probability, Fundamentals of Computational Modeling

Laboratory Course, Research Project, and Case Study

529-0300-00L Research Project

Abstract
In a research project students extend their knowledge in a particular field, get acquainted with the scientific way of working, and learn to work on an actual research topic. Research projects are carried out in a core or optional subject area as chosen by the student.

Objective
First contact with experimental techniques of chemical engineering in a research group. Critical evaluation and presentation of the results in a scientific report.

Content
This laboratory project is organized during the spring vacation before the sixth semester. The participant can choose his topic from the list of projects suggested. Main emphasis during this research work is to gain experience in using different engineering tools and evaluation and interpretation of the results. Some projects are presented as a scientific report.

529-0637-00L Chemical Engineering Laboratory II

Abstract
Introduction to the main specific areas in chemical and biochemical engineering. The students sharpen their laboratory skills and learn to plan and perform problem-oriented experiments and to analyse, interpret and present the results.

Objective
Introduction to the main specific areas in chemical and biochemical engineering, the students sharpen their laboratory skills and learn combined techniques to plan and perform problem-oriented experiments and to analyse, interpret and present the results.

Content
Teams of two students will conduct four or five experiments from the following areas: reactor stability, characterization of multiphase reactors, heterogeneous gas phase catalysis, polymer reaction engineering, process control and automation, safety and ecological analysis.

529-0459-00L Case Studies in Process Design

Abstract
The learning objective is to design, simulate and optimize a real (bio-)chemical process from a process systems perspective. Specifically, a commercial process simulation software will be used for the process simulation and optimization. Students have to integrate knowledge and develop engineering thinking and skills acquired in the other courses of the curriculum.

Objective
Simulate and optimize a chemical production process using a commercial process simulation software.

Data: 08.05.2017 12:41 Autumn Semester 2016 Page 375 of 1570
The learning objectives (LO) of this course are:

**LO 1: Create a model describing the production process**
- Students will apply a commercial process simulator systematically for process creation and analysis.
- Students will create a simulation flowsheet for steady-state simulation.
- Students will discriminate the models for the different process units.
- Students will evaluate the sequencing in which process units associated with recycle loops are solved to obtain converged material and energy balances.

**LO 2: Evaluate the performance of the production process**
- Students will analyse and understand the degrees of freedom in modelling process units and flowsheets.
- Students will understand the role of process simulators in process creation.
- Students will make design specifications and follow the iterations implemented to satisfy them.
- Students will judge the role of process simulators in equipment sizing and costing and profitability analysis.
- Students will assess the economic performance of the process, including investment and operation costs.
- Students will assess the environmental impact of the production process.

**LO 3: Optimise the design and operating conditions of the production process**
- Students will solve sensitivity analyses and optimisations are conducted considering technical and economic criteria.
- Students will generate process integration alternatives to improve the initial production process.
- Students will optimise the production process considering economic and environmental criteria.

Prerequisites / notice

Before the case study week, students do exercises in the course of Process Simulation and Flowsheeting in order to get familiar with Aspen Plus simulation software (compulsory). They also receive guidelines for environmental impact assessment and skills on oral presentations.

The problem statement and detailed instructions are provided at the beginning of the case study week.

During the case study week:
- Students work in teams of 3-5 people.
- Students have to pose and solve the different questions presented in the problem statement.
- Students have to coordinate the activities, the preparation of the written report and the oral presentation.
- Students will be assessed in specific questions they may find along the case study development.
- An industry expert, namely a chemical engineer from ETHZ, exchanges with the groups.

One week after the case study week, the groups deliver the written report.

One week later, the students receive the comments on the work done, and implement required corrections.

All the groups prepare a single presentation comparing the results and showing their achievements.

Finally, the students visit the real industrial process at the site. They also present their work to the industrial experts on the day of the industry visit.

**GESS Science in Perspective**

*Recommended GESS Science in Perspective (Type B) for D-CHAB.*

*see GESS Science in Perspective: Type A: Enhancement of Reflection Capability*

*see GESS Science in Perspective: Language Courses ETH/UZH*

**Master’s Thesis**

*Only students who fulfill the following criteria are allowed to begin with their master thesis:
  a. successful completion of the bachelor programme;
  b. fulfilling of any additional requirements necessary to gain admission to the master programme.*

**Duration of the Master's Thesis** 16 weeks.

**Abstract**

In the Master thesis students prove their ability to independent, structured and scientific working. The Master thesis is carried out in a research group of the Department of Chemistry and Applied Biosciences, usually in the Institute of Chemical and Bioengineering, as chosen by the student.

**Objective**

In the Master Thesis students prove their ability to independent, structured and scientific working.

**Course Units for Additional Admission Requirements**

The courses below are only available for MSc students with additional admission requirements.

</table>

*Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.*

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

The goal of this course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

**Objective**

The goal of this course is to provide students with a wide general understanding cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.
Content

The focus is animal cells and the development of multicellular organisms with a clear emphasis on the molecular basis of cellular structures and phenomena. The topics include biological membranes, the cytoskeleton, protein sorting, energy metabolism, cell cycle and division, viruses, extracellular matrix, cell signaling, embryonic development and cancer research.

Prerequisites / notice

none

551-0016-AAL

Biology II

E-  2 credits  4R  M. Stoffel, E. Hafen

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement. Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract

The lecture course Biology II is a basic introductory course into biology for students who need to pass this course for admission to their MSc curriculum.

Objective

The objective of the lecture course Biology II is the understanding of form, function, and development of animals and of the basic underlying mechanisms.

Content

The following numbers of chapters refer to the text-book "Biology" (Campbell & Reece, 7th edition, 2005) on which the course is based. Chapters 1-4 are a basic prerequisite. The sections "Structure of the Cell" (Chapters 5-10, 12, 17) and "General Genetics" (Chapters 13-16, 18, 46) are covered by the lecture Biology I.

1. Genomes, DNA Technology, Genetic Basis of Development

Chapter 19: Eukaryotic Genomes: Organization, Regulation, and Evolution
Chapter 20: DNA Technology and Genomics
Chapter 21: The Genetic Basis of Development

2. Form, Function, and Development of Animals I

Chapter 40: Basic Principles of Animal Form and Function
Chapter 41: Animal Nutrition
Chapter 44: Osmoregulation and Excretion
Chapter 47: Animal Development

3. Form, Function, and Development of Animals II

Chapter 42: Circulation and Gas Exchange
Chapter 43: The Immune System
Chapter 45: Hormones and the Endocrine System
Chapter 48: Nervous Systems
Chapter 49: Sensory and Motor Mechanisms

Literature

The following text-book is the basis for the courses Biology I and II:

Prerequisites / notice

Prerequisite: Lecture course Biology I of winter semester

529-0051-AAL

Analytical Chemistry I

E-  3 credits  6R  D. Günther, R. Zenobi

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract

Introduction into the most important spectroscopical methods and their applications to gain structural information.

Objective

Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications

Content

Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:

- Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.

Lecture notes

Script will be for the production price
Prerequisites / notice
Exercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounds" (4th semester) is recommended.

551-0013-AAL Biochemistry
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
The lecture is a basic introductory course on the molecular principles of biology for students who need to pass this course for admission to their MSc curriculum.

Objective
The goal of this course is to give the students a basic understanding of the molecules that build a cell and make it function, and the basic principles of metabolism and molecular genetics.

Content
The course content is based on the following chapters of the textbook Biochemistry (Berg, Tymoczko, Stryer, 7th edition, 2012, Freeman & Co, New York):

- Chapter 1: The molecular design of life
- Chapter 2: Protein composition and structure
- Chapter 3: Exploring proteins and proteomes
- Chapter 4: DNA, RNA and the flow of information
- Chapter 5: Exploring Genes and Genomes
- Chapter 7: Hemoglobin
- Chapter 8: Enzymes and the basic concepts of catalysis
- Chapter 11: Carbohydrates
- Chapter 12: Lipids and cell membranes
- Chapter 15: Metabolism: Basic concepts and design

529-0001-00L Introduction to Computer Science

Abstract
Introduction to UNIX, data representation, introduction to C++ programming, errors, algorithms, computer architecture, sorting and searching, databases, numerical algorithms, types of algorithms, simulation, data communication & networks, chemical structures, operating systems, programming languages, software engineering.

Objective
Discuss fundamentals of computer architecture, languages, algorithms and programming with an eye to their application in the area of chemistry, biology and material science.

Content
Minimal introduction to UNIX, Data representation and processing, algorithms and programming in C++, Errors, programming guidelines, efficiency, computer architecture, algorithms for sorting and searching, databases, numerical algorithms, types of algorithms, simulation, data communication & networks, chemical structures, operating systems, programming languages, style, software engineering.

Lecture notes
Available (in English), distributed at first lecture

Literature
See: www.csms.ethz.ch/education/infol

Prerequisites / notice
Since the exercises on the computer do convey and test essentially different skills as those being conveyed during the lectures and tested at the written exam, the results of the exercises are taken into account when evaluating the results of the exam.

For more information about the lecture: www.csms.ethz.ch/education/infol

Information about the practical course will be given on the first day.

Qualitative analysis (determination of cations and anions), acid-base-equilibria (pH-values, titrations, buffer), precipitation equilibria (gravimetry, potentiometry, conductivity), redox reactions (syntheses, redox-titrations, galvanic elements), metal complexes (syntheses, complexometric titration)
analysis of measured values, states of aggregation (vapour pressure, conductivity, calorimetry)

Contents:
- Qualitative analysis (simple cation and anion separation process, determination of cations and anions), acid-base-equilibria (strengths of acids and bases, pH- and pKa-values, titrations, buffer systems, Kjeldahl determination), precipitation equilibria (gravimetry, potentiometry, conductivity, oxidation state and redox behaviour (syntheses), redox-titrations, galvanic elements), metal complexes (syntheses of complexes, ligand exchange reactions, complexometric titration)
- Analysis of measured values (measuring error, average value, error analysis), states of aggregation (vapour pressure), characteristics of electrolytes (conductivity measurements), thermodynamics (calorimetry)

Chemical reactivity and classes of compounds. Eliminations, fragmentsations, chemistry of aldehydes and ketones (hydrates, acetals, imines, enamines, nucleophilic addition of organometallic compounds, reactions with phosphorus and sulfur ylides; reactions of enolates as nucleophiles) and of carboxylic acid derivatives. Aldol reactions.

Acquisition of a basic repertoire of synthetic methods including important reactions of aldehydes, ketones, carboxylic acids and carboxylic acid derivatives, as well as eliminations and fragmentations. Particular emphasis is placed on the understanding of reaction mechanisms and the correlation between structure and reactivity. A deeper understanding of the concepts presented during the lecture is reached by solving the problems handed out each time and discussed one week later in the exercise class.

Chemical reactivity and classes of compounds. Eliminations, fragmentsations, chemistry of aldehydes and ketones (hydrates, acetals, imines, enamines, nucleophilic addition of organometallic compounds, reactions with phosphorus and sulfur ylides; reactions of enolates as nucleophiles) and of carboxylic acid derivatives. Aldol reactions.

A pdf file of the printed lecture notes is provided online. Supplementary material may be provided online.

No set textbooks. Optional literature will be proposed at the beginning of the class and in the lecture notes.

Reaction Kinetics

Abstract

Objective
Introduction to Chemical Reaction Kinetics

Content
Fundamental concepts: rate laws, elementary reactions and composite reactions, molecularity, reaction order. Experimental methods in reaction kinetics up to new developments in femtosecond kinetics. Simple chemical reaction rate theories: temperature dependence of the rate constant and Arrhenius equation, collision theory, reaction cross-section, transition state theory. Reaction mechanisms and complex kinetic systems, approximation techniques, chain reactions, explosions and detonations. Homogeneous catalysis and enzyme kinetics.

Lecture notes

Literature

Prerequisites
Voraussetzungen:
- Mathematik I und II
- Allgemeine Chemie I und II
- Physikalische Chemie I

Lecture notes
402-0043-00L Physics I O 4 credits 3V+1U T. Esslinger

Abstract
Introduction to the concepts and tools in physics with the help of demonstration experiments: mechanics of point-like and ridged bodies, periodic motion and mechanical waves.

Objective
The concepts and tools in physics, as well as the methods of an experimental science are taught. The student should learn to identify, communicate and solve physical problems in his/her own field of science.

Content
Mechanics (motion, Newton's laws, work and energy, conservation of momentum, rotation, gravitation, fluids)
Periodic Motion and Waves (periodic motion, mechanical waves, acoustics)

Lecture notes
The lecture follows the book "Physics" by Paul A. Tipler.

Literature
- Paul A. Tipler and  Gene P. Mosca, Physics (for Scientists and Engineers), W. H. Freeman and Company

Prerequisites
Prerequisites: Mathematics I & II

401-0373-00L Mathematics III: Partial Differential Equations O 4 credits 2V+1U F. Da Lio

Abstract

Objective
The main objective is that the students get a basic knowledge of the classical tools to solve explicitly linear partial differential equations.
## Examples of partial differential equations
- Classification of PDEs
- Superposition principle

## One-dimensional wave equation
- D'Alembert's formula
- Duhamel's principle

## Separation of variables
- Resolution of wave and heat equation
- Homogeneous and inhomogeneous boundary conditions, Dirichlet and Neumann boundary conditions

## Laplace equation
- Resolution of the Laplace equation on rectangle, disk and annulus
- Poisson formula
- Mean value theorem and maximum principle

## Fourier series
- Representation of piecewise continuous functions via Fourier series
- Examples and applications

## Separation of variables
- Resolution of wave and heat equation
- Homogeneous and inhomogeneous boundary conditions, Dirichlet and Neumann boundary conditions

## Fourier transform
- Derivation and Definition
- Inverse Fourier transformation and inversion formula
- Interpretation and properties of the Fourier transform
- Resolution of the heat equation

## Laplace transform
- Definition, motivation and properties
- Inverse Laplace transform of rational functions
- Application to ordinary differential equations

### Lecture notes
There are available some Lecture Notes in English and also in German of the Professor. These can be found following the links provided under the tab 'Lernmaterialien'.

### Literature
2) Y. Pinchover and J. Rubinstein, An Introduction to Partial Differential Equations, Cambridge University Press
3) E. Kreyszig, Advanced Engineering Mathematics, John Wiley & Sons (only Chapters 1,2,6,11)

### Prerequisites / notice
Prerequisites:
- Practical Course General Chemistry (1. Semester, 529-0011-04)
- Practical Course Inorg. and Org. Chemistry I (2. Sem., 529-0230)
- Attendance of Course Inorg. Chemistry 1 (3. Sem., 529-0121)
If necessary, access priority will be settled according to the results of the first-year examinations.

Abstract

This course teaches the fundamentals of thermodynamics applied to the description of real mixtures in the presence of physicochemical equilibria, including methods to quantitatively estimate them. While giving insights into the meaning and properties of main thermodynamic quantities, the course keeps primary focus on application to real chemical engineering problems.

Objective

The objective of the course is twofold. First, to teach the methods to calculate the volumetric and thermodynamic properties of mixtures in the presence of physicochemical equilibria. In particular, students are supposed to acquire the knowledge on which thermodynamic properties have to be estimated to carry out such calculation, on which data which need to be gathered and estimated, on the methods, the relative assumption and approximations. Second, the course is intended to give the students a sufficient theoretical insight on the thermodynamic properties, which will be used for future applications and studies.
The first part of the course is focusing on pure fluids (ideal and real). First, some fundamentals of thermodynamics are reviewed, including thermodynamic quantities and balances (of mass, energy and entropy). Then, equations of state and their use to estimate the volumetric properties of pure fluids are introduced. Finally, it is discussed how to use previous results for the estimation of the main thermodynamic properties (internal energy, enthalpy, entropy, free Gibbs energy, fugacity, etc.).

The second part of the course is focusing on mixtures, starting from binary mixture to mixtures of N components. Again, real mixtures are discussed, with emphasis on when such mixtures can be approximated as ideal ones and on the corrections which are needed to switch from ideal to real mixtures. As for pure fluids, first the use of the equations of state is discussed to estimate volumetric properties, then the estimation of the thermodynamic properties of mixtures is introduced. In this part, a particular focus is given to phase equilibria in the absence of chemical reactions. The most common equilibria (liquid-vapor, solid-liquid, liquid-liquid, etc) are discussed.

In the last part of the course, the chemical equilibria are discussed, with particular focus on the calculation of mass and energy balances for multicomponent systems (mixtures), also in the presence of physical equilibria.

During the lectures, theoretical aspects will be discussed and will be linked to application by the discussion of a comprehensive study case, including the methods for its solution. Detailed exercises will be given (and discussed later) to the students, to let them familiarize with the main methods discussed during the lecture.

No script will be available. Support material consists of PowerPoint presentations, which will be available in PDF format online.

Books on this subject can be mostly found under the title: 'Chemical Engineering Thermodynamics', 'Thermodynamics for Chemical Engineers', or 'Chemical Process Principles'. A selection:

Acquisition of material properties and data:

11. "TRC Thermodynamic Tables", Thermodynamic Research Center, College Station USA

The course broadens the view and understanding of technology by linking it with its commercial applications and with society. The lectures present a realistic model of a company and provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyse the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities. The business game presents a realistic model of a company and provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyse the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities.
Prerequisites / notice
Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Business Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich.

No prior knowledge of business or economics is required to successfully complete this course.

<tr>
<td>Abstract</td>
<td>The seminar covers basic issues of research design, small-n research, and data collection. It deals with issues of causality, conceptualization, case study design and QCA. Data collection includes interviews, surveys, and text analysis. This MACIS core seminar covers basic issues of research design, small-n research, and data collection. It familiarizes students with generic research design problems such as defining research questions, analyzing causality, and designing single and comparative case studies. It then introduces them to basic issues in small-n research. Students acquire an understanding of the specific challenges and design problems in qualitative analysis. Finally, students are introduced to exemplary methods of data collection. By the end of the course, students would be able to use the principal methods of data collection used by political scientists/have a critical understanding of the advantages and disadvantages of the methods, and should be able to reflect on and discuss the methods in light of research questions of their interest.</td>

**Abstract**

This seminar is designed for advanced students with an interest in comparative European politics and EU integration and politics. It introduces students to state-of-the-art theorizing, data, methods, and empirical findings and provides them with opportunities to work with data on their own. After taking this seminar, students should have a good overview of current research and be prepared to write their Master's thesis in this area. Topics include: European integration, EU decision-making, parliaments in the EU and its member states, party groups and parliamentarians. Students may also propose research topics of their interest.

**Objective**

This seminar is designed for advanced students with an interest in comparative European politics and EU integration and politics. It introduces students to state-of-the-art theorizing, data, methods, and empirical findings and provides them with opportunities to work with data on their own. After taking this seminar, students should have a good overview of current research and be prepared to write their Master's thesis in this area. Topics include: European integration, EU decision-making, parliaments in the EU and its member states, party groups and parliamentarians. Students may also propose research topics of their interest.

**Content**

This course deals with how the concept of security and security studies as a subfield of international relations have evolved from the Cold War to today’s “globalized” security environment. It looks at the changing landscape of threats that states and societies face, the way states organize themselves to confront these threats, and how security studies theories can explain these developments.

**Literature**

**Prerequisites / notice**

Class will only take with a maximum of 5 students and is limited to approx. 15 participants. MACIS students are given priority.

**Prerequisites / notice**

All texts will be available online.

**Lecture notes**

The seminar is an opportunity to explore in depth particular issues and to engage in discussions in a small group. Students will be expected to contribute to such discussions and present short position papers. Most importantly, students will also be expected to engage in continuous independent study.

**Lecture notes**

The seminar is an opportunity to explore in depth particular issues and to engage in discussions in a small group. Students will be expected to contribute to such discussions and present short position papers. Most importantly, students will also be expected to engage in continuous independent study.

**Prerequisites / notice**

None
Public policies result from decision-making processes that take place within formal institutions of the state (parliament, government, public administration, courts). That is, policies are shaped by the characteristics of decision-making processes and the characteristics of public institutions and related actors (e.g., interest groups). In this course, students acquire the contextual knowledge for analyzing public policies. They learn why and how policies and laws are developed, designed, and implemented at national and international levels, and what challenges arise in this regard. The course is organized in three modules. The first module (Stefan Bechtold) examines basic concepts and the role of law, law-making, and law enforcement in modern societies. The second module (Frank Schimmelfennig) deals with the functioning of legislatures, governments, and interest groups. The third module (Frank Schimmelfennig) focuses on the European Union and international organizations.

### Content

#### Objective

- To demonstrate knowledge on the role of policy and politics in energy transitions
- To recognize current challenges in the energy system to understand the theoretical frameworks and concepts for studying transitions

#### Reading materials

### Literature

### Prerequisites / notice

- This is a Master level course. The course is capped at 25 students, with ISTP Master students having priority.

### Abstract

This course addresses the role of policy and its underlying politics in the transformation of the energy sector. It covers historical, socio-economic, and political perspectives and applies various theoretical concepts to specific aspects of governing the energy transition.

### Objective

- To gain an overview of the history of the transition of large technical systems
- To recognize current challenges in the energy system to understand the theoretical frameworks and concepts for studying transitions
- To demonstrate knowledge on the role of policy and politics in energy transitions

<td>This course introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for the rate and direction of technical change in the energy sector. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It then introduces theoretical frameworks and concepts for studying innovation and transitions. It then focuses on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions and policy feedback. The course has a highly interactive (seminar-like) character. Students are expected to actively engage in the weekly discussions and to give a presentation (15-20 minutes) on one of the weekly topics during that particular session. The presentation (30%) and participation in the discussions (20%) will form one percent of the final grade, the remaining 50% of the final grade will be formed by a final exam.</td>
<td>Slides and reading material will be made available via moodle.ethz.ch (only for registered students).</td>

<td>This course introduces students to key statistical methods for analyzing social science data with a special emphasis on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical Software Stata.</td>
<td>A reading list will be provided via moodle.ethz.ch at the beginning of the semester.</td>
</tr>
</tbody>
</table>
Objective

- Students
  - have a sound understanding of linear and logit regression
  - know strategies to test causal hypotheses using regression analysis and/or experimental methods
  - are able to formulate and implement a regression model for a particular policy question and a particular type of data
  - are able to critically interpret results of applied statistics, in particular, regarding causal inference
  - are able to critically read and assess published studies on policy evaluation
  - are able to use the statistical software STATA for data Analysis

Content

The topics covered in the first part of the course are a revision of basic statistics and linear and logit regression analysis. The second part of the course focuses on causal inference and introduces methods such as panel data analysis, difference-in-difference methods, instrumental variable estimation, and randomized controlled trials mostly used for policy evaluation. The course shows how the various methods differ in terms of the required identifying assumptions to infer causality as well as the data needs. Students will apply the methods from the lectures by solving weekly assignments using statistical software and data sets provided by the instructors. These data sets will cover topics at the interface of policy, technology and society. Solving the assignments contributes to the final grade with a weight of 30%. Students are assisted in solving the assignments during the exercises session.

Permission to begin master thesis is required to take part in Colloquium.

Abstract

In this colloquium, students enrolled in the MACIS program first present and discuss research design and methods issues concerning their prospective MA theses. Towards the end of the semester they present preliminary findings from their MA thesis work.

Objective

It is the goal of the colloquium to help students with the initial steps of writing their master theses. During the colloquium, they will develop a relevant research question and hypotheses and select appropriate methods and data.

Only students who fulfill the following criteria are allowed to begin with their master thesis:

a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract

The Master Thesis is an independent piece of research on an issue in comparative and international politics. It combines theory, methods, and empirical work.

Objective

The Thesis should demonstrate the students’ ability to conduct independent research on the basis of the theoretical and methodological knowledge acquired during the MA program.

Content

Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label "Systems Biology", focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

Evolutionary Dynamics

W 5 credits

Evolutionary dynamics is concerned with the mathematical principles according to which life has evolved. This course offers an introduction to mathematical modeling of evolution, including deterministic and stochastic models.

Objective

The goal of this course is to understand and to appreciate mathematical models and computational methods that provide insight into the evolutionary process.

Content

Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the context of different biological systems, focusing on asexual populations. Viruses and cancer cells provide the most prominent examples of such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies equation, evolution of HIV, evolutionary game theory, birth-death processes, evolutionary stability, evolutionary graph theory, somatic evolution of cancer, stochastic tunneling, cell differentiation, hematopoietic stem cell genetics, genetic progression of cancer and the speed of adaptation, diffusion theory, fitness landscapes, neutral networks, branching processes, evolutionary escape, and epistasis.

Lecture notes
No.

Literature

Prerequisites / notice
Prerequisites: Basic mathematics (linear algebra, calculus, probability)

636-0017-00L

Computational Biology

W 4 credits

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective

Attendees will learn which information is contained in genetic sequencing data and how to extract information from them using computational tools. The main concepts introduced are:
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:
- epidemiology
- pathogen evolution
- macroevolution of species

Content

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze this alignment (such as BLAST algorithm, GWAS approaches). Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes
Slides of the lecture will be available online.
https://www.bsse.ethz.ch/cevo/education/cb-materials.html

Literature

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST

Prerequisites / notice
Basic knowledge in linear algebra, analysis, and statistics will be helpful. Some programming experience will be useful for the exercises, but is not required. Programming skills will not be tested in the examination.

636-0706-00L

Spatio-Temporal Modelling in Biology

W 5 credits

This course focuses on modeling spatio-temporal problems in biology, in particular on the cell and tissue level. A wide range of mathematical techniques will be presented as part of the course, including concepts from non-linear dynamics (ODE and PDE models), stochastic techniques (SDE, Master equations, Monte Carlo simulations), and thermodynamic descriptions.

Objective

The aim of the course is to introduce students to state-of-the-art mathematical modelling of spatio-temporal problems in biology. Students will learn how to choose from a wide range of modelling techniques and how to apply these to further our understanding of biological mechanisms. The course aims at equipping students with the tools and concepts to conduct successful research in this area; both classical as well as recent research work will be discussed.
Content

1. Introduction to Modelling in Biology
2. Morphogen Gradients
3. Turing Pattern
4. Travelling Waves & Wave Pinning
5. Application Example 1: Dorso-ventral axis formation
6. Chemotaxis, Cell Adhesion & Migration
7. Introduction to Numerical Methods
8. Simulations on Growing Domains
9. Image-Based Modelling
10. Branching Processes
11. Cell-based Simulation Frameworks
12. Application Example 2: Limb Development
13. Summary

Lecture notes

All lecture material will be made available online

<tr>
<td>Content</td>
<td>Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits from elementary devices to systems.</td>
