<td>Students know the most important concepts and methods of pharmaceutical care of patients with regard to OTC and Rx-only drugs as well as the essential concepts and methods of public health, prevention and health care. They master the basic rules concerning the pharmaceutical triage and their implications. For the clinical pictures covered during the course, they are able to make therapeutic plans or accompany and optimize doctor’s orders. Students show an adequate understanding of the rights and duties of pharmacists as medical personnel regarding medical care, the framework of the Swiss health care system. They are capable of handling important medical products and instructing patients about their use. Students have the necessary basic skills and applications of first aid and emergency medicine. They know the essence, chances and limits with reference to additional assortments, therapeutic options like phytotherapy, complementary medicine, veterinary pharmacy and non-medicinal methods of healing. Students have the essential knowledge of legal aspects and regulations concerning pharmacists and know the basics of business administration. Pharmaceutical Care: possibilities of pharmaceutical care of patients regarding OTC and Rx-only drugs in the officinal pharmacy. Good pharmaceutical triage in practice, introduction to the pharmaceutic valification of prescriptions, recognition of medicinal, patient related, therapeutic problems and the finding of solutions: Choice of therapy (OTC), accompanying and optimizing therapies (Rx), compliance, correct administration of drugs, cooperation with other medical professions in the field of outpatient treatment. Traditional and proactive pharmaceutical service.; development of adequate means of documentations of intervention and consultation as well as pharmaceutical follow-up care. Public health: role and possibilities of officinal pharmacies as partners within the Swiss health care system: primary health care, prevention, campaigns, early detection, instruction and mediation, referral to doctors. Needs of customers, patients and employees, and social interaction. Significance of the medical profession (illness, suffering, promotion of health and well-being). Basic training in first aid, emergency medicine and wound care. Medical products: handling of important applications and instruction of patients. Important and additional forms of therapy and assortments: phytotherapy, complementary medicine, veterinary pharmacy, non-medicinal methods of healing. Economy and law in everyday pharmacy: overview of the Swiss legal system. Relevant legal framework, jurisdiction and regulations and their meaning with regard to quality assurance for practicing pharmacists. Basics of finance and accounting as well as personnel management and insurance matters. Organisation and competencies of the various partners within the Swiss health care system, focusing on the intermediate position and the role of pharmacists as part of the medical community.</td>

<td></td>
<td></td>
</tr>
<tr>
<td><strong>Abstract</strong></td>
<td>This colloquium is open to doctoral candidates in fields related to Architecture and Urbanism. Its focus will be on contemporary topics in urbanism and will involve two or three one-day sessions over the course of the semester, each of which will be attended by an invited scholar.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>The sessions will involve brief presentations of dissertation work by the participants followed by discussions with the guests.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>The motivation behind the workshop is to focus on the beginnings of the gta on the occasion of its 50th anniversary. Among the founding fathers there were fascinating protagonists such as Adolf Max Vogt, Bernhard Hoesli, and Paul Hofer. Based on an understanding of their concepts, methods and ideas, a text collage will culminate in a script for a one-hour-long performance reading. In addition to the graphically significant gta publications produced at this time (“Rainbow”-books), contemporary image and film materials can be integrated as well as interviews with contemporary witnesses and the present gta chair. The result intends both contextualization as well as critical revision.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>

<tr>
<td><strong>Abstract</strong></td>
<td>Introduction to methodological approaches in the history and theory of architecture; presentation and discussion of individual doctoral projects.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>The doctoral students analyze critically relevant approaches in the history and theory of architecture and discuss fundamental questions with regard to their individual research projects, to produce and hand in their proposals.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>The two-semester course in the first year of the doctoral program in the history and theory of architecture has a twofold objective: First, reading sessions on central approaches in the history and theory of architecture provide a methodological basis for the a doctoral at the Institute gta. Secondly, by both, reading sessions and presentation and discussion sessions on the individual research projects, the doctoral students get support in the production of the proposal which they work on and which they have to present after the first year.</td>

<tr>
<td>064-0015-16L</td>
<td>PhD Colloquium Theory of Information Technology for Architects</td>
<td>W</td>
<td>2 credits</td>
<td>2K</td>
<td>L. Hovestadt</td>
</tr>
<tr>
<td><strong>Abstract</strong></td>
<td>Information technology plays an increasingly important role in research. To meet this challenging development, it is not only important to acquire respective skills, but also to consider and understand information technology in what sets it apart from other gestalts of technics (like mechanics, dynamics, or thermodynamics).</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>The aim of this colloquium is to counter an observable tendency, that proportional to the degree in which students master practical skills in computing, they increasingly submit uncritically, in their understanding and framing of problems, to the dictation of schemata and templates implemented by technical systems.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>The starting point for this colloquium is to comprehend computing not in terms of skills, but as a literacy which we can experience emerging today. Like in the case of writing as well, computing cannot be reduced to either logics, grammar, arithmetics, or analytics. Rather, computation, if comprehended as a literacy, relates to any of the established categories of learning and raises questions of an architectonic kind. This colloquium draws from the principal richness of cultural forms of knowing and learning and thematizes approaches to formulate a theoretical stance on information technology for architects which is driven by and resting on the actual reality of computability today. In this, it is complementary to those theory courses on technology offered by the historical disciplines at ETH.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Prerequisites / notice</strong></td>
<td>To benefit from this course, you should have a practical affinity to technics, as well as an abstract interest in information technology in its comprehensive cultural context.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Abstract</strong></td>
<td>Advanced PhD candidates of urban studies, urban and landscape design and urban sociology report about their experiences and insights in the concrete application of methods utilized for their research and scientific publications. Discussion of ongoing individual work, methodological questions, critical perspectives on urban and landscape design and city's relation to society.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>The seminar seeks to provide participants with a differentiated knowledge of methods in the field of the urbanism. Furthermore, it provides a platform to exchange contemporary urban research experiences across disciplinary boundaries, drawing from different geographies of knowledge production. Possible meta-themes include modes of data assessment in urban studies, ways of progressing from hypothesis to synthesis, and research by design as method.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>

The colloquium deals with the general problems, questions and methods of the interdisciplinary research field "The History of Knowledge". PhD students at ETH Zurich working in the broad area of energy present their research to their colleagues, to their advisors and to the scientific community. The colloquium is highly recommended for first and second semester MAGPW students.

Objective
Knowledge of advanced research in the area of energy, science and technology.

Content
PhD students at ETH Zurich working in the broad area of energy present their research to their colleagues, to their advisors and to the scientific community. Every week there are two presentations, each structured as follows: 15 min introduction to the research topic, 15 min presentation of the results, 15 min discussion with the audience.

Lecture notes
Slides will be distributed.

Course Catalogue of ETH Zurich
Research Colloquium History of Knowledge (HS 2016) W 2 credits 2S M. Mazzotti, R. S. Abhari, J. Carmelet, M. Filippini

The summer school presents three areas that could mobilise sand alternatives for construction and other applications: (i) I. Microbiologically Induced Calcite Precipitation (MICP), (ii) Chemical Crystallization Processes and (iii) 3D printing.

I. Microbiologically Induced Calcite Precipitation (MICP)

Also known as bio-cementation it is a process utilised in self-healing concrete and soil stabilisation. The application to sand will produce naturally grown structural sand bricks. This workshop will compare MICP for various sand types, building wastes and bacterial cultures.

II. Chemical Crystallization Processes

Based on material computation experiments pioneered by architect and engineer Frei Otto, this workshop combines form finding properties of sand with structural and thinking and chemical crystallization processes.

III. 3D Printing

3D Printing with sand and building waste, finally, explores the potential of sand as a substrate within a binding agent. In combination with a robotic arm, 3D printing of sand is an in situ digitally controlled construction process. It overcomes the need for traditional form-work and transportation of material, thereby reducing the grey energy.

Data: 06.09.2017 12:54 Autumn Semester 2016 Page 409 of 1570
In particular, the summer school addresses research exploring the borderlands of the diverse fields of STS and urban studies. It will be of particular interest to PhD candidates who have already begun their research and are in the stages before or after conducting field studies. As participants are required to enrol in one of three thematic groups, their stages of research may differ per group.

The summer school is to support PhD researchers in their individual research and specific research stages by sharing their work with keynotes and colleagues. Accordingly, participants are expected to develop their skills of articulating and communicating their ideas, examine various STS methods and techniques of approaching cities, and to discuss their research and obstacles in an academic setting. The three sessions; problematizing, describing and assembling, allow participants in various stages of their research to learn about the relevance of STS methodologies and concepts of urban research in general, and for their particular interest and research stage. They are also aimed at researchers not yet familiar with the approach and interested in learning a subset of its concepts (eg. networks/artefacts) and methodologies (e.g. ethnography/digital methods). Throughout the sessions participants will learn to; question the city from a STS perspective (problematising), they will be introduced to the methodologies that tackle these questions (describing), and they will encounter ways of thinking through questions and answers (assembling). Specifically, participants are to write a full paper, design a poster and make a presentation. All deliverables will be evaluated by the keynote speakers, four external reviewers, and the organizers. The poster presentation will take place in front of a full audience, while paper presentations in the workgroup only. The organizers are inquiring for publishing opportunities of outstanding papers (eg. planNext from the AESOP YA, Contour at the EPFL or Spatium at the IAUS). The website will be updated with the posters and a review of following the event.

The Assembling Cities summer school aims to bring together an interdisciplinary group of doctoral students who treat the city as their empirical site. Academic backgrounds include, but are not limited to: anthropology, architecture, geography, history, philosophy, political science, sociology, visual arts, and urban planning. In particular, the summer school addresses research exploring the borderlands of the diverse fields of STS and urban studies. It will be of particular interest to PhD candidates who have already begun their research and are in the stages before or after conducting field studies. As participants are required to enrol in one of three thematic groups, their stages of research may differ per group. In other words, the three themes can be interpreted to speak to various stages of research (problematising, describing, and assembling respectively). The summer school is positioned at the intersection of science and technology studies (STS), urban studies and planning studies. The program emphasizes the development of conceptual and methodological insights as part of innovative approaches to contemporary urban phenomena. To the fields of urban studies it provides a more varied and dynamic conceptualisation of the city; it does not reduce urban phenomena to the logic of a capitalist mode of production. This endeavour relating urban studies with STS presents new, cross-cutting ways of examining arising planning issues.

Planning studies can benefit from new tools of interpreting problems of interconnection and expertise. The relevance of STS in urban research is explored with three themes: problematizing, describing and assembling (cities). Participants will be distributed in thematic groups, and lectures will be held by keynote speakers according to theme. Following the call, participants are required to indicate which theme fits their paper best as they will be shared within the thematic groups. The first day will include a keynote presentation followed by an informal poster session for each thematic group. The poster sessions are a chance for the other two groups to learn about participants’ research and ask questions. The following day two sessions will be held with the support of the respective keynote. During the first (morning) session the participants will present their papers (max 15 min) within their thematic groups followed by a general 20 min discussion. During this time, key points will be noted and later discussed in the second (afternoon) session in which each group will prepare a plenary discussion and presentation for the final day. The final day consists of a plenary discussion of each theme opened by the respective keynote and moderated by members of the thematic group. Each thematic group will summarize their discussions and findings in a final presentation. The framework for the discussion and presentations will be defined together with the keynotes and could be, for example, a specific question and/or obstacle, a clear toolbox, or excerpts from selected presentations related to each respective theme. The summer school will open with an excursion to the housing project Hunzikerareal by the housing cooperative Mehr als wohnen in Zurich. This large mixed-use area development is used as an illustration of how institutions, individuals and artefacts mediate the planning process towards an inclusionary and diverse project.

11) Modeling of Neural Circuits |
| Prerequisites / notice | For doctoral students of the Neuroscience Center Zurich (ZNZ). |
| 376-1795-00L   | Advanced Course in Neurobiology I (Functional Anatomy of the Rodent Brain) (University of Zurich) | W    | 2    | 2V    | J.M. Fritschy, H. U. Zeilhofer |
| Abstract       | The goal of this Advanced Course in Neurobiology is to provide students with a broader knowledge in several important areas of neurobiology. The course consists of four parts: Part I deals with various topics in developmental neurobiology. Part II is devoted to aspects of signal transduction. Part III focuses on synaptic transmission. Part IV gives deeper insights into systems neuroscience. |
| Objective      | This credit point course is designed for doctoral students who have successfully completed the Introductory Course in Neuroscience at the Neuroscience Center Zürich. The goal is to provide students with a broader and deeper knowledge in several important areas of neurobiology. |
| Prerequisites / notice | Für Doktorierende des Zentrums für Neurowissenschaften Zürich. Nicht für Master-Studierende geeignet. |
| 151-0255-00L   | Energy Conversion and Transport in Biosystems | W    | 4    | 2V+1U | D. Poulikakos, A. Ferrari  |
| Abstract       | Theory and application of thermodynamics and energy conversion in biological systems with focus on the cellular level. |
Theory and application of energy conversion at the cellular level. Understanding of the basic features governing solutes transport in the principal systems of the human cell. Connection of characteristics and patterns from other fields of engineering to biofluidics. Heat and mass transport processes in the cell, generation of forces, work and relation to biomedical technologies.

Mass transfer models for the transport of chemical species in the human cell. Organization and function of the cell membrane and of the cell cytoskeleton. The role of molecular motors in cellular force generation and their function in cell migration. Description of the functionality of these systems and of analytical experimental and computational techniques for understanding of their operation.

Introduction to cell metabolism, cellular energy transport and cellular thermodynamics.

Material in the form of hand-outs will be distributed.

I. Ethics & the Process of Ethical Inquiry

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

Integrity in Research & Research Misconduct
- What is “integrity” in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 Rs (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:
- “Introduction to the Responsible Conduct of Research” (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

401-5640-00L ZüKoSt: Seminar on Applied Statistics

E- 0 credits 1K

Abstract
About 5 talks on applied statistics.

Objective
See how statistical methods are applied in practice.
### Statistical Consulting

- **Seminars by invited speakers covering selected microbiology themes.**

- **The Statistical Consulting service is open for all members of ETH, including students, and partly also to other persons.**

  - **Professors**
  - Getting familiar with scientific arguments and discussions. Overview of current research topics. Making contacts with fellow students in seminars.

  - **Students and researchers can get advice for analyzing scientific data, often for a thesis.**

  - **Suitable for doctorate**

  - **Eligible for credits**

  - **M. Aebi, H.M. Fischer, W.D. Hardt, J. Piel, J. Vorholt-Zambelli**

- **Contact:** beratung@stat.math.ethz.ch . Tel. 044 632 2223. See also http://stat.ethz.ch/consulting

- **Requirements:** Knowledge of the basic concepts of statistics is desirable.

### Doctoral Thesis

- **Seminars by invited speakers covering selected microbiology themes.**

- **Discussion of selected microbiology themes presented by invited speakers.**

- **This is not a course, but a consulting service. There are no exams nor credits.**

- **Contact:** beratung@stat.math.ethz.ch . Tel. 044 632 2223. See also http://stat.ethz.ch/consulting

- **Requirements:** Knowledge of the basic concepts of statistics is desirable.

### Current Immunological Research in Zürich

- **This monthly meeting is a platform for Zurich-based immunology research groups to present and discuss their ongoing research projects.**

- **At each meeting three PhD students or Postdocs from the participating research groups present an ongoing research project in a 30 min seminar followed by a plenary discussion.**

- **The aim of this monthly meeting is to provide further education for master and doctoral students as well as Postdocs in diverse topics of immunology and to give an insight in the related research. Furthermore, this platform fosters the establishment of science- and technology-based interactions between the participating research groups.**

- **Presentation and discussion of current research projects carried out by various immunology-oriented research groups in Zurich.**

**Abstract**

This seminar will feature invited lectures about recent advances and developments in systems biology, including topics from biology, bioengineering, and computational biology.

**Objective**

To provide an overview of current systems biology research.

**Content**

The final list of topics will be available at [http://www.bsse.ethz.ch/education/](http://www.bsse.ethz.ch/education/).

</tr>
<tr>
<td>Abstract</td>
<td>The lecture provides a journey into the molecular world of scents from the chemical secrets behind Chanel N°5 to structure-odor relationships, industrial processes, and total synthesis of terpenoids. Each subunit is centered on one odorant family and highlights a certain class of chemical reactions, illustrated by prominent perfume examples.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>After completion of this lecture module the students know all the major perfume materials of the important odor families with their academic and industrial syntheses, their olfactory properties, their usage, their historic perspective, and today's economic importance. The students can explain the significance of important building blocks and industrial transformations, and can estimate how attractive chemical processes are on large scale. They can retrosynthetically plan academic and industrial syntheses, their olfactory properties, and their functioning. The acquired knowledge on structure-odor relationships enables them to predict and design new odorants. The students can approximate the conformational space of odorants and especially macrocycles on the basis of simple rules, and know how ollactone models are used. The students understand and can explain the molecular mechanism of smell, the biosynthesis of terpenes, and the basics of perfumery composition. The latter enables them to further their education in perfumery at specialized Universities such as the ISIPCA in Versailles; yet, the student also knows about the links of Fragrance Chemistry with Pharmaceutical Chemistry and the Specialty Chemicals business in general.</td>

<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The students will learn how to record rotationally and rovibrationally resolved spectra in the THz and IR frequency range. For that purpose state-of-the-art sources like synchrotrons, FELs and other THz sources will be discussed. In this context, the basics of Fourier transform infrared spectroscopy will also be reviewed. The analysis of such spectra with interactive programs will then be explained. Finally, applications of high resolution molecular spectroscopy in the field of atmospheric and interstellar chemistry will be discussed. The identification and the quantitative determination of atmospheric pollutants will be discussed in detail. In addition, the identification of interstellar molecules in the context of the origin of life will be reviewed. The question of the identification of the interstellar unidentified infrared bands and of the interstellar diffuse bands will also be addressed. Finally, high resolution molecular spectroscopy of chiral molecules in the context of molecular parity violation will be discussed</td>

Autumn Semester 2016
Page 419 of 1570
The ICB seminar series covers the umbrella of diverse research activities encompassed within the institute, including catalysis, functional materials, polymer engineering, separations, microfluidics, process design, and systems engineering. This series was founded with the aim of promoting cross-disciplinary scientific discourse and interaction with other distinguished groups working worldwide, and is targeted at students or promoting cross-disciplinary scientific discourse and interaction with other distinguished groups working worldwide. The seminars are invited from various national and international institutions.

Prerequisites / notice
A solid knowledge in quantum mechanics is helpful, but not a condition to assist the lecture.

<td>N. Hansen</td>
</tr>
</tbody>
</table>

Abstract
Theoretical analysis as well as issues of practical implementation of state of the art free energy methods.

Objective
Recognition of the concepts that underlie the different approaches devised for the determination of free energies

Content
A wide variety of fundamental chemical quantities such as binding or equilibrium constants, solubilities, partition coefficients, and adsorption coefficients are related to the difference in free energy between particular (non)physical states of a system. A maze of computational techniques to calculate free energies is nowadays available that differ in efficiency and accuracy. However, most of them are rooted in a few basic ideas. In the lecture state of the art methods are discussed in light of these basic ideas.

Lecture notes
Handouts will be provided

|--------|---------------------------------------------------------|------|-------|-------|-----------|

Abstract
This course comprises a series of seminars on current topics regarding environmental impact and safety of chemical products and processes. Invited national and international speakers from public and industrial research institutions present their latest developments and applications, and show future trends.

Objective
Giving the students the opportunity to experience recent research progress at first hand; encouraging participation in discussions with speaker and audience.

Abstract
The course is constituted of a series of seminars on various topics of relevance in chemical engineering, with specific emphasis on those of direct interest in the research area of the group. Speakers are invited from various national and international institutions.

Objective
Expose the students to the most recent advances in the general area of chemical engineering.

Content
The course is constituted of a series of seminars on various topics of relevance in chemical engineering, with specific emphasis on those of direct interest in the research area of the group. Speakers are invited from various national and international institutions.

Lecture notes
When available, will be distributed at the end of the single seminar.

Abstract
The ICB seminar series covers the umbrella of diverse research activities encompassed within the institute, including catalysis, functional materials, polymer engineering, separations, microfluidics, process design, and systems engineering. This series was founded with the aim or promoting cross-disciplinary scientific discourse and interaction with other distinguished groups working worldwide.

Objective
Students are expected to attend all seminars in one academic year, and should register at the beginning of each seminar. Additionally they must deliver a two page written report at the end of the year describing the topics covered, main conclusions, and interrelationships between the different themes.

Content
The ICB seminar series covers the umbrella of diverse research activities encompassed within the institute, including catalysis, functional materials, polymer engineering, separations, microfluidics, process design, and systems engineering. This series was founded with the aim of promoting cross-disciplinary scientific discourse and interaction with other distinguished groups working worldwide, and is targeted at individuals who have made outstanding contributions within their fields. Each year, around 7 distinguished scientists and technologists will be invited to speak on topics of current interest in Chemical and Biochemical Engineering. PhD students are particularly encouraged to attend in order to broaden their perception and enrich their scientific horizons.

Abstract
Discussion of different aspects of the chemical reactivity in micelles and in vesicles (liposomes) as polymericar compartments.

Objective
Deeper understanding of micelles and vesicles as self-organizing reaction compartments.

Content
With a few selected recent examples, properties of micelles and vesicles will be discussed with respect to applications as reaction compartments.

**Abstract**
- Seminar series with external and occasional internal speakers addressing current research topics.
- Presentations on isotope geochemistry, cosmochemistry, fluid processes, economic geology, petrology, mineralogy and experimental studies. Mostly international speakers provide students, department members and interested guests with insight into current research topics in these fields.

**Objective**
- Seminar series addressing current research topics in Petrology (Magmaic Petrology and Crystalline Geology and Experimental Petrology).
- The goal of this class is to learn about the modern methods and ideas on heat and mass transfers in magmatology through recently published papers and computer softwares. The class will allow students to explore some of the most challenging concepts in this field, and become familiar with state-of-the-art techniques to model these processes.
- Seminar series with external and occasional internal speakers addressing current research topics.
- The class will focus mostly on reading recent literature on topics of interests, and will contain some computer exercises to allow students to work by themselves on some well-defined problems.

**Content**
- Einordnen der Ergebnisse in den groesseren Kontext.
- Seminar series with external and occasional internal speakers addressing current research topics in Petrology (Veranstaltungskalender).
- Seminar series addressing current research topics.
- Seminar series with external and occasional internal speakers addressing current research topics in Petrology.

**Prerequisites / notice**
- PhD or advanced MSc students are expected to present one paper relating to their research interests and read papers discussed by the other students. The grading is based on participation in discussions and the given oral presentations.

PhD Colloquium for Master and Ph.D. Students

**Goal:**

To identify, discuss, and resolve methodological problems that emerge while elaborating a master or doctoral thesis.

**Lecturers:**

P. Peyrot

**Prerequisites / notice:**

Distributed electronically.

**Content:**

Presentation and discussion of current research.

**Lectures:**

May be held either in English or German. Students receive 2 credit points for submitting a brief, written commentary on one of the presented topics (approx. 5 pages).

**Dates:**

See [http://www.cis.ethz.ch/education/index](http://www.cis.ethz.ch/education/index)

**Prerequisites:**

Participants are expected to read the drafts/papers/presentations beforehand and give constructive feedback to the Ph.D. student presenting.

**Event:**

The colloquium takes place 8 times per semester. The schedule will be arranged together with the PhD students at the beginning of the semester.

**Lectures:**

The colloquium will take place about 8 times per semester. The schedule will be arranged together with the PhD students at the beginning of the semester. Participants will learn to know arguments and ideas dealing with systematic problems in philosophy.

**Prerequisites / notice:**

Students interested in empirical development economics will present their ongoing work, with a particular focus on the methods (to be used and challenges faced). Participants are expected to read the drafts/papers/presentations beforehand and give constructive feedback to the Ph.D. student presenting.

**Event:**

The colloquium will take place about 8 times per semester. The schedule will be arranged together with the Ph.D. students at the beginning of the semester. Participants will learn to know arguments and ideas dealing with systematic problems in philosophy.

**Prerequisites / notice:**

Members of Staff

Open for Master students on personal invitation. Personal registration required to Mr. Wingert.

**Objective:**

Key problems of research projects will be discussed. Participants will learn to know arguments and ideas dealing with systematic problems in philosophy.

**Prerequisites / notice:**

Distributed electronically.

**Abstract:**

Ph.D. students and members of staff report on their research.

**Objective:**

Participants will learn to know arguments and ideas dealing with systematic problems in philosophy.
The students shall obtain a basic knowledge about business law. They shall be able to recognize and evaluate issues in the area of business law and suggest possible solutions.

**Objective**

The students shall obtain the following competence:

- They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
- They shall be acquainted with corporate functions as contracting, negotiation, claim administration and dispute resolution.
- They shall be familiar with the issues of corporate compliance, i.e. the system to ascertain that all legal and ethical rules and standards are observed. They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

**Lecture notes**

A comprehensive script will be made available online on the moodle platform.

---

**851-0735-09L Workshop & Lecture Series on the Law & Economics**

**W** 2 credits 2S  

S. Bechtold, H. Gersbach, of Innovation

**Abstract**

This series is a joint project by ETH Zurich and the University of Zurich. It provides an overview of interdisciplinary research on intellectual property, innovation, and technology policy. Scholars from law, economics, management and related fields give a lecture and/or present their current research. All speakers are internationally well-known experts from Europe, the U.S., and beyond.

**Objective**

After the workshop and lecture series, participants shall be acquainted with interdisciplinary approaches towards intellectual property, innovation, antitrust and technology policy research. They should also have an overview of current topics of international research in these areas.

**Content**

The workshop and lecture series will present a mix of speakers who represent the wide range of current social science research methods applied to intellectual property, innovation, antitrust policy and technology policy issues. In particular, theoretical models, empirical and experimental research as well as legal research methods will be represented.

**Lecture notes**

Papers discussed in the workshop and lecture series are posted in advance on the course web page.

**851-0125-18L Self-Ownership - Philosophical and Juridical Perspectives**

**W** 3 credits 2G

**Abstract**

Rights in Objects are founded on an inalienable Self-Ownership. These Idea ist central for personal rights. We speak of my body, my genes, my name, my portrait, my ideas or ways of expression.

**Objective**

Participants will make acquaintance with founding texts of the natural rights property concept (John Locke). They will see the connection between inalienable self-ownership, prohibition of slavery, derivative commercial rights and modern personal rights. They will learn about the problems of self-ownership today concerning property in one's body and intellectual property. Critical alternatives to the property paradigm will be discussed.

Participants will have the opportunity to gain access to unfamiliar texts from the philosophical tradition and to see their relevance today. They experience the consequences of a certain use of concepts and orient themselves in current bioethical, juridical and political discussions.

**Content**

Texts by Locke, Nozick, Christman, Otsuka, Rasmussen, Schneider, Stirner, Fichte and Forschner. Founding of property right in self-ownership (Locke), revival of this concept in Nozick and his egalitarian critics. Critique of the concept of self-ownership related to property in one's body. Looking back to the personal self-relatedness that comes up again in Intellectual Property and in modern personal rights.

**Literature**

Text, Seminarplan und Literaturliste in ILIAS Lehrdokumentenablage.

---

**851-0585-15L Complexity and Global Systems Science**

**W** 3 credits 2V  

D. Helbing, N. Antulov-Fantulin

**Prerequisites**

- solid mathematical skills
- Particularly suitable for students of D-ITET, D-MAVT

**Abstract**

This course discusses complex techno-socio-economic systems, their counter-intuitive behaviors, and how their theoretical understanding empowers us to solve some long-standing problems that are currently bothering the world.

**Objective**

Participants should learn to get an overview of the state of the art in the field, to present it in a well understandable way to an interdisciplinary scientific audience, to develop models for open problems, to analyze them, and to defend their results in response to critical questions. In essence, participants should improve their scientific skills and learn to think scientifically about complex dynamical systems.

**Content**

This course starts with a discussion of the typical and often counter-intuitive features of complex dynamical systems such as self-organization, emergence, (sudden) phase transitions at “tipping points”, multi-stability, systemic instability, deterministic chaos, and turbulence. It then discusses phenomena in networked systems such as feedback, side and cascade effects, and the problem of radical uncertainty. The course progresses by demonstrating the relevance of these properties for understanding societal and, at times, global-scale problems such as traffic jams, crowd disasters, breakdowns of cooperation, crime, conflict, social unrests, political revolutions, bubbles and crashes in financial markets, epidemic spreading, and/or “tragedies of the commons” such as environmental exploitation, overfishing, or climate change. Based on this understanding, the course points to possible ways of mitigating techno-socio-economic-environmental problems, and what data science may contribute to their solution.

**Mathematical skills can be helpful**

---

**851-0240-15L Colloquium on the Science of Learning and Instruction**

**W** 1 credit 1K  

E. Stern, P. Greutmann, further lecturers

**Abstract**

In the colloquium we discuss scientific projects concerning the teaching in mathematics, computer science, natural sciences and technology (STEM). The colloquium is conducted by the professorships participating in the Competence Center EduETH (ETH) and in the Institute for Educational Sciences (LZfE).

**Objective**

Participants are exemplarily introduced to different research methods used in research on learning and instruction and learn to weigh advantages and disadvantages of these approaches.

---

**851-0738-00L Intellectual Property: Introduction**

**W** 2 credits 2V  

M. Schweizer
According to a myth, the ancient Greek philosopher Democrit dissected animals, because he was in search of the seat of the soul. Current philosophy reflects on and evaluates technology. The technical developments in the 19th and 20th century have led to a philosophical treatment of questions relating to the mind and the brain. Between these two dates lies a history of 2500 years, in which the relationship between the mind and the brain has been defined in various ways. Starting with ancient and medieval theories, the lecture will have its focus on modern theories from the nineteenth century onward. I will discuss essential issues in the history of the neurosciences such as localization theories, the neuron doctrine, reflex theory, theories of emotions, neurocybernetics and the importance of visualizing the brain and its parts, but I will also include works of art and literature.

Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thickets).

The seminar will comprise practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

For students of chemistry-related degree programs, the lecture 'Protecting inventions in chemistry' (851-0738-03) will be offered in the autumn semester.
This colloquium offers an opportunity for students to discuss their ongoing research and scientific ideas in the behavioral sciences, both at the micro- and macro-levels of cognitive, behavioral and social science. It also offers an opportunity for students from other disciplines to discuss their ideas in so far as they have some relation to behavioral science. The possible research areas are wide and may include theoretical as well as empirical approaches in Social Psychology and Research on Higher Education, Sociology, Modelling and Simulation in Sociology, Decision Theory and Behavioral Game Theory, Economics, Research on Learning and Instruction, Cognitive Psychology and Cognitive Science. Ideally the students (from Bachelor, Master, Ph.D. and Post-Doc programs) have started to start work on their thesis or on any other term paper.

Course credit can be obtained either based on a talk in the colloquium plus a written essay, or by writing an essay about a topic related to one of the other talks in the course. Students interested in giving a talk should contact course organizers (Rütsche, Stern) before the first session of the semester. Priority will be given to advanced / doctoral students for oral presentations. The course credits will be obtained by a written report of approximately 10 pages. The colloquium also serves as a venue for invited talks by researchers from other universities and institutions related to behavioral and social sciences.

**851-0252-01L**  **Human-Computer-Interaction: Cognition and Usability**  
Number of participants limited to 30.  
3 credits  
L. Sanders, O. Woolley

**Abstract**  
This seminar introduces theory and methods in computer-human interaction and usability. Cognitive Science provides a theoretical framework for designing user interfaces as well as a range of methods for assessing usability (user testing, cognitive walkthrough, GOMS). The seminar will provide an opportunity to experience some of the methods in applied group projects.

**Objective**  
This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability. Presentations will cover basics of human-computer interaction and selected topics like mobile interaction, adaptive systems, human error and attention. A focus of the seminar will be on getting to know evaluation techniques in HCI. Students form work groups that first familiarize themselves with a select usability evaluation method (e.g. user testing, GOMS, task analysis, heuristic evaluation, questionnaires or Cognitive Walkthrough). They will then apply the methods to a human-computer interaction setting (e.g. an existing software or hardware interface) and present the method as well as their procedure and results to the plenary. Active participation is vital for the success of the seminar, and students are expected to contribute to presentations of foundational methods, themes and results of their chosen group project. In order to obtain course credit a written essay / report will be required (details to be specified in the introductory session of the course).

**851-0252-02L**  **Introduction to Cognitive Science**  
Number of participants limited to 70.  
3 credits  
S. Ognjanovic

**Abstract**  
The lectures provide an overview of the foundations of cognitive science and investigate processes of human cognition, especially knowledge acquisition, knowledge representation and usage in information processing tasks.

**Objective**  
Cognitive Science views human cognition as information processing and provides an inter-disciplinary integration of approaches from cognitive psychology, informatics (e.g., artificial intelligence), neuroscience and anthropology among others. The lectures provide an overview of basic mechanisms of human information processing and various application domains. A focus will be on matters of knowledge acquisition, representation and usage in humans and machines. Models of human perception, reasoning, memory and learning are presented and students will learn about experimental methods of investigating and understanding human cognitive processes and representation structures.

**851-0252-03L**  **Cognition in Architecture - Designing Orientation and Navigation for Building Users**  
Number of participants limited to 40.  
3 credits  
S. Ognjanovic

**Abstract**  
How can behavioral and cognitive science inform architecture? This project-oriented seminar investigates contributions of cognitive science to architectural design with an emphasis on orientation and navigation in complex buildings and urban settings. It includes theories on spatial memory and decision-making as well as hands-on observations of behavior in real and virtual reality.

**Objective**  
Taking the perspectives of building users (occupants and visitors) is vital for a human-centered design approach. Students will learn about relevant theory and methods in cognitive science and environmental psychology that can be used to understand human behavior in built environments. The foundations of environmental psychology and human spatial cognition will be introduced. A focus of the seminar will be on how people perceive their surroundings, how they orient in a building, how they memorize the environment and how they find their way from A to B. Students will also learn about a range of methods including real-world observation, virtual reality experiments, eye-tracking and behavior simulation for design. Students will reflect on the roles of designers and other stakeholders with respect to human-centered design and an evidence-based design perspective. The seminar is geared towards a mix of students from architecture / planning, engineering, computer science and behavioral science as well as anybody interested in the relation between design and cognition. Participation in the course requires students to assume a course credit in "Vertiefungsfach" or "Wahlfach".

**851-0585-04L**  **Lecture with Computer Exercises: Modelling and Simulating Social Systems with MATLAB**  
Number of participants limited to 70.  
3 credits  
S. Ognjanovic

**Content**  
This course introduces the basic functionalities and features of the mathematical software package MATLAB, such as the simple operations with matrices and vectors, differential equations, statistical tools, the graphical representation of data in various forms, and video animations of spatio-temporal data. With this knowledge, students are expected to implement themselves in MATLAB, models of various social processes and systems, including agent-based models, e.g. models of interactive decision making, group dynamics, human crowds, or game-theoretical models.

**Prerequisites / notice**  
The number of participants is limited to the size of the available computer teaching room. The MATLAB code related to the seminar thesis should be well enough documented for further use by others and must be handed over to the Chair of Sociology, in particular of Modeling and Simulation, for further free and unrestricted use.
The colloquium addresses advanced and graduate students. First, it offers participants the opportunity to present their own research projects (work in progress); and, second, it provides a most fruitful space to discuss methodological, theoretical and systematic complex issues.

**Objective**

The colloquium addresses advanced and graduate students. First, it offers participants the opportunity to present their own research projects (work in progress); and, second, it provides a most fruitful space to discuss methodological, theoretical and systematic complex issues.

---

**851-0252-05L**  
**Research Colloquium Cognitive Science**  
**W 1 credit 2K**  
**C. Hölscher, V. Schinazi, T. Thrash**  
**Prerequisite:** Participants should be involved in research in the cognitive science group.

**Abstract**

The colloquium provides a forum for researchers and graduate students in cognitive science to present/discuss their ongoing projects as well as jointly discuss current publications in cognitive science and related fields. A subset of the sessions will include invited external visitors presenting their research. Participants of this colloquium are expected to participate in active research group.

**Objective**

Graduate student train and improve their presentation skills based on their own project ideas, all participants stay informed on current trends in the field and have the opportunity for networking with invited scholars.

---

**851-0738-03L**  
**Protecting Inventions in Chemistry**  
**W 2 credits 2V**  
**C. Soltmann**  
**Particularly suitable for students of D-CHAB**

**Abstract**

The lecture gives students of chemistry-related degree programs an overview of the options to protect inventions and the underlying research efforts. The lecture aims to put the participants in a position to use this know-how in the workplace.

**Objective**

Research and development play an important role in chemistry-related technology sectors such as inorganic and organic chemistry or pharmacy.

Investments in the development of new substances and active components in these sectors are traditionally secured by patents because publicly known inventions, generally chemical substances, may easily be reproduced by others.

In the last years, the know-how about intellectual property has become increasingly important for chemists and engineers. Both in the production process and in the distribution sector, chemists and engineers are increasingly being confronted with questions concerning the protection of technical inventions and the use of patent information. As more than three-quarters of all publicly available technical information are available only in patents, it is more and more important for researchers and engineers to be capable of extracting relevant information from the flood of patents.

Patents are not only a powerful measure to protect investments and inventions in chemistry-related sectors but also an important source of information about competitors and potential cooperation partners and about the development of markets. Accordingly, the know-how about patents and patent information has become a key qualification on the strategic level in companies and in the research sector.

The seminar is customised to the needs of chemists and students of related degree programs. Participants will become familiar with practice-oriented aspects of intellectual property and will be enabled to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups
- Special aspects of protecting inventions in chemistry-related sectors, e.g. polymorphs and inventions in the field of nanotechnology.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will comprise practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

The lecture is coordinated in particular to the needs of the following degree programs: Agricultural science, biotechnology, chemical engineering, pharmacy, food science, pharmaceutical sciences.

For engineering and physics students, the lecture 'The Role of Intellectual Property in daily routine: A Practical Introduction' (851-0738-01) will be offered in the autumn semester.

---

**851-0585-41L**  
**Computational Social Science**  
**W 3 credits 2S**  
**D. Helbing, M. Leiss, O. C. Rouly**

**Abstract**

The seminar aims at three-fold integration: (1) bringing modeling and computer simulation of techno-socio-economic processes and phenomena together with related empirical, experimental, and data-driven work, (2) combining perspectives of different scientific disciplines (e.g. sociology, computer science, physics, complexity science, engineering), (3) bridging between fundamental and applied work.

Participants of the seminar should understand how tightly connected systems lead to networked risks, and why this can imply systems we do not understand and cannot control well, thereby causing systemic risks and extreme events.

They should also be able to explain how systemic instabilities can be understood by changing the perspective from a component-oriented to an interaction- and network-oriented view, and what fundamental implications this has for the proper design and management of complex dynamical systems.

Computational Social Science and Global Systems Science serve to better understand the emerging digital society with its close co-evolution of information and communication technology (ICT) and society. They make current theories of crises and disasters applicable to the solution of global-scale problems, taking a data-based approach that builds on a serious collaboration between the natural, engineering, and social sciences, i.e. an interdisciplinary integration of knowledge.

**851-0252-07L**  
**Recent Debates in Social Networks Research**  
**W 2 credits 2S**  
**C. Stadtfeld, P. Block**  
**Number of participants limited to 30**

**Abstract**

Social Networks research is a highly interdisciplinary field. For example, scholars in Sociology, Psychology, Political Sciences, Computer Science, Physics, Mathematics and Statistics contribute to the development of theories and methods. This course aims at understanding, comparing and structuring recent debates in the field of Social Networks.

**Objective**

Social Networks research is a highly interdisciplinary field. At the end of this seminar, students will understand and be able to compare different subject-specific approaches to social networks research (e.g., from Sociology, Psychology, Political Sciences, Computer Science, Physics, Mathematics and Statistics). They will be familiar with recent publications in the field of Social Networks and be able to critically participate in a number of recent debates. Amongst others, these debates touch upon the co-evolution of selection and influence mechanisms, appropriateness of statistical models, generic mechanisms and features of social networks, models for the analysis of dynamic networks.

**364-1062-00L**  
**Experimental Methods**  
**W 1 credit 1V**  
**C. Waibel**  
**This course is complemented by a course on z-Tree**

---
This course introduces PhD students into the principles of experimental methods and outlines how to prepare, conduct and evaluate an experiment. This course aims to prepare PhD students for conducting their own experiment.

This course introduces the role of policy and its underlying politics in the transformation of the energy sector. It covers historical, socio-economic and political perspectives and applies various theoretical concepts to specific aspects of governing the energy transition.

This course introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for the rate and direction of technical change in the energy sector. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It then introduces theoretical frameworks and concepts for studying innovation and transitions. It then focuses on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions and policy feedback.

Number of participants limited to 30.

This course introduces the role of policy and the underlying politics in the transformation of the energy sector. It covers historical, socio-economic, and political perspectives as well as to the historical and social context. Approaching the theories of Susan Sontag, Roland Barthes and Bourdieu as well as postmodern or posthuman criticism.

The course discusses writers from Henry James to Margaret Atwood whose interest for photography led them to elaborate new intriguing modes of representation. The aim is to identify how literature, photography and art meet to promote a photographic aesthetics while approaching the theories of Susan Sontag, Roland Barthes and Bourdieu as well as postmodern or posthuman criticism.

A reading list with articles for each lecture has been published in Moodle.

This course is particularly suited for students of the following programmes: MA Comparative International Studies; MSc Energy Science & Technology; MSc Environmental Sciences; MSc Management, Technology & Economics; MSc Science, Technology & Policy; ETH & UZH PhD programmes.

A reading list with articles for each lecture has been published in Moodle.

851-0609-06L Governing the Energy Transition

This course provides an introduction to philosophical issues surrounding quantum physics. In particular, we will examine different interpretations of quantum mechanics (such as the many-world interpretation) and the transition between the quantum and the classical physical realm (here phenomena such as decoherence will be highlighted).

By the end of the course students are able to describe and compare different interpretations of quantum mechanics. They are able to identify and examine issues concerning these different interpretations and issues concerning the transition between quantum and classical descriptions in physics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific contexts.

This seminar is devoted to the introduction into the ideas and concepts of one of the most influential thinkers of the 20th century. We will read selected texts by Freud for getting an overview over his medical, psychological and cultural thinking.

Literature
Myths of Creation and First Origins (Genesys and Gospel of St. John, Theogony, Upanishads), philosophy (Fichte, Hegel), literature and poetry (Wieland, Hölderlin, Novalis, Wordsworth, Melville, Richard Wagner, Beckett). For an introduction, see Wolfgang Iser, Emergenz: Nachgelassene und verstreut publizite Essays (Konstanz 2013).

Prerequisites / notice
readings partly in English
Cinema in the 20th Century

The Indian film industry has been around for 100 years and is one of the richest and most variegated of the world. The lecture reconstructs the historical development of Indian cinema and uses it as a lens through which cultural, social and political change in the subcontinent can be explored.

Objective

The objectives of this course are three-fold. For one, the participants shall learn to question aesthetic certainties and received modes of perception of cinematic, aesthetic art. Second, they will be acquainted with the potential of films as a historical source to grasp processes of social and cultural change. Besides, the reconstruction of the international career of a specific variety of art and entertainment will also raise important questions of cultural globalisation and consumerism. As a side-effect, a sit where the students will also be provided with important insights into the chequered history of the Indian subcontinent in during the course of the 20th century.

Literature

Zur Einführung:

Prerequisites / notice

A detailed course description and session plan will be available from 15 Sept 2013 onwards at http://www.gmzw.ethz.ch/education

Collections in Context: What Do Historians and Scientists Learn from Butterflies, Stones, and Bones?

851-0101-53L

Abstract

Zurich holds huge scientific collections. They contain objects from around the world, some of them dating back to the 18th century. This interdisciplinary seminar combines perspectives from the history of science and from current scientific disciplines. What do these objects tell us about Zurich's place in the global history of science? What potentials do old collections hold for scientists today?

Scientific Publishing

851-0158-08L

Abstract

This course is only for doctoral students.

Frontiers in Energy Research

851-0906-00L

Abstract

Knowledge of advanced research in the area of energy.

Creativity

851-0157-67L

Objective

We will deal with historical and contemporary theories of inventive imagination, fantasy, and creativity. Looking at artistic, psychological, pedagogical, economic, and entrepreneurial discourses of creativity from the 18th to the 21st century we will discuss their specific contexts in order to uncover historical differences and changes. Is it indeed possible to identify conjunctions between the economicization, scientification and normalization of creativity? Are there any alternatives to the reigning paradigm of creativity? And if so, what are those?

Scientific Publishing

851-0157-68L

Objective

The technological upheavals wrought by the "digital age" have put the subject of scientific publishing on the map (again). Open access, copyright, or print-on-demand are just a few of the buzzwords that have defined controversies in recent years. The aim of this seminar is assist students in developing critical perspectives on these contemporary debates - by learning about the history of scientific publishing, including the role of specific publishers and journals, the footnote, or the malleable nature of authorship.

The Mathematics of Scientific Racism

851-0157-70L

Abstract

How did racial scientists determine racial affiliation? In the seminar we will examine the practical challenges and eventuated works of physical anthropologists from 1850 to the present. By scrutinizing the scientific toolbox of racial scientists, we will reveal how national affiliation, anti-Semitic perceptions and Gender identity shaped scholars' choices of graphical and computational methods.

Objective

The aim of the course is to analyze the mutual relations between scientific theories and social perceptions, and to follow the formation of the "scientific mind". The course focuses on racial scientists and on the way their practices of computation and statistical analysis influenced their world-views - and vice versa. The students will be instructed on the way historians of science analyze scientific sources. They will gain a better understanding of the complexities of disciplinary dynamics, social biases and institutional pressures shaping scientific ideas, and learn on the influences such scientific ideas may have on the society as a whole.

Prerequisites / notice

Please note that the seminar will be held in English and most texts will be in English. However, a small portion of the reading material will be in German.

History of Astronomy

851-0157-69L

Objective

Being creative may appear to be the most important requirement of the present age: creative thinking, start-ups, project development all seem to promise an ongoing innovation of work and life. Instead of repeating that promise once again, this course asks for the historical conditions of discourses of creativity.

Number of participants limited to 40.

- Understanding main topics of sociology and philosophy of science.

5 credits 2S

H. von Sass

- Introduction into the sociology of science of Bruno Latour, esp. the Agent/Network/Theory.

8 credits 2S

M. Wulz

- Understanding main topics of sociology and philosophy of science.

- Being creative may appear to be the most important requirement of the present age: creative thinking, start-ups, project development all seem to promise an ongoing innovation of work and life.

- Among them are constructivist approaches that seek to understand scientific knowledge not primarily as a system of objective truths, but rather as an outcome of human 'constructions'. Other approaches deal with the problem of how scientific objects are related to systems of power and oppression, namely in the case of objects collected during the time of european colonialism overseas. Secondly, students will become familiarized with how old collections can yeald new insights for current scientists working, e.g., on questions of ecology. Thirdly, the seminar shall serve as a plattform to discuss ways of dialogue and possible collaboration between these different approaches.

- Students will be expected to read theoretical texts and case studies during semester, participate in discussions with external experts (historians, curators, and scientists), and to write a summarizing essay at the end of the term.

8 credits 2S

M. Stadler

- Scientific objects are related to systems of power and oppression, namely in the case of objects collected during the time of european colonialism overseas.

- Students will be expected to read theoretical texts and case studies during semester, participate in discussions with external experts (historians, curators, and scientists), and to write a summarizing essay at the end of the term.

8 credits 2S

M. Wulz

8 credits 2S

M. Wulz
Computer Science

**Abstract**
This course studies philosophical issues concerning computers and computing. Topics include: information (and information content), computational complexity, the Turing Test for computer thought; the "Chinese Room" argument against the possibility of strong AI; connectionist AI; consciousness; the Church-Turing thesis; computational and hypercomputational models of mind; and free will.

**Objective**
- Exhibit a general understanding of the philosophy and history of computing.
- Explain central problems in the field and their potential solutions, independently and at a level requiring in-depth knowledge and critical understanding.
- Communicate clearly in writing about topics in this field.

**Prerequisites / notice**
Short notice about program changes are possible and will be communicated through the ZGW newsletter. Please register with www.zgw.ethz.ch/de/newsletter.html

Credit points can be gained by regular attending and by writing an essay. In addition to the five colloquia there will be a deepening seminar on offer (lecturer K. Espahangizi).

Free childcare available.

**851-0331-05L** The Art of Conversation

**Abstract**
This course will offer the occasion to reflect upon the art of conversation: its codes, its pleasures of improvisation, its worldly aspects and its importance in everyday life.

**Objective**
This will permit us to consider different figures of the writer and salon hostess, such as Mme de Lafayette, Mme du Deffand, Julie de Lespinasse, and Mme de Staël.

**Prerequisites / notice**
Short notice about program changes are possible and will be communicated through the ZGW newsletter. Please register with www.zgw.ethz.ch/de/newsletter.html

Credit points can be gained by regular attending and by writing an essay. In addition to the five colloquia there will be a deepening seminar on offer (lecturer K. Espahangizi).

Free childcare available.

**851-0331-06L** The Secretaries of the Baroque Age and the "Honest Dissimulation"

**Abstract**
Torquato Accetto, secretary and poet, published the treatise "Della simulazione onesta" in 1641. It was a thin manual to survive political turmoils and moral instability of the time; it was also a guide to "secret" writing in a time of censorship. The course follows the reception of the treatise up to the 20th century and focuses on how it got shaped to meet various historical and political ideas.

**Objective**
The students know the author and his coeval context; the students can relate the writing modalities of the treatise to the socio-cultural context of various historical times; the students know how to identify and interpret the metaphorical potential of the texts, as well as its literary power.

**Prerequisites / notice**
Short notice about program changes are possible and will be communicated through the ZGW newsletter. Please register with www.zgw.ethz.ch/de/newsletter.html

Credit points can be gained by regular attending and by writing an essay. In addition to the five colloquia there will be a deepening seminar on offer (lecturer K. Espahangizi).

Free childcare available.

**862-0002-16L** Research Colloquium History of Knowledge (HS 2016)

**Abstract**
The colloquium of the ZGW focuses on present developments, debates and perspectives in the field of history of knowledge. On the second and fourth date there will be public events in the Cabaret Voltaire.

**Objective**
The colloquium deals with the general problems, questions and methods of the interdisciplinary research field "The History of Knowledge". Knowledge has become one of the existential conditions of modern societies and it increasingly determines their dynamics. Therefore, it is getting more and more relevant to develop a differentiated analysis of the epistemic, social and cultural constraints of the production, circulation and the decay of knowledge. In addition, the colloquium asks after the cultural and ethical resonances of knowledge not only within science but also in relation to art, literature, technology, everyday life, and so on.

**Prerequisites / notice**
Short notice about program changes are possible and will be communicated through the ZGW newsletter. Please register with www.zgw.ethz.ch/de/newsletter.html

Credit points can be gained by regular attending and by writing an essay. In addition to the five colloquia there will be a deepening seminar on offer (lecturer K. Espahangizi).

Free childcare available.
The lecture gives an overview about the different Man-Machine-Relations since the middle of the 19th century when the image of mathematics changed. In particular, it focuses on the consequences of the fact that in the 19th century mathematics started to not only reflect on their own conceptual and methodological foundations in a general manner (which had been done since the dawn of mathematics and was especially a philosophical task), but to formalize them in a strict, mathematical way: the objects of mathematics, its logical language and its proof procedures. Through Cantor’s set theory, the mathematical treatment of logic since Boole and especially through Frege and the formalization of its axioms in a wide ranging discussion involving Zermelo, Fraenkel and others, this self-reflexive stance came to the fore.

Yet, the deeper mathematics dug into its foundations, the more radical the problems became. Finally, the optimistic Hilbert program of laying the foundation of mathematics within mathematics and of proving its own consistency as well as its completeness contributed to clarifying of the foundation of mathematics primarily as if it was doomed to failure. Gödel proved his famous incompleteness theorems and thereby dismissed at the same time the formalist attempt to reduce mathematical truth to logical provability. His work resulted in detailed insights in the precariousness of the foundation of mathematics and further numerous of productive consequences within mathematics.

Moreover, Gödel’s theorems open many far-reaching and intriguing questions in view of our image of mathematics, questions concerning the conception of mathematical practice and knowledge, the limits of calculability of mathematics and the possible role of computability and machines in mathematics, the relation of proof procedures and the involved intuitive aspects. In short, the image of mathematics is not as static as we sometimes expect it to be, it was radically redrawn by the mathematicians of the 20th century and has since then again been open to diverging interpretations.

Literature

851-0125-51L Man and Machine

W 3 credits 2G M. Hampe

Particularly suitable for students of D-CHAB, D-HEST, D-MATH, D-MATL

Abstract
The lecture gives an overview about the different Man-Machine-Relations since the 16th century. Different models of machines will be important here: the clockwork, the steam engine and the computer.

Objective
On the one hand models of machines had a heuristic value in research on man, e.g. in Harvey’s discovery of blood circulation in the 17th century or in brain research in the 20th century. On the other hand these models were always criticised, sometimes polemically, because they are supposedly not adequate for man.

Students should learn about the connections between the history of anthropology and technology and be able at the end of the course to evaluate the critical philosophical arguments that are connected with the metaphor of the machine.

851-0300-85L The Knowledge of Literature. An Introduction

W 3 credits 2V A. Kilcher

Abstract
This lecture provides a general introduction to literary theory and presents the important theories dealing with knowledge and its role in and as literature.

Objective
Students are introduced to the various approaches and methods of literature studies and gain an overview of literary theory.

Content
This lecture has two aims: Firstly, it serves as a general introduction into the field of literary theory (thereby looking into “knowledge about literature”). Secondly, there will be a special emphasis on recent theoretical approaches, based on literature and knowledge as one of its components (thus investigating the “knowledge of literature”). Even though traditional criticism disagrees, a number of recent approaches, based on literature and culture studies, hold that literature is not to be conceived of as standing in opposition to the world and the classificatory system of the academic disciplines, particularly the sciences (e.g. Foucauldian discourse analysis and New Historicism). Instead, these approaches understand literature in terms of its epistemological function in the constitution and formation of knowledge. Literature itself generates models of knowledge, sometimes with critical or even utopian intentions. Moreover, it draws attention to the fundamental role of order and representation (systematization, narrative rendering, linguistic and pictorial representation) in both humanities and sciences.

851-0300-79L Theories of Joke

W 3 credits 2S A. Kilcher

Abstract
From Plato, Aristotle and Cicero, philosophers have tried to find the core principle of wit (or the joke, as both meanings are contained in the German term "Witz"). Even during the 20th century, the philosophy of life and psychoanalysis struggle with it. The seminar provides an overview of this history.

Objective
This seminar deals with the meaning and history of "Witz" (wit, joke) as a form of knowledge. It places "Witz" as a switch or transitional figure within the development of modern theories of knowledge in particular.

Content
Contrary to intuitive expectations, the German term “Witz” is not only an instance of the comical, but also a form of knowledge that plays on similarity and difference by juxtaposing the disparate. In this vein, especially during the 17th and 18th centuries, “Witz” becomes a central attribute of poetic and rhetorical types of expression (wit). Only during the 19th century and onwards these comical and even utopian intentions. Moreover, it draws attention to the fundamental role of order and representation (systematization, narrative rendering, linguistic and pictorial representation) in both humanities and sciences.

862-0078-02L Research Colloquium. Extra-European History and Global History (HS 2016)

For PhD students and postdoctoral. Masterstudents are welcome.

W 2 credits 1K H. Fischer-Tine, M. Dusinberre

Abstract
The fortnightly colloquium provides a forum for PhD students and postdoctoral researchers to present and discuss their current work. Half of the slots are reserved for presentations by invited external scholars.

Objective
PhD students will have an opportunity to improve their presentation skills and obtain an important chance to receive feedback both from peers and more advanced scholars.

364-1078-00L z-Tree: Programming Experiments in Economics and the Social Sciences

W 1 credit 1G J. Schmitz

This course is complemented by a course on experimental methods (364-1062-00L Experimental Methods). It is not mandatory but recommended to take both courses.
This lecture will deal with the manifestations of the "selfish gene" principle in human social behavior. Cooperation and competition, related theory and methods in cognitive science and environmental psychology that can be used to address human cognitive and behavioral needs in built environments. The foundations of environmental psychology and human spatial cognition will be introduced. A focus of the course will be on how people perceive their surroundings and orient in space. Students will learn about a range of methods including real-world observation, and methods of architectural analysis such as space syntax. Students will also be exposed to behavioral simulation in design, virtual reality experiments, and eye-tracking. Students will reflect the roles of designers and other stakeholders with respect to human-centered design as well as an evidence-based design perspective. The course is tailored for students from a relevant design studio. Upon registering, students should send an email about their design studio to b.emo@gess.ethz.ch. As an alternative to obtaining D-GESS credit, architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".

This course explores selected topics of cognitive neuroscience. The course begins with a basic introduction to the field covering neural anatomy and brain physiology. Contemporary methods used in neuroscientific research (e.g., fMRI, EEG) will also be introduced and their benefits and limits critically reviewed. Using this knowledge, we will discuss some of the classic works in neuroscience in visual perception, memory and emotion. This will be accompanied by some famous cases of patients demonstrating problems in these domains (e.g., people with agnosia or amnesia). Further topics will include the cognitive and neural processes involved in pain processing, the placebo effect, as well as spatial representation and navigation.

The class is open to all Ph.D. (and Master students) who are interested in conducting (behavioral) economic experiments.

Special students and auditors need special permission from the lecturers.

Prerequisites:
- Knowledge of basic principles of cognitive science.
- Familiarity with experimental methods.

- **Course Catalogue of ETH Zurich**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

**UZH Module Code**: SPV0Y005

Mind the enrolment deadlines at UZH: [http://www.uzh.ch/studies/application/mobilitaet_en.html](http://www.uzh.ch/studies/application/mobilitaet_en.html)

**Abstract**

The course gives an introduction to human and comparative neuroanatomy, molecular, cellular and systems neuroscience.

**Objective**

The course gives an introduction to human and comparative neuroanatomy, molecular, cellular and systems neuroscience.

**Content**

1) Human Neuroanatomy I&II
2) Comparative Neuroanatomy
3) Development I&II
4) Membran and Action Potential
5) Synaptic Transmission & Plasticity I&II
6) Glia and Blood-Brain-Barrier
7) Somatosensory and Motor System
8) Visual System
9) Auditory System
10) Circuits underlying Emotion
11) Modeling of Neural Circuits

**Prerequisites / notice**

For doctoral students of the Neuroscience Center Zurich (ZNZ).

Mind the enrolment deadlines at UZH: [http://www.uzh.ch/studies/application/mobilitaet_en.html](http://www.uzh.ch/studies/application/mobilitaet_en.html)

**Abstract**

The goal of this Advanced Course in Neurobiology is to provide students with a broader knowledge in several important areas of neurobiology. The course consists of four parts: Part I deals with various topics in developmental neurobiology. Part II is devoted to aspects of signal transduction. Part III focuses on synaptic transmission. Part IV gives deeper insights into systems neuroscience.

**Objective**

This credit point course is designed for doctoral students who have successfully completed the Introductory Course in Neuroscience at the Neuroscience Center Zürich. The goal is to provide students with a broader and deeper knowledge in several important areas of neurobiology.

**Prerequisites / notice**

**Abstract**

Participation in weekly seminars on a variety of topics including Food Microbiology, Food Toxicology, Food Biochemistry, Food Processing, Consumer Behavior, Food Technology, and Food Materials and Technology, and oral presentation of a selected published study in one of these areas inspired by participation in the seminars.

**Objective**

The objectives are to become familiar with and stimulate interest in leading-edge science related to the research topics of the Institute of Food, Nutrition and Health. Participants attend weekly seminars given by external and internal speakers, and are also required to deliver a presentation on a recent research article inspired by a topic from the semester presentations.

<tr>
<td>Abstract</td>
<td>Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them algorithmically. The lecture addresses theoretical foundations concerning geometric structures. Central objects of interest are triangulations. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>We study planar graph triangulations, the art gallery theorem, convexity in R^d, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chan's Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction), Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lecture notes</td>
<td>Yes</td>
<td></td>
<td></td>
<td></td>
<td></td>

</table>
The aim of this seminar is to introduce students to recent research results in the area of programming languages and software engineering. To accomplish that, students will study and present research papers in the area as well as participate in paper discussions. The papers will span topics in both theory and practice, including papers on program verification, program analysis, testing, programming language design, and development tools. A particular focus will be on domain-specific languages.

The publications to be presented will be announced on the seminar home page at least one week before the first session. Organizational note: the seminar will meet only when there is a scheduled presentation. Please consult the seminar's home page for information.

<tr>
<td></td>
<td>This short course is designed to help junior researchers in Computer Science develop the skills needed to write their first research articles. Writing for Publication in Computer Science is a short course (5 x 4-lesson workshops) designed to help doctoral students develop the skills needed to write their first research articles. The course deals with topics such as: understanding the needs of different target readerships, - managing the writing process efficiently, - structuring texts effectively, - producing logical flow in sentences and paragraphs, - editing texts before submission, and - revising texts in response to colleagues' feedback and reviewers' comments.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Number of participants limited to 15. The course is highly recommended to PhD students who started in 2015.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Participants will be expected to produce a number of short texts (e.g., draft of a conference abstract) as homework assignments; they will receive individual feedback on these texts during the course. Wherever feasible, elements of participants' future conference/journal articles can be developed as assignments within the course, so it is likely to be particularly useful for those who have i) their data and are about to begin the writing process, or ii) an MSc thesis they would like to convert for publication.</td>

<td>This course will provide a solid foundation for understanding physical principles of THz applications. We will discuss various building blocks of THz technology - components dealing with generation, manipulation, and detection of THz electromagnetic radiation. We will introduce THz applications in the domain of imaging, communications, and energy harvesting.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>This is an introductory course on Terahertz (THz) technology and applications. Devices operating in THz frequency range (0.1 to 10 THz) have been increasingly studied in the recent years. Progress in nonlinear optical materials, ultrafast optical and electronic techniques has strengthened research in THz application developments. Due to unique interaction of THz waves with materials, applications with new capabilities can be developed. In theory, they can penetrate somewhat like X-rays, but are not considered harmful radiation, because THz energy level is low. They should be able to provide resolution as good or better than magnetic resonance imaging (MRI), possibly with simpler equipment. Imaging, very-high bandwidth communication, and energy harvesting are the most widely explored THz application areas. We will study the basics of THz generation, manipulation, and detection. Our emphasis will be on the physical principles and applications of THz in the domain of imaging, communication and energy harvesting.</td>
<td></td>
<td></td>
<td></td>
<td></td>

  - Bayesian theory of optimal decisions
  - Maximum likelihood and Bayesian parameter inference
  - Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
  - Ensemble methods: Bagging and Boosting
  - Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
  - Non parametric density estimation: Parzen windows, nearest neighbour
  - Dimension reduction: principal component analysis (PCA) and beyond

**Prerequisites**
- Control systems (227-0216-00L) or equivalent.

**Lecture notes**
- Yes.

**Literature**
Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.
Students should at least have followed one previous course offered by the Machine Learning Institute (e.g., CIL or LIS) or an equivalent course offered by another institution.

227-0559-00L Seminar in Distributed Computing  W  2 credits  2S  R. Wattenhofer

Abstract
In this seminar participating students present and discuss recent research papers in the area of distributed computing. The seminar consists of algorithmic as well as systems papers in distributed computing theory, peer-to-peer computing, ad hoc and sensor networking, or multi-core computing.

Objective
In the last two decades, we have experienced an unprecedented growth in the area of distributed systems and networks; distributed computing now encompasses many of the activities occurring in today’s computer and communications world. This course introduces the basics of distributed computing, highlighting common themes and techniques. We study the fundamental issues underlying the design of distributed systems: communication, coordination, synchronization, uncertainty. We explore essential algorithmic ideas and lower bound techniques.

In this seminar, students present the latest work in this domain.

Seminars language: English

Content
Different each year. For details see: www.disco.ethz.ch/courses.html

Lecture notes
Slides of presentations will be made available.

Literature
Papers.
The actual paper selection can be found on www.disco.ethz.ch/courses.html.

**Abstract**
The course focuses on important factors that drive the innovation performance of firms, like innovation capabilities, science-industry relationships, environmental policy and it shows how innovation activities relate to firm performance and to the technological dynamics of industries. Hence, the course provides an understanding of the relationship between technical change and industrial dynamics.

**Objective**
The course provides students with the basic skills to understand and assess empirically the technological activities of firms and the technological dynamics of industries.

**Content**
The course consists of two parts. Part I provides an introduction into important topics in the field of the economics of innovation. Part II consists of empirical exercises based on the KOF Innovation Data. In part I we will learn about:

- a) market conditions that encourage firms to invest in R&D (Research and Development) and develop new products.
- b) the role of universities for the technological activities of a firm (technology transfer).
- c) how technologies diffuse among firms.
- d) how the R&D activities of firms are affected by economic crises and how firms finance their R&D activities.
- e) how we can measure the returns to R&D activities.
- f) how (environmental) policies affect the technological activities of a firm. In part II we will use the KOF Innovation Survey Data in order to assess empirically the technological activities of firms referring to the topics introduced in part I.

**Lecture notes**
Will be provided in the course

**Literature**
For an introduction into the economics of innovation see G.M. Peter Swann, The Economics of Innovation - an Introduction, Edward Elgar, 2009.

**Prerequisites / notice**
Course is directed to advanced Master-Students and PhD Students with an interest in empirical work.

**Abstract**
The purpose of this course is to review and discuss issues in current theory and research relevant to innovation in the digital space.

**Objective**
Through in-depth analysis of published work, doctoral candidates will identify and appraise theoretical and empirical studies, formulate research questions, and improve the positioning of their own research within the academic debate.

**Content**
The Internet has a twofold impact on the way individuals and firms innovate. First, firms increasingly draw on digital technology to access and capture innovation-relevant knowledge in their environment. Second, individuals, firms, and other organizations extensively utilize the Internet to create, diffuse, and commercialize new digital products and services. During the past decade, theory and research on innovation in the digital space has flourished and generated extensive insights of relevance to both academia and management practice. This has brought us better understanding of working models, and some fundamental reasons for innovation success or failure. A host of new models and research designs have been created to explore the innovation in the digital space, but these have also brought out many open research questions. We will review some of the existing streams of work, and in the process explore a new research agenda.

**Format**
The course is organized in one block of 2 days. The course is a combination of pre-readings, presentations by faculty and students, and discussions. The students prepare presentations of papers in order to facilitate analysis and discussion.

364-0559-00L Dynamic Macroeconomics (Doctoral Course) W 3 credits 2V H. Gersbach
Objective
Abstract Dynamic models and workhorses in macroeconomics
In this doctoral course, we learn dynamic general equilibrium theory and the basic workhorses in macroeconomics. After the course the participants will be able to speak the Arrow-Debreu and recursive language and apply the frameworks to interesting issues in Growth, Public Finance, Monetary Theory and Banking.

Content
1. Introduction
2. The Arrow-Debreu Approach and Sequential Markets
3. The Neoclassical Growth Model and the Representative Agent Model
4. Mathematical Background
5. Frictions and Banking
5.1 Overview
5.2 Banks in Macroeconomic Models
5.3 Ramsey cum Banks: General Equilibrium with Banks and Outside Equity
6. Overlapping Generations Models and Models with Heterogenous Agents
7. Debates
7.1 Theory of Piketty
7.2 High Bank Equity Requirements

364-0556-00L Doctoral Workshop: Astute Modelling W 3 credits 1G H. Gersbach
Prerequisite: Students are expected to attend the course 364-0559-00L "Dynamic Macroeconomics (Doctoral Course)", before registering for this workshop.
Objective
Abstract In this workshop, ongoing research is presented and the criteria and guidelines for astute modelling of economic, political, and social situations are discussed.

Prerequisites / notice We will learn how to craft models, how to present our own research and improve our analytical skills.

364-0585-01L PhD Course: Applied Econometrics W 2 credits 2S P. Egger
Objective
Abstract In this course, we will address three blocs of selected problems: (i) estimation of fixed and random effects panel data models for single equations and systems of equations; (ii) estimation of models with endogenous treatment effects or sample selection; (iii) estimation of models with interdependent data (so-called spatial models).

Students will be able to program estimation routines for such problems in STATA and apply them to data-sets. They will be given a data-set and will have to work out empirical problems in the context of a term paper.

Data: 06.09.2017 12:54 Autumn Semester 2016 Page 441 of 1570
Lecture notes

For panel data analysis, I will rely on the book:

For sample selection and endogenous treatment effect analysis, I will rely on the book:

For spatial econometrics:
I will mostly use papers.

I will prepare a script (based on slides), covering all topics.

364-0517-00L Urban and Spatial Economics

Abstract

This course explores the economic factors which influence location decisions of households and firms, and it explores theories of how these decisions induce the formation of cities. The course will cover the neoclassical models of land use, concepts from the new economic geography, zoning, and transportation and traffic congestion.

Prerequisite: one semester in microeconomics.

Objective

The objective of the course is to provide graduate students with an understanding of the economic factors which give rise to urban spatial structure and the models which have been employed to study these processes. The course aims to help students develop an appreciation for the use of economic models in both positive and normative frameworks. We will assess both the history of thought regarding the role of markets in creating urban development, and we will read about modern theories of externalities and economic factors which induce agglomeration. The final section of the course will focus on transportation problems in urban areas and the use of economic models to assess public policy measures to deal with congestion and associated externalities.

Content

Outline of Lectures

Topic 1: Why do cities exist?
Topic 2: The Basic Muth-Mills model
Topic 3: The New Economic Geography
Topic 4: Business demand for land and Von Thünen's model
Topic 5: Urban spatial structure
Topic 6: Land use control
Topic 7: City size and city growth
Topic 8: Traffic externalities and congestion
Topic 9: Public transport

Lecture notes

Textbook

- Cities, agglomeration and spatial equilibrium by E. L. Glaeser, 2008, Oxford University Press.
- The new introduction to geographical economics, Steven Brakman, Harry Garretsen and Charles van Marrewijk, Cambridge.

364-0581-00L Microeconomics Seminar (ETH/UZH)

Abstract

Research Seminar research papers of leading researchers in Microeconomics are presented and discussed

Objective

Research Seminar research papers of leading researchers in Microeconomics are presented and discussed

Content

Invited Speakers present current research in Microeconomics

364-1013-00L Managerial Cognition

Abstract

The primary objective of this module is to introduce some of the major theoretical threads and controversies in the field of managerial cognition. A secondary objective is to help understand the process of empirical research that has the potential to make an impact on research and management practice.

Objective

The module will seek to provide:
1) Exposure to key theoretical streams in the area.
2) Familiarity with the issues, methods, findings and gaps in the area.
3) Skills in finding insight in the literature.
4) Skills in critiquing the literature, defining research problems and proposing empirical research in this area.

Content

Session 1 - Introduction to the field of managerial cognition
Session 2 - Methods to study managerial cognition
Session 3 - Sensemaking, Mindfulness and Attention
Session 1: Introduction

This module aims to introduce major theoretical perspectives on organizational knowledge and to improve the competence of doctoral students to publish in relevant research areas. How knowledge is conceptualized and what aspects of knowledge are being studied serve as a starting point for the student to lead the class in a discussion of the strengths and weaknesses of the paper. For each session, students should emphasize the following topics in their critique:

- list the weaknesses of the paper (you can use bulletpoints)
- list the strengths of the paper (you can use bulletpoints)
- summarize the central framework/ theory that is proposed
- summarize the research problem or question
- Propose at least one alternative methodology and explain why you think the alternative method(s) would have been better suited
- prepare a one-page research idea: what would be a new research question? how would you extend the paper? what could be counterintuitive results?
- three bullet points summarizing the paper weaknesses
- three bullet points summarizing the paper strengths

Assignments: At the beginning of each session, students must distribute copies of their critique of the assigned reading (please see your names at the end of each reference). The critique should be brief, extending to a maximum of one printed page. The critique is meant to serve as a starting point for the student to lead the class in a discussion of the strengths and weaknesses of the paper. For each session, students should emphasize the following topics in their critique:

Session 1: Introduction

Session 2: Some methods to study managerial cognition

Session 3: Sensemaking, Mindfulness and Attention

Assignments: At the beginning of each session, students must distribute copies of their critique of the assigned reading (please see your names at the end of each reference). The critique should be brief, extending to a maximum of one printed page. The critique is meant to serve as a starting point for the student to lead the class in a discussion of the strengths and weaknesses of the paper. For each session, students should emphasize the following topics in their critique:

Session 1:
- summarize the research problem or question
- summarize the central framework/ theory that is proposed
- list the strengths of the paper (you can use bulletpoints)
- list the weaknesses of the paper (you can use bulletpoints)

Session 2:
- Same as for session 1 with particular emphasis on the pros and cons of the method used
- Propose at least one alternative methodology and explain why you think the alternative method(s) would have been better suited

Session 3:
- three bullet points summarizing the paper strengths
- three bullet points summarizing the paper weaknesses
- prepare a one-page research idea: what would be a new research question? how would you extend the paper? what could be counterintuitive results?

Please contact Dr Daniella Laureiro Martinez for more information on this course.
This module aims:
- to provide a basic understanding of key theoretical perspectives on organizational knowledge.
- to provide insights on the research questions, methods, findings and implications of the selected papers.
- to build skills in critically analyzing the literature.
- to identify the areas.

Given its prominence in the history of organization science, an impressive variety of theories have evolved that deals with organizational epistemology, the way of knowing in the organization (e.g., Brown & Duguid, 1991; Grant, 1996; Kogut & Zander, 1992; Lave & Wenger, 1991; Nonaka, 1994; Spender, 1996; Tsoukas, 1996; von Krogh et al., 1994). In this module, students will learn about various seminal contributions in the area of organizational knowledge and make connections between theory and empirical research, and identify the ongoing trends and future research directions.

Session 1: Knowledge based view of the firm.
Session 2: Knowledge sharing and transfer
Session 3: Social practice view on knowledge and knowing

Remark: The list might change. Students will be informed about the changes before the first session.

In each session, students will have three assignments:
1) prepare for in-depth discussion of all papers. The students are supposed to read in advance all the papers that will be presented in the sessions.
2) critically review and discuss the assigned papers. Assignments will be done after participants confirm their presence.
3) submit in advance a short critique of the assigned papers - max 2 pages.

Content
Session 1: Technology rules. Once upon a time, people believed that technology determines organization. What techniques we use explain Organizations and Technical Change

Session 2: Never Mind the Bollocks ... Once upon a time, people believed that technologies were fully malleable to social dynamics. Marxists, social constructivists and management gurus (still) share great optimism in the human ability of solving technical problems, once the right organizational processes are in place. Revolutionary, ambitious, path-breaking. Occasionally buffling, though.

Session 3: It takes two to tango: Technological and organizational dynamics. And last, the big compromise, or the balance finally found? It is not white. It is not black. But it is not grey either. Pragmatic, practical, progressive. Relevant? Actionable?
A. Bommier

Organizational behavior concerns the study of individual and group-level processes in organizations like creativity, motivation, decision-making, and leadership. In this module an overview of major research streams and empirical paradigms in organizational behavior is provided.

The objectives of this course are:
- to provide an overview of OB research
- to discuss major research streams in OB
- to enable students to relate their own research to concepts and methods used in OB

The course is taught by Florian Wangenheim (ETHZ).

Session 3. It takes two to tango: technological and organizational dynamics

Further info on assignments will be circulated by email before the start of the course.

Prerequisites / notice

On each session, students will have two assignments: 1) prepare a summary and critique of at least one of the readings for the day; 2) come prepared to critically discuss all the readings for the day. For the critique, readings will be reassigned in advance of each sessions.

Session 2. Never Mind the Bollocks: organizations rule

The purpose of the course is to confront students with current theoretical thinking in marketing, and currently used theories for sociological theory will be related to current marketing thought.
364-1064-00L Experimental Methods

Inaugural Seminar - PhD Retreat

Pre-registration upon invitation required.

This course is complemented by a course on z-Tree Programming (364-1078-00L z-Tree: Programming Experiments in Economics and the Social Sciences). It is not mandatory but recommended to take both courses.

Abstract

This course introduces PhD students into the principles of experimental methods and outlines how to prepare, conduct and evaluate an experiment.

Objective

The purpose of this course is to:
- introduce students to the world of economics, management and systems research at MTEC
- make students aware of silo-thinking in the specific subdisciplines and encourage them to go beyond those silos
- discuss current issues with regard to substantive, methodological and theoretical domains of research in the respective fields

Content

1. Introduction: What are economic experiments and why to use them?
4. Conducting experiments: Instructions, testing, recruiting, sessions.
5. Measuring techniques: Eliciting beliefs, risk attitudes, social preferences.

Prerequisites / notice

This course is complemented by a course on programming experiments with z-tree. It is not mandatory but recommended to take both courses.

Literature

Books:

Basic Articles:

A reading list with articles for each lecture has been published in Moodle.

364-1015-00L KOF-ETH-UZH International Economic Policy Seminar

(University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: DOEC0584

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract

In this seminar series, which is held jointly with Prof. Dr. Woltek and Prof. Dr. Hoffman from the University of Zurich, distinguished international researchers present their current research related to international economic policy. The participating doctoral students are expected to attend the presentations (bi-weekly). Moreover, a critical review has to be prepared for 1 of the papers presented.

Objective

On the one hand, participating students are exposed to research at the frontier of international economic policy research. On the other hand, skills such as critical thinking and preparing reviews are learned.

Prerequisites / notice

This course is complemented by a course on programming experiments with z-tree. It is not mandatory but recommended to take both courses.

364-1078-00L z-Tree: Programming Experiments in Economics and the Social Sciences

This course is complemented by a course on experimental methods (364-1062-00L z-Tree: Programming Experiments in Economics and the Social Sciences). It is not mandatory but recommended to take both courses.

Abstract

Learn the basic features of the software z-Tree. Learn how to program an experiment that can be implemented.

Objective

z-Tree is the standard software tool for programming economic experiments. This class gives a basic introduction into z-Tree. The class is split in two parts: In the first part, students get acquainted with the software and learn how to program simple experiments. Students should then be able to start working on a project which they have to present in the second part of the class. Students will be evaluated based on their programmed experiment.

Prerequisites / notice

The class is open to all Ph.D. (and Master students) who are interested in conducting (behavioral) economic experiments.

This course is focused on providing students with the knowledge and understanding required to develop simple computational fluid dynamics (CFD) codes to solve the incompressible Navier-Stokes equations and to critically assess the results produced by CFD codes. As part of the course, students will write their own codes and verify and validate them systematically.

Objective
Introduction to various aspects of measurement techniques, with particular emphasis on thermo-fluidic applications. Understanding of various sensing technologies and analysis procedures. Exposure to typical experiments, diagnostics hardware, data acquisition and processing.

Content
In-class introduction to representative measurement techniques in the research areas of the participating institutes (fluid dynamics, energy technology, process engineering) Student participation in 8-10 laboratory experiments (study groups of 3-5 students, dependent on the number of course participants and available experiments) Lab reports for all attended experiments have to be submitted by the study groups. A final exam evaluates the acquired knowledge individually.

Literature

Prerequisites / notice
Basic understanding in the following areas:
- fluid mechanics, thermodynamics, heat and mass transfer
- electrical engineering / electronics
- numerical data analysis and processing (e.g. using MATLAB)

151-0182-00L Fundamentals of CFD Methods W 4 credits 3G A. Haselbacher

Abstract
This course is focused on providing students with the knowledge and understanding required to develop simple computational fluid dynamics (CFD) codes to solve the incompressible Navier-Stokes equations and to critically assess the results produced by CFD codes. As part of the course, students will write their own codes and verify and validate them systematically.

Objective
1. Students know and understand basic numerical methods used in CFD in terms of accuracy and stability.
2. Students have a basic understanding of a typical simple CFD code.
3. Students understand how to assess the numerical and physical accuracy of CFD results.

Content
1. Governing and model equations. Brief review of equations and properties
2. Overview of basic concepts: Overview of discretization process and its consequences
3. Overview of numerical methods: Finite-difference and finite-volume methods
4. Analysis of spatially discrete equations: Consistency, accuracy, stability, convergence of semi-discrete methods
5. Time-integration methods: LMS and RK methods, consistency, accuracy, stability, convergence
6. Analysis of fully discrete equations: Consistency, accuracy, stability, convergence of fully discrete methods
7. Solution of one-dimensional advection equation: Motivation for and consequences of upwinding, Godunov's theorem, TVD methods, DRP methods
8. Solution of two-dimensional advection equation: Dimension-by-dimension methods, dimensional splitting, multidimensional methods
9. Solution of one- and two-dimensional diffusion equations: Implicit methods, ADI methods
10. Solution of one-dimensional advection-diffusion equation: Numerical vs physical viscosity, boundary layers, non-uniform grids
11. Solution of incompressible Navier-Stokes equations: Incompressibility constraint and consequences, fractional-step and pressure-correction methods
12. Solution of incompressible Navier-Stokes equations on unstructured grids

Lecture notes
The course is based mostly on notes developed by the instructor.

Literature

Prerequisites / notice
Prior knowledge of fluid dynamics, applied mathematics, basic numerical methods, and programming in Fortran and/or C++ (knowledge of MATLAB is "not" sufficient).

151-0517-00L Scientific Visualization for Engineering Applications W 4 credits 2V+2P X. Tricoche

Abstract
The course offers an overview of measurement tasks in engineering environments. Different concepts for the acquisition and processing of typical measurement quantities are introduced. Following an initial in-class introduction, laboratory exercises from different application areas (especially in thermofluidsics and process engineering) are attended by students in small groups.

Objective
Introduction to various aspects of measurement techniques, with particular emphasis on thermo-fluidic applications. Understanding of various sensing technologies and analysis procedures. Exposure to typical experiments, diagnostics hardware, data acquisition and processing.

Content
In-class introduction to representative measurement techniques in the research areas of the participating institutes (fluid dynamics, energy technology, process engineering) Student participation in 8-10 laboratory experiments (study groups of 3-5 students, dependent on the number of course participants and available experiments) Lab reports for all attended experiments have to be submitted by the study groups. A final exam evaluates the acquired knowledge individually.

Literature
There is no required textbook. Suggested references are:

**Course Code**
http://www.msrl.ethz.ch/education/distinguished-seminar-in-robotics--systems---controls--151-0623-0.html for a list of upcoming lectures.

**Course Code**
Students are required to attend every lecture. Attendance will be monitored. If for some reason a student cannot attend one of the lectures, the student must select another ETH or University of Zurich seminar related to the field and submit a one page description of the seminar topic. Please see http://www.msrl.ethz.ch/education/distinguished-seminar-in-robotics--systems---controls--151-0623-0.html for a suggestion of other lectures.

**Course Code**
Students are required to attend all seven lectures to obtain credit. If a student must miss a lecture then attendance at a related special lecture will be accepted that is reported in one page summary of the attended lecture. No exceptions to this rule are allowed.

**Course Code**
The course "Leading and Coaching Focus Project Teams (Basic Course)" for Autumn Semester is examined together with the course "Leading and Coaching Focus Project Teams (Advanced Course)" for Spring Semester with 4 ECTS.

**Course Code**
This is the first part of a two-semester course.
### Abstract
Aim is enhancement of knowledge and competency regarding coaching skills. Participants should be coaches of focus projects. Topics:
- Overview of the role and mindset of a coach, introduction into coaching methodology, building competencies by doing and exchanging good practices from former focus projects.

### Objective
- Basic knowledge about role and mindset of a coach;
- Knowledge and reflection about the classical problems in coaching of a focus project;
- Development of personal coaching skills;
- Knowledge and know-how about coaching methods;
- Reflection and exchange of experiences about personal coaching situations;
- Inspiration and learning from good cases regarding organizational and team management aspects.

### Content
Content of both basic and advanced course (2 semester):
- Basic knowledge about role and mindset of a coach
- Introduction into coaching: definition & models
- Introduction into the coaching process
- Role of coaches between examiner and “friend”
- Knowledge and reflection about the problems in coaching a focus project
- Knowledge about team development
- Reflection about critical phases in the innovation process for an innovation team
- Know-how about reference model for analysis critical situations
- Development of personal coaching competencies, e.g. active listening, asking questions, giving feedback
- Competencies in theoretical models
- Coaching competencies: exercises and reflection

### Literature
- Slides, script and other documents will be distributed via electronically
- Access only for participants registered to this course.

### Prerequisites
Participants (Students, PhD Students, Postdocs) should be part of the coaching team of focus project teams.

### Prerequisites / notice
The course "Leading and Coaching Focus Project Teams (Basic Course)" (HS) is examined together with "Leading and Coaching Focus Project Teams (Advanced Course)" (FS) in FS with 4 ECTS.

### Table: Principles of Nonlinear Finite-Element-Methods

<td>Principles of Nonlinear Finite-Element-Methods</td>
<td>5 credits</td>
<td>20 ECTS</td>
</tr>
</tbody>
</table>

**Abstract**
Most problems in engineering are of nonlinear nature. The nonlinearities are caused basically due to the nonlinear material behavior, contact conditions and instability of structures. The principles of the nonlinear Finite-Element-Method (FEM) will be introduced in the scope of this lecture for treating such problems.

**Objective**
The goal of the lecture is to provide the students with the fundamentals of the non linear Finite Element Method (FEM). The lecture focuses on the principles of the nonlinear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Methods are simulations of:
- Crash
- Collapse of structures
- Materials in Biomechanics (soft materials)
- General forming processes

Special attention will be paid to the modeling of the nonlinear material behavior, thermo-mechanical processes and processes with large plastic deformations. The ability to independently create a virtual model which describes the complex non linear systems will be acquired through accompanying exercises. These will include the Matlab programming of important model components such as constitutive equations.

**Content**
- Fundamentals of continuum mechanics to characterize large plastic deformations
- Elasto-plastic material models
- Updated-Lagrange (UL), Euler and combined Euler-Lagrange (ALE) approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- Modeling of crack propagation
- Introduction of advanced FE-Methods

**Lecture notes**
yes

**Literature**

**Prerequisites / notice**
If we will have a large number of students, two dates for the exercises will be offered.

</tbody>
</table>

**Abstract**
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. The module provides an overview of the principles of management, teaches knowledge about management that is highly complementary to the students' technical knowledge, and provides a basis for advancing the knowledge of the various subjects offered at D-MTEC.
We develop a 'systemic' view of organizations.

This course focuses on the analysis of innovation as a pervasive process that cuts across organizational and functional boundaries. It looks at the sources of innovation, at the tools and techniques that organizations deploy to routinely innovate, and at the strategic implications of technical change.

Objective

This course is an introduction to the critical management skills involved in planning, structuring, controlling and leading an organization. It aims to enable all students to:

- understand the core concepts necessary to analyze how innovation happens
- master the most common methods and tools organizations deploy to innovate
- develop the ability to critically evaluate the innovation process, and act upon the main obstacles to innovation

Content

This course focuses on the analysis of innovation as a pervasive process that cuts across organizational and functional boundaries. It looks at the sources of innovation, at the tools and techniques that organizations deploy to routinely innovate, and the strategic implications of technical change.

Abstract

This course is an introduction to the critical management skills involved in planning, structuring, controlling and leading an organization. We develop a 'systemic' view of organizations. We look at organizations as part of an industry context, which is affected by different elements like strategy, structure, culture, tasks, people and outputs. We consider how managerial decisions are made in any one of these domains affect decisions in each of the others.

Content

Further information is available on the Tim Group Chair's website:

http://www.timgroup.ethz.ch/en/courses

and on the Moodle of the course:

https://moodle-app2.etzh.ch/course/view.php?id=2209

(The Enrollment Key to Moodle will be provided during the course)

Lecture notes

The content of the course will rely on the book:

Selected readings from the book and additional learning materials will be available on the course Moodle:

https://moodle-app2.etzh.ch/course/view.php?id=2209

Prerequisites / notice

The final exam of the present course is in written form. The final exam is requested for all types of students (BSc, MSc, MA, PhD, and Exchange students).

It is not possible to retake the exam within the same term or academic year. We strongly recommend Exchange students to take it into consideration when selecting the courses to attend.

Abstract

This course focuses on the analysis of innovation as a pervasive process that cuts across organizational and functional boundaries. It looks at the sources of innovation, at the tools and techniques that organizations deploy to routinely innovate, and the strategic implications of technical change.

Objective

This course is designed to enable all students to:

- understand the core concepts necessary to analyze how innovation happens
- master the most common methods and tools organizations deploy to innovate
- develop the ability to critically evaluate the innovation process, and act upon the main obstacles to innovation

Content

This course focuses on the analysis of innovation as a pervasive process that cuts across organizational and functional boundaries. It looks at the sources of innovation, at the tools and techniques that organizations deploy to routinely innovate, and the strategic implications of technical change.

How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, guest speakers, simulations and group work.

Lecture notes

Slides will be available on the TIMGROUP website.

Literature

Readings will be available on the TIMGROUP website.

Prerequisites / notice

No specific background in technology or innovation is required.

Abstract

The course is designed to convey a profound understanding of marketing's role in modern firms, its interactions and interfaces with other disciplines, its main instruments and recent trends. Particular attention is given to emerging marketing concepts and instruments, and the role of marketing in technology firms.
Objective

After taking the lecture, students should have knowledge on

1) The definition and role of marketing (marketing basics)
2) Creating marketing insights - understanding customer behavior
   - Theoretical concepts in customer behavior (customer behavior)
   - Analytical means to extend knowledge on customer behavior (marketing research)
   - Strategic tools to quantify customer behavior (CLV, CE)
3) Strategic marketing - translating marketing insights into actionable marketing strategies
   - Segmentation, Targeting, and Positioning
   - Attracting customers (marketing mix, 4Ps)
   - Maintaining profitable customer relations (CRM)

Content

The course is designed to convey a profound understanding of marketing's role in modern firms, its interactions and interfaces with other disciplines, its main instruments and recent trends. Particular attention is given to emerging marketing concepts and instruments, and the role of marketing in technology firms.

The lecture features a short tutorial that is held at irregularly spaced intervals throughout the semester (approximately every third week). The tutorial is embedded within the lecture and consists of short sessions of about 30 minutes. It serves to illustrate theoretical and methodological concepts from the lecture by walking students through the analysis of real-world data from the telecommunications industry. The case data will be provided so that students practice and apply the concepts of the lecture on their own. The tutorial is held jointly by two Teaching Assistants (Zhiying Cui and Jana Gross) and the professor (Prof. F. v. Wangenheim).

<td>Content</td>
<td>This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer. Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources, When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? What is the best way to protect the environment? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.</td>

Abstract
Overview of financial and managerial accounting
Accounting for current and fixed assets
Liabilities and owners equity
Recording change in balance sheet
Measuring financial performance
Managing financial reporting
Full and variable costing system
Using accounting information for decision making purposes

Objective
Understand the different procedures involved in the accounting system
Record change in financial position
Measure business income
Prepare final accounts
Understand the principles of cost accounting
Calculate the different product costs
Make decisions about the acceptance or rejection of a particular product

Content
Managerial Accounting: Balance sheet, income statement, double-entry accounting, journal and ledger, accounting for merchandising activities, value-added tax, adjustments before final accounts, provisions, depreciation, valuation,

Prerequisites / notice
This course is a prerequisite for the course Financial Management.

363-0790-00L Technology Entrepreneurship W 2 credits 2V U. Claesson, B. Clarysse
Abstract
Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

Objective
This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

Content
See course website: http://www.entrepreneurship.ethz.ch/sresources/courses/tech-entrepreneurship.html

Lecture notes
Lecture slides and case material

363-1021-00L Monetary Policy W 3 credits 2V J.E. Sturm, D. Kaufmann
Abstract
The main aim of this course is to analyse the goals of monetary policy and to review the instruments available to central banks in order to pursue these goals. It will focus on the transmission mechanisms of monetary policy and the differences between monetary policy rules and discretionary policy. It will also make connections between theoretical economic concepts and current real world issues.

Objective
This lecture will introduce the fundamentals of monetary economics and explain the working and impact of monetary policy.

Content
See course website: http://www.entrepreneurship.ethz.ch/sresources/courses/tech-entrepreneurship.html

Lecture notes
Lecture slides and case material

401-0625-01L Applied Analysis of Variance and Experimental Design W 5 credits 2V+1U L. Meier
Abstract

Objective
Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.

Content

Literature

Lecture notes
Basic knowledge in international economics and a good background in macroeconomics. The course website can be found at: https://moodle-app2.let.ethz.ch/course/view.php?id=2467

535-0546-00L Patents W 1 credit 1V A. Koept, P. Pliska
Abstract
Knowledge in the field of intellectual property, especially of patents and trademarks, with particular emphasis on pharmaceutics. Introduction into intellectual property; prosecution of patent applications; patent information; exploitation and enforcement of patents; peculiarities in pharmaceutics and medicine; social, political and ethical aspects; Trademarks.

Objective
Basic knowledge in the field of industrial property, especially of patents and trademarks, with particular emphasis on the chemical, pharmaceutical and biotech field.

Content
1. Introduction into industrial property (patents, trademarks, industrial designs);
2. Prosecution of patent applications (patentability);
3. Patent information (patent publications, databases, searches);
4. Exploitation and enforcement of patents (possibilities of exploitation, licenses, parallel imports, scope of protection, patent infringement);
5. Peculiarities in pharmaceutics and medicine (supplementary protection certificates, experimental use exemption, therapy and diagnosis, medical indication);
6. Social, political and ethical aspects (patents and prices for medicinal products, traditional knowledge and ethnomedicine, bioprospecting and biopiracy, human DNA inventions);
7. Trademarks, types of trademarks, grounds for refusal, peculiarities of pharma-trademarks.

Lecture notes
A script is available in electronic form during the lecture.

Literature

636-0507-00L Synthetic Biology II W 4 credits 4A S. Panke, Y. Benenson, J. Stelling
Abstract
7 months biological design project, during which the students are required to give presentations on advanced topics in synthetic biology (specifically genetic circuit design) and then select their own biological system to design. The system is subsequently modeled, analyzed, and experimentally implemented. Results are presented at an international student competition at the MIT (Cambridge).
Objective

The students are supposed to acquire a deep understanding of the process of biological design including model representation of a biological system, its thorough analysis, and the subsequent experimental implementation of the system and the related problems.

Content

Presentations on advanced synthetic biology topics (e.g., genetic circuit design, adaptation of systems dynamics, analytical concepts, large scale de novo DNA synthesis), project selection, modeling of selected biological system, design space exploration, sensitivity analysis, conversion into DNA sequence, (DNA synthesis external) implementation and analysis of design, summary of results in form of scientific presentation and poster, presentation of results at the iGEM international student competition (www.igem.org).

Lecture notes

Handouts during course

Prerequisites / notice

The final presentation of the project is typically at the MIT (Cambridge, US). Other competing schools include regularly Imperial College, Cambridge University, Harvard University, UC Berkeley, Princeton University, CalTech, etc.

This project takes place between end of Spring Semester and beginning of Autumn Semester. Registration in April.

Please note that the number of ECTS credits and the actual work load are disconnected.

851-0180-00L Research Ethics 2 credits 2G G. Achermann

Particularly suitable for students of D-BIOL, D-CHAB, D-HEST

Abstract

This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

Objective

The main goal of this course is to enhance the student's ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.
I. Ethics & the Process of Ethical Inquiry

- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

Integrity in Research & Research Misconduct
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 R's (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:

- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

**Stochastic Arnold Diffusion of Deterministic Systems**

During the first lectures we will review the theory of tempered distributions and their Fourier transforms. We will go in particular through the

**Fourier Analysis in Function Space Theory**

In 1964, V. Arnold constructed an example of a nearly integrable deterministic system exhibiting instabilities. In the 1970s, physicist B. Chirikov coined the term for this phenomenon "Arnold diffusion", where diffusion refers to stochastic nature of instability. One of the most famous examples of stochastic instabilities for nearly integrable systems is dynamics of asteroids in Kirkwood gaps in the Asteroid belt. They were discovered numerically by astronomer J. Wisdom. During the course we shall discuss various aspects of this phenomenon, in particular, a class of nearly integrable deterministic systems, where stochastic diffusive behaviour was proven, namely, that distributions given by deterministic evolution of certain probability measures weakly converge to a stochastic diffusion process.

401-5003-66L | Some Problems of Mathematical Fluid Dynamics | Z | 0 credits | 2V | A. Shnirelmann

Abstract

Ideal incompressible fluid is one of the most fundamental models in the continuum mechanics. The fluid flow is described by the Euler-Lagrange equations which, in spite of their apparent simplicity, are among the toughest in the whole mathematics. No wonder that the study of these equations involves many different mathematical structures, and requires a stereoscopic approach to capture the full picture. In these lectures I’ll propose various viewpoints on the fluid. Here are the topics of the lectures.

1. Analyticity properties of the flows of the ideal incompressible fluid. Complex singularities, their persistence and propagation.
3. Two-point problem for the Euler-Lagrange equations. Surjectivity of the exponential map in 2-d, and pathologies in 3-d.
5. Generalized flows and weak solutions of the Euler equations. Models of turbulent cascade.

## Number | Title | Type | ECTS | Hours | Lecturers
---|---|---|---|---|---
401-5005-66L | Random Two-Dimensional Geometries | Z | 0 credits | 2V | G. Miermont

Abstract

There have been some very important efforts in the recent years to understand certain canonical models of two-dimensional random geometries, whose inspiration came from theoretical physics in the years 80-90. These are defined either as continuum limits of discrete models (random maps) or purely continuum objects defined in terms of conformally invariant processes (Gaussian free field, SLE). In these lectures, we will review the perspective on scaling limits of random maps, discuss the various ways to encode them based on their combinatorics, and describe some of the (many) natural continuum random structures that arise from these models.

Objective

The objective is to introduce students in mathematics and physics to an area of mathematical analysis involving differential geometry which is of fundamental importance for the development of classical macroscopic continuum physics.

Content

The course shall begin with the basic structure associated to hyperbolic partial differential equations, characteristic hypersurfaces and bicharacteristics, causal structure, and the domain of dependence theorem. The course shall then focus on nonlinear systems of equations in two independent variables, in particular the Euler equations of compressible fluids with plane symmetry and the Einstein equations of general relativity with spherical symmetry.

Prerequisites / notice

Basic real analysis and differential geometry.

## Number | Title | Type | ECTS | Hours | Lecturers
---|---|---|---|---|---
401-4463-62L | Partial Differential Equations (Hyperbolic PDEs) | W | 7 credits | 4V | D. Christodoulou

Abstract

The course begins with characteristics, the definition of hyperbolicity, causal structure and the domain of dependence theorem. The course then focuses on nonlinear systems of equations in two independent variables, in particular the Euler equations of compressible fluids with plane symmetry and the Einstein equations of general relativity with spherical symmetry.

Content

The course shall begin with the basic structure associated to hyperbolic partial differential equations, characteristic hypersurfaces and bicharacteristics, causal structure, and the domain of dependence theorem. The course shall then focus on nonlinear systems of equations in two independent variables. The first topic shall be the Euler equations of compressible fluids under plane symmetry where we shall study the formation of shocks, and second topic shall be the Einstein equations of general relativity under spherical symmetry where we shall study the formation of black holes and spacetime singularities.

Prerequisites / notice

Basic real analysis and differential geometry.

## Literature

2. **Javier Duoandikoetxea**, "Fourier Analysis" AMS.
In this course we try to understand Peter Scholze's seminal paper on Perfectoid Spaces. We will cover in details (as much as time permits) the preliminary background from Huber's work on adic spaces, which provides the context for the basic constructions. Time permitting, we will also see how this theory leads to applications in p-adic etale cohomology.

The theory of perfectoid spaces provides functors, called tilting, between geometric objects in characteristic 0 and in characteristic p. In the zero dimensional case (fields) this essentially recovers a construction of Fontaine and Wintenberger that underlies p-adic Hodge theory: the absolute Galois group of an infinitely ramified p-adic field and that of the perfection of the corresponding Laurent series field (the tilded field) are canonically isomorphic. Subsequent works by Scholze have shown that perfectoid spaces are a powerful new tool across many aspects of arithmetic geometry.

**Prerequisites / notice**

**401-4145-66L** Reading Course: Abelian Varieties over Finite Fields

**W** 2 credits 4A J. Fresán, P. S. Jossen

**Abstract** In this course we try to understand Peter Scholze's seminal paper on Perfectoid Spaces. We will cover in details (as much as time permits) the preliminary background from Huber's work on adic spaces, which provides the context for the basic constructions. Time permitting, we will also see how this theory leads to applications in p-adic etale cohomology.

**Content** The theory of perfectoid spaces provides functors, called tilting, between geometric objects in characteristic 0 and in characteristic p. In the zero dimensional case (fields) this essentially recovers a construction of Fontaine and Wintenberger that underlies p-adic Hodge theory: the absolute Galois group of an infinitely ramified p-adic field and that of the perfection of the corresponding Laurent series field (the tilded field) are canonically isomorphic. Subsequent works by Scholze have shown that perfectoid spaces are a powerful new tool across many aspects of arithmetic geometry.

**401-4147-66L** Introduction to Lie Groups

**W** 8 credits 4G P. D. Nelson

**Abstract** Topological groups and Haar measure. Definition of Lie groups, examples of local fields and examples of discrete subgroups; basic properties; Lie subgroups. Lie algebras and relation with Lie groups: exponential map, adjoint representation. Semisimplicity, nilpotency, solvability, compactness: Killing form. Lie's and Engel's theorems. Definition of algebraic groups and relation with Lie groups.

**Objective** The goal is to have a broad though foundational knowledge of the theory of Lie groups and their associated Lie algebras with an emphasis on the algebraic and topological aspects of it.

**Literature**
1. A. Knapp: "Lie groups beyond an Introduction" (Birkhaeuser)
2. J. Fresán: "Understand the basic techniques of rigidity theory."
3. The goal is to have a broad though foundational knowledge of the theory of Lie groups and their associated Lie algebras with an emphasis on the algebraic and topological aspects of it.

**Prerequisites / notice**

**401-3225-00L** Topics in Rigidity Theory

**W** 6 credits 3G M. Burger

**Abstract** The aim of this course is to give detailed proofs of Margulis' normal subgroup theorem and his superrigidity theory for lattices in higher rank Lie groups.

**Objective** Understand the basic techniques of rigidity theory.

**Content** This course gives an introduction to rigidity theory, which is a set of techniques initially invented to understand the structure of a certain class of discrete subgroups of Lie groups, called lattices, and currently used in more general contexts of groups arising as isometries of non-positively curved geometries. A prominent example is the Lie group $SL(n, R)$, but it could also be achieved throughout the semester.

**Literature**
2. D. Witte-Morris: "Introduction to Arithmetic groups", available on Arxiv

**Prerequisites / notice**

**401-4531-66L** Algebraic Topology I

**W** 8 credits 4G P. S. Jossen

**Abstract** This is an introductory course in algebraic topology. The course will cover the following main topics: introduction to homotopy theory, homology and cohomology of spaces.

**Literature**

**Prerequisites / notice**

**401-3001-61L** Geometric Aspects of Hamiltonian Dynamics

**W** 6 credits 3V P. Biran

**Abstract** The course will concentrate on the geometry of the group of Hamiltonian diffeomorphisms introduced by Hofer in the early 1990's and its relations to various topics in symplectic geometry such as capacities, Lagrangian manifolds, holomorphic curves, as well as recent algebraic structures on the group of Hamiltonian diffeomorphisms such as quasi-morphisms.

**Literature**
Books:
1. L. Polterovich: "The geometry of the group of symplectic diffeomorphisms"
2. H. Hofer & E. Zehnder: "Symplectic invariants and Hamiltonian dynamics"

**Prerequisites / notice**

Some knowledge of elementary algebraic topology would be useful.
In this course we study the concept of a semigroup of bounded linear operators and we use this concept to investigate existence, uniqueness, and regularity properties of solutions of partial differential equations (PDEs) of the evolutionary type.

The course includes content (i) on semigroups of bounded linear operators, (ii) on solutions of partial differential equations (PDEs) of the evolutionary type, and (iii) on the analytic concepts used to formulate and study such semigroups and such PDEs.

Lecture notes

Lecture Notes are available in the lecture homepage (please follow the link in the Learning materials section).

Prerequisites / notice

Mandatory prerequisites: Functional analysis.

Start of lectures: Friday, September 23, 2016
For more details, please follow the link in the Learning materials section.
This course gives a comprehensive introduction into the numerical treatment of linear and non-linear elliptic boundary value problems, related eigenvalue problems and linear, parabolic evolution problems. Emphasis is on theory and the foundations of numerical methods. Practical exercises include MATLAB implementations of finite element methods.

Participants of the course should become familiar with:
- concepts underlying the discretization of elliptic and parabolic boundary value problems
- analytical techniques for investigating the convergence of numerical methods for the approximate solution of boundary value problems
- methods for the efficient solution of discrete boundary value problems
- implementational aspects of the finite element method

A selection of the following topics will be covered:
- Elliptic boundary value problems
- Galerkin discretization of linear variational problems
- The primal finite element method
- Mixed finite element methods
- Discontinuous Galerkin Methods
- Boundary element methods
- Spectral methods
- Adaptive finite element schemes
- Singularly perturbed problems
- Sparse grids
- Galerkin discretization of elliptic eigenproblems
- Non-linear elliptic boundary value problems
- Discretization of parabolic boundary value problems

Course slides will be made available to the audience.

Practical exercises based on MATLAB

Abstract

The aim of this course is to review new and fundamental mathematical tools, computational approaches, and inversion and optimal design methods used to address challenging problems in nanophotonics. The emphasis will be on analyzing plasmon resonant nanoparticles, super-focusing & super-resolution of electromagnetic waves, photonic crystals, electromagnetic cloaking, metamaterials, and metasurfaces in statistics.

The recent advances in nanoscience present great challenges for the applied and computational mathematics community. In nanophotonics, the aim is to control, manipulate, reshape, guide, and focus electromagnetic waves at nanometer length scales, beyond the resolution limit. In particular, one wants to break the resolution limit by reducing the focal spot and confine light to length scales that are significantly smaller than half the wavelength.

Interactions between the field of photonics and mathematics has led to the emergence of a multitude of new and unique solutions in which today’s conventional technologies are approaching their limits in terms of speed, capacity and accuracy. Light can be used for detection and measurement in a fast, sensitive and accurate manner, and thus photonics possesses a unique potential to revolutionize healthcare.

Light-based technologies can be used effectively for the very early detection of diseases, with non-invasive imaging techniques or point-of-care applications. They are also instrumental in the analysis of processes at the molecular level, giving a greater understanding of the origin of diseases, and hence allowing prevention along with new treatments. Photonic technologies also play a major role in addressing the needs of our ageing society, from pace-makers to synthetic bones, and from endoscopes to the micro-cameras used in in-vivo processes. Furthermore, photonics are also used in advanced lighting technology, and in improving energy efficiency and quality. By using photonic media to control waves across a wide band of wavelengths, we have an unprecedented ability to fabricate new materials with specific microstructures.

The main objective in this course is to report on the use of sophisticated mathematics in diffractive optics, plasmonics, super-resolution, photonic crystals, and metamaterials for electromagnetic invisibility and cloaking. The course merges highly nontrivial multi-mathematics in order to make a breakthrough in the field of mathematical modelling, imaging, and optimal design of optical nanodevices and nanostructures capable of light enhancement, and of the focusing and guiding of light at a subwavelength scale. We demonstrate the power of layer potential techniques in solving challenging problems in photonics, when they are combined with asymptotic analysis and the elegant theory of Gohberg and Sigal on meromorphic operator-valued functions.

In this course we shall consider both analytical and computational matters in photonics. The issues we consider lead to the investigation of fundamental problems in various branches of mathematics. These include asymptotic analysis, spectral analysis, mathematical imaging, optimal design, stochastic modelling, and analysis of wave propagation phenomena. On the other hand, deriving mathematical foundations, and new and efficient computational frameworks and tools in photonics, requires a deep understanding of the different scales in the wave propagation problem, an accurate mathematical modelling of the nanodevices, and fine analysis of complex wave propagation phenomena. An emphasis is put on mathematically analyzing plasmon resonant nanoparticles, diffractive optics, photonic crystals, super-resolution, and metamaterials.

Topics in Probability Theory

The goal of this course is to give a sample of some basic results and features to illustrate various areas of probability theory.

Advanced Topics in Computational Statistics

This lecture covers selected advanced topics in computational statistics, including various classification methods, the EM algorithm, clustering, handling missing data, and graphical modelling.

The course is roughly divided in three parts: (1) Supervised learning via (variations of) nearest neighbor methods, (2) the EM algorithm and clustering, (3) handling missing data and graphical models.

Time Series Analysis

Statistical analysis and modeling of observations in temporal order, which exhibit dependence. Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. Implementations in the software R.
Understanding of the basic models and techniques used in time series analysis and their implementation in the statistical software R. This course deals with modeling and analysis of variables which change randomly in time. Their essential feature is the dependence between successive observations.

Applications occur in geophysics, engineering, economics and finance. Topics covered: Stationarity, trend estimation, seasonal decomposition, autocorrelations, spectral and wavelet analysis, ARIMA-, GARCH- and state space models. The models and techniques are illustrated using the statistical software R.

Not available

Upon completion of the course, students are able to classify combinatorial problems and to apply adequate techniques to solve them.

This course deals with modeling and analysis of variables which change randomly in time. Their essential feature is the dependence between successive observations.

Upon completion of the course, students are able to classify combinatorial problems and to apply adequate techniques to solve them.

High-Dimensional Statistics 4 credits 2V P. L. Bühmann

“High-Dimensional Statistics” deals with modern methods and theory for statistical inference when the number of unknown parameters is of much larger order than sample size. Statistical estimation and algorithms for complex models and aspects of multiple testing will be discussed.

Lasso and Group Lasso for high-dimensional linear and generalized linear models; Additive models and many smooth univariate functions; Non-convex loss functions and l1-regularization; Stability selection, multiple testing and construction of p-values; Undirected graphical modeling

Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

Mathematical Finance 11 credits 4V+2U M. Schweizer

Advanced introduction to mathematical finance:
- absence of arbitrage and martingale measures
- option pricing and hedging
- optimal investment problems
- additional topics

Advanced level introduction to mathematical finance, presupposing knowledge in probability theory and stochastic processes.

This is an advanced level introduction to mathematical finance for students with a good background in probability. We want to give an overview of main concepts, questions and approaches, and we do this in both discrete- and continuous-time models. Topics include absence of arbitrage and martingale measures, option pricing and hedging, optimal investment problems, and probably others.

Knowledge of basic concepts in probability theory, and intermediate knowledge of statistics (e.g. a course in linear models or computational statistics).

Statistical Physics 10 credits 4V+2U G. Blatter

This lecture covers the concepts of classical and quantum statistical physics, and some aspects of kinetic gas theory and hydrodynamics. In a more advanced part degenerate Fermions, Bose-Einstein condensation, real Bose gases, magnetism, general mean field theory and critical phenomena will be addressed.

Lecture notes: available in german.

No specific book is used for the course. Relevant literature will be given in the course.

Combinatorics II 4 credits 2G N. Hungerbühler

The course Combinatorics I and II is an introduction into the field of enumerative combinatorics.

Upon completion of the course, students are able to classify combinatorial problems and to apply adequate techniques to solve them.

Contents of the lectures Combinatorics I and II: congruence transformation of the plane, symmetry groups of geometric figures, Euler's function, Cayley graphs, formal power series, permutation groups, cycles, Bunsdie's lemma, cycle index, Polya's theorems, applications to graph theory and isomers.

Monte Carlo and Quasi-Monte Carlo Methods: Mathematical and Numerical Analysis 4 credits 2S C. Schwab

Number of participants limited to 6.

Introduction and current research topics in the theory and implementation of Monte Carlo and quasi-Monte Carlo methods and applications.

Registration to the seminar will only be effective once

Student Seminar in Probability 4 credits 2S A.S. Sznitman, J. Bertoin, P. Nolin, W. Werner

Limited number of participants.

Registration to the seminar will only be effective once

Data: 06.09.2017 12:54 Autumn Semester 2016 Page 464 of 1570
The seminar is centered around a topic in probability theory which changes each semester. The student seminar in probability is held at times at the undergraduate level (typically during the spring term) and at times at the graduate level (typically during the autumn term). The themes vary each semester. The number of participants to the seminar is limited. Registration to the seminar will only be effective once confirmed by email from the organizers.

Abstract
This course gives an introduction into the fundamentals of semiconductor materials. The main focus is on state-of-the-art fabrication and characterization methods. The course will be continued in the spring term with a focus on applications.

Objective
Basic knowledge of semiconductor physics and technology. Application of this knowledge for state-of-the-art semiconductor device processing.

Content
Fundamentals of Solid State Physics: Semiconductor materials, band structures, carrier statistics in intrinsic and doped semiconductors, p-n junctions, low-dimensional structures; Bulk Material growth of Semiconductors: Czochralski method, floating zone method, high pressure synthesis; Semiconductor Epitaxy: Fundamentals, MBE, MOCVD, LPE; In situ characterization: RHEED, LEED, AES, XPS, process control (temperature, thickness)

| 402-0521-66L | Modern Aspects in Surface Science Research: Techniques and Applications | W    | 6 credits | 2V+1U  | O. Gürtü |

Abstract
The course will treat the subjects of the crystal structure of bulk and surfaces, imaging surfaces with electrons and ions, general scanning probe microscopy methods, Scanning Tunnelling Microscopy, Atomic force microscopy, Electronic structure of the bulk and surfaces, Photoelectric emission, STM and AFM spectroscopy. The various techniques will be illustrated with examples from modern research.

Objective
It is the aim of this course to provide a review of modern aspects in surface science research.

Content
Course description
The course will start with an overview of the fundamentals of bulk crystals and a reminder on the x-ray diffraction from crystals. We will continue with the extension of the alphabet of bulk crystal structure to surfaces and the nomenclature of surface reconstructions and interesting structures like moiré patterns will be introduced. Following the two introductory weeks, we will dwell in to the realm of imaging the surfaces. We will start with electron beam based imaging and analysis techniques of surfaces. Scanning Electron Microscopy (SEM), Low Energy Electron Diffraction (LEED) and Low Energy Electron Microscopy (LEEM) will be discussed. Imaging with ion beam based techniques like Low Energy Ion Scattering (LEIS) and He-ion microscopy will be touched upon. Following these, probe microscopy techniques will be explored starting with the topograpfriner and continuing with Scanning Tunnelling Microscopy (STM). Basics of Atomic Force Microscopy (AFM) will follow. Imaging is a fundamental part of efforts on understanding surfaces. Yet, a thorough understanding and capability of generating and manipulating novel surface and interface systems can only be achieved by studying the electronic structure of surfaces. In order to investigate the electronic structure of surface and interface systems, a basic knowledge of the bulk electronic structure is necessary. So, introductory concepts on the electronic structure of the bulk and low dimensional systems will be discussed. Then, the basics of photoelectron emission form surfaces will be given. In the final two weeks of the course an overview of the spectroscopic modes of scanning probes and atomic scale electron spectroscopy will be introduced.

Course contents
1) Introduction and reminder of bulk crystals (week 1):
Reminder of the crystal structure, x-ray diffraction and determination of the crystal structure.

2) Crystal surfaces (weeks 2 and 3):
Definitions, description of surfaces, and reconstructions; Moiré patterns; quasi-crystals.

3) Imaging surfaces with electrons (week 4):
SEM, LEED, LEEM

4) Imaging surfaces with ions (week 5):
LEIS, He ion microscopy

5) Introduction to probe microscopy (week 6):
General problems, field ion microscope, topografiner

6) Scanning Tunnelling Microscopy (weeks 6, 7 and 8):
Tunnelling problem (reminder), work function derivation and measurement with STM, imaging surfaces in real space, surface reconstructions, examples form metals and semiconductors and hybrid surface systems

7) Atomic force microscopy (week 9):
Technique, basics, examples.

8) Electronic structure of the bulk (week 10):
Reminders; density of states, band structure, low dimensional systems

9) Electronic structure of surfaces (week 11):
Bulk derived states, image states, examples from STM research

10) Photoelectric emission (week 12):
Basics of spectroscopy with x-rays and electrons.

11) STM and AFM derived spectroscopy techniques (weeks 13 and 14):
Comparative studies of Scanning Tunnelling spectroscopy (STS) to other integral spectroscopic methods.

Ultrafast Processes in Solids

Abstract
Ultrafast processes in solids are of fundamental interest as well as relevant for modern technological applications. The dynamics of the lattice, the electron gas as well as the spin system of a solid are discussed. The focus is on time resolved experiments which provide insight into pico- and femtosecond dynamics.

Objective
After attending this course you understand the dynamics of essential excitation processes which occur in solids and you have an overview over state of the art experimental techniques used to study fast processes.

Content
1. Experimental techniques, an overview
2. Dynamics of the electron gas
   2.1 First experiments on electron dynamics and lattice heating
   2.2 The finite lifetime of excited states
   2.3 Detection of lifetime effects
   2.4 Dynamical properties of reactions and adsorbents
3. Dynamics of the lattice
4. Dynamics of the spin system
   4.1 Laser induced ultrafast demagnetization
   4.2 Ultrafast spin currents generated by lasers
   4.3 Landau-Lifchitz-Dynamics
   4.4 Laser induced switching
5. Correlated materials

Lecture notes and slides are made available during the course, through the Moodle portal.

Prerequisites / notice
This lecture is complementary to the lecture on "ultrafast methods for solid state physics" of the spring semester. Both lectures can be attended independently. The focus of this lecture is on the physical processes whereas the focus of the "ultrafast methods for solid state physics" lecture is on the experimental techniques.

Optical Properties of Semiconductors

Abstract
This course presents a comprehensive discussion of optical processes in semiconductors.

Objective
The rich physics of the optical properties of semiconductors, as well as the advanced processing available on these material, enabled numerous applications (lasers, LEDs and solar cells) as well as the realization of new physical concepts. Systems that will be covered include quantum dots, exciton-polaritons, quantum Hall fluids and graphene-like materials.

Content
Electronic states in III-V materials and quantum structures, optical transitions, excitons and polaritons, novel two dimensional semiconductors, spin-orbit interaction and magneto-optics.

Prerequisites / notice
Prerequisites: Quantum Mechanics I, Introduction to Solid State Physics

Semiconductor Nanostructures

Abstract
The course covers the foundations of semiconductor nanostructures, e.g., materials, band structures, bandgap engineering and doping, field-effect transistors. The physics of the quantum Hall effect and of common nanostructures based on two-dimensional electron gases will be discussed, i.e., quantum point contacts, Aharonov-Bohm rings and quantum dots.

Objective
At the end of the lecture the student should understand four key phenomena of electron transport in semiconductor nanostructures:
1. The integer quantum Hall effect
2. Conductance quantization in quantum point contacts
3. the Aharonov-Bohm effect
4. Coulomb blockade in quantum dots

Content
1. Introduction and overview
2. Semiconductor crystals: Fabrication and band structures
3. k·p-theory, effective mass
4. Envelope functions and effective mass approximation, heterostructures and band engineering
5. Fabrication of semiconductor nanostructures
6. Electrostatics and quantum mechanics of semiconductor nanostructures
7. Heterostructures and two-dimensional electron gases
8. Drude Transport
9. Electron transport in quantum point contacts; Landauer-Büttiker description
10. Ballistic transport experiments
11. Interference effects in Aharonov-Bohm rings
12. Electron in a magnetic field, Shubnikov-de Haas effect
13. Integer quantum Hall effect
14. Coulomb blockade and quantum dots
The course reviews current research topics in Terahertz Science with a strong focus on scientific applications in physics, chemistry and biology, as well as the emerging field of nonlinear THz optics.

The course will focus predominantly on understanding research conducted over the last 4-5 years at the forefront of this developing field, with a strong emphasis on nonlinear THz science which has only recently become possible. This in particular has generated excitement as it offers potential new ways to control chemical reactions and/or phase transitions in materials.

Topics to be discussed in the class include:

1) Overview of THz & interactions with matter
2) THz generation and detection
3) Linear THz spectroscopies
4) Imaging
5) Nonlinear THz interactions

Script will be distributed via moodle.

The readings for the course will draw mostly on current journal articles that will be distributed in class/via moodle. There is also a general textbook listed below available electronically via the ETH library system. You can also order a black-and-white paperback via an "on-demand" system for a pretty reasonable price.

The former course title of this course is "Terahertz Technology and Applications".

<tr>
<td>Content</td>
<td>In the first part we will discuss the basic concepts of EFTs, with particular attention to the concepts of decoupling of heavy degrees of freedom, matching and renormalization, chiral Lagrangians. The Standard Model viewed as an EFT will also be discussed as a specific application. The second part of the course is devoted to Supersymmetry, starting from the discussion of the SUSY algebra and its representations, to arrive, after the presentation of the superfield formalism, to the construction of the supersymmetric version of gauge field theories. A phenomenological discussion of the mechanisms of SUSY breaking and the construction of viable supersymmetric extensions of the Standard Model will also be presented.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Topics:</td>
<td>- Introduction to Effective Field Theories - The Appelquist-Carrazone theorem - The matching procedure - Chiral Lagrangians - The SM as an EFTs - The SUSY algebra - Superspace and superfields - Supersymmetric field theories - Supersymmetric gauge theories - Supersymmetry breaking - The Minimal supersymmetric Standard Model</td>

Experimental part:
* Introductory material:
  - reminders of detectors/accelerators
  - reminders of statistics: likelihoods, hypothesis testing
  - reminders of multivariate techniques: Neural Networks, Decision Trees
* Main topics:
  - pre-history (pre-LEP)
  - LEP1: measurements at the Z-pole
  - LEP2: towards the limit \( mh<114 \text{ GeV} \)
  - TeVatron searches
  - LHC:
    -- main channels overview
    -- dissect or analysis
    -- combine information from all channels
    -- differential measurements
    -- off-shell measurements
  - Future:
    -- pseudo-observables / EFT

Abstract
This lecture covers advanced topics in ultra-fast time resolved molecular spectroscopy and kinetics. Although primarily theoretical, and focused on quantum phenomena, contents include the discussion of certain modern experimental techniques.

Objective
Goals are: acquisition of the basic knowledge in modern, ultra-fast Spectroscopy and chemical kinetics and of some knowledge of theoretical methods currently used to interpret experimental data; exercise the interpretation of computational results related to molecular quantum dynamics on selected examples and discussion of the problems involved.

Content
The lecture is intended to be a brief introduction to essential aspects regarding quantum dynamics, in particular regarding molecular physics and the primary steps of chemical reactions. It proposes also an introduction to the methods and computational algorithms used in the theoretical treatment of molecular quantum dynamics, in particular of short time propagation of wave packets. A practical course in handling computer programs specifically devised for quantum dynamics is offered.

Lecture notes
A program and handouts can be downloaded from the indicated web site or will be delivered in the first session. Handouts are in English. 
A program of the lecture as well as lecture notes in English containing a detailed literature list will be distributed before the 1st session. These documents contain a detailed list of specific publications. The short literature list given below is helpful in assisting the lecture. The website http://mctdh.uni-hd.de/ offers a view on a widely used computer program. 

Literature

Prerequisites / notice
A solid knowledge in quantum mechanics is helpful, but not a condition to assist the lecture.

376-1791-00L Introductory Course in Neuroscience I (University of Zurich) W 2 credits 2V J.M. Frütschly, W. Knecht

Abstract
The course gives an introduction to human and comparative neuroanatomy, molecular, cellular and systems neuroscience.

Objective
The course gives an introduction to human and comparative neuroanatomy, molecular, cellular and systems neuroscience.

Content
1) Human Neuroanatomy I&II
2) Comparative Neuroanatomy
3) Development I&II
4) Membran and Action Potential
5) Synaptic Transmission & Plasticity I&II
6) Glia and Blood-Brain-BARRIER
7) Somatosensory and Motor System
8) Visual System
9) Auditory System
10) Circuits underlying Emotion
11) Modeling of Neural Circuits

376-1795-00L Advanced Course in Neurobiology I (Functional Anatomy of the Rodent Brain) (University of Zurich) W 2 credits 2V J.M. Frütschly, H. U. Zeilhofer

Abstract
The goal of this Advanced Course in Neurobiology is to provide students with a broader knowledge in several important areas of neurobiology. The course consists of four parts: Part I deals with various topics in developmental neurobiology. Part II is devoted to aspects of signal transduction. Part III focuses on synaptic transmission. Part IV gives deeper insights into systems neuroscience.

Objective
This credit point course is designed for doctoral students who have successfully completed the Introductory Course in Neuroscience at the Neuroscience Center Zürich. The goal is to provide students with a broader and deeper knowledge in several important areas of neurobiology.

402-0620-00L Current Topics in Accelerator Mass Spectrometry and Their Applications 0 credits 1S M. Christl, S. Willett

Abstract
The seminar is aimed at all students who, during their studies, are confronted with age determination methods based on long-living radionuclides found in nature. Basic methodology, the latest developments, and special examples from a wide range of applications will be discussed.

402-0846-66L The BFKL Equation Reloaded and the Multi-Regge Kinematics in QCD and in N=4 SYM W 1 credit 2G V. Del Duca

Abstract
The goal of the course is to help the audience to keep abreast of the strong advances there have been in the study of the high energy limit of scattering amplitudes in the last decade.

Objective
The goal of the course is to help the audience to keep abreast of the strong advances there have been in the study of the high energy limit of scattering amplitudes in the last decade.

Content
- the BFKL Hamiltonian as an integrable model
- the analytic structure of the Mueller-Navelet jet cross sections in QCD
- the analytic properties of N=4 SYM amplitudes in multi-Regge kinematics

Prerequisites / notice
For doctoral students of the Neuroscience Center Zurich (ZNZ).

402-0848-66L Follow-up of the block course "An Introduction to the Perturbative Pomeron and to the BFKL Equation in QCD and in N=4 SYM"

<td>Rhizosphere Ecology</td>
<td>W</td>
<td>4 credits</td>
<td>4G</td>
<td>H. A.Gamper, T. I. McLaren</td>
</tr>
<tr>
<td><strong>Abstract</strong></td>
<td>This course is about the physical, chemical, and biological processes in the rhizosphere and their effect on plant growth. Effects of fertilisers, companion plants, and microbial symbionts, and other microbes on nutrient cycling and plant uptake are discussed. An “intercropping” experiment in the glasshouse is used as a model to check for rhizosphere effects on plant growth and mineral nutrition.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>To gain a holistic understanding of resource-driven and regulatory processes in agricultural and natural ecosystems. Develop skills on the critical analysis of scientific papers. Define explanatory hypotheses, identify knowledge gaps for further investigations. Carry out a multi-disciplinary experiment that involves aspects of soil, (micro-)biology, plant physiology, pathology, and ecology. Develop manual skills in the set up of a glasshouse experiment, in soil and plant analyses, and in isolation and DNA-based characterisation of rhizobia. Gain insights on basic methods to analyse (bio-)chemical, molecular genetic, and graphical data. Discuss and interpret data in the context of the literature. Prepare a research report in the format of a scientific paper and a poster in the format of a conference paper, partially alone and partially in small groups, using data obtained from the glasshouse experiment.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>This course is designed to stimulate thinking and promote critical analysis of important processes that occur in the rhizosphere. As part of this course, the knowledge acquired will be used for analysing and interpreting experimental data, as well as, preparing a scientific report and conference-type poster. The course will cover the relative importance of spatial scales and various physicochemical and microbiological dynamics as influenced by roots. We will discuss root traits and activities that influence the immediately root-surrounding soil and thereby contribute to mineral nutrient mobilization and immobilization. An overview of the most relevant root-microbe symbioses for agroecosystems will be provided and root and microbial traits discussed, which could be of use in efforts towards utilization of intercropping and bioinoculants as a possible means of reducing energetically expensive inputs to farming systems. A special emphasis will be given to the importance of physicochemical features of soils and the chemical forms (= species) of elements important for plant uptake. Practical experience will be gained with setting up a glasshouse experiment, soil and root sampling, basic soil and plant analyses, isolation of rhizobia, determination of the number of colony forming units (CFU), assays to screen for phosphorus and zinc solubilizing bacteria, DNA extraction, PCR amplification, and restriction fragment length polymorphism analysis (RFLP) of host range determining symbiosis-specific genes.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

Abstract
The colloquium introduces students to the disciplines in plant sciences and provides integrated knowledge from the molecular level to ecosystems and from basic research to applications, making use of the synergies between the different research groups of the PSC. The colloquium offers a unique chance to approach interdisciplinary topics as a challenge in the field of plant sciences.

Objective
Major objectives of the colloquium are:
- introduction of graduate students and Master students to the broad field of plant sciences
- promotion of an interdisciplinary and integrative teaching program
- promotion of active participation and independent work of students
- promotion of presentation and discussion skills
- increased interaction among students and professors

Prerequisites / notice
We ask all course attendees of the agricultural sciences to have passed the exams at the end of the lectures Plant Nutrition I and II (Nutrient cycling in agroecosystems) by Prof. E. Frossard. All others, have to have successfully worked through the e-learning module Plant Nutrition I by Prof. E. Frossard. All others, have to have successfully worked through the e-learning module Plant Nutrition I by Prof. E. Frossard.

https://moodle-app2.let.ethz.ch/course/view.php?id=279

Remark: The course is designed to be complementary to those on Radioisotopes in Plant Nutrition (751-3405-00L), and Nutrient Fluxes in Plant Nutrition I by Prof. E. Frossard:

#### Abstract
Aerosols I deals with basic physical and chemical properties of aerosol particles. The importance of aerosols in the atmosphere and in other fields is discussed.

#### Objective
Knowledge of basic physical and chemical properties of aerosol particles and their importance in the atmosphere and in other fields.

#### Content
- Description and properties of aerosol particles
- Aerosol production
- Physical and chemical characterization
- Aerosol dynamics (diffusion, coagulation...)
- Optical properties (light scattering, absorption, extinction)
- Aerosol production, physical and chemical characterization.

#### Literature

#### Prerequisites / notice
- Knowledge of basic physical and chemical properties of aerosol particles and their importance in the atmosphere and in other fields is discussed.

Abstract
The purpose of this course is to provide fundamental background on the role of land surface processes (vegetation, soil moisture dynamics, land energy and water balances) for the climate system. The course consists of 2 contact hours per week, including 2 computer exercises.

Objective
The students can understand the role of land processes and associated feedbacks for the climate system.

Lecture notes
Powerpoint slides will be made available

Prerequisites / notice
Prerequisites: Introductory lectures in atmospheric and climate science

Abstract
The lecture will introduce the student to the thematics of solar ultraviolet radiation and its effects on the atmosphere and the biosphere. The lecture will cover the modeling and the measurement of solar ultraviolet radiation. The instruments used for solar radiation measurements will also be introduced.

Objective
The lecture should enable the student to understand the specific problematics related to solar ultraviolet radiation and its interaction with the atmosphere and the biosphere.
1) Einführung in die Problematik  Motivation
   - Begriffe (UV-C, UV-B, UV-A,...)
   - Einfluss der UV Strahlung auf Biosphäre (Mensch, Tier, Pflanzen)
   - Positive und schädliche Effekte
   - Wirkungsspektrum, Konzept, Beispiele
   - UVIndex

2) Geschichtlicher Rückblick
   - Rayleigh - Himmelsblau
   - 1907: Dorno, PMOD
   - 1970: Bener, PMOD
   - 1980: Berger, Erythemal sunburn meter
   - 1990+: State of the Art

3) Extraterrestrische UV Strahlung
   - Spektrum
   - Energieverteilung
   - Variabilität (Spektral, zeitlich, relativ zu Totalstrahlung)
   - Satellitenmessungen, Übersicht

4) Einfluss der Atmosphäre auf die solare UV Strahlung
   - Atmosphärenaufbau
   - Beinflussende Parameter (Ozon, Wolken, ...)
   - Geschichte: Ozondepletion, Polare Ozonlücke und Einfluss auf die UV Strahlung
   - Wolken
   - Aerosole
   - Rayleighstreuung
   - Trends (Ozon, Wolken, Aerosole)
   - Radiation Amplification Factor (RAF)

5-6) Strahlungstransfer
   - Strahlungsstrahlengleichung
   - Modellierung, DISORT
   - libRadtran, TUV, FASTRT
   - Parameter
   - Sensitivitätsstudien
   - Vergleiche mit Messungen
   - 3-D Modellierung (MYSTIC)
   - Beer-Lambert Gesetz

7) Strahlungsmessungen
   - Instrumente zur Strahlungsmessung
   - Messgrössen: Irradiance (global, direct, diffus), radiance, aktinischer Fluss
   - Horizontale und geneigte Flächen
   - Generelle Problematik: Freiluftmessungen...
   - Qualitätssicherung

8) Solare UV Strahlungsmessungen
   - Problematic: Dynamik, Spektrale Variabilität, Alterung
   - Stabilität
   - Spezifische Instrumente: Filterradiometer, Spektroradiometer, Dosimetrie
   - Übersicht Aufbau und Verwendung

9-10) Solare UV Strahlungsmessgeräte
   - Spektroradiometer, Filterradiometer (Breit und schmalbandig)
   - Charakterisierung
   - Kalibriermethoden (Im Labor, im Feld)
   - Qualitätssicherung, Messkampagnen

11-12) Auswerteverfahren
   - Atmosphärische Parameter aus Strahlungsmessungen
   - Ozon, SO2
   - Albedo (Effektiv versus Lokal)
   - Aerosol Parameter (AOD, SSA, g, Teilchenverteilungen)
   - Zusammenspiel Messungen - Modellierung
   - Aktinische UV-Strahlungsfrequenzen und Bestimmung von atmosphärischen Photolysefrequenzen

13) UV Klimatologie
   - Trends
   - UV Klimatologie durch Messnetze
   - UV Klimatologie durch Satellitenmessungen am Beispiel von TOMS
   - Modellierung am Beispiel Meteosat-JRC
   - UV Rekonstruktionen

14) Aktuelle Forschungen
   - Internationale Projekte, Stand der Forschung

---

701-1233-00L Stratospheric Chemistry

**Abstract**
Thermodynamical and kinetic basics: bi- and termolecular reactions, photo-dissociation. Chemical family concept. Chapman chemistry. Radical reactions of oxygen species with nitric oxide, active halogens and odd hydrogen. Ozone depletion cycles. Methane depletion and ozone production in the lower stratosphere. Heterogeneous chemistry on background aerosol. Chemistry and dynamics of the ozone hole. The lecture gives an overview on the manifold reactions which occur in the gas phase, in stratospheric aerosol droplets and in polar cloud particles. The focus is on the chemistry of stratospheric ozone and its influence through natural and anthropogenic effects. Especially the intercontinental air traffic and the ozone depletion caused by FCKW CFC in the mid-latitude and the polar regions as well as coupling with the greenhouse effect.

**Objective**
The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. Natural handouts will be provided for every chapter.

Prerequisites / notice: Prerequisites: Basics in physical chemistry are required and an overview equivalent to the bachelor course in atmospheric chemistry (lecture 701-0471-01) is expected.

701-1211-01L Master's Seminar: Atmosphere and Climate 1 W 3 credits 2S H. Joos, O. Stebler, F. Tummon, M. A. Wüst

Abstract: In this seminar, the process of writing a scientific proposal will be introduced. The essential elements of a proposal, including the peer review process, will be outlined and class exercises will train scientific writing skills. Knowledge exchange between class participants is promoted through the preparation of a master thesis proposal and evaluation of each other's work.

Objective: Training scientific writing skills.

Content: In this seminar, the process of writing a scientific proposal will be introduced. The essential elements of a proposal, including the peer review process, will be outlined and class exercises will train scientific writing skills. Knowledge exchange between class participants is promoted through the preparation of a master thesis proposal and evaluation of each other's work.

651-4095-01L Colloquium Atmosphere and Climate 1 W 1 credit 1K H. Joos, C. Schär, D. N. Bresch, N. Gruber, R. Knutti, U. Lohmann, T. Peter, S. Seneviratne, H. Wernli, M. Wild

Abstract: The colloquium is a series of scientific talks by prominent invited speakers assembling interested students and researchers from around Zürich. Students take part of the scientific discussions.

Objective: The students are exposed to different atmospheric science topics and learn how to take part in scientific discussions.

### Literature

### Prerequisites / notice

Students should have a basic knowledge of biogeochemical processes (BSc course on Biogeochemical processes in aquatic systems or equivalent).

Content
(i) Definition, importance and biogeochemical classification of trace elements. (ii) Key biogeochemical processes controlling the cycling of different trace elements (base metals, redox-sensitive and chalcophile elements, volatile trace elements) in natural and engineered environments. (iii) Abiotic and biotic processes that determine the environmental fate and impact of selected trace elements.

Lecture notes
Selected handouts (lecture notes, literature, exercises) will be distributed during the course.

Prerequisites / notice
Students are expected to be familiar with the basic concepts of aquatic and soil chemistry covered in the respective classes at the bachelor level (soil mineralogy, soil organic matter, acid-base and redox reactions, complexation and sorption reactions, precipitation/dissolution reactions, thermodynamics, kinetics, carbonate buffer system).
This lecture is a prerequisite for attending the laboratory course "Trace elements laboratory".

701-1346-00L Carbon Mitigation W 3 credits 2G N. Gruber
Abstract
Future climate change can only kept within reasonable bounds when CO2 emissions are drastically reduced. In this course, we will discuss a portfolio of options involving the alteration of natural carbon sinks and carbon sequestration. The course includes introductory lectures, presentations from guest speakers from industry and the public sector, and final presentations by the students.
Objective
The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences.
Content
From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.

Lecture notes
None

Literature
Will be identified based on the chosen topic.

Prerequisites / notice
Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion.

Data: 06.09.2017 12:54 Autumn Semester 2016 Page 480 of 1570
Lecture notes Material will be handed out in the course.

Prerequisites / notice Two afternoons are held in the class. The lab work will be done from the students according to their timetable, but has to be finished after 3 weeks. Effort is roughly 1-2 days per week, depending on the skills of the student.

701-1676-01L Landscape Genetics Number of participants limited to 14.

Prerequisites: good knowledge in population genetics and experience in using GIS is required.

Abstract This six-day winter school aims at teaching advanced Master students, PhD students and postdocs on landscape genetics. It provides both theoretical background as well as hands-on exercises on major topics of contemporary landscape genetics and landscape genomics such as landscape effects on gene flow and adaptive genetic variation in a landscape context.

Objective Landscape genetics is an evolving scientific field of both basic and applied interest. Researchers as well as conservation managers make increasing use of landscape genetic thinking and methods. Landscape genetics builds on concepts and methods from landscape ecology and population genetics. This winter school introduces advanced students to major concepts and methods of landscape genetics and genomics, i.e. (i) the study of landscape effects on dispersal and gene flow and (ii) the study of the interactions between the environment and adaptive genetic variation. The winter school focuses on currently used methods and hands-on exercises. It is specifically aimed at the needs of advanced students (Master, PhD and postdocs).

Content Themes:
(1) Genetic data: estimates of gene flow; genetic distances; assignment tests and parentage analysis.
(2) Landscape data: landscape resistance and least cost paths; transects.
(3) Landscape genetic analysis of gene flow: partial Mantel tests and causal modeling; multiple regression on distance matrices and mixed effects models.
(4) Networks and graph theory.
(5) Landscape genomics: adaptive genetic variation; outlier detection; environmental association.
(6) Overlays: Bayesian clustering; barrier detection; kriging.

Lecture notes Hand-outs will be distributed.

Literature The course requires 4 hours of preparatory reading of selected papers on landscape genetics. These papers will be distributed by e-mail.

Prerequisites / notice Grading will be according to a short written report (4 pages) on one of the themes of the course (workload: about 8 hours) and according to student contributions during the course.

Prerequisites: students should have basic knowledge in population genetics, GIS and R.

551-0737-00L Experimental Ecology: Evolution and Ecology W 2 credits S. Bonhoeffer

Abstract Interaction seminar. Student-mediated presentations, guests and discussions on current themes in ecology, evolutionary and population biology.

Objective Getting familiar with scientific arguments and discussions. Overview of current research topics. Making contacts with fellow students in other groups.

Content Scientific talks and discussions on changing subjects.

Lecture notes None

Literature None

Prerequisites / notice For information and details: http://www.eco.ethz.ch/news/zis or contact: Lehre-eve@env.ethz.ch

Human-Environment Systems

Number Title Type ECTS Hours Lecturers

701-1651-00L Environmental Governance W 3 credits 2G E. Lieberherr, G. de Buren, R. Schweizer

Abstract The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

Objective To understand how an environmental policy problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

Content Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors’ behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of ‘environmental governance’ and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Lecture notes Lecture slides and additional course material will be provided throughout the semester.

Literature We will mostly work with readings from the following books:

Data: 06.09.2017 12:54 Autumn Semester 2016 Page 481 of 1570
A detailed course schedule will be made available at the beginning of the semester.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy).

**Abstract**

Technological change plays a crucial role in efforts to create a more sustainable future. In this context, policy decision makers must design rules that minimize its risks and maximize its benefits for society at large. The course discusses this challenge from an interdisciplinary perspective taking into account legal, economic, historical, development and environmental aspects.

**Objective**

- to recognize the challenges and opportunities of technological change in terms of sustainable development
- to become familiar with policy instruments to promote innovation
- to improve understanding of political decision-making processes in the regulation of science & technology
- improved understanding of the role of science and technology in the context of human and societal development

**Content**

Science and Technology Policy is normally associated with the improvement of national competitiveness; yet, it is also an integral part of effective environmental and development policies. The course will discuss the challenges and opportunities of technological change in terms of sustainable development and show how public policy on the national and the international level is responding to this change.

In this context, students are to become familiar with the basic principles of political economy and New Growth Theory and how such theories help explain political decisions as well as political outcomes in the area of Science, Technology and Innovation. State interventions are either designed to regulate (e.g. environmental regulations, anti-trust law) or facilitate (e.g. intellectual property rights protection, public investment in R&D and technical education, technology transfer) technological change. This will be illustrated by looking at different industries and different national systems of innovation. Subsequently the positive and negative consequences for society and the natural environment will be discussed from a short-term and a long-term perspective.

**Lecture notes**

Reader with issue-specific articles. E-version is partly available under https://www.ethz.ch/content/specialinterest/gess/cis/international-relations/en/teaching/materials/tech.html

The 2-hour course (5-7 p.m.) will be held as a series of lectures. The course materials will be available in form of an electronic Reader at the beginning of the semester. The class will be taught in English.

Students will be asked to give a (a) presentation (15 Minutes) or write a review paper based on a article selected from the electronic script, and (b) they will have to pass a written test at the end of the course in order to obtain 3 credit points in the ECTS System. In the final mark (a) will have a weight of 40% and (b) 60%.

Prerequisites / notice

The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines.

Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.
Objective

At the end of the course students should:

Know:
- Function, purpose and algorithm of a selected number of transdisciplinary methods

Understand:
- Functional application in case studies and other problem oriented projects

Be able to reflect on:
- Potential, limits, and necessity of transdisciplinary methods

Be prepared for:
- Transdisciplinary Case Study 2017

Content

The lecture is structured as follows:

- Overview of concepts and methods of inter-/transdisciplinary integration of knowledge, values and interests (approx. 20%)
- Analysis of a selected number of transdisciplinary methods focusing problem framing, problem analysis, and impact (approx. 50%)
- Practical application of the methods in a broader project setting (approx. 30%)

Lecture notes

Handouts are provided by the lecturers

Literature

Selected scientific articles and book-chapters

Prerequisites / notice

This course is recommended and helpful for students participating in the Transdisciplinary Case Study 2017.

701-1551-00L Sustainability Assessment W 3 credits 2G P. Krütli, C. E. Pohl

Abstract

The course deals with the concepts and methodologies for the analysis and assessment of sustainable development. A special focus is given to the social dimension and to social justice as a guiding principle of sustainability as well as to trade-offs between the three dimensions of sustainability.

Objective

At the end of the course students should

Know:
- core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

Content

The course is structured as follows:

- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;
- Trade-offs in selected examples.

Lecture notes

Handouts.

Literature

Selected scientific articles & book chapters

Forest and Landscape Management

701-1615-00L Advanced Forest Pathology W 3 credits 2G T. N. Sieber

Abstract

In-depth understanding of concepts, insight into current research and experience with methods of Forest Pathology based on selected pathosystems.

Objective

To know current biological and ecological research on selected diseases, to be able to comment on it and to understand the methods.
To understand the dynamics of selected pathosystems and disturbance processes.
To be able to diagnose tree diseases and injuries.
To know forest protection strategies and to be able to comment on them.

Content

Stress and disease, virulence and resistance, disease diagnosis and damage assessment, tree disease epidemiology, disease management, ecosystem pathology.
Systems (examples): Air pollution and trees, endophytic fungi, mycorrhiza, wood decay, conifer- root rot, Phytophthora diseases, chestnut canker and its hypoviruses, urban trees, complex diseases, emerging diseases

Lecture notes

no script, the ppt-presentations and specific articles will be made available among others:

Prerequisites / notice

The course is composed of introductory lectures, practical work, discussions and reading. The participants should have basic knowledge in forest pathology (corresponding to the course 701-0563-00 "Wald- und Baumkrankheiten, see teaching book of H. Butin: Tree diseases and disorders, Oxford University Press 1995, 252 pp.).

701-1631-00L Foundations of Ecosystem Management W 5 credits 3G J. Ghazoul, C. Garcia

Abstract

This course introduces the broad variety of conflicts that arise in projects focusing on sustainable management of natural resources. It explores case studies of ecosystem management approaches and considers their practicability, their achievements and possible barriers to their uptake.

Objective

Students should be able to
a) propose appropriate and realistic solutions to ecosystem management problems that integrate ecological, economic and social dimensions across relevant temporal and spatial scales.
b) identify important stakeholders, their needs and interests, and the main conflicts that exist among them in the context of land and resource management.
Traditional management systems focus on extraction of natural resources, and their manipulation and governance. However, traditional management has frequently resulted in catastrophic failures such as, for example, the collapse of fish stocks and biodiversity loss. These failures have stimulated the development of alternative ecosystem management approaches that emphasise the functionality of human-dominated systems. Inherent to such approaches are system-wide perspectives and a focus on ecological processes and services, multiple spatial and temporal scales, as well as the need to incorporate diverse stakeholder interests and decision making. Thus, ecosystem management is the science and practice of managing natural resources, biodiversity and ecological processes, to meet multiple demands of society. It can be local, regional or global in scope, and addresses critical issues in developed and developing countries relating to economic and environmental security and sustainability.

This course provides an introduction to ecosystem management, and in particular the importance of integrating ecology into management systems to meet multiple societal demands. The course explores the extent to which human-managed terrestrial systems depend on underlying ecological processes, and the consequences of degradation of these processes for human welfare and environmental well-being. Building upon a theoretical foundation, the course will tackle issues in resource ecology and management, notably forests, agriculture and wild resources within the broader context of sustainability, biodiversity conservation and poverty alleviation or economic development. Case studies from tropical and temperate regions will be used to explore these issues. Dealing with ecological and economic uncertainty, and how this affects decision making, will be discussed. Strategies for conservation and management of terrestrial ecosystems will give consideration to landscape ecology, protected area systems, and community management, paying particular attention to alternative livelihood options and marketing strategies of common pool resources.

To analyze the evolution as well as the key elements of environmental governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of ‘environmental governance’ and how legitimate and effective are these approaches in addressing persistent environmental challenges?

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)
Stable Isotope Ecology of Terrestrial Ecosystems  ■  W  2 credits  2G  R. A. Werner, N. Buchmann, A. Gessler

Abstract
This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and water 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions. Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.

Content
The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

Literature
Will be discussed in class.

Prerequisites / notice
This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

102-0675-00L Earth Observation  W  4 credits  3G  I. Hajnsek, E. Baltsavias

Abstract
The aim of the course is to provide the fundamental knowledge about earth observation sensors, techniques and methods for bio/geophysical environmental parameter estimation.

Objective
The aim of the course is to provide the fundamental knowledge about earth observation sensors, techniques and methods for bio/geophysical environmental parameter estimation. Students should know at the end of the course:
1. Basics of measurement principle
2. Fundamentals of image acquisition
3. Basics of the sensor-specific geometries
4. Sensor-specific determination of environmental parameters

Content
Die Lehrveranstaltung gibt einen Einblick in die heutige Erdbefrachtung mit dem folgenden skizzierten Inhalt:
1. Einführung in die Fernerkundung von Luft- und Weltraum gestützten Systemen
2. Einführung in das Elektromagnetische Spektrum
3. Einführung in optische Systeme (optisch und hyperspektoral)
4. Einführung in Mikrowellen-Technik (aktiv und passiv)
5. Einführung in atmosphärische Systeme (meteo und chemisch)
6. Einführung in die Techniken und Methoden zur Bestimmung von Umweltparametern
7. Einführung in die Anwendungen zur Bestimmung von Umweltparametern in der Hydrologie, Glaziologie, Forst und Landwirtschaft, Geologie und Topographie

Lecture notes
Folien zu jeden Vorlesungsblock werden zur Verfügung gestellt.

Lecture notes
Ausgewählte Literatur wird am Anfang der Vorlesung vorgestellt.

701-1681-00L Element Balancing and Soil Functions in Managed Ecosystems  W  3 credits  2G  A. Keller

Abstract
Applying element balances of agricultural soils and the assessment of soil functions for real applications in computer exercises to design preventive strategies against soil pollution and to support sustainable management of regional agroecosystems also in the context of spatial planning procedures.

Objective
The students learn to critically assess changes in land use management on element cycles in agro-ecosystems and to assess soil services (soil functions). You design solutions for chemical problems in soil protection at the regional scale and learn to assess soil functions using different methods.

Content
The students apply a regional balance model for Swiss regions in computer exercises and assess major soil functions of agricultural soils. You assess the sustainability of current land use and analyse management options improving nutrient and metal cycling in agro-ecosystems. The students will have the opportunity to calculate specific scenarios regarding land use management and environmental changes. Special focus we placed on the soil services such as regulation-, production function and soil as habitat, and the assessment of these functions based on soil mapping data.

Lecture notes
Literature and Exercises for a case study

Lecture notes
Literature will be provided.

Prerequisites / notice
The course consists of lectures and computer exercises. The course take place every 2 weeks à 4 hours. recommended prerequisites for attending this course:
- Bodenschutz und Landnutzung
- Biochemistry of Trace Elements
- Angewandte Bodenökologie

701-1776-00L Geographic Data Processing with Python and ArcGIS  W  1 credit  2U  A. Baltenweiler

Abstract
The course communicates the basics of the programming language Python and gives a general introduction into the geoprocessing framework of ArcGIS. In addition various Python libraries (numyp, Scipy, GDAL, statsmodels, pandas) will be introduced which increase the functional range of the geoprocessing framework substantially.

Objective
The students learn the basics of geographic data processing based on the programming language Python and ArcGIS (arcpy). They get the ability to implement their own processing sequences and models for geoprocessing. The students are able to integrate open source libraries in their python scripts and know how the libraries are applied to spatial datasets.

Content
The course communicates a deepened understanding of the geoprocessing frameworks arcpy and covers basic language concepts of Python such as datatypes, control structures and functions. In addition the application of popular Python libraries in combination with spatial datasets will be shown.

Lecture notes
Lecture notes, exercises and worked out solutions to them will be provided.

Lecture notes

Prerequisites / notice
The course will be taught in German. All material will be provided in English. Knowledge of ArcGIS is assumed.

701-1682-00L Dendroecology  W  3 credits  3G  C. Bigler, A. Rigling, K. Treydte

Abstract
The course dendroecology offers theoretical and practical aspects of dendrochronology. The impact of different environmental influences on tree-ring characteristics will be shown. The students learn various methods to date tree rings and they understand how ecological and environmental processes and patterns can be reconstructed using tree rings.
The students...
- understand, how wood is configured and how tree-ring structures are formed.
- are able to identify and describe different tree-ring structures.
- understand the theoretical and practical aspects of the dating of tree rings.
- know the effects of different abiotic and biotic environmental influences (climate, site, competition, insects, fire, physical-mechanical influences) on trees and tree rings.
- discover a tool for understanding and reconstructing global change processes.
- learn software to date, standardize and analyze tree rings.
- get hands-on experience based on the demonstration of wood (increment cores, stem discs, wedges), sampling in the field, and measuring and dating of tree rings in the tree-ring lab.
- solve R-based exercises (R tutorial will be provided) and answer questions in Moodle.
- work out an independent research question related to a dendroecological topic and write a short literature review based on scientific papers.

- Overview and history of dendrochronology
- Principles of dendrochronology
- Evolution of tree rings
- Formation and structure of wood and tree rings
- Intra-seasonal tree-ring growth
- Continuous and discontinuous tree-ring characteristics
- Sampling and measuring
- Crossdating methods (visual, skeleton plots, quantitative)
- Standardization of tree-ring series
- Development of tree-ring chronologies
- Dendrogeomorphology, dendrohydrolgy, dendroglaciology
- Stable isotopes
- Climate, climate-growth relationships, climate reconstructions
- Age and size structures, forest dynamics (regeneration, growth, competition, mortality)
- Disturbance ecology (fire, insects, blowdown)
- Application of tree-ring research in practice and in interdisciplinary research projects
- Field and lab day (date for one entire day or two half days will be searched together with the students in the beginning of the semester): discussion of different dendroecological questions in the forest; sampling of trees; insight into different tree-ring projects in the lab (Swiss Federal Institute for Forest, Snow and Landscape Research WSL)

Lecture notes
Lecture notes (in English) will be handed out in the class.

The lecture notes and further documents (papers, software) can also be downloaded from Moodle (https://moodle-app2.let.ethz.ch) following registration for the course.

Literature
Literature lists will be handed out in the class.

Time schedule (total of 90 hours): There will be 12 lectures with each two hours (total of 24 hours presence) as well as a field and lab day (8 hours presence). In addition, the students are expected to put 18 hours into the preparation of the lectures as well as 18 hours for the exercises. 4 hours are reserved for the lab work and 18 hours for the project.

The class language is German and English, on request English only.

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 487 of 1570
The CCES Winter School provides insights into theoretical and methodological foundations on the challenges of knowledge exchange and dialogue between science and practice. It offers media and knowledge management training for enhancing stakeholder involvement. Selected case examples support group work discussions and analysis. Real stakeholder meetings are organized for testing techniques in view of identifying diverse expectations and needs and working towards solutions. Together the Winter School participants and stakeholders experience and develop ways for better linking environmental science and practice.

The course is structured by an intimate interconnection between theoretical inputs, reflection and translation into own topics and projects. The course offers insights into a wide spectrum of crossing boundaries between science and practice (e.g. information, consultation, co-production of knowledge) and provides test fields for and room for reflection of own experiences.

The first block with inputs, individual and group work, and reflection is a preparation for the second block, which focuses on implementation of stakeholder interactions. Between the two blocks coached project work is offered.

The CCES Winter School takes place at Propstei Wislikofen in January and February 2017. Accommodation is provided.

Course materials (e.g. slides, articles, toolboxes) are provided for preparatory reading and during the course (in Moodle).

Collection of key literature in online reader in Moodle.

The specific texts selected for discussion will vary, but examples include:

- Jared Diamond (2005) Collapse
- Leopold (1949) A Sand County Almanach
- Carson (1962) Silent Spring
- Jared Diamond (2005) Collapse

Discussions might also encompass films or other forms of media and communication about nature.

**701-0017-00L EAWAG PhD Skills Seminar**

**W 2 credits 2S J. Jokela, J. Hering**

**Abstract**

Purpose is to discuss and teach the professional skills that are needed in science (or future career in science). Course consists of lectures and practical sessions. Course is organized by Eawag scientists.

**Objective**

Purpose is to discuss and teach the professional skills that are needed in science (or future career in science). Course consists of lectures and practical sessions.

**Content**

Lectures and exercises in:
- Project management
- Application of research grants
- Scientific publishing
- Reviewing
- Writing papers
- Applying jobs
- Job interviews

**701-0763-00L Basic Concepts of Management**

**W 2 credits 2V R. Schwarzenbach**

**Abstract**

This course deals with fundamental and proven management concepts. The lecturers emphasize the practical applicability of concepts. The course was designed in close cooperation with practitioners; e.g. Mr. S. Baldenweg, mechanical engineer ETH, MBA Insead, share his experience in several guest lectures.

**Objective**

Students:

- will be familiar with basic general management concepts.
- learn about the fundamental concepts of strategy development with practical examples.
- will get to know the basic organisational issues and the essential types of organisations.
- get a rough overview on the concepts of financial management.
- will learn about the strategic positioning of small departments within larger organisations.
- will learn about the fundamental mechanisms for handling change, and will be able to recognise these situations.
- will learn the basic principles of project management and of successful self-management.
- will reflect on customer oriented information representation.

**Content**

Die finanzielle Abbildung von Organisationen und Projekten wird übersichtsweise dargestellt und die stufengerechte Darstellung von Informationen anhand von realen Beispielen besprochen.

Die Inhalte werden durchgängig mit Praxisbeispielen illustriert.

**Lecture notes**

Skripten werden elektronisch zur Verfügung gestellt.

**Literature**

**Prerequisites / notice**

Deutsch

**851-0180-00L Research Ethics**

**W 2 credits 2G G. Achermann**

Particularly suitable for students of D-BIOL, D-CHAB, D-HEST

**Abstract**

This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

**Objective**

The main goal of this course is to enhance the student’s ability to:

- recognize and identify ethical issues and conflicts.
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.

**Prerequisites / notice**

Deutsch
I. Ethics & the Process of Ethical Inquiry
---------------------------------------
Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)
----------------------------------------------------------
Integrity in Research & Research Misconduct
- What is “integrity” in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 R's (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks;
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

|                 | Objective                      |      |       |        | Voltage, current and properties of basic elements of electric circuits, i.e. capacitors, resistors and inductors should be understood in relation to electric and magnetic fields. Furthermore, the students should be able to mathematically describe, analyze and finally design technical realizations of circuit elements. Students should also be familiar with the calculation of voltage and current distributions of DC circuits. The effect and the mathematical formulation of magnetic induction should be known for technical applications. The fundamentals of complex AC current calculus for description of periodic sinusoidal quantities should be known and students should be able to apply the concept to basic AC circuits. |

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 492 of 1570
Abstract
The course covers the fundamental concepts of computer programming with a focus on systematic algorithmic problem solving. Taught language is C++. No programming experience is required.

Objective
Primary educational objective is to learn programming with C++. When successfully attended the course, students have a good command of the mechanisms to construct a program. They know the fundamental control and data structures and understand how an algorithmic problem is mapped to a computer program. They have an idea of what happens "behind the scenes" when a program is translated and executed.
Secondary goals are an algorithmic computational thinking, understanding the possibilities and limits of programming and to impart the way of thinking of a computer scientist.

Content
The course covers fundamental data types, expressions and statements, (Limits of) computer arithmetic, control statements, functions, arrays, structural types and pointers. The part on object orientiation deals with classes, inheritance and polymorphy, simple dynamic data types are introduced as examples.
In general, the concepts provided in the course are motivated and illustrated with algorithms and applications.

Lecture notes
A script written in English will be provided during the semester. The script and slides will be made available for download on the course web page.

Literature
Bjarne Stroustrup: Einführung in die Programmierung mit C++, Pearson Studium, 2010

Prerequisites / notice
From AS 2013, an admission to the exam does not any more formally require an attending of the recitation sessions. Handing in solutions to the weekly exercise sheets is thus not mandatory, but we strongly recommend it.

Examination is a one hour-long written test.

Abstract
Digital and analogue signals and their representation. Combinational and sequential circuits and systems, boolean algebra, K-maps. Finite state machines. Memory and computing building blocks in CMOS technology, programmable logic circuits.

Objective
Deepen and extend the knowledge from lecture and exercises, usage of design software Quartus II as well as an oscilloscope

Content
The contents of the digital circuits laboratory will deepen and extend the knowledge of the correspondent lecture and exercises. With the help of the logic device design software Quartus II different circuits will be designed and then tested on an evaluation board. You will build up the control for a 7-digit display as well as an adder and you will create different types of latches and flip-flops. At the end of the laboratory a small synthesizer will be programmed that is able to play self-created melodies. At the same time the usage of a modern oscilloscope will be taught in order to analyse the programmed circuits through the digital and analogue inputs.

Bachelor Studies (Programme Regulations 2012)

Abstract
In this lecture we treat problems in applied analysis. The focus lies on the simplest cases of three fundamental types of partial differential equations of second order: the Laplace equation, the heat equation and the wave equation.

Content
1.) Klassifizierung von PDE's
   - linear, quasilinear, nicht-linear
   - elliptisch, parabolisch, hyperbolisch

2.) Quasilineare PDE
   - Methode der Charakteristiken (Beispiele)

3.) Elliptische PDE
   - Bsp: Laplace-Gleichung
   - Harmonische Funktionen, Maximumsprinzip, Mittelwerts-Formel.
   - Methode der Variablenseparation.

4.) Parabolische PDE
   - Bsp: Wärmeleitungsgleichung
   - Bsp: Inverse Wärmeleitungsgleichung
   - Methode der Variablenseparation

5.) Hyperbolische PDE
   - Bsp: Wellengleichung
   - Formel von d'Alembert in (1+1)-Dimensionen
   - Methode der Variablenseparation

6.) Green'sche Funktionen
   - Rechnen mit der Dirac-Deltafunktion
   - Idee der Green'schen Funktionen (Beispiele)

7.) Ausblick auf numerische Methoden
   - 5-Punkt-Diskretisierung des Laplace-Operators (Beispiele)

https://people.math.ethz.ch/~felder/PG/

Prerequisites / notice
Prerequisites: Analysis I and II, Fourier series (Komplexe Analysis)
Signals and Systems I

Objective
Introduction to mathematical signal processing and system theory.

Content

Prerequisites / notice
Prerequisites: Physics I.
Modern, transistor-based electronics has transformed our lives and plays a crucial role in our economy since the 2nd half of last century.

The main objective of this course in electronic circuits is to introduce the concept of active device, including operational amplifiers, and their use in amplification, signal conditioning, switching and filtering to students. In addition to gaining experience with typical electronic circuits that are found in common applications, including their own Groupenarbeit and Fachpraktikum projects, students sharpen their understanding of linear circuits based on nonlinear devices, imperfections of electronic circuits and the concept of design (as opposed to analysis). The course is a prerequisite for higher semester subjects such as analog integrated circuits, RF circuits for wireless communications, A/D and D/A converters and optoelectronics.

### Examination Block 3

The courses of the examination block 3 will be offered in spring semester.

Internship in Industry
Please note the conditions for Internships in industry as set forward by the "Guidelines for the "Laboratory Courses - Projects - Seminars ", see https://www.ee.ethz.ch/content/dam/ethz/special-interest/let/department/Studies/Bachelor/Regulations/Richtlinien_Praktika-Projekte-Seminare_v5_final.pdf (German only).

### Internship in Industry

**Number:** 227-0093-10L  
**Title:** Internship in Industry  
**Type:** W  
**ECTS:** 6 credits  
**Hours:** external organisers

**Abstract**  
The main objective of the 12-week internship is to expose bachelor's students to the industrial work environment. During this period, students have the opportunity to be involved in on-going projects at the host institution.

**Objective**  
Please note the conditions for Internships in industry as set forward by the "Guidelines for the "Laboratory Courses - Projects - Seminars ", see https://www.ee.ethz.ch/content/dam/ethz/special-interest/let/department/Studies/Bachelor/Regulations/Richtlinien_Praktika-Projekte-Seminare_v5_final.pdf (German only).

### Additional Subjects

**Number:** 227-0651-00L  
**Title:** Applied Circuit and PCB-Design

**Abstract**  
Participants learn how to design a predefined electronic circuit and how to lay out the pertaining circuit board. CAE and CAD activities for design and simulation are carried out with the aid of Altium Designer.

**Objective**  
The goal is to become acquainted with all those practical aspects of electronic circuit and PCB design by working through a modest but complete application example. This involves analysis of specifications, the evaluation of electronic parts, efficient testing and failure search, electromagnetic compatibility (EMC), the usage of industrial CAE/CAD tools for circuit simulation and PCB layout, generating production data for the board manufacturer, board mounting, testing and start up.

**Content**
- Understanding circuit, system, and product specifications
- Guidelines, standards, and regulations
- Design and development flow
- Introduction to the Altium Designer environment
- Selection of components and circuit sizing
- Preparing schematic symbols and footprints for CAE/CAD
- Working with database component libraries
- Logically structured schematic circuit diagrams
- Capturing a predefined circuit
- Definition of net classes and layout rules in schematics
- Design for EMC
- Checking schematic data
- Simulation of mixed signal circuits using Spice
- Hints for improved testing and debugging
- Component placement on the PCB
- Turning circuit diagrams into a workable layout
- Manual and automatic interconnect routing
- Definition of layout rules
- RF- and EMC-guidelines for circuit wire routing
- Differential pairs and impedance-controlled routing
- Introduction to PCB manufacturing
- Preparation of production and assembly data
- PCB and device assembly (component mounting)
- Final circuit testing and start up

**Literature**  
All necessary documents will be available as electronic documents (PDF).

**Prerequisites / notice**  
- The course is recommended to all students who plan to design an electronic circuit or a PCB in an upcoming term project or as part of their master thesis. Attending this course during the term before will ensure they are optimally prepared and will allow them to fully focus on their project.
- The number of participants is limited.
- For their own students and staff, the Department of Information Technology and Electrical Engineering provides electronic components and consumables free of charge. All other participants have to bear a 200 CHF fee for those items.

### Third Year Core Courses

**Can be freely combined, a list of recommendations is available under www.ee.ethz.ch/bachelor-kernfaecher**

**Number:** 227-0101-00L  
**Title:** Discrete-Time and Statistical Signal Processing

**Abstract**  
The course introduces some fundamental topics of digital signal processing with a bias towards applications in communications: discrete-time linear filters, equalization, DFT, discrete-time stochastic processes, elements of detection theory and estimation theory, LMMSE estimation and LMMSE filtering, LMS algorithm, Viterbi algorithm.

**Objective**  
The course introduces some fundamental topics of digital signal processing with a bias towards applications in communications. The two main themes are linearity and probability. In the first part of the course, we deepen our understanding of discrete-time linear filters. In the second part of the course, we review the basics of probability theory and discrete-time stochastic processes. We then discuss some basic concepts of detection theory and estimation theory, as well as some practical methods including LMMSE estimation and LMMSE filtering, the LMS algorithm, and the Viterbi algorithm. A recurrent theme throughout the course is the stable and robust "inversion" of a linear filter.
1. Discrete-time linear systems and filters:
state-space realizations, z-transform and spectrum,
decimation and interpolation, digital filter design,
stable realizations and robust inversion.

2. The discrete Fourier transform and its use for digital filtering.

3. The statistical perspective:
probability, random variables, discrete-time stochastic processes;
detection and estimation: MAP, ML, Bayesian MMSE, LMMSE;
Wiener filter, LMS adaptive filter, Viterbi algorithm.

Lecture notes

227-0102-00L Discrete Event Systems W 6 credits 4G L. Thiele, L. Vanbever, R. Wattenhofer

Abstract
Introduction to discrete event systems. We start out by studying popular models of discrete event systems. In the second part of the course
we analyze discrete event systems from an average-case and from a worst-case perspective. Topics include: Automata and Languages,

Objective
Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the
proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans.
The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a
keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study
processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new
modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by studying popular models of discrete event
systems, such as automata and Petri nets. In the second part of the course we analyze discrete event systems. We first examine discrete
event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply Markov chains and
queueing theory for an understanding of the typical behavior of a system. In the last part of the course we analyze discrete event systems
from a worst-case perspective using the theory of online algorithms and adversarial queueing.

Content
1. Introduction
2. Automata and Languages
3. Smarter Automata
4. Specification Models
5. Stochastic Discrete Event Systems
6. Worst-Case Event Systems
7. Network Calculus

[sipser] Introduction to the Theory of Computation
Michael Sipser

227-0103-00L Control Systems W 6 credits 2V+2U F. Dörfler

Abstract
Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of
control systems for single input - single output and multivariable systems.

Objective
Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of
control systems for single input - single output and multivariable systems.

Content
Process automation, concept of control. Modelling of dynamical systems - examples, state space description, linearisation,
analytical/numerical solution. Laplace transform, system response for first and second order systems - effect of additional poles and zeros.
Closed-loop control - idea of feedback, PID control, Ziegler - Nichols tuning. Stability, Routh-Hurwitz criterion, root locus, frequency
response, Bode diagram, Bode gain/phase relationship, controller design via "loop shaping", Nyquist criterion. Feedforward compensation,
cascade control. Multivariable systems (transfer matrix, state space representation), multi-loop control, problem of coupling, Relative Gain
Array, decoupling, sensitivity to model uncertainty. State space representation (modal description, controllability, control canonical form,
observer canonical form), state feedback, pole placement - choice of poles. Observer, observability, duality, separation principle. LQ
Regulator, optimal state estimation.
High-Speed Signal Propagation

As clock frequencies rise in the GHz domain, there is a need to grasp signal propagation to maintain good signal integrity in the face of symbol interference and cross-talk.

Understanding of high-speed signal propagation in interconnects, microwave cables and integrated transmission lines such as microwave integrated circuits and/or printed circuit boards.

As system clock frequencies continuously rise in the GHz domain, a need urgently develops to understand high-speed signal propagation in order to maintain good signal integrity in the face of phenomena such as inter-symbol interference (ISI) and cross-talk.

Concepts such as Scattering parameters (or S-parameters) are key to the characterization of networks over wide bandwidths. At high frequencies, all structures effectively become "transmission lines." Unless care is taken, it is highly probable that one ends up with a bad transmission line that causes the designed system to malfunction.

Filters will also be considered because it turns out that some of the problems associated by lossy transmission channels (lines, cables, etc) can be corrected by adequate filtering in a process called "equalization."

Exercises will be held in German, but assistants also speak English.

Power Electronics

Fields of application of power electronic systems. Principle of operation of basic pulse-width modulated and line-commutated power electronic converters. Analysis of the operating behavior and of the control-oriented behavior, converter design. Reduction of effects of line-commutated rectifiers on the mains, electromagnetic compatibility.

Lecture notes

Lecture notes and associated exercises including correct answers, simulation program for interactive self-learning including visualization/animation features.

Prerequisites / notice

Prerequisites: Basic knowledge of electric circuit analysis and signal theory.

Communication Systems

Information Theory, Signal Space Analysis, Baseband Transmission, Passband Transmission, Example und Channel, Data Link Layer, MAC, Example Layer 2, Layer 3, Internet

Introduction into the fundamentals of digital communication systems. Selected examples on the application of the fundamental principles in existing and upcoming communication systems

Covered are the lower three layer of the OSI reference model: the physical, the data link, and the network layer. The basic terms of information theory are introduced. After this, we focus on the methods for the point-to-point communication, which may be addressed elegantly and coherently in the signal space. Methods for error detection and correction as well as protocols for the retransmission of perturbed data will be covered. Also the medium access for systems with shared medium will be discussed. Finally, algorithms for routing and flow control will be treated.

The application of the basic methods will be extensively explained using existing and future wireless and wired systems.

Prerequisites / notice

Prerequisites: Signal and Systems Theory II.

**Abstract**
- **Introduction to electric power systems and transformer and power line models.**

**Objective**
- At the end of the course, the student will be able to:
  - **Structure of electric power systems, transformer and power line models.**
  - **Analysis of and power flow calculation in basic systems.**
  - **Symmetrical and unsymmetrical three-phase systems.**
  - **Transient current and voltage processes.**
  - **Technology of electric power systems.**

**Content**
- **Components and describe what they are needed for.**
- **Apply models for transformers and lines.**
- **Explain the technology of overhead power lines.**
- **Calculate stationary power flows.**
- **Current and voltage transients.**
- **Other basic parameters in simple power systems.**

**Literature**

**Prerequisites / notice**
- **Recommended background:**
  - Undergraduate physics, mathematics, semiconductor devices

**Lecture notes**
- Lecture script in English, exercises and sample solutions, translation of important vocabulary; english-german.
Content

L1. Bioelectronics history, its applications and overview of the field
   - Volta and Galvani dispute
   - BMI, pacemaker, cochlear implant, retinal implant, limb replacement devices
   - Fundamentals of biosensing
   - Glucometer and ELISA

L2. Fundamentals of quantum and classical noise in measuring biological signals

L3. Biomeasurement techniques with photons

L4. Acoustics sensors
   - Differential equation for quartz crystal resonance
   - Acoustic sensors and their applications

L5. Engineering principles of optical probes for measuring and manipulating molecular and cellular processes

L6. Optical biosensors
   - Differential equation for optical waveguides
   - Optical sensors and their applications
   - Plasmonic sensing

L7. Basic notions of molecular adsorption and electron transfer
   - Quantum mechanics: Schrödinger equation energy levels from H atom to crystals, energy bands
   - Electron transfer: Marcus theory, Gerischer theory

L8. Potentiometric sensors
   - Fundamentals of the electrochemical cell at equilibrium (Nernst equation)
   - Principles of operation of ion-selective electrodes

L9. Amperometric sensors and bioelectric potentials
   - Fundamentals of the electrochemical cell with an applied overpotential to generate a faraday current
   - Principles of operation of amperometric sensors
   - Ion flow through a membrane (Fick equation, Nernst equation, Donnan equilibrium, Goldman equation)

L10. Channels, amplification, signal gating, and patch clamp Y4

L11. Action potentials and impulse propagation

L12. Functional electric stimulation and recording
   - MEA and CMOS based recording
   - Applying potential in liquid - simulation of fields and relevance to electric stimulation

L13. Neural networks memory and learning

Literature
Plonsey and Barr, Bioelectricity: A Quantitative Approach (Third edition)

Prerequisites / notice
Supervised exercises solving real-world problems. Some Matlab based exercises in groups.

Electives
This is but a short selection. Other courses from the ETH course catalogue may be chosen. Please consult the "Richtlinien zu Projekten, Praktika, Seminaren" (German only), published on our website (http://www.ee.ethz.ch/pps-richtlinien).

Economics, Law and Management Electives
These subjects are particularly suitable for students planning to apply to the Master's Degree Program in Energy Science and Technology (MSc EST) or Management, Technology and Economics (MSc MTEC).

Abstract
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. The module provides an overview of the principles of management, teaches knowledge about management that is highly complementary to the students' technical knowledge, and provides a basis for advancing the knowledge of the various subjects offered at D-MTEC.

Objective
Discovering Management combines in an innovate format a set of lectures and an advanced business game. The learning model for Discovering Management involves 'learning by doing'. The objective is to introduce the students to the relevant topics of the management literature and give them a good introduction in entrepreneurship topics too. The course is a series of lectures on the topics of strategy, innovation, corporate finance, leadership, design thinking and corporate responsibility. While the 14 different lectures provide the theoretical and conceptual foundations, the experiential learning outcomes result from the interactive business game. The purpose of the business game is to analyse the innovative needs of a large multinational company and develop a business case for the company to grow. This business case is as relevant to someone exploring innovation within an organisation as it is if you are planning to start your own business. By discovering the key aspects of entrepreneurial management, the purpose of the course is to advance students' understanding of factors driving innovation, entrepreneurship, and company success.

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 501 of 1570
Content

Managerial Economics aims to broaden the students' understanding of the principles of business management, emphasizing the interdependence of various topics in the development and management of a firm. The lectures introduce students not only to topics relevant for managing large corporations, but also touch upon the different aspects of starting up your own venture. The lectures will be presented by the respective area specialists at D-MTEC.

The course broadens the view and understanding of technology by linking it with its commercial applications and with society. The lectures are designed to introduce students to topics related to strategy, corporate innovation, leadership, corporate and entrepreneurial finance, value chain analysis, corporate social responsibility, and business model innovation. Practical examples from industry experts will stimulate the students to critically assess these issues. Creative skills will be trained by the business game exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of Chief Innovation Officer of a large multinational company. As they learn more about the specific case and identify the challenge they are faced with, the students will have to develop an innovative business case for this multinational corporation. Doing so, this exercise will provide an insight into the context of managerial problem-solving and corporate innovation, and enhance the students' appreciation for the complex tasks companies and managers deal with. The business game presents a realistic model of a company and provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyse the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities.

Prerequisites / notice

Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Business Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich.

No prior knowledge of business or economics is required to successfully complete this course.

363-0305-00L Empirical Methods in Management W 3 credits 2G A. Scherer

Objective

- Ability to formulate research questions and designing an appropriate study
- Ability to collect and analyze data using a variety of methods
- Ability to critically assess the quality of empirical research in management
- Applied knowledge of empirical methods through out-of-class assignments

Content

1) Introduction to empirical management research
2) Research designs: exploratory, descriptive, experimental
3) Measurement and scaling
4) Data collection and sampling
5) Data analysis methods
6) Reporting and presenting empirical research

Prerequisites / notice

Assignments and projects: This course includes out-of-class assignments and projects to give students some hands-on experience in conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Students will have at least one week to work on each assignment. Students are expected to work on these assignments individually. Duplicate answers will receive no credit and will be subject to a disciplinary review. Assignments will be graded and need to be turned-in on time.

Class participation: Class participation is encouraged and can greatly improve students' learning in this class. In this spirit, students are expected to attend class regularly and come to class prepared.

363-0503-00L Principles of Microeconomics W 3 credits 2G M. Filippini

Objective

The learning objectives of the course are:

1) Students must be able to discuss basic principles, problems and approaches in microeconomics.
2) Students can analyse and explain simple economic principles in a market using supply and demand graphs.
3) Students can contrast different market structures and describe firm and consumer behaviour.
4) Students can identify market failures such as externalities related to market activities and illustrate how these affect the economy as a whole.
5) Students can apply simple mathematical treatment of some basic concepts and can solve utility maximization and cost minimization problems.

Lecture notes

Lecture notes, exercises and reference material can be downloaded from Moodle.

Literature

The book can also be used for the course 'Principles of Macroeconomics' (Sturm)

For students taking only the course 'Principles of Microeconomics' there is a shorter version of the same book:

Complementary:

363-0511-00L Managerial Economics W 4 credits 3V S. Rausch, V. Hoffmann

Not for MSc students belonging to D-MTEC!

Objective

The objective of the course is to provide undergraduate and graduate students in MAVT with an understanding of the use of economic concepts for firm-level management decisions. The course covers a number of models and methods of analysis which are commonly employed in business decisions. The course covers the economic theory of choice, models of oligopoly and industrial organization, applications of game theory to contract design and agency theory, and the theory of decision making under uncertainty focusing specifically on long-term investment decisions. The course will include three lectures by Professor Volker Hoffman focusing on related case-studies in management.

Literature

Microökonomie (Pearson Studium - Economic VWL) Gebundene Ausgabe, August 2013, Robert S. Pindyck, Dr. Daniel L. Rubinfeld.

The course acquaints students who have previous not studied economics to economic concepts and quantitative methods which can be used to solve management decision problems.

851-0703-00L Introduction to Law W 2 credits 2V O. Streitf Göppf

Students who have attended or will attend the lecture "Introduction to Law for Civil Engineering and Architecture or "Introduction to Law" (851-0708-00), cannot register for this course unit.

Abstract

This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered.
The Role of Intellectual Property in Daily Routine: A Comprehensive Introduction

Students are able to identify basic structures of the legal system. They understand selected topics of public and private law and are able to apply the fundamentals in more advanced law classes.

Content
Basic concepts of law, sources of law.
Private law: Contract law (particularly contract for work and services), tort law, property law.
Public law: Human rights, administrative law, procurement law, procedural law.
Insights into the law of the EU and into criminal law.

Lecture notes
Jaap Hage, Bram Akkermans (Eds.), Introduction to Law, Cham 2014 (Online Resource ETH Library)

Literature
Further documents will be available online (see https://moodle-app2.let.ethz.ch/course/view.php?id=2170).

Chemical Engineering Electives

Objective
Students are introduced to the basics of micromachining and silicon process technology and will learn about the fabrication of microsystems and -devices by a sequence of defined processing steps (process flow).

Content
- Introduction to microsystems technology (MST) and micro electro mechanical systems (MEMS)
- Basic silicon technologies: Thermal oxidation, photolithography and etching, diffusion and ion implantation, thin film deposition.
- Specific microsystems technologies: Bulk and surface micromachining, dry and wet etching, isotropic and anisotropic etching, beam and membrane formation, wafer bonding, thin film mechanical and thermal properties, piezoelectric and piezoresistive materials.
- Selected microsystems: Mechanical sensors and actuators, microresonators, thermal sensors and actuators, system integration and encapsulation.

Lecture notes
Outlines (available online)
Understanding of physical and technical principles in biomechanics, biomaterials, tissue engineering, medical imaging as well as the history of biomedical engineering.

**Abstract**
Introduction to biomechanics, biomaterials, tissue engineering, medical imaging as well as the history of biomedical engineering. Mathematical description and problem solving.

**Content**
- Tissue and Cellular Biomechanics
- Molecular and Cell Biology
- Computer-Aided Design
- Composite Materials
- Medical Imaging

**Lecture notes**
- Stored on ILIAS.

**Literature**

Additional third year core courses may be credited as electives.

**Abstract**
The lecture covers the following main topics: Social perception and interpersonal judgement; attitudes; group dynamics and group performance; leadership behavior and leadership styles.

**Objective**
The aim of the lecture is to impart a well-founded scientific understanding of social influence processes in individuals, groups, organizations, and social settings.

**Content**
- Im Einzelnen sollen die Teilnehmerinnen und Teilnehmer lernen:
  - an den Beispielen von Kaufverhalten oder ökologischem Verhalten zu beschreiben, wie Normen und Einstellungen Einfluss auf das Verhalten nehmen,
  - Die Subjektivität und die Fehlerquellen sozialer Wahrnehmung verstehen,
  - Prinzipien der Psychologie der Kommunikation zu nutzen für eine Verbesserung der Kommunikation in Studium und Beruf,
  - Merkmale und Strukturen von Gruppen zu identifizieren und mit geeigneten Methoden zu analysieren,
  - Die Grundlagen von Konformität und Gehorsam gegenüber Autoritäten zu erkennen,
  - Gruppenphänomene wie soziales Faulenzen, Risiko- und Konservatismus-Schub und Gruppenenden entgegenzuwirken,
  - Gruppenleistungen und -entscheidungen zu optimieren,
  - Führungssstile zu unterscheiden lernen,
  - Techniken zur Moderation von interagierenden Gruppen kennen zu lernen.

**Abstract**
Various studies are used to introduce basic sociological concepts, theories and empirical research methods, along with selected sociological topics. The goal of the course is to provide participants with an understanding of working practice in empirical sociology and the central findings of sociological studies.

**Objective**
To learn about methods of empirical social research and key results of classic and modern sociological studies.

**Content**
Soziologie befasst sich mit den Regelmäßigkeiten sozialer Handlungen und ihrer gesellschaftlichen Folgen. Sie richtet ihren Blick auf die Beschreibung und Erklärung neuer gesellschaftlicher Entwicklungen und erfasst diese mit empirischen Forschungsmethoden.

**Folgende Themen werden behandelt:**

3. Der Beitrag der Sozialtheorie. Darstellung und Diskussion ausgewählter Studien zu einzelnen Themenbereichen, z.B.: (1) Die Entstehung sozialer Kooperation, (2) Reputation und Märkte, (3) Soziale Netzwerke u.a.m.

**Ergänzende Gruppenarbeiten (nicht verpflichtend).** Im Rahmen des MTU-Programms des ITET und Programmen anderer Departemente können Semestertreffen in Soziologie (Durchführung einer kleinen empirischen Studie, Konstruktion eines Simulationsmodells sozialer Prozesse oder Diskussion einer vorliegenden soziologischen Untersuchung) angefertigt werden. Kreditpunkte (in der Regel 6 bis 12) für "kleine" oder "grosse" Semestertreffen werden nach den Regeln des Departements, das Semestergruppenarbeiten ermöglicht, vergeben.

**Lecture notes**
Folien der Vorlesung und weitere Materialien (Fachartikel, Kopien aus Büchern) werden auf der Webseite der Vorlesung zum Download zur Verfügung gestellt.

**Literature**
Folien der Vorlesung und weitere Materialien (Fachartikel, Kopien aus Büchern) werden auf der Webseite der Vorlesung zum Download zur Verfügung gestellt.

**Prerequisites / notice**
Interesse am Thema und Bereitschaft zum Mitdenken.
Abstract
The course explains main principles of air transport in general and elaborates on simple interdisciplinary topics. Since working on broad topics like aerodynamics, manufacturers, airport operation, business aviation, business models etc. the students get a good overview in air Transportation.

Objective
Understand and explain basics, principles and contexts in the broader air transport industry. Lay the foundation of working in or with the air transport industry. Ideal foundation for Aviation II - Management of Air Transport

Content
Weekly: 1h independent preparation; 2h lectures and 1h training with an expert in the respective field
Concept: This course will be taught as Aviation I. A subsequent course is under evaluation.

Content: Transport as part of the overall transportation scheme; Aerodynamics; Aircraft (A/C) Designs & Structures; A/C Operations; Law Enforcement; Maintenance & Manufacturers; Airport Operations & Planning; Customs & Security; ATC & Airspace; Air Freight; General Aviation; Business Jet Operations; Business models within Airline Industry; Military Operations.

Technical visit: This course includes a guided tour at Zurich Airport (baggage sorting system, apron, ATC Tower).

Examination: written, 60 min, open books (Examination in German; Answers may be given in English)

Lecture notes
Slides are provided prior to each class

Literature
We will also use English papers

Prerequisites / notice
We will also use English papers

Number of participants limited to 20.
The successful participation in EW1 ("Human Learning") and EW2 ("Designing Learning Environments for School") is recommended, but not a mandatory prerequisite.

Abstract
In this class, students will learn concepts and skills for coping with psychosocial demands of teaching.

Objective
Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

1. They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).
2. They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions).

Abstract
Didactical methods in mechanical and electrical engineering.

Objective
- The students can plan, conduct and critically reflect single lessons.
- They orient themselves towards the academic goals and take into account existing knowledge, the professional environment and the ambitions of the students.
- They can apply the basic teaching principles meaningfully in their subject and suitably structure the learning phases.
- They can reduce and present complex technical content such that it is in a form suitable for the students to learn.
- They have considered examples of the common conceptual errors encountered by students

Content
- Didactic analysis
- Competences and goals
- Preparation and wrap-up of lessons
- Process and structure of a typical lesson
- Teaching techniques (informative introduction to lessons, Advance Organizer, learning assignments, frontal teaching, questions, assignments, feedback)
- Assignments and short tests
- Media and language competence
- Conceptual change, misconceptions,
- Integration of the subcomponents of a lesson.

Literature

Prerequisites / notice
Voraussetzung: Erziehungswissenschaftliche Lehrveranstaltung schon absolviert oder gleichzeitig.
Prerequisites: successful completion of FD I and FD II.

Abstract
In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

Objective
The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Content
Gemäss aktualisierter Ablaufplanung mit Mentor und Betreuer.

The objective is for the students:
- (Mini-)Leitprogramm
- Gelenktes Entdeckendes Lernen
- Puzzle
- Werkstatt
- Projektarbeit

Zu diesen Themen sind die vorhandenen Manuals aus den IfV zu verwenden, bzw. wo nötig zu adaptieren.

Teaching Internship Including Examination Lessons

M. Thaler

227-0859-00L
Teaching Internship Including Examination Lessons
Electrical Engineering and Information Technology

Only for students who enrolled before HS 2011 into TC.

The teaching internship can only be visited if all other courses of TC have been completed.

Repetition of the teaching internship is no possible, also if the examination lessons have to be repeated.

Abstract
Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Objective
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content
Die Studierenden sammeln Erfahrungen in der Unterrichtsführung, der Auseinandersetzung mit Lernenden, der Klassenbetreuung und der Teaching Internship Including Examination Lessons

Die Themen für die beiden Prüfungslektionen am Schluss des Praktikums erfahren die Studierenden in der Regel eine Woche vor dem Prüfungstermin. Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie bis am Vortag um 12 Uhr den beiden Prüfungsexperten (Fachdidaktiker/-in, Departementsvertreter/-in) ein. Die gehaltenen Lektionen werden kriteriumsbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltenen Lektionen im Rahmen eines kurzen Kolloquiums.

Lecture notes

Dokument: schriftliche Vorbereitung für Prüfungslektionen.

Content

Gemäss aktualisierter Ablaufplanung mit Mentor und Betreuer.

Das Fachgebiet richtet sich nach dem aktuellen Unterrichtsprogramm des betreuenden FH/BMS-Dozenten, und seinem Auftrag zum geleiteten Selbststudium.

Auszugehen ist vom verwendeten Skript / Lehrbuch Zu erarbeiten ist die dazugehörende eLearning-Umgebung (Tests, Repetitionsfragen, Uebungsaufgaben, Arbeitsprogramme, etc.).

Die anzuwendende eLearning-Plattform richtet sich nach den lokalen Usanzen der FH / BMS.

Andernfalls ist eine einfach handhabbare, lizenzfreie Plattform in Absprache mit dem Betreuer festzulegen.

Der abzuliefernde Bericht hat sich an die Richtlinien der vorhandenen Manuals aus den IfV zu halten. Er ist in zwei Teilen zu erstellen, für Studenten/(Benützer), und für den Dozenten/(Entwickler) getrennt.

Typisch soll die Arbeit 3 - 4 Unterrichtseinheiten à 45 Minuten abdecken (bei Einzelarbeit), bei Arbeit zu zweit mindestens 6 solche Einheiten.

Die Einsatzezeile ist wenn möglich durch Erprobung, zu überprüfen. Die aus der Erprobung resultierenden Korrekturen sind eingearbeitet.

Lecture notes

Eine kurze Anleitung zur mentorierten Arbeit in Fachdidaktik wird zur Verfügung gestellt.

Literature

K. Frey, Allgemeine Didaktik, FH-Skript bzw. Lehrbuch des Praktikumslehrers.

Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

Prerequisites / notice

Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

ECTS

European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
This second course in our VLSI series is concerned with how to turn digital circuit netlists into safe, testable and manufacturable mask

A. Lapidoth
Part I - Linear Signal Representation and Approximation: Hilbert spaces, least squares and LMMSE estimation, projection and estimation

A. Wittneben
VLSI II: Design of Very Large Scale Integration

Know how to design digital VLSI circuits that are safe, testable, durable, and make economic sense.

4G
Fundamentals in signal processing, detection/estimation, and machine learning.

Signal and Information Processing: Modeling, Filtering, Learning

H. A. Loeliger
Information Theory I

The second course begins with a thorough discussion of various technical aspects at the circuit and layout level before moving on to economic issues of VLSI. Topics include:

- The difficulties of finding fabrication defects in large VLSI chips.
- How to make integrated circuit testable (design for test).
- Synchronous clocking disciplines compared, clock skew, clock distribution, input/output timing.
- Synchronization and metastability.
- CMOS transistor-level circuits of gates, flip-flops and random access memories.
- Sinks of energy in CMOS circuits.
- Power estimation and low-power design.
- Current research in low-energy computing.
- Layout parasitics, interconnected delay, static timing analysis.
- Switching currents, ground bounce, IR-drop, power distribution.
- Floorplanning, chip assembly, packaging.
- Layout design at the mask level, physical design verification.
- Intrusion, electrostatic discharge, and latch-up.
- Models of industrial cooperation in microelectronics.
- The caveats of virtual components.
- The cost structures of ASIC development and manufacturing.
- Market requirements, decision criteria, and case studies.
- Yield models.
- Avenues to low-volume fabrication.
- Marketing considerations and case studies.
- Management of VLSI projects.

Exercises are concerned with back-end design (floorplanning, placement, routing, clock and power distribution, layout verification). Industrial CAD tools are being used.

Lecture notes

All written documents in English.

Literature

Highlight:
Students are offered the opportunity to design a circuit of their own which then gets actually fabricated as a microchip! Students who elect to participate in this program register for a term project at the Integrated Systems Laboratory in parallel to attending the VLSI II course.

Prerequisites:
"VLSI I: from Architectures to Very Large Scale Integration Circuits and FPGAs" or equivalent knowledge.

Further details:
http://www.iis.ee.ethz.ch/stud_area/vorlesungen/vlsi2.en.html

227-0417-00L
Information Theory I

W 6 credits 4G A. Lapidoth

Abstract
This course covers the basic concepts of information theory and of communication theory. Topics covered include the entropy rate of a source, mutual information, typical sequences, the asymptotic equi-partition property, Huffman coding, channel capacity, the channel coding theorem, the source-channel separation theorem, and feedback capacity.

Objective
The fundamentals of Information Theory including Shannon's source coding and channel coding theorems

Content
The entropy rate of a source, Typical sequences, the asymptotic equi-partition property, the source coding theorem, Huffman coding, Arithmetic coding, channel capacity, the channel coding theorem, the source-channel separation theorem, feedback capacity

Literature
T.M. Cover and J. Thomas, Elements of Information Theory (second edition)

227-0427-00L
Signal and Information Processing: Modeling, Filtering, Learning

W 6 credits 4G H.A. Loeliger

Abstract
Fundamentals in signal processing, detection/estimation, and machine learning.

I. Linear signal representation and approximation: Hilbert spaces, LMMSE estimation, regularization and sparsity.

Objective
The course is an introduction to some basic topics in signal processing, detection/estimation theory, and machine learning.

Content

Lecture notes
Lecture notes.

Prerequisites:
- local bachelors: course "Discrete-Time and Statistical Signal Processing" (5. Sem.)
- others: solid basics in linear algebra and probability theory

227-0439-00L
Wireless Access Systems

W 6 credits 2V+2U A. Wittneben

Notice
Prerequisites:

Abstract Wireless access systems support locally constrained wireless connectivity and mobile access to a backbone network (typically the Internet). In this course the student develops a comprehensive understanding of existing and upcoming wireless access technologies (including WiFi, Bluetooth, RFID, NFC, VANET) and related Physical Layer and Medium Access Control Layer problems and opportunities.

Objective The course consists of two tracks. The track “Technology&Systems” is structured as regular lecture. In the introduction we will discuss the challenges and potential of pervasive wireless access and study some fundamentals of short/medium range wireless communications. The main body of this track is devoted to existing and upcoming systems. A comprehensive survey of Ultrawide band (UWB) as the promising transmission technology for pervasive wireless access completes this track. In the track “Simulate&Practice” we form student teams that implement and analyze functional blocks of the physical layer of various advanced wireless access systems based on MATLAB simulations. The track includes combination tasks where different teams combine their functional blocks (e.g. transmitter, receiver) in order to simulate the complete physical layer.

Content 1. Short range wireless communication: fundamental Physical Layer challenges and solutions
2. Wireless Local Area Network (WLAN)
3. Vehicular Networks (VANET)
4. Ultra-Wideband (UWB) technology: fundamental principles, promises and solutions
5. Wireless Body Area Networks (WBAN)
6. Wireless Personal Area Networks (Bluetooth, Zigbee)
7. Radio Frequency Identification (RFID) and Near Field Communication (NFC)

Lecture notes Lecture Slides and handouts.

Literature
- Selected Books

Abstract Introduction to discrete event systems. We start out by studying popular models of discrete event systems. In the second part of the course we analyze discrete event systems from an average-case and from a worst-case perspective. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Network Calculus.

Objective Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by studying popular models of discrete event systems, such as automata and Petri nets. In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply Markov chains and queuing theory for an understanding of the typical behavior of a system. In the last part of the course we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queuing.

Content 1. Introduction
2. Automata and Languages
3. Smarter Automata
4. Specification Models
5. Stochastic Discrete Event Systems
6. Worst-Case Event Systems
7. Network Calculus

Abstract Study of concepts and methods for the mathematical description and analysis of dynamical systems. The concept of feedback. Design of control systems for single input - single output and multivariable systems.
High-Speed Signal Propagation
Understanding of high-speed signal propagation in microwave cables and printed circuit boards.

As clock frequencies rise in the GHz domain, there is a need grasp signal propagation to maintain good signal integrity in the face of symbol interference and cross-talk.

Understanding of high-speed signal propagation in interconnects, microwave cables and integrated transmission lines such as microwave integrated circuits and/or printed circuit boards.

Exercise:
Filters will also be considered because it turns out that some of the problems associated by lossy transmission channels (lines, cables, etc) can be corrected by adequate filtering in a process called "equalization."

Lecture notes:
Handouts of presented slides. No script but an accompanying textbook is recommended.

Prerequisites / notice:
Prerequisites: Signal and Systems Theory II. MATLAB is used for system analysis and simulation.

**Title:** Physics of Failure and Failure Analysis of Electronic Devices and Equipment

**W:** 3 credits  
**2V:** 2

**U. Sennhauser**

**Abstract:** Failures have to be avoided by proper design, material selection and manufacturing. Properties, degradation mechanisms, and expected lifetime of materials are introduced and the basics of failure analysis and analysis equipment are presented. Failures will be demonstrated experimentally and the opportunity is offered to perform a failure analysis with advanced equipment in the laboratory.

**Objective:**
- Introduction to the degradation and failure mechanisms and causes of electronic components, devices and systems as well as to methods and tools of reliability testing, characterization and failure analysis.

**Content:**
- Summary of reliability and failure analysis terminology; physics of failure: materials properties, physical processes and failure mechanisms; failure analysis of ICs, PCBs, opto-electronics, discrete and other components and devices; basics and properties of instruments; application in circuit design and reliability analysis

**Lecture notes:** Comprehensive copy of transparencies

227-0447-00L

**Title:** Image Analysis and Computer Vision

**W:** 6 credits  
**3V+1U:**

**L. Van Gool, O. Gökser, E. Konukoglu**

**Abstract:** Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

**Objective:**
- The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that need as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

**Lecture notes:** Course material, Script, computer demonstrations, exercises and problem solutions

227-0455-00L

**Title:** Terahertz: Technology & Applications

**W:** 3 credits  
**2V:**

**K. Sankaran**

**Abstract:** This course will provide a solid foundation for understanding physical principles of THz applications. We will discuss various building blocks of THz technology - components dealing with generation, manipulation, and detection of THz electromagnetic radiation. We will introduce THz applications in the domain of imaging, communications, and energy harvesting.

**Objective:**
- This is an introductory course on Terahertz (THz) technology and applications. Devices operating in THz frequency range (0.1 to 10 THz) have been increasingly studied in the recent years. Progress in nonlinear optical materials, ultrafast optical and electronic techniques has strengthened research in THz application developments. Due to unique interaction of THz waves with materials, applications with new capabilities can be developed. In theory, they can penetrate somewhat like X-rays, but are not considered harmful radiation, because THz energy level is low. They should be able to provide resolution as good or better than magnetic resonance imaging (MRI), possibly with simpler equipment. Imaging, very-high bandwidth communication, and energy harvesting are the most widely explored THz application areas. We will study the basics of THz generation, manipulation, and detection. Our emphasis will be on the physical principles and applications of THz in the domain of imaging, communication and energy harvesting.

**Content:**
- INTRODUCTION
- Chapter 1: Introduction to THz Physics
- Chapter 2: Components of THz Technology
- THz TECHNOLOGY MODULES
- Chapter 3: THz Generation
- Chapter 4: THz Detection
- Chapter 5: THz Manipulation
- APPLICATIONS
- Chapter 6: THz Imaging
- Chapter 7: THz Communication
- Chapter 8: THz Energy Harvesting

**Literature:**
- Yun-Shik Lee, Principles of Terahertz Science and Technology, Springer 2009

**Prerequisites:**
- Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.
- The course language is English.

**227-0468-00L**

**Title:** Analog Signal Processing and Filtering

**W:** 6 credits  
**2V+2U:**

**H. Schmid**

**Suitable for Master Students as well as Doctoral Students.**

**Abstract:** This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers.

**Objective:**
- This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers. The way the exam is done allows for the different interests of the two groups.

The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.

**Lecture notes:** Lecture notes are handed out.
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can

**Prerequisites / notice**

Some material is protected by password; students from ETHZ who are interested can write to haschmid@ethz.ch to ask for the password even if they do not attend the lecture.

**Prerequisites:** Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.

**Abstract**

Introduction to the fundamentals of acoustics in the area of sound field calculations, measurement of acoustical events, outdoor sound propagation and room acoustics of large and small enclosures.

**Objective**

Introduction to acoustics. Understanding of basic acoustical mechanisms. Survey of the technical literature. Illustration of measurement techniques in the laboratory.

**Content**

Fundamentals of acoustics, measuring and analyzing of acoustical events, anatomy and properties of the ear. Outdoor sound propagation, absorption and transmission of sound, room acoustics of large and small enclosures, architectural acoustics, noise and noise control, calculation of sound fields.

**Lecture notes**

The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

**Prerequisites:** Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.

**Abstract**

The course provides advanced knowledge in the design of complex computer systems, in particular embedded systems. Models and methods are discussed that are fundamental for systems that consist of software and hardware components.

**Objective**

The course provides advanced knowledge in the design of complex computer systems, in particular embedded systems. Models and methods are discussed that are fundamental for systems that consist of software and hardware components.

**Content**

The course covers the following subjects: (a) Models for describing hardware and software components (specification), (b) Hardware-Software Interfaces (instruction set, hardware and software components, reconfigurable computing, heterogeneous computer architectures, System-on-Chip), (c) Application specific instruction sets, code generation and retargetable compilation, (d) Performance analysis and estimation techniques, (e) System design (hardware-software partitioning and design space exploration).

**Lecture notes**

Material for exercises, copies of transparencies.

**Literature**

**Prerequisites**

Prerequisites for the course is a basic knowledge in the following areas: computer architecture, digital design, software design, embedded systems

**Abstract**

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

**Objective**

Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensible to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.

**Content**

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

**Lecture notes**

No lecture notes, but slides will be made available on the course webpage.

**Literature**

**Prerequisites**

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should at least have followed one previous course offered by the Machine Learning Institute (e.g., CIL or LIS) or an equivalent course offered by another institution.
Risk management and the vulnerability lifecycle of software and networked services are discussed. Threats like denial of service, spam, worms, and viruses are studied in-depth. Fundamental security related concepts like identity, availability, authentication and secure channels are introduced. State of the art technologies like secure shell, network and transport layer security, intrusion detection and prevention systems, cross-site scripting, secure implementation techniques and more for securing the Internet and web applications are presented. Several case studies illustrate the dark side of the Internet and explain how to protect against current threats. A hands-on computer lab that accompanies the lecture gives a deep dive on firewalls, penetration testing and intrusion detection.

This lecture is intended for students with an interest in securing Internet services and networked devices. Students are assumed to have knowledge in networking as taught in the Communication Networks lecture.

Prerequisites / notice
Knowledge in computer networking and Internet protocols (e.g. course Communication Networks (D-ITET) or Operating Systems and Networks (D-INFK)).

Due to recent changes in the Swiss law, ETH requires each student of this course to sign a written declaration that he/she will not use the information given in this for illegal purposes. This declaration will have to be signed and submitted no later than at the beginning of the second lesson.

</tr>
<tr>
<td>Content</td>
<td>Designing systems with a low energy footprint is an increasingly important. There are many applications for low-power systems ranging from mobile devices powered from batteries such as today's smart phones to energy efficient household appliances and datacenters. Key drivers are to be found mainly in the tremendous increase of mobile devices and the growing integration density requiring to carefully reason about power, both from a provision and consumption viewpoint. Traditional circuit design classes introduce low-power solely from a hardware perspective with a focus on the power performance of a single or at most a hand full of circuit elements. Similarly, low-power aspects are touched in a multitude of other classes, mostly as a side topic. However in successfully designing systems with a low energy footprint it is not sufficient to only look at low-power as an aspect of second class. In modern low-power system design advanced CMOS circuits are of course a key ingredient but successful low-power integration involves many more disciplines such as system architecture, different sources of energy as well as storage and most importantly software and algorithms. In this lecture we will discuss aspects of low-power design as a first class citizen introducing key concepts as well as modeling and measurement techniques focusing mainly on the design of networked embedded systems but of course equally applicable to many other classes of systems. The lecture is further accompanied by a reading seminar as well as exercises and lab sessions.</td>

### Content
The first part of the lecture covers individual system's aspects starting with tamperproof or tamperresistant hardware in general over operating system related security mechanisms to application software systems such as host based intrusion detection systems. The main topics covered are: tamper resistant hardware, CPU support for security, protection mechanisms in the kernel, file system security (permissions / ACLs / network file system issues), IPC Security, mechanisms in more modern OS, such as Capabilities and Zones, Libraries and Software tools for security assurance, etc.

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security, logging and auditing (BSM audit, dtrace, ...), cryptographic support, and trustworthy computing (TGG, SGX).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

#### Abstract
This lecture discusses fundamental concepts and technologies in the area of network security. Several case studies illustrate the dark side of the Internet and explain how to protect against such threats. A hands-on computer lab that accompanies the lecture gives a deep dive on firewalls, penetration testing and intrusion detection.

#### Objective
Students are aware of current threats that Internet services and networked devices face and can explain appropriate countermeasures. Students can identify and assess known vulnerabilities in a software system that is connected to the Internet. Students know fundamental network security concepts. Students have an in-depth understanding of important security technologies. Students know how to configure a real firewall and know some penetration testing tools from their own experience.

#### Content
Risk management and the vulnerability lifecycle of software and networked services are discussed. Threats like denial of service, spam, worms, and viruses are studied in-depth. Fundamental security related concepts like identity, availability, authentication and secure channels are introduced. State of the art technologies like secure shell, network and transport layer security, intrusion detection and prevention systems, cross-site scripting, secure implementation techniques and more for securing the Internet and web applications are presented. Several case studies illustrate the dark side of the Internet and explain how to protect against current threats.

A hands-on computer lab that accompanies the lecture gives a deep dive on firewalls, penetration testing and intrusion detection. This lecture is intended for students with an interest in securing Internet services and networked devices. Students are assumed to have knowledge in networking as taught in the Communication Networks lecture.

Due to recent changes in the Swiss law, ETH requires each student of this course to sign a written declaration that he/she will not use the information given in this for illegal purposes. This declaration will have to be signed and submitted no later than at the beginning of the second lesson.

#### Prerequisites / notice
Knowledge in computer networking and Internet protocols (e.g. course Communication Networks (D-ITET) or Operating Systems and Networks (D-INFK)).

### Literature

MATLAB is used for system analysis and simulation.
Context recognition in mobile communication systems like mobile phone, smart watches and wearable computer will be studied using advanced methods from sensor data fusion, pattern recognition, statistics, data mining and machine learning.

Context comprises the behavior of individuals and of groups, their activities as well as the local and social environment.

Using internal sensors and sensors in our environment including data from the wristwatch, bracelet or internet (crowd sourcing), our ‘smart phone’ detects our context continuously, e.g. where we are, what we are doing, with whom we are together, what is our constitution, what are our needs. Based on this information our ‘smart phone’ offers us the appropriate services like a personal assistant. Context comprises user’s behavior, his activities, his local and social environment.

In the data path from the sensor level to signal segmentation to the classification of the context, advanced methods of signal processing, pattern recognition and machine learning will be applied. Sensor data generated by crowdsourcing methods are integrated. The validation using MATLAB is followed by implementation and testing on a smart phone.

Context recognition as the crucial function of mobile systems is the main focus of the course. Using MATLAB the participants implement and verify the discussed methods also using a smart phone.

The main topics of the course include:

- Sensor nets, sensor signal processing, data fusion, time series (segmentation, similarly measures), supervised learning (Bayes Decision Theory, Decision Trees, Random Forest, KNN-Methods, Support Vector Machine, AdaBoost, Deep Learning), clustering (k-means, dbSCAN, topic models), Recommender Systems, Collaborative Filtering, Crowdsourcing.

The exercises show concrete design problems like motion and gesture recognition using distributed sensors, detection of activity patterns and localization of the local environment.

Presentations of the PhD students and the visit at the Wearable Computing Lab introduce in current research topics and international research projects.

Language: german/english (depending on the participants)

### 227-0555-00L Fault Tolerance in Distributed Systems

**Abstract**
Fault-tolerance (failure models, consensus, agreement), replication (primary copy, 2PC, 3PC, Paxos, quorum systems), shared memory (spin locks, concurrency).

**Objective**
Become acquainted with pertinent technologies and architectures of fault-tolerant distributed systems.

**Content**
We discuss fault-tolerance issues (models, consensus, agreement) as well as replication issues (primary copy, 2PC, 3PC, Paxos, quorum systems, distributed storage) and problems with asynchronous multiprocessing (shared memory, spin locks, concurrency).

**Prerequisites / notice**
This lecture takes place in the second half of the semester; the lecture is the second part of the lecture "Verteilte Systeme" (Distributed Systems, 252-0213-00L). Students may attend at most one of the two lectures.

**Lecture notes**
Course material, Script, computer demonstrations, exercises and problem solutions

**Content**
- Fault-tolerance (failure models, consensus, agreement)
- Replication (primary copy, 2PC, 3PC, Paxos, quorum systems)
- Shared memory (spin locks, concurrency)

**Objective**
- Become acquainted with pertinent technologies and architectures of fault-tolerant distributed systems.

**Prerequisites / notice**
- Understand the function, the design, and the performance modeling of parallel computer systems.

**Content**
Understand the function, the design, and the performance modeling of parallel computer systems.

**Objective**
- Design and model parallel computer systems

**Prerequisites / notice**
- Understand the function, the design, and the performance modeling of parallel computer systems.

### 227-0627-00L Applied Computer Architecture

**Abstract**
This lecture gives an overview of the requirements and the architecture of parallel computer systems, performance, reliability and costs.

**Objective**
Understand the function, the design and the performance modeling of parallel computer systems.

**Content**
The lecture "Applied Computer Architecture" gives technical and corporate insights in the innovative Computer Systems/Architectures (CPU, GPU, FPGA, special processors) and their real implementations and applications. Often the designs have to deal with technical limits.

**Prerequisites / notice**
- Fault Tolerance in Distributed Systems
- Performance, Reliability, and Costs of Parallel Computer Systems

### 151-0593-00L Embedded Control Systems

**Abstract**
This course provides a comprehensive overview of embedded control systems. The concepts introduced are implemented and verified on a microprocessor-controlled haptic device.

**Objective**
Familiarize students with main architectural principles and concepts of embedded control systems.

**Content**
An embedded system is a microprocessor used as a component in another piece of technology, such as cell phones or automobiles. In this intensive two-week block course the students are presented the principles of embedded digital control systems using a haptic device as an example for a mechatronic system. A haptic interface allows for a human to interact with a computer through the sense of touch.

**Prerequisites**
- Control Systems I
- Informatics I

**Lecture notes**
Lecture notes, lab instructions, supplemental material

**Prerequisites / notice**
Prerequisite courses are Control Systems I and Informatics I.

### 252-1411-00L Security of Wireless Networks

**Abstract**
Core Elements: Wireless communication channel, Wireless network architectures and protocols, Attacks on wireless networks, Protection techniques.

**Objective**
After this course, the students should be able to describe and classify security goals and attacks in wireless networks; describe security architectures of the following wireless systems and networks: 802.11, GSM/UMTS, RFID, ad hoc/sensor networks; reason about security protocols for wireless network; implement mechanisms to secure 802.11 networks.

**Content**

**Prerequisites / notice**
- Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.
- The course language is English.

**Lecture notes**
Course material, Script, computer demonstrations, exercises and problem solutions

**Prerequisites**
- Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.
- The course language is English.
Objective
In the last two decades, we have experienced an unprecedented growth in the area of distributed systems and networks; distributed computing now encompasses many of the activities occurring in today's computer and communications world. This course introduces the basics of distributed computing, highlighting common themes and techniques. We study the fundamental issues underlying the design of distributed systems: communication, coordination, synchronization, uncertainty. We explore essential algorithmic ideas and lower bound techniques.

In this seminar, students present the latest work in this domain.

Seminar language: English

Abstract
This second course in our VLSI series is concerned with how to turn digital circuit netlists into safe, testable and manufacturable mask layout, taking into account various parasitic effects. Low-power circuit design is another important topic. Economic aspects and management issues of VLSI projects round off the course.

Objective
Know how to design digital VLSI circuits that are safe, testable, durable, and make economic sense.

Content
The second course begins with a thorough discussion of various technical aspects at the circuit and layout level before moving on to economic issues of VLSI. Topics include:
- The difficulties of finding fabrication defects in large VLSI chips.
- How to make integrated circuit testable (design for test).
- Synchronous clocking disciplines compared, clock skew, clock distribution, input/output timing.
- Synchronization and metastability.
- CMOS transistor-level circuits of gates, flip-flops and random access memories.
- Sinks of energy in CMOS circuits.
- Power estimation and low-power design.
- Current research in low-energy computing.
- Layout parasitics, interconnected delay, static timing analysis.
- Switching currents, ground bounce, IR-drop, power distribution.
- Floorplanning, chip assembly, packaging.
- Layout design at the mask level, physical design verification.
- Electromigration, electrostatic discharge, and latch-up.
- Models of industrial cooperation in microelectronics.
- The caveats of virtual components.
- The cost structures of ASIC development and manufacturing.
- Market requirements, decision criteria, and case studies.
- Yield models.
- Avenues to low-volume fabrication.
- Marketing considerations and case studies.
- Management of VLSI projects.

Exercises are concerned with back-end design (floorplanning, placement, routing, clock and power distribution, layout verification). Industrial CAD tools are being used.

Lecture notes

Literature
All written documents in English.

Prerequisites / notice

Highlight:
Students are offered the opportunity to design a circuit of their own which then gets actually fabricated as a microchip! Students who elect to participate in this program register for a term project at the Integrated Systems Laboratory in parallel to attending the VLSI II course.

Prerequisites:
"VLSI I: from Architectures to Very Large Scale Integration Circuits and FPGAs” or equivalent knowledge.

Physics of Failure and Failure Analysis of Electronic Components

Introduction to the degradation and failure mechanisms and causes of electronic components, devices and systems as well as to methods and tools of reliability testing, characterization and failure analysis.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

Recommended Subjects

These courses are recommended, but you are free to choose courses from any other special field. Please consult your tutor.

<td>Covered are the lower three layer of the OSI reference model: the physical, the data link, and the network layer. The basic terms of information theory are introduced. After this, we focus on the methods for the point to point communication, which may be addressed elegantly and coherently in the signal space. Methods for error detection and correction as well as protocols for the retransmission of perturbed data will be covered. Also the medium access for systems with shared medium will be discussed. Finally, algorithms for routing and flow control will be treated.</td>

| 227-0157-00L | Semiconductor Devices: Physical Bases and Simulation | W    | 4 credits | 3G   | A. Schenk |
| Abstract | The course addresses the physical principles of modern semiconductor devices and the foundations of their modeling and numerical simulation. Necessary basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided. Computer simulations of the most important devices and of interesting physical effects supplement the lectures. |
| Objective | The course aims at the understanding of the principle physics of modern semiconductor devices, of the foundations in the physical modeling of transport and its numerical simulation. During the course also basic knowledge on quantum-mechanics, semiconductor physics and device physics is provided. |
| Content | The main topics are: transport models for semiconductor devices (quantum transport, Boltzmann equation, drift-diffusion model, hydrodynamic model), physical characterization of silicon (intrinsic properties, scattering processes), mobility of cold and hot carriers, recombination (Shockley-Read-Hall statistics, Auger recombination), impact ionization, metal-semiconductor contact, metal-insulator-semiconductor structure, and heterojunctions. The exercises are focussed on the theory and the basic understanding of the operation of special devices, as single-electron transistor, resonant tunneling diode, pn-diode, bipolar transistor, MOSFET, and laser. Numerical simulations of such devices are performed with an advanced simulation package (Sentaurus-Synopsys). This enables to understand the physical effects by means of computer experiments. |
| Literature | The script (in book style) is sufficient. Further reading will be recommended in the lecture. |

| 227-0166-00L | Analog Integrated Circuits                  | W    | 6 credits | 2V+2U | Q. Huang |
| Abstract | This course provides a foundation in analog integrated circuit design based on bipolar and CMOS technologies. Integrated circuits are responsible for much of the progress in electronics in the last 50 years, particularly the revolutions in the Information and Communications Technologies we witnessed in recent years. Analog integrated circuits play a crucial part in the highly integrated systems that power the popular electronic devices we use daily. Understanding their design is beneficial to both future designers and users of such systems. The basic elements, design issues and techniques for analog integrated circuits will be taught in this course. |
| Objective | Review of bipolar and MOS devices and their small-signal equivalent circuit models; Building blocks in analog circuits such as current sources, active load, current mirrors, supply independent biasing etc; Amplifiers: differential amplifiers, cascode amplifier, high gain structures, output stages, gain bandwidth product of op-amps; Stability; Comparators; Second-order effects in analog circuits such as mismatch, noise and offset; A/D and D/A converters; Introduction to switched capacitor circuits. The exercise sessions aim to reinforce the lecture material by well guided step-by-step design tasks. The circuit simulator SPECTRE is used to facilitate the tasks. There is also an experimental session on op-amp measurements. |
| Content | Handsouts of presented slides. No script but an accompanying textbook is recommended. |
| Lecture notes | Handouts of presented slides. No script but an accompanying textbook is recommended. |

| 227-0377-00L | Physics of Failure and Failure Analysis of Electronic Devices and Equipment | W    | 3 credits | 2V   | U. Sennhauser |
| Abstract | Failures have to be avoided by proper design, material selection and manufacturing. Properties, degradation mechanisms, and expected lifetime of materials are introduced and the basics of failure analysis and analysis equipment are presented. Failures will be demonstrated experimentally and the opportunity is offered to perform a failure analysis with advanced equipment in the laboratory. |
| Objective | Introduction to the degradation and failure mechanisms and causes of electronic components, devices and systems as well as to methods and tools of reliability testing, characterization and failure analysis. |
| Content | Summary of reliability and failure analysis terminology; physics of failure: materials properties, physical processes and failure mechanisms; failure analysis of ICs, PCBs, opto-electronics, discrete and other components and devices; basics and properties of instruments; application in circuit design and reliability analysis |
| Lecture notes | Comprehensive copy of transparencies |

| 227-0455-00L | Terahertz: Technology & Applications       | W    | 3 credits | 2V   | K. Sankaran |
| Abstract | This course will provide a solid foundation for understanding physical principles of THz applications. We will discuss various building blocks of THz technology - components dealing with generation, manipulation, and detection of THz electromagnetic radiation. We will introduce THz applications in the domain of imaging, communications, and energy harvesting. |

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 521 of 1570
This is an introductory course on Terahertz (THz) technology and applications. Devices operating in THz frequency range (0.1 to 10 THz) have been increasingly studied in the recent years. Progress in nonlinear optical materials, ultrafast optical and electronic techniques has strengthened research in THz application developments. Due to unique interaction of THz waves with materials, applications with new capabilities can be developed. In theory, they can penetrate somewhat like X-rays, but are not considered harmful radiation, because THz energy level is low. They should be able to provide resolution as good or better than magnetic resonance imaging (MRI), possibly with simpler equipment. Imaging, very-high bandwidth communication, and energy harvesting are the most widely explored THz application areas. We will study the basics of THz generation, manipulation, and detection. Our emphasis will be on the physical principles and applications of THz in the domain of imaging, communication and energy harvesting.

### Literature
- Yun-Shik Lee, Principles of Terahertz Science and Technology, Springer 2009
- A. N. Tiwari, Solar Cells
- M. P. M. Ciappa, Analog Signal Processing and Filtering
- H. Schmid, W. H. Schmid

### Prerequisites / notice
Good foundation in electromagnetics & knowledge of microwave or optical communication is helpful.

### Content
**INTRODUCTION**

**THz TECHNOLOGY MODULES**

- Chapter 1: Introduction to THz Technology
- Chapter 2: Components of THz Technology
- Chapter 3: THz Generation
- Chapter 4: THz Detection
- Chapter 5: THz Manipulation
- Chapter 6: THz Imaging
- Chapter 7: THz Communication
- Chapter 8: THz Energy Harvesting

**APPLICATIONS**

Chapter 9: THz Sensing and Imaging
Chapter 10: THz Communication
Chapter 11: THz Energy Harvesting

### Objective
The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.

### Content
At the beginning, signal-flow graphs in general and driving-point signal-flow graphs in particular are introduced. We will use them during the whole term to analyze circuits and understand how signals propagate through them. The theory and CMOS implementation of active filters is then discussed in detail using the example of Gm-C filters and active-RC filters. The ideal and nonideal behaviour of opamps, current conveyors, and inductor simulators follows. For example, the practical design of circuits and systems is done with an overview over different quality measures and figures of merit used in scientific literature and datasheets. Finally, an introduction to discrete-time and mixed-domain filters and circuits is given, including sensor read-out amplifiers, correlated double sampling, and chopping, and an introduction to sigma-delta A/D and D/A conversion on a system level.

### Lecture notes
The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

### Literature

### Prerequisites / notice
Prerequisites: Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

### Content
This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers.

### Objective
This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers. The way the exam is done allows for the different interests of the two groups.

### Lecture notes
Lecture reprints (in english).

### Content
The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

### Literature
- M. P. M. Ciappa, Analog Signal Processing and Filtering

### Prerequisites / notice
Prerequisites: Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

### Content
Solar radiation characteristics, physical mechanisms for the light to electrical power conversion, properties of semiconductors for solar cells, processing and properties of conventional Si and GaAs based solar cells, technology and physics of thin film solar cells based on compound semiconductors, other solar cells including organic and dye sensitized cells, problems and new developments for power generation in space, interconnection of cells and solar module design, measurement techniques, system design of photovoltaic plants, system components such as inverters and controllers, engineering procedures with software demonstration, integration in buildings and other specific examples.

### Objective
The students shall get acquainted with the most important concepts and techniques for characterization, numerical modeling and built-in reliability of modern power semiconductor devices. This knowledge is intended to provide the future engineer with the theoretical background and tools for the design of dependable power devices and systems.
The characterization of the electronic properties of semiconductor and related materials is fundamental to manufacture integrated devices, and is the subject of this lecture. This lecture consists of a theoretical part (80%) and of laboratory exercises and demonstrations (20%).

The first section of the lecture deals with basic techniques and procedures for the experimental characterization of relevant electronic parameters in the bare semiconductor (mainly silicon), like resistivity, carrier and doping density, contact resistance, and Schottky barriers, defect density, carrier lifetime, mobility. The second section deals with techniques involving basic structures and devices (contact chains, MIS capacitors, diodes, gated diodes, BJTs, MOSFETs) for the characterization of atomic transport, mechanical stress, dielectric thickness, impact ionization, channel mobility, instabilities, defect formation at interfaces and in thin film dielectrics, carry transport and trapping in thin film dielectrics, quasi-static and dynamic device characteristics. The list of the covered methods includes among others probing, Kelvin measurements, Van der Pauw technique, Hall spectroscopy, SIMS, Raman spectroscopy, spreading resistance, scanning probe techniques, static/high-speed I-V, static/high-frequency C-V, open circuit voltage decay, carrier recombination techniques, Zerbst techniques, deep level transient spectroscopy, split C-V, charge pumping, and inverse modeling techniques using TCAD. All methods are presented in conjunction with the proper test structures. During the laboratory activities, a selection of the experimental techniques discussed in the lecture are demonstrated on the base of realistic examples.

During the laboratory activities, selections of the experimental techniques presented in the lecture are demonstrated on the base of realistic examples. Furthermore, schematic power devices will be simulated by the students with advanced TCAD tools and circuit simulators.

### Lecture notes and literature

Handouts to the lecture (approx. 250 pp.)

- Eichi Ohno: "Introduction to Power Electronics"
- B. Murai et al.: "Smart Power ICs"
- B. J. Baliga: "Physics Modern Power Devices"
- S. K. Ghandi: "Semiconductor Power Devices"

Handouts to the lecture (approx. 200 pp.)

- Schroeder D.K, Semiconductor Material and Device Characterization, Wiley Ed.
- F. Balestra Ed., Nanoscale CMOS : innovative materials, modeling and characterization, ISTE

### 227-0620-00L Characterization of the Electronic Properties of Materials for Semiconductor Devices

- **Course code:** 227-0620-00L
- **Title:** Characterization of the Electronic Properties of Materials for Semiconductor Devices
- **Credit points:** 4 credits
- **ECTS:** 3G

#### Abstract

This lecture provides theoretical and experimental knowledge on the techniques for the characterization of the main electronic properties of semiconductors and thin film materials used in microelectronics, with special focus on silicon.

#### Objective

The characterization of the electronic properties of semiconductor and related materials is fundamental to manufacture integrated devices, which fulfill the required specifications. By this lecture, the students shall get acquainted with the main electrical characterization techniques of the electronic properties of semiconductors and thin film materials used in microelectronics, as well as with their physical principles. This knowledge is intended to provide the future engineer with the theoretical background and experimental tools for process control in semiconductor manufacturing, parameter extraction in device simulation, and design of dependable devices.

#### Content

This lecture consists of a theoretical part (80%) and of laboratory exercises and demonstrations (20%). In the first section of the lecture, methods and procedures are presented for the experimental characterization of relevant electronic parameters in the bare semiconductor (mainly silicon), like resistivity, carrier and doping density, contact resistance, and Schottky barriers, defect density, carrier lifetime, mobility. The second section deals with techniques involving basic structures and devices (contact chains, MIS capacitors, diodes, gated diodes, BJTs, MOSFETs) for the characterization of atomic transport, mechanical stress, dielectric thickness, impact ionization, channel mobility, instabilities, defect formation at interfaces and in thin film dielectrics, carrier transport and trapping in thin film dielectrics, quasi-static and dynamic device characteristics. The list of the covered methods includes among others probing, Kelvin measurements, Van der Pauw technique, Hall spectroscopy, SIMS, Raman spectroscopy, spreading resistance, scanning probe techniques, static/high-speed I-V, static/high-frequency C-V, open circuit voltage decay, carrier recombination techniques, Zerbst techniques, deep level transient spectroscopy, split C-V, charge pumping, and inverse modeling techniques using TCAD. All methods are presented in conjunction with the proper test structures. During the laboratory activities, a selection of the experimental techniques discussed in the lecture are demonstrated on the base of realistic examples.

- Schroeder D.K, Semiconductor Material and Device Characterization, Wiley Ed.
- F. Balestra Ed., Nanoscale CMOS : innovative materials, modeling and characterization, ISTE

### 227-0627-00L Applied Computer Architecture

- **Course code:** 227-0627-00L
- **Title:** Applied Computer Architecture
- **Credit points:** 6 credits
- **ECTS:** 4G

#### Abstract

This lecture gives an overview of the requirements and the architecture of parallel computer systems, performance, reliability and costs.

#### Objective

Understand the function, the design and the performance modeling of parallel computer systems.

#### Content

The lecture "Applied Computer Architecture" gives technical and corporate insights in the innovative Computer Systems/Architectures (CPU, GPU, FPGA, special processors) and their real implementations and applications. Often the designs have to deal with technical limits.

- Which computer architecture allows the control of the over 1000 magnets at the Swiss Light Source (SLS)?
- Which architecture is behind the alarm center of the Swiss Railway (SBB)?
- Which computer architectures are applied for driver assistance systems?
- Which computer architecture is hidden behind a professional digital audio mixing desk?
- How can data streams of about 30 TB/s, produced by a protone accelerator, be processed in real time?
- Can the weather forecast also be processed with GPUs?
- How can a good computer architecture be found?
- Which are the driving factors in successful computer architecture design?

### Lecture notes and literature

- Script and exercises sheets.
- Prerequisites:
  - Basics of computer architecture.

### 227-0659-00L Integrated Systems Seminar

- **Course code:** 227-0659-00L
- **Title:** Integrated Systems Seminar
- **Credit points:** 1 credit
- **ECTS:** 1S

#### Abstract

In the "Fachseminar IIS" the students learn to communicate topics, ideas or problems of scientific research by listening to more experienced authors and by presenting scientific work in a conference-like situation for a specific audience.

#### Objective

The seminar aims at instructing graduate and PhD students in the basics of presentation techniques, i.e. "how to give a professional talk". Attendees have the possibility to become acquainted with a current topic by a literature study, and to present the results thereof in a 20 minutes talk in English. The participation at the seminar gives also an overview on current problems in modern nano- and opto-electronics.

#### Content

The seminar topics are simulation of nanoelectronic processes and devices, and the optical as well as electronical simulation of opto-electronic devices as lasers, photodiodes, etc.

### Lecture notes and literature

- Presentation material

### 227-2037-00L Physical Modelling and Simulation

- **Course code:** 227-2037-00L
- **Title:** Physical Modelling and Simulation
- **Credit points:** 5 credits
- **ECTS:** 4G

#### Abstract

This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

#### Objective

- Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability (a) to develop own simple field simulation programs, (b) to select an appropriate field solver for a given problem, (c) to perform field simulations, (d) to evaluate the obtained results, and (e) to interactively improve the models until sufficiently accurate results are obtained.

### Lecture notes and literature

- Script and exercices sheets.
Content

The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. After the introduction follows a detailed overview of the available numerical methods for solving electromagnetic, thermal and mechanical boundary value problems. This part of the course contains a general introduction into numerical methods, differential and integral forms, linear equation systems, Finite Difference Method (FDM), Boundary Element Method (BEM), Method of Moments (MoM), Multiple Multipole Program (MMP) and Finite Element Method (FEM). The theoretical part of the course finishes with a presentation of multiphysics simulations through several practical examples of HF-engineering such as coupled electromagnetic-mechanical and electromagnetic-thermal analysis of MEMS.

In the second part of the course the students will work in small groups on practical simulation problems. For solving practical problems the students can develop and use own simulation programs or chose an appropriate commercial field solver for their specific problem. This practical simulation work of the students is supervised by the lecturers.

151-0601-00L

Theory of Robotics and Mechatronics

Objective

Robots are often viewed from three perspectives: perception (sensing), manipulation (affecting changes in the world), and cognition (intelligence). Robotic systems integrate aspects of all three of these areas. This course provides an introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. It's a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

Content

An introduction to the theory of robotics, and covers the fundamentals of the field, including rigid motions, homogeneous transformations, forward and inverse kinematics of multiple degree of freedom manipulators, velocity kinematics, motion planning, trajectory generation, sensing, vision, and control. This course is a requirement for the Robotics Vertiefung and for the Masters in Mechatronics and Microsystems.

Lecture notes

The course will be taught in English.

151-0605-00L

Nanosystems

Abstract

From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles. Intermolecular forces, their macroscopic manifestations, and ways to control such interactions. Self-assembly and directed assembly of 2D and 3D structures. Special emphasis on the emerging field of molecular electronic devices.

Objective

Familiarize students with basic science and engineering principles governing the nano domain.

Content

Special emphasis is placed on the emerging field of molecular electronic devices, their working principles, applications, and how they may be assembled. Topics are treated in 2 blocks:

(I) From Quantum to Continuum

From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale

Intermolecular forces, their macroscopic manifestations, and ways to control such interactions. Self-assembly and directed assembly of 2D and 3D structures.

Literature

Prerequisites / notice

Course format:

Lectures and Mini-Review presentations: Thursday 10-13, ML F 36

Homework: Mini-Reviews
Students select a paper (list distributed in class) and expand the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper.

151-0620-00L

Embedded MEMS Lab

Abstract

Practical course: Students are introduced to the process steps required for the fabrication of MEMS (Micro Electro Mechanical System) and carry out the fabrication and testing steps in the clean rooms by themselves. Additionally, they learn the requirements for working in clean rooms. Processing and characterization will be documented and analyzed in a final report. Limited access

Objective

Students learn the individual process steps that are required to make a MEMS (Micro Electro Mechanical System). Students carry out the process steps themselves in laboratories and clean rooms. Furthermore, participants become familiar with the special requirements (cleanliness, safety, operation of equipment and handling hazardous chemicals) of working in the clean rooms and laboratories. The entire production, processing, and characterization of the MEMS is documented and evaluated in a final report.

Content

With guidance from a tutor, the individual silicon microsystem process steps that are required for the fabrication of an accelerometer are carried out:

- Photolithography, dry etching, wet etching, sacrificial layer etching, critical point drying, various cleaning procedures
- Packaging and electrical connection of a MEMS device
- Testing and characterization of the MEMS device
- Written documentation and evaluation of the entire production, processing and characterization

Lecture notes

A document containing theory, background and practical course content is distributed at the first meeting of the course.

Literature

The document provides sufficient information for the participants to successfully participate in the course.
This course intends to enable all students to:

- understand the core concepts necessary to analyze how innovation happens
- master the most common methods and tools organizations deploy to innovate
- develop the ability to critically evaluate the innovation process, and act upon the main obstacles to innovation

This course focuses on the analysis of innovation as a pervasive process that cut across organizational and functional boundaries. It looks at the sources of innovation, at the tools and techniques that organizations deploy to routinely innovate, and the strategic implications of technical change.

Methods are deployed to sustain managerial decision-making in highly volatile environments. These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, guest speakers, simulations and group work.

How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, guest speakers, simulations and group work.

No specific background in economics or management is required.

**Prerequisites / notice**

Participating students are required to attend all scheduled lectures and meetings of the course.

Participating students are required to provide proof that they have personal accident insurance prior to the start of the laboratory portion of the course.

This master's level course is limited to 15 students per semester for safety and efficiency reasons.

If there are more than 15 students registered, we regret to restrict access to this course by the following rules:

Priority 1: master students of the master's program in "Micro and Nanosystems"

Priority 2: master students of the master's program in "Mechanical Engineering" with a specialization in Microsystems and Nanoscale Engineering (MAVT-tutors Profs Daraio, Dual, Hierold, Koumoutsakos, Nelson, Norris, Park, Poulikakos, Pratsinis, Stemmer), who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

Priority 3: master students, who attended the bachelor course "151-0621-00L Microsystems Technology" successfully.

Priority 4: all other students (PhD, bachelor, master) with a background in silicon or microsystems process technology.

If there are more students in one of these priority groups than places available, we will decide by drawing lots.

Students will be notified at the first lecture of the course (introductory lecture) as to whether they are able to participate.

The course is offered in autumn and spring semester.

### 151-0911-00L Introduction to Plasmonics

**Abstract**
This course provides fundamental knowledge of surface plasmon polaritons and discusses their applications in plasmonics.

**Objective**
Electromagnetic oscillations known as surface plasmon polaritons have many unique properties that are useful across a broad set of applications in biology, chemistry, physics, and optics. The field of plasmonics has arisen to understand the behavior of surface plasmon polaritons and to develop applications in areas such as catalysis, imaging, photovoltaics, and sensing. In particular, metallic nanoparticles and patterned metallic interfaces have been developed to utilize plasmonic resonances. The aim of this course is to provide the basic knowledge to understand and apply the principles of plasmonics. The course will strive to be approachable to students from a diverse set of science and engineering backgrounds.

**Content**
- Fundamentals of Plasmonics
- Basic electromagnetic theory
- Optical properties of metals
- Surface plasmon polaritons on surfaces
- Surface plasmon polariton propagation
- Localized surface plasmons

Applications of Plasmonics
- Waveguides
- Extraordinary optical transmission
- Enhanced spectroscopy
- Sensing
- Metamaterials

**Lecture notes**
Class notes and handouts

**Literature**

**Prerequisites / notice**
Physics I, Physics II

### 363-0389-00L Technology and Innovation Management

**Abstract**
This course focuses on the analysis of innovation as a pervasive process that cuts across organizational and functional boundaries. It looks at the sources of innovation, at the tools and techniques that organizations deploy to routinely innovate, and the strategic implications of technical change.

**Objective**
This course intends to enable all students to:

- understand the core concepts necessary to analyze how innovation happens
- master the most common methods and tools organizations deploy to innovate
- develop the ability to critically evaluate the innovation process, and act upon the main obstacles to innovation

This course looks at technology and innovation management as a process. Continuously, organizations are faced with a fundamental decision: they have to allocate resources between well-known tasks that reliably generate positive results; or explore new ways of doing things, new technologies, products and services. The latter is a high risk choice. Its rewards can be high, but the chances of success are small.

How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, cases-based discussion, guest speakers, simulations and group work.

**Lecture notes**
Slides will be available on the TIMGROUP website.

**Literature**
Readings will be available on the TIMGROUP website.

**Prerequisites / notice**
No specific background in economics or management is required.

**Data: 06.09.2017 12:54   Autumn Semester 2016   Page 525 of 1570**
### Objective
Detailed understanding of the principle of operation and modulation of advanced power electronics converter systems, especially of zero voltage switching and zero current switching non-isolated and isolated DC/DC converter systems and three-phase voltage DC link inverter systems. Furthermore, the course should convey knowledge on the switching frequency related losses of power semiconductors and inductive power components and introduce the concept of space vector calculus which provides a basis for the comprehensive discussion of three-phase PWM converters systems in the lecture Power Electronic Systems II.

### Content
- Basics of the switching behavior and gate drive circuits of power semiconductor devices and auxiliary circuits for minimizing the switching losses are explained. Furthermore, zero voltage switching, zero current switching, and resonant DC/DC converters are discussed in detail; the operating behavior of isolated full-bridge DC/DC converters is detailed for different secondary side rectifier topologies; high frequency loss mechanisms of magnetic components of converter circuits are explained and approximate calculation methods are presented; the concept of space vector calculus for analyzing three-phase systems is introduced; finally, phase-oriented and space vector modulation of three-phase inverter systems are discussed related to voltage DC link inverter systems and the design of the main power components based on analytical calculations is explained.

### Lecture notes
Lecture notes and associated exercises including correct answers, simulation program for interactive self-learning including visualization/animation features.

### Prerequisites / notice
Prerequisites: Introductory course on power electronics.

<td>In the course &quot;Drive System II&quot; the power semiconductors are repeated. The creation of converters based on the combination of switches/cells and based topologies is explained. Another main focus is on the 3-level inverter with its switching and transfer functions. Further topics are the control of the synchronous machine, of line-side converters and issues with converter-fed machines.</td>
<td>The students establish a deeper understanding in regards of the design of the main components of an electrical drive system. They establish knowledge on the most important interaction with the grid and the machine and their related high dynamic control.</td>
<td>Converter topologies (switch or cell based), multi-pulse diode rectifiers, system aspects of transformer and electrical machines, 3-level inverter with its switching and transfer functions, grid side harmonics, modeling and control of synchronous machines (including permanent magnet machines), control of line-side converters, reflection effects with power cables, winding isolation and bearing stress. Field trip to ABB Semiconductors.</td>
<td>Skript is sold at the beginning of the lectures or can be downloaded from Ilias</td>
<td>Prerequisites: Electrical Drive Systems I (recommended), Basics in electrical engineering, power electronics, automation and mechatronics</td>

<tr>
<td>Portfolio and risk management in the electrical power business, Pan-European power market and trading, futures and forward contracts, hedging, options and derivatives, performance indicators for the risk management, modelling of physical assets, cross-border trading, ancillary services, balancing power market, Swiss market model</td>
<td>Knowledge on the worldwide liberalisation of electricity markets, pan-European power trading and the role of power exchanges. Understand financial products (derivatives) based on power. Management of a portfolio containing physical production, contracts and derivatives. Evaluate trading and hedging strategies. Apply methods and tools of risk management.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Content

1. Pan-European power market and trading
   1.1. Power trading
   1.2. Development of the European power markets
   1.3. Energy economics
   1.4. Spot and OTC trading
   1.5. European energy exchange EEX

2. Market model
   2.1. Market place and organisation
   2.2. Balance groups / balancing energy
   2.3. Ancillary services
   2.4. Market for ancillary services
   2.5. Cross-border trading
   2.6. Capacity auctions

3. Portfolio and Risk management
   3.1. Portfolio management 1 (introduction)
   3.2. Forward and futures contracts
   3.3. Risk management 1 (m2m, VaR, hpfc, volatility, cVaR)
   3.4. Risk management 2 (PaR)
   3.5. Contract valuation (HPFC)
   3.6. Portfolio management 2
   2.8. Risk Management 3 (enterprise wide)

4. Energy & Finance I
   4.1. Options 1 basics
   4.2. Options 2 hedging with options
   4.3. Introduction to derivatives (swaps, cap, floor, collar)
   4.4. Financial modelling of physical assets
   4.5. Trading and hydro power
   4.6. Incentive regulation

Lecture notes
Handouts of the lecture
Prerequisites / notice
1 excursion per semester, 2 case studies, guest speakers for specific topics.

227-0523-00L Railway Systems I W 6 credits 4G M. Meyer

Abstract Basic characteristics of railway vehicles and their interfaces with the railway infrastructure: - Transportation tasks and vehicle types - Running dynamics - Mechanical part of rail vehicles - Brakes - Traction chain and auxiliary supply - Railway power supply - Signalling systems - Traffic control and maintenance

Objective - Overview of the technical characteristics of railway systems - Know-how about the design and construction principles of rail vehicles - Interrelationship between different fields of engineering sciences (mechanics, electro and information technology, transport systems) - Understanding tasks and opportunities of engineers working in an environment which has strong economical and political boundaries - Insight into the activities of the railway vehicle industry and railway operators in Switzerland - Motivation of young engineers to start a career in the railway industry or with railway operators

Content EST I (Frühjahrssemester) - Begriffen, Grundlagen, Merkmale

1 Einführung:
1.1 Geschichte und Struktur des Bahnsystems
1.2 Fahrdynamik
2 Vollbahnfahrzeuge:
2.1 Fahrzeugfertigung, stadler Bussnang
2.2 Bremsen
2.3 Traktionsantriebssysteme
2.4 Hilfsbetriebe und Komfortanlagen
2.5 Steuerung und Regelung
3 Infrastruktur:
3.1 Fahrweg
3.2 Bahnstromversorgung
3.3 Sicherungsanlagen
4 Betrieb:
4.1 Interoperabilität, Normen und Zulassung
4.2 RAMS, LCC
4.3 Anwendungsbeispiele

Voraussichtlich ein oder zwei Gastvorträge

Lecture notes Abgabe der Unterlagen (gegen eine Schutzgebühr) zu Beginn des Semesters. Rechtzeitig eingeschriebene Teilnehmer können die Unterlagen auf Wunsch und gegen eine Zusatzgebühr auch in Farbe beziehen.

Prerequisites / notice Dozent: Dr. Markus Meyer, Emkamatik GmbH

Voraussichtlich ein oder zwei Gastvorträge von anderen Referenten.

EST I (Herbstsemester) kann als in sich geschlossene einsemestrige Vorlesung besucht werden. EST II (Frühjahrssemester) dient der weiteren Vertiefung der Fahrzeugtechnik und der Integration in die Bahinfrastruktur.

227-0618-00L Modeling, Characterization and Reliability of Power Semiconductors W 6 credits 4G M. P. M. Ciappa

Abstract This lecture provides theoretical and experimental knowledge on the techniques for the characterization and numerical modeling of power semiconductors, as well as on the related built-in reliability strategies.

Objective The students shall get acquainted with the most important concepts and techniques for characterization, numerical modeling and built-in reliability of modern power semiconductor devices. This knowledge is intended to provide the future engineer with the theoretical background and tools for the design of dependable power devices and systems.

Content This lecture consists of a theoretical part (50%) and of laboratory exercises and demonstrations (50%). The theoretical part covers the basic techniques and procedures for characterization, modeling and built-in reliability of modern power semiconductor devices with special attention to MOS and IGBT. The starting part on technology provides an overview on the main device families and includes a review of the most relevant application-oriented aspects of the device physics, thermal management, and packaging. The second section deals with the basic experimental characterization techniques for the definition of the semiconductor material properties, electrical characteristics, safe operating area, and junction temperature of the devices. The following section introduces the basic principles for electrical, thermal, and electro-thermal simulation of power semiconductors by Technology Computed Aided Design (TCAD) and compact modeling. Finally, procedures are methods to present and implement efficient built-in reliability programs targeted on power semiconductors. They include failure physics, dedicated failure analysis techniques, accelerated testing, defect screening, and lifetime modeling. During the laboratory activities, selections of the experimental techniques presented in the lecture are demonstrated on the base of realistic examples. Furthermore, schematic power devices will be simulated by the students with advanced TCAD tools and circuit simulators.

Lecture notes Handouts to the lecture (approx. 250 pp.)
227-0697-00L Industrial Process Control

Abstract: Introduction to process automation and its application in process industry and power generation

Objective: Knowledge of process automation and its application in industry and power generation

Content: Introduction to process automation: system architecture, data handling, communication (fieldbusses), process visualization, engineering, etc.; Analysis and design of open loop control problems: discrete automata, decision tables, petri-nets, drive control and object oriented function group automation philosophy, RT-UML; Engineering: Application programming in IEC61131-3 (function blocks, sequence control, structured text); process visualization and operation; engineering integration from sensor, cabling, topology design, function, visualization, diagnosis, to documentation; Industry standards (e.g. OPC, Profibus); Ergonomic design, safety (IEC61508) and availability, supervision and diagnosis. Practical examples from process industry, power generation and newspaper production.

Lecture notes: Slides will be available as .PDF documents, see "Learning materials" (for registered students only)

Prerequisites / notice: Practical exercises will illustrate some topics, e.g. some control software coding using industry standard programming tools based on IEC61131-3.

227-0759-00L International Business Management for Engineers

Abstract: Globalization of markets increases global competition and requires enterprises to continuously improve their performance to sustainably survive. Engineers substantially contribute to the success of an enterprise provided they understand and follow fundamental international market forces, economic basics and operational business management.

Objective: The goal of the lecture is to get a basic understanding of international market mechanisms and their consequences for a successful enterprise. Students will learn by practical examples how to analyze international markets, competition as well as customer needs and how they convert into a successful portfolio an enterprise offers to the global market. They will understand the basics of international business management, why efficient organizations and effective business processes are crucial for the successful survival of an enterprise and how all this can be implemented.

Content: The first part of the course provides an overview about the development of international markets, the expected challenges and the players in the market. The second part is focusing on the economic aspects of an enterprise, their importance for the long term success and how to effectively manage an international business. Based on these fundamentals the third part of the course explains how an innovative product portfolio of a company can be derived from considering the most important external factors and which consequences in respect of product innovation, competitive product pricing, organization and business processes emerge. Each part of the course includes practical examples to demonstrate the procedure.

Lecture notes: A script is provided for this lecture.

Prerequisites / notice: The lecture will be held in three blocks each of them on a Saturday. Each block will focus on one of the three main topics of the course. Between the blocks the students will work on specific case studies to deepen the subject matter. About two weeks after the third block a written examination will be conducted.

151-0563-01L Dynamic Programming and Optimal Control

Abstract: Introduction to Dynamic Programming and Optimal Control

Objective: Covers the fundamental concepts of Dynamic Programming & Optimal Control.

Content: Dynamic Programming Algorithm; Deterministic Systems and Shortest Path Problems; Infinite Horizon Problems, Bellman Equation; Deterministic Continuous-Time Optimal Control.

Prerequisites / notice: Requirements: Knowledge of advanced calculus, introductory probability theory, and matrix-vector algebra.

**Systems and Control**

**Core Subjects**

These core subjects are particularly recommended for the field of "Systems and Control".

<td>227-0102-00L</td>
<td>Discrete Event Systems</td>
<td>W</td>
<td>6</td>
<td>4G</td>
<td>L. Thiele, L. Vanbever, R. Wattenhofer</td>
</tr>
</tbody>
</table>

**Abstract**
Introduction to discrete event systems. We start out by studying popular models of discrete event systems. In the second part of the course we analyze discrete event systems from an average-case and from a worst-case perspective. Topics include: Automata and Languages, Specification Models, Stochastic Discrete Event Systems, Worst-Case Event Systems, Verification, Network Calculus.

**Objective**
Over the past few decades the rapid evolution of computing, communication, and information technologies has brought about the proliferation of new dynamic systems. A significant part of activity in these systems is governed by operational rules designed by humans. The dynamics of these systems are characterized by asynchronous occurrences of discrete events, some controlled (e.g. hitting a keyboard key, sending a message), some not (e.g. spontaneous failure, packet loss).

The mathematical arsenal centered around differential equations that has been employed in systems engineering to model and study processes governed by the laws of nature is often inadequate or inappropriate for discrete event systems. The challenge is to develop new modeling frameworks, analysis techniques, design tools, testing methods, and optimization processes for this new generation of systems.

In this lecture we give an introduction to discrete event systems. We start out the course by studying popular models of discrete event systems, such as automata and Petri nets. In the second part of the course we analyze discrete event systems. We first examine discrete event systems from an average-case perspective: we model discrete events as stochastic processes, and then apply Markov chains and queuing theory for an understanding of the typical behavior of a system. In the last part of the course we analyze discrete event systems from a worst-case perspective using the theory of online algorithms and adversarial queuing.

**Content**
1. Introduction
2. Automata and Languages
3. Smarter Automata
4. Specification Models
5. Stochastic Discrete Event Systems
6. Worst-Case Event Systems
7. Network Calculus

**227-0447-00L Image Analysis and Computer Vision**

**Abstract**

**Objective**
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.
### Cell and Molecular Biology for Engineers I

**Course Code:** 227-0526-00L  
**Credit:** 6  
**Instructor:** G. Hug

**Objective:**  
The goal of this course is understanding the stationary and dynamic problems in electrical power systems. The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of large linear and non-linear systems of equations related to electrical power networks.

**Content:**  
The electrical power transmission system, the energy management system, requirements of the electrical power transmission (demand oriented, operationally, economically), network planning and network operation, models of N-port network components (line, cables, shunts, transformers), the p.u. computation, computer oriented network models, linear networks (solution methods - direct, iterative), algorithms for the solution of non-linear sets of equations, derived from the electrical power system (Newton-Raphson), power flow computation (problem definition, solution methods), three phase short-circuit computation, application of power flow algorithms. Introduction to power system stability.

**Prerequisites:**  
Control systems (227-0216-00L) or equivalent.

**Literature:**  

**Lecture notes:**  
Lecture notes. Course is supported by WWW-teaching system.

Content

Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

- Biomedical Engineering, Robotics, Systems and Control
- Medical Faculty, University of Zurich
Students of other departments, faculties, courses are also welcome
This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

401-0647-00L Introduction to Mathematical Optimization W 5 credits 2V+1U D. Adjiashvili
Introduction to basic techniques and problems in mathematical optimization, and their applications to problems in engineering.

The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

Topics covered in this course include:
- Linear Programming (simplex method, duality theory, shadow prices, ...);
- Basic Combinatorial Optimization problems (spanning trees, network flows, knapsack problem, ...);
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

Information about relevant literature will be given in the lecture.

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advanced lecture covering similar topics and more.

401-3901-00L Mathematical Optimization
W 11 credits 4V+2U R. Weismantel

Objective
Advanced optimization theory and algorithms.

Content
1. Linear Optimization: The geometry of linear programming, the simplex method for solving linear programming problems, Farkas’ Lemma and infeasibility certificates, duality theory of linear programming.
3. Integer optimization: Ties between linear and integer optimization, total unimodularity, complexity theory, cutting plane theory.
4. Combinatorial optimization: Network flow problems, structural results and algorithms for matroids, matchings and, more generally, independence systems.

636-0007-00L Computational Systems Biology
W 6 credits 3V+2U J. Stelling

Objective
The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

Content
Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label “Systems Biology”, focuses on how networks, which are more than the mere sum of their parts’ properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

<tr>
<td>Abstract</td>
<td>This lecture provides deeper knowledge on the possible applications of virtual reality, its basic technology, and future research fields. The goal is to provide a strong knowledge on Virtual Reality for a possible future use in business processes.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Virtual Reality can not only be used for the visualization of 3D objects, but also offers a wide application field for small and medium enterprises (SME). This could be for instance an enabling technology for net-based collaboration, the transmission of images and other data, the interaction of the human user with the digital environment, or the use of augmented reality systems. The goal of the lecture is to provide a deeper knowledge of today's VR environments that are used in business processes. The technical background, the algorithms, and the applied methods are explained more in detail. Finally, future tasks of VR will be discussed and an outlook on ongoing international research is given.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Content
Introduction into Virtual Reality; basics of augmented reality; interaction with digital data, tangible user interfaces (TUI); basics of simulation; compression procedures of image-, audio-, and video signals; new materials for force feedback devices; introduction into data security; cryptography; definition of free-form surfaces; digital factory; new research fields of virtual reality

Lecture notes
The handout is available in German and English.

Prerequisites / notice
Prerequisites:
"Visualization, Simulation and Interaction - Virtual Reality I" is recommended.

Didactical concept:
The course consists of lectures and exercises.

Abstract
The 4 hour lecture covers the basics of writing & presenting a scientific text. The focus will be on the structure and elements of a scientific text and not on the language. Citation rules, good practice of scientific writing and an overview on software tools will be part of the training.

Objective
Knowledge on structure and content of a scientific text. The course further is arranged to stimulate a discussion on how to properly write a legible scientific text versus writing an interesting novel. We will further discuss the practice of properly citing and critically reflect on recent plagiarism allegations.

Content
* Topic 1: Structure of a Scientific Text (The Title, the author list, the abstract, State-of-the-Art, the “in this paper” paragraph, the scientific part, the summary, Equations, Figures).
* Topic 2: Power Point Presentations.
* Topic 3: Citation Rules and Citation Software.
* Topic 4: Guidelines for Research Integrity.

Literature
ETH "Citation Etiquette", see www.plagiate.ethz.ch.

Prerequisites / notice
Students should already have a Bachelor degree and plan to do either a semester project or a master thesis in the immediate future.

Abstract
The course introduces some fundamental topics of digital signal processing with a bias towards applications in communications: discrete-time linear filters, equalization, DFT, discrete-time stochastic processes, elements of detection theory and estimation theory, LMMSE estimation and LMMSE filtering, LMS algorithm, Viterbi algorithm.

Objective
The course introduces some fundamental topics of digital signal processing with a bias towards applications in communications. The two main themes are linearity and probability. In the first part of the course, we deepen our understanding of discrete-time linear filters. In the second part of the course, we review the basics of probability theory and discrete-time stochastic processes. We then discuss some basic concepts of detection theory and estimation theory, as well as some practical methods including LMMSE estimation and LMMSE filtering, the LMS algorithm, and the Viterbi algorithm. A recurrent theme throughout the course is the stable and robust "inversion" of a linear filter.

Content
1. Discrete-time linear systems and filters: state-space realizations, z-transform and spectrum, decimation and interpolation, digital filter design, stable realizations and robust inversion.
2. The discrete Fourier transform and its use for digital filtering.
3. The statistical perspective: probability, random variables, discrete-time stochastic processes; detection and estimation: MAP, ML, Bayesian MMSE, LMMSE; Wiener filter, LMS adaptive filter, Viterbi algorithm.

Lecture notes
Lecture Notes.
Content
- discussion of the field equations relevant for high voltage engineering.
- analytical and numerical solutions/solving of this equations, as well as the derivation of the important equivalent circuits for the description of the fields and losses in insulations
- introduction to kinetic theory of gases
- mechanisms of the breakdown in gaseous, liquid and solid insulations, as well as insulation systems
- methods for the mathematical determination of the electric withstand of gaseous, liquid and solid insulations
- application of the expertise on high voltage components
- excursions to manufacturers of high voltage components
- exercise to learn on computer-modeling in high voltage engineering

<td>This year the UN Conference in Paris will shape future world objectives to tackle climate change. This course provides an introduction to the notion of sustainable development when applied to our built environment</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Objective

At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmental aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

Content

The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development
- Case Study 1: Sustainable construction, the role of construction industry (national/international)
- Case Study 2: Cities, forms of settlements
- Case Study 3: Material resources, scenarios, energy, construction materials, urban metabolism
- Case Study 4: Buildings, heating/cooling, consumers, prosumers and other stakeholder, cooperations
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Economics for sustainable construction
- Method 3: Construction, flexibility, modularity
- Synthesis 1: Climate Change mitigation and adaptation in cities
- Synthesis 2: Transition to sustainable development

Lecture notes

All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature

A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

151-0123-00L Experimental Methods for Engineers W 4 credits 2V+2U T. Rösgen, R. S. Abhari, K. Boulouchos, D. J. Norris, H.M. Prasser, A. Steinfeld

Abstract

The course presents an overview of measurement tasks in engineering environments. Different concepts for the acquisition and processing of typical measurement quantities are introduced. Following an initial in-class introduction, laboratory exercises from different application areas (especially in thermofluidics and process engineering) are attended by students in small groups.

Objective

Introduction to various aspects of measurement techniques, with particular emphasis on thermo-fluidic applications. Understanding of various sensing technologies and analysis procedures. Exposure to typical experiments, diagnostics hardware, data acquisition and processing. Study of applications in the laboratory. Fundamentals of scientific documentation & reporting.

Content

In-class introduction to representative measurement techniques in the research areas of the participating institutes (fluid dynamics, energy technology, process engineering)

Student participation in 8-10 laboratory experiments (study groups of 3-5 students, dependent on the number of course participants and available experiments)

Lab reports for all attended experiments have to be submitted by the study groups.

A final exam evaluates the acquired knowledge individually.

Lecture notes

Presentations, handouts and instructions are provided for each experiment.

Literature

Prerequisites / notice

Basic understanding in the following areas:
- fluid mechanics, thermodynamics, heat and mass transfer
- electrical engineering / electronics
- numerical data analysis and processing (e.g. using MATLAB)

151-0163-00L Nuclear Energy Conversion W 4 credits 2V+1U H.M. Prasser

Abstract

Physical fundamentals of the fission reaction and the sustainable chain reaction, thermal design, construction, function and operation of nuclear reactors and power plants, light water reactors and other reactor types, conversion and breeding

Objective

Students get an overview on energy conversion in nuclear power plants, on construction and function of the most important types of nuclear reactors with special emphasis to light water reactors. They obtain the mathematical/physical basis for quantitative assessments concerning most relevant aspects of design, dynamic behaviour as well as material and energy flows.

Content

Nuclear physics of fission and chain reaction. Thermodynamics of nuclear reactors. Design of the reactor core. Introduction into the dynamic behaviour of nuclear reactors. Overview on types of nuclear reactors, difference between thermal reactors and fast breeders. Construction and operation of nuclear power plants with pressurized and boiling water reactors, role and function of the most important safety systems, special features of the energy conversion. Development tendencies of reactor technology.

Lecture notes

Hand-outs will be distributed. Additional literature and information on the website of the lab: https://www.ethz.ch/content/specialinterest/mavt/energy-technology/lab-of-nuclear-energy-systems/en/studium/teaching-materials/151-0163-00l-nuclear-energy-conversion.html

151-0185-00L Radiation Heat Transfer W 4 credits 2V+1U A. Steinfeld, A. Z’Graggen

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 540 of 1570
The course first reviews the governing equations and combustion chemistry, setting the ground for the analysis of homogeneous gas-phase mixtures, laminar diffusion and premixed flames. Catalytic combustion and its coupling with homogeneous combustion are dealt in detail, and turbulent combustion modeling approaches are presented. Available numerical codes will be used for modeling.

Number of participants limited to 20.

Objective

Learn the steps of turbomachinery design.

Content

Understand the principles, and learn the design procedures and the behaviour of turbomachines.

Lecture notes

Copy of the slides presented.

Literature

| Lecture notes | HANDOUTS are EXCLUSIVELY IN GERMAN ONLY, however recommendations for English text books will be provided. |

Content

1 Einführung:
1.1 Geschichte und Struktur des Bahnsystems
1.2 Fahrdynamik

2 Vollbahnfahrzeuge:
2.1 Mechanik: Kasten, Drehgestelle, Lauftechnik, Adhäsion
2.2 Bremsen
2.3 Traktionsantriebssysteme
2.4 Hilfsbetriebe und Komfortanlagen
2.5 Steuerung und Regelung

3 Infrastruktur:
3.1 Fahrweg
3.2 Bahnstromversorgung
3.3 Sicherungsanlagen

4 Betrieb:
4.1 Interoperabilität, Normen und Zulassung
4.2 RAMS, LCC
4.3 Anwendungsbeispiele

Voraussichtlich ein oder zwei Gastreferate

Geplante Exkursionen:
- Betriebszentrale SBB, Zürich Flughafen
- Reparaturlager und Unterhalt, SBB Zürich Altstetten
- Fahrzeuglager, Stadler Bussnang

Lecture notes

Abgabe der Unterlagen (gegen eine Schutzgebühr) zu Beginn des Semesters. Rechtzeitig eingeschriebene Teilnehmer können die Unterlagen auf Wunsch und gegen eine Zusatzgebühr auch in Farbe beziehen.

Prerequisites / notice

Dozent:
Dr. Markus Meyer, Emkamatik GmbH

Voraussichtlich ein oder zwei Gastvorträge von anderen Referenten.

EST I (Herbstsemester) kann als in sich geschlossene einsemestrige Vorlesung besucht werden. EST II (Frühjahrssemester) dient der weiteren Vertiefung der Fahrzeugtechnik und der Integration in die Bahninfrastruktur.

---

227-0526-00L  Power System Analysis

Abstract
The goal of this course is understanding the stationary and dynamic problems in electrical power systems. The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of large linear and non-linear systems of equations related to electrical power networks.

Objective
The goal of this course is understanding the stationary and dynamic problems in electrical power systems. The course includes the development of stationary models of the electrical network, their mathematical representation and special characteristics and solution methods of large linear and non-linear systems of equations related to electrical power networks.

Content
The electrical power transmission system, the energy management system, requirements of the electrical power transmission (demand oriented, operationally, economically), network planning and network operation, models of N-port network components (line, cables, shunts, transformers), the p.u. computation, computer oriented network models, linear networks (solution methods - direct, iterative), algorithms for the solution of non-linear sets of equations, derived from the electrical power system (Newton-Raphson), power flow computation (problem definition, solution methods), three phase short-circuit computation, application of power flow algorithms. Introduction to power system stability.

Lecture notes
Lecture notes. Course is supported by WWW-teaching system.

227-0731-00L  Power Market I - Portfolio and Risk Management

Abstract
Portfolio and risk management in the electrical power business, Pan-European power market and trading, futures and forward contracts, hedging, options and derivatives, performance indicators for the risk management, modelling of physical assets, cross-border trading, ancillary services, balancing power market, Swiss market model

Objective
Lecture notes will be distributed electronically during the course. A script is provided for this lecture.

- Renewables Energy Technologies I
- International Business Management for Engineers

### Content

1. Pan-European power market and trading
   1.1. Power trading
   1.2. Development of the European power markets
   1.3. Energy economics
   1.4. Spot and OTC trading
   1.5. European energy exchange EEX

2. Market model
   2.1. Market place and organisation
   2.2. Balance groups / balancing energy
   2.3. Ancillary services
   2.4. Market for ancillary services
   2.5. Cross-border trading
   2.6. Capacity auctions

3. Portfolio and Risk management
   3.1. Portfolio management 1 (introduction)
   3.2. Forward and futures contracts
   3.3. Risk management 1 (m2m, VaR, hpfc, volatility, cVaR)
   3.4. Risk management 2 (PaR)
   3.5. Contract valuation (HPFC)
   3.6. Portfolio management 2
   2.8. Risk Management 3 (enterprise wide)

4. Energy & Finance I
   4.1. Options 1 basics
   4.2. Options 2 hedging with options
   4.3. Introduction to derivatives (swaps, cap, floor, collar)
   4.4. Financial modelling of physical assets
   4.5. Trading and hydro power
   4.6. Incentive regulation

### Handouts of the lecture

Lecture notes: A script is provided for this lecture.

### Prerequisites / notice

Prerequisites: 1 excursion per semester, 2 case studies, guest speakers for specific topics.

Course Moodle: https://moodle-app2.let.ethz.ch/course/view.php?id=2196

### Abstract

- **International Business Management for Engineers**: Globalization of markets increases global competition and requires enterprises to continuously improve their performance to sustainably survive. Engineers substantially contribute to the success of an enterprise provided they understand and follow fundamental international market forces, economic basics and operational business management.

---

### Literature

### Prerequisites / notice

Prerequisites: Fundamentals of chemistry, physics and thermodynamics are a prerequisite for this course.

Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.
Implementation of Environmental and other Sustainability Goals

**Objective**
To provide understanding of how sustainability can be made operational in an organisation. To do so, students will understand how to integrate sustainability thinking into the typical current organisational environment and processes, such as planning, implementing and controlling.

**Content**
We meet for five 3-hour-lectures, with discussions and case studies during course time. Additionally, small case studies in-between courses will be given at most course days.

Course topics are:
- Sustainable Development and its meaning for Management
- Management Standards for Sustainability (ISO and others)
- Sustainability Opportunities and Innovation
- Organisation and Implementation
- The concept of 'Continuous Improvement'
- Environmental Performance Measurement (Concepts, Standards, Methods)
- Life Cycle Costing, Life Cycle Management
- (Sustainable) Supply Chain Management
- Communication of Sustainability Issues

Lecture notes
Course documentation as well as case study descriptions will be provided during the course via the "ilias" repository.
There are two ways to approach the course's issues:

c) We will touch upon the hotel sustainable scheme and label "Ibex" see: http://www.e2mc.com/images/stories/e2_bilder/downloads/Umweltfocus_d.pdf (for an english version, pls contact the lecturer at arthurb@ethz.ch)

Prerequisites / notice
If you have specific interests or questions, let me know at arthurb@ethz.ch. Maybe I can include your issues - or I can't :-)

151-0360-00L

Procedures for the Analysis of Structures

W 4 credits 2V+1U G. Kress

Abstract
Basic theories for structure integrity calculations are presented with focus on strength, stability, fatigue and elasto-plastic structural analysis.

Theories and models for one dimensional and planar structures are presented based on energy theorems.

Objective
Basic principles applied in structural mechanics. Introduction to the theories of planar structures. Development of an understanding of the relationship between material properties, structural theories and design criteria.

Content
1. Basic problem of continuum mechanics and energy principles: structural theories, homogenization theories; finite elements; fracture mechanics.
3. Strength of material theories and material properties: ductile behaviour, plasticity, von Mises, Tresca, principal stress criterion; brittle behaviour; viscoplastic behaviour, creep resistance.
4. Structural design: fatigue and dynamic structural analysis.

Lecture notes
yes

151-0524-00L

Continuum Mechanics I

W 4 credits 2V+1U E. Mazza

Abstract
The lecture deals with constitutive models that are relevant for design and calculation of structures. These include anisotropic linear elasticity, linear viscoelasticity, plasticity, viscoplasticity. Homogenization theories and laminate theory are presented. Theoretical models are complemented by examples of engineering applications and experiments.

Objective
Basic theories for solving continuum mechanics problems of engineering applications, with particular attention to material models.

Content

Lecture notes
yes

151-0573-00L

System Modeling

W 4 credits 2V+2U G. Ducard, C. Onder

Abstract

Objective

Content
Introduction to generic system modeling approaches for control-oriented models based on first principles and on experimental data. Examples: mechatronic, thermodynamic, chemistry, fluid dynamic, energy, and process engineering systems. Model scaling, linearization, order reduction, and balancing. Estimation techniques (least-squares methods).

Class case studies: Loud-speaker, Water-propelled rocket, geostationary satellites, etc.

The exercises address practical examples. One larger case study is to be solved.

Lecture notes

Literature
The handouts in English will be sold in the first lecture.

A list of references is included in the handouts.

151-0593-00L

Embedded Control Systems

Abstract
This course provides a comprehensive overview of embedded control systems. The concepts introduced are implemented and verified on a microprocessor-controlled haptic device.

Objective
Familiarize students with main architectural principles and concepts of embedded control systems.

Content
An embedded system is a microprocessor used as a component in another piece of technology, such as cell phones or automobiles. In this intensive two-week block course the students are presented the principles of embedded digital control systems using a haptic device as an example for a mechatronic system. A haptic interface allows for a human to interact with a computer through the sense of touch.

Subjects covered in lectures and practical lab exercises include:
- The application of C-programming on a microprocessor
- Digital I/O and serial communication
- Quadrature decoding for wheel position sensing
- Queued analog-to-digital conversion to interface with the analog world
- Pulse width modulation
- Timer interrupts to create sampling time intervals
- System dynamics and virtual worlds with haptic feedback
- Introduction to rapid prototyping

Lecture notes
Lab instructions, supplemental material

Prerequisites / notice
Prerequisite courses are Control Systems I and Informatics I.

This course is restricted to 33 students due to limited lab infrastructure. Interested students please contact Marianne Schmid (E-Mail: marischm@ethz.ch)

After your reservation has been confirmed please register online at www.mystudies.ethz.ch.

Detailed information can be found on the course website http://www.idsc.ethz.ch/education/lectures/embedded-control-systems.html

151-0927-00L

Rate-Controlled Separations in Fine Chemistry

W 4 credits 3G M. Mazzotti

Abstract
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 546 of 1570
### Objective
The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

### Content
The class covers separation techniques that are central in the purification and downstream processing of chemicals and biopharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Liquid-liquid extraction; 2) Adsorption and chromatography; 3) Membrane processes; 4) Crystallization and precipitation.

### Lecture notes
Handouts during the class

### Literature
Recommendations for text books will be covered in the class

### Prerequisites / notice
Requirements: Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

### Literature recommendations will be distributed during the lecture

<table>

</table>

### Objective
- **Corporate Sustainability**
  - Understand the limits and the potential of corporate sustainability for sustainable development
  
  Develop critical thinking skills (argumentation, communication, evaluative judgment) that are useful in the context of corporate sustainability using an innovative writing and peer review method.
  
  Be able to recognize and realize opportunities for corporate sustainability in a business environment

- **Resource and Environmental Economics**
  - Understanding of the basic issues and methods in resource and environmental economics; ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

Specific topics include:

- Topics are: Introduction to resource and environmental economics
- Importance of resource and environmental economics
- Main issues of resource and environmental economics
- Normative basis
- Utilitarianism
- Fairness according to Rawls
- Economic growth and environment
- Externalities in the environmental sphere
- Governmental internalisation of externalities
- Private internalisation of externalities: the Coase theorem
- Free rider problem and public goods
- Types of public policy
- Efficient level of pollution
- Tax vs. permits
- Command and Control Instruments
- Empirical data on non-renewable natural resources
- Optimal price development: the Hotelling-rule
- Effects of exploration and Backstop-technology
- Effects of different types of markets.
- Biological growth function
- Optimal depletion of renewable resources
- Social inefficiency as result of over-use of open-access resources
- Cost-benefit analysis and the environment
- Measuring environmental benefit
- Measuring costs
- Concept of sustainability
- Technological feasibility
- Conflicts sustainability / optimality
- Indicators of sustainability
- Problem of climate change
- Cost and benefits of climate change
- Climate change as international ecological externality
- International climate policy: Kyoto protocol
- Implementation of the Kyoto protocol in Switzerland

*Data: 06.09.2017 12:54  Autumn Semester 2016  Page 547 of 1570*
This course aims to develop the competency of chemical engineers in process flowsheeting and simulation. Specifically, students will learn the following skills:

- Deep understanding of chemical engineering fundamentals: the acquisition of new concepts and the application of previous knowledge in the area of chemical process systems and their mechanisms are crucial to intelligently simulate and evaluate processes.
- Modelling of general chemical processes and systems: students have to be able to identify the boundaries of the system to be studied and develop the set of relevant mathematical relations, which describe the process behavior.
- Mathematical reasoning and computational skills: the familiarization with mathematical algorithms and computational tools is essential to be capable of achieving rapid and reliable solutions to simulation and optimization problems. Hence, students will learn the mathematical principles necessary for process simulation and optimization, as well as the structure and application of process simulation software. Thus, they will be able to develop criteria to correctly use commercial software packages and critically evaluate their results.

Commercial software for simulation: Aspen Plus
- Thermodynamic property methods
- Reaction and reactors
- Separation / columns
- Convergence & debugging

Prerequisites / notice
A basic understanding of material and energy balances, thermodynamic property methods and typical unit operations (e.g., reactors, flash separations, distillation/absorption columns etc.) is required.
The lecture Energy and Mobility imparts profound knowledge on how to reduce energy in mobility systems. Both Engineering science and Energy and Mobility.

Semester Project

The main objectives of this lecture are:

- To train students in solving specific problems from the field of Energy Science & Technology.
- To familiarize students with the technical and social skills acquired during the master's program.

The semester project is designed to train the students in solving specific problems from the field of Energy Science & Technology. This project uses the technical and social skills acquired during the master's program. The semester project is advised by a professor and must be approved in advance by the tutor.

Content

- Vorstellung der Dozierenden mit Fallstudie aus der persönlichen Berufspraxis (CH, RK, WL, FS)
- Resourcen der Welt und Bedeutung für die Schweiz (RK)
- Metallische Erzlagerstätten - Einführung (CH)
- Metallische Erzlagerstätten - Magmatische Prozesse Test 1 (CH)
- Ozeanische Hydrothermalsysteme, Oberflächenenergie und Atmosphärenentwicklung (CH)
- Metallische Erzlagerstätten - Magmatisch-hydrothermale Systeme Test 2 (CH)
- Energierohstoffe - Einführung; Bildungsprozesse Petroleum und Erdgas (WL)
- Energierohstoffe - Öl und Gas (WL)
- Energierohstoffe - Kohle und CO2-Entsorgung Test 3 (WL/RK)
- Nichtmetallische Rohstoffe - Baustoffe (RK)
- Nichtmetallische Rohstoffe - Erden (RK/FS)
- Nichtmetallische Rohstoffe - Industriemineralien Test 4 (FS)
- Industriemineralien und nachhaltige Nutzung von Rohstoffen der Erde (FS)

Lecture notes

Kursnotizen werden in den Stunden verteilt

Literature

Prerequisites

2G

The 4 hour lecture covers the basics of writing & presenting a scientific text. The focus will be on the structure and elements of a scientific text and not on the language. Citation rules, good practice of scientific writing and an overview on software tools will be part of the training. The lecture will be thought on two afternoons. Some exercises will be built into the lecture.

Abstract

The lecture Energy and Mobility imparts profound knowledge on how to reduce energy in mobility systems. Both Engineering science and social science aspects are integrated, as technological potentials, policy tools, and human decision making behaviour are combined in order to assess how to reduce energy demand for transport.

Objective

The main objectives of this lecture are:

(i) Students gain profound knowledge on how to frame problems related to the reduction of energy demand (or greenhouse gas emissions) of mobility (sub-)systems.
(ii) Students have an overview on the most relevant technological potentials (fuel-based and vehicle-based).
(iii) Students can assess whether a given reduction goal is ambitious or not, and whether given policy tools are adequate to reach the defined reduction goal.

Content

The lecture Energy and Mobility deals with the intersection of energy and transportation with focus on motorized individual transport. The lecture deals with the question, how the energy demand, or greenhouse gas emissions, of mobility can be reduced. A five step approach provides a common framework:

a) Status quo and Scope: Definition of the system boundary (whole transport system, or only road transport) and of the status quo of that system (energy demand and energy carrier mix for this system, current technology mix, transportation services provided);

b) Trends and Targets: Analysis of trend development of the mobility system under consideration, establishment of a trend scenario (baseline scenario). Definition of the reduction targets (expressed in terms of energy demand or greenhouse gas emissions; base year and target year; absolute or relative reduction target)

c) Potential Analysis: Analysis of currently employed technologies and of upcoming technologies. Identification of the reduction potential of current, conventional technologies and of future, alternative technologies. Technologies cover both the fuel and the vehicle side.

d) Policy Measures: Possible policy measures, direct, indirect and macro-level effects of policies, psychological aspects of decision making, elements of behavioral economics and prospect theory, combination of policies into policy mixes.

e) Effects and Side Effects: Forecasting the effects of policy measures, differentiation between effects that can be quantified and those that cannot. Identification of unintended (side) counter-effects like rebound effects and perverse incentives.

Multidisciplinary Courses

With the consent of the tutor, the students are free to choose individually from the entire course offer of ETH Zürich.

Course Catalogue of ETH Zurich

Semester Project

How to Write Scientific Texts in Engineering Sciences

Abstract

The 4 hour lecture covers the basics of writing & presenting a scientific text. The focus will be on the structure and elements of a scientific text and not on the language. Citation rules, good practice of scientific writing and an overview on software tools will be part of the training. The lecture will be thought on two afternoons. Some exercises will be built into the lecture.

Objective

Knowledge on structure and content of a scientific text. The course further is arranged to stimulate a discussion on how to properly write a legible scientific text versus writing an interesting novel. We will further discuss the practice of properly citing and critically reflect on recent plagiarism allegations.

Content

* Topic 1: Structure of a Scientific Text (The Title, the author list, the abstract, State-of-the-Art, the "in this paper" paragraph, the scientific part, the summary, Equations, Figures).

* Topic 2: Power Point Presentations.

* Topic 3: Citation Rules and Citation Software.

* Topic 4: Guidelines for Research Integrity.

Literature

ETH "Citation Etiquette", see www.plagiate.ethz.ch.

Prerequisites / notice

ETH Guidelines on "Guidelines for Research Integrity", see www.ee.ethz.ch > Education > Contact, links & documents > Forms and documents > Brochures / guides.

Semester Project

Registration in mystudien required!

Abstract

The semester project is designed to train the students in solving specific problems from the field of Energy Science & Technology. The project uses the technical and social skills acquired during the master’s program. The semester project is advised by a professor and must be approved in advance by the tutor.

**Abstract**
This course covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems - notably through ordinary differential equations.

**Objective**
Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

**Content**
1. Single-Variable Calculus:
   - review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.
   - 2. Linear Algebra and Complex Numbers:
     - systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.
   - 3. Ordinary Differential Equations:
     - separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.
     - Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).

**Literature**
- Brown, LeMay, Bursten CHEMIE (deutsch)
- Housecroft and Constable, CHEMISTRY (englisch)
- Octby, Gillis, Nachtrieb, MODERN CHEMISTRY (englisch)

**Prerequisites / notice**
Prerequisites: familiarity with the basic notions from Calculus, in particular those of function and derivative.

**Mathe-Lab (Assistance):**
Mondays 12-14, Tuesdays 17-19, Wednesdays 17-19, in Room HG E 41.

**Abstract**
Provides a basic introduction into Earth Sciences, emphasizing different rock-types and the geological rock-cycle, as well as introduction into geophysics and plate tectonic theory.

**Objective**
Understanding basic geological and geophysical processes

**Content**
Overview of the Earth as a system, with emphasis on plate tectonic theory and the geological rock-cycle. Provides a basic introduction to crystals and minerals and different rock-types. Lectures include processes in the Earth's interior, physics of the earth, planetology, introduction to magmatic, metamorphic and sedimentary rocks. Exercises are conducted in small groups to provide more in depth understanding of concepts and content of the lectures.

**Lecture notes**
werden abgegeben.

**Literature**

**Prerequisites / notice**
Exercises and short excursions in small groups (10-15 students) will be lead by student assistants. Specific topics in earth sciences will be discussed using examples and case studies. Hand samples of the major rock types will be described and interpreted. Short excursions in the region of Zurich will permit direct experience with earth science processes (e.g. earth surface processes) and recognition of earth science problems and solutions relevant for modern society (e.g. building materials, water resources). Working in small groups will allow for discussion and examination of actual earth science themes.

**Abstract**

This practical course provides an introduction to elementary laboratory techniques.

The experiments cover a wide range of techniques, including analytical and synthetic techniques (e.g. investigation of soil and water samples or the preparation of simple compounds). Furthermore, the handling of gaseous substances is practised.

**Objective**

This course is intended to provide an overview of experimental chemical methods.

The handling of chemicals and proper laboratory techniques represent the main learning targets. Furthermore, the description and recording of laboratory processes is an essential part of this course.

**Content**

The classification and analysis of natural and artificial compounds is a key subject of this course. It provides an introduction to elementary laboratory techniques, and the experiments cover a wide range of analytic and synthetic tasks:

- Selected samples (e.g. soil and water) will be analysed with various methods, such as titrations, spectroscopy or ion chromatography. The chemistry of aqueous solutions (acid-base equilibria and solvatisation or precipitation processes) is studied.
- The synthesis of simple inorganic complexes or organic molecules is practised.
- Furthermore, the preparation and handling of environmentally relevant gaseous species like carbon dioxide or nitrogen oxides is a central subject of the Praktikum.

**Lecture notes**

The script will be published on the web. Details will be provided on the first day of the semester.

**Literature**

A thorough study of all script materials is requested before the course starts.

---

Andrew Putnis

Hans-Rudolf Wenk, Andrei Bulak

Data Analysis and Visualisation with Matlab in Earth Sciences

Abstract
This lecture and the corresponding exercises provide the students with an introduction to the concepts and tools of scientific data analysis. Based on current questions in the Earth Sciences, the students solve problems of increasing complexity both in small groups and singly using the software package MATLAB. Students also learn how to effectively visualise different kinds of datasets.

Objective
The following concepts are introduced in the course:
- Effective data analysis and visualisation in 2D and 3D
- Working with matrices and arrays
- Programming and development of algorithms
- Learning to effectively use animations
- Statistical description of a dataset
- Interactive data-mining
- Uncertainty, error propagation and bootstrapping
- Regression analysis
- Testing hypotheses

ECTS: 2 credits
Hours: 4P
Lecturers: S. Wiemer, G. De Souza, T. Tormann

Laboratory Course in Physics for Students in Earth Sciences

Abstract
The central aim is to provide an individual experience of the physical phenomena and the basic principles of the experiment. By conducting simple physical experiments the student will learn how to properly use physical instruments and how to evaluate the results correctly.

Objective
This laboratory course aims to provide basic knowledge of:
- the setup of a physics experiment,
- the use of measurement instruments,
- various measuring techniques,
- the analysis or measurement errors,
- and the interpretation of the measured quantities.

Content
Fehlerrechnung, 9 ausgewählte Versuche zu folgenden Themen:

Die Auswahl der Versuche kann zwischen den verschiedenen Studienängen variieren.

ECTS: 3 credits
Hours: 4P
Lecturers: A. Biland, M. Doebeli, M. Münchn

Interpretation of Geological Maps I

Abstract
The general courses in Earth Sciences are offered in the 3rd and 4th semester. Out of 40 offered credits, 35 credits have to be acquired.

Objective

Content
- Symmetriener und Ordnung, Punktguppen, Translationsgruppen, Raumgruppen,
- einfache Strukturtypen, dichte Kugelpackungen, Strukturbestimmende Faktoren
- Chemisch Bindungen, Beziehungen zwischen Struktur und Eigenschaften eine Kristalls.
- Grundlagen von Thermodynamik und Computersimulationen in der Kristallographie.
- Einleitung in die Mineralogie und Mineralensystematik.
- Praktikum in Mineralbestimmen aufgrund makroskopischer Eigenschaften.

Literature
5. Hans-Rudolf Wenk, Andrei Bulakh

ECTS: 2 credits
Hours: 2P
Lecturers: M. Frehner

Data: 06.09.2017 12:54 Autumn Semester 2016 Page 553 of 1570
2010) and UZH Earth Sciences BSc, i.e. students in the third semester or higher.

Abstract
Introduction to reading and construction of simple geologic maps.
Construction of geological cross-sections.
Introduction to Lambert projection and Schmidt net (i.e., stereoplots).

This course is mainly a hands-on-training, where students solve exercises under supervision.

Objective
To improve the ability to understand geological structures in three dimensions and visualize them.

Learn how to read and interpret geological maps, as well as drawing geological cross-sections.

Learn the handling of the Schmidt net, so that students can later plot their own field data.

Content
strike lines, symbols
true and apparent thickness of geological units
true and apparent dip
V-rule
3-Point-Problems
unconformities
faults
introduction to the Lambert projection
folds
magmatic structures

Lecture notes
Exercises and instructions are handed out and are available online in Moodle.

Literature
Semester literature can be found in the ERDW-library.

Prerequisites / notice
This course is not a prerequisite, but nevertheless extremely helpful for the Terrainkurs II.

651-3323-00L Earth and Climate History W+ 3 credits 2G G. Haug
Course will no longer take place after HS16.

Abstract
The goal of the course is to give the students a perception of the major aspects of planetary history and to add to their curiosity about methods which can be applied in the investigations of more specific problems and to planetary features.

Objective

Content
Frühe Geschichte der Erde, der Litho-, Atmo- und Biosphäre; Phanerozoische Platten und Terranes; Entwicklung des Lebens im Phanerozoikum, Mesozoische Anoxia, Kreide-Tertiär-Grenze, Tertiäre Abkühlung, Messian-Salinitätskrise, Hominidenentwicklung, Quartäre Klimaschwankungen.

Lecture notes
Unterlagen werden abgegeben.

Literature

Examination Blocks

651-3341-00L Lithosphere O 3 credits 2V S. Wiemer, E. Kissling
Prerequisite: successful completion of Dynamic Earth I and II is mandatory.

Course will no longer take place after HS16.

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 554 of 1570
Comprehensive understanding of role and evolution of oceanic and continental lithosphere in global plate tectonics and evolution of earth. Understanding principles of theoretical and experimental geothermics and fundamentals of mantle and lithosphere rheologies.

Objective
Comprehensive understanding of role and evolution of oceanic and continental lithosphere in global plate tectonics and evolution of earth. Understanding principles of theoretical and experimental geothermics and fundamentals of mantle and lithosphere rheologies.

Content

Lecture notes
Detailed scriptum in digital form and additional learning modules (www.lead.ethz.ch) available on intranet.

see list in scriptum.

ECTS

N. Gruber

Understanding of basic physical and chemical processes in the atmosphere. Understanding of mechanisms of and interactions between: weather - climate, atmosphere - ocean - continents, troposphere - stratosphere. Understanding of environmentally relevant structures and processes on vastly differing scales. Basis for the modelling of complex interrelations in the atmosphere.

D. Vance

D. Byrne

The objective of the systems analysis course is to deepen and illustrate the mathematical concepts on the basis of a series of very concrete examples. Topics covered include: linear box models with one or several variables, non-linear box models with one or several variables, time-discrete models, and continuous models in time and space.

W. H. Wernli

C. Roques

Understanding of basic physical and chemical processes in the atmosphere. Understanding of mechanisms of and interactions between: weather - climate, atmosphere - ocean - continents, troposphere - stratosphere. Understanding of environmentally relevant structures and processes on vastly differing scales. Basis for the modelling of complex interrelations in the atmosphere.

Detailed scriptum in digital form and additional learning modules (www.lead.ethz.ch) available on intranet.

2V

Atmosphere

H. Wernli, E. M. Fischer, T. Peter

Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

ECTS

O

3 credits

2V

H. Wernli

Basic principles of the atmosphere, physical structure and chemical composition, trace gases, atmospheric cycles, circulation, stability, radiation, condensation, clouds, oxidation capacity and ozone layer.

Lecturers

In addition to the suggested literature handouts are distributed.

Lecture notes

http://www.up.ethz.ch/education/systems-analysis.html

Case studies

- ground water use
- hydrochemistry and tracer
- aquifers and their properties
- ground water hydraulics, Darcy's law
- aqifers and their properties
- hydrochemistry and tracer
- ground water use

Literature

Isotope Geochemistry and Isotope Geology

W+ 3 credits

2G

S. Bernasconi, D. Vance

The course focuses on the most important systems of radioactive and stable isotopes used in geochemistry and geology. Applications of isotope geochemistry for solving fundamental geological problems are discussed on the basis of case studies.

Objective
Development of a basic knowledge and understanding of the applications of the most important systems of stable and radiogenic isotopes.

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 555 of 1570
The following methods will be discussed in detail: the radioactive-radiogenic systems Rb-Sr, Sm-Nd, U-Th-Pb and K-Ar, as well as the stable isotope systems of oxygen, carbon, nitrogen, sulfur and hydrogen.

We will discuss how these methods are used in the following research fields: geochemistry of the earth, age dating, paleotemperature reconstructions, evolution of the crust and mantle reservoirs, sediment diagenesis, fluid rock interactions, hydrothermal activity, paleoceanography, biogeochemical cycles.

**Lecture notes**: Available

**Literature**

- Dickin A. P., Radiogenic Isotope Geology, (2005), Cambridge University Press

William White (2011). Geochemistry

**Prerequisites / notice**

Geochemie I: (Bachelor course)

---

**651-3503-00L** Metamorphism

**W+** 3 credits 3G  M. W. Schmidt

**Abstract**

Understanding of the principles governing (chemical) reactions in metamorphic processes and resulting (physical) properties of metamorphic rocks s.l.. Recognition of metamorphic minerals and rocks (e.g. Gesteinsbestimmung)

---

**651-3505-00L** Mineral Resources

**W+** 3 credits 2V  C. A. Heinrich, R. Kündig, W. Leu, F. Schenker

**Abstract**

Overview of the geological formation processes and the global distribution of mineral resources (metals, energy resources, bulk materials and industrial minerals), their economic importance, as well as the political and environmental aspects of responsible resource extraction and site rehabilitation.

**Objective**

**Content**

- Vorstellung der Dozierenden aus der persönlichen Berufspraxis (CH, RK, WL, FS)
- Resourcen der Welt und Bedeutung für die Schweiz (RK)
- Metallische Erzlagerstätten - Einführung (CH)
- Metallische Erzlagerstätten - Magmatische Prozesse Test 1 (CH)
- Oceanische Hydrothermal Systeme, Oberflächenerze und Atmosphärenentwicklung (CH)
- Metallische Erzlagerstätten - Magmatisch-hydrothermale Systeme Test 2 (CH)
- Energierohstoffe - Einführung; Bildungsprozesse Petroleum und Erdgas (WL)
- Energierohstoffe - Oel und Gas (WL)
- Energierohstoffe - Kohle und CO2-Entsorgung Test 3 (WL/RK)
- Nichtmetallische Rohstoffe - Baustoffe (RK)
- Nichtmetallische Rohstoffe - Erden (RK/FS)
- Nichtmetallische Rohstoffe - Industriemineralien Test 4 (FS)
- Industriemineralien und nachhaltige Nutzung von Rohstoffen der Erde (FS)

**Lecture notes**

Kursnotizen werden in den Stunden verteilt

**Literature**

**Prerequisites / notice**

---

**651-3521-00L** Tectonics

**W+** 3 credits 2V  J.P. Burg, E. Kissling

**Abstract**

Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alps-Himalaya orogenic system.

**Objective**

Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Assessment of mechanisms responsible for plate movements (the Earth as a heat transfer machine, dynamics of earth mantle, plate driving forces) and subsequent large-scale structures (oceanic basins and cycle of the oceanic lithosphere, convergence and mountain systems and continental growth, etc) through theoretical and experimental information. Evaluation of plate tectonic and other orogenic processes through the study of reference examples taken in Alps-Himalaya orogenic system.

**Content**

- Plate tectonic frame work: earth cooling and mantle-plate interaction, three kinds of plate boundaries and their roles and characteristics, cycle of oceanic lithosphere, longevity and growth of continents, supercontinents. Rheology of layered lithosphere and upper mantle. Obduction systems Collisions systems Extensional systems Basin evolution Passive and active continental margin evolution

**Lecture notes**

Detailed scriptum in digital form and additional learning moduls (www.lead.ethz.ch) available on the intranet.

**Literature**

651-3523-00L Hydrogeology and Quaternary Geology W+ 3 credits 2G M. Kleipikova, P. Haldimann, S. Ivy Ochs

Abstract
This course provides the basics of quaternary geology and an overview of the aspects of the hydrogeology of quaternary sediments and karst within Switzerland.

Objective
- Become familiar with the processes that formed the landscapes during the last 2 Mio. years.
- Understand the types of landscape in the forming quaternary sediments.
- Get insight into the role of the quaternary aquifers and apply fundamental hydrogeological techniques.
- Learn about the risk exposure of aquifers and ways to protect
- Familiarize with the concepts for characterization of fractured and karst aquifers

Content
Erforschungsgeschichte und Gliederung des Quartärs. Klimaentwicklung.
Prozesse während Kaltezeiten (Eisvorsprünge, glaziale Erosion) und während Warmzeiten (Sedimentation, fluviale Erosion) (mit Übungen).
Quartäre Geomorphologie, quartäre Ablagerungen (mit Übungen).
Entwicklungsgeschichte der Täler in den Alpen und im Alpenvorland (mit Übungen).
Altersbestimmungen, Quartärstratigraphische Methoden. Stratigraphie der Talfüllungen.
Wiederholung Hydrogeologischer Grundlagen.
Grundwasservorkommen der Schweiz (mit Übungen).
Hydrogeologie quartärer Ablagerungen (namentlich fluvioglaziale Schotter).
Nutzung und Bewirtschaftung der Grundwasservorkommen in quartären Ablagerungen (mit Übungen).
Grundwassernutzung im Hauptsiedlungsraum der Schweiz.
Gefährdung und Schutz der Grundwasservorkommen in quartären Lockergesteinen (mit Übungen).
Einführung in die Hydrogeologie von Karst- und Grundwasserleitern (mit Übung).

Lecture notes
Während der Vorlesung werden die wichtigsten Daten und Fakten auf Blättern abgegeben und im Internet zum Download bereitgestellt.

Literature
Zahlreiche Publikationen des BAFU zur Hydrologie und Hydrogeologie der Schweiz

Prerequisites / notice
Voraussetzung erfolgreicher Abschluss von 701-0401-00 Hydrospäre

651-3525-00L Introduction to Engineering Geology W+ 3 credits 3G S. Löw

Abstract
This introductory course starts from a descriptions of the behavior and phenomena of soils and rocks under near surface loading conditions and their key geotechnical properties. Lab and field methods for the characterization of soils, rocks and rock masses are introduced. Finally practical aspects of ground engineering, including tunneling and landslide hazards are presented.

Objective
Understanding the basic geotechnical and geomechanical properties and processes of rocks and soils. Understanding the interaction of rock and soil masses with technical systems. Understanding the fundamentals of geotechnical hazards.

Content

Lecture notes
Written course documentation available under "Kursunterlagen".

Literature

651-3527-00L Earth Science Mapping Exercises II W+ 2 credits 2P J.P. Burg

Abstract
Reading and interpretation of geological and climatological maps.

Objective
Reading and interpretation of geological and climatological maps.

Content
Advanced analysis of geological maps and construction of geological sections. Special points: normal faults of the Rheintal graben, Bull Lake West (USA), Val de Ruz, Helvetic nappes of the Säntis area. Reconstruction of the geological history of the map areas. References to the Geology of Switzerland.

Lecture notes
Exercises and instructions are handed out.

651-3541-00L Exploration and Environmental Geophysics W+ 4 credits 3V F. Broglini, J. Doetsch

Abstract
Overview and understanding of the most important geophysical methods: Potential field methods (Gravimetrics and Magnetics), Electrical and electromagnetic methods, Refraction and reflection seismics, Georadar. Discussion of survey design, sources and receivers and data processing.

Objective
Overview and understanding of the most important geophysical methods. Proposed solutions to assess and observe problems relevant to exploration and environmental geophysics in soil, ice and lithosphere at different scales. Getting familiar with measuring- and interpretation procedures. Pointing out the possibilities and limitations of geophysical methods.

Content

Lecture notes
Available through eDoz/ILIAS.

Additional material will be provided by the lecturers.
## Major in Geology: Compulsory Laboratory Courses

These practical courses are mandatory for the BSc-specializations "geology" and "geophysics".

## Major in Geology: Electives

From the offered elective courses in autumn and spring semester 8 credits must be acquired. Primarily courses from the core courses of BSc Earth Sciences have to be selected. Other elective courses from the ETH and University of Zurich are possible, however they must be granted by the advisor of geology (Professor Stefano Bernasconi).

Prerequisites / notice
Voraussetzung erfolgreicher Abschluss von 701-0401-00 Hydrospäre

Primarily core courses of the BSc Earth Sciences majors should be chosen.

651-3561-00L Cryosphere W 3 credits
Objective
Students are able
- to qualitatively describe the main components of the cryosphere and their role in the climate system
- to formally describe the relevant physical processes which determine the state of cryosphere components

Content
Introduction into the different components of the Cryosphere: Snow, glaciers, sea ice and permafrost, and their roles in the climate system. Each part is used to emphasize on one specific physical aspect: material qualities of ice, mass balance and dynamics of glaciers and energy balance of sea ice.

Lecture notes
handouts will be distributed during the teaching semester

651-3527-00L Earth Science Mapping Exercises II W 2 credits
Objective
Reading and interpretation of geological and climatological maps.

Content
Advanced analysis of geological maps and construction of geological sections. Special points: normal faults of the Rheintal graben, Bull Lake West (USA), Val de Ruz, Helvetic nappes of the Säntis area. Reconstruction of the geological history of the map areas. References to the Geology of Switzerland.

Introduction to generation of climatological maps. Analysis of synoptic scale patterns of air pressure and temperature advection on the surface and one upper air level. (Hydrostatic) Conclusions about vertical stratification of the atmosphere. Elementary prognostic interpretation. Inclusion of special actually weather phenomenon.

Lecture notes
Exercises and instructions are handed out.

Prerequisites / notice
Requirement: Earth science mapping exercises I

651-3525-00L Introduction to Engineering Geology W 3 credits
Objective
Understanding the basic geotechnical and geomechanical properties and processes of rocks and soils.

Content

Lecture notes
Written course documentation available under "Kursunterlagen".

Literature

Major in Geophysics

Advisor of the major geophysics is Prof. Taras Gerya.

Major in Geophysics: Core Courses

From the offered core courses in autumn and spring semester, 27 credits have to be acquired.

Abstract
Overview and understanding of the most important geophysical methods: Potential field methods (Gravimetrics and Magnetics), Electrical and electromagnetic methods, Refraction and reflection seismic, Georadar. Discussion of survey design, sources and receivers and data processing.

Objective
Overview and understanding of the most important geophysical methods. Proposed solutions to assess and observe problems relevant to exploration and environmental geophysics in soil, ice and lithosphere at different scales. Getting familiar with measuring- and interpretation procedures. Pointing out the possibilities and limitations of geophysical methods.

Content
Seismology

Objectives: General knowledge of seismology.

Available through eDoz/ILIAS.

Earth Science Mapping Exercises II

Objectives: Reading and interpretation of geological and climatological maps.

Advanced analysis of geological maps and construction of geological sections. Special points: normal faults of the Rheintal graben, Bull Lake West (USA), Val de Ruz, Helvetic nappes of the Säntis area. Reconstruction of the geological history of the map areas. References to the Geology of Switzerland.

Introduction to generation of climatological maps. Analysis of synoptic scale patterns of air pressure and temperature advection on the surface and one upper air level. (Hydrostatic) Conclusions about vertical stratification of the atmosphere. Elementary prognostic interpretation. Inclusion of special actually weather phenomenon.

Exercises and instructions are handed out.

Requirements: Earth science mapping exercises I

Introduction to Engineering Geology

This introductory course starts from a description of the behavior and phenomena of soils and rocks near surface loading conditions and their key geotechnical properties. Lab and field methods for the characterization of soils, rocks and rock masses are introduced. Finally, practical aspects of ground engineering, including tunneling and landslide hazards are presented.

Understanding the basic geotechnical and geomechanical processes and processes of rocks and soils. Understanding the interaction of rock and soil masses with technical systems. Understanding the fundamentals of geological hazards.

Written course documentation available under "Kursunterlagen".

Introduction to Hydrogeology

This course provides the basics of quaternary geology and an overview of the aspects of the hydrogeology of quaternary sediments and karst within Switzerland.

The course covers the basics of quaternary geology and an overview of the aspect of the hydrogeology of quaternary sediments and karst within Switzerland.

Become familiar with the concepts for characterization of fractured and karst aquifers.

Familiarize with the concepts for characterization of fractured and karst aquifers.

Understanding the basic geotechnical and geomechanical processes and processes of rocks and soils. Understanding the interaction of rock and soil masses with technical systems. Understanding the fundamentals of geological hazards.

Additional material will be provided by the lecturers.

Introduction to Geophysical Exploration

This course introduces geological mass wasting processes.

Geological mass wasting processes.

Familiarize with the processes that formed the landscapes during the last 2 Mio. years.

Geological mass wasting processes.

Reading and interpretation of geological and climatological maps.

Reading and interpretation of geological and climatological maps.

Understanding geological hazards.

Introduction to the principles of ground engineering, including tunneling and landslide hazards.

Advanced analysis of geological maps and construction of geological sections. Special points: normal faults of the Rheintal graben, Bull Lake West (USA), Val de Ruz, Helvetic nappes of the Säntis area. Reconstruction of the geological history of the map areas. References to the Geology of Switzerland.

Introduction to generation of climatological maps. Analysis of synoptic scale patterns of air pressure and temperature advection on the surface and one upper air level. (Hydrostatic) Conclusions about vertical stratification of the atmosphere. Elementary prognostic interpretation. Inclusion of special actually weather phenomenon.

Exercises and instructions are handed out.

Requirements: Earth science mapping exercises I

Written course documentation available under "Kursunterlagen".

Understanding the basic geotechnical and geomechanical processes and processes of rocks and soils. Understanding the interaction of rock and soil masses with technical systems. Understanding the fundamentals of geological hazards.

Written course documentation available under "Kursunterlagen".
Objective
Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Assessment of mechanisms responsible for plate movements (the Earth as a heat transfer machine, dynamics of earth mantle, plate driving forces) and subsequent large-scale structures (oceanic basins and cycle of the oceanic lithosphere, convergence and mountain systems and continental growth, etc) through theoretical and experimental information. Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alps-Himalaya orogenic system.

Content
Plate tectonic frame work: earth cooling and mantle-plate interaction, three kinds of plate boundaries and their roles and characteristics, cycle of oceanic lithosphere, longevity and growth of continents, supercontinents. Rheology of layered lithosphere and upper mantle. Oduction systems Collisions systems Extensional systems Basin evolution Passive and active continental margin evolution

Lecture notes
Detailed scriptum in digital form and additional learning modules (www.lead.ethz.ch) available on the intranet.

Literature

651-3505-00L Mining Resources W+ 3 credits 2V C. A. Heinrich, R. Kündig, W. Leu, F. Schenker

Abstract
Overview of the geological formation processes and the global distribution of mineral resources (metals, energy resources, bulk materials and industrial minerals), their economic importance, as well as the political and environmental aspects of responsible resource extraction and site rehabilitation.

Objective

Content
- Vorstellung der Dozierenden mit Fallstudie aus der persönlichen Berufspraxis (CH, RK, WL, FS)
- Resourcen der Welt und Bedeutung für die Schweiz (RK)
- Metallische Erzlagarten - Einführung (CH)
- Metallische Erzlagarten - Magnetische Prozesse Test 1 (CH)
- Ozeanische Hydrothermalisysteme, Oberflächenenergie und Atmosphärenentwicklung (CH)
- Metallische Erzlagarten - Magnetisch-hydrothermale Systeme Test 2 (CH)
- Energierohstoffe - Einführung - Bildungsprozesse Petroleum und Erdgas (WL)
- Energierohstoffe - Kohle und CO2-Entsorgung Test 3 (WL/RK)
- Nichtmetallische Rohstoffe - Baustoffe (RK)
- Nichtmetallische Rohstoffe - Erden (RK/Fs)
- Nichtmetallische Rohstoffe - Industriemineralien Test 4 (FS)
- Industriemineralien und nachhaltige Nutzung von Rohstoffen der Erde (FS)

Literature

651-3503-00L Metamorphism W+ 3 credits 3G M. W. Schmidt

Abstract
Understanding of the principles governing (chemical) reactions in metamorphic processes and resulting (physical) properties of metamorphic rocks s.l.. Recognition of metamorphic minerals and rocks (e.g. Gesteinseinteilung)

651-3501-00L Isotope Geochemistry and Isotope Geology W+ 3 credits 2G S. Bernasconi, D. VANCE

Abstract
The course focuses on the most important systems of radioactive and stable isotopes used in geochemistry and geology. Applications of isotope geochemistry for solving fundamental geological problems are discussed on the basis of case studies.

Objective
Development of a basic knowledge and understanding of the applications of the most important systems of stable and radiogenic isotopes. The following methods will be discussed in detail: the radioactive-radiogenic systems Rb-Sr, Sm-Nd, U-Th-Pb and K-Ar, as well as the stable isotope systems of oxygen, carbon, nitrogen, sulfur and hydrogen.

Content
We will discuss how these methods are used in the following research fields: geochemistry of the earth, age dating, paleotemperature reconstructions, evolution of the crust and mantle reservoirs, sediment diagenesis, fluid rock interactions, hydrothermal activity, paleoceanography, biogeochemical cycles

Numerical Methods in Environmental Sciences

Abstract
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

Objective
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

Content
Classification of numerical problems, introduction to finite-difference methods, time integration schemes, non-linearity, conservative numerical techniques, an overview of spectral and finite-element methods. Examples and exercises from a diverse cross-section of Environmental Science.

Three obligatory exercises, each two hours in length, are integrated into the lecture. The implementation language is Matlab (previous experience not necessary: a Matlab introduction is given). Example programs and graphics tools are supplied.

Lecture notes
Is provided (CHF 10.- per copy).

Literature
List of literature is provided.
A script will be available.

Faraday (2005): Linear Models with R

Part 1 Emission, Immission, Transmission
Fluxes of pollutants and their environmental impact
- physical and chemical processes leading to emission of pollutants
- mass and energy of processes
- Emission measurement techniques and concepts
- quantification of emissions from individual and aggregated sources
- extent and development of the emissions (Switzerland and global)
- propagation and transport of pollutants (transmission)
- meteorological parameters influencing air pollution dispersion
- deterministic and stochastic models, describing the air pollution dispersion
- dispersion models (Gaussian model, box model, receptor model)
- measurement concepts for ambient air (immission level)
- extent and development of ambient air mixing ratios
- goal and instrument of air pollution control

Part 2 Air Pollution Control Technologies
- The reduction of the formation of pollutants is done by modifying the processes (pro cess-integrated measures) and by different engineering operations for the cleaning of waste gas (downstream pollution control). It will be demonstrated, that the variety of these procedures can be traced back on the application of a few basic principles of physical chemistry.
- Procedures for the removal of particles (inertial separator, filtration, electrostatic pre-captors, scrubbers) with their different mechanisms (field forces, impaction and diffu-sion processes) and the modelling of these mechanisms.
- Procedures for the removal of gaseous pollutants and the description of the driving forces involved, as well as the equilibrium and the kinetics of the relevant processes (absorption, adsorption as well as thermal, catalytic and biological conversions).
- Discussion of the technical possibilities to solve the actual air pollution problems.

Lecture notes
- Brigitte Buchmann, Air pollution control, Part I
- Peter Hofer, Air pollution control, Part II
- Lecture slides and exercises

401-0649-00L Applied Statistical Regression

W 5 credits 2V+1U M. Dettling

Abstract
This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

Objective
The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content
The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Lecture notes
A script will be available.

Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery & Lin (2001): Introduction to Linear Regression Analysis

Prerequisites / notice
The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

401-6215-00L Using R for Data Analysis and Graphics (Part I)

W 1 credit 1G A. Drewek, A. J. Papritz

Abstract
The course provides the first part an introduction to the statistical software R for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

Objective
The students will be able to use the software R for simple data analysis.

Content
The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www rstudio.org

Lecture notes
An Introduction to R. http://stat.ethz.ch/CRAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

Prerequisites / notice
The course resources will be provided via the Moodle web learning platform
Please login (with your ETH (or other University) username+password) at https://moodle-app2.let.ethz.ch/enrol/users.php?id=1145
Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

701-0535-00L Environmental Soil Physics/Vadose Zone Hydrology

W 3 credits 2G+2U D. Or
The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

**Students are able to**
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media.
- quantify driving forces and resulting fluxes of water, solute, and heat in soils.
- apply modern measurement methods and analytical tools for hydrological data collection
- conduct and interpret a limited number of experimental studies
- explain links between physical processes in the vadose-zone and major societal and environmental challenges

**Students are able**
- to apply basic mathematical equations to simple problems of environmental fluid dynamics
- to understand and discuss the components of the basic physical equations in fluid dynamics
- to name the bases, concepts and methods of environmental fluid dynamics

**Additional topics:**
- Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.
- Biological Processes in the Vadose Zone - An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange, and challenges for bio- and phytoremediation.

**Weeks 1 to 3:** Physical Properties of Soils and Other Porous Media

- Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior
- Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.
- Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity
- Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing

**Weeks 6 to 9:** Water Flow in Soil - Hydrodynamics:
- Part 1 - Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.
- Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.
- Part 2 - Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.
- Midterm exam
- Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.
- Part 3 - Use of Hydrus model for simulation of unsaturated flow

**Week 10 to 11:** Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

**Week 12 to 13:** Solute Transport in Soils
- Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.
- Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

- Additional topics:
- Continuum hypothesis, forces, constitutive laws, state equations and basic principles of thermodynamics, kinematics, laws of mass and momentum on rotating earth.
- Concepts and illustrative flow systems: vorticity dynamics, boundary layers, instability, turbulence - with respect to environmental fluid systems.
- Scale analysis: dimensionless variables and dynamical similarity, simplification of the fluid system, e.g. shallow water assumption, geostrophic flow.
- Waves in environmental fluid systems.

**Weeks 4 to 5:** Soil Water Retention and Potential (Hydrostatics)

- Basic physical terminology and mathematical laws:
- Continuum hypothesis, forces, constitutive laws, state equations and basic principles of thermodynamics, kinematics, laws of mass and momentum on rotating earth.
- Concepts and illustrative flow systems: vorticity dynamics, boundary layers, instability, turbulence - with respect to environmental fluid systems.
- Scale analysis: dimensionless variables and dynamical similarity, simplification of the fluid system, e.g. shallow water assumption, geostrophic flow.
- Waves in environmental fluid systems.

**Weeks 10 to 11:** Energy Balance and Land Atmosphere Interactions

- Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

**Weeks 12 to 13:** Solute Transport in Soils

- Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.

**Additional topics:**
- Continuum hypothesis, forces, constitutive laws, state equations and basic principles of thermodynamics, kinematics, laws of mass and momentum on rotating earth.
- Concepts and illustrative flow systems: vorticity dynamics, boundary layers, instability, turbulence - with respect to environmental fluid systems.
- Scale analysis: dimensionless variables and dynamical similarity, simplification of the fluid system, e.g. shallow water assumption, geostrophic flow.
- Waves in environmental fluid systems.
Objective
a) Students understand the basic concepts of flow and contaminant transport processes and boundary conditions in groundwater.
b) Students are able to formulate simple practical flow and transport problems.
c) Students are able to understand and apply simple analytical solutions to simple flow and transport problems.
d) Students are able to use simple numerical codes to adequately solve simple flow (and transport) problems.

Content
Properties of porous media.
Exercises: Groundwater use, porosity, grain size analysis.

Flow properties, Darcy's law, filter.

Flow equations, stream function.
Exercises: Darcy's law.

Analytical solutions, confined aquifers, steady-state flow.
Exercises: Head isolines.

Use of superposition principles, transient flow, free surface flow.
Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems I.
Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems II.
Exercises: Finite difference formulations to flow problems.

Transport processes.
Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems I.
Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems II.
Exercises: Analytical solutions to transport problems.

Path lines, groundwater protection.
Exercises: Analytical solutions to transport problems.

Groundwater remediation, groundwater management.
Exercises: Groundwater remediation.

651-3561-00L  Cryosphere  3 credits  2V  M. Funk, M. Huss, K. Steffen

Abstract
This course introduces the different parts of the cryosphere - snow, glaciers, sea ice, permafrost - and their role in the climate system. A significant physical aspect is the focus in each part. Those completing the course are able to describe the dynamics of cryosphere components both formally and using examples.

Objective
- Students are able to qualitatively describe the main components of the cryosphere and their role in the climate system.
- To formally describe the relevant physical processes which determine the state of cryosphere components.

Content
Introduction into the different components of the Cryosphere: Snow, glaciers, sea ice and permafrost, and their roles in the climate system. Each part is use to emphasized on one specific physical aspect: material qualities of ice, mass balance and dynamics of glaciers and energy balance of sea ice.

Lecture notes
handouts will be distributed during the teaching semester

Field Trips, Laboratory and Block Courses
The Practical Training in Atmosphere and Climate takes place in Spring Semester.

Courses can be chosen from the complete offerings of the ETH Zurich and University of Zurich.

Number  Title  Type  ECTS  Hours  Lecturers
701-0565-00L  Fundamentals of Natural Hazards Management  W  3 credits  3G  H. R. Heinimann, B. Krummenacher, S. Lönw

Abstract
Risks to life and human assets result when settlement areas and infrastructure overlap regions where natural hazard processes occur. This course utilizes case studies to teach how a future natural hazards-specialist should analyze, assess and manage risks.
**Objective**

Concepts will be explained step-by-step through a set of case studies, and applied in lab by the students. The following principal steps are used when coping with natural hazard-risks. At each step, students will learn and apply the following skills:

- Risk analysis - What can happen?
  - Characterize the processes and environmental measures that lead to a natural hazard and integrate modeling results of these processes.
  - Identify threats to human life and assets exposed to natural hazards and estimate possible drawbacks or damages.
- Risk assessment - What are the acceptable levels of risk?
  - Apply principles to determine acceptable risks to human life and assets in order to identify locations which should receive added protection.
  - Explain causes for conflicts between risk perception and risk analysis.
- Risk management - What steps should be taken to manage risks?
  - Explain how various hazard mitigation approaches reduce risk.
  - Describe hazard scenarios as a base for adequate dimensioning of control measures.
  - Identify the best alternative from a set of thinkable measures based on an evaluation scheme.
- Explain the principles of risk-governance.

**Content**

Die Vorlesung besteht aus folgenden Blöcken:

1) Einführung ins Vorgehenskonzept (1W)
2) Risikoanalyse (6W + Exkursion) mit:
   - Systemabgrenzung
   - Gefahrenbeurteilung
   - Expositions- und Folgenanalyse
3) Risikobewertung (2W)
4) Risikomanagement (2W + Exkursion)
5) Abschlussbesprechung (1W)

Choice of courses from the complete offerings of ETH and UZH.

ECTS | European Credit Transfer and Accumulation System

- Special students and auditors need special permission from the lecturers.
Reflected Light Microscopy and Ore Deposits

This course provides basic knowledge in microscopy of igneous rocks. Apart from the identification of common igneous minerals in thin sections, mineral assemblages, structures, and textures will be investigated and the results of microscopy will be combined with igneous phase equilibria to understand generation, differentiation, and emplacement of igneous rocks.

Mineral assemblages, structures, and textures are determined and utilized to understand the generation, differentiation, and emplacement of igneous rocks. In addition, we will apply igneous phase equilibria that have been introduced in other lectures (such as magmatism and volcanism at ETH/Uni Zurich or an equivalent igneous petrology course) to natural rock samples in order to constrain qualitatively parental magma compositions and crystallization conditions.

The range of investigated rocks encompasses mantle rocks, tholeiitic, calc-alkaline and alkaline plutonic and volcanic rocks that contain the most common igneous minerals.

Lecture notes

Basis of the optical determinations of (igneous) minerals using the polarizing microscope are the tables of Tröger (‘Optische Bestimmung der gesteinsbildenden Minerale’, Optical determination of rock-forming minerals, 1982) that are available in sufficient volumes in the class room.

Some loose sheets will be distributed during the lecture providing additional information and templates for thin section descriptions.

Additionally, I recommend the lecture notes of H.-G. Stosch (University of Karlsruhe, in German) that can be provided in printed form upon request.

Literature

- Also available in the D-ERDW library, NO building, on D-floor.
- Nesse, W.D.: Introduction to optical mineralogy. 3. Ed. (2004). Figures from this book will be used in lectures. Besides the theory, this book describes all optical properties of important minerals. Petrographers working on varying types of silicate rocks should have a look at this book.

Prerequisites / notice

Participants should have basic knowledge in crystallography, mineralogy, and petrology, and have taken practical courses in microscopy of thin sections, as well as lectures in metamorphic petrology and structural geology!
Abstract
Introduction to reflected light microscopy. Use of the microscope. Identification of opaque minerals through the used of tables. Description of textures and paragenetic sequences. Given Participants should attend in parallel with Ore Deposits I (651-4037-00L).

Objective
Recognition of the most important ore minerals in polished section, interpretation of mineral textures in geological context

Content
Introduction to reflected light microscopy as a petrographic technique. Leaning main diagnostic criteria. Study of small selection of important and characteristic minerals. Interpreting polished (thin) sections as exercise

Lecture notes
To be handed out in class

Prerequisites / notice
Credits and mark based on independent description of selected sample(s) towards the end of the course

851-4113-00L
Sedimentary Petrography and Microscopy
W+ 2 credits 2G V. Picotti, M. G. Fellin

Abstract
Microscopy of carbonate (1st half of semester) and siliciclastic rocks (2nd half) rocks as well as siliceous, phosphatic and evaporitic sediments.

Objective
Description of grains and cement/matrix, texture, classification of the main sedimentary rocks. Discussion and interpretation of the environment of sedimentation. Diagenetic Processes.

Content
Microscopy of carbonate and siliciclastic rocks, siliceous and phosphatic rocks, their origin and classification. Diagenesis.

Lecture notes
To be handed out in class

Literature

Prerequisites / notice
The earlier attendance of other MSc microscopy courses (e.g. magmatic and metamorphic rocks) is not required if during the BSc a general course on microscopy of rocks was completed.

Part B: Methods

Abstract
Practical work in analytical chemistry for Earth science students.

Objective
Knowledge of some analytical methods used in Earth sciences.

Content
Introduction to analytical chemistry and atom physics.

Lecture notes
Short handouts for each analytical method.

Literature
English textbooks recommended

651-4117-00L
Sediment Analysis
W+ 3 credits 2G M. G. Fellin, A. Gilli, V. Picotti

Abstract
Aims, usefulness and theoretical background of methods for sediment analysis.

Objective
The course offers a series of basic methods useful for the analysis of sediments. It is also offered to apply these methods on material collected for the students Master or PhD projects.

Content
Staining of thin sections for feldspar and carbonate, peels of carbonate rocks, modal analysis of siliciclastic rocks, calcimetry and organic carbon measurement, heavy mineral analysis, cold cathodoluminescence microscopy of carbonate rocks, simple clay mineral separation, exoscopy of quartz grains.

Lecture notes
For the various analytical methods English texts are available from text books and scientific publications.

Literature

Prerequisites / notice
It is desirable but not excluding that the students bring their own material (Master or PhD project) for some of the analytical methods.

651-4031-00L
Geographic Information Systems
W+ 3 credits 4G A. Baltensweiler, M. Hägeli-Golay

Abstract
Introduction to the architecture and data processing capabilities of geographic information systems (GIS). Practical application of spatial data modeling and geoprocessing functions to a selected project from the earth sciences.

Objective
Knowledge of the basic architecture and spatial data handling capabilities of geographic information systems.

Content
Theoretical introduction to the architecture, modules, spatial data types and spatial data handling functions of geographic information systems (GIS). Application of data modeling principles and geoprocessing capabilities using ArcGIS: Data design and modeling, data acquisition, data integration, spatial analysis of vector and raster data, particular functions for digital terrain modeling and hydrology, map generation and 3D-visualization.

Lecture notes
Introduction to Geographic Information Systems, Tutorial: Introduction to ArcGIS Desktop

Literature

651-4063-00L
X-ray Powder Diffraction
W+ 3 credits 2G L. M. Plötze

Abstract
In the course the students learn to measure X-ray diffraction patterns of minerals and to evaluate these using different software for qualitative and quantitative mineral composition as well as crystallographic parameters.

Objective
Upon successful completion of this course students are able to:
- describe the principle of X-ray diffraction analysis
- carry out a qualitative and quantitative mineralogical analysis independently,
- critically assess the data,
- communicate the results in a scientific report.

Content
Fundamental principles of X-ray diffraction
Setup and operation of X-ray diffractometers
Interpretation of powder diffraction data
Qualitative and quantitative phase analysis of crystalline powders (e.g. with Rietveld analysis)

Lecture notes
Selected handouts will be made available in the lecture

Autumn Semester 2016
Prerequisites / notice
The course includes a high portion of practical exercises in sample preparation as well as measurement and evaluation of X-ray powder diffraction data. Own sample will be analysed qualitatively and quantitatively. Knowledge in mineralogy of this system is essential. The lecture course is limited to 12 participants.

---

Restricted Choice Modules Geology
A minimum of two restricted choice modules must be completed for the major Geology.

Palaeoclimatology: Compulsory Courses

</tr>
</tbody>
</table>

Abstract
The course "Climate history and paleoclimatology gives an overview on climate through geological time and it provides insight into methods and tools used in paleoclimatic research.

Objective
The student will have an understanding of evolution of climate and its major forcing factors - orbital, atmosphere chemistry, tectonics- through geological time. He or she will understand interaction between life and climate and he or she will be familiar with the use of most common geochemical climate "proxies", he or she will be able to evaluate quality of marine and terrestrial sedimentary paleoclimatic archives. The student will be able to estimate rates of changes in climate history and to recognize feedbacks between the biosphere and climate.

Content
Geological time, stratigraphy, geological archives, climate archives, palaeoclimatic proxies
Climate through geological time: "lessons from the past"
Cretaceous greenhouse climate
The Late Paleocene Thermal Maximum (PETM)
Cenozoic Cooling
Onset and Intensification of Southern Hemisphere Glaciation
Onset and Intensification of Northern Hemisphere Glaciation
Pliocene warmth
Glacial and Interglacials
Millennial-scale climate variability during glaciations
The last deglaciation(s)
The Younger Dryas
Holocene climate - climate and societies

<td>V. Picotti, A. Gilli</td>
</tr>
</tbody>
</table>

Abstract
The course will focus on biological and chemical aspects of sedimentation in marine environments. Marine sedimentation will be traced from coast to deep-sea. The use of stable isotopes palaeoceanography will be discussed. Neritic, hemipelagic and pelagic sediments will be used as proxies for environmental change during times of major perturbations of climate and oceanography.

Objective
- You will understand chemistry and biology of the marine carbonate system
- You will be able to relate carbonate mineralogy with facies and environmental conditions
- You will be familiar with cool-water and warm-water carbonates
- You will see carbonate and organic-carbon rich sediments as part of the global carbon cycle
- You will be able to recognize links between climate and marine carbonate systems (e.g. acidification of oceans and reef growth)
- You will be able to use geological archives as source of information on global change
- You will have an overview of marine sedimentation through time

Content
- carbonates: chemistry, mineralogy, biology
- carbonate sedimentation from the shelf to the deep sea
- carbonate facies
- cool-water and warm-water carbonates
- organic-carbon and black shales
- C-cycle, carbonates, Corg: CO2 sources and sink
- Carbonates: their geochemical proxies for environmental change: stable isotopes, Mg/Ca, Sr
- marine sediments through geological time
- carbonates and evaporites
- lacustrine carbonates
- economic aspects of limestone

Lecture notes
No script. Scientific articles will be distributed during the course

Literature
We will read and critically discuss scientific articles relevant for "biological and chemical processes in marine and lacustrine systems"
Details on the program will be handed out during the first lecture.

Sediments preserved a record of past landscapes. This course focuses on understanding the processes that modify sedimentary landscapes with time and how we can read these changes in the sedimentary record.

Details on the program will be handed out during the first lecture.

We will attribute the papers for presentation on the 26th, so please be here on that day!

The course will focus on biological and chemical aspects of sedimentation in marine environments. Marine sedimentation will be traced from coast to deep-sea. The use of stable isotopes palaeoceanography will be discussed. Carbonates: their geochemical proxies for environmental change: stable isotopes, Mg/Ca, Sr

Carbonates and evaporites

Marine sediments through geological time

Carbonates and evaporites

Luminescence dating

4. critically read and evaluate the application of dating methods in scientific publications.
3. choose which dating method (or combination of methods) is suitable for a certain field problem.
2. be able to calculate an age based on data of the six methods studied.
1. understand the fundamental principles of the most frequently used dating methods for Quaternary studies.

At the end of the course students will:
1. understand the fundamental principles of the most frequently used dating methods for Quaternary studies.
2. be able to calculate an age based on data of the six methods studied.
3. choose which dating method (or combination of methods) is suitable for a certain field problem.
4. critically read and evaluate the application of dating methods in scientific publications.

Prerequisite: Successful completion of the MSc-course "Sedimentology" (651-4041-00L).

The grading of students is based on in-class exercises and end-semester examination.

Visit to radiocarbon lab, cosmogenic nuclide lab, noble gas lab, accelerator (AMS) facility.

Required attending the lecture, visiting laboratories, handing back solutions for problem sets (Exercises)

The grading of students is based on in-class exercises and end-semester examination.

The grading of students is based on in-class exercises and end-semester examination.
Objective
Upon successful completion of this course students are able to:

<tr>
<td>651-4003-00L</td>
<td>Numerical Modelling of Rock Deformation</td>
<td>W</td>
<td>3</td>
<td>2</td>
<td>M. Frehner</td>
</tr>
</tbody>
</table>

Objective
Introduction to the programming software Matlab.
Learning and understanding the continuum mechanics equations describing rock deformation.
Mathematical equations describing rock rheology: elasticity + viscosity.
Introduction to the finite-element method for modeling rock deformation in 2D.
A small applied project-work at the end of the semester will be tailored to the student's interest.

At the end of this course, the students should be able to
- Use Matlab for their future needs (e.g., for their MSc Thesis)
- Understand the fundamental concept of the finite-element method
- Apply the finite-element method to successfully work on a small project tailored to the student's interests.

In addition, innovative methods will be applied to mark the performance in the course, which includes self-evaluation and peer-evaluation among the students. Therefore, some soft-skills will be required and trained as well, such as
- honest self-evaluation and self-grading
- providing honest feedback to a colleague in a tone that is acceptable
- receiving feedback from a colleague without taking criticism personal
- learning the procedure of scientific peer-evaluation

Content
Introduction to Matlab
Continuum mechanics equations necessary to describe rock deformation
Rheological equations: elasticity + viscous materials
Introduction to the finite-element method (in 1D)
Numerical integration + isoparametric elements
Going to 2D finite elements
Finite-element method for 2D elasticity
Stress calculation + visualization
Finite-element method for 2D viscous materials
Heterogeneous media
Final project-based work tailored to the student's interest.

A substantial part of the lecture will take place in the computer-lab, where numerical finite element codes will be applied. The used software is Matlab. Students may bring their own laptop with a pre-installed copy of Matlab.

Lecture notes
The script is very diverse and ranges from PowerPoint-based pdf-files, to self-study tutorials. Also, the more theoretical and mathematical aspects will be explained on the black board without a proper script.

Literature

Prerequisites / notice
A good knowledge of linear algebra is expected.

The used software is Matlab. So, knowledge of Matlab is advantageous. Students may bring their own laptop with a pre-installed copy of Matlab.
The objective of this course is to introduce Rock Physics as a laboratory and interpretive tool.

Prerequisites / notice
Undergraduate courses in the following subjects are highly recommended in order to get the most out of this specialist course:
- Basic structural Geology
- Geophysics

Lecturers

Workshop lectures and exercises

Literature

Assessment of mechanisms responsible for plate movements (the Earth as a heat transfer machine, dynamics of earth mantle, plate driving forces) and subsequent large-scale structures (oceanic basins and cycle of the oceanic lithosphere, convergence and mountain systems and continental growth, etc) through theoretical and experimental information.

Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alps-Himalaya orogenic system.

Objective
Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales.

Assessment of mechanisms responsible for plate movements (the Earth as a heat transfer machine, dynamics of earth mantle, plate driving forces) and subsequent large-scale structures (oceanic basins and cycle of the oceanic lithosphere, convergence and mountain systems and continental growth, etc) through theoretical and experimental information.

Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alps-Himalaya orogenic system.

Content

Collisions systems
Extensional systems
Basin evolution
Passive and active continental margin evolution

The course "Basics in Palaeobotany" gives an overview on the evolution and palaeobiology of plants and their relevance for the reconstruction of past environments.

Palaeoecology

Consult the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
The course discusses the formation and development of different basin types as part of lithosphere geodynamics. It introduces conceptual models and governing physics, with practical application to the study of basin evolution. Techniques for the analysis of subsidence and thermal history are demonstrated. Organic matter, petroleum play, and their biogeochemical investigation are examined.

Objective
Based on the introductory education and practical training during this course, each participant should be able to choose and apply approaches and techniques to own problems of basin analysis, and should be versed to expand their knowledge independently.

In particular, each participant should:
- Develop an intuitive understanding for origin, dynamics, and temporal evolution of basins in a geological / geodynamic context;
- Acquire the necessary theoretical foundation to describe basin evolution quantitatively;
- Be familiar with geological and geophysical methods that are applied to obtain information about rock properties, structural geometry, and thermal and subsidence history of basins;
- Understand the burial and maturation of organic matter in basins, the development of petroleum play, and be acquainted with geochemical methods to study the evolution of biogenic carbon.
The following topics are covered:

- Introduction; classification schemes and types of basins; heat conduction; geotherms;
- The lithosphere; isostasy; rifts and basins due to lithospheric stretching; uniform extension model; modifications to the uniform stretching model; dynamics of rifting.
- Elasticity of the lithosphere; flexural compensation; geometry and analytical description of loads and the resulting deflection; foreland basins; their anatomy;
- Reconstruction of basin evolution; borehole data; porosity loss and decompaction; backstripping; subsidence curves; thermal history and its reconstruction;
- Petroleum play concept; organic production; source rock prediction and depositional environment; petroleum generation, expulsion, migration, alteration; reservoir and traps;
- Carbon cycle; maturation of organic matter; geochemistry of biogenic carbon; biomarkers; analytical techniques
- Overview of other basin types: effects of mantle dynamics, strike-slip basins.

Each week of the course is split in lectures and corresponding practicals, in which the concepts are applied to simplified problems.

Grading of the semester performance is based on submitted practicals (50%) and a final exam (50%). The exam will take place in the time slot of the last practical (18.12.).

Lecture notes
Lecture notes are provided online during the course. They summarize the current subjects week by week, and provide the essential theoretical background.

Literature
Main reference:

Recommended, but not required (available in library).

Supplementary:

Prerequisites / notice
Familiarity with MATLAB is advantageous, but not required.

Abstract
Introduction into seismic interpretation for solving geological and environmental problems. A special focus is given to the seismic facies analysis and seismic sequence stratigraphy. In addition, the seismic attributes are explained, which are important for the analysis of paleo-geomorphology and structural deformation.

Objective
1. Acquire techniques for a comprehensive interpretation of seismic sections for solving geologic, tectonic, stratigraphic and environmental problems
2. Correlation of seismic facies to lithologic facies in different sedimentary systems
3. Recognition of structural elements and faults on seismic sections.
4. Learning the techniques of 3D seismic data interpretation
5. Reconstruction of sedimentary history using seismic stratigraphy and facies analysis and core information.
The four day course consists of lectures that are accompanied by a variety of exercises.

Day 1:
Introduction seismic facies analysis with exercise
Seismic resolution
Factors controlling sedimentation
Exercise: Seismic section in Straits of Florida

Day 2:
Seismic attributes and seismic geomorphology
Siliciclastic deltas, shelves and turbidite systems, 2D-3D
Exercise: Seismic section Tarragon Basin
Seismic facies carbonates
Exercise: Seismic section platform margin Great Bahama Bank
Deepwater environments, including cold-water coral habitats

Day 3:
Seismic facies of mixed systems with exercises
Faults and structures on seismic sections
Exercise: Seismic section Golf von Mexiko

Day 4:
Telling ages on seismic section
Seismic stratigraphy and sequence stratigraphy
Exercise: Sequence analysis Straits of Andros
Final discussion

Lecture notes
An original script (110 pages) designed for the class will be distributed at the beginning of the course.

Literature
Books Seismic Facies:

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 576 of 1570
The aim of the course is to gain a thorough understanding of the physical processes leading to and governing earthquake source ruptures. See webpage

The course is an introduction to the concepts of geodesy applied to the seismic cycle and to the monitoring of ground deformation. S. Wiemer

This course is a general introduction to the methods of seismic hazard analysis. N. Houlié

Course notes will be made available on a designated course web site. An overview of the discussed principles are available in the three slides. Script in English is planned. PDF of articles cited.

We will cover a range of topics, including:

1. Plate Tectonics before Space Geodesy.
2. Space geodetic techniques (VBLI, gravity, etc.)
3. The seismic cycle in Seismology (California, North Anatolia fault, Sumatra).
4. GPS and geodynamics
5. Characterization of the Earth System
6. Introduction to elastodynamics: strain, stress, equation of motion.
7. Seismic Cycle: inter-, co-, and post-seismic processes
8. Aseismic creep and slow slip transients
9. Ground Motion Attenuation, Site Effects, and Microzoning
10. Earthquake source inversion and data assimilation
11. Representation theorem, point and extended sources, source spectra.
12. Earthquake source physics

The grading is based on participation, homework sets, and a final oral presentation. There is no final exam.
This concerns a bi-yearly course that will be taught again in Fall 2017. The course will be evaluated in 2 parts:
- a two hours final exam at the end of the course,
- a presentation discussing a topic of choice based on a group of suggested papers

The course is worth 3 credit points, and a satisfactory total grade (4 or better) is needed to obtain 3 ECTS. The final writing exam has a weight of 70% and the presentation weighs for 30%.

The course will be given in English.

Earthquake Seismology: Compulsory Courses
One additional elective course of at least 3KP has to be completed for this Module according to prior agreement with the Subject Advisor (Autumn or Spring Semester).

Abstract
The course will cover basic physical theory related to mineral and rock magnetism, measurement techniques, and applications in earth and soil sciences, climatology and biophysics.

Objective
There are two objectives in this course: (1) to acquire an understanding of the physical theory behind the origin of magnetism in a mineral or rock; and (2) to learn how material magnetic properties can be used to study environmental and geologic systems and processes.

1. Fundamentals of magnetism
2. Magnetic mineralogy
3. Measurement techniques
4. Time
5. Special Topics: Magnetoclimatology, mass transport, pollution monitoring, biophysics, magnetic properties of nanoscale materials

Lecture notes Available on-line

Geomagnetics: Courses of Choice
One additional elective course of at least 3KP has to be completed for this Module according to prior agreement with the Subject Advisor (Autumn or Spring Semester).

Abstract
This course introduces the different parts of the cryosphere - snow, glaciers, sea ice, permafrost - and their role in the climate system. A significant physical aspect is the focus in each part. Those completing the course are able to describe the dynamics of cryosphere components both formally and using examples.

Objective
Students are able
- to qualitatively describe the main components of the cryosphere and their role in the climate system
- to formally describe the relevant physical processes which determine the state of cryosphere components

Content
Introduction into the different components of the Cryosphere: Snow, glaciers, sea ice and permafrost, and their roles in the climate system. Each part is used to emphasize on one specific physical aspect: material qualities of ice, mass balance and dynamics of glaciers and energy balance of sea ice.

Lecture notes Handouts will be distributed during the teaching semester

Glaciology: Courses of Choice

Overview of the most important earth surface processes and landforms in cold regions (regions with glaciers and intense frost) with emphasis on high-mountain aspects. Discussion of present research challenges.

Knowledge of the most prominent climate-related geomorphological processes and phenomena in high-mountain regions, understanding of primary research challenges.

Erosion and sedimentation by glaciers as a function of topography, englacial temperature, sediment balance, sliding and melt water runoff. Processes and landforms in regions of seasonal and perennial frost (frost weathering, rock falls, debris cones/talus, solifluction, permafrost creep/rock glaciers, debris flows).

Glacial and periglacial geomorphodynamics in high-mountain regions. Ca. 100 pages.

Basic knowledge about geomorphology and glaciers/permafrost from corresponding courses at ETH/USZH or from the related lecture notes.

Physics of Glaciers

Understanding glaciers and ice sheets with simple physical concepts. Topics include the reaction of glaciers to the climate, ice rheology, temperature in glaciers and ice sheets, glacier hydrology, glacier seismology, basal motion and calving glaciers. A special focus is the current development of Greenland and Antarctica.

After the course the students are able understand and interpret measurements of ice flow, subglacial water pressure and ice temperature.

They will have an understanding of glaciology-related physical concepts sufficient to understand most of the contemporary literature on the topic. The students will be well equipped to work on glacier-related problems by numerical modelling, remote sensing, and field work.

The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a closer look at ice deformation, basal motion, heat flow and glacier hydraulics. The specific dynamics of tide water and calving glaciers is investigated, as is the reaction of glaciers to changes in mass balance (and therefore climate).

A list of relevant literature is available on the class web site.

Handouts are available

Good high school mathematics and physics knowledge required.

Lithosphere Structure and Tectonics

Seismic Tomography

Seismic tomography is the science of interpreting seismic measurements (seismograms) to derive information about the structure of the Earth. The subject of this course is the formal relationship existing between a seismic measurement and the nature of the Earth, or of certain regions of the Earth, and the ways to use it, to gain information about the Earth.

Tectonics

Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alp-Himalaya orogenic system.

Comprehensive understanding of evolution, mechanics, and rheology of divergent, convergent and wrenching tectonic systems from the lithospheric scale to local shallow crustal and outcrop-scales. Assessment of mechanisms responsible for plate movements (the Earth as a heat transfer machine, dynamics of earth mantle, plate driving forces) and subsequent large-scale structures (oceanic basins and cycle of the oceanic lithosphere, convergence and mountain systems and continental growth, etc) through theoretical and experimental information.

Evaluation of plate tectonic and other orogenic processes through the study of reference examples of taken in Alp-Himalaya orogenic system.
Content
Plate tectonic frame work: earth cooling and mantle-plate interaction, three kinds of plate boundaries and their roles and characteristics, cycle of oceanic lithosphere, longlifety and growth of continents, supercontinents.
Rheology of layered lithosphere and upper mantle.
Obduction systems
Collisions systems
Extensional systems
Basin evolution

Abstract
This course focuses on the principles (fundamentals) and basic concepts of rock mechanics and rock engineering (e.g. tunnelling, rock slope stability).

Objective
The course aims to introduce the fundamentals and basic concepts of rock mechanics and generic rock engineering. The student shall understand how rocks behave at different scales, under various artificial loads and in the shallow subsurface (a few km below ground). The link between rock mechanics, geology, hydrogeology and tectonics (i.e. the conditions under which the rock formed) will be clearly established. The student shall understand basic principles of rock mechanics and rock engineering. In addition, the student shall learn how to carry out laboratory tests, to interpret these tests and to apply the results from lab and field investigations to simple engineering problems. This knowledge is required for subsequent integration courses (Landslide Analysis and Hazard Mitigation; Engineering Geology of Underground Excavations).

Content
This course focuses on the principles (fundamentals) and basic concepts of rock mechanics and generic rock engineering. The behavior of different rock types is studied with laboratory investigations which are linked to the theoretical aspects discussed in lectures and applied in exercises. The course is compulsory for the MSc Eng Geol. The applications of rock mechanical principles and rock engineering methods are extensively covered in subsequent courses.

Lecture notes
Written course documentation available on our homepage: www.engineeringgeology.ethz.ch

651-4033-00L Soil Mechanics and Foundation Engineering W+ 4 credits 3V+2U M. Perras, A. Wolter, M. Stolz

Abstract
The course presents the principles of soil mechanics and soil behaviour characteristics and its applications in geotechnical structures and systems. It is based on more descriptive courses on Engineering Geology within the BSc Geol. Program and is a compulsory prerequisite for other courses within the MSc Eng. Geol. program.

Objective
Understanding the principles of soil behaviour and the fundamentals of geotechnical practices in calculations. Ability to communicate with geotechnical engineers.

Content
Soil Mechanics:
Fundamental concepts of strength and deformation of different soils. Introduction to geotechnical calculations
Significance of (ground)water
Geotechnical Engineering in Soils:
Evaluation of geotechnical scenarios, handling of forecast uncertainties, relation of soil properties and soil composition, interactions between soil and building,
standard construction methods in soils (foundations, slopes, dams and levees),
requirements for the geotechnical prognosis

Lecture notes
This lecture is supported by the textbook: "Geotechnical Engineering" by Donald P. Coduto, 2nd edition, 2011; ISBN-13: 978-0-13-135425-8

Prerequisites / notice
Courses must be completed:
Introduction to Engineering Geology (BSc level)
Introduction to Groundwater
Sedimentology and Quaternary deposits
Principles of Physics

Courses recommended:
Eng Geol Site Investigations
Eng Geol Field Course I (soils)
Clay Mineralogy

651-4023-00L Groundwater W+ 4 credits 3G M. O. Saar, X.Z. Kong

Abstract
The course provides an introduction into quantitative analysis of groundwater flow and solute/heat transport. It is focussed on understanding, formulating, and solving groundwater flow and solute/heat transport problems.

Objective
a) Students understand the basic concepts of groundwater flow and solute/heat transport processes and boundary conditions.
b) Students are able to formulate simple, practical groundwater flow and solute/heat transport problems.
c) Students are able to understand and apply simple analytical and/or numerical solutions to fluid flow and solute/heat transport problems.
Content

1. Introduction to groundwater problems. Concepts to quantify properties of aquifers.
2. Flow equation. The generalised Darcy law.
3. The water balance equation.
5. Analytical solutions to flow problems I
6. Analytical solutions to flow problems II
7. Finite difference solution to flow problems.
12. Analytical solutions to transport problems I.
13. Analytical solutions to transport problems II

Lecture notes

Handouts of slides.

Abstract

This course introduces students to the methods used in characterising, developing or monitoring geotechnical engineering project sites. Measurements, tools and analyses are described that are relevant to determining the geologic conditions at a site as well as deformations that occur under natural or construction conditions.

Objective

This course aims to introduce the general procedures taken during a engineering geological site investigation. Students who complete the course should be able to design a site investigation program of measurements based on information from initial desk studies, and to analyse, integrate and interpret data from the measurement program.

Content

The methods that are routinely employed in site investigations will be described focusing on their applicability in different geologic environments. The limitations of the data in constraining the parameters of interest will be addressed together with problems of interpretation and cost-versus-information value. Specific topics addressed include drilling, coring, sampling, borehole testing, geophysical methods used in engineering geology, satellite, air- and ground-based surface and displacement monitoring (photogrammetry, LIDAR and Radar), and in-situ deformation measurement methods.

Lecture notes

Lecture notes will be available for download 1-2 days before each class.

Literature

Online (ETH): http://www.icevirtuallibrary.com/content/book/100017

Supplemental literature will be suggested and made available during the course.

Engineering Geology: Integration

Courses for this Module take place in spring semester.

**Abstract**

This course presents fundamental digital signal processing and filter theory with a focus on geophysical applications.

**Objective**

The goal of the course is to provide an understanding of the principles of digital signal processing and filter theory. Form: two hours lecture with two hours of computer based exercises per week over 7 weeks.

**Content**

- Analog-digital conversion: dynamic range and resolution
- Dirac-impulse, step function
- Laplace transformation
- Z-transformation
- Differential equations of linear time-invariant systems
- Examples: seismometer and RC-filter
- Impulse response and transfer function
- Frequency selective filters: example Butterworth filters
- Digital filters: impulse invariance and bilinear transformation
- Inverse filters
- Response spectra

**Lecture notes**

Lecture notes will be made available for download from the website of the course.

**Literature**

The class follows no single book. A list of relevant texts will be given in class.

**Prerequisites / notice**

Students must bring their own laptop in class for Matlab exercises.

**Abstract**

In this 13-week sequence, students learn how to write programs from scratch to solve partial differential equations that are useful for Earth science applications. Programming will be done in MATLAB and will use the finite-difference method and marker-in-cell technique. The course will emphasise a hands-on learning approach rather than extensive theory.

**Objective**

The goal of this course is for students to learn how to program numerical applications from scratch. By the end of the course, students should be able to write state-of-the-art MATLAB codes that solve systems of partial-differential equations relevant to Earth and Planetary Science applications using finite-difference method and marker-in-cell technique. Applications include Poisson equation, buoyancy driven variable viscosity flow, heat diffusion and advection, and state-of-the-art thermomechanical code programming. The emphasis will be on commonality, i.e., using a similar approach to solve different applications, and modularity, i.e., re-use of code in different programs. The course will emphasise a hands-on learning approach rather than extensive theory, and will begin with an introduction to programming in MATLAB.

**Content**

- A provisional week-by-week schedule (subject to change) is as follows:
  - Week 1: Introduction to the finite difference approximation to differential equations. Introduction to programming in Matlab. Solving of 1D Poisson equation.
  - Week 3: Solving momentum and continuity equations in case of constant viscosity with stream function/vorticity formulation.
  - Week 4: Staggered grid for formulating momentum and continuity equations. Indexing of unknowns. Solving momentum and continuity equations in case of constant viscosity using pressure-velocity formulation with staggered grid.
  - Weeks 5: Conservative finite differences for the momentum equation. "Free slip" and "no slip" boundary conditions. Solving momentum and continuity equations in case of variable viscosity using pressure-velocity formulation with staggered grid.
  - Week 7: Advection in 2-D with Marker-in-cell method. Combining flow calculation and advection for buoyancy driven flow.
  - Week 9: Solving 2D heat conservation equation in case of constant thermal conductivity with explicit and implicit approaches.
  - Week 10: Solving 2D heat conservation equation in case of variable thermal conductivity with implicit approach. Temperature advection with markers. Creating thermomechanical code by combining mechanical solution for 2D buoyancy driven flow with heat diffusion and advection based on marker-in-cell approach.
  - Week 11: Subgrid diffusion of temperature. Implementing subgrid diffusion to the thermomechanical code.
  - Week 12: Implementation of radioactive, adiabatic and shear heating to the thermomechanical code.
  - Week 13: Implementation of temperature-, pressure- and strain rate-dependent viscosity, temperature- and pressure-dependent density and temperature-dependent thermal conductivity to the thermomechanical code. Final project description.

**Abstract**

Fluid mechanics is one of the fundamental building blocks of modern geophysics. This course aims to provide the students with the basics tools used in fluid dynamics studies of geophysical-astrophysical problems. The course is a combination of lectures, exercises and demo experiments to present the same concepts in various forms.

**Objective**

The goal of this course is to develop familiarity with basic fluid dynamical concepts relevant to geophysical and astrophysical problems.

**Content**

- (i) Basic concepts.
- (ii) Conservation Laws.
- (iii) Dynamical similarity and scale analysis.
- (iv) The inviscid approximation.
- (v) Streamlines-Streamfunctions.
- (vi) Elements of boundary layer theory - Application to viscous boundary layer.
- (vii) Vorticity-Concept and Examples.
- (viii) Introduction to rotating fluid.
- (ix) Viscous boundary layer in rotating fluid.
- (x) Non-rotating thermal convection.
- (xi) Introduction to rotating thermal convection.
Introduction to partial differential equations, Sturm-Liouville problem, eigenvalues and eigenfunctions, orthogonality, orthogonal expansion.

The course will guide students in learning about solutions of partial differential equations arising in connection with various physical problems. Continuum Mechanics

The goal of this course is to learn and understand few principal partial differential equations (conservation laws) that are applicable for many problems. Wave Propagation

The course is a general introduction to the theory of seismic wave propagation.

ECTS

Wave Propagation

The course is a general introduction to the theory of seismic wave propagation. Wave Propagation

The course is a general introduction to the theory of seismic wave propagation.

GRADING will be based on homeworks (30%) and oral exams (70%).

Lecture notes

Script is available by request to taras.gerya@erdw.ethz.ch

Literature

Taras Gerya Introduction to Numerical Geodynamic Modelling Cambridge University Press, 2010

4. R. Snieder, "A guided tour of mathematical methods for the physical sciences"
2. M. Boas, "Mathematical methods in the physical science"

Objective

The course will guide students in learning about solutions of partial differential equations arising in connection with various physical problems. Special attention will be paid to the solutions of Laplace's equation in spherical and cylindrical polars. In addition the basics of vector calculus will be discussed in order to support Geophysical Fluid Dynamics and Potential Field Theory courses.

Content

It explains the principles and assumptions used in seismology. It provides the tools to solve basic seismological problems.
The course explains the principles and assumptions used in seismology. It provides the tools to solve basic seismological problems. The course includes the theorems in dynamic elasticity, the formulation with potentials, Greens function, elastic waves from point dislocations sources, moment tensors, 1D, 2D, and 3D wave propagation problems, reflection and transmission at plane boundaries, and surface waves in a vertically heterogeneous medium.

651-4015-00L  Seismotectonics  W+  3 credits  2G  A. P. Rinaldi, I. Molinari

Abstract
If you're interested in knowing more about the relationship between seismicity and plate tectonics, this is the course for you. (If you're not that interested, but yr program of study requires that you complete this course, this is also the course for you.)

Objective
By the conclusion of this course, we hope that you:

- have a solid understanding of stress and strain and tensor representations;
- have a feeling for what theorey is and why it is important;
- have a more sophisticated understanding of the relationship b/w plate tectonics and eqks;
- understand eqk source representations of varying complexity;
- understand eqks in the context of different tectonic settings;
- understand why we can't predict eqks; and
- understand that "modern science is... a set of research directions rather than a collection of nuggets of established truth."

Content
To begin our series of 14 meetings, we will review fundamentals of continuum mechanics and tensor analysis; our goal is to help you understand deformation from the scale of crornstarch in the classroom to the scale of plate tectonics. We will tell you about several ways to approximately represent an earthquake source; we'll present these in order of increasing sophistication. We'll discuss a currently-popular theory to explain earthquake triggering. We'll talk about the conceptual connections between earthquakes and tectonic deformation. You will enjoy (at least) two computer exercises.

- Discussed: stress and deformation in the Earth; stress and strain tensors; rheology and failure criteria; fault stresses, friction and effects of fluids; stable and unstable sliding; earthquake focal mechanisms; relationship between stress fields and focal mechanisms; seismic moment and moment tensors; relationship between moment- and deformation tensors; crustal deformation from seismic, geologic, and geodetic observations; earthquake stress drop, scaling, and source parameters; earthquake induced stress changes; global earthquake distribution; current global earthquake activity; different seismotectonic regions; examples of earthquake activity in different tectonic settings, such as in subduction zones, California, the Mediterranean, and in Switzerland.

Literature

Prerequisites / notice
You should have at least a foggy recollection of calculus.

651-4021-00L  Engineering Seismology  W+  3 credits  2G  D. Fäh, M. Pilz

Abstract
This course is a general introduction to the methods of seismic hazard analysis. It provides an overview of the input data and the tools in deterministic and probabilistic seismic hazard assessment, and discusses the related uncertainties.

Objective
This course is a general introduction to the methods of seismic hazard analysis.

Content
In the course it is explained how the disciplines of seismology, strong-motion geophysics, and earthquake engineering contribute to the evaluation of seismic hazard. It provides an overview of the input data and the tools in deterministic and probabilistic seismic hazard assessment, and discusses the related uncertainties. The course includes the discussion related to Intensity and macroseismic scales, historical seismicity and earthquake catalogues, ground motion parameters used in earthquake engineering, definitions of the seismic source, ground motion attenuation, site effects and microzonation, and the use of numerical tools to estimate ground motion parameters, both in a deterministic and probabilistic sense.

During the course recent earthquakes and their impacts are discussed and related to existing hazard assessments for the areas of interest.

651-4010-00L  Planetary Physics and Chemistry  W+  3 credits  2G  P. Tackley

Abstract
This course aims to give a physical understanding of the formation, structure, dynamics and evolution of planetary bodies in our solar system and also apply it to ongoing discoveries regarding planets around other stars.

Objective
The goal of this course is to enable students to understand current knowledge and uncertainties regarding the formation, structure, dynamics and evolution of planets and moons in our solar system, as well as ongoing discoveries regarding planets around other stars. Students will practice making quantitative calculations relevant to various aspects of these topics through weekly homeworks.

The following gives an overview of the course content and approximate schedule (subject to change).

 Mineralogy and Petrology

 Mineralogy and Petrology: Compulsory Courses

 Mineralogy and Petrology: Courses of Choice

 "Physical Properties of Minerals"

 Number: 651-4028-00L
 Title: Physical Properties of Minerals
 Type: W
 ECTS: 3
 Hours: 2G
 Lecturers: E. Reusser

 Abstract: Physical properties of minerals, e.g. electrical properties, elastic properties are discussed. The effect of the crystal symmetry on the symmetry of physical properties as well as the mathematical formulation of the physical properties are major topics.

 Objective: To provide students with the conceptual and practical skills necessary to implement thermodynamic models and data as provided in the earth science literature. The computer software package Maple is relied upon to allow students to solve realistic problems without the distraction of mathematical details.

 Content: Elementary concepts (1st and 2nd Laws; composition, state and extent); stability criteria; Legendre transforms; Maxwell relations and other manipulations of thermodynamic functions; calculation of Gibbs energy for a pure solid; simple solution models; order-disorder solution models; reciprocal solution models; equations of state for molecular fluids; free energy minimization.

 This course is neither an introduction to computer methods for calculating petrological phase equilibria nor an introduction to phase diagram methods.

 Prerequisites / notice: The grade for the course is based on exercises assigned as homework. Some familiarity with elementary thermodynamics (phase rule, reactions) and mathematics (differentiation, integration) is assumed. Experience with Maple or comparable programs such as Mathematica is helpful.

 X-ray Powder Diffraction

 Number: 651-4063-00L
 Title: X-ray Powder Diffraction
 Type: W
 ECTS: 3
 Hours: 2G
 Lecturers: L. M. Plötze

 Abstract: In the course the students learn to measure X-ray diffraction patterns of minerals and to evaluate these using different software for qualitative and quantitative mineral composition as well as crystallographic parameters.

 Objective: Upon successful completion of this course students are able to:
 - describe the principle of X-ray diffraction analysis
 - carry out a qualitative and quantitative mineralogical analysis independently,
 - critically assess the data,
 - communicate the results in a scientific report.

 Content: Fundamental principles of X-ray diffraction
 Setup and operation of X-ray diffractometers
 Interpretation of powder diffraction data
 Qualitative and quantitative phase analysis of crystalline powders (e.g. with Rietveld analysis)

 Lecture notes: Selected handouts will be made available in the lecture

 Prerequisites / notice: The course includes a high portion of practical exercises in sample preparation as well as measurement and evaluation of X-ray powder diffraction data. Own sample will be analysed qualitatively and quantitatively. Knowledge in mineralogy of this system is essential. The lecture course is limited to 12 participants.

 Phase Petrology

 Number: 651-4223-00L
 Title: Phase Petrology
 Type: W
 ECTS: 3
 Hours: 2G
 Lecturers: L. Tajcmanová

 Abstract: A comprehensive introduction to heterogeneous phase equilibria in the geosciences.

 Objective: The aim of the course is to give insight into processes that lead to the formation of magmatic and metamorphic rocks.

 Data: 06.09.2017 12:54
 Autumn Semester 2016
 Page 587 of 1570
Content

The course will give an introduction to phase petrology and its application to magmatic and metamorphic systems. Further, the course will give an introduction to thermobarometry of mineral assemblages. The origin and interpretation of microstructures and chemical zonation in rocks will be discussed. We will also touch kinetics of rock forming processes and the role of fluids during the lectures.

The specific topics will involve:
Mineral reactions and chemical equilibrium in metamorphic and magmatic rocks, recalculation of rock and mineral analyses, mineral modes, P-T-X relations.

Literature

1) the blue book by F Spear 1993 Metamorphic phase equilibria and pressure-temperature-time paths. MSA Mongraph
2) Principles of Metamorphic Petrology; Ron H. Vernon, Geoffrey Clarke

<td><strong>Applied Mineralogy and Non-Metallic Resources I</strong></td>
<td>W+</td>
<td>3</td>
<td>2G</td>
<td>R. Kündig, C. Bühler</td>
</tr>
</tbody>
</table>

**Abstract**
Geological and mineralogical aspects to important non-metallic mineral resources. Industrial use of specific mineral resources as well as economic, strategic and environmental aspects are discussed. Examples from all over the world with a specific focus on the non-metallic mineral resources potential in Switzerland.

**Objective**
Students will learn to understand the use of non-metallic mineral resources from a geological and mineralogical point of view as well as from an industrial, technical and strategic (political) point of view. Environmental aspects on the worldwide use of non-metallic mineral resources are discussed. A special focus will be given on the situation in Switzerland.

**Content**
Teaching, case-studies and excursions (e.g. raw-material industry).

Course "Applied mineralogy and non-metallic resources I" (autumn/winter semester):
Non-metallic resources. Occurrences, geology, extraction, properties, fabrication and use. Industrial aspects, (new) technologies, market, stock, situation, reserves & resources, trends and development, environmental aspects, law.

Chapters: e.g. coal/coal (coal, graphite, diamond, fullerene); oil/gas (oil- and tarsands, oil-shits); phosphates/nitrates; aluminum (bauxite, corundum); salt; carbonates; titanium; clay and clay minerals; sulphur; gypsum/anhydrite; fluorite; asbestos; talc; micas; rare earth elements.

**Course "Applied mineralogy and non-metallic resources II"** (fall/summer semester):

Chapters: e.g. Stone industry - technical aspects of building stones, properties, weathering, treatment, quarries, products. Crushed stones - quarries, products, planning, environment. Gravel and sand - resources/reserves, environment (protection/ law), alternative products (substitution). Cement and concrete (geological resources, prospecting, fabrication, environment).

**Lecture notes**
Will be given according to the lessons. Partially integration of e-learning tools.

**Literature**

<td>2G</td>
<td>C. A. Heinrich</td>
</tr>
</tbody>
</table>

**Abstract**
Can be chosen as an elective course within the Bachelor. Prospective MSc-students attending the module "Mineral Resources" should attend Ore Deposits I and II in the first year of their MSc studies.

**Objective**
Understanding the fundamental processes of hydrothermal and magmatic ore formation, recognising and interpreting mineralised rocks in geological context

**Content**
(a) Principles of hydrothermal ore formation: base metal deposits in sedimentary basins. Practical classification of sample suites by genetic ore deposit types
Mineral solubility and ore deposition, principles & thermodynamic prediction using activity diagrams. Stable isotopes in ore-forming hydrothermal systems (O, H, C, S) Driving forces and structural focussing of hydrothermal fluid flow

(b) Introduction to orthomagmatic ore formation. Chromite, Ni-Cu sulphides and PGE in layered mafic intrusions. Distribution coefficients between silicate and sulphide melts. Carbonatites and pegmatite deposits.

**Lecture notes**
Notes handed out during lectures

**Literature**
Extensive literature list distributed in course

**Prerequisites / notice**
2 contact hours per lecture / week including lectures, exercises and practical study of samples, and small literature-based student presentations. Supplementary contact for sample practicals and exercises as required. Credits and mark based on participation in course (exercises, 50%) and 1h written exam in the last lecture of the semester (50%).

**Abstract**
Introduction to computer tools for the simulation of hydrothermal processes. This includes fluid flow modelling and thermodynamic modelling of hydrothermal reactions. The computer programs are handed out to the students and can be run on normal PCs. No programming knowledge is necessary.

**Objective**
Learn how to use the simulation programs HYDROTHERM and HCh to explore how hydrothermal systems work.
Introduction to computer tools for the simulation of hydrothermal processes: HYDROTHERM for fluid flow simulations, HCH for thermodynamic modeling. While learning the respective computer programs is an essential part of the course, the emphasis will be on using these tools to learn how the physics and chemistry of hydrothermal systems actually work.

Computer programs and course material will be distributed during the course.

Abstract

Global mineral economics and the strategies of mineral exploration -- including geological, geochemical and geophysical methods, but also non-geological factors such as organisational, political and environmental aspects. Changing external lecturers.

Objective

Practical understanding of the procedure of exploring a mineral prospect, based on geological analysis, exploration by drilling, resource calculation of tonnage and grade as a basis for economic evaluation for reporting to investors.

Content

This block course will comprise 4 half-day lectures and a series of practical exercises from selection of a mineral property to discovery of mineral resources and their valuation. Teams are formed as Limited Partnership companies that have to select and bid for a mineral property offered during an auction. Each company has the same nominal budget. The highest bidder purchases the selected property, others need to purchase the remaining properties during an auction. Justification for selecting the property is justified in a report. The companies must understand the geology of their mineral property to prepare a diamond drill program to discover and, eventually, delineate the mineral resources. This drill program is presented in a report prior to drilling. Drilling in the tri-dimensional matrix of the property is simulated using the software FOREUR, until budget lapse. The companies must select drill intervals for chemical analysis to document the extent and composition of the discovered mineralization. Portions of the mineral rights can be traded for capital between the companies. An estimate of the tonnage and grade of the discovered resource is prepared using geometric methods and GIS software (ex. ArcGIS). The ground value of the resource is estimated by a computation of the Net Smelter Return at current metal prices. The results of the exploration program are presented in a comprehensive report.

Lecture notes

Handouts for background information and a computer simulation program for the case-study exercise will be provided. Participants must bring a Windows-based laptop computer.

Prerequisites / notice

Prerequisites: Knowledge of mineral deposit-type characteristics is useful (orogenic gold, Cu-Zn VMS, Ni-Cu-PGE); at least "Ressourcen der Erde", or adequate knowledge of mineral deposits acquired by preparatory reading. Basic knowledge of ArcGIS software is important to produce maps and sections required in reports. Training exercises and tutorials will be provided in advance to prepare for the course. Taught biennially in collaboration with University of Geneva.

This course is co-organised by ETH Zurich (Prof. C. Heinrich) and University of Geneva (Prof. L. Fontbote)
Objective
The student will have an understanding of evolution of climate and its major forcing factors -orbital, atmosphere chemistry, tectonics-through geological time. He or she will understand interaction between life and climate and he or she will be familiar with the use of most common geochemical climate "proxies", he or she will be able to evaluate quality of marine and terrestrial sedimentary paleoclimate archives. The student will be able to estimate rates of changes in climate history and to recognize feedbacks between the biosphere and climate.

Content
Climate system and earth history - climate forcing factors and feedback mechanisms of the geosphere, biosphere, and hydrosphere.
Geological time, stratigraphy, geological archives, climate archives, paleoclimate proxies
Climate through geological time: "lessons from the past"
Cretaceous greenhouse climate
The Late Paleocene Thermal Maximum (PETM)
Cenozoic Cooling
Onset and Intensification of Southern Hemisphere Glaciation
Onset and Intensification of Northern Hemisphere Glaciation
Pliocene warmth
Glacial and Interglacials
Millennial-scale climate variability during glaciations
The last deglaciation(s)
The Younger Dryas
Holocene climate - climate and societies

651-4225-00L Topics in Geochemistry W 3 credits 2G S. Bernasconi, G. Bernasconi-Green
Abstract
This course aims to present and discuss advanced topics in geochemistry based on the critical reading of research papers. Themes will vary from year to year and suggestions from students are welcome. The format of the course will be: one or more lectures introducing a theme, followed by a presentation of one or more papers by a student or group of students.

Objective
The goal of the course is discuss topics in advanced geochemistry which were not covered in other general and specialized geochemistry courses. In addition, we aim at training the student's ability to critically evaluate research papers and to summarize the findings concisely in an oral presentation.

Content
Themes will vary from year to year and suggestions from students are welcome. Some possible topics are:
Organic geochemistry.
Isotope geochemistry of organic matter: carbon, hydrogen and nitrogen.
Multiply-substituted isotopologues.
Mass-independent fractionations.
Mass transfer and isotopes in modern and ancient ocean-floor hydrothermal systems and subduction zone environments.
Noble gas geochemistry: terrestrial and extraterrestrial applications

Lecture notes None
Literature Will be identified based on the chosen topic.

651-4010-00L Planetary Physics and Chemistry W 3 credits 2G P. Tackley
Abstract
This course aims to give a physical understanding of the formation, structure, dynamics and evolution of planetary bodies in our solar system and also apply it to ongoing discoveries regarding planets around other stars.

Objective
The goal of this course is to enable students to understand current knowledge and uncertainties regarding the formation, structure, dynamics and evolution of planets and moons in our solar system, as well as ongoing discoveries regarding planets around other stars. Students will practice making quantitative calculations relevant to various aspects of these topics through weekly homeworks.

Literature It is recommended but not mandatory to buy one of these books:
Fundamental Planetary Science, by Jack J. Lissauer & Imke de Pater (paperback), Cambridge University Press, 2013. (books.ch Fr64.90, amazon.co.uk £35.00, amazon.de €38.81, amazon.com $49.26).

651-4235-00L Marine Geology and Geochemistry W 3 credits 2G G. Bernasconi-Green

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 591 of 1570
Abstract

Introduction to oceanographic methods and international research programs in marine geology and an overview of physical, chemical and biological processes in modern marine environments.

Objective

This course aims at giving an overview of oceanographic methods and an understanding of physical, chemical and biological processes in modern marine environments. This course will combine lectures and student participation. Student presentations are based on critical reading of research papers and integration of data and results from international oceanographic programs and ocean drilling.

Content

Specific topics will be chosen to examine processes of crustal formation, alteration, mass transfer and biological activity in mid-ocean ridge, continental margin and subduction zone settings, with consideration of data and new results obtained from international oceanographic programs and from DSDP, ODP and IODP drilling.

Student participation and discussions are based on critical reading of research papers, use of internet-based data, and web-based cruise results. Requirements to obtain credit points are oral or poster presentations and a short written summary of selected themes.

Lecture notes

No formal script will be distributed. Handouts will be given, where necessary. These will consist of the most important diagrams presented in the lectures. The students are expected to take their own notes and consult the literature for more details.

Literature

Lists of literature relevant to the selected topics will be handed out in the course.

Prerequisites / notice

This course is offered every 2 years.

651-4229-00L Advanced Geochronology  W  3 credits  2G  A. Quadt Wykradt-Hüchtenbruck, H. Busemann, B. Ellis, M. Guillong, A. Liati

Objective

The purpose of this lecture is to provide a comprehensive overview of: a) the different radiometric methods in Geology, the different dating tasks and the constraints put by the complexity of natural systems, including dating by cosmogenic nuclides, b) the various analytical tools available today for radiometric dating, their advantages and disadvantages, c) the Geochemistry and d) detailed description of case studies, as examples of approach of a number of geological problems and interpretation of the data.

Content

The content of this lecture is summarised as follows:

Anthi Liati:
- Ion microprobes - U-Pb SHRIMP dating (zircon, sphene, rutile, monazite)
- Dating metamorphic rocks
- Combined geochronology and petrology subduction and exhumation rates
- Tracing the timing of mantle and crustal events via zircon-dating in mantle xenoliths: Two case studies: South Namibia, Kilbourne Hole (New Mexico)

Henner Busemann:
- Noble gas geo- and cosmochemistry
- Surface exposure dating with cosmogenic nuclides
- carbon-14 dating and U-Th-He thermochronology
- Visit of the radiogenic and noble gas isotope laboratories of IGMR

Albrecht von Quadt:
- Analytical tools and applications to radiogenic isotopes (basics about TIMS, LA-ICP-MS-MC)
- Dating magmatic rocks and ore deposits (porphyry, epithermal Cu-Au-(Mo) deposits)
- U-Pb, Re-Os, Pb-Pb methods - Hf tracing of zircons
- Geochronology and geochemistry of magmatic systems

Marcel Guillong:
- LA-ICP-MS as the method of choice for dating, in comparison to other methods (Ion-probe, TIMS, ...)
- Data reduction in LA-ICP-MS: from measured counts per seconds to the final age of a sample, with hands on example.
- The challenge to date very young Zircons, with an example from Kos.

Ben Ellis:
- Ar-Ar dating techniques
- Ar-Ar dating of volcanic rocks

Lecture notes

Script (for part of the lecture), partly power point presentations (in the web) and partly copies of power point transparencies.

Electives

Courses can be chosen from the complete offerings of the ETH Zurich and University of Zurich (according to prior agreement with the subject advisor).
Abstract
This colloquium comprises geophysical research presentations by invited leading scientists from Europe and overseas, advanced ETH Ph.D. students, new and established ETH scientists with specific new work to be shared with the institute. Topics cover the field of geophysics and related disciplines, to be delivered at the level of a well-informed M.Sc. graduate/early Ph.D. student.

Objective
Attendants of this colloquium obtain a broad overview over active and frontier research areas in geophysics as well as opened questions. Invited speakers typically present recent work: Attendants following this colloquium for multiple terms will thus be able to trace new research directions, trends, potentially diminishing research areas, controversies and resolutions thereof, and thus build a solid overview of state and direction of geophysical research. Moreover, the diverse content and delivery style shall help attendants in gaining experience in how to successfully present research results.

651-1851-00L
Introduction to Scanning Electron Microscopy

Objective
Introducing students and researchers to the fundamentals and applications of scanning electron microscope instrumentation and methods.

Content
- Basic principles of scanning electron microscopy
- Instrumentation and methods for sample analysis
- Practical exercises

Lecture notes
Scripts and operation manuals are provided during the course.

Literature

Prerequisites / notice
Full dayblock course after the end of HS

651-0048-00L
Electron Microprobe Course

Objective
A comprehensive understanding of the interaction of electrons with condensed matter and details on the instrumentation and methods for elemental analysis.

Content
- Principles of electron optics
- Interaction of electrons with matter
- Production of X-rays
- Interaction of X-rays with matter
- Detection of X-rays

Lecture notes
Kursunterlagen

Literature

Prerequisites / notice
Prerequisite: Analytical methods in Petrology and Geology (651-4055-00L).

327-0703-00L
Electron Microscopy in Material Science

Objective
Introduction to electron microscopy in material science, focusing on the interaction of electrons with condensed matter and details on the instrumentation and methods designed to use these probes in the structural and chemical analysis of various materials.

Content
- Principles of electron optics
- Interaction of electrons with matter
- Production of X-rays
- Interaction of X-rays with matter

Lecture notes
English

Literature

651-3541-00L
Exploration and Environmental Geophysics

Objective
An overview of the most important geophysical methods: Potential field methods (Gravimetrics and Magnetics), Electrical and electromagnetic methods, Refraction and reflection seismics, Georadar. Discussion of survey design, sources and receivers and data processing.

Content
- Overview and understanding of geophysical methods
- Potential field methods
- Electrical and electromagnetic methods
- Refraction and reflection seismics
- Georadar

Lecture notes
Available through eDoz/ILIAS.

Literature

651-4086-00L
Experimental Methods in Petrology

Objective
Overview of the most common experimental methods employed in petrology to determine thermodynamic and physical properties and phase equilibria of minerals, mineral assemblages, magmas and fluids. The basic principals of low, moderate, high and ultrahigh pressure devices are discussed combined with an introduction into the synthesis of starting materials and the evaluation of run products.
Objective
This course shall provide the basics of experimental petrology. The principal goals are the acquisition of basic knowledge about experimental equipment employed in petrology and the design and setup of an experimental study targeted to obtain quantitative data on phase relations, thermodynamic, kinetic and rheologic properties of earth materials as well as the examination, analysis and evaluation of experiments. At the end of the course, the participants should be able to evaluate experimental data independently and design appropriate experiments on their own.

Content
The course 'Experimental methods in petrology' covers the following subjects:

1. Introduction and historical summary of experimental petrology
2. Experimental methods at ambient pressure (1 bar) with practical exercise to determine the free energy of formation of wustite (FeO)
3. Experimental buffering techniques (phase rule, buffering of partial pressures of gases and supercritical fluids, buffering of mixed volatile phases at elevated pressures, buffering of activities and solid-solution in solid phases
4. Experimental methods at moderate pressures: externally (cold seal) and internally (IHPV) heated gas-pressure apparatus with practical demonstration/exercise
5. High-pressure solid-media experimental techniques (piston cylinders)
6. Ultrahigh-pressure experimental techniques (multi-anvil apparatus, diamond-anvil-cells (DAC)
7. Evaluation of petrologic experiments (preparation of run products, analytical and spectroscopic methods of examination and quantification)

The practical work in the laboratories is conducted (with the exception of exercise #1) on a small research project where the various techniques and equipment are demonstrated and the practical use is trained.

Lecture notes
A summary of the material presented in the lectures are distributed weekly.

Literature
Currently, there is no comprehensive book available that summarizes the most important aspects of experimental petrology; publications relating to individual subjects are referred during the lectures.

Prerequisites / notice
This course addresses to a public (master and PhD students) that is interested in an introduction to experimental research in petrology, but does not require basic knowledge in experimental methods. However, basic knowledge in petrology and physical chemistry (thermodynamics) is required to follow the course.

---

**651-4082-00L Flows and Mineral Deposits**

**W 2 credits 2S**

**Abstract**
Presentations and literature discussions on current research topics in crustal fluids and mineral resources research.

**Objective**
Provide a deeper understanding in the selected research fields on hydrothermal processes and ore deposit formation. This is achieved by literature work as well as discussions of current BSc, MSc and PhD projects at the institute.

**Content**
Current research in hydrothermal geochemistry, Modellierung von Fluidprozessen, Mikroanalytik, Isotopen-Tracing von hydrothermalen Transportprozessen und der Bildung von Erzlagertäten

**Prerequisites / notice**
Register in MyStudies and send mail to szandra.fekte@erdw.ethz.ch, to be placed on distributor for the evolving program

---

**651-4114-00L Illustrations in Natural History (University of Zürich)**

**W 1 credit 1V**

- University lecturers

**Abstract**
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: BIO271

- Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

**Objective**
- the most important drawing techniques commonly applied in science
- accurate observation
- basic knowledge in image processing with Photoshop

**Content**
In this course, both classic and computer-based drawing and illustration-techniques are presented. We begin with sketches with the pencil and continue with Indian ink which we use for drawings using hatching and dots. Finally, one drawing is carried out in detail with a pencil. This drawing will then be scanned and processed in Photoshop. The emphasis is on practicing the methods.

**Prerequisites / notice**
Please bring pencils (HB and 2H) as well as Indian ink-pens or fine black markers. In the second half of the semester, the students may bring their own laptops with Photoshop because usually, we do not have enough computers in the lecture hall for all.

---

**651-4273-00L Numerical Modelling in Fortran**

**W 3 credits 2V**

- P. Tackley

**Abstract**
This course gives an introduction to programming in FORTRAN95, and is suitable for students who have only minimal programming experience. The focus will be on Fortran 95, but Fortran 77 will also be covered for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts.

**Objective**
FORTRAN 95 is a modern programming language that is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95, but Fortran 77 will also be covered for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

**Prerequisites**
See http://jupiter.ethz.ch/~pj/FORTRAN/FortranClass.html

---

**651-4273-01L Numerical Modelling in Fortran (Project)**

**W 1 credit 1U**

- P. Tackley

**Prerequisite:** 651-4273-00L Numerical Modelling in Fortran

**Abstract**
This course gives an introduction to programming in FORTRAN95, and is suitable for students who have only minimal programming experience. The focus will be on Fortran 95, but Fortran 77 will also be covered for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts.

**Objective**
FORTRAN 95 is a modern programming language that is specifically designed for scientific and engineering applications. This course gives an introduction to programming in this language, and is suitable for students who have only minimal programming experience, for example with MATLAB scripts. The focus will be on Fortran 95, but Fortran 77 will also be covered for those working with already-existing codes. A hands-on approach will be emphasized rather than abstract concepts, using example scientific problems relevant to Earth science.

**Content**
The project consists of writing a Fortran program to solve a problem agreed upon between the instructor and student; the topic is often related to (and helps to advance) the student’s Masters or PhD research. The project is typically started towards the end of the end of the main Fortran class when the student has acquired sufficient programming skills, and is due by the end of Semesterprüfung week.

**Autumn Semester 2016**

Page 594 of 1570
The dynamics of glaciers and polar ice sheets is the key requisite to understand their history and their future evolution. We will take a seminar series with external and occasional internal speakers addressing current research topics. Changing programs announced via D-Physics of Glaciers University lecturers.

Seminar in Hydrology
Understanding of a broad scope of current problems and state-of-the-art practice in seismology.

Seminar in Seismology
Understanding of a broad scope of current problems and state-of-the-art practice in seismology.

Research Seminar Structural Geology and Tectonics
A seminar series with both invited speakers from both inside and outside the ETH.

Tunnelling I
Basic aspects of design and analysis of underground structures. Conventional tunnel construction methods. Auxiliary measures (ground improvement and drainage, forepoling, face reinforcement). Numerical analysis methods.

Colloquium Department Earth Sciences
Invited speakers from the entire range of Earth Sciences.
Selected themes in sedimentology, tectonics, palaeontology, geophysics, mineralogy, paleoclimate and engineering geology on a regional and global scale.

According to variable program.

Humangeography III (Geographies of Difference) (Universität Zürich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: GEO232
Prerequisite: Human Geography II (UZH Module Code: GEO122)

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

- Sie vertiefen ihre theoretischen, empirischen und methodischen Fähigkeiten in folgenden Themenbereichen:
  - Gesellschaft und Raum
  - Gesellschaft und Entwicklung
  - Gesellschaft und natürliche Umwelt/Ressourcen
  - Öffentlich und Geschlossenheit in Wirtschaft und Gesellschaft
  - Chancen und Herausforderungen einer globalisierten Weltwirtschaft
  - Sie sind in der Lage, Verknüpfungen zwischen grundlegenden sozial- und wirtschaftswissenschaftlichen Theorien und deren Konkretisierung in der Geographie herzustellen.
  - Sie können die erwähnten Themen mit ausgewähltem Faktenwissen verknüpfen und diskutieren
  - Sie schulen Ihre analytischen und theoretischen Fähigkeiten und können diese in Diskussionen einbringen
  - Sie können die Relevanz von weiterführenden wissenschaftlichen Texten diskutieren und mit einem Ausgangstext verknüpfen
  - Sie sind in der Lage, eine Diskussion über wissenschaftliche Themen zu strukturieren und - mit einfachen Moderationstechniken - zu moderieren

UZH Module Code: GEO112

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

Human Geography I: One Earth - Many Worlds (University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: GEO112

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Imparting of research questions and basic principles in Human Geography

To get an overview about basic research questions and principles of Human Geography

(1) Society and space (2) Society and development (structure and dynamic of population, urbanisation, disparities (3) Society and natural environment (natural resources; food security, sustainability)

Lecture notes
PowerPoint-slides (German)

Literature

Physical Geography III (Geomorphology and Glaciology) (University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: GEO231

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Das Modul bietet eine kurze Einführung in einige Komponenten und Prozesse des hydrologischen Kreislaufes. Dabei werden einzelne Wasserspeicher (Schnee-, Boden- und Grundwasser) und Flüsse zwischen den Speichern (Verdunstung, Niederschlag und Abfluss) betrachtet. Übungen ergänzen die Vorlesung.

Physical Geography I (Fundamentals and Spheres) (University of Zurich)
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: GEO111

Mind the enrolment deadlines at UZH:

Geophysical Fluid Dynamics and Numerical Modelling Seminar
E- Dr 0 credits 1S P. Tackley, M. D. Ballmer, T. Gerya, D. A. May

Heat and Mass Transfers in Magmatology W Dr 1 credit 1S O. Bachmann, J. Leuthold
Heat and mass transfers in the crust control many aspects of the differentiation of our planet, including (1) type of volcanic eruptions we should expect at the surface of our planet, (2) the volcanic/plutonic ratio in the crust, and (3) how volcanic degassing occurs, with important consequences on the climate response following volcanic eruptions.

The goal of this class is to learn about the modern methods and ideas on heat and mass transfers in magmatology through recently published papers and computer softwares. The class will allow students to explore some of the most challenging concepts in this field, and become familiar with state-of-the-art techniques to model these processes.

The class will focus mostly on reading recent literature on topics of interests, and will contain some computer exercises to allow students to work by themselves on some well-defined problems.

651-1091-02L Geological Colloquium
- E- Dr 0 credits 2K J.P. Burg, P. Nievergelt
- Invited speakers from the entire range of Earth Sciences.
- Selected themes in sedimentology, tectonics, paläontology, geophysics, mineralogy, paleoclimate and engineering geology on a regional and global scale.
- The presentations are held in German. Membership of the Geological Society in Zurich is not required.

651-3280-00L Earth Science Excursions
- W 1 credit 2P P. Brack
- Only for MSc and doctorate students of D-ERDW. Only for excursions that are not part of the BSc excursion program 2.-6. semester.
- Further information and additional registration on https://www.conference.ethz.ch/erdw/

651-2001-00L Semester Research Project
- W 3 credits 6A Lecturers
- Small individual research project done by a student and supervised by a Professor/Dozent/Oberassistent of D-ERDW. The content of each project is unique and is defined by the supervisor. The project consists of research activity aimed at producing new scientific results and/or data. Short scientific report/paper is written by the student, which serves as a basis for project grading.
- To gain admission to the master programme;
- To get prepared for a MSc project.
- The project consists of research activity aimed at producing new scientific results and/or data. Short scientific report/paper is written by the student, which serves as a basis for project grading.

651-4060-00L MSc Project Proposal
- The MSc Project Proposal is only offered in autumn semester. A registration in spring semester is subject to special approval by the study director.
- The introductory lecture for all majors on "Conduct as a Scientist" will be taught at the beginning of spring semester 2017 on Tuesday February 21, 2017 at 16:15 during the Engineering Geology Seminar.
- The main purpose of the Master Project Proposal is to help students organize ideas, material and objectives for their Master Thesis, and to begin development of communication skills.
- The main objectives of the Master Project Proposal are to demonstrate the following abilities:
  - to formulate a scientific question
  - to present scientific approach to solve the problem
  - to interpret, discuss and communicate scientific results in written form
  - to gain experience in writing a scientific proposal

651-4062-00L Master’s Thesis
- Only students who fulfill the following criteria are allowed to begin with their master thesis:
  a. successful completion of the bachelor programme;
  b. fulfilling of any additional requirements necessary to gain admission to the master programme;
  c. have successful completed the MSc Project Proposal

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 597 of 1570

### Abstract
- Provides a basic introduction into Earth Sciences, emphasizing different rock-types and the geological rock-cycle, as well as introduction into geophysics and plate tectonic theory.
- Understanding basic geological and geophysical processes
- Overview of the Earth as a system, with emphasis on plate tectonic theory and the geological rock-cycle. Provides a basic introduction to minerals and different rock-types. Lectures include processes in the Earth's interior, physics of the earth, planetology, introduction to magmatic, metamorphic and sedimentary rocks. Exercises are conducted in small groups to provide a more in depth understanding of concepts and content of the lectures.
- Exercises and short excursions in small groups (10-15 students) will be lead by student assistants. Specific topics in earth sciences will be discussed using examples and case studies. Hand samples of the major rock types will be described and interpreted. Short excursions in the region of Zurich will permit direct experience with earth science processes (e.g. earth surface processes) and recognition of earth science problems and solutions relevant for modern society (e.g. building materials, water resources). Working in small groups will allow for discussion and examination of actual earth science themes.
- Introduction to the scientific methodology. The student should develop his/her capability to turn physical observations into mathematical models, and to solve the latter. The student should acquire an overview over the basic concepts in mechanics.
### Content

**Chapters:** 1, 2, 3, 4, 5, 6 (without: 6-5, 6-6, 6-8), 7, 8 (without 8-9), 9, 10 (without 10-10), 11 (without 11-7), 13 (without 13-13, 13-14), 14 (without 14-6), 15 (without 15-3, 15-5)

**Abstract**
Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

**Objective**
The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".
Introduction to Engineering Geology

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
This introductory course starts from a descriptions of the behavior and phenomena of soils and rocks under near surface loading conditions and their key geotechnical properties. Lab and field methods for the characterization of soils, rocks and rock masses are introduced. Finally practical aspects of ground engineering, including tunneling and landslide hazards are presented.

Objective
Understanding the basic geotechnical and geomechanical properties and processes of rocks and soils. Understanding the interaction of rock and soil masses with technical systems. Understanding the fundamentals of geological hazards.

Content

Lecture notes
Written course documentation available under "Kursunterlagen".

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Demanding biological topics are dealt with under consideration of the special needs of persons involved in teaching. The module comprises the parts:

1) Lecture (Tues. 08.00-09.45 hrs)
2) Colloquium (every second Tues. 10.15-12.00 hrs., begins on first lecture day)
3) Seminar with presentation (every second Tues. 10.15-12.00 hrs., begins in second lecture week)
4) Semester thesis in a research group (7 weeks)

Performance Assessment:
Performance is assessed during the course of the entire module, with a final test. Active participation in the colloquia and group seminars is required. The thesis report and an oral presentation have to be completed.

The Specialized Biology Course with an Educational Focus (12 CP) can be acknowledged, in agreement with the advisor of the respective elective major, as one of the two obligatory research projects (each 15 CP). In such a case, additional 3 CP must be obtained in another course.

In case of overbooking of the course, students enrolled in the Teaching Diploma in Biology will have priority for registration.

The course is organized jointly with the University of Zurich (Fachbereich Biologie) and is held at the Life Science Zurich Learning Center of the ETH Zurich and the University of Zurich.

The program of this course represents one half (6 CP) of that of the Specialized Biology Course with an Educational Focus (551-0963-00, 12 CP).

**Abstract**

Selected topics in general chemistry:

1) The language of chemistry
2) Chirality and stereochemistry
3) Oxidation of water
4) Chemistry of the atmosphere

**Objective**

In this course, participants acquire extended and more in-depth knowledge of selected chemistry topics. The selection is based to a large extent on the partial aspects of chemistry that are typically taught at high school. By gaining a broader understanding, teachers are put in a position where they can comprehend the topics that are to be taught in a wider and, to some extent, unconventional context and critically process these in respect of their teachability and learnability. At the same time, interrelationships between the classical sub-disciplines of chemistry are highlighted, along with the unique features of chemistry as one of the central natural sciences.

**Content**

- The language of chemistry: Concepts, formulas, aesthetics, and philosophical aspects
- Chirality and stereochemistry: Selected aspects, origin of biomolecular chirality, inorganic chemistry
- Cosmochemistry
- Chemistry of the atmosphere

**Lecture notes**

Folien und ausgewählte Literatur werden zur Verfügung gestellt.

**Literature**

Ausgewählte Artikel aus der Primär- und Sekundärliteratur werden vorgestellt, kommentiert und zur Lektüre empfohlen.

**Prerequisites / notice**

- LE 551-0968-00L - belegen.

A. Baertsch

Simultaneous enrolment in Introductory Internship Chemistry - course 529-0966-00L - is compulsory.

**Abstract**

Implementing findings from research into teaching and learning for chemistry lessons and coverage of subject-specific teaching and learning specialities.

**Objective**

- Among other things, students are put in a position where they can
- divide up the subject matter into contents that can be learned by heart or accessed intellectually, and communicate these contents
- break down technically complex contents to the right level for a class and still present these in a stringent, error-free manner in their simplified form
- establish which subject matter can be presented with which teaching techniques and methods that have been recognised as efficient in teaching terms, and adapt these tools to the learning content in question.
- plan school experiments, incorporate them in lessons, perform them in accordance with all the rules of the art, and also evaluate them in a beneficial manner.
- assess pupils’ prior knowledge, clarify it in greater detail and take it into account for planning lessons.
- design a sequential curriculum suitable for the levels in question and put it into practice.
- reliably identify stumbling blocks in the contents and get round these.

**Content**

Schwerpunkte im ersten Studiensemester bilden die folgenden Themen:

- Auswahl gymnasiumsrelevanter Lerninhalte
- Modellbegriff in den Naturwissenschaften, insbesondere der Chemie
- Sprache und Fachsprache im Chemieunterricht
- Wechselwirkungen zwischen Beobachtungen in der realen Welt und Deutungsversuchen auf der Modell-Ebene
- Interdisziplinarität mit Biologie, Mathematik und Physik
- Leistungserhebung und -beurteilung im Theorie- und Laborunterricht
- Atemmodelle und chemische Bindung
- Mathematische Beschreibung chemischer Systeme (z.B. Stöchiometrie und Gleichgewichtssysteme)
- Auswahl, Konzeption, Einbettung, Vorbereitung, Durchführung, Nachbereitung und Auswertung von Demonstrations- und Schüler-Experimenten

**Lecture notes**

Prerequisites / notice
Der Chemieunterricht am Gymnasium soll einerseits dem zukünftigen Nichtnaturwissenschaftler ein grundlegendes Rüstzeug an chemischen Kenntnissen und Fähigkeiten für den Alltag an die Hand geben, andererseits aber auch auf ein naturwissenschaftlich orientiertes Hochschulstudium vorbereiten können. Diese beiden Anforderungen sind im Unterricht gleichermaßen zu berücksichtigen.

Da viele Lerninhalte zudem zwingend sequentiell und einander benützend strukturiert sind, ist dem logischen und aus Schülerperspektive nachvollziehbaren Aufbau des Unterrichts besonderes Augenmerk zu schenken. Dies bedeutet eine besonders feine Abstimmung von fachlichen Inhalten unterschiedlichen Niveaus und der für ihre Vermittlung eingesetzten didaktischen Methoden und Techniken auf die kognitive Leistungsfähigkeit der Lernenden.

Anhand der Diskussion ausgearbeiteter und bewährter Beispiele, aber auch durch selbständiges Probehandeln und mit Hilfe selbst zu erstellender kleiner Unterrichtsbausteine soll die zukünftige Lehrkraft befähigt werden, einen den spezifischen Rahmenbedingungen angepassten eigenen Unterricht zu konzipieren und durchzuführen, der diesem hohen Qualitätsanspruch genügen kann.

402-0091-00L Teaching science in Higher Education W 2 credits 1V G. Schiltz

Abstract
This course imparts fundamental didactic concepts that are relevant to teaching science in a Higher Education context.

Objective
Students are able to characterize and to discuss the model of outcomes based education.

Number Title Type ECTS Hours Lecturers
402-0737-00L Energy and Environment in the 21st Century (Part I) W 6 credits 2V+1U M. Dittmar

Abstract
The energy and related environmental problems, the physics principles of using energy and the various real and hypothetical options are discussed from a physicist point of view. The lecture is intended for students of all ages with an interest in a rational approach to the energy problem of the 21st century.

Objective
Scientists and espially physicists are often confronted with questions related to the problems of energy and the environment.

Content
Introduction: energy types, energy carriers, energy density and energy usage. How much energy does a human needs/uses?

Energy conservation and the first and second law of thermodynamics

Fossil fuels (our stored energy resources) and their use.

Burning fossil fuels and the physics of the greenhouse effect.

physics basics of nuclear fission and fusion energy

controlled nuclear fission energy today, the different types of nuclear power plants, uranium requirements and resources, natural and artificial radioactivity and the related waste problems from the nuclear fuel cycle.

Nuclear reactor accidents and the consequences, a comparison with risks from other energy using methods.

The problems with nuclear fusion and the ITER project.

Nuclear fusion and fission: `exotic“ ideas.

Hydrogen as an energy carrier: ideas and limits of a hydrogen economy.

new clean renewable energy sources and their physical limits (wind, solar, geothermal etc)

Energy perspectives for the next 100 years and some final remarks

Lecture notes

402-0910-00L

Physics Didactics I: Special Didactics of Physics
Teaching
Limited number of participants.
Further information is available from the lecturer via email: mamohr@ethz.ch

Simultaneous enrolment in Introductory Internship Physics - course 402-0920-00L - is compulsory for Teaching Diploma Physic

Information for UZH students:
Enrolment to this course unit only possible at ETH. No enrolment to module 090Phy1 at UZH.
Please mind the ETH enrolment deadlines for UZH students: https://www.ethz.ch/en/studies/non-degree-courses/special-students/special-students-university-of-zurich.html

Objective
Die Studierenden verfügen über fachdidaktisches Grundwissen für den Physikunterricht an einer Mittelschule. Sie können eigene Lektionen unter Berücksichtigung der vielfältigen Rahmenbedingungen planen, durchführen und evaluieren. Sie reflektieren ihren Unterricht und sind bestrebt, ihn didaktisch und pädagogisch weiter zu entwickeln.

Die Studierenden kennen die Einsatzmöglichkeiten, Chancen und Schwierigkeiten verschiedener Unterrichtsmethoden und Hilfsmittel. Sie können die Eignung von Unterrichtsformen im Hinblick auf eine Lernsituation beurteilen. Sie bemühen sich in ihrem Unterricht, geeignete Methoden und Medien angepasst an die Klasse und das Thema einzusetzen.

Content
Thematische Schwerpunkte
Fachspezifisches: Sachstrukturen der gängigen Unterrichtsthemen, Alltagsbezüge, Fehlvorstellungen, Demonstrations- und Schülerexperimente, Arbeitsmittel zu physikalischen Themen des Grundlagen- und Schwerpunktunterrichts
Einsatz verschiedener Unterrichtsmaterialien: Experimente, Computer, Taschenrechner, Video, Simulation Unterrichtsformen: Lernaufgabe, Werkstatt, Puzzle, Projekt, Gruppenarbeit, Praktikum
Lernformen
Interaktive Lehr-Lernveranstaltung mit Vorträgen und Demonstrationen des Dozenten, studentischer Einzel- und Kleingruppenarbeit, kurzen Präsentationen der Studierenden, Verlefie der Inhalte durch Bearbeitung von Aufträgen ausserhalb der Kontaktstunden

Lecture notes
Folien und weitere Unterlagen werden zur Verfügung gestellt

ECTS: European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
The lecture series treats high-impact theories of strategic studies from antiquity to the present. Overall, the objective is to become acquainted with the basics of both scientific areas and to make references to military practice. Military psychology is a branch of applied psychology; consequently selected aspects of psychological principles will be covered. Military pedagogy hasn't yet established itself firmly as an independent scientific discipline, it nevertheless can draw on a deep-seated tradition in Switzerland. Thus, the great importance that has been attached to the discussion of education in Swiss society and academia will be taken into account.

Subjects:
- History of military psychology
- Psychological images of humanity (psychoanalysis, behaviourism, behavioural biology, humanistic psychology, cognitivist)
- Motivational theories
- Defence-, service-, operational- and combat motivation
- Swiss military pedagogy
- Education as defining feature of pedagogic thinking and acting

Literature
- Annen, H., Steiger, R. & Zwygart, U.: Gemeinsam zum Ziel, Huber, Frauenfeld 2004 (provided as pdf)
- Stadelmann, J.: Führung unter Belastung, Huber, Frauenfeld 1998 (provided as pdf)

The lecture is supported by a virtual learning environment containing relevant documents (presentations and texts) and information to further literature.

853-0037-01L Military History I (without Exercises) Z 3 credits 2V

Abstract
Examine the fundamentals of the two sciences and establish links with military life. Discuss various schools of thought in psychology and focus on concept and process theories of motivation. Explore characteristics of pedagogical thinking and discuss the values of military education with reference to the young adult serving in the armed forces.

Objective
- Becoming acquainted with basic psychological views of human behaviour and experience
- Knowing concept- and process theories of motivation and being able to transfer them to the military context
- Knowing the possibilities and limitations of military education and deriving consequences

Content
Overall, the objective is to become acquainted with the basics of both scientific areas and to make references to military practice. Military psychology is a branch of applied psychology; consequently selected aspects of psychological principles will be covered. Military pedagogy hasn't yet established itself firmly as an independent scientific discipline, it nevertheless can draw on a deep-seated tradition in Switzerland. Thus, the great importance that has been attached to the discussion of education in Swiss society and academia will be taken into account.

Subjects:
- History of military psychology
- Psychological images of humanity (psychoanalysis, behaviourism, behavioural biology, humanistic psychology, cognitivist)
- Motivational theories
- Defence-, service-, operational- and combat motivation
- Swiss military pedagogy
- Education as defining feature of pedagogic thinking and acting

Literature

- Stadelmann, J.: Führung unter Belastung, Huber, Frauenfeld 1998 (provided as pdf)

The lecture is supported by a virtual learning environment containing relevant documents (presentations and texts) and information to further literature.

853-0063-02L Military History I (without Exercises) Z 3 credits 2V

Abstract
The purpose of the lecture is to outline the development of the armed forces (assets regarding manpower, technology and armament), the concepts of warfare and the actual warfare in the 19th and 20th century.

Objective
- Distinguish between military history as a subject and historiography as a way of describing events;
- Analyse the modern developments regarding armed forces and warfare in the context of socio-economic changes;
- Based on the approach regarding revolution in military affairs, describe the evolution of the armed forces and of warfare;
- Exemplify the issues regarding the evolution of the combat (First and Second World War, Vietnam War and Algerian War).

Content
The lecture first examines the bases of the science of (military) history. It focuses on how military history developed from war history, on specific similarities and differences between military history and general historiography, the different ways of dealing with history in Switzerland, Germany, France and in the Anglo-Saxon cultural area (different approaches) as well as on institutions which deal with military history such as universities, military academies, national and international commissions and associations etc.

The lecture is structured along the lines of the concept of "Military Revolution" and starts with the formation of modern, European armed forces after the Oranian Army reform in the 17th century. Based on the "Military Revolution" approach, the lecture examines the structural changes regarding the armed forces and the development of warfare from the 18th to the 20th century. Special emphasis will be put on how the battlefield was revolutionized due to the Napoleonic wars, the industrialization in the 19th century, the First World War, the mechanization and totalization during the Second World War and the period of the Cold War.

Literature

853-0082-00L Strategic Studies I Z 3 credits 2V

Abstract
The lecture series treats high-impact theories of strategic studies from antiquity to the present. The participants know in what ways the understanding of strategy has evolved over time. They understand the balance of strategy's basic components: ends, ways and means. They know the most important classics of strategy and war theory, especially against their specific background. Based on the analysis of historical and contemporary examples, they are aware the ambiguity of declaration and implementation of strategies. They are capable of analyzing critically original texts and modern scholarly works in the field of strategic studies.

Content
The two-term lecture series treats classic strategic studies from antiquity to the present. Term 1 covers the theories up until roughly 1900, term 2 the theories ever since. Theories are deemed classic, if they were prominent in their respective times and if they had a strong reception after, be it in literature, in academic debates or as guidelines for action. Each out of some 50 theories is discussed in three steps: historical context, core messages and reception.

Lecture notes Slides as well as a textbook with primary sources and a list of further reading are accessible electronically. The textbook is also available in hard copy.

Literature
- Peter Paret, Makers of Modern Strategy, From Machiavelli to the Nuclear Age, Princeton 1986
- History of military psychology
- History of military pedagogy
- Education as defining feature of pedagogic thinking and acting
- History of military psychology
- History of military pedagogy
- Education as defining feature of pedagogic thinking and acting

Prerequisites / notice
The lecture is held in German. Passive knowledge of English and French are required.
The program of the course is organized into 14 units of 90 minutes each. The units combine the elements of lecture (where analytical concepts are taught) and application (where these concepts are applied). Additionally, guest lecturers will hold talks on selected issues.

- Swiss economic autarchy - madness or option?
- Global resource positions and world trade: Implications for the Swiss Armed Forces I
- Global resource positions and world trade: Implications for the Swiss Armed Forces II
- Economic causes of military instability
- Aggressive emerging economies: Economic growth and rearmament
- The process of an arms deal
- Costs and financing of a military conflict
- Economic analysis of terrorism
- Economic analysis of cyberwar
- Economic analysis of the present GSOA initiative: Compulsory military service vs. voluntary militia
- Global arms production and international arms trade
- The privatisation of military security
- Standardisation and interoperability: Does NATO membership increase Swiss military efficiency
- Written exam

Lecture notes
As this course has been completely redesigned and is being offered for the first time in the fall semester of 2013, a script is not yet available. However, the lecturer will distribute all necessary course material in time and directly to the students, either in the classroom or by uploading files to a public server.

Literature
The Lecturer will distribute all necessary literature directly to the students by disseminating pdf files or citing links to online references.

Prerequisites / notice
Exam “Military Business Administration I” passed successfully or profound basic knowledge of business administration and economics. The course is open to external participants.

853-0064-00L  Military Sociology I  Z  3 credits  2V  T. Szvircsev Tresch

Abstract
Beside of the most important terms of sociology, demographic changes and the related value and structure change will be analysed. The second part focuses on organizational sociology. Thirdly, the course examines to which extent armed forces can be considered as organizations like any other and to which extent they constitute a special case from an organizational and normative point of view.

Objective
Recognize and explain current changes (social change) in modern society (individualisation, pluralisation); describe demographic changes in Switzerland; explain the structures of societies; define issues and fields of research in modern military sociology and explain the foundations of organisational sociology; explain the military in terms of organisational sociology and identify specific traits of the military as an organisation.

Content
Societal change; organizations as societal phenomena; aims, structures, environments of organizations; specifics of the military as an organization; impacts of technological and societal changes on the armed forces in modern societies.

Literature
A reader with a set of texts will be handed out.

Abstract

WebClass Introductory Course History of Technology is an introductory course to the history of technology. The students are challenged to discover how technological innovations take place within complex economical, political and cultural contexts. They get introduced into basic theories and practices of the field.

Objective

Students are introduced into how technological innovations take place within complex economical, political and cultural contexts. They get to know basic theories and practices of the field.

</tbody>
</table>

Abstract

Using the concrete example of Britain, the "cradle of modernity", this lecture offers a survey and analysis of the crucial historical transformations that engendered "modernity" in Europe from the late 18th to the mid 20th centuries.

Objective

At the end of this lecture course, students can: (a) highlight the most important changes in the "long nineteenth century" in Europe (b) explain their long-term effects; and (c) relate these changes to global developments.

Content

The thematic foci include: the economic and social consequences of the industrial revolution, the genesis of political ideologies and social movements, shifts in gender roles, colonialism and imperialism, as well as the emergence of consumerism and a "leisure society."

Lecture notes

Power Point Slides and sources will be made available at POLYBOX in the course of the semester.

Literature

Mandatory and further reading will be listed on course plan that is made available before the first session.

Abstract

In the second half of the 20th century, postal services have dramatically changed. Communication today is computerbased. The lecture offers problem oriented insights into this sociotechnical process of translation.

Objective

Students become familiar with the mutual interdependence of social and technological change that characterises the history of computing and communication.

Abstract

The Indian film industry has been around for 100 years and is one of the richest and most variegated of the world. The lecture reconstructs the historical development of Indian cinema and uses it as a lens through which cultural, social and political change in the subcontinent can be explored.

Objective

The objectives of this course are three-fold. For one, the participants shall learn to question aesthetic certainties and received modes of perception of cinematic art. Secondly they will be acquainted with the huge potential of films as a historical source to grasp processes of social and cultural change. Besides, the reconstruction of the international career of a specific variety of art and entertainment will also raise important questions of cultural globalisation and consumerism. As a side-effect, a sit were, the students will will also be provided with important insights into the chequered history of the Indian subcontinent in during the course of the 20th century.

**Abstract**

- The Archives of Contemporary History provide 75 video interviews with contemporary witnesses who report on their missions abroad for swiss humanitarian aid and development cooperation. Based on selected interviews the motives of their commitment and the experience in a foreign country are examined.
- The course provides basic knowledge about the beginnings of modern development aid and its increasing professionalism. It aims for a critical and historically informed reflection on the transfer of knowledge and technology between the first and the third world. Furthermore it sharpens the critical awareness of the possibilities and limitations of retrospective accounts of eyewitnesses.

**Literature**

---

**Objective**

- The aim of this seminar is threefold: Firstly, students will become familiarised with historiographical approaches to scientific collections. Among them are constructivist approaches that seek to understand scientific knowledge not primarily as a system of objective truths, but rather as an outcome of human ‘constructions’. Other approaches deal with the problem of how scientific objects are related to systems of power and oppression, namely in the case of objects collected during the time of European colonialism overseas. Secondly, students will become familiarized with how old collections can yield new insights for current scientists working, e.g., on questions of ecology. Thirdly, the seminar shall serve as a platform to discuss ways of dialogue and possible collaboration between these different approaches.

**Content**

- Zurich holds huge scientific collections. They contain objects from around the world, some of them dating back to the 18th century. This interdisciplinary seminar combines perspectives from the history of science and from current scientific disciplines. What do these objects tell us about Zurich's place in the global history of science? What potentials do old collections hold for scientists today?

---

**Objective**

- To highlight how the politics of the Arabian Peninsula is a product of two spheres: politics within states and politics between states.

- Introduce the Arabian Peninsula as a political unit, but not a homogeneous one.

- An overview of the type of political systems prevalent in the region.

---

**Objective**

- The course explores the complex nature of politics and history of the Arabian Peninsula. It takes a closer look at the political systems of several countries of the Arabian Peninsula, especially Yemen, Saudi Arabia and Oman and Bahrain.

---

**Objective**

- The subject of this lecture course is the history and theory of architecture from the industrial revolution up to now. Based on current questions a variety of case studies will be discussed.

---

**Objective**

- The aim is to give an overview on crucial events, works of art, buildings and theories since the beginning of the 19th century up to today.

---

**Objective**

- The two-semester course offers an introduction to the history and theory of architecture from the industrial revolution up to now. Based on selected interviews the motives of their commitment and the experience in a foreign country are examined.

---

**Abstract**

- The course provides basic knowledge about the beginnings of modern development aid and its increasing professionalism. It aims for a critical and historically informed reflection on the transfer of knowledge and technology between the first and the third world. Furthermore it sharpens the critical awareness of the possibilities and limitations of retrospective accounts of eyewitnesses.

---

**Literature**

In the first semester an introduction to the discipline and the methods are given along the thematic issues from the beginning of urban culture until the mid-19th century.

01. Introduction to the discipline and method: The history of urban design as a historical project

02. Athens and Rome in the ancient world: Myth, selfportrayal and speculation

03. From the spirit of equality to the colonial module: Greek and Roman City foundings

04. From the urban ideal to new cities in the Middle Ages and the Renaissance

05. Baroque strategies: The new organisation of Rome under Sixtus V, the production of Versailles under Louis XIV and the invention of St. Petersburg

06. The city between Absolutism and Enlightenment: baroque defence-designs, the European colonization of the American continent and the reconstruction of Lisbon

07. Ideology and speculation after the Glorious Revolution: landscapegardens and urban figurations in England from 1650-1850

08. Between modernization, Grandeur and repression: Embellishment in Paris from 1750-1830

09. The construction of the bourgeois city: Georges-Eugène Haussmann transforms Paris into the capital of the 19th century

10. Architectural insertion and plan for the expansion of the city: From the Berlin of Karl Friedrich Schinkel to James Hobrecht

11. Neoabsolute power, bourgeois self-confidence and Marxian Idealism: The Viennese Ringstrasse and Ildefonso Cerdas Ensanche for Barcelona

The lectures emphasizes on the historical plannings and methods and presents each specific urban development within a broader context.

The lecture will be hold only in one semester includes the developments of the 20th century

1. Le Corbusier: theories, visions and clearcuts in the name of he autorité

2. The United States in the Jazz Age: Between Metropolis of Tomorrow and Broadacre City

3. Italy in the Fascist Era: Monumental ensembles and new town between assiduousness of modernization and obsession of representation

4. Urban design under totalitarian regimes: The architects of the "Tausendjährige Reich" and the "engineers of luck" of the Soviet Union of Stalin

5. Coming to terms with the past and the Cold War: Reconstruction in the two German states

6. The myth of the human scale: the 1950s in Spain, Great Britain, Scandinavia and Italy

7. Postwar Experiments: Rationalistic classicism in France

8. Two new towns in the 20th century: Chandigarh and Brasilia

9. Fictions and visions: The international utopia of the city

10. The second conquest of the North American territorium: The automobile and the city in the USA

11. Analysis, analogy and renewal: The adventure of the typological city
“All beginnings are difficult,” goes the saying, “but without them there wouldn’t be an end.” However, what makes beginnings so difficult?

Students know a wide variety of literary text (and their authors) that are related in content or form to the practice of photography. Students

This lecture provides a general introduction to literary theory and presents the important theories dealing with knowledge and its role in and as literature.

“Bekenntnisse des Hochstaplers Felix Krull” was published in 1954, one year before Thomas Mann’s death. This humorous autobiography

Myths of Creation and First Origins (Genesis und Gospel of St. John, Theogony, Upanishads), philosophy (Fichte, Hegel), literature and

This seminar deals with the meaning and history of “Witz” (wit, joke) as a form of knowledge. It places “Witz” as a switch or transitional

Contrary to intuitive expectations, the German term “Witz” is not only an instance of the comical, but also a form of knowledge that plays on

Instead, these approaches understand literature in terms of its epistemological forms and functions. Thus, the main thesis is that literature actively participates in the constitution and formation of knowledge. Literature itself generates models of knowledge, sometimes with critical or even utopian intentions. Moreover, it draws attention to the fundamental role of order and representation (systematization, narrative rendering, linguistic and pictorial representation) in both humanities and sciences.

All interested students are most welcome. The course is not intended as a language course but a good knowledge of English is a necessary requirement in order to participate to class discussions and to do the reading.

- Students familiarize themselves with the critical technique of ‘close reading’
- Students read and discuss the “Bekennnisse”
- Students familiarize themselves with the critical technique of ‘close reading’
- The seminar establishes current and well-founded research perspectives on Mann’s novel, preferably from the context of the history of knowledge and the history of idea. Approaches from the fields of gender studies, discourse analysis and other areas will also be considered

Theories of Joke

From Plato, Aristotle and Cicero, philosophers have tried to find the core principle of wit (or the joke, as both meanings are contained in the German term “Witz”). Even during the 20th century, the philosophy of life and psychoanalysis struggle with it. The seminar provides an overview of this history.

This seminar deals with the meaning and history of “Witz” (wit, joke) as a form of knowledge. It places “Witz” as a switch or transitional figure within the development of modern theories of knowledge in particular.

Part I

Introduction to English Literature: Science and Fiction

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 612 of 1570
"Plot is to the novelist what experiment is to the scientist." (Lionel Trilling) We will read Emile Zola's essay "The Experimental Novel" and other texts to look on the one hand at the scientific aspect to fiction and fiction writing and on the other hand at the narrative and fictional aspects to science.

When we write a literary text we also enter into a set-up for experiments and explore the possibilities ensuing from the specific structure and consistency of such a text. Literary writing allows us to go over to another kind of knowledge. Thus, the question: what is it that I want to write about? is replaced by: what do I write?

Any attempt to write literature is confronted with an unforeseeable linguistic dynamism whose feasibility is determined by laws and rules quite different from those of science and technology. For the science-oriented writer, experiencing the self-evidence produced by literary approaches in his or her own writing project opens up a field of language with new content and new methods.

In this course we shall analyze and apply conditions and criteria for literary writing on the basis of our own texts.

When we write a literary text we also enter into a set-up for experiments and explore the possibilities ensuing from the specific structure and overall consistency of such a text. This form of writing takes us from the question: what is it that I want to write about? to the question: what do I write?

How do such literary approaches differ from the ways in which the natural sciences use language?

In this course we shall analyze and apply conditions and criteria for literary writing on the basis of our own texts. The course is intended for persons who are interested in literary approaches to exactitude. Any attempt to write literature is confronted with an unforeseeable linguistic dynamism whose feasibility is determined by laws and rules quite different from those of science and technology. For the science-oriented writer, experiencing the self-evidence produced by literary approaches in his or her own writing project opens up a field of language with new content and new methods.

In the natural sciences as well as in engineering we set up experiments, analyze equation systems, and formulate theories. In order to complement these practices, the course «Writing» shall pursue precision in literary writing, its choice of word and its self-evidence.

When we write a literary text we enter into a set-up for experiments and explore the possibilities ensuing from the specific structure and public.

Any attempt to write literature is confronted with an unforeseeable linguistic dynamism whose feasibility is determined by laws and rules quite different from those of science and technology. For the science-oriented writer, experiencing the self-evidence produced by literary approaches in his or her own writing project opens up a field of language with new content and new methods.

In this course we shall analyze and apply conditions and criteria for literary writing on the basis of our own texts.

The course is intended for persons who are interested in literary approaches to exactitude. For the science-oriented writer, experiencing the self-evidence produced by literary approaches in his or her own writing project opens up a field of language with new content and new methods.
851-0626-01L  International Aid and Development  W  2 credits  2V  I. Günther

Objective
The course gives economic and empirical foundations for a sound understanding of the instruments, prospects and limitations of international development aid.

Content
Introduction to the Determinants of Underdevelopment; History of Aid; Aid and Development: Theories and Empirics; Political Economy of Aid; Experience and Impact of Aid; New Instruments of Aid: e.g. Micro-Finance, Budget-Support; Fair-Trade.

Literature
Articles and book abstracts will be uploaded to a course website.

851-0609-06L  Governing the Energy Transition  W  2 credits  2V  T. Schmidt

Objective
- To gain an overview of the history of the transition of large energy systems
- To recognize current challenges in the energy system to understand the theoretical frameworks and concepts for studying transitions
- To demonstrate knowledge on the role of policy and politics in energy transitions

Content
Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the recent United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of the energy system necessary. This course introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for the rate and direction of technical change in the energy sector. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It then introduces theoretical frameworks and concepts for studying innovation and transitions. It then focusses on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions and policy feedback.

Literature
A reading list will be provided via moodle.ethz.ch at the beginning of the semester.

151-0757-00L  Environmental Management  W  2 credits  2G  R. Züst

Objective
An environmental management system has the objective to continuously improve the environmental performance of the activities, products and services of a company. The company has to introduce different management procedures. The goal of this lecture is to provide basics and specific procedure to implement the environmental dimension in the planning and decision making processes of an organisation.

Content
Introduction to environmental managment / environmental management systems, energy and material flows; economical and ecological problems in industry; charakterisation of an enterprise (incl. management handbook); structure and contents of an environmental management system; overview on the ISO 14001 ff. series; methods for environmental evaluation and assessment; integrated management systems; planning methodology and life-cycle-design design; planning exampl

Objective
- have a sound understanding of linear and logit regression
- know strategies to test causal hypotheses using regression analysis and/or experimental methods
- able to formulate and implement a regression model for a particular policy question and a particular type of data
- are able to critically interpret results of applied statistics, in particular, regarding causal inference
- are able to critically read and assess published studies on policy evaluation
- are able to use the statistical software STATA for data Analysis
The topics covered in the first part of the course are a revision of basic statistics and linear and logit regression analysis. The second part of the course focuses on causal inference and introduces methods such as panel data analysis, difference-in-difference methods, instrumental variable estimation, and randomized controlled trials mostly used for policy evaluation. The course shows how the various methods differ in terms of the required identifying assumptions to infer causality as well as the data needs. Students will apply the methods from the lectures by solving weekly assignments using statistical software and data sets provided by the instructors. These data sets will cover topics at the interface of policy, technology and society. Solving the assignments contributes to the final grade with a weight of 30%. Students are assisted in solving the assignments during the exercises session.

363-1027-00L  Introduction to Health Economics and Policy  W  3 credits  2V  W. Mimra
Abstract
Health expenditures constitute about 10% of GDP in OECD countries. Extensive government intervention is a typical feature in health markets. Risk factors to health have been changing with growing importance of lifestyle factors such as smoking, obesity and lack of physical activity. This course gives an introduction to the economic concepts and empirical findings in health economics.
Objective
Introduce students without prior economics background to the main concepts of health economics and policy to enhance students understanding of how health care institutions and markets function.
Content
The course gives an introduction to the economic concepts and empirical findings in health economics to enhance students understanding of how health care institutions and markets function. First, the three important decisions made by individuals will be analyzed: What determines the health behaviors, like the intensity of preventive measures like sport, that an individual undertakes? What types and amount of personal health care services does an individual demand? How much health insurance coverage will be purchased?
In a second part, the major participants on the supply side of health care markets - physicians, hospitals, nurses and pharmaceutical manufacturers - will be discussed. E.g., how important are financial incentives in the choice of medicine as a career, specialty choice and practice location? What does it mean and imply that a physician is an agent for a patient? How do pharmaceutical firms decide on investments in new products and how can public policy encourage pharmaceutical innovation?
The choices made by societies about how health care services are financed and about the types of organizations that supply health care will be addressed in a third part. One important choice is whether a country will rely on public financing of personal health care services or encourage private health insurance markets. How could and should a public health insurance system be designed? What health care services should be included or excluded from a public system? Another important choice is whether a society relies on government provision of health care services, private provision by not-for-profit or for-profit organizations or some combination. The advantages and disadvantages of the alternatives will be discussed to provide a framework for analyzing specific types of health care systems.

Literature
Jay Bhattacharya, Timothy Hyde, Peter Tu, "Health Economics", Palgrave Macmillan.

363-0387-00L  Corporate Sustainability  W  3 credits  2G  V. Hoffmann
Abstract
The lectures address the assessment of corporate sustainability and its links to strategy, technology, and finance. Students learn why sustainability matters for managers and how businesses can act towards it. E-modules allow students to train critical thinking skills. In the 2nd half of the semester, sustainability challenges on water, energy, mobility, and food are explored in group projects.
Objective
Understand the limits and the potential of corporate sustainability for sustainable development
Content
Develop critical thinking skills (argumentation, communication, evaluative judgment) that are useful in the context of corporate sustainability using an innovative writing and peer review method.
Overview of the key concepts of corporate sustainability and topics related to Water, Energy, Mobility, and Food
Business implications of sustainable development, in particular for the assessment of sustainability performance, strategic change towards sustainability, technological innovations and sustainability, and finance and corporate sustainability.
Critical thinking skills for corporate sustainability.
In-depth corporate sustainability challenges in the track phase: How to deal with environmental pressure groups? How to use the strengths of business to solve pressing sustainability problems? How to catalyze technological innovations for sustainability? How to invest money in a sustainable way?

Lecture notes
Presentation slides will be made available on moodle prior to lectures.
Literature
Literature recommendations will be distributed during the lecture

363-0565-00L  Principles of Macroeconomics  W  3 credits  2V  J.E. Sturm
Abstract
This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation? What significance do international economic relations have for Switzerland?
Objective
This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to everyday economic problems.
Content
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.
Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? What is the best way to protect the environment? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.
Lecture notes
The course webpage (to be found at https://moodle-app2.let.ethz.ch/course/view.php?id=2467) contains announcements, course information and lecture slides.
Literature

We advise you to also buy access to Aplia. This internet platform will support you in learning for this course. To save money, you should buy the book together with Aplia. This is sold as a bundle (ISBN: 9781473715998).
Besides this textbook, the slides and lecture notes will cover the content of the lecture and the exam questions.

363-0561-00L  Financial Market Risks  W  3 credits  2G  D. Sorrette
Abstract
I aim to introduce students to the concepts and tools of modern finance and to make them understand the limits of these tools, and the many problems met by the theory in practice. I will put this course in the context of the on-going financial crises in the US, Europe, Japan and China, which provide fantastic opportunities to make the students question the status quo and develop novel solutions.
Objective
The course explains the key concepts and mechanisms of financial economics, their depth and then stresses how and why the theories and models fail and how this is impacting investment strategies and even a global view of citizenship, given the present developing crises in the US since 2007 and in Europe since 2010.

- Development of the concepts and tools to understand these risks and master them.
- Working knowledge of the main concepts and tools in finance (Portfolio theory, asset pricing, options, real options, bonds, interest rates, inflation, exchange rates)
- Strong emphasis on challenging assumptions and developing a systemic understanding of financial markets and their many dimensional risks

Content
1. The Financial Crises: what is really happening? Historical perspective and what can be expected in the next decade(s). Bubbles and crashes. The illusion of the perpetual money machine.

2. Risks in financial markets
   - What is risk?
   - Measuring risks of financial assets
   - Introduction to three different concepts of probability
   - History of financial markets, diversification, market risks

3. Introduction to financial risks and its management.
   - Relationship between risk and return
   - Portfolio theory: the concept of diversification and optimal allocation
   - How to price assets: the Capital Asset Pricing Model
   - How to price assets: the Arbitrage Pricing Theory, the factor models and beyond

4. Financial markets: role and efficiency
   - What is an efficient market?
   - Financial markets as valuation engines: exogeneity versus endogeneity (reflexivity)
   - Deviations from efficiency, puzzles and anomalies in the financial markets
   - Financial bubbles, crashes, systemic instabilities

5. An introduction to Options and derivatives
   - Calls, Puts and Shares and other derivatives
   - Financial alchemy with options (options are building blocks of any possible cash flow)
   - Determination of option value; concept of risk hedging

6. Valuation and using options
   - A first simple option valuation model
   - The Binomial method for valuing options
   - The Black-Scholes model and formula
   - Practical examples and implementation
   - Realized prices deviate from these theories: volatility smile and real option trading
   - How to imperfectly hedge with real markets?

7. Real options
   - The value of follow-on investment opportunities
   - The timing option
   - The abandonment option
   - Flexible production
   - Conceptual aspects and extensions

8. Government bonds and their valuation
   - Relationship between bonds and interest rates
   - Real and nominal rates of interest
   - Term structure and Yields to maturity
   - Explaining the term structure
   - Different models of the term structure

9. Managing international risks
   - The foreign exchange market
   - Relations between exchange rates and interest rates, inflation, and other economic variables
   - Hedging currency risks
   - Currency speculation
   - Exchange risk and international investment decisions

Lecture notes
Lecture slides will be available on the site of the lecture

Literature
Corporate finance
Brealey / Myers / Allen

+ Additional paper reading provided during the lectures

Prerequisites / notice
none

363-1050-00L Conference of Disarmament: Simulation of Negotiations

Abstract
The Global Studies Institute (University of Geneva) is organizing a simulation seminar on nuclear disarmament in collaboration with the Chair of Negotiation and Conflict Management (ETH), experts from the United Nations Institute for Disarmament Research and the Geneva Center for Security Policy.

Objective
The simulation is conducted in collaboration with experts and students during a two days seminar at the University of Geneva.

Students will have the possibility to participate in simulated diplomatic negotiations and to analyse and assess the negotiation logic behind the situations. They should gain insight in the basic information on disarmament issues and on the functioning of the Conference on Disarmament as well as on negotiation techniques in general.
The simulation project is intended for Master's or Doctoral students of the Global Studies Institute (GSI) of the University of Geneva, of the ETH and for interested students of the Geneva Centre for Security Policy (GCSP). The simulation will be in French and English and is conducted by Prof. Calmy-Rey, former President of Switzerland.

In the lectures, students will be provided with basic information on disarmament issues and on the functioning of the Conference on Disarmament as well as on negotiation techniques in general. Students will take the role of negotiators in the simulation (including the heads of the delegations), of keeper of the minutes or of observers and analysts. Students will co-develop their mandates for the negotiation and be assisted by experts that are specialized in international negotiations as well as in the topic of disarmament. The negotiation tables will be chaired by former diplomats. Representatives of diplomatic missions in Geneva will play the role of the "Capitals" to which the heads of delegations will have to give account of the ongoing negotiations.

More details on the program, timetable, reading lists and performance assessment will be published here: https://chamilo.unige.ch/home/courses/M165/7d_session=0

The simulation will take place on the 26 and 27 November 2015 at the University of Geneva.

Languages: English and French

Data: 06.09.2017 12:54

Autumn Semester 2016

Page 617 of 1570
Discovering Management aims to broaden the students' understanding of the principles of business management, emphasizing the interdependence of various topics in the development and management of a firm. The lectures introduce students not only to topics relevant for managing large corporations, but also touch upon the different aspects of starting up your own venture. The lectures will be presented by the respective area specialists at D-MTEC.

The course broadens the view and understanding of technology by linking it with its commercial applications and with society. The lectures are designed to introduce students to topics related to strategy, corporate innovation, leadership, corporate and entrepreneurial finance, value chain analysis, corporate social responsibility, and business model innovation. Practical examples from industry experts will stimulate the students to critically assess these issues. Creative skills will be trained by the business game exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of Chief Innovation Officer of a large multinational company. As they learn more about the specific case and identify the challenge they are faced with, the students will have to develop an innovative business case for this multinational corporation. Doing so, this exercise will provide an insight into the context of managerial problem-solving and corporate innovation, and enhance the students' appreciation for the complex tasks companies and managers deal with. The business game presents a realistic model of a company and provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyse the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities.

No prior knowledge of business or economics is required to successfully complete this course.

**701-0747-00L Environmental Policy of Switzerland**

**Abstract**

This course presents the basics of policy analysis and the specific characteristics of Swiss environmental policy. Policy instruments, actors and processes are addressed both theoretically as well as by means of current Swiss environmental policy examples.

**Objective**

Beyond acquiring basic knowledge about policy analysis, this course teaches students how to analytically address current and concrete questions of environmental policy. Through exercises the students learn about political science concepts and frameworks as well as real-life political decision-making processes. The well-grounded examination of complex political conflict situations is an important precondition for the entry into the (environmental policy) workforce or a future research career.

**Content**

The processes of change, overuse or destruction of the natural environment through humans have historically placed high demands on social and political institutions. In the interplay between the environment, society and economy, the environmental policy field encompasses the sum of public measures that have the goal to eliminate, reduce or avoid environmental degradation. The course systematically presents the basics of environmental policy instruments, actors, programs and processes as well as their change over time. A key aspect is the distinction between politics and political science and specifically environmental policy.

**Literature**

The lecture is based on the following book to be published in the summer of 2016:

**Prerequisites / notice**

The detailed semester program (syllabus) is made available to the students at the beginning of the semester.

**701-0757-00L Principles of Economics**

**Abstract**

This course covers the bases for understanding micro- and macroeconomic issues and theories. Participants are given the tools to argue in economic and political terms and to evaluate the corresponding measures. Group and individual exercises deepen the knowledge gained.

**Objective**

Students are able to
- describe fundamental micro- and macroeconomic issues and theories.
- apply suitable economic arguments to a given theme.
- evaluate economic measures.

**Content**

Supply and demand behaviour of firm and households; market equilibrium and taxation; national income and indicators; inflation; unemployment; growth; macroeconomics policies

**Literature**

**Prerequisites / notice**

**701-0985-00L Social Intercourse with Current Environmental Risks**

**Abstract**

The lecture treats the social intercourse with risks of technical systems. The notion of risk and the perception of risk are discussed by case studies (e.g. nanotechnology) and socio-political instruments for decision-making are presented. Methods are presented that can be applied to deal with environmental risks and how they can be used for sustainable innovation.

**Objective**

- Getting acquainted to the extended risk concept
- Evaluation of the risks caused by technology within the societal context
- Knowledge about the mode science and society handle current environmental risks (examples gene- and nanotechnology)
- Knowledge about handling risks (e.g. precautionary principle, protection goal, damage definition, ethics)

**Content**

- Risks and technical systems (risk categories, risk perception, risk management)
- Illustration with case studies (nanotechnology)
- Implementation (politics, science, media, etc.)
- Decision making (technology assessment, cost/benefit analysis etc.)
- The role of the media
- prospects for future developments

**Prerequisites / notice**

The lecture is held biweekly (for 2 hours). The dates are 26.9., 3.10. (out of schedule), 24.10, 7.11, 21.11, 5.12, 19.12

**701-0727-00L Politics of Environmental Problem Solving in Developing Countries**

**Abstract**

The course focuses on processes and drivers of decision-making on natural resources management issues in developing countries. It gives insights into the relevance of ecological aspects in developing countries. It covers concepts, instruments, processes and actors in environmental politics at the example of specific environmental challenges of global importance.
Objective
After completion of the module, students will be able to:
- Identify and appraise ecological aspects in development cooperation, development policies and developing countries' realities
- Analyze the forces, components and processes, which influence the design, the implementation and the outcome of ecological measures
- Characterize concepts, instruments and drivers of environmental politics and understand, how policies are shaped, both at national level and in multilateral negotiations
- Study changes (improvements) in environmental politics over time as the result of the interaction of processes and actors, including international development organizations

Content
Key issues and basic concepts related to environmental politics are introduced. Then the course predominantly builds on case studies, providing information on the context, specifying problems and potentials, describing processes, illustrating the change management, discussing experiences and outcomes, successes and failures. The analysis of the cases elucidates factors for success and pitfalls in terms of processes, key elements and intervention strategies.

Different cases not only deal with different environmental problems, but also focus on different levels and degrees of formality. This ranges from local interventions with resource user groups as key stakeholders, to country level policies, to multi- and international initiatives and conventions. Linkages and interaction of the different system levels are highlighted. Special emphasis is given to natural resources management.

The cases address the following issues:
- Land use and soil fertility enhancement: From degradation to sustainable use
- Common property resource management (forest and pasture): Collective action and property rights, community-based management
- Ecosystem health (integrated pest management, soil and water conservation)
- Payment for environmental services: Successes in natural resources management
- Climate change and agriculture: Adaptation and mitigation possibilities
- Biodiversity Convention: Implications for conservations and access to genetic resources
- Biodiversity as a means for more secure livelihoods: Agroforestry and intercropping
- The Millennium Development Goals: Interactions between poverty and the environment
- Poverty and natural resources management: Poverty reduction strategies, the view of the poor themselves
- Food security: Policies, causes for insecurity, the role of land grabbing
- Biofuels and food security: Did politics misfire?
- Strategy development at global level: IAASTD and World Development Report 2008

Abstract
Providing information on the context, specifying problems and potentials, describing processes, illustrating the change management, discussing experiences and outcomes, successes and failures. The analysis of the cases elucidates factors for success and pitfalls in terms of processes, key elements and intervention strategies.

Objective
Key issues and basic concepts related to environmental politics are introduced. --- | --- | --- | --- | --- | ---
851-0125-03L | Research Colloquium for Ph.D.-Students and Members of Staff | Z | 0 credits | 1K | L. Wingert

Abstract
Ph.D. students and members of staff report on their research.

Objective
Key problems of research projects will be discussed. Participants will learn to know arguments and ideas dealing with systematic problems in philosophy.

851-0125-41L | Introduction Into Philosophy of Technology | W | 3 credits | 2V | O. Müller

Abstract
Since antiquity philosophy reflects about and evaluates technology. The technical developments in the 19th and 20th century have led to an autonomous philosophy of technology, which had become important also for other philosophical disciplines (e.g. in Heidegger's philosophy).

Objective
The course gives an overview on the main schools in the philosophy of technology. Students should learn to analyse and evaluate different philosophies of technology (compensation, objectification, externalisation). For credit point a critical protokoll is to be written.

851-0125-58L | Philosophy of the Environmental Sciences: An Introduction | W | 3 credits | 2S | A. Schwarz

Abstract
Environmental knowledge and management is quite common in different research fields and in everyday practice. We will be identifying those concepts, objects and methods that mainly construe what might be called the core of the environmental sciences. This will be done by using different philosophical tools and approaches.

Objective
The environmental sciences cover a wide range of scientific practices and objects and accordingly afford different kinds of scientific knowledge. Additionally, there is an important interplay between the scientific and the societal sphere. In this seminar we will examine likewise central and widespread concepts such as sustainable development or resilience by using philosophical tools that will allow to probe the different uses of those concepts, their semantic range in terms of historical depth and semantic fields and finally their logical coherence. Another important topic is the philosophical investigation of methods and objects that can be identified in the environmental sciences. Those methods are for instance Life Cycle Assessment or Adaptive Ecosystem Management, technological objects may be a wind engine or a hydropower plant. The latter raise questions of how renewable energies can be assessed and valued, including the more general issue of how values and norms can be embedded in technological objects. This leads us to the third and last complex of topics that focus on current deliberations about possible new ways of existence in the age of the Anthropocene and as a consequence the formation of adequate life styles in our societies. This refers to issues in philosophical and social anthropology and the challenge of climate change.

851-0125-60L | Introduction to Epistemology | W | 3 credits | 2G | N. El Kassar

Abstract
In this course we will examine fundamental questions of epistemology, e.g. What is knowledge? How are we to conceive of perception? Which beliefs are rational and justified? How do we acquire knowledge? By discussing a selection of seminal philosophical texts we will study fundamental epistemological theories.

**Objective**

- conceptions of fundamental epistemological concepts
- sensitivity to epistemological questions
- capacity to reflect epistemological theories
- capacity to discuss epistemological theories
- reading philosophical texts (including English texts)

**Abstract**

Rights in Objects are founded by an inalienable Self-Ownership. These ideas are central for personal rights. We speak of my body, my genes, my name, my portrait, my ideas, or ways of expression.

Participants will make acquaintance with founding texts of the natural rights property concept (John Locke). They will see the connection between inalienable self-ownership, prohibition of slavery, derivative commercial rights and modern personal rights. They will learn about the problems of self-ownership today concerning property in one's body and intellectual property. Critical alternatives to the property paradigm will be discussed.

Participants will have the opportunity to gain access to unfamiliar texts from the philosophical tradition and to see their relevance today. They will experience the consequences of a certain use of concepts and orient themselves in current bioethical, juridical and political discussions.

Texts by Locke, Nozick, Christman, Otsuka, Rasmussen, Schneider, Stirner, Fichte and Forschner. Founding of property right in self-ownership (Locke), revival of this concept in Nozick and his egalitarian critics. Critique of the concept of self-ownership related to property in one's body. Looking back to the personal self-relatedness that comes up again in Intellectual Property and in modern personal rights.

**Literature**

Text, Seminarplan und Literaturliste in ILIAS Lehrdokumentenablage.

The lecture gives an overview about the different Man-Machine-Relations since the 16th century. Different models of machines will be important here: the clockwork, the steam engine and the computer.

On the one hand models of machines had a heuristic value in research on man, e.g. in Harvey's discovery of blood circulation in the 17th century or in brain research in the 20th century. On the other hand these models were always criticised, sometimes polemically, because they are supposedly not adequate for man.

Students should learn about the connections between the history of anthropology and technology and be able at the end of the course to evaluate the critical philosophical arguments that are connected with the metaphor of the machine.

It is useful to know which fellowships are available or to know the causes of frequent occurrence of extreme weather. These truths are of instrumental value. Is it also intrinsically good to know the truth, e.g. to know that there are gravitational waves? And which is the role of truth in our lives? The course will deal with such philosophical questions.

3. Ebenso soll ein besseres Urteil gebildet werden darüber, welche existenzielle Rolle die Suche nach Wahrheiten im persönlichen Leben hat.

How should we understand human beings according to our best knowledge about us, the social world, human history and nature? What are the relationships between biological and socio-cultural determinants of our thinking and doing? Michael Tomasello, psychologist, and social philosopher, has answered these questions in a thought-provoking way. His answers will be studied and examined.

**Literature**

The lecture series "Images of Mathematics" deals with the formalization of the objects and the logical language of mathematics from Hilbert to Gödel and considers its consequences in view of our conception of mathematical practice and knowledge, the limits of calculability and computability in mathematics, and the relation between the logical proof procedures and the involved intuitive aspects.

The lecture series will present philosophical problems of theoretical mathematics in the 20th century and will discuss the consequences of formalization and axiomaticization. It aims at a critical reflection on the modern images of mathematics.
How we understand Mathematics is probably strongly influenced by the Mathematics lessons we participated in during our school days. The common image of mathematics is therefore often characterized by the impression of a very stable form of knowledge with clear-cut problems and suitable recipes for finding the solution. It is a very static image which is very much in conflict with the rapid series of innovations that the discipline has experienced especially since the 19th century: Mathematics as a field of research has been highly innovative and even revolutionary as few other scientific disciplines in the last 200 hundred years.

These mathematical innovations did not only contribute to a progress amassing more and more knowledge. They very often changed how mathematicians conceived of their discipline. Even a contribution to a specific research question that appears at first sight to be minor can sometimes establish new connections to other fields, found a whole research field of its own or introduce new methods thereby changing the whole image of mathematics in the same way that a small addition to a picture can alter radically what we take it to represent.

The lecture series "Images of Mathematics" deals with a few moments in the history of the scientific discipline since the middle of the 19th century when the image of mathematics changed. In particular, it focuses on the consequences of the fact that in the 19th century mathematics started to not only reflect on its own conceptual and methodological foundations in a general manner (which had been done since the dawn of mathematics and was especially a philosophical task), but to formalize them in a strict, mathematical way: the objects of mathematics, its logical language and its proof procedures. Through Cantor’s set theory, the mathematical treatment of truth since Boole and especially through Frege and the formalization of its axioms in a wide ranging discussion involving Zermelo, Fraenkel and others, this self-reflexive stance came to the fore.

Yet, the deeper mathematics dug into its foundations, the more radical the problems became. Finally, the optimistic Hilbert program of laying the foundation of mathematics within mathematics and of proving its own consistency as well as its completeness contributed to clarifying of the foundation of mathematics primarily insofar as it was doomed to failure. Gödel proved his famous incompleteness theorems and thereby dismissed at the same time the formalist attempt to reduce mathematical truth to logical provability. His work resulted in detailed insights in the precariousness of the foundation of mathematics and further numerous of productive consequences within mathematics.

Moreover, Gödel’s theorems open many far-reaching and intriguing questions in view of our image of mathematics, questions concerning the conception of mathematical practice and knowledge, the limits of calculability of mathematics and the possible role of computability and machines in mathematics, the relation between the logical proof procedures and the involved intuitive aspects. In short, the image of mathematics is not as static as we sometimes expect it to be, it was radically redrawn by the mathematicians of the 20th century and has since then again been open to diverging interpretations.

851-0125-57L Values in Science

| Objective | Should science be free from moral, political or ideological influences? According to the so-called value-free ideal it should. Many scientists think of themselves as committed to truth and objectivity and nothing else. In this seminar, we will track the history of the value-free ideal and engage in a debate about the potential role of so-called non-epistemic values in science. |
| Content | www.blogs.ethz.ch/valuesinscience/ |

851-0180-00L Research Ethics

| Objective | The main goal of this course is to enhance the student’s ability to: - recognize and identify ethical issues and conflicts, - analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter. Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level. |
| Content | To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises. |

| Literature | G. Achermann, Particularly suitable for students of D-BIOL, D-CHAB, D-HEST |

I. Ethics & the Process of Ethical Inquiry
---------------------------------------

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)
----------------------------------------------------------

Integrity in Research & Research Misconduct
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 Rs (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
- Recommended literature:
  - "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

851-0145-05L Narratives of Health and Illness W 3 credits 2S S. Baier

Number of participants limited to 30

Particularly suitable for students of D-HEST

Abstract
Das Seminar gibt einen Einblick in den Forschungsbereich der Narrativen Medizin als Teilbereich der Medizinischen Geisteswissenschaften. Erzählungen spielen eine vielfältige Rolle, wenn es um Gesundheit und Krankheit geht.
This course studies philosophical issues concerning computers and computing.

Objectives:
- Exhibit a general understanding of the philosophy and history of computing.
- Communicate clearly in writing about topics in this field.
- Explain central problems in the field and their potential solutions, independently and at a level requiring in-depth knowledge and critical understanding.

Prerequisites / notice:
- Leistungsnachweise der Studenten:
- Ihre Texte schicken Sie bitte an die eigens eingerichtete Email-Adresse:
groundproblem-tod@ethz.ch

- Formalism (Minimalanforderungen):
  - Schriftbild: Zeilenabstand 1.5, Schriftgrösse 12, Seitenabstand 2.5cm, Schriftart: Arial, Times New Roman.
  - Vor- und Nachname, Matrikelnummer, Veranstaltungsnr., Dozent, E-Mail-Adr., Studiengang.

- organisatorische Rückfragen bitte an
  den Assistenten Raphael Salvi: raphael.salvi@phil.gess.ethz.ch

Data: 06.09.2017 12:54 Autumn Semester 2016 Page 623 of 1570
Abstract
The lecture explores various strands in philosophy of science in a critical way, focusing on the notion of rationality in science, especially with regards to environmental research. It addresses the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

Objective
- Students learn to engage with problems in the philosophy of science and to relate them to natural and environmental sciences, thus developing their skills in critical thinking about science and its use. They know the most important positions in philosophy of science and the objections they face. They can identify, structure and discuss issues raised by the use of science in society.

Content
1. Core differences between classical Greek and modern conceptions of science.
2. Classic positions in the philosophy of science in the 20th century: logical empiricism and critical rationalism (Popper); the analysis of scientific concepts and explanations.
3. Objections to logical empiricism and critical rationalism, and further developments: What is the difference between the natural sciences, the social sciences and the arts and humanities? What is progress in science (Kuhn, Fleck, Feyerabend)? Is scientific knowledge relativistic? What is the role of experiments and computer simulations?
4. Issues raised by the use of science in society: The relation between basic and applied research; inter- and transdisciplinarity; ethics and accountability of science.

Lecture notes
A reader will be available for students.

Literature
A list of introductory literature and handbooks will be distributed to the students.

Prerequisites / notice
Oral examination during the session examination.
Further optional exercises accompany the lecture and offer the opportunity for an in-depth discussion of selected texts from the reader. Students receive an additional credit point. They have to sign up separately for the exercises for the course 701-0701-01 U.

701-0701-01L Philosophy of Science: Exercises
W 1 credit 1U 2 credits G. Hirsch Hadorn, C. J. Baumberger

Abstract
The exercises in philosophy of science serve to develop skills in critical thinking by discussing seminal texts about the rationality of science. Topics discussed include the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

Objective
- Students can engage with problems in the philosophy of science and to relate them to natural and environmental sciences. They learn to analyze and summarize philosophical texts. In this way, they develop their skills in critical thinking with a focus on the rationality of science.

Content
- The optional exercises accompany the lecture and serve to develop skills in critical thinking with a focus on the rationality of science, based on discussing seminal texts. The texts cover important positions in the philosophy of science and their critics. Topics discussed include the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

Lecture notes
A reader will be available for students.

Literature
A list of literature will be distributed to the student together with the reader.

Prerequisites / notice
Students that want to subscribe for this course also have to subscribe for the lecture 701-0701-00 V "Wissenschaftsphilosophie". Credit points are given for preparing a structure and a summary of one of the texts.

701-0703-00L Environmental Ethics
W 2 credits 2V M. Huppenbauer

Abstract
The lecture begins with an introduction to applied ethics in general. The main focus is on environmental ethics. Students learn to handle important concepts and positions of environmental ethics. They achieve a deeper understanding of these concepts and positions in applying them to ecological problems and discussing them in case studies.

Objective
- On completion of this lecture course you will have acquired the ability to identify and process general and environmental ethical problems.
- You will be capable of recognising and analysing environmental ethical problems and of working towards a solution. You will have acquired a fundamental knowledge of standpoints and arguments to be found within the field of environmental ethics and will have practised these in small case studies.

Content
- Introduction to general and applied ethics.
- Overview and discussion of ethical theories relevant to the environment.
- Familiarisation with various basic standpoints within environmental ethics.
- Cross-section topics, such as sustainability, intergenerational justice, protection of species, etc.
- Practising of newly acquired knowledge in case studies (protection of species, climate change, etc.)

Lecture notes
Summaries of the individual sessions will be distributed, including the most important theories and keywords; reading list.

Literature
- Angelika Krebs (Hg.), Naturethik. Grundtexte der gegenwärtigen tier- und ökoethischen Diskussion 1997
- John O'Neill et al., Environmental Values, 2008
- Klaus Peter Rippe, Ethik im ausserhumanen Bereich, Paderborn (mentis) 2008
- General introductions:
  - Marcus Düwell et. al. (Hg.), Handbuch Ethik, 2. Auflage, Stuttgart (Metzler Verlag), 2006
  - Johann S. Ach et. al (Hrsg.), Grundkurs Ethik 1. Grundlagen, Paderborn (mentis) 2008

Prerequisites / notice
The procedure for accumulating CP will be explained at the start of term.
I expect participants to be motivated and contribute to discussions, keeping the course interesting and lively.

851-0121-32L Introduction to Ethics of Science
W 3 credits 2S N. Mazouz

Abstract
This course covers both, issues of research ethics and of the social responsibility of scientists. Thereby the relevant theories for the determination of science and its tasks are introduced, as well as the main ethical theories.

Objective
Students learn to identify, analyse and evaluate problems concerning research ethics as well as the political and social role of science. They form their abilities to reason as well as to interpret and write texts.

Political Science
This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

Lecture notes

Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link ‘Registered students, please click here for course materials’ at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike Hudecheck <michaehu@student.ethz.ch>). All assigned papers must be read ahead of the respective meeting. Following the course on the basis of on-line slides and papers alone is not sufficient. Physical presence in the classroom is essential. Many books and journals covering international environmental policy issues can be found at the D-GESS library at the IFW building, Haldeneggsteig 4, B-floor, or in the library of D-USYS.

Prerequisites / notice

None

<table>
<thead>
<tr>
<th>851-0589-00L</th>
<th>Technology and Innovation for Development</th>
<th>W Dr 3 credits 2V</th>
<th>P. Aerni</th>
</tr>
</thead>
</table>

Abstract

Technological change plays a crucial role in efforts to create a more sustainable future. In this context, policy decision makers must design rules that minimize its risks and maximize its benefits for society at large. The course discusses this challenge from an interdisciplinary perspective taking into account legal, economic, historical, development and environmental aspects.

Objective

- to recognize the challenges and opportunities of technological change in terms of sustainable development
- to improve understanding of political decision-making processes in the regulation of science & technology
- improved understanding of the role of science and technology in the context of human and societal development

Content

Science and Technology Policy is normally associated with the improvement of national competitiveness; yet, it is also an integral part of effective environmental and development policies.

The course will discuss the challenges and opportunities of technological change in terms of sustainable development and show how public policy on the national and the international level is responding to this change.

In this context, students are to become familiar with the basic principles of political economy and New Growth Theory and how such theories help explain political decisions as well as political outcomes in the area of Science, Technology and Innovation. State interventions are either designed to regulate (e.g. environmental regulations, anti-trust law) or facilitate (e.g. intellectual property rights protection, public investment in R&D and technical education, technology transfer) technological change. This will be illustrated by looking at different industries and different national systems of innovation. Subsequently the positive and negative consequences for society and the natural environment will be discussed from a short-term and a long-term perspective.

Lecture notes

Reader with issue-specific articles. E-version is partly available under https://www.ethz.ch/content/specialinterest/gess/cis/international-relations/en/teaching/materials/tech.html
Prerequisites / notice

The 2-hour course (5-7 p.m.) will be held as a series of lectures. The course materials will be available in form of an electronic Reader at the beginning of the semester. Students will be asked to give a (a) presentation (15 Minutes) or write a review paper based on a article selected from the electronic script, and (b) they will have to pass a written test at the end of the course in order to obtain 3 credit points in the ECTS System. In the final mark (a) will have a weight of 40% and (b) 60%.

853-0038-00L Swiss Foreign Policy W 3 credits 2V D. Möckli

Abstract

This course analyzes the foundations and challenges of Swiss foreign policy. After reviewing the history of foreign policy conceptions since the early 20th century, we will discuss the determining factors of Swiss foreign policy and examine, together with guest speakers from the foreign ministry, current issues such as the Syria crisis, the migration challenge, terrorism, and Swiss-EU relations.

Objective

Students should acquire a sound understanding of Swiss foreign policy and the relevant academic and political debates associated with it.

Data: 06.09.2017 12:54 Autumn Semester 2016 Page 626 of 1570
Participants should gain a solid understanding of security challenges stemming from the use and control of dual-use technologies. In developing an understanding for causes of war and their development over the last 500 years. Knowledge of fundamental concepts in F. Schimmelfennig

Students will receive a handout of slides accompanying the lectures. A reading list will be handed out at the beginning of the semester. The course will be supported by an e-learning environment.

853-0047-01L World Politics Since 1945: The History of International Relations (Without Exercises) W 3 credits 2V A. Wenger

This lecture series provides students with an overview of the development of international relations since the end of World War II. The first part of the series deals with the development of and changes in Cold War security policy structures. The second part deals with the period after the transformation of 1989/91; the focus here is on current issues in international security policy.

By the end of the semester, participants should have a solid knowledge of the history and theoretical foundations of International Relations since the end of the Second World War.

Reading:

Prerequisites / notice
The lecture is being supported by a website on Moodle. If you have any questions, please contact Lukas Meyer, lukas.meyer@sipo.gess.ethz.ch.

853-0060-00L Current Issues in Security Policy W 3 credits 2V A. Wenger, O. Thranert

This course provides an overview of the security implications of so-called "dual-use" technologies, i.e. technologies that can be used for both peaceful and military aims. The course will also cover various policies - in particular arms control - that are discussed and applied by the international community in dealing with such dual-use technologies.

In addition, the students should become aware of how researchers can deal with sensitive knowledge regarding research transparency and control.

The aim of the course is to provide participants with an overview of international security politics with a special focus on dual-use technologies. Students will analyze the character of dual-use security risks and of risk-based security strategies and instruments. Thematic areas include the nuclear non-proliferation regime, biological and chemical weapons conventions, missile proliferation, the nuclear programs of Iran and North Korea, cyber and space technologies, as well as robotics and nanotechnology.

Prerequisites / notice
Participants are expected to study the compulsory texts provided at the beginning of the semester via the online platform Moodle.

853-0033-00L Leadership I W 3 credits 2V F. Kerni

The lectures "Leadership I" (WS) and "Leadership II" (SS) have been designed as a two-semester lecture series, but may also be followed independently of one another or in reverse order. "Leadership I" covers the following fields: leadership basics, leadership theories and leadership styles, the concept of leadership responsibility and the role of communication in practical leadership.

The aim of this lecture is to give students an introductory overview of relevant topics regarding leadership research and practice, thus enabling them to gain a deeper understanding of the leadership phenomenon. Students should understand different concepts of leadership in the complex interaction between individuals, groups, organisation, context and situation. They should be informed about the evolution of the understanding of mankind in relation to working processes and its impact on organisations and the understanding of leadership theory in the past 100 years. They should grasp the concept of leadership responsibility (leadership ethics) and be able to derive consequences for leadership in practical situations. They should recognize the fundamental importance of communication in leadership situations and receive input which enables them to communicate adequately in specific situations.

Prerequisites / notice
The 1-hour written exam will take place during the last lecture in the semester.

853-0015-01L Conflict Research I: Causes of War in Historical Context (without exercises) W 3 credits 2V S. Rüegger, G. Schwitz

This course offers an introduction to research on causes of wars. War as a social phenomenon is covered from the pre-state world to today's state system after the end of the Cold War. Topics include state formation and collapse, nationalism, decolonization, democracy, and ethnic conflict.

Developing an understanding for causes of war and their development over the last 500 years. Knowledge of fundamental concepts in research on causes of war.

853-0302-01L European Integration (Seminar without Tutorial) W 2 credits 2S F. Schimmelfennig

The lecture course covers the theory, development, and core policy fields of European integration as well as structures and processes of the EU as a decision- and policy-making system.

The seminar is designed to help students understand the European Union as a particular kind of political system that differs both from the nation-state and from other international organizations. It imparts basic knowledge on the development, institutions, procedures, and policies of the EU and provides an introduction to major approaches to integration theory and political science research on the EU.
Content

1. Introduction
2. Theories of European integration
3. The development of European integration
4. Internal market and monetary union
5. Internal and external security policies
6. Constituticalization
7. Widening and differentiation
8. Switzerland, the EEA, and EU neighbourhood policies
9. Identity, trust, and solidarity
10. Public spheres, parties, and elections
11. Decision-making and policy development in the EU
12. Statehood and democracy in the EU
13. European integration in crisis

Lecture notes
The seminar covers the theory, development, and core policy fields of European integration as well as structures and processes of the EU as a decision- and policy-making system.

Literature
Basislektüre

Prerequisites / notice
The grade is based on a written exam.

860-0001-00L Public Institutions and Policy-Making Processes  W  3 credits  3G  T. Bernauer, S. Bechtold, F. Schimmelfennig
Number of participants limited to 25.
Priority for Science, Technology, and Policy MSc students.

Abstract
Students acquire the contextual knowledge for analyzing public policies. They learn why and how public policies and laws are developed, designed, and implemented at national and international levels, and what challenges arise in this regard.

Objective
Public policies result from decision-making processes that take place within formal institutions of the state (parliament, government, public administration, courts). That is, policies are shaped by the characteristics of decision-making processes and the characteristics of public institutions and related actors (e.g. interest groups). In this course, students acquire the contextual knowledge for analyzing public policies. They learn why and how public policies and laws are developed, designed, and implemented at national and international levels, and what challenges arise in this regard. The course is organized in three modules. The first module (Stefan Bechtold) examines basic concepts and the role of law, law-making, and law enforcement in modern societies. The second module (Thomas Bernauer) deals with the functioning of legislatures, governments, and interest groups. The third module (Frank Schimmelfennig) focuses on the European Union and international organisations.

Content
Schedule (for up-to-date information, see the syllabus that will be distributed to participants electronically):
W1: Bechtold, Bernauer: Introduction
How are laws created and interpreted? How are they enforced?
W2: Bechtold: Why do we need laws and why do people and firms usually obey the law? What are possible goals of legal systems? What is the relationship between laws, social norms, and moral values?
W3: Bechtold: What role does scientific evidence play in the creation and enforcement of the law? How does the law deal with non-quantifiable factors or incommensurable values?
W4: no class
W5: Bernauer: How are parliaments (legislatures) elected, how do they work, and how do their characteristics and processes affect policy-making.
W6: Bernauer: Why do forms of government differ and how does this affect policy-making? Why and in what respect are public administrations efficient/effective, and why sometimes not?
W7: Bernauer: How do interest groups and social movements affect policy-making.
W8: Study week
W9: Schimmelfennig: Governance beyond the state: why and how states create international institutions.
W10: Schimmelfennig: International organizations and regimes: case studies of global governance.
W11: Schimmelfennig: Institutions and policy-making in the European Union.
W12: Schimmelfennig: International organizations and policy diffusion.
W13: End-of-semester exam

An add-on module to this course (3 ECTS) involves an essay. This part of the course is accessible only to ISTP MSc students and requires enrollment in the main course (3 ECTS). ISTP MSc students must enrol in both parts. Other students can only enrol in the main course.

3rd week of January: deadline for review essay

Lecture notes
Reading materials will be distributed electronically to the students when the semester starts.

This is a Master level course. The course is capped at 25 students, with ISTP Master students having priority.

851-0595-01L International Organizations W 3 credits 2S Z. Bakaki

Abstract

The course offers a comprehensive examination of the role of international organizations (IOs) in world politics. Besides teaching the basic theories and methods that are necessary for studying IOs, this course considers the application of those theories and methods to a range of special institutions.

Objective

The first part of this course offers an introduction and will seek to explain how, if at all, IOs obtain some measure of authority in international affairs, i.e., why states delegate certain tasks to IOs instead of dealing unilaterally or multilaterally outside of an institutional context. The second part of the course focuses on the impact and effectiveness of international institutions. We assess whether and how IOs influence state compliance with agreements, and whether IOs socialize states to behave in certain ways. The third and final part of the course examines a special set of IOs: international alliances and international regimes, i.e., explicit principles, norms, rules, and decision-making procedures that define expected behavior in a specific problem field.

Content

The requirements for the course include participation in class discussions (10%), one class presentation (30%), and a final exam (60%).

a) Participation: The quality of students' experience in this course depends on the participation of students. Regular attendance and active class participation constitute a significant portion of the course grade. Students will be expected to read the required readings, think critically about them, and discuss them in class.

b) Class Presentation: First, you will submit one short (maximum 2 pages) paper summarizing the readings for a particular week. This short paper should be distributed to the class ahead of the meeting time (email, at least 24 hours in advance). Each student writing such a paper must also prepare a short class presentation. The goal of this exercise is not simply to summarize the assigned readings, as others in the class will already be familiar with the assignment. Rather, a good summary discusses the broader issues, themes, and questions underlying the readings or identifies problems with research design or potential flaws in the particular articles. The paper(s) and presentation(s) serve as a starting point for a more focused in-class discussion.

c) Final exam: The final examination will take place at the last week of the course. It lasts 1.5 hours, during which you will be required to answer 3 questions out of 9 questions.

Psychology, Pedagogics

851-0240-00L Human Learning (EW1) W 2 credits 2G E. Stern

This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

Abstract

This course is only apt for students who intend to enrol in the programs "Teaching Diploma" or "Teaching Certificate". It is about learning in childhood and adolescence.

Objective

Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Content

Themen der Schwerpunkte:

Lernen als Verhaltensänderung und als Informationsverarbeitung: Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzerwerb unter besonderer Berücksichtigung des Wissenstransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen: Intelligenztheorien, Geschlechtsunterschiede beim Lernen

This colloquium offers an opportunity for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

851-0252-01L  Human-Computer Interaction: Cognition and Usability
Number of participants limited to 30.

| Objective | This seminar introduces theory and methods in human-computer interaction and usability. Cognitive Science provides a theoretical framework for designing user interfaces as well as a range of methods for assessing usability (user testing, cognitive walkthrough, GOMS).

| Abstract | This seminar will provide an opportunity to experience some of the methods in applied group projects.

| Prerequisites / notice | This lecture is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat".

851-0252-03L  Cognition in Architecture - Designing Orientation and Navigation for Building Users
Number of participants limited to 40.

| Objective | How can behavioral and cognitive science inform architecture? This project-oriented seminar investigates contributions of cognitive science to architectural design with an emphasis on orientation and navigation in complex buildings and urban settings. It includes theories on spatial memory and decision-making as well as hands-on observations of behavior in real and virtual reality.

| Abstract | Taking the perspectives of building users (occupants and visitors) is vital for a human-centered design approach. Students will learn about relevant theory and methods in cognitive science and environmental psychology that can be used to understand human behavior in built environments. The foundations of environmental psychology and human spatial cognition will be introduced. A focus of the seminar will be on how people perceive their surroundings, how they orient in a building, how they memorize the environment and how they find their way from A to B. Students will also learn about a range of methods including real-world observation, virtual reality experiments, eye-tracking and behavior simulation for design. Students will reflect on the roles of designers and other stakeholders with respect to human-centered design and an evidence-based design perspective. The seminar is geared towards a mix of students from architecture, engineering, computer science and behavioral science as well as anybody interested in the relation between design and cognition.

851-0252-04L  Behavioral Studies Colloquium
Number of participants limited to 30.

| Objective | This colloquium offers an opportunity for students to discuss their ongoing research and scientific ideas in the behavioral sciences, both at the micro- and macro-levels of cognitive, behavioral and social science. It also offers an opportunity for students from other disciplines to discuss their research ideas in relation to behavioral science. The colloquium also features invited research talks.

| Abstract | Students know and can apply autonomously up-to-date investigation methods and techniques in the behavioral sciences. They achieve the ability to develop their own ideas in the field and to communicate their ideas in oral presentations and in written papers. The credits will be obtained by a written report of approximately 10 pages.

| Content | This colloquium offers an opportunity for students to discuss their ongoing research and scientific ideas in the behavioral sciences, both at the micro- and macro-levels of cognitive, behavioral and social science. It also offers an opportunity for students from other disciplines to discuss their ideas in so far as they have some relation to behavioral science. The possible research areas are wide and may include theoretical as well as empirical approaches in Social Psychology and Research on Higher Education, Sociology, Modelling and Simulation in Science, Decision Theory and Behavioral Game Theory, Economics, Research on Learning and Instruction, Cognitive Psychology and Cognitive Science. Ideally the students (from Bachelor, Master, Ph.D. and Post-Doc programs) have started to start work on their thesis or on any other term paper.

| Course credit | Course credit can be obtained either based on a talk in the colloquium plus a written essay, or by writing an essay about a topic related to one of the other talks in the course. Students interested in giving a talk should contact the course organizers (Rütsche, Stern) before the first session of the semester. Priority will be given to advanced / doctoral students for oral presentations. The course credits will be obtained by a written report of approximately 10 pages. The colloquium also serves as a venue for invited talks by researchers from other universities and institutions related to behavioral and social sciences.

851-0253-03L  The Sense of Time and its Effects on Motivation, Cognition, and Emotion
Number of participants limited to 45.

| Objective | While time is studied prominently in physics, it is also an integral part of our mind. Some of the main parameters of our sense of time are time immersion, time specificity, time speed, time texture, time horizon, time motion, time embodiment, and lifetime localization. Our sense of time can (often unconsciously) have profound effects on our motivation, cognition, and emotion.

| Abstract | To learn and understand how our sense of time influences our motivation, cognition, and emotion and to learn that our sense of time is malleable and can be influenced for the better. The course involves participating actively and regularly, reading articles, giving an oral presentation (in groups or individually), and writing a short paper.

851-0252-02L  Introduction to Cognitive Science
Number of participants limited to 70.

| Objective | Cognitive Science views human cognition as information processing and provides an inter-disciplinary integration of approaches from cognitive psychology, informatics (e.g., artificial intelligence), neuroscience and anthropological others. The lectures provide an overview of basic mechanisms of human information processing and various application domains. A focus will be on matters of knowledge acquisition, representation and usage in humans and machines. Models of human perception, reasoning, memory and learning are presented and students will learn about experimental methods of investigating and understanding human cognitive processes and representation structures.

| Prerequisites / notice | This course is particularly suitable for students of D-ITET.
The lecture covers the following main topics: Social perception and interpersonal judgement; attitudes; group dynamics and group performance; leadership behavior and leadership styles.

The participants should develop competencies in the structuring of communication, interaction, and management processes.

Im Einzelnen sollen die Teilnehmerinnen und Teilnehmer lernen:

- an den Beispielen von Kaufverhalten oder ökologischem Verhalten zu beschreiben, wie Normen und Einstellungen Einfluss auf das Verhalten nehmen.
- Die Subjektivität und die Fehlerquellen sozialer Wahrnehmung verstehen,
- Prinzipien der Psychologie der Kommunikation zu nutzen für eine Verbesserung der Kommunikation in Studium und Beruf,
- Merkmale und Strukturen von Gruppen zu identifizieren und mit geeigneten Methoden zu analysieren,
- Die Grundlagen von Konformität und Gehorsam gegenüber Autoritäten zu erkennen,
- Gruppenphänomene wie soziales Faulenzen, Risiko- und Konservatismus-Schub und Gruppendenken entgegenuwirken,
- Gruppenleistungen und -entscheidungen zu optimieren.
- Führungsstile zu unterscheiden lernen,
- Techniken zur Moderation von interagierenden Gruppen kennen zu lernen.

There is no script, but slides will be made available before the lectures.

363-0311-00L Psychological Aspects of Risk Management and Technology

<table>
<thead>
<tr>
<th>Objective</th>
</tr>
</thead>
</table>
- understand basic components of risk management in organizations
- know and apply methods for risk identification/evaluation, risk mitigation, risk communication
- know psychological foundations of risk perception, decision-making under risk, and risk communication
- know organizational principles for managing uncertainty
- apply theoretical foundations to applied issues such as safety management, regulatory activities, and technology design and implementation in different domains (e.g., transport systems, IT, insurance)

<table>
<thead>
<tr>
<th>Content</th>
</tr>
</thead>
</table>
The syllabus includes the following topics:
- Elements of risk management
- risk identification and evaluation
- risk mitigation
- risk communication
- Psychological and organizational concepts relevant in risk management
- decision-making under uncertainty
- risk perception
- resilient organizational processes for managing uncertainty

<table>
<thead>
<tr>
<th>Prequisites / Literature</th>
</tr>
</thead>
</table>
There are no prerequisites for this course. The course includes a manual and slides available before the lectures.

370-0721-00L Psychology

<table>
<thead>
<tr>
<th>Objective</th>
</tr>
</thead>
</table>
Students are able to
- describe the areas, concepts, theories, methods and findings of psychology.
- differentiate scientific psychology from "everyday" psychology.
- structure the conclusions and significance of an experiment, according to a theory of psychology.

<table>
<thead>
<tr>
<th>Content</th>
</tr>
</thead>
</table>
Einführung in die psychologische Forschung und Modellbildung unter besonderer Berücksichtigung der kognitiven Psychologie und des psychologischen Experiments. Themen sind u.a.: Wahrnehmung; Lernen und Entwicklung; Denken und Problemlösen; Kognitive Sozialpsychologie; Risiko und Entscheidung.

851-0252-08L Cognition in Studio Design - Analytic Tools for Evidence-Based Design

<table>
<thead>
<tr>
<th>Objective</th>
</tr>
</thead>
</table>
Taking the perspectives of the end user (occupants and visitors) is vital for a human-centered design approach. Students will learn about relevant theory and methods in cognitive science and environmental psychology that can be used to address human cognitive and behavioral needs in built environments. The foundations of environmental psychology and human spatial cognition will be introduced. A focus of the course will be on how people perceive their surroundings and orient in space. Students will learn about a range of methods including real-world observation, and methods of architectural analysis such as world models. Students will also be exposed to behavior simulation in design, virtual reality experiments, and eye-tracking. Students will reflect the roles of designers and other stakeholders with respect to human-centered design as well as an evidence-based design perspective. The course is tailored for students from a relevant design studio.

851-0238-01L Support and Diagnosis of Knowledge Acquisition Processes (EW3)

<table>
<thead>
<tr>
<th>Objective</th>
</tr>
</thead>
</table>
Enrolment only possible with matriculation in Teaching Diploma (except for students of Sport Teaching Diploma, who complete the sport-specific course unit EW3) and for students who intend to enroll in the "Teaching Diploma".

Lecture notes

There are no lectures, but slides will be made available before the lectures.
Abstract
In this seminar students learn advanced techniques to support and to diagnose knowledge acquisition processes in school.

Objective
The main goals are:
(1) You have a deep understanding about the cognitive mechanisms of knowledge acquisition.
(2) You have a basic understanding about psychological test theory and can appropriately administer tests.
(3) You know various techniques of formative assessment and can apply these to uncover students' misconceptions.

Prerequisites / notice
Für eine reibungslose Semesterplanung wird um persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

Abstract
This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the EU are covered.

Objective
Students are able to identify basic structures of the legal system. They understand selected topics of public and private law and are able to apply the fundamentals in more advanced law classes.

Content
Basic concepts of law, sources of law.
Private law: Contract law (particularly contract for work and services), tort law, property law.
Public law: Human rights, administrative law, procurement law, procedural law.
Insights into the law of the EU and into criminal law.

</tr>
</tbody>
</table>

Number of participants limited to 20.

Prerequisites: Environmental Law: Conceptions and Fields (851-0705-01L) offered in spring semester.

Abstract
This workshop offers to the students the opportunity to intensify their environmental legal knowledge on the basis of individual topics or cases of their respective programme or professional interest in a guided self-study. They develop a better understanding for the practical application of legal regulations on environmental matters.

Objective
The aim of this workshop is to equip students with legal skills and methods to solve or treat problems and questions of the environmental law and foster the understanding on the possibilities and limits of legal problem-solving. The students choose an inquiry with practical relevance. To this end they work out the legal basis demonstrating a legal correct solution or approach to a solution. In doing so, students will get to know legal methods and research possibilities.

Content
At the beginning of the workshop the students are introduced to the legal methods and sources as well as in the aim and the process of the workshop. The participants will organize themselves in a team of two persons giving themselves an inquiry on topics of the environmental law. It is also possible to choose questions at the interfaces of e.g. zoning law, energy law, transport law. A proposal, which will be presented to the lecturer, as well as an optional Q&A-session in class will facilitate the start. Next the working on topics will follow by self-study. The results will be presented in form of a memopaper with a maximum of ten pages (excluding graphs and tables). At the end of the workshop, a presentation of ten minutes will be made to the plenum including a question-and-answer session. Class language will be German.

Lecture notes
Den Studierenden werden Unterlagen zur juristischen Metoden- und Quellenlehre sowie zum Inhalt und Ablauf des Kurses zu Beginn der Veranstaltung kostenlos abgegeben.

Literature
Rechtsgrundlagen, Literatur und Gerichtsentwürfe werden themenspezifisch selber rechneicht, unter Mithilfe und Beratung des Dozenten.

Prerequisites / notice
Die Veranstaltung erfordert die Bereitschaft, sich aktiv und selbständig mit einer selbstgewählten Fragestellung oder einem eigenen Fallbeispiel aus dem Gebiet des Umweltrechts und allenfalls aus Schnittstellengebieten auseinanderzusetzen. Damit die Interaktivität und die Begleitung der Teams gewährleistet werden kann, ist die Teilnehmerzahl auf maximal 16 Personen beschränkt. Es handelt sich um eine Vertiefungsveranstaltung. Der Besuch der Vorlesung "Umweltrecht: Konzepte und Rechtsgebiete" (851-0705-01) ist Voraussetzung.

Abstract
The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.
Le cours de droit civil porte notamment sur le droit des obligations (droit des contrats et responsabilité civile) et sur les droits réels (propriété, gages et servitudes). De plus, il est donné un bref aperçu du droit de la procédure et de l'exécution forcée.

Sont indispensables:
- le Code civil et le Code des obligations;
- Vue d'ensemble des codes actuels et de la législation européenne (Code civil et Code des obligations) ou italienne (Codice civile e Codice delle obbligazioni), disponibles auprès de la plupart des établissements.

Le cours de droit public (2e sem.) sont l'équivalent des cours "Recht I" et "Recht II" en langue allemande et des exercices y relatifs.
- Les examens peuvent se faire en français ou en italien.
- Examen au 1er propédeutique; convient pour travail de semestre.

851-0727-02L  E-Business-Law  W  2 credits  2V  D. Rosenthal

Abstract
Particularly suitable for students of D-INF, D-ITET

The course deals with the basic legal framework for doing e-business as well as using information technology. It discusses a variety of legal concepts and rules to be taken into account in practice, be it when designing and planning new media business models, be it when implementing online projects and undertaking information technology activities.

Objective
The objective is knowing and understanding key legal concepts relevant for doing e-business, in particularly understanding how e-business is regulated by law nationally and internationally, how contracts are concluded and performed electronically, which rules have to be obeyed in principle when doing business on the Internet with regard to third party and own content and client data, the concept of liability applied in e-business and the role of the law in the practical implementation and operation of e-business applications.

Content
Vorgesehene Strukturierung der Vorlesung:

1) Welches Recht gilt im E-Business?
- Internationalität des Internets
- Regulierende Branchen

2) Gestaltung und Vermarktung von E-Business-Angeboten
- Verwendung fremder und Schutz der eigenen Inhalte
- Haftung im E-Business (und wie sie beschränkt werden kann)
- Domain-Namen

3) Vermarktung von E-Business-Kunden
- Verträge im E-Business
- Konsumentenschutz
- Elektronische Signaturen
- Datenschutz
- Spam

4) Verträge mit E-Business-Providern

Lecture notes
Es wird mit Foliens präsentiert, die als PDF über die elektronische Dokumentenablage (ILIAS) auf dem System der ETHZ gängig abrufbar sind. Auf dem Termin- und Themenplan (ebenfalls online abrufbar) sind Links zu Gesetzesvoten und weiteren Unterlagen abrufbar.

Literature
Weiterführende Materialien, Links und Literatur sind auf dem Termin- und Themenplan aufgeführt (zu gegebener Zeit abrufbar)

Prerequisites / notice
Die Semesterendprüfung ist in Form eines schriftlichen Kurztests (normalerweise MC) in voraussichtlich der letzten Doppelstunde geplant. Es wird angegeben, welche Unterlagen beim jeweiligen Thema den Prüfungsstoff definieren. Der Test wird möglicherweise elektronisch durchgeführt.

Ferner bietet Ursula Widmer eine Vorlesung zum Thema Informationssicherheit an, welche die rechtlichen Aspekte der Sicherheit von ICT-Infrastrukturen und Netzen und der transportierten und verarbeiteten Informationen.

851-0733-00L  Traffic Law / Traffic Commercial Law  W  2 credits  2G  S. Scherler

Abstract
Within the scope of the lecture "Traffic Law / Traffic Commercial Law", besides an introduction into the legal basis of the national and international traffic, the main interest will be laid on actual political and economical questions and problems with respect to traffic (e.g. financing of traffic, road pricing, rail reform, air traffic vs. environment law etc.).

Objective
Participants are acquiring a comprehensive summary about the system Traffic Law/Traffic Commercial Law in Switzerland. With practical exercises and subsequent detailed reviews themes and subjects of special interest to participants are being treated more thoroughly.

Content

851-0735-10L  Business Law  W  2 credits  2V  P. Peyrot

Abstract
The students shall obtain a basic knowledge about business law. They shall be able to recognize and evaluate issues in the area of business law and suggest possible solutions.
Objective

The students shall obtain the following competence:

- They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
- They shall be acquainted with corporate functions as contracting, negotiation, claims management and dispute resolution.
- They shall be familiar with the issues of corporate compliance, i.e. the system to ascertain that all legal and ethical rules are observed.
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

Lecture notes

A comprehensive script will be made available online on the moodle platform.

Workshop and Lecture Series in Law and Finance

851-0735-04L

Objective

The Workshop and Lecture Series in Law & Finance is a joint seminar of ETH Zurich, the University of Zurich and the University of St. Gallen. Each semester, several guest scholars from law, finance and related fields give a lecture and/or discuss their ongoing research. All speakers are internationally well-known experts from Europe, the U.S. and beyond.

Content

Participants discuss current Law & Finance issues with guest scholars from the U.S. and in particular, participants write a comment on one of the discussed papers.

Lecture notes

To be discussed papers are posted in advance on the course's web page.

Literature

- Viral Acharya et al., Regulating Wall Street (Wiley 2011)

Workshop & Lecture Series on the Law & Economics of Innovation

851-0735-09L

Objective

This series is a joint project by ETH Zurich and the University of Zurich. It provides an overview of interdisciplinary research on intellectual property, innovation, antitrust and technology policy. Scholars from law, economics, management and related fields give a lecture and/or present their current research. All speakers are internationally well-known experts from Europe, the U.S. and beyond.

Content

The workshop and lecture series will present a mix of speakers who represent the wide range of current social science research methods applied to intellectual property, innovation, antitrust and technology policy research. They should also have an overview of current topics of international research in these areas.

Lecture notes

Papers discussed in the workshop and lecture series are posted in advance on the course web page.

Literature

Environmental Regulation: Law and Policy

851-0735-11L

Objective

The aim of this course is to make students with a technical scientific background aware of the legal and political context of environmental policy in order to place technical solutions in their regulatory context.

Content

Topics covered in lectures:

1. Environmental Regulation
   a. Perspectives
   b. Regulatory Challenges of Environment Problems
   c. Regulatory Tools
2. Law: International, European and national laws
   a. International law
   b. European law
   c. National law
3. Policy: Case studies

Assessment:

(i) Class participation (25%): Students will be expected to contribute to class discussions and prepare short memos on class readings.
(ii) Exam (75%) consisting of three parts:
   a. Policy brief - a maximum of 2 pages (including graphs and tables);
   b. Background document to the policy brief - this document sets out a more detailed and academic overview of the topic (maximum 8 pages including graphs and tables);
   c. Presentation of the policy brief: presentations can use a maximum of 5 slides and can last 7 minutes.

Number of participants limited to 15.

Particularly suitable for students of D-USYS
The course is taught as a small interactive seminar and significant participation is expected from the students. Participation will be capped at 15 in order to maintain the interactive nature of the classes. All classes, readings, and assignments, are in English. Teaching will take place over two weeks in September and October. The exam date will be in December.

During the second week of the teaching period, students will have individual 30-minute meetings with the lecturer to discuss their project.

An electronic copy of relevant readings will be provided to the students at no cost before the start of the lectures.

The course is (inter)related to materials discussed in Politikwissenschaft: Grundlagen (851-0577-00 V), Ressourcen- und Umweltökonomie (751-1551-00 V), Umweltrecht: Konzepte und Rechtsgebiete (851-0705-01 V), Rechtlicher Umgang mit natürlichen Ressourcen (701-0743-01 V), Environmental Governance (701-1651-00 G), Policy and Economics of Ecosystem Services (701-1653-00 G), International Environmental Politics: Part I (851-0594-00 V).

### 851-0738-00L
**Intellectual Property: Introduction**
*Particularly suitable for students of D-ITET, D-MAVT, D-MATL*

**Abstract**
The course provides an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights). Aspects of competition law are treated insofar as they are relevant for the protection of intellectual creations and source designations. The legal principles are developed based on current cases.

**Objective**
The aim of this course is to enable students at ETH Zurich to recognize which rights may protect their creations, and which rights may be infringed as a result of their activities. Students should learn to assess the risks and opportunities of intellectual property rights in the development and marketing of new products. To put them in this position, they need to know the prerequisites and scope of protection afforded by the various intellectual property rights as well as the practical difficulties involved in the enforcement of intellectual property rights. This knowledge is imparted based on current rulings and cases.

Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thickets).

### 851-0738-01L
**The Role of Intellectual Property in Daily Routine: A Practical Introduction**
*Particularly suitable for students of D-BAUG, D-ITET, D-MAVT*

**Abstract**
The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

**Objective**
In recent years, knowledge about intellectual property has become increasingly important for engineers. Both in production and distribution and in research and development, engineers are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint students with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will comprise practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

The lecture is in particular tailored to the needs of the following degree programs: Agricultural science, architecture, civil engineering, computational science and engineering, computer science, electrical engineering and information technology, environmental engineering, geomatic engineering and planning, interdisciplinary sciences, materials science, mathematics, mechanical engineering, physics.

For students of chemistry-related degree programs, the lecture ‘Protecting inventions in chemistry’ (851-0738-03) will be offered in the autumn semester.

### 851-0738-03L
**Protecting Inventions in Chemistry**
*Particularly suitable for students of D-CHAB*

**Abstract**
The lecture gives students of chemistry-related degree programs an overview of the options to protect inventions and the underlying research efforts. The lecture aims to put the participants in a position to use this know-how in the workplace.
Investments in the development of new substances and active components in these sectors are traditionally secured by patents because publicly known inventions, generally chemical substances, may easily be reproduced by others.

In the last years, the know-how about intellectual property has become increasingly important for chemists and engineers. Both in the production process and in the distribution sector, chemists and engineers are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information. As more than many inventors of all patent information are available only in patents, it is more and more important for researchers and engineers to be able to extract relevant information from the flood of patents.

The seminar is customised to the needs of chemists and students of related degree programs. Participants will become familiar with practice-oriented aspects of intellectual property and will be enabled to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects in day-to-day research, at the workplace and for the formation of start-ups
- Special aspects of protecting inventions in chemistry-related sectors, e.g. polymorphs and inventions in the field of nanotechnology.

Case studies will illustrate and deepen the topics addressed during the lecture.

The seminar will comprise practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

The course will be offered again in the spring semester. For engineering and physics students, the lecture ‘The Role of Intellectual Property in daily routine: A Practical Introduction’ (851-0738-01) will be offered in the autumn semester.
This course starts with a discussion of the typical and often counter-intuitive features of complex dynamical systems such as self-organization, emergence, (sudden) phase transitions at “tipping points”, multi-stability, systemic instability, deterministic chaos, and turbulence. It then discusses phenomena in networked systems such as feedback, side and cascade effects, and the problem of radical uncertainty. The course progresses by demonstrating the relevance of these properties for understanding societal and, at times, global-scale problems such as traffic jams, crowd disasters, breakdowns of cooperation, crime, conflict, social unrests, political revolutions, bubbles and crashes in financial markets, epidemic spreading, and/or “tragedies of the commons” such as environmental exploitation, overfishing, or climate change. Based on this understanding, the course points to possible ways of mitigating techno-socio-economic-environmental problems, and what data science may contribute to their solution.

Prerequisites / notice
Mathematical skills can be helpful

Abstract
This colloquium offers an opportunity for students to discuss their ongoing research and scientific ideas in the behavioral sciences, both at the micro- and macro-levels of cognitive, behavioral and social science. It also offers an opportunity for students from other disciplines to discuss their ideas in so far as they have some relation to behavioral science. The possible research areas are wide and may include theoretical as well as empirical approaches in Social Psychology and Research on Higher Education, Sociology, Modeling and Simulation in Sociology, Decision Theory and Behavioral Game Theory, Economics, Research on Learning and Instruction, Cognitive Psychology and Cognitive Science. Ideally the students (from Bachelor, Master, Ph.D. and Post-Doc programs) have started to start work on their thesis or on any other term paper. Course credit can be obtained either based on a talk in the colloquium plus a written essay, or by writing an essay about a topic related to one of the other talks in the course. Students interested in giving a talk should contact the course organizers (Rütsche, Stern) before the first session of the semester. Priority will be given to advanced/doctoral students. The course credits will be obtained by a written report of approximately 10 pages. The colloquium also serves as a venue for invited talks by researchers from other universities and institutions related to behavioral and social sciences.

Objective
Students know and can apply autonomously up-to-date investigation methods and techniques in the behavioral sciences. They achieve the ability to develop their own ideas in the field and to communicate their ideas in oral presentations and in written papers. The credits will be obtained by a written report of approximately 10 pages.

Content

</tr>
</tbody>
</table>

Abstract
How do various interest groups influence the methods of production, distribution, and use of digital resources? Current models focusing on strong intellectual property rights are contrasted with open models like, e.g. Open Source/Content/Access. The course discusses consequences from different models and introduces »digital sustainability« as an alternative vision for society.

Objective
At the heart of the discourse is the handling of digital goods and intellectual property in society. Digitalization and the Internet allow handling knowledge in a way, which directly contrasts with the traditional understanding of "intellectual property" and the industries based on it. Starting from economic and legal bases, we compare proprietary and open/f"free" models. Sustainable development as a concept is transferred to digital goods, taking into account the particular nature of digital stuff. After the lecture, you should (hopefully) be able to:
- characterize the nature of digital goods vs. physical goods
- critique the basic concepts of copyright and patent rights
- explain the political/legal and economic differences between proprietary and open approaches to the production and use of digital goods
- using an example, explain the meaning of digital sustainability and argue why it is relevant for a knowledge society
- transfer the ideas of the free/open source software model to other digital goods (e.g., open content, open access)

Prerequisites / notice
Mathematical skills can be helpful
This course introduces the foundations of game theory. It focuses on models of social interaction, conflict and cooperation, the emergence of cooperation and concepts of strategic decision-making behaviour. Examples, applications and the contrast between theory and empirical results are particularly emphasized.

The technical reality of today's business model of the knowledge and culture industries (starting from the music label and Hollywood, via publishers, up to software vendors) is a fundamental threat to the economic viability of tomorrow's business model. Powerful commercial interests are at stake as "intellectual property" (the fourth factor of production) will become ever more important in the 21st century. Accordingly, "piracy" and "file-sharing" are attacked with all means. At the core lies the question about the design of property in digital assets. For that, we apply a concept of "intellectual property", which is several hundred years old and does not address digital reality in an adequate manner, sometimes leading to absurd situations.

The original goal seems to get forgotten: to help society develop by spreading knowledge as much as possible. Using the PC becomes the new cultural technique of the 21st century. In contrast to "reading, writing and arithmetic", this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency extends to the provider of the infrastructure, who can define technical rules, which can take away or restrict the user's freedom. Even advanced users may have difficulties in recognizing these, often hidden, restrictions and in evaluating their societal relevance. But exactly these invisible consequences we need to understand and investigate, because they decide about access, distribution and usage of digital knowledge.

The problem is, that this reality poses a fundamental threat to the economic viability of tomorrow's business model. Powerful commercial interests are at stake as "intellectual property" (the fourth factor of production) will become ever more important in the 21st century. Accordingly, "piracy" and "file-sharing" are attacked with all means. At the core lies the question about the design of property in digital assets. For that, we apply a concept of "intellectual property", which is several hundred years old and does not address digital reality in an adequate manner, sometimes leading to absurd situations.

The original goal seems to get forgotten: to help society develop by spreading knowledge as much as possible. Using the PC becomes the new cultural technique of the 21st century. In contrast to "reading, writing and arithmetic", this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency extends to the provider of the infrastructure, who can define technical rules, which can take away or restrict the user's freedom. Even advanced users may have difficulties in recognizing these, often hidden, restrictions and in evaluating their societal relevance. But exactly these invisible consequences we need to understand and investigate, because they decide about access, distribution and usage of digital knowledge.

Comparative to the environmentalist movement of the 60s and 70s, a growing political movement for "Free Software" exists today, with «GNU/Linux» as its most popular symbol. The movement fights against treating software code as private property but as a central cultural good available to all without private interests. Based on the success of the Free Software movement, new initiatives extend the concepts to other domains (e.g. scientific knowledge, music)...

As a «teaser» to the lecture, you are invited to read the essay «ETH Zurich - A Pioneer in Digital Sustainability!». It can be downloaded from www.essays2030.ethz.ch.

More on teach.digisius.info starting from September. Stay tuned.

501-0811-00L Sociology I W 1 credit 2V C. Schmid
Cognitive neuroscience bridges two seemingly distinct but closely related disciplines. On one side, there is cognitive psychology and on the other biology, or more specifically, neuroscience. In terms of research, this relatively young field aims to explain such diverse mental techniques: participating in observation, interviews, photo and video site inspections in urban rooms, mindmapping etc.

Sociology: Urban Quality of Life - Ethnological Field
In this ethnographic field research we examine the question, how people are perceiving and creating their environment, and how an urban environment will be. For ethnographic surveys of the built environment architects nowadays use a number of methods and milieus, their obstinacy, creativity and their special way of life is considered significant for better understanding the city as central point of cultures with each other. Urban ethnology investigates symboles and practices representing and participating in the normal course of city life. Urban ethnology understands urban space not only as built environment, but also as a lived cultural and social context. With sociological perspective on architectural practice and provides an introduction to sociological research. Research in District 5 and in Zurich North
In this ethnographic field research we examine the question, how people are perceiving and creating their environment, and how an urban quality of life is forming. We investigate four neighborhoods in the Zurich Region: upper District 5, Zurich West, Seebach and Glattpark.

Environmental Behavior in Social Context
This introductory class in the environmental social sciences covers topics such as environmental behavior, environmental concern, social dilemmas and social norms.

Multivariate Methods
One of the lectures 701-1541-00 (autumn semester) OR 752-2110-00 (spring semester) are highly recommended for students in Environmental Sciences with the Major Environmental systems and Policy.

This seminar is devoted to the introduction into the ideas and concepts of one of the most influential thinkers of the 20th century. We will discuss some of the classic works in neuroscience in visual perception, memory and emotion. This will be accompanied by some famous cases of patients demonstrating problems in these domains (e.g., people with agnosia or amnesia). Further topics will include the cognitive and neural processes involved in pain processing, the placebo effect, as well as spatial representation and navigation.

This course targets students at the Bachelor level with no previous experience. The main requirement for this course is an open and critical mind. By the end of the course, the student will be able to identify the major brain structures and to explain the basic functioning of neurons as well as some of the fundamental principles of how our brain works. Students should have an understanding of the methods used to generate the various findings reported in the literature and the media. The course aims to enable and encourage the students to critically evaluate these findings, and what can and cannot be answered with neuroscience techniques. For each of the topics, students should be able to identify the phenomenon, give examples, and discuss one or two of the main theories explaining it.

851-0597-01L **Evolutionary Foundations of Social Behavior**

**Number of participants limited to 20.**

**Abstract**

This lecture will deal with the manifestations of the *selfish gene* principle in human social behavior. Cooperation and competition, selfishness and altruism, gender relations and parent-child conflicts are issues, the evolutionary backgrounds of which will be discussed. Special attention will be paid to the costly signaling theory.

**Objective**

You will receive an in-depth overview of the application of Darwinian theory on behavioral phenomena. This will enable you to approach the heuristic perspective of the so-called adaptationist program of social phenomena. Finally, you will be able to discern the benefits and the problems of the evolutionary perspective within various scientific disciplines, especially anthropology, psychology, empirical social research and comparative cultural sciences.

**Literature**

<td><strong>Abstract</strong></td>
<td>In the last 2500 years, the mind-brain relationship has been articulated in various ways. In these lectures, I will explore the scientific and philosophical aspects of this relationship in the context of relevant cultural, historical and technological processes, with a focus on the modern neurosciences, but I will also discuss works of art and literature.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>By the end of the lecture, students should be familiar with essential positions in the scientific and philosophical treatment of questions relating the mind to the brain. It should also become clear that some of the most relevant problems in current neurosciences have a long history.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>According to a myth, the ancient Greek philosopher Democrit dissected animals, because he was in search of the seat of the soul. Current neuroscientists use neuroimaging techniques like functional magnetic-resonance-tomography in order to localize cognitive and emotional qualities in the brain. Between these two dates lies a history of 2500 years, in which the relationship between the mind and the brain has been defined in various ways. Starting with ancient and medieval theories, the lecture will have its focus on modern theories from the nineteenth century onward. I will discuss essential issues in the history of the neurosciences such as localization theories, the neuron doctrine, reflex theory, theories of emotions, neurocybernetics and the importance of visualizing the brain and its parts, but I will also include works of art and literature.</td>

<tr>
<td><strong>Abstract</strong></td>
<td>This seminar is devoted to the introduction into the ideas and concepts of one of the most influential thinkers of the 20th century. We will read selected texts by Freud for getting an overview over his medical, psychological and cultural thinking.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>30 years ago it would have been bizarre to ask the question: Who was Sigmund Freud? The influence of psychoanalysis on twentieth century thinking was taken for granted even by those ones who rejected Freud's ideas. In contrast, the question today would be: What are Freud's central theories? We will tackle this question in the seminar and reconstruct Freud's thinking from his own medical writings to those writings, in which he developed a critical view of his time. The aim of the seminar is not only to understand Freud's thinking in historical context, but also to reflect, what it could mean to us in early twentieth century.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Abstract</strong></td>
<td>Bruno Latour (* 1947) is one of the most important contemporary sociologist of science. He enriched our understanding of what a scientific fact is and how we get to it, i.e. how it is made up, not only discovered. Latour defends a constructivist approach with realist elements. What that exactly means, will be clarified in this course.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>- Introduction to the sociology of science of Bruno Latour, esp. the Agent/Network/Theory.</td>
<td></td>
<td></td>
<td></td>
<td></td>

Die Veranstaltung ist ausgebucht

Abstract
The course is designed to provide an overview of the astronomical developments from the ancient Greek world to the 16th century. We are going to use primary sources tackling historical, technical and philosophical questions. Special attention will be paid to the dramatic change in the way people understood the structure of the heavens and the nature of the physical world.

Objective
The course aims at providing a working knowledge of astronomy and cosmology from the ancient world to the 16th century. Upon its completion the students will be able to describe how our knowledge of the heavens changed from Aristotle’s system to the Copernican Revolution. In addition, they will also have acquired an appreciation of the debates about man’s place in the cosmos and the philosophical principles underpinning cosmology.

851-0157-70L The Mathematics of Scientific Racism 6 W 2 credits 1S A. Teicher

Abstract
How did racial scientists determine racial affiliation? In the seminar we will examine the practical challenges and eventual works of physical anthropologists from 1850 to the present. By scrutinizing the scientific toolbox of racial scientists, we will reveal how national affiliation, anti-Semitic perceptions and Gender identity shaped scholars’ choices of graphical and computational methods.

Objective
The aim of the course is to analyze the mutual relations between scientific theories and social perceptions, and to follow the formation of the “scientific mind”. The course focuses on racial scientists and on the way their practices of computation and statistical analysis influenced their world-views - and vice versa. The students will be instructed on the way historians of science analyze scientific sources. They will gain a better understanding of the complexities of disciplinary dynamics, social biases and institutional pressures shaping scientific ideas, and learn on the influences such scientific ideas may have on the society as a whole. Please note that the seminar will be held in English and most texts will be in English. However, a small portion of the reading material will be in German.

Prerequisites / notice

701-0771-00L Environmental Consciousness and Public Relations 6 Number of participants limited to 60.

Sign in until 29.09.2016.

Abstract
"Environmental Consciousness and Public Relations" shows how to communicate about environment and sustainability successfully. We look at campaigns, exhibitions and other public relations measures to learn, how to design and realize good communication.

Objective
You learn how to handle tools and concepts in environmental communication. And you can evaluate communication projects. We also discuss the evolution of consciousness.

Content
- Methods and tools in environmental communication.
- Marketing mix
- Examples of campaigns, events, print products, media relations.
- Integral sustainability

Lecture notes
Handouts

Literature
- Integral Vision; Ken Wilber, 2005

Prerequisites / notice
We will discuss new trends in environmental communication with the focus on integral solutions.

851-0158-07L Worldviews in Conflict 6 W 3 credits 2V W. A. Stahel, H. von Sass, C. aus der Au Heymann

Abstract
Worldviews guide our thoughts and our actions even though we may not be aware of it. They often are realized only when they are confronted with each other. By means of lectures, discussions and contributions of participants, we will examine those worldviews as to the underlying philosophical concepts and their relations to the sciences, philosophy and religion.

Objective
Students of all disciplines shall obtain a basis for their own exploration of worldviews. Prior knowledge of philosophical concepts and history is not required.

Type B: Reflection About Subject-Specific Methods and Contents

Subject-specific courses: Recommended for doctoral, master and bachelor students (after first-year examination only).

Students who already took a course within their main study program are NOT allowed to take the course again.

These course units are also listed under "Type A", which basically means all students can enroll

D-ARCH

Number Title Type ECTS Hours Lecturers
851-0724-00L Property Law for Geometers: Land Registry and Geoinformation Law 6 W 2 credits 2V M. Huser

Abstract
Particularly suitable for students of D-ARCH, D-BAUG, D-USYS

Objective
Fundamental concepts of Land Register Law and Land Surveying Law (substantive and procedural rules of Land Register Law, the parts and the relevance of the Land Register, process of registration with the Land Register, legal problems of land surveying, reform of the official land surveying).

Content
Overview of the legal norms of land registry and surveying law.

Lecture notes
Abgegebene Unterlagen: Skript in digitaler Form

Literature

- Meinrad Huser, Datenschutz bei Geodaten

Prerequisites / notice
Requirements: Property Law (12-722)
Environmental Law: Topics and Case Studies

Number of participants limited to 20.

Prerequisites: Environmental Law: Conceptions and Fields (851-0705-01L) offered in spring semester.

Particularly suitable for students of D-ARCH, D-BAUG, D-USYS

Abstract
This workshop offers to the students the opportunity to intensify their environmental legal knowledge on the basis of individual topics or cases of their respective programme or professional interest in a guided self-study. They develop a better understanding for the practical application of legal regulations on environmental matters.

Objective
The aim of this workshop is to equip students with legal skills and methods to solve or treat problems and questions of the environmental law and foster the understanding on the possibilities and limits of legal problem-solving. The students choose an inquiry with practical relevance. To this end they work out the legal basis demonstrating a legal correct solution or approach to a solution. In doing so, students will get to know legal methods and research possibilities.

Content
At the beginning of the workshop the students are introduced to the legal methods and sources as well as in the aim and the process of the workshop. The participants will organize themselves in a team of two persons giving themselves an inquiry on topics of the environmental law. It is also possible to choose questions at the interfaces of e.g. zoning law, energy law, transport law. A proposal, which will be presented to the lecturer, as well as an optional Q&A-session in class will facilitate the start. Next the working on topics will follow by self-study. The results will be presented in form of a memo/paper with a maximum of ten pages (excluding graphs and tables). At the end of the workshop, a presentation of ten minutes will be made to the plenum including a question-and-answer session. Class language will be German.

Lecture notes
Den Studierenden werden Unterlagen zur juristischen Methoden- und Quellenlehre sowie zum Inhalt und Ablauf des Kurses zu Beginn der Veranstaltung kostenlos abgegeben.

Literature
Rechtsgrundlagen, Literatur und Gerichtsentscheide werden themenspezifisch selber recherchiert, unter Mithilfe und Beratung des Dozenten.

Prerequisites / notice
Die Veranstaltung erfordert die Bereitschaft, sich aktiv und selbständig mit einer selbstgewählten Fragestellung oder einem eigenen Fallbeispiel aus dem Gebiet des Umweltrechts und allenfalls aus Schrifttumsgebieten auseinanderzusetzen. Damit die Interaktivität und die Belieferung der Teams gewährleistet werden kann, ist die Teilnehmerzahl auf maximal 16 Personen beschränkt. Es handelt sich um eine Vertiefungsveranstaltung. Der Besuch der Vorlesung "Umweltrecht: Konzepte und Rechtsgebiete" (851-0705-01) ist Voraussetzung.

Space Planning Law and Environment

Particularly suitable for students of D-ARCH, D-BAUG, D-USYS

Abstract
System of swiss planning law, Constitutional and statutory provisions, Space planning and fundamental rights, Instruments, Application, legal protection, enforcement, Practical training.

Objective
Basic understanding of nature and function of space planning from a legal point of view. Basic knowledge of space planning instruments, relationship between space planning and constitutional law (especially property rights), solving of practical cases.

Content

Lecture notes
Haller, Walter/Karlen, Peter, Raumplanung-, Bau- und Umweltrecht, 3.A., Zürich 1999

Human-computer interaction: cognition and usability

Particularly suitable for students of D-ARCH, D-INFK, D-IT

Abstract
This seminar introduces theory and methods in human-computer interaction and usability. Cognitive Science provides a theoretical framework for designing user interfaces as well as a range of methods for assessing usability (user testing, cognitive walkthrough, GOMS). The seminar will provide an opportunity to experience some of the methods in applied group projects.

Objective
This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability. Presentations will cover basics of human-computer interaction and selected topics like mobile interaction, adaptive systems, human error and attention. A focus of the seminar will be on getting to know evaluation techniques in HCI. Students form work groups that first familiarize themselves with a select usability evaluation method (e.g. user testing, GOMS, task analysis, heuristic evaluation, questionnaires or Cognitive Walkthrough). They will then apply the methods to a human-computer interaction setting (e.g. an existing software or hardware interface) and present the method as well as their procedure and results to the plenary. Active participation is vital for the success of the seminar, and students are expected to contribute to presentations of foundational themes, methods and results of their chosen group project. In order to obtain course credit a written essay / report will be required (details to be specified in the introductory session of the course).

Cognition in architecture - designing orientation and navigation for building users

Particularly suitable for students of D-ARCH

Abstract
How can behavioral and cognitive science inform architecture? This project-oriented seminar investigates contributions of cognitive science to architectural design with an emphasis on orientation and navigation in complex buildings and urban settings. It includes theories on spatial memory and decision-making as well as hands-on observations of behavior in real and virtual reality.

Objective
Taking the perspectives of building users (occupants and visitors) is vital for a human-centered design approach. Students will learn about relevant theory and methods in cognitive science and environmental psychology that can be used to understand human behavior in built environments. The foundations of environmental psychology and human spatial cognition will be introduced. A focus of the seminar will be on how people perceive their surroundings, how they orient in a building, how they memorize the environment and how they find their way from A to B. Students will also learn about a range of methods including real-world observation, virtual reality experiments, eye-tracking and behavior simulation for design. Students will reflect on the roles of designers and other stakeholders with respect to human-centered design and an evidence-based design perspective. The seminar is geared towards a mix of students from architecture / planning, engineering, computer science and behavioral science as well as anybody interested in the relation between design and cognition. Architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".
Abstract
In the second half of the 20th century, postal services have dramatically changed. Communication today is computer-based. The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers. Both in production and distribution, engineering and research, engineers are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

Objective
The lecture is in particular tailored to the needs of the following degree programs: Agricultural science, architecture, civil engineering, geomatic engineering and planning, interdisciplinary sciences, materials science, mathematics, mechanical engineering, physics.

Content
The seminar will comprise practical exercises on how to use and search patent information. Basic knowledge of how to read and evaluate patent documents as well as how to use publicly available patent databases to obtain the required patent information will also be provided.

Prerequisites / notice
The lecture is particularly suitable for students of D-ARCH, D-BAUG, D-MAVT.

- Meinrad Huser, Datenschutz bei Geodaten

Requirements: Property Law (12-722)

851-0705-02L Environmental Law: Topics and Case Studies

W 2 credits 2S C. Jäger

Number of participants limited to 20.

Prerequisites: Environmental Law: Conceptions and Fields (851-0705-01L) offered in spring semester.

Abstract
This workshop offers to the students the opportunity to intensify their environmental legal knowledge on the basis of individual topics or cases of their respective programme or professional interest in a guided self-study. They develop a better understanding for the practical application of legal regulations on environmental matters.

Objective
The aim of this workshop is to equip students with legal skills and methods to solve or treat problems and questions of the environmental law and foster the understanding on the possibilities and limits of legal problem-solving. The students choose an inquiry with practical relevance. To this end they work out the legal basis demonstrating a legal correct solution or approach to a solution. In doing so, students will get to know legal methods and research possibilities.

Content
At the beginning of the workshop the students are introduced to the legal methods and sources as well as in the aim and the process of the workshop. The participants will organize themselves in a team of two persons giving themselves an inquiry on topics of the environmental law. It is also possible to choose questions at the interfaces of e.g., zoning law, energy law, transport law. A proposal, which will be presented to the lecturer, as well as an optional Q&A-session in class will facilitate the start. Next the working on topics will follow by self-study. The results will be presented in form of a memo/paper with a maximum of ten pages (excluding graphs and tables). At the end of the workshop, a presentation of ten minutes will be made to the plenum including a question-and-answer session. Class language will be German.

Lecture notes
Den Studierenden werden Unterlagen zur juristischen Methoden- und Quellenlehre sowie zum Inhalt und Ablauf des Kurses zu Beginn der Veranstaltung kostenlos abgegeben.

Literature
Rechtsgrundlagen, Literatur und Gerichtsentscheide werden themenspezifisch selber recherchiert, unter Mithilfe und Beratung des Dozenten.

851-0707-00L Space Planning Law and Environment

W 2 credits 2G O. Bucher

System of swiss planning law, Constitutional and statutory provisions, Space planning and fundamental rights, Instruments, Application, legal protection, enforcement, Practical training.

Objective
Basic understanding of nature and function of space planning from a legal point of view. Basic knowledge of space planning instruments, relationship between space planning and constitutional law (especially property rights), solving of practical cases.

This course analyzes the history of urban architecture primarily in its existing three dimensional form as a complex human artefact. It also offers problem oriented insights into this sociotechnical process of translation.

Students become familiar with the mutual interdependence of social and technological change that characterises the history of computing and communication.

051-0363-00L

History of Urban Design I

Abstract
The lecture covers the time from the beginning of urban culture until the mid 19th century. With selected examples it emphasizes on the historical plannings and methods of European cities. Each specific urban development will be presented within a broader context.

Objective
This course analyzes the history of urban architecture primarily in its existing three dimensional form as a complex human artefact. It also explores the inspirations that prompted the creation of this artefact: philosophical and religious concepts, social conditions, property relationships and the mechanisms that exploit the economics of real estate and the influence of building technology. Intellectual, literary or artistic modes of thought will also be assessed with regard to their impact on urban development. Urbanism has its own distinctive approach as a discipline, but it is also clearly responsive to the influence of related disciplines. Study is made of actual cities and urban expansion plans which are in the process of implementation, as well as unrealized projects and visions of the future. These projects sometimes illustrate ways of thinking that are equal to, or clearer than, actual urban situations.

Content
In the first semester an introduction to the discipline and the methods are given along the thematic issues from the beginning of urban culture until the mid-19th century.

01. Introduction to the discipline and method: The history of urban design as a historical project
02. Athens and Rome in the ancient world: Myth, selfportrayal and speculation
03. From the spirit of equality to the colonial module: Greek and Roman City foundations
04. From the urban ideal to new cities in the Middle Ages and the Renaissance
05. Baroque strategies: The new organisation of Rome under Sixtus V, the production of Versailles under Louis XIV and the invention of St. Petersburg
06. The city between Absolutism and Enlightenment: baroque defence-designs, the European colonization of the American continent and the reconstruction of Lisbon
07. Ideology and speculation after the Glorious Revolution: landscapegardens and urban figurations in England from 1650-1850
08. Between modernization, Grandeur and repression: Embellishment in Paris from 1750-1830
09. The construction of the bourgeois city: Georges-Eugène Haussmann transforms Paris into the capital of the 19th century
10. Architectural insertion and plan for the expansion of the city: From the Berlin of Karl Friedrich Schinkel to James Hobrecht
11. Neoabsolute power, bourgeois self-confidence and Marxian Idealism: The Viennese Ringstrasse and Ildenonzo Cerdas Ensansche for Barcelona

Lecture notes
The lecturers are accompanied by a script (two semesters of the bachelor studies), that can be purchased at the chair for the history of urban design (HIL D 75.2) at the price of CHF 30.-. The script serves as an auxiliary means to the attended lecture compiling the most important illustrations showed and the names and dates of the buildings and its builders along with a short introductory note.

Literature
Further recommended literature to consult is listed within the script.

701-0703-00L

Environmental Ethics

Abstract
The lecture begins with an introduction to applied ethics in general. The main focus is on environmental ethics. Students learn to handle important concepts and positions of environmental ethics. They achieve a deeper understanding of these concepts and positions in applying them to ecological problems and discussing them in case studies.

Objective
On completion of this lecture you will have acquired the ability to identify and process general and environmental ethical problems. You will be capable of recognising and analysing environmental ethical problems and of working towards a solution. You will have acquired a fundamental knowledge of standpoints and arguments and be able to find within the field of environmental ethics and will have practised these in small case studies.

Content
- Introduction to general and applied ethics.
- Overview and discussion of ethical theories relevant to the environment.
- Familiarisation with various basic standpoints within environmental ethics.
- Current topics, such as sustainability, intergenerational justice, protection of species, etc.
- Practising of newly acquired knowledge in case studies (protection of species, climate change, etc.)

Lecture notes
Summaries of the individual sessions will be distributed, including the most important theories and keywords; reading list. In the part of the course serving as an introduction to general and applied ethics, we shall be using the following textbook: Barbara Bleisch/Markus Huppenbauer: Ethische Entscheidungsfindung. Ein Handbuch für die Praxis, 2nd Edition Zürich 2014

Literature
- Andrew Light/Homes Rolston III. Environmental Ethics. An Anthology, 2003
- John O'Neill et al., Environmental Values, 2008
- Klaus Peter Rippe, Ethik im ausserhumanen Bereich, Paderborn (mentis) 2008

Generel introductions:
- Marcus Düwel et. al. (Hrsg.), Handbuch Ethik, 2. Auflage, Stuttgart (Metzler Verlag), 2006
- Johann S. Ach et. al. (Hrsg.), Grundkurs Ethik 1. Grundlagen, Paderborn (mentis) 2008

Prerequisites / notice
The procedure for accumulating CP will be explained at the start of term. I expect participants to be motivated and contribute to discussions, keeping the course interesting and lively.
Number of participants limited to 20.

Science, Technology, and Policy MSc and MAS in Development and Cooperation have priority.

Abstract
This course introduces students to key statistical methods for analyzing social science data with a special emphasis on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical Software Stata.

Objective
Students
- have a sound understanding of linear and logit regression
- know strategies to test causal hypotheses using regression analysis and/or experimental methods
- are able to formulate and implement a regression model for a particular policy question and a particular type of data
- are able to critically interpret results of applied statistics, in particular, regarding causal inference
- are able to critically read and assess published studies on policy evaluation
- are able to use the statistical software STATA for data Analysis

Content
The topics covered in the first part of the course are a revision of basic statistics and linear and logit regression analysis. The second part of the course focuses on causal inference and introduces methods such as panel data analysis, difference-in-difference methods, instrumental variable estimation, and randomized controlled trials mostly used for policy evaluation. The course shows how the various methods differ in terms of the required identifying assumptions to infer causality as well as the data needs. Students will apply the methods from the lectures by solving weekly assignments using statistical software and data sets provided by the instructors. These data sets will cover topics at the interface of policy, technology and society. Solving the assignments contributes to the final grade with a weight of 30%. Students are assisted in solving the assignments during the exercises session.

Autumn Semester 2016
I. Ethics & the Process of Ethical Inquiry

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

Integrity in Research & Research Misconduct
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 R's (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

851-0144-19L Philosophy of Time

Particularly suitable for students of D-BIOL, D-INFK, D-MATH, D-PHYS

W 3 credits 2V N. Sieroka

Abstract
This course provides an introduction to philosophical issues surrounding the concept of time. We will treat topics such as: the existence of past, present, and future; the possibility of time travel; the constitution of time consciousness and its possible neurophysiological counterparts; temporal biases in the conduct of our lives; responsibility to future and past generations.

Data: 06.09.2017 12:54 Autumn Semester 2016 Page 648 of 1570
Objective
By the end of the course students are able to describe and compare different theories and concepts of time (physical time, perceptual time, historical time ...). They are able to identify and examine issues concerning time as they occur in various philosophical subdisciplines - especially in philosophy of science, philosophy of mind, metaphysics, and ethics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific and social contexts.

Part of the course reflects on methods and contents from physics, neuroscience/cognitive science, and logic.

851-0101-53L Collections in Context: What Do Historians and Scientists Learn from Butterflies, Stones, and Bones?

Abstract
Zurich holds huge scientific collections. They contain objects from around the world, some of them dating back to the 18th century. This interdisciplinary seminar combines perspectives from the history of science and from current scientific disciplines. What do these objects tell us about Zurich's place in the global history of science? What potentials do old collections hold for scientists today?

Objective
The aim of this seminar is threefold: Firstly, students will become familiarised with historiographical approaches to scientific collections. Among them are constructivist approaches that seek to understand scientific knowledge not primarily as a system of objective truths, but rather as an outcome of human 'constructions'. Other approaches deal with the problem of how scientific objects are related to systems of power and oppression, namely in the case of objects collected during the time of european colonialism overseas. Secondly, students will become familiarized with how old collections can yeald new insights for current scientists working, e.g., on questions of ecology. Thirdly, the seminar shall serve as a plattform to discuss ways of dialogue and possible collaboration between these different approaches.

Students will be expected to read theoretical texts and case studies during semester, participate in discussions with external experts (historians, curators, and scientists), and to write a summarizing essay at the end of the term.

The lecture gives students of chemistry-related degree programs an overview of the options to protect inventions and the underlying research efforts. The lecture aims to put the participants in a position to use this know-how in the workplace.
Objective

Research and development play an important role in chemistry-related technology sectors such as inorganic and organic chemistry or pharmacy.

Investments in the development of new substances and active components in these sectors are traditionally secured by patents because publicly known inventions, generally chemical substances, may easily be reproduced by others.

In the last years, the know-how about intellectual property has become increasingly important for chemists and engineers. Both in the production process and in the distribution sector, chemists and engineers are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information. As more than three-quarters of all publicly available technical information are available only in patents, it is more and more important for researchers and engineers to be capable of extracting relevant information from the flood of patents.

Patents are not only a powerful measure to protect investments and inventions in chemistry-related sectors but also an important source of information about competitors and potential cooperation partners and about the development of markets. Accordingly, the know-how about patents and patent information has become a key qualification on the strategic level in companies and in the research sector.

The seminar is customised to the needs of chemists and students of related degree programs. Participants will become familiar with practice-oriented aspects of intellectual property and will be enabled to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups
- Special aspects of protecting inventions in chemistry-related sectors, e.g. polymorphs and inventions in the field of nanotechnology.

Case studies will illustrate and deepen the topics addressed during the lecture.

Prerequisites / notice

The lecture is coordinated in particular to the needs of the following degree programs: Agricultural science, biotechnology, chemical engineering, food science, pharmaceutical sciences.

For engineering and physics students, the lecture 'The Role of Intellectual Property in daily routine: A Practical Introduction' (851-0738-01) will be offered in the autumn semester.

851-0180-00L Research Ethics

Particularly suitable for students of D-BIOL, D-CHAB, D-HEST

W 2 credits 2G G. Achermann

Abstract

This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

Objective

The main goal of this course is to enhance the student’s ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.
I. Ethics & the Process of Ethical Inquiry

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?

The environmental sciences cover a wide range of scientific practices and objects and accordingly afford different kinds of scientific interpretations of quantum mechanics. Students are able to identify and examine issues concerning these different interpretations and issues concerning the transition between quantum and classical descriptions in physics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific contexts.

851-0144-20L Philosophical Aspects of Quantum Physics

Abstract
This course provides an introduction to philosophical issues surrounding quantum physics. In particular, we will examine different interpretations of quantum mechanics (such as the many-world interpretation) and the transition between the quantum and the classical physical realm (here phenomena such as decoherence will be highlighted).

Objective
By the end of the course students are able to describe and compare different interpretations of quantum mechanics. They are able to identify and examine issues concerning these different interpretations and issues concerning the transition between quantum and classical descriptions in physics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific contexts.

851-0125-58L Philosophy of the Environmental Sciences: An Introduction

Abstract
Environmental knowledge and management is quite common in different research fields and in everyday practice. We will be identifying those concepts, objects and methods that mainly construct what might be called the core of the environmental sciences. This will be done by using different philosophical tools and approaches.

Objective
The environmental sciences cover a wide range of scientific practices and objects and accordingly afford different kinds of scientific knowledge. Additionally, there is an important interplay between the scientific and the societal sphere. In this seminar we will examine likewise central and widespread concepts such as sustainable development or resilience by using philosophical tools that will allow to probe the different uses of those concepts, their semantic range in terms of historical depth and semantic fields and finally their logical coherence. Another important topic is the philosophical investigation of methods and objects that can be identified in the environmental sciences. Those methods are for instance Life Cycle Assessment or Adaptive Ecosystem Management, technological objects may be a wind engine or a hydropower plant. The latter raise questions of how renewable energies can be assessed and valued, including the more general issue of how values and norms can be embedded in technological objects. This leads us to the third and last complex of topics that focus on current deliberations about possible new ways of existence in the age of the Anthropocene and as a consequence the formation of adequate life styles in our societies. This refers to issues in philosophical and social anthropology and the challenge of climate change.

851-0125-51L Man and Machine

Abstract
The lecture gives an overview about the different Man-Machine-Relations since the 16th century. Different models of machines will be important here: the clockwork, the steam engine and the computer.

Objective
On the one hand models of machines had a heuristical value in research on man, e.g. in Harvey's discovery of blood circulation in the 17th century or in brain research in the 20th century. On the other hand these models were always criticised, sometimes polemically, because they are supposedly not adequate for man.

Students should learn about the connections between the history of anthropology and technology and be able at the end of the course to evaluate the critical philosophical arguments that are connected with the metaphor of the machine.

D-ERDW

851-0157-69L History of Astronomy

Abstract
The course is designed to provide an overview of the astronomical developments from the ancient Greek world to the 16th century. We are going to probe the primary sources tackling historical, technical and philosophical questions. Special attention will be paid to the dramatic change in the way people understood the structure of the heavens and the nature of the physical world.

Objective
The course aims at providing a working knowledge of astronomy and cosmology from the ancient world to the 16th century. Upon its completion the students will be able to describe how our knowledge of the heavens changed from Aristotle's system to the Copernican Revolution. In addition, they will also have acquired an appreciation of the debates about man's place in the cosmos and the philosophical principles underpinning cosmology.

701-0703-00L Environmental Ethics

Abstract
The lecture begins with an introduction to applied ethics in general. The main focus is on environmental ethics. Students learn to handle important concepts and positions of environmental ethics. They achieve a deeper understanding of these concepts and positions in applying them to ecological problems and discussing them in case studies.

Objective
On completion of this lecture course you will have acquired the ability to identify and process general and environmental ethical problems. You will be capable of recognising and analysing environmental ethical problems and of working towards a solution. You will have acquired a fundamental knowledge of standpoints and arguments to be found within the field of environmental ethics and will have practised these in small case studies.

Content
- Introduction to general and applied ethics.
- Overview and discussion of ethical theories relevant to the environment.
- Familiarisation with various basic standpoints within environmental ethics.
- Cross-section topics, such as sustainability, intergenerational justice, protection of species, etc.
- Practising of newly acquired knowledge in case studies (protection of species, climate change, etc.)
Lecture notes

Summaries of the individual sessions will be distributed, including the most important theories and keywords; reading list.

In the part of the course serving as an introduction to general and applied ethics, we shall be using the following textbook:

Literature

- Andrew Light/Holmes Rolston III, Environmental Ethics. An Anthology, 2003
- John O’Neill et al., Environmental Values, 2008
- Klaus Peter Rippe, Ethik im ausserhumanen Bereich, Paderborn (mentis) 2008

General introductions:

- Marcus Düwell et al. (Hrsg.), Handbuch Ethik, 2. Auflage, Stuttgart (Metzler Verlag), 2006

Prerequisites / notice

The procedure for accumulating CP will be explained at the start of term.

I expect participants to be motivated and contribute to discussions, keeping the course interesting and lively.

Science, Technology, and Policy MSc and MAS in Development and Cooperation have priority.

Abstract

This course introduces students to key statistical methods for analyzing social science data with a special emphasis on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical Software Stata.

Objective

Students

- have a sound understanding of linear and logit regression
- know strategies to test causal hypotheses using regression analysis and/or experimental methods
- are able to formulate and implement a regression model for a particular policy question and a particular type of data
- are able to critically interpret results of applied statistics, in particular, regarding causal inference
- are able to critically read and assess published studies on policy evaluation
- are able to use the statistical software STATA for data Analysis

Content

The topics covered in the first part of the course are a revision of basic statistics and linear and logit regression analysis. The second part of the course focuses on causal inference and introduces methods such as panel data analysis, difference-in-difference methods, instrumental variable estimation, and randomized controlled trials mostly used for policy evaluation. The course shows how the various methods differ in terms of the required identifying assumptions to infer causality as well as the data needs.

Students will apply the methods from the lectures by solving weekly assignments using statistical software and data sets provided by the instructors. These data sets will cover topics at the interface of policy, technology and society. Solving the assignments contributes to the final grade with a weight of 30%. Students are assisted in solving the assignments during the exercises session.

851-0125-51L Man and Machine W 3 credits 2G M. Hampe

Particularly suitable for students of D-CHAB, D-HEST, D-MAVT, D-MATL

Abstract

The lecture gives an overview about the different Man-Machine-Relations since the 16th century. Different models of machines will be important here: the clockwork, the steam engine and the computer.

Objective

On the one hand models of machines had a heuristic value in research on man, e.g. in Harvey's discovery of blood circulation in the 17th century or in brain research in the 20th century. On the other hand these models were always criticized, sometimes polemically, because they are supposedly not adequate for man.

Students should learn about the connections between the history of anthropology and technology and be able at the end of the course to evaluate the critical philosophical arguments that are connected with the metaphor of the machine.

851-0180-00L Research Ethics W 2 credits 2G G. Achermann

Particularly suitable for students of D-BIOL, D-CHAB, D-HEST

Abstract

This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

Objective

The main goal of this course is to enhance the student’s ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.
I. Ethics & the Process of Ethical Inquiry
---------------------------------------
Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)
----------------------------------------------------------
Integrity in Research & Research Misconduct
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 Rs (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks;
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access;
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

851-0551-03L  Postal Knowledge and the History of Digital Societies  W  3 credits  2S  D. F. Zetti  
Particularly suitable for students of D-ARCH, D-BAUG, D-NEST, D-INFK, D-ITET, D-MAVT

Abstract
In the second half of the 20th century, postal services have dramatically changed. Communication today is computerbased. The lecture offers problem oriented insights into this sociotechnical process of translation.

Objective
Students become familiar with the mutual interdependence of social and technological change that characterises the history of computing and communication.

Introduction to Health Economics and Policy

W  3 credits  2V  W. Mimra

Abstract

Health expenditures constitute about 10% of GDP in OECD countries. Extensive government intervention is a typical feature in health markets. Risk factors to health have been changing with growing importance of lifestyle factors such as smoking, obesity and lack of physical activity. This course gives an introduction to the economic concepts and empirical findings in health economics.

Objective

Introduce students without prior economics background to the main concepts of health economics and policy to enhance students understanding of how health care institutions and markets function.

Content

The course gives an introduction to the economic concepts and empirical findings in health economics to enhance students understanding of how health care institutions and markets function. First, the three important decisions made by individuals will be analyzed: What determines the health behaviors, like the intensity of preventive measures like sport, that an individual undertakes? What types and amount of personal health care services does an individual demand? How much health insurance coverage will be purchased?

In a second part, the major participants on the supply side of health care markets - physicians, hospitals, nurses and pharmaceutical manufacturers - will be discussed. E.g., how important are financial incentives in the choice of medicine as a career, specialty choice and practice location? What does it mean and imply that a physician is an agent for a patient? How do pharmaceutical firms decide on investments in new products and how can public policy encourage pharmaceutical innovation?

The choices made by societies about how health care services are financed and about the types of organizations that supply health care will be addressed in a third part. One important choice is whether a country will rely on public financing of personal health care services or encourage private health insurance markets. How could and should a public health insurance system be designed? What health care services should be included or excluded from a public system? Another important choice is whether a society relies on government provision of health care services, private provision by not-for-profit or for-profit organizations or some combination. The advantages and disadvantages of the alternatives will be discussed to provide a framework for analyzing specific types of health care systems.

Applied Statistics and Policy Evaluation

W  3 credits  3G  I. Günter, K. Hartgen

Abstract

This course introduces students to key statistical methods for analyzing social science data with a special emphasis on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical Software Stata.

Objective

- Students have a sound understanding of linear and logit regression
- know strategies to test causal hypotheses using regression analysis and/or experimental methods
- are able to formulate and implement a regression model for a particular policy question and a particular type of data
- are able to critically interpret results of applied statistics, in particular, regarding causal inference
- are able to critically read and assess published studies on policy evaluation
- are able to use the statistical software STATA for data Analysis

Content

The topics covered in the first part of the course are a revision of basic statistics and linear and logit regression analysis. The second part of the course focuses on causal inference and introduces methods such as panel data analysis, difference-in-difference methods, instrumental variable estimation, and randomized controlled trials mostly used for policy evaluation. The course shows how the various methods differ in terms of the required identifying assumptions to infer causality as well as the data needs.

Students will apply the methods from the lectures by solving weekly assignments using statistical software and data sets provided by the instructors. These data sets will cover topics at the interface of policy, technology and society. Solving the assignments contributes to the final grade with a weight of 30%. Human-Computer Interaction: Cognition and Usability

W  3 credits  2S  I. Barisic, C. Hölscher, S. Ognjanovic

Abstract

This seminar introduces theory and methods in human-computer interaction and usability. Cognitive Science provides a theoretical framework for designing user interfaces as well as a range of methods for assessing usability (user testing, cognitive walkthrough, GOMS). The seminar will provide an opportunity to experience some of the methods in applied group projects.

Objective

This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability. Presentations will cover basics of human-computer interaction and selected topics like mobile interaction, adaptive systems, human error and attention. A focus of the seminar will be on getting to know evaluation techniques in HCI. Students form work groups that first familiarize themselves with a selected usability evaluation method (e.g. user testing, GOMS, task analysis, heuristic evaluation, questionnaires or Cognitive Walkthrough). They will then apply the methods to a human-computer interaction setting (e.g. an existing software or hardware interface) and present the method as well as their procedure and results to the plenary. Active participation is vital for the success of the seminar, and students are expected to contribute to presentations of foundational themes, methods and results of their chosen group project. In order to obtain course credit a written essay / report will be required (details to be specified in the introductory session of the course).

851-0727-02L

E-Business-Law

W  2 credits  2V  D. Rosenthal

Abstract

The course deals with the basic legal framework for doing e-business as well as using information technology. It discusses a variety of legal concepts and rules to be taken into account in practice, be it when designing and planning new business models, be it when implementing online projects and undertaking information technology activities.

Objective

The objective is knowing and understanding key legal concepts relevant for doing e-business, in particularly understanding how e-business is regulated by law nationally and internationally, how contracts are concluded and performed electronically, which rules have to be observed in particular in the Internet with regard to third party and own content and client data, the concept of liability applied in e-business and the role of the law in the practical implementation and operation of e-business applications.
Vorgesehene Strukturierung der Vorlesung:

1) Welches Recht gilt im E-Business?
2) Gestaltung und Vermarktung von E-Business-Angeboten
3) Beziehung zu E-Business-Kunden
4) Verträge mit E-Business-Providern
5) Die Semesterprüfung

Weiterführende Materialien, Links und Literatur sind auf dem Termin- und Themenplan aufgeführt (zu gegebener Zeit abrufbar via Digital Sustainability in the Knowledge Society: M. M. Dapp

How do various interest groups influence the methods of production, distribution, and use of digital resources? Current models focusing on strong intellectual property rights are contrasted with open models like, e.g. Open Source/Content/Access. The course discusses consequences from different models and introduces «digital sustainability» as an alternative vision for society.

At the heart of the discourse is the handling of digital goods and intellectual property in society. Digitization and the Internet allow handling knowledge in a way, which directly contrasts with the traditional understanding of "intellectual property" and the industries based on it. Starting from economic and legal basics, we compare proprietary and open/free models. Sustainable development as a concept is transferred to digital goods, taking into account the particular nature of digital stuff.

After the lecture, you should (hopefully) be able to:
- characterize the nature of digital goods vs. physical goods
- critique the basic concepts of copyright and patent rights
- explain the political/legal and economic differences between proprietary and open approaches to the production and use of digital goods
- using an example, explain the meaning of digital sustainability and argue why it is relevant for a knowledge society
- transfer the ideas of the free/open source software model to other digital goods (e.g., open content, open access)

Technical reality: Within minutes you can make perfect copies of high-value digital goods of knowledge or culture (as text, audio, video, image or software) and distribute them around the globe -- for free. «Digitization plus Internet» allows for the first time in humankind's history the (theoretically) free access and global exchange of knowledge at minimal cost. A tremendous opportunity for societal development, in north and south. «Cool, so what's the problem?»

The problem is, that this reality poses a fundamental threat to today's business model of the knowledge and culture industries (starting from the music label and Hollywood, via publishers, up to software vendors). Powerful commercial interests are at stake as «knowledge» (the fourth factor of production) will become ever more important in the 21st century. Accordingly, «piracy» and «file-sharing» are attacked with all means. At the core lies the question about the design of property in digital assets. For that, we apply a concept of «intellectual property», which is several hundred years old and does not address digital reality in an adequate manner, sometimes leading to absurd situations. Its original goal seems to get forgotten: to help society develop by spreading knowledge as much as possible. A tremendous opportunity for societal development, in north and south. «Cool, so what's the problem?»

Using the PC becomes the new cultural technique of the 21st century. In contrast to «reading, writing and arithmetics», this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency extends to the provider of the infrastructure, who can dictate technical rules, which can take away or restrict the user's freedom. Even advanced users may have difficulties in recognizing these, often hidden, restrictions and in evaluating their societal relevance. But exactly these invisible consequences we need to understand and investigate, because they decide about access, distribution and usage of digital knowledge.

Comparative to the environmentalist movement of the 60s and 70s, a growing political movement for «Free Software» exists today, with «GNU/Linux» as its most popular symbol. The movement fights against treating software code as private property but as a cultural good available to all without private interests. Based on the success of the Free Software movement, new initiatives extend the concepts to other domains (e.g. scientific knowledge, music)... As a «teaser» to the lecture, you are invited to read the essay «ETH Zurich - A Pioneer in Digital Sustainability!». It can be downloaded from www.essays2030.ethz.ch.

More on teach.digisus.info starting from September. Stay tuned.

Lecture notes

Slides and other material (both usually in English) will be made available on a weekly basis as the lecture proceeds.
WebClass Introductory Course History of Technology is an introductory course to the history of technology. The students are challenged to discover how technological innovations take place within complex economical, political and cultural contexts. They get introduced into basic theories and practices of the field.

Particularly suitable for students of D-MATL, D-MAVT.

Number of participants limited to 70.

Content
This course introduces the basic functionalities and features of the mathematical software package MATLAB, such as the simple operations with matrices and vectors, differential equations, statistical tools, the graphical representation of data in various forms, and video animations of spatio-temporal data. With this knowledge, students are expected to implement themselves in MATLAB, models of various social processes and systems, including agent-based models, e.g. models of interactive decision making, group dynamics, human crowds, or game-theoretical models.

Part of this course will consist of supervised programming exercises in a computer pool. Credit points are finally earned for the implementation of a mathematical model from the sociological literature in MATLAB and the documentation in a seminar thesis.

Lecture notes
The lecture slides will be presented on the course web page after each lecture.

Literature

Further literature, in particular regarding computer models in the social sciences, will be provided in the course.

Prerequisites / notice
The number of participants is limited to the size of the available computer teaching room. The MATLAB code related to the seminar thesis should be well enough documented for further use by others and must be handed over to the Chair of Sociology, in particular of Modeling and Simulation, for further free and unrestricted use.

Philosophy of Time
W 3 credits
2V
N. Sieroka

Abstract
This course provides an introduction to philosophical issues surrounding the concept of time. We will treat topics such as: the existence of past, present and future; the possibility of time travel; the constitution of time consciousness and its possible neurophysiological counterparts; temporal biases in the conduct of our lives; responsibility to future and past generations.
Objective
By the end of the course students are able to describe and compare different theories and concepts of time (physical time, perceptual time, historical time ...). They are able to identify and examine issues concerning time as they occur in various philosophical subdisciplines - especially in philosophy of science, philosophy of mind, metaphysics, and ethics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific and social contexts.

Part of the course reflects on methods and contents from physics, neuroscience/cognitive science, and logic.

Abstract
This course studies philosophical issues concerning computers and computing. Topics include: information (and information content), computational complexity, the Turing Test for computer thought; the "Chinese Room" argument against the possibility of strong AI; connectionist AI; consciousness; the Church-Turing thesis; computational and hypercomputational models of mind; and free will.

Objective
- Exhibit a general understanding of the philosophy and history of computing.
- Explain central problems in the field and their potential solutions, independently and at a level requiring in-depth knowledge and critical understanding.
- Communicate clearly in writing about topics in this field.

Abstract
The course will start by presenting a modern logic, namely (propositional) modal logic, which has turned out to be extremely fruitful and to have numerous interesting applications in computer science, mathematics and philosophy. Subsequently, two of these applications to computer science, tense logic and dynamic logic, and one application to mathematics, provability logic, will be introduced.

Objective
- Learn the fundamental concepts of a range of propositional logics
- Learn how to construct proofs in these logics
- Study the interface between mathematical logic and computer science, and mathematical logic and mathematics

More on teach.digisus.info starting from September. Stay tuned.

**Lecture notes**

Slides and other material (both usually in English) will be made available on a weekly basis as the lecture proceeds.

**Literature**

Content of the following books is covered (PDFs freely available online):

Other recommended books are:
1. (general) Chris DiBona et al., Open Sources Voices from the Open Source Revolution, O'Reilly, 1999.

Prerequisites / notice

For administrative and didactic reasons (high level of interaction and credit group assignments on current hot topics), the number of participants is limited to 45.

Of course, any interested person is invited to attend the lecture without doing the group assignment. The website is actively used for the lecture.

**851-0125-41L Introduction Into Philosophy of Technology**

**Abstract**

Since antiquity philosophy reflects about and evaluates technology. The technical developments in the 19th and 20th century have led to a pro-technological philosophy of technology, which had become important also for other philosophical disciplines (e.g. in Heidegger's philosophy).

**Objective**

The course gives an overview on the main schools in the philosophy of technology. Students should learn to analyse and evaluate different philosophies of technology (compensation, objectification, externalisation). For credit point a critical protokoll is to be written.

**851-0727-02L E-Business-Law**

**Abstract**

The course deals with the basic legal framework for doing e-business as well as using information technology. It discusses a variety of legal concepts and rules to be taken into account in practice, be it when designing and planning new media business models, be it when implementing online projects and undertaking information technology activities.

**Objective**

The objective is knowing and understanding key legal concepts relevant for doing e-business, in particular understanding how e-business is regulated by law nationally and internationally, how contracts are concluded and performed electronically, which rules have to be obeyed in particular in the Internet with regard to third party and own content and client data, the concept of liability applied in e-business and the role of the law in the practical implementation and operation of e-business applications.

**Content**

Vorgesehene Strukturierung der Vorlesung:

1) Welches Recht gilt im E-Business? Internationale Aspekte Regulierte Branchen
2) Gestaltung und Vermarktung von E-Business-Angeboten Verwendung fremder und Schutz der eigenen Inhalte Haftung im E-Business (und wie sie beschränkt werden kann) Domain-Namen
3) Beziehung zu E-Business-Kunden Verträge im E-Business, Konsumentenschutz Elektronische Signaturen Datenschutz Spam

**Lecture notes**

Es wird mit Folien gearbeitet, die als PDF über die elektronische Dokumentenablage (ILIAS) auf dem System der ETHZ vorgängig abrufbar sind. Auf dem Termin- und Themenplan (ebenso online abrufbar) sind Links zu Gesetzestexten und weiteren Unterlagen abrufbar. Schliesslich wird jede Vorlesung auch als Podcast aufgezeichnet, der jedoch nur für die Studierenden mit einem Passwort (erhältlich beim Dozenten) zugänglich sind.

WebClass Introductory Course History of Technology

**Prerequisites / notice**
Die Semesterrprüfung ist in Form eines schriftlichen Kurztests (normalerweise MC) in voraussichtlich der letzten Doppelstunde geplant. Es wird angegeben, welche Unterlagen beim jeweiligen Thema den Prüfungsstoff definieren. Der Test wird möglicherweise elektronisch durchgeführt.

Ferner bietet Ursula Widmer eine Vorlesung zum Thema Informationssicherheit an, welche die rechtlichen Aspekte der Sicherheit von ICT-Infrastrukturen und Netzen und der transportierten und verarbeiteten Informationen.

**Abstract**
This seminar introduces theory and methods in human-computer interaction and usability. Cognitive Science provides a theoretical framework for designing user interfaces as well as a range of methods for assessing usability (user testing, GOMS, task analysis, heuristic evaluation, questionnaires or Cognitive Walkthrough). The seminar will provide an opportunity to experience some of the methods in applied group projects.

**Objective**
This seminar will introduce key topics, theories and methodology in human-computer interaction (HCI) and usability. Presentations will cover basics of human-computer interaction and selected topics like mobile interaction, adaptive systems, human error and attention. A focus of the seminar will be on getting to know evaluation techniques in HCI. Students form work groups that first familiarize themselves with a select usability evaluation method (e.g. user testing, GOMS, task analysis, heuristic evaluation, questionnaires or Cognitive Walkthrough). They then apply the methods to a human-computer interaction setting (e.g. an existing software or a hardware interface) and present the method as well as their procedure and results to the plenary. Active participation is vital for the success of the seminar, and students are expected to contribute to presentations of foundational themes, methods and results of their chosen group project. In order to obtain course credit a written essay / report will be required (details to be specified in the introductory session of the course).

**851-0549-00L Human-Computer Interaction: Cognition and Usability**

**Prerequisites / notice**
Particularly suitable for students of D-ARCH, D-INFK, D-ITET

**Number of participants limited to 30.**

**851-0585-04L Lecture with Computer Exercises: Modelling and Simulating Social Systems with MATLAB**

**Prerequisites / notice**
The number of participants is limited to the size of the available computer teaching room. The MATLAB code related to the seminar thesis should be well enough documented for further use by others and must be handed over to the Chair of Sociology, in particular of Modeling and Simulation, for further free and unrestricted use.

**Number of participants limited to 70.**

**Content**
This course introduces first the basic functionalities and features of the mathematical software package MATLAB, such as the simple operations with matrices and vectors, differential equations, statistical tools, the graphical representation of data in various forms, and video animations of spatio-temporal data. With this knowledge, students are expected to implement themselves in MATLAB, models of various social processes and systems, including agent-based models, e.g. models of interactive decision making, group dynamics, human crowds, or game-theoretical models.

Part of this course will consist of supervised programming exercises in a computer pool. Credit points are finally earned for the implementation of a mathematical model from the sociological literature in MATLAB and the documentation in a seminar thesis.

**851-0735-10L Business Law**

**Prerequisites / notice**
The students shall obtain a basic knowledge about business law. They shall be able to recognize and evaluate issues in the area of business law and suggest possible solutions.
A comprehensive script will be made available online on the moodle platform.

**International Environmental Politics**

**Objective**
- The students shall obtain the following competence:
  - They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
  - They shall be acquainted with corporate functions as contracting, negotiation, claims management and dispute resolution.
  - They shall be familiar with the issues of corporate compliance, i.e. the system to ascertain that all legal and ethical rules are observed.
  - They shall be able to contribute to the legal management of the company and to discuss legal issues.
  - They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

**Lecture notes**
A comprehensive script will be made available online on the moodle platform.

**Objective**
- The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.

**Content**
This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

**Lecture notes**
Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link ‘Registered students, please click here for course materials’ at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike Hudecheck <michaehu@student.ethz.ch>). All assigned papers must be read ahead of the respective meeting. Following the course on the basis of on-line slides and papers alone is not sufficient. Physical presence in the classroom is essential. Many books and journals covering international environmental policy issues can be found at the D-GESS library at the IFW building, Haldeneggsteig 4, B-floor, or in the library of D-USYS.

**Literature**

**Prerequisites**
None

**Objective**
- The Role of Intellectual Property in Daily Routine: A practical introduction

**Practical Introduction**
- Particularly suitable for students of D-MAVT, D-ITET

**Abstract**
The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

**Objective**
In recent years, knowledge about intellectual property has become increasingly important for engineers. Both in production and distribution and in research and development, engineers are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint students with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

**Topics covered during the lecture will include:**
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

**Case studies will illustrate and deepen the topics addressed during the lecture.**

**Prerequisites**
None

**Objective**
- Introduction to Cognitive Science

**Number of participants limited to 70.**

**Abstract**
The lectures provide an overview of the foundations of cognitive science and investigate processes of human cognition, especially perception, learning, memory and reasoning. This includes a comparison of cognitive processes in humans and technical systems, especially with respect to knowledge acquisition, knowledge representation and usage in information processing tasks.

**Objective**
Cognitive Science views human cognition as information processing and provides an inter-disciplinary integration of approaches from cognitive psychology, informatics (e.g., artificial intelligence), neuroscience and anthropology among others. The lectures provide an overview of basic mechanisms of human information processing and various application domains. A focus will be on matters of knowledge acquisition, representation and usage in humans and machines. Models of human perception, reasoning, memory and learning are presented and students will learn about experimental methods of investigating and understanding human cognitive processes and representation structures.

**Prerequisites**
None
Literature about technology transposes models, products and procedures of scientific progress into the logic of poetry. This literature

In the second half of the 20th century, postal services have dramatically changed. Communication today is computer-based. The lecture

Philosophy of Time

The course provides an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights). This knowledge is imparted based on current rulings and cases.

Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thieft).

851-0585-15L Complexity and Global Systems Science

Prerequisites: solid mathematical skills

Particularly suitable for students of D-ITET, D-MAVT

Abstract

This course discusses complex techno-economic systems, their counter-intuitive behaviors, and how their theoretical understanding empowers us to solve some long-standing problems that are currently bothering the world.

Objective

Participants should learn to get an overview of the state of the art in the field, to present it in a well understandable way to an interdisciplinary scientific audience, to develop models for open problems, to analyze them, and to defend their results in response to critical questions. In essence, participants should improve their scientific skills and learn to think scientifically about complex dynamical systems.

Content

This course starts with a discussion of the typical and often counter-intuitive features of complex dynamical systems such as self-organization, emergence, (sudden) phase transitions at "tipping points", multi-stability, systemic instability, deterministic chaos, and turbulence. It then discusses phenomena in networked systems such as feedback, side and cascade effects, and the problem of radical uncertainty. The course progresses by demonstrating the relevance of these properties for understanding societal and, at times, global-scale problems such as traffic jams, crowd disasters, breakdowns of cooperation, crime, conflict, social unrests, political revolutions, bubbles and crashes in financial markets, epidemic spreading, and/or "tragedies of the commons" such as environmental exploitation, overfishing, or climate change. Based on this understanding, the course points to possible ways of mitigating techno-socio-economic-environmental problems, and what data science may contribute to their solution.

Prerequisites / notice

Mathematical skills can be helpful

851-0306-05L Literature and Technology - Simulations, Prototypes, Machines

Particularly suitable for students of D-ITET, D-MAVT, D-MATL

Abstract

Literature about technology transposes models, products and procedures of scientific progress into the logic of poetry. This literature converts not only technology into fiction, but it also creates new cultural and social contextualisations, which reveal alternative readings of configurations of knowledge.

Objective

Students are familiar with different relations between literature and technology. They can verbalise and analyse central contents.

Content

851-0551-03L Postal Knowledge and the History of Digital Societies

Particularly suitable for students of D-ARCH, D-BAUG, D-HEST, D-INFK, D-ITET, D-MAVT

Abstract

In the second half of the 20th century, postal services have dramatically changed. Communication today is computer-based. The lecture offers problem oriented insights into this sociotechnical process of translation.

Objective

Students become familiar with the mutual interdependence of social and technological change that characterises the history of computing and communication.

Content

D-MATH

Number Title Type ECTS Hours Lecturers

851-0144-19L Philosophy of Time

Particularly suitable for students of D-BIOL, D-INFK, D-MATH, D-PHYS

W 3 credits 2V N. Sieroka

Abstract

This course provides an introduction to philosophical issues surrounding the concept of time. We will treat topics such as: the existence of past, present, and future; the possibility of time travel; the constitution of time consciousness and its possible neurophysiological counterparts; temporal biases in the conduct of our lives; responsibility to future and past generations.

Objective

By the end of the course students are able to describe and compare different theories and concepts of time (physical time, perceptual time, historical time ...). They are able to identify and examine issues concerning time as they occur in various philosophical disciplines - especially in philosophy of science, philosophy of mind, metaphysics, and ethics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific and social contexts.

Part of the course reflects on methods and contents from physics, neuroscience/cognitive science, and logic.

851-0157-69L History of Astronomy

Particularly suitable for students of D-ERDW, D-MATH, D-PHYS

Die Veranstaltung ist ausgebucht

W 3 credits 2S S. Mastorakou

Abstract

The course is designed to provide an overview of the astronomical developments from the ancient Greek world to the 16th century. We are going to use primary sources tackling historical, technical and philosophical questions. Special attention will be paid to the dramatic change in the way people understood the structure of the heavens and the nature of the physical world.

Objective

The course aims at providing a working knowledge of astronomy and cosmology from the ancient world to the 16th century. Upon its completion the students will be able to describe how our knowledge of the heavens changed from Aristotle’s system to the Copernican Revolution. In addition, they will also have acquired an appreciation of the debates about man’s place in the cosmos and the philosophical principles underpinning cosmology.

851-0125-63L Images of Mathematics

Particularly suitable for students of D-MATH

W 3 credits 2G M. Hampe, A. Schubbach

Data: 06.09.2017 12:54
Autumn Semester 2016
Page 662 of 1570
The lecture series "Images of Mathematics" deals with the formalization of the objects and the logical language of mathematics from Hilbert to Gödel and considers its consequences in view of our conception of mathematical practice and knowledge, the limits of calculability and computability in mathematics, and the relation between the logical proof procedures and the involved intuitive aspects.

The lecture series will present philosophical problems of theoretical mathematics in the 20th century and will discuss the consequences of formalization and axiomatization. It aims at a critical reflection on the modern images of mathematics. How we understand Mathematics is probably strongly influenced by the Mathematics lessons we participated in during our school days. The common image of mathematics is therefore often characterized by the impression of a very stable form of knowledge with clear-cut problems and suitable recipes for finding the solution. It is a very static image which is very much in conflict with the rapid series of innovations that the discipline has experienced especially since the 19th century: Mathematics as a field of research has been highly innovative and even revolutionary as few other scientific disciplines in the last 200 hundred years. These mathematical innovations did not only contribute to a progress amassing more and more knowledge. They very often changed how mathematicians conceived of their discipline. Even a contribution to a specific research question that appears at first sight to be minor can sometimes establish new connections to other fields, found a whole research field of its own or introduce new methods thereby changing the whole image of mathematics in the same way that a small addition to a picture can alter radically what we take it to represent.

Yet, the deeper mathematics dug into its foundations, the more radical the problems became. Finally, the optimistic Hilbert program of laying the foundation of mathematics within mathematics and of proving its own consistency as well as its completeness contributed to clarifying of the foundation of mathematics primarily insofar as it was doomed to failure. Gödel proved his famous incompleteness theorems and thereby dismissed at the same time the formalist attempt to reduce mathematical truth to logical provability. His work resulted in detailed insights in the precariousness of the foundation of mathematics and further numerous of productive consequences within mathematics.

Moreover, Gödel’s theorems open many far-reaching and intriguing questions in view of our image of mathematics, questions concerning the conception of mathematical practice and knowledge, the limits of calculability and mathematics and the possible role of computability and machines in mathematics, the relation between the logical proof procedures and the involved intuitive aspects. In short, the image of mathematics is not as static as we sometimes expect it to be, it was radically redrawn by the mathematicians of the 20th century and has since then again been open to diverging interpretations.

Introduction to Game Theory. Models and Experimental Studies

Abstract
This course introduces the foundations of game theory. It focuses on models of social interaction, conflict and cooperation, the emergence of cooperation and concepts of strategic decision-making behaviour. Examples, applications and the contrast between theory and empirical results are particularly emphasized.

Objective
Learn the fundamentals, models, and logic of thinking about game theory.

Apply game theory models to strategic interaction situations and critically assess game theory's capabilities through a wide array of experimental results.

Content
The Spieltheorie introduces the fundamental ideas and concepts of game theory. The Hobbachi's question about the conditions for social order, the relationship between order and social norms, and the emergence of cooperation and strategies, are the central themes.

Lecture notes

Prerequisites / notice
Um Missverständnisse zu vermeiden: Die Vorlesung ist für Hörerinnen und Hörer aller Departemente geeignet. (Nicht nur für D-MATL, D-MAVT)

Digital Sustainability in the Knowledge Society

Abstract
How do various interest groups influence the methods of production, distribution, and use of digital resources? Current models focusing on strong intellectual property rights are contrasted with open models like, e.g. Open Source/Content/Access. The course discusses consequences from different models and introduces "digital sustainability" as an alternative vision for society.

At the heart of the discourse is the handling of digital goods and intellectual property in society. Digitization and the Internet allow handling knowledge in a way, which directly contrasts with the traditional understanding of "intellectual property" and the industries based on it. Starting from economic and legal basics, we compare proprietary and open/*free* models. Sustainable development as a concept is transferred to digital goods, taking into account the particular nature of digital stuff.

After the lecture, you should (hopefully) be able to
- characterize the nature of digital goods vs. physical goods
- critique the basic concepts of copyright and patent rights
- explain the political/legal and economic differences between proprietary and open approaches to the production and use of digital goods
- using an example, explain the meaning of digital sustainability and argue why it is relevant for a knowledge society.
- transfer the ideas of the free/open source software model to other digital goods (e.g., open content, open access)
Content

Technical reality: Within minutes you can make perfect copies of high-value digital goods of knowledge or culture (as text, audio, video, image or software) and distribute them around the globe -- for free. «Digitization plus Internet» allows for the first time in humankind's history the (theoretically) free access and global exchange of knowledge at minimal cost. A tremendous opportunity for societal development, in north and south. «Cool, so what's the problem?»

The problem is, that this reality poses a fundamental threat to today's business model of the knowledge and culture industries (starting from the music label and Hollywood, via publishers, up to software vendors). Powerful commercial interests are at stake as «knowledge» (the fourth factor of production) will become ever more important in the 21st century. Accordingly, «piracy» and «file-sharing» are attacked with all means. At the core lies the question about the design of property in digital assets. For that, we apply a concept of «intellectual property», which is a several hundred years old and does not address digital reality in an adequate manner, sometimes leading to absurd situations. Its original goal seems to get forgotten: to help society develop by spreading knowledge as much as possible.

Using the PC becomes the new cultural technique of the 21st century. In contrast to «reading, writing and arithmetics», this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency extends to the provider of the infrastructure, who can define technical rules, which can take away or restrict the user's freedom. Even advanced users may have difficulties in recognizing these, often hidden, restrictions and in evaluating their societal relevance. But exactly these invisible consequences we need to understand and investigate, because they decide about access, distribution and usage of digital knowledge. Comparable to the environmentalist movement of the 60s and 70s, a growing political movement for «Free Software» exists today, with GNU/Linux as its most popular symbol. The movement fights against treating software code as private property but as a central cultural good available to all without private interests. Based on the success of the Free Software movement, new initiatives extend the concepts to other domains (e.g. scientific knowledge, music)... As a «lessee» to the lecture, you are invited to read the essay «ETH Zurich - A Pioneer in Digital Sustainability». It can be downloaded from www.essays2020.ethz.ch.

More on teach.digisus.info starting from September. Stay tuned.

Lecture notes

Slides and other material (both usually in English) will be made available on a weekly basis as the lecture proceeds.

Prerequisites / notice

For administrative and didactic reasons (high level of interaction and credit group assignments on current hot topics), the number of participants is limited to 45.

Of course, any interested person is invited to attend the lecture without doing the group assignment. The website is actively used for the lecture.

851-0703-00L

Introduction to Law

Students who have attended or will attend the lecture "Introduction to Law for Civil Engineering and Architecture" or "Introduction to Law" (851-0708-00), cannot register for this course unit.

Particularly suitable for students of D-MAVT, D-MATL

Abstract

This class introduces into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered.

Objective

Students are able to identify basic structures of the legal system. They understand selected topics of public and private law and are able to apply the fundamentals in more advanced law classes.

Content

Basic concepts of law, sources of law.

Private law: Contract law (particularly contract for work and services), tort law, property law.

Public law: Human rights, administrative law, procurement law, procedural law.

Insights into the law of the EU and into criminal law.

Lecture notes

Jaap Hage, Bram Akkermans (Eds.), Introduction to Law, Cham 2014 (Online Resource ETH Library)

Further documents will be available online (see https://moodle-appl2.let.ethz.ch/course/view.php?id=2170).

851-0306-05L

Literature and Technology - Simulations, Prototypes, Machines

Particularly suitable for students of D-ITET, D-MAVT, D-MATL

Abstract

Literature about technology transposes models, products and procedures of scientific progress into the logic of poetry. This literature converts not only technology into fiction, but it also creates new cultural and social contextualisations, which reveal alternative readings of configurations of knowledge.

Objective

Students are familiar with different relations between literature and technology. They can verbalise and analyse central contentions.

Content

Im Seminar lesen wir unter anderem Texte von E.T.A. Hoffmann, Franz Kafka, Georg Kaiser und Max Frisch.

851-0738-00L

Intellectual Property: Introduction

Particularly suitable for students of D-ITET, D-MAVT, D-MATL

Abstract

The course provides an introduction to Swiss and European intellectual property law (trademarks, copyright, patent and design rights). Aspects of competition law are treated insofar as they are relevant for the protection of intellectual creations and source designations. The legal principles are developed based on current cases.

Objective

The aim of this course is to enable students at ETH Zurich to recognize which rights may protect their creations, and which rights may be infringed as a result of their activities. Students should learn to assess the risks and opportunities of intellectual property rights in the development and marketing of new products. To put them in this position, they need to know the prerequisites and scope of protection afforded by the various intellectual property rights as well as the practical difficulties involved in the enforcement of intellectual property rights. This knowledge is imparted based on current rulings and cases.

Another goal is to enable the students to participate in the current debate over the goals and desirability of protecting intellectual creations, particularly in the areas of copyright (keywords: fair use, Creative Commons, Copyleft) and patent law (software patents, patent trolls, patent thickets).

851-0125-51L

Man and Machine

Particularly suitable for students of D-CHAB, D-HEST, D-MAVT, D-MATL

Abstract

The lecture gives an overview about the different Man-Machine-Relations since the 16th century. Different models of machines will be important here: the clockwork, the steam engine and the computer.

**Objective**

- On the one hand models of machines had a heuristic value in research on man, e.g. in Harvey's discovery of blood circulation in the 17th century or in brain research in the 20th century. On the other hand these models were always criticised, sometimes polemically, because they are supposedly not adequate for man.
- Students should learn about the connections between the history of anthropology and technology and be able at the end of the course to evaluate the critical philosophical arguments that are connected with the metaphor of the machine.

- By the end of the semester, participants should have a solid knowledge of the history and theoretical foundations of International Relations since the end of the Second World War.

- The aim of the course is to provide participants with an overview of international security politics with a special focus on dual-use technologies. Students will analyze the character of dual-use security risks and of risk-based security strategies and instruments. Thematic areas include the nuclear non-proliferation regime, biological and chemical weapons conventions, missile proliferation, the nuclear programs of Iran and North Korea, cyber and space technologies, as well as robotics and nanotechnology.

- The lecture begins with an introduction to applied ethics in general. The main focus is on environmental ethics. Students learn to handle important concepts and positions of environmental ethics. They achieve a deeper understanding of these concepts and positions in applying them to ecological problems and discussing them in case studies.

- On completion of this lecture course you will have acquired the ability to identify and process general and environmental ethical problems.

- On the course serving as an introduction to general and applied ethics, students will be introduced to various basic standpoints within environmental ethics.

- On the procedure for accumulating CP will be explained at the start of term.

- Environmental history becomes a central dimension of understanding the past, in particular the modern age and the history of the 20th century. The lecture will focus on prominent topics such as the industrial revolution, the rise of modern nationalisms, and the war of 1914-1918, as well as the global economic system and the development of the welfare state.

- The reading list will be distributed at the beginning of the semester via the online platform Moodle.

- The lecture begins with an introduction to current research on environmental history, focusing on the period from the 19th century to the present day.

- Students are asked to write an exam during the second last session (11.12.2015).

- Students should be motivated and contribute to discussions, keeping the course interesting and lively.

- The lecture is being supported by a website on Moodle. If you have any questions, please contact Lukas Meyer, lukas.meyer@sipg.gess.ethz.ch.

- The lecture notes are provided on OLAT.

- The lecture series provides students with an overview of the development of international relations since the end of World War II. The first part of the series deals with the development of and changes in Cold War security policy structures. The second part deals with the period after the transformation of 1989/91; the focus here is on current issues in international security policy.

- The lecture will cover various aspects of environmental ethics, including the role of ethics in decision-making, the ethical implications of technology, and the role of science in society.

- The lecture will cover various aspects of environmental ethics, including the role of ethics in decision-making, the ethical implications of technology, and the role of science in society.

- The procedure for accumulating CP will be explained at the start of term.

- The course material is provided on OLAT.

- The lecture will cover various aspects of environmental ethics, including the role of ethics in decision-making, the ethical implications of technology, and the role of science in society.

- The lecture will cover various aspects of environmental ethics, including the role of ethics in decision-making, the ethical implications of technology, and the role of science in society.

- The procedure for accumulating CP will be explained at the start of term.
Within minutes you can make perfect copies of high-value digital goods of knowledge or culture (as text, audio, video).

At the heart of the discourse is the handling of digital goods and intellectual property in society. Digitization and the Internet allow handling knowledge in a way, which directly contrasts with the traditional understanding of “intellectual property” and the industries based on it. Starting from economic and legal basics, we compare proprietary and open/*free* models. Sustainable development as a concept is transferred to digital goods, taking into account the particular nature of digital stuff. After the lecture, you should (hopefully) be able to:

- characterize the nature of digital goods vs. physical goods
- critique the basic concepts of copyright and patent rights
- explain the political/legal and economic differences between proprietary and open approaches to the production and use of digital goods
- using an example, explain the meaning of digital sustainability and argue why it is relevant for a knowledge society
- transfer the ideas of the free/open source software model to other digital goods (e.g., open content, open access)

The problem is, that this reality poses a fundamental threat to today's business model of the knowledge and culture industries (starting from the music label and Hollywood, via publishers, up to software vendors). Powerful commercial interests are at stake as «knowledge» (the fourth factor of production) will become ever more important in the 21st century. Accordingly, «piracy» and «file-sharing» are attacked with all means. At the core lies the question about the design of property in digital assets. For that, we apply a concept of «intellectual property», which is several hundred years old and does not address digital reality in an adequate manner, sometimes leading to absurd situations. Its original goal seems to get forgotten: to help society develop by spreading knowledge as much as possible. Using the PC becomes the new cultural technique of the 21st century. In contrast to «reading, writing and arithmetic», this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency extends to the provider of the infrastructure, who can define technical rules, which can take away or restrict the user's freedom. Even advanced users may have difficulties in recognizing these, often hidden, restrictions and in evaluating their societal relevance. But exactly these invisible consequences we need to understand and investigate, because they decide about access, distribution and usage of digital knowledge.

Comparable to the environmentalist movement of the 60s and 70s, a growing political movement for «Free Software» exists today, with «GNU/Linux» as its most popular symbol. The movement fights against treating software code as private property but as a central cultural good available to all without private interests. Based on the success of the Free Software movement, new initiatives extend the concepts to other domains (e.g. scientific knowledge, music)...

Good available to all without private interests. Based on the success of the Free Software movement, new initiatives extend the concepts to other domains (e.g. scientific knowledge, music).

Comparable to the environmentalist movement of the 60s and 70s, a growing political movement for «Free Software» exists today, with «GNU/Linux» as its most popular symbol. The movement fights against treating software code as private property but as a central cultural good available to all without private interests. Based on the success of the Free Software movement, new initiatives extend the concepts to other domains (e.g. scientific knowledge, music).

As a «teaser» to the lecture, you are invited to read the essay «ETH Zurich - A Pioneer in Digital Sustainability!». It can be downloaded from www.essays2030.ethz.ch.

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 667 of 1570
Further literature, in particular regarding computer models in the social sciences, will be provided in the course.

The number of participants is limited to the size of the available computer teaching room. The MATLAB code related to the seminar thesis should be well enough documented for further use by others and must be handed over to the Chair of Sociology, in particular of Modeling and Simulation, for further use and unrestricted use.

851-0125-58L Philosophy of the Environmental Sciences: An Introduction

Particularly suitable for students of D-ARCH, D-BSSE, D-CHAB, D-MTEC, D-LYSYS

Abstract

Environmental knowledge and management is quite common in different research fields and in everyday practice. We will be identifying those concepts, objects and methods that mainly construe what might be called the core of the environmental sciences. This will be done by using different philosophical tools and approaches.

Objective

The environmental sciences cover a wide range of scientific practices and objects and accordingly afford different kinds of scientific knowledge. Additionally, there is an important interplay between the scientific and the societal sphere. In this seminar we will examine likewise central and widespread concepts such as sustainable development or resilience by using philosophical tools that will allow to probe the different uses of those concepts, their semantic range in terms of historical depth and semantic fields and finally their logical coherence. Another important topic is the philosophical investigation of methods and objects that can be identified in the environmental sciences. Those methods are for instance Life Cycle Assessment or Adaptive Ecosystem Management, technological objects may be a wind engine or a hydropower plant. The latter raise questions of how renewable energies can be assessed and valuated, including the more general issue of how values and norms can be embedded in technological objects. This leads us to the third and last complex of topics that focus on current deliberations about possible new ways of existence in the age of the Anthropocene and as a consequence the formation of adequate life styles in our societies. This refers to issues in philosophical and social anthropology and the challenge of climate change.

363-1050-00L Conference of Disarmament: Simulation of Negotiations

Abstract

The Global Studies Institute (University of Geneva) is organizing a seminar simulation on nuclear disarmament in collaboration with the Chair of Negotiation and Conflict Management (ETH), experts from the United Nations Institute for Disarmament Research and the Geneva Center for Security Policy.

Objective

Students will have the possibility to participate in simulated diplomatic negotiations and to analyse and assess the negotiation logic behind the situations. They should gain insight in the basic information on disarmament issues and on the functioning of the Conference on Disarmament as well as on negotiation techniques in general.

Content

The simulation project is intended for Master's or Doctoral students of the Global Studies Institute (GSI) of the University of Geneva, of the ETH and for interested students of the Geneva Centre for Security Policy (GCSP). The simulation will be in French and English and is conducted by Prof. Calmy-Rey, former President of Switzerland.

In the lectures, students will be provided with basic information on disarmament issues and on the functioning of the Conference on Disarmament as well as on negotiation techniques in general. Students will take the role of negotiators in the simulation (including the heads of the delegations), of keeper of the minutes or of observers and analysts.

Students will co-develop their mandates for the negotiation and be assisted by experts that are specialized in international negotiations as well as in the topic of disarmament. The negotiation tables will be chaired by former diplomats. Representatives of diplomatic missions in Geneva will play the role of the "Capitals" to which the heads of delegations will have to give account of the ongoing negotiations.

More details on the program, timetable, reading lists and performance assessment will be published here: https://chamilo.unige.ch/home/courses/M165/?id_session=0

The simulation will take place on the 26 and 27 November 2015 at the University of Geneva.

Languages: English and French

Dates/Time/Location (GE = University of Geneva)

22 Sept. | ETH HG D 22 | 10:15-12:00 | Introduction
29 Sept. | GE Uni Mail Salle 1170 | 10:15-12:00 | Introduction to Negotiation Techniques (Dr. Vitalijs Butenko and Dr. Sibylle Zürcher, ETH)
6 Oct. | ETH HG D 16.2 | 10:15-12:00 | Distribution of the roles, composition of the negotiation tables, preparation of mandates for the HA (humanitarian approach)
13 Oct. | ETH HG D 22 | 10:15-12:00 | Preparation of the mandates for the FMCT (Fissile Material Cut-off Treaty)
20 Oct. | GE Uni Mail Salle 1170 | 10:15-12:00 | No session; Students deepen and summarize their mandates on one page (A4)
27 Oct. | GE Uni Mail Salle 1170 | 10:15-12:00 | Discussion of the Mandates I (FMCT)
10 Nov. | GE Uni Mail Salle 1170 | 10:15-12:00 | Discussion of the Mandates II (HA)
17 Nov. | GE Uni Mail Salle 1170 | 10:15-12:00 | Preparation Meeting
26 & 27 Nov. | GE Salles 407 et 408 | 10:00-18:00 | Simulation at Uni Dufour
1 Dec. | GE Uni Mail Salle 1170 | 10:15-12:00 | Discussion of the results

Note: The participation in the simulation on 26. and 27. November in Geneva is necessary. The two hours lectures on the 22. September, 6. and 13. October have to be attended in Zürich via conference call (ETH HG D 16.2). The other lectures during the semester can be attended via Skype.

To get the 3 ECTS, students have to participate at the 2 days simulation in Geneva, attend the 3 mandatory lecture parts via conference call and write a report of 5 pages at the end of the course.

(The technical note for registration: At this stage all registered students are on the waiting list)

463-0565-00L Principles of Macroeconomics

This course examines the behaviour of macroeconomic variables, such as gross domestic product, unemployment and inflation rates. It tries to answer questions like: How can we explain fluctuations of national economic activity? What can economic policy do against unemployment and inflation? What significance do international economic relations have for Switzerland?

This lecture will introduce the fundamentals of macroeconomic theory and explain their relevance to every-day economic problems.
This course helps you understand the world in which you live. There are many questions about the macroeconomy that might spark your curiosity. Why are living standards so meagre in many African countries? Why do some countries have high rates of inflation while others have stable prices? Why have some European countries adopted a common currency? These are just a few of the questions that this course will help you answer.

Furthermore, this course will give you a better understanding of the potential and limits of economic policy. As a voter, you help choose the policies that guide the allocation of society's resources. When deciding which policies to support, you may find yourself asking various questions about economics. What are the burdens associated with alternative forms of taxation? What are the effects of free trade with other countries? What is the best way to protect the environment? How does the government budget deficit affect the economy? These and similar questions are always on the minds of policy makers.

We advise you to also buy access to Aplia. This internet platform will support you in learning for this course. To save money, you should buy the book together with Aplia. This is sold as a bundle (ISBN: 9781473715998).

Besides this textbook, the slides and lecture notes will cover the content of the lecture and the exam questions.

Lecture with Computer Exercises: Modelling and Simulating Social Systems with MATLAB

Number of participants limited to 70.

This course introduces first the basic functionalities and features of the mathematical software package MATLAB, such as the simple operations with matrices and vectors, differential equations, statistical tools, the graphical representation of data in various forms, and video animations of spatio-temporal data. With this knowledge, students are expected to implement themselves in MATLAB, models of various social processes and systems, including agent-based models, e.g. models of interactive decision making, group dynamics, human crowds, and game-theoretical models.

Part of this course will consist of supervised programming exercises in a computer pool. Credit points are finally earned for the implementation of a mathematical model from the sociological literature in MATLAB and the documentation in a seminar thesis.

The number of participants is limited to the size of the available computer teaching room. The MATLAB code related to the seminar thesis should be well enough documented for further use by others and must be handed over to the Chair of Sociology, in particular of Modeling and Simulation, for further free and unrestricted use.

851-0738-01L The Role of Intellectual Property in Daily Routine: A Practical Introduction

Particularly suitable for students of D-BAUG, D-ITET, D-MAFT

Abstract

The lecture gives an overview of the fundamental aspects of intellectual property, which plays an important role in the daily routine of engineers. The lecture aims to make participants aware of the various methods of protection and to put them in a position to use this knowledge in the workplace.

851-0549-00L WebClass Introductory Course History of Technology

Number of participants limited to 100.

WebClass Introductory Course History of Technology is an introductory course to the history of technology. The students are challenged to discover how technological innovations take place within complex economical, political and cultural contexts. They get introduced into basic theories and practices of the field.

Prerequisites / notice

Um Missverständnisse zu vermeiden: Die Vorlesung ist für Hörerinnen und Hörer aller Departemente geeignet. (Nicht nur für D-MATL, D-MAVT)

Literature

Die folgenden Einführungen unterscheiden sich nach Anwendungen und Grad der Formalisierung. Zur Einführung kann man sich eines der folgenden Bücher ansehen, die ab Januar im Handapparat der D-GESS-Bibliothek stehen werden:

Hafetz, Aviad, Game Theory: Interactive Strategies in Economics and Management. Cambridge, UK: Cambridge University Press

Weitere Literatur und Übungsaufgaben zum Download unter:

http://www.socio.ethz.ch/publications/spieltheorie

Further literature, in particular regarding computer models in the social sciences, will be provided in the course.

851-0585-04L Lecture with Computer Exercises: Modelling and Simulating Social Systems with MATLAB

Number of participants limited to 70.

WebClass Introductory Course History of Technology is an introductory course to the history of technology. The students are challenged to discover how technological innovations take place within complex economical, political and cultural contexts. They get introduced into basic theories and practices of the field.

Lecture notes

Further literature, in particular regarding computer models in the social sciences, will be provided in the course.

851-0549-00L WebClass Introductory Course History of Technology

Number of participants limited to 100.

Abschluss: Verspätete Anmeldungen können nicht berücksichtigt werden.

Further literature, in particular regarding computer models in the social sciences, will be provided in the course.
In recent years, knowledge about intellectual property has become increasingly important for engineers. Both in production and distribution and in research and development, engineers are increasingly being confronted with questions concerning the patenting of technical inventions and the use of patent information.

The lecture will acquaint students with practical aspects of intellectual property and enable them to use the acquired knowledge in their future professional life.

Topics covered during the lecture will include:
- The importance of innovation in industrialised countries
- An overview of the different forms of intellectual property
- The protection of technical inventions and how to safeguard their commercialisation
- Patents as a source of technical and business information
- Practical aspects of intellectual property in day-to-day research, at the workplace and for the formation of start-ups.

Case studies will illustrate and deepen the topics addressed during the lecture.

Prerequisites / notice

The lecture is in particular tailored to the needs of the following degree programs: Agricultural science, architecture, civil engineering, computational science and engineering, computer science, electrical engineering and information technology, environmental engineering, geomatic engineering and planning, interdisciplinary sciences, materials science, mathematics, mechanical engineering, physics.

For students of chemistry-related degree programs, the lecture 'Protecting inventions in chemistry' (851-0738-03) will be offered in the autumn semester.

851-0591-00L Digital Sustainability in the Knowledge Society W 2 credits 2V M. M. Dapp

Particularly suitable for students of D-INFK, D-ITET, D-MATL, D-MAVT, D-MTEC, D-USYS.

Abstract

How do various interest groups influence the methods of production, distribution, and use of digital resources? Current models focusing on strong intellectual property rights are contrasted with open models like, e.g. Open Source/Content/Access. The course discusses consequences from different models and introduces «digital sustainability» as an alternative vision for society.

Objective

At the heart of the discourse is the handling of digital goods and intellectual property in society. Digitization and the Internet allow handling knowledge in a way, which directly contrasts with the traditional understanding of "intellectual property" and the industries based on it. Starting from economic and legal basics, we compare proprietary and open/free models. Sustainable development as a concept is transferred to digital goods, taking into account the particular nature of digital stuff.

After the lecture, you should (hopefully) be able to
- characterize the nature of digital goods vs. physical goods
- critique the basic concepts of copyright and patent rights
- explain the legal/economic differences between proprietary and open approaches to the production and use of digital goods
- transfer the concepts of the free/open source software model to other digital goods (e.g., open content, open access)

Content

Technical reality: Within minutes you can make perfect copies of high-value digital goods of knowledge or culture (as text, audio, video, image or software) and distribute them around the globe -- for free. «Digitization plus Internet» allows for the first time in human kind's history the (theoretically) free access and global exchange of knowledge at minimal cost. A tremendous opportunity for societal development, in north and south. «Cool, so what's the problem?»

The problem is, that this reality poses a fundamental threat to today's business model of the knowledge and culture industries (starting from the music label and Hollywood, via publishers, up to software vendors). Powerful commercial interests are at stake as «knowledge» (the fourth factor of production) will become ever more important in the 21st century. Accordingly, «piracy» and «file-sharing» are attacked with all means. At the core lies the question about the design of property in digital assets. For that, we apply a concept of «intellectual property», which is several hundred years old and does not address digital reality in an adequate manner, sometimes leading to absurd situations. Its original goal seems to get forgotten: to help society develop by spreading knowledge as much as possible.

Using the PC becomes the new cultural technique of the 21st century. In contrast to «reading, writing and arithmetic», this new cultural technique cannot exist in isolation, but depends on a hard- and software infrastructure. This dependency extends to the provider of the infrastructure, who can define technical rules, which can take away or restrict the user's freedom. Even advanced users may have difficulties in recognizing these, often hidden, restrictions and in evaluating their societal relevance. But exactly these invisible consequences we need to understand and investigate, because they decide about access, distribution and usage of digital knowledge.

Comparable to the environmentalist movement of the 60s and 70s, a growing political movement for «Free Software» exists today, with «GNU/Linux» as its most popular symbol. The movement fights against treating software code as private property but as a central cultural good available to all without private interests. Based on the success of the Free Software movement, new initiatives extend the concepts to other digital goods (e.g., open content, open access).

- transfer the ideas of the free/open source software model to other digital goods (e.g., open content, open access)
- explain the political/legal and economic differences between proprietary and open approaches to the production and use of digital goods
- using an example, explain the meaning of digital sustainability and argue why it is relevant for a knowledge society
- transfer the ideas of the free/open source software model to other digital goods (e.g., open content, open access)

After the lecture, you should (hopefully) be able to
- characterize the nature of digital goods vs. physical goods
- critique the basic concepts of copyright and patent rights
- explain the legal/economic differences between proprietary and open approaches to the production and use of digital goods
- transfer the concepts of the free/open source software model to other digital goods (e.g., open content, open access)

Lecture notes

Slides and other material (both usually in English) will be made available on a weekly basis as the lecture proceeds.

Literature

Content of the following books is covered (PDFs freely available online):

Prerequisites / notice

For administrative and didactic reasons (high level of interaction and credit group assignments on current hot topics), the number of participants is limited to 45.

Of course, any interested person is invited to attend the lecture without doing the group assignment. The website is actively used for the participants is limited to 45.

851-0703-00L Introduction to Law W 2 credits 2V O. Streiff Gnöpf

Students who have attended or will attend the lecture "Introduction to Law for Civil Engineering and Architecture" or "Introduction to Law" (851-0708-00), cannot register for this course unit.

Particularly suitable for students of D-MAVT, D-MATL

Abstract

This class introduces students into basic features of the legal system. Fundamental issues of constitutional law, administrative law, private law and the law of the EU are covered.

**701-0791-00L**

**Environmental History - Introduction and Overview**

**W 2 credits**

**2V**

**D. Speich Chassé**

**Number of participants limited to 100.**

**Abstract**
Our society faces a serious ecological crisis. Of what historical dimension is this crisis? How have human societies already in earlier times changed their environment, and, consequently, perhaps also ours? What were the main ecological challenges for societies and how did they change over time? And how did societies adapt to changing environmental conditions?

**Objective**
Introduction into environmental history; survey of long-term development of human-nature-interrelations; discussion of selected problems. Improved ability to assess current problems from a historical perspective and to critically interrogate one’s own standpoint.

**Lecture notes**
Course material is provided on OLAT.

**Literature**
- Uekötter, Frank (Ed.) 2010. The turning points of environmental history, Pittsburgh: University of Pittsburgh Press.
- Johann S. Ach et. al (Hrg.), Grundkurs Ethik 1. Grundlagen, Paderborn (mentis) 2008

- Andrew Light/Holmes Rolston III, Environmental Ethics. An Anthology, 2003

**Prerequisites / notice**
Students are asked to write an exam during the second last session (11.12.2015).

---

**701-0985-00L**

**Social Intercourse with Current Environmental Risks**

**W 1 credit**

**1V**

**B. Nowack, C. M. Som-Koller**

**Abstract**
The lecture treats the social intercourse with risks of technical systems. The notion of risk and the perception of risk are discussed by case studies (e.g. nanotechnology) and socio-political instruments for decision-making are presented. Methods are presented that can be applied to deal with environmental risks and how they can be used for sustainable innovation.

**Objective**
- Getting acquainted to the extended risk concept
- Evaluation of the risks caused by technology within the societal context
- Knowledge about the mode science and society handle current environmental risks (examples gene- and nanotechnology)
- Knowledge about handling risks (e.g. precautionary principle, protection goal, damage definition, ethics)
- Knowledge about possibilities for sustainable innovation
- Risks and technical systems (risk categories, risk perception, risk management)
- Illustration with case studies (nanotechnology)
- Implementation (politics, science, media, etc.)
- Decision making (technology assessment, cost/benefit analysis etc.)
- The role of the media
- Prospects for future developments

**Lecture notes**
Copies of slides and selected documents will be distributed.

**Prerequisites / notice**
The lecture is held biweekly (for 2 hours). The dates are 26.9., 3.10. (out of schedule), 24.10, 7.11, 21.11, 5.12, 19.12

---

**853-0725-00L**

**History Part One: Europe (The Cradle of Modernity, Britain ca. 1789-1939)**

**W 3 credits**

**2V**

**H. Fischer-Tiné**

**Abstract**
Using the concrete example of Britain, the "cradle of modernity", this lecture offers a survey and analysis of the crucial historical transformations that engendered "modernity" in Europe from the late 18th to the mid 20th centuries.

**Objective**
At the end of this lecture course, students can: (a) highlight the most important changes in the "long nineteenth century" in Europe (b) explain their long-term effects; and (c) relate these changes to global developments.

**Content**
The thematic foci include: the economic and social consequences of the industrial revolution, the genesis of political ideologies and social movements, shifts in gender roles, colonialism and imperialism, as well as the emergence of consumerism and a "leisure society."

**Lecture notes**
Power Point Slides and sources will be made available at POLYBOX in the course of the semester.

**Literature**
Mandatory and further reading will be listed on course plan that is made available before the first session.

---

**851-0735-10L**

**Business Law**

**W 2 credits**

**2V**

**P. Peyrot**

**Abstract**
The students shall obtain a basic knowledge about business law. They shall be able to recognize and evaluate issues in the area of business law and suggest possible solutions.

**Objective**
The students shall obtain the following competence:
- They shall obtain a working knowledge on the legal aspects involved in setting up and managing an enterprise.
- They shall be acquainted with corporate functions as contracting, negotiation, claims management and dispute resolution.
- They shall be familiar with the issues of corporate compliance, i.e. the system to ascertain that all legal and ethical rules are observed.
- They shall be able to contribute to the legal management of the company and to discuss legal issues.
- They shall have an understanding of the law as a part of the corporate strategy and as a valuable resource of the company.

**Lecture notes**
A comprehensive script will be made available online on the moodle platform.

---

**853-0060-00L**

**Current Issues in Security Policy**

**W 3 credits**

**2V**

**A. Wenger, O. Thranert**

**Abstract**
This course provides an overview of the security implications of so-called "dual-use" technologies, i.e. technologies that can be used for both peaceful and military aims. The course will also cover various policies - in particular arms control - that are discussed and applied by the international community in dealing with such dual-use technologies.

**Objective**
Participants should gain a solid understanding of security challenges stemming from the use and control of dual-use technologies. In addition, the students should become aware of how researchers can deal with sensitive knowledge regarding research transparency and control.
Content

The aim of the course is to provide participants with an overview of international security politics with a special focus on dual-use technologies. Students will analyze the character of dual-use security risks and of risk-based security strategies and instruments. thematic areas include the nuclear non-proliferation regime, biological and chemical weapons conventions, missile proliferation, the nuclear programs of Iran and North Korea, cyber and space technologies, as well as robotics and nanotechnology.

Lecture notes

Participants are expected to study the compulsory texts provided at the beginning of the semester via the online platform Moodle.

Prerequisites / notice

An online learning platform serves as a supplement to the course.

**Objective**
The environmental sciences cover a wide range of scientific practices and objects and accordingly afford different kinds of scientific knowledge. Additionally, there is an important interplay between the scientific and the societal sphere. In this seminar we will examine likewise central and widespread concepts such as sustainable development or resilience by using philosophical tools that will allow to provoke different uses of those concepts, their semantic range in terms of historicity and/or anamnesic fields and finally their logical coherence. Another important topic is the philosophical investigation of methods and objects that can be identified in the environmental sciences. Those methods are for instance Life Cycle Assessment or Adaptive Ecosystem Management, technological objects may be a wind engine or a hydropower plant. The latter raise questions of how renewable energies can be assessed and valued, including the more general issue, that such cooperation and the respective public policies are effective and/or efficient. Particular suitable for students of D-ARCH, D-BBSE, D-CHAB, D-MTEC, D-USYS

**Abstract**
Environmental knowledge and management is quite common in different research fields and in everyday practice. We will be identifying those concepts, objects and methods that mainly construe what might be called the core of the environmental sciences. This will be done by using different philosophical tools and approaches. The environmental sciences cover a wide range of scientific practices and objects and accordingly afford different kinds of scientific knowledge. Additionally, there is an important interplay between the scientific and the societal sphere. In this seminar we will examine likewise central and widespread concepts such as sustainable development or resilience by using philosophical tools that will allow to provoke different uses of those concepts, their semantic range in terms of historicity and/or anamnesic fields and finally their logical coherence. Another important topic is the philosophical investigation of methods and objects that can be identified in the environmental sciences. Those methods are for instance Life Cycle Assessment or Adaptive Ecosystem Management, technological objects may be a wind engine or a hydropower plant. The latter raise questions of how renewable energies can be assessed and valued, including the more general issue, that such cooperation and the respective public policies are effective and/or efficient.

**Lectures**
Slides and other material (both usually in English) will be made available on a weekly basis as the lecture proceeds.

**Literature**
Content of the following books is covered (PDFs freely available online):

**Prerequisites / notice**
For administrative and didactic reasons (high level of interaction and credit group assignments on current hot topics), the number of participants is limited to 45. Of course, any interested person is invited to attend the lecture without doing the group assignment. The website is actively used for the participants is limited to 45. Of course, any interested person is invited to attend the lecture without doing the group assignment. The website is actively used for the participants and Simulation, for further free and unrestricted use.

**Data:** 06.09.2017 12:54
**Autumn Semester 2016**

**Page:** 675 of 1570
This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Lecture notes
Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

Assigning reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link 'Registered students, please click here for course materials' at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike.Hudecheck@student.ethz.ch). All assigned papers must be read ahead of the respective meeting. Following the course on the basis of on-line slides and papers alone is not sufficient. Physical presence in the classroom is essential. Many books and journals covering international environmental policy issues can be found at the D-GESS library at the IFW building, Haldeneggsteig 4, B-floor, or in the library of D-USYS.

Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link 'Registered students, please click here for course materials' at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike.Hudecheck@student.ethz.ch).

Abstract
This workshop is to equip students with legal skills and methods to solve or treat problems and questions of the environmental law and foster the understanding on the possibilities and limits of legal problem-solving. The students choose an inquiry with practical relevance. To this end they work out the legal basis demonstrating a legal correct solution or approach to a solution. In doing so, students will get to know legal methods and research possibilities.

Objective
The aim of this workshop is to equip students with legal skills and methods to solve or treat problems and questions of the environmental law and foster the understanding on the possibilities and limits of legal problem-solving. The students choose an inquiry with practical relevance. To this end they work out the legal basis demonstrating a legal correct solution or approach to a solution. In doing so, students will get to know legal methods and research possibilities.

Content
At the beginning of the workshop the students are introduced to the legal methods and sources as well as in the aim and the process of the workshop. The workshops will organize themselves in a team of two persons giving themselves an inquiry on topics of the environmental law. It is also possible to choose questions at the interfaces of e.g. zoning law, energy law, transport law. A proposal, which will be presented to the lecturer, as well as an optional Q&A-session in class will facilitate the start. Next the working on topics will follow by self-study. The results will be presented in form of a memo/paper with a maximum of ten pages (excluding graphs and tables). At the end of the workshop, a presentation of ten minutes will be made to the plenum including a question-and-answer session. Class language will be German.

Lecture notes
Den Studierenden werden Unterlagen zur juristischen Methoden- und Quellenlehre sowie zum Inhalt und Ablauf des Kurses zu Beginn der Veranstaltung kostenlos abgegeben.

Literature
Rechtgrundlagen, Literatur und Gerichtsentscheide werden themenspezifisch selber rechechieriert, unter Mithilfe und Beratung des Dozenten.

Prerequisites / notice
Die Veranstaltung erfordert die Bereitschaft, sich aktiv und selbständig mit einer selbstgewählten Fragestellung oder einem eigenen Fallbeispiel aus dem Gebiet des Umweltrechts und allenfalls aus Schnittstellengebieten auseinanderzusetzen. Damit die Interaktivität und die Begleitung der Teams gewährleistet werden kann, ist die Teilnehmerzahl auf maximal 16 Personen beschränkt. Es handelt sich um eine Vertiefungsveranstaltung. Der Besuch der Vorlesung "Umweltrecht: Konzepte und Rechtsgebiete" (851-0705-01) ist Voraussetzung.

Abstract
Fundamental concepts of Land Register Law and Land Surveying Law (substantive and procedural rules of Land Register Law, the parts and the relevance of the Land Register, process of registration with the Land Register, legal problems of land surveying, reform of the official land surveying).

Objective
Overview of the legal norms of land registry and surveying law.
collections. They contain objects from around the world, some of them dating back to the 18th century. This interdisciplinary seminar combines perspectives from the history of science and from current scientific disciplines. What do these objects tell us about Zurich’s place in the global history of science? What potentials do old collections hold for scientists today?

Objective
The aim of this seminar is threefold: Firstly, students will become familiarised with historiographical approaches to scientific collections. Among them are constructivist approaches that seek to understand scientific knowledge not primarily as a system of objective truths, but rather as an outcome of human 'constructions'. Other approaches deal with the problem of how scientific objects are related to systems of power and oppression, namely in the case of objects collected during the time of European colonialism overseas. Secondly, students will become familiarized with how old collections can yield new insights for current scientists working, e.g., on questions of ecology. Thirdly, the seminar shall serve as a platform to discuss ways of dialogue and possible collaboration between these different approaches.

Students will be expected to read theoretical texts and case studies during semester, participate in discussions with external experts (historians, curators, and scientists), and to write a summarizing essay at the end of the term.

Prerequisites / notice
Requirements: Property Law (12-722)

851-0735-11L Environmental Regulation: Law and Policy W 3 credits 1S B. Schär, M. Greeff

The course will be offered again in the spring semester 2017.

Number of participants limited to 15.

Abstract
The aim of this course is to equip students with a legal and regulatory skill-set that allows them to translate their technical knowledge into a policy brief directed at legally trained regulators. More generally, it aims to inform students with a technical scientific background about the legal and political context of environmental policy. The focus of the course will be on international and European issues and regulatory frameworks - where relevant, the position of Switzerland within these international networks will also be discussed.

Objective
The aim of this course is to make students with a technical scientific background aware of the legal and political context of environmental policy in order to place technical solutions in their regulatory context.

Content
Topics covered in lectures:

1. Environmental Regulation
   a. Perspectives
   b. Regulatory Challenges of Environment Problems
   c. Regulatory Tools
2. Law: International, European and national laws
   a. International law
   b. European law
   c. National law
3. Policy: Case studies

Assessment:
(i) Class participation (25%): Students will be expected to contribute to class discussions and prepare short memos on class readings.
(ii) Exam (75%) consisting of three parts:
   a. Policy brief - a maximum of 2 pages (including graphs and tables);
   b. Background document to the policy brief - this document sets out a more detailed and academic overview of the topic (maximum 8 pages including graphs and tables);
   c. Presentation of the policy brief: presentations can use a maximum of 5 slides and can last 7 minutes.

Lecture notes
The course is taught as a small interactive seminar and significant participation is expected from the students. Participation will be capped at 15 in order to maintain the interactive nature of the classes. All classes, readings, and assignments, are in English.

Teaching will take place over two weeks in September and October. The exam date will be in December.

During the second week of the teaching period, students will have individual 30-minute meetings with the lecturer to discuss their project. An electronic copy of relevant readings will be provided to the students at no cost before the start of the lectures.

No specific pre-existing legal knowledge is required, however all students must have successfully completed Grundzüge des Rechts (851-0708-00 V) or an equivalent course.

The course is (inter)related to materials discussed in Politikwissenschaft: Grundlagen (851-0577-00 V), Ressourcen- und Umweltökonomie (751-1551-00 V), Umweltrecht: Konzepte und Rechtsgebiete (851-0705-01 V), Rechtlicher Umgang mit natürlichen Ressourcen (701-0743-01 V), Environmental Governance (701-1651-00 G), Policy and Economics of Ecosystem Services (701-1653-00 G), International Environmental Politics: Part I (851-0594-00 V).

701-0727-00L Politics of Environmental Problem Solving in Developing Countries W 2 credits 2G U. Scheidegger

Abstract
The course focuses on processes and drivers of decision-making on natural resources management issues in developing countries. It gives insights into the relevance of ecological aspects in developing countries. It covers concepts, instruments, processes and actors in environmental politics at the example of specific environmental challenges of global importance.
After completion of the module, students will be able to:
- Identify and appraise ecological aspects in development cooperation, development policies and developing countries' realities
- Analyze the forces, components and processes, which influence the design, the implementation and the outcome of ecological measures
- Characterize concepts, instruments and drivers of environmental politics and understand, how policies are shaped, both at national level and in multilateral negotiations
- Study changes (improvements) in environmental politics over time as the result of the interaction of processes and actors, including international development organizations
- Analyze politics and design approaches to influence them, looking among others at governance, social organization, legal issues and institutions

Key issues and basic concepts related to environmental politics are introduced. Then the course predominantly builds on case studies, providing information on the context, specifying problems and potentials, describing processes, illustrating the change management, discussing experiences and outcomes, successes and failures. The analysis of the cases elucidates factors for success and pitfalls in terms of processes, key elements and intervention strategies.

Different cases not only deal with different environmental problems, but also focus on different levels and degrees of formality. This range from local interventions with resource user groups as key stakeholders, to country level policies, to multi- and international initiatives and conventions. Linkages and interaction of the different system levels are highlighted. Special emphasis is given to natural resources management.

The cases address the following issues:
- Land use and soil fertility enhancement: From degradation to sustainable use
- Common property resource management (forest and pasture): Collective action and property rights, community-based management
- Ecosystem health (integrated pest management, soil and water conservation)
- Payment for environmental services: Successes in natural resources management
- Climate change and agriculture: Adaptation and mitigation possibilities
- Biodiversity Convention: Implications for conservations and access to genetic resources
- Biodiversity as a means for more secure livelihoods: Agroforestry and intercropping
- The Millennium Development Goals: Interactions between poverty and the environment
- Poverty and natural resources management: Poverty reduction strategies, the view of the poor themselves
- Food security: Policies, causes for insecurity, the role of land grabbing
- Biofuels and food security: Did politics misfire?
- Strategy development at global level: IAASTD and World Development Report 2008

Information concerning the case studies and specific issues illustrated therein will be provided during the course (uploaded on Moodle)

- Strategy development at global level: IAASTD and World Development Report 2008

This course teaches the possibilities and limits of the law in order to protect natural resources and landscapes against harm and nuisance. The lecture begins with an introduction to applied ethics in general. The main focus is on environmental ethics. Students learn to handle important concepts and positions of environmental ethics. They achieve a deeper understanding of these concepts and positions in terms of their application to ecological problems and discussing them in case studies.

After completion of the module, students will be able to:
- Recognize and analyze ecological problems in order to develop strategies for their solution
- Understand the complexity of the legal situation and its influence on the design and implementation of ecological measures
- Apply the knowledge gained to ecological problems and discuss them in case studies

The learning concept is based on the coordinated implementation of the relevant legislations. The complexity of the legal situation will be discussed by analysing virtual and real law cases focused on spatial projects and planning.

The students know the opportunities and restrictions which are given by the law when using natural resources. They have insights into the important concepts and positions of environmental ethics. They achieve a deeper understanding of these concepts and positions in terms of processes, key elements and intervention strategies.

The cases address the following issues:
- Land use and soil fertility enhancement: From degradation to sustainable use
- Common property resource management (forest and pasture): Collective action and property rights, community-based management

### Content
- Introduction to general and applied ethics.
- Overview and discussion of ethical theories relevant to the environment.
- Familiarisation with various basic standpoints within environmental ethics.
- Cross-section topics, such as sustainability, intergenerational justice, protection of species, etc.
- Practising of newly acquired knowledge in case studies (protection of species, climate change, etc.).

### Lecture notes
Summaries of the individual sessions will be distributed, including the most important theories and keywords; reading list.

In the part of the course serving as an introduction to general and applied ethics, we shall be using the following textbook: Barbara Bleisch/Markus Huppenbauer: Ethische Entscheidungsfundierung. Ein Handbuch für die Praxis, 2nd Edition Zürich 2014

### Literature
- Andrew Light/Holmes Rolston III, Environmental Ethics. An Anthology, 2003

- Johann S. Ach et al. (Hrsg.), Grundkurs Ethik 1. Grundlagen, Paderborn (mentis) 2008

### Prerequisites / notice
The procedure for accumulating CP will be explained at the start of term. I expect participants to be motivated and contribute to discussions, keeping the course interesting and lively.

### 701-0731-00L Environmental Behavior in Social Context

**W** 2 credits 2S  H. Bruderer Enzler

<table>
<thead>
<tr>
<th>Abstract</th>
<th>This introductory class in the environmental social sciences covers topics such as environmental behavior, environmental concern, social dilemmas and social norms.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Objective</td>
<td>Basic knowledge of the environmental social sciences</td>
</tr>
<tr>
<td>Content</td>
<td>Overview on current fields of research and their relevance for practical application</td>
</tr>
</tbody>
</table>

| Lecture notes | |

### 701-0747-00L Environmental Policy of Switzerland I

W 3 credits 2V  E. Lieberherr

<table>
<thead>
<tr>
<th>Abstract</th>
<th>This course presents the basics of policy analysis and the specific characteristics of Swiss environmental policy. Policy instruments, actors and processes are addressed both theoretically as well as by means of current Swiss environmental policy examples.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Objective</td>
<td>Based on acquiring basic knowledge about policy analysis, this course teaches students how to analytically address current and concrete questions of environmental policy. Through exercises the students learn about political science concepts and frameworks as well as real-life political decision-making processes. The well-grounded examination of complex political conflict situations is an important precondition for the entry into the (environmental policy) workforce or a future research career.</td>
</tr>
<tr>
<td>Content</td>
<td>The processes of change, overuse or destruction of the natural environment through humans have historically placed high demands on social and political institutions. In the interplay between the environment, society and economy, the environmental policy field encompasses the sum of public measures that have the goal to eliminate, reduce or avoid environmental degradation. The course systematically presents the basics of environmental policy instruments, actors, programs and processes as well as their change over time. A key aspect is the distinction between politics and political science and specifically environmental policy.</td>
</tr>
</tbody>
</table>

| Lecture notes | Instead of lecture notes different texts on policy analysis and Swiss environmental policy are made available to the students. |

### 701-0791-00L Environmental History - Introduction and Overview

W 2 credits 2V  D. Speich Chassé

<table>
<thead>
<tr>
<th>Abstract</th>
<th>Our society faces a serious ecological crisis. Of what historical dimension is this crisis? How have human societies already in earlier times changed their environment, and, consequently, perhaps also ours? What were the main ecological challenges for societies and how did they change over time? And how did societies adapt to changing environmental conditions?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Objective</td>
<td>Introduction into environmental history; survey of long-term development of human-nature-interrelations; discussion of selected problems. Improved ability to assess current problems from a historical perspective and to critically interrogate one's own standpoint.</td>
</tr>
</tbody>
</table>

| Lecture notes | Course material is provided on OLAT. |

### 701-0985-00L Social Intercourse with Current Environmental Risks

W 1 credit 1V  B. Nowack, C. M. Som-Koller

<table>
<thead>
<tr>
<th>Abstract</th>
<th>The lecture treats the social intercourse with risks of technical systems. The notion of risk and the perception of risk are discussed by case studies (e.g. nanotechnology) and socio-political instruments for decision-making are presented. Methods are presented that can be applied to deal with environmental risks and how they can be used for sustainable innovation.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Objective</td>
<td>- Getting acquainted to the extended risk concept</td>
</tr>
<tr>
<td>- Evaluation of the risks caused by technology within the societal context</td>
<td></td>
</tr>
<tr>
<td>- Knowledge about handling risks (e.g. precautionary principle, protection goal, damage definition, ethics)</td>
<td></td>
</tr>
<tr>
<td>- Knowledge about possibilities for sustainable innovation</td>
<td></td>
</tr>
</tbody>
</table>
The course will help students to improve their French, whilst developing greater discrimination in reading. It will also offer them the opportunity to increase their awareness of different literary genres and contemporary cultural issues.

The topics covered in the first part of the course are a revision of basic statistics and linear and logit regression analysis. The second part of the course focuses on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical Software Stata.

The course introduces students to key statistical methods for analyzing social science data with a special emphasis on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical Software Stata.

This course is intended for students who have reached level B2. Participants will train their skills so that they may perform simple and complex tasks in both oral and written communication.

This course introduces students to key statistical methods for analyzing social science data with a special emphasis on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical Software Stata.

The topics covered in the first part of the course are a revision of basic statistics and linear and logit regression analysis. The second part of the course focuses on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical Software Stata.
### Abstract
Bachelor and master students at C1-C2 level. The course enhances students appreciation and understanding of literature in English. Through the analysis and interpretation of literary texts, students improve their analytical and English language skills; their grammar skills through writing; and their range of vocabulary through reading, discussions, and writing.

### Objective
- Introduce students to a variety of literary texts in English
- Help students to develop critical, creative, and personal approaches to analyzing literary texts and by extension become more astute readers in general
- Provide students with an opportunity to enhance and practice their argumentation skills in discussions and in writing
- Improve the way in which students organize their ideas and arguments in a sustained, coherent, and logical manner
- Improve students grammatical and lexical repertoire through reading and discussion
- Impart a life-long interest in literature written in English

### Content
A variety of texts, including classical and modern poetry, short stories, and one short novel, are analyzed. Classwork is interactive, with pair, small group, and plenary discussions. Writing tasks are designed to help students produce coherent and well-structured texts. Lexical work helps students to increase their range of vocabulary and allow them to apply freshly acquired vocabulary in speaking and writing.

### Lecture notes
No script

### Literature
Materials: Texts are available online (Moodle) and as handouts.

### Prerequisites / notice
- Attend regularly throughout the semester
- Participate actively in discussions, group work, and pair work
- Do at least 3 hours' work a week outside the classroom, including reading and writing
- Complete written assignments during the semester

NB: This is Part I of a two-part course. Part 2 runs in the spring semester. Each part can be taken on its own. However, a separate enrolment is required for each part.

### Important note:
The course is only open to students who register on-line via the Sprachenzentrum website during the registration period (review the SZ website) and who receive on-line confirmation that they have been accepted on this course.

### 851-0832-11L Advanced English for Academic Purposes (C1-C2)  W  2 credits  2U  R. Taylor

- Your course registration is only valid with a simultaneous online registration at the language center ([www.sprachenzentrum.uzh.ch](http://www.sprachenzentrum.uzh.ch)).

### Abstract
This course is designed for Bachelor and Master students from all disciplines, who wish to improve their English from C1 towards C2 level and train their language skills at Mastery level. Selected Academic English features are included to add value to the course to meet standard entrance requirements by leading universities and colleges worldwide.

### Objective
Participants should already have reached a level of C1 (advanced), as defined in the Council of Europe Global Scale. The course is also open to participants whose level is above C1.

### Content
The course aims to train and develop linguistic skills at Mastery level, with a focus on formal and informal lexis, on listening and oral communication skills, increasing fluency, accuracy and complexity of spoken language; writing well-structured descriptive texts and argumentative essays, with the aim to fulfill the language requirements for study at an English speaking university or follow University Masters Courses held in English.

### Lecture notes
No script. Handouts will be delivered weekly and published on Moodle.

### Literature
Participants will be expected to make a contribution of CHF 5.00 at the beginning of the course to cover the costs of photocopying.

### Prerequisites / notice
- Attend regularly throughout the semester;
- Take part actively in class discussions, group work and pair work;
- do at least 2 hours' work per week outside class, including reading and writing;
- Use the electronic tools provided;
- Complete a portfolio report of four key tasks, aiming to practice the skills focussed on during the semester.

A language certificate from the Language Center is issued on successful completion of the course; Bachelor and Master students of the ETH will receive D-Gess credits and a mark, awarded electronically at the end of the semester. Details will follow at the beginning of the semester.

The course is only open to students who register on-line via the Sprachenzentrum website (in February 2015, please review the SZ webpage) and who receive on-line confirmation that they have been accepted on this course.

### 851-0886-00L New Zealand Through Literature and Film (C1-C2)  m  W  3 credits  2U  M. Norgate

- Your course registration is only valid with a simultaneous online registration at the language center ([www.sprachenzentrum.uzh.ch](http://www.sprachenzentrum.uzh.ch)).

### Abstract
The course is designed for Bachelor and Master students from all disciplines who wish to gain an insight into New Zealand culture, history, society, and politics through New Zealand’s rich tradition in literature and film while improving their English language skills further towards C2.

### Objective
- The aim is to explore the following questions through texts and film to introduce students to New Zealand and, in a broader sense, to raise their awareness of some of the key issues affecting former colonies from early settlement to the present day: What did New Zealand mean to its early settlers? Where did the settlers come from? How did they live? What is the Treaty of Waitangi, and what is its status today? What does it mean to live in multi-cultural New Zealand today?

- Students will learn the discourse used, and issues under consideration, in the analysis and discussion of poetry, prose, and film. They will become aware of various ways of "reading" texts and film, and will improve their skills in planning and writing cohesive essays in which they marshal their views in a convincing and formal manner. Overall, the aims are that students become more discerning readers, improve their skills in expressing their views in written and spoken form clearly and concisely, and gain an understanding of the importance of literature and film to the development of a uniquely New Zealand identity.

### Content
The course gives a roughly chronological view of New Zealand's literary heritage, from Maori settlement to the present day, using selected poems, a short novel, short stories, articles, and films. A key focus is the way New Zealanders' notion of their own identity has shifted over the years, as expressed by the country's film-makers and writers working in English, and to a limited degree, in Maori (English translations are provided).

### Lecture notes
No script
Spanish: Grammar and Pragmatic Communication (B2.1)

Objective

The course aims to approach the Italian language through literature. While reading short stories the participants will deepen their linguistic and syntactic competence as well as their understanding of the Italian culture by means of written exercises and class discussions. In particular, the course will:

- To become acquainted with the cultural and social realities characteristic of Italy as described in the short stories.
- To be able to express oneself in a clear and differentiated way in using formulations and structures taken from the texts.
- To capture lexical and syntactic meanings in texts.
- To understand complex texts namely literary short stories.
- To understand complex texts namely literary short stories.
- To capture lexical and syntactic meanings in texts.
- To be able to express oneself in a clear and differentiated way in using formulations and structures taken from the texts.
- To become acquainted with the cultural and social realities characteristic of Italy as described in the short stories.

The main activity of the course is the visioning of films in Spanish (Spain and Latin America), giving an emphasis on a specific thematic, geopolitical and cultural spectrum of the Spanish language. It also aims the participant to get familiarized with topics, images, customs, dialogs and vocabulary, carrying out an observation and then an analysis and comment of these elements.

Literature

The chosen films can be seen / borrowed from the Selbstlernzentrum (http://www.sprachenzentrum.uzh.ch/slz/index.php).

Prerequisites / notice

- Participation in the fortnightly lessons (maximum 1 absence)
- Preparation (glossary and thematics) of one of the chosen films
- Entries in the blog and forum of the course

Important information for ETH students: The enrollment in this course at the Sprachenzentrum does not enrol the student automatically for the granting of the D-GESS points. Please inform yourself.

Italian: Language and Literature (B2-C1)

Objective

The course aims to approach the Italian language through literature. While reading short stories the participants will deepen their linguistic and syntactic competence as well as their understanding of the Italian culture by means of written exercises and class discussions.

Abstract

The course targets are:

- to understand complex texts namely literary short stories.
- to capture lexical and syntactic meanings in texts.
- to be able to express oneself in a clear and differentiated way in using formulations and structures taken from the texts.
- to become acquainted with the cultural and social realities characteristic of Italy as described in the short stories.

Content

Durante il corso vengono letti e commentati testi narrativi brevi particolarmente significativi sia per il lessico e le strutture linguistiche impiegate sia per i contenuti strettamente collegati a realtà culturali e sociali tipiche per l’Italia. A presentazioni, orali e scritte, s’alterneranno discussioni sui testi e riflessioni sulla costruzione dei racconti e sulle scelte lessicali e sintattiche.

Lecture notes

Materiale didattico

Il materiale didattico (testi letterari, schede lessicali e grammatiche, materiale audiovisivo ecc.) sarà messo a disposizione dall’insegnante. Verrà richiesto un contributo di CHF 5.- per le fotocopie.

Il corso è accompagnato da una classe virtuale sulla piattaforma didattica OLAT, con materiali per approfondimenti e wiki. Ulteriori informazioni verranno date all’inizio del semestre.
Prerequisites / notice

Mastering the structures of the academic communication in Italian. The course covers the areas work, home and personal interests; everyday situations and conversations in hotel, restaurant and shops; and other academic contexts.

851-0826-05L Italian for Academic Purposes (B2)
Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Abstract
In the course, different textforms will be practiced which are used in the academic domain. This includes the scientific essay, the abstract, the oral presentation, and the handout.

Objective
Mastering the structures of the academic communication in Italian.

851-0849-00L Basic Course A1 (Brazilian-Portuguese)
Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Abstract
This course is designed for participants with no previous knowledge of Portuguese. In the course, participants learn simple basic vocabulary, common daily idiomatic expressions, and fundamental grammar. The focus is on the phonetic features of Portuguese language. Intercultural and cultural issues relating to Brazil are also taken into consideration.

Objective
Participants can understand and form simple questions, messages, and requests.

851-0849-01L Basic Course A2 (Brazilian-Portuguese)
Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Abstract
This course is designed for participants with a basic knowledge of Portuguese (level A1). The course deals with everyday topics. Participants practice simple forms of communication as these occur in daily life. Lexical and linguistic structures are taught within these contexts. Intercultural and socio-cultural issues relating to Brazil are also taken into consideration.

Objective
Participants can talk and write about themselves and everyday topics using simple sentences. They can take part in simple daily conversations, understand and write simple messages, describe an event in a time sequence, and express wishes, assumptions, and recommendations.

851-0885-07L Greek Basic Course Part I
Abstract
Language course for beginners. We will work with a textbook which contains easy original Greek texts. Basic knowledge of Greek grammar, vocabulary and of some characteristics of the Greek language and culture.

Objective
Basic knowledge of Greek grammar, vocabulary and of some characteristics of the Greek language and culture.

851-0885-08L Greek Basic Course Part III
Abstract
In this third semester "Graecum" we consolidate the knowledge of the language. The course focuses on the lecture of a Platonic dialog and of Homer's Odyssey. The course prepares the students for the final exam in January.

Objective
The students should be able to translate a Greek text on a higher level. They should have a sound knowledge of the Homeric Epos and the Platonic philosophy.

851-0885-09L Modern Greek Language I (A1.1)
Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Abstract
This course is the first part of a language course which runs over four semesters, covering levels A1 and A2 of the Global European Framework. Modern Greek Language I is designed for students who have no or very little command of Modern Greek and covers level A1.1.

Objective
Practice of oral communication and study of basic vocabulary and grammar; focus on noun and adjectival structures, personal and possessive pronouns, active verbs (Present Tense) and the use of adverbs. Initiation to web-based activities in Greek and enhancement of interest and activities in Greek language and culture.

Content
The course covers the areas work, home and personal interests; everyday situations and conversations in hotel, restaurant and shops; asking for the way and asking for advice; simple text materials, such as poems, songs and comics will support learning activities.

Lecture notes
Keines

Literature
- The course book by D. Dimitra & M. Papacheimona, Ellinika tora 1+1 (Greek now 1+1, including 2 audio-CD), units 1-5, Athens 2002, and workbook one, Tetradio Askiseon 1, have been ordered for the course members and are available at "Bücherladen der Zentrale der Studentenschaft", Schönberggasse 2.
- Web-based activities to support and enhance classroom teaching will be accessible via Moodle, an electronic platform offered by LET of ETHZ (http://moodle.let.ethz.ch/).
- Additional course materials and handouts will be distributed in class.
- A set of 1400 vocabulary cards for the entire coursebook (Ellinika tora 1+1) is available and can be ordered at the beginning of the semester.

Prerequisites / notice
All course participants are expected to attend regularly and participate actively in class
- do at least 3 hours’ work at home
- submit all their written work for correction
- commit themselves to online-activities in the Moodle-LET online-classroom
- pass all semester-tests.

All candidates who fulfill the course requirements will receive a language certificate, issued by the Language Center, awarding 2 ECTS credits.

D-GESS students will receive on-line credit points and marks, in addition to the LC-certificate.

The course is only open to students who register on-line via the Sprachzentrum-website and who receive online confirmation that they have been accepted on this course. Please note the limited online-registration period!

Data: 06.09.2017 12:54

Autumn Semester 2016

Page 683 of 1570
Abstract
This is Part III of the Modern Greek language course, running over four semesters. Modern Greek III covers level A2.1 of the Global European Framework and is designed for students who have already attended courses I and II at the Sprachenzentrum UNI/ETHZ, or whose language proficiency is equivalent to level A1.2.

Objective
Extensive vocabulary work (approx. 400 new words); reading of elementary texts; additional practice through speaking only Greek in class; improving listening comprehension; writing short essays (about the past and the future, describing events and personal experience). Grammar work will focus on verbs (simple past, simple future, subjunctive and imperative; active and passive voice).

Content
Challenging everyday situations; discussion of specific topics (eg. describing pictures and photographs, talking about daily chores); elementary listening comprehension practice (dialogues, talking about events, advertisements); reading comprehension (advertisements, cooking recipes, poems).

Lecture notes
Keines

Literature
- Audio-visual materials and handouts (photocopies) will be used. Photocopies will be distributed during the semester.
- Web-based activities can be accessed via Moodle platform, supported by LET of ETHZ (http://moodle.let.ethz.ch/).

Prerequisites / notice
All course participants are expected to
- attend regularly and participate actively in class
- do at least 3 hours of individual study at home
- take part actively in online-activities in the Moodle-LET online-classroom
- submit their written work for correction (Semester-Portfolio)
- pass the semester-test

All participants who fulfill the course requirements will receive a language certificate, issued by the Language Center, awarding 2 ECTS credits.

The course is only open to students who register on-line via the Sprachzentrum-website and who receive on-line confirmation that they have been accepted on this course. Please note the limited online-registration period!

All Modern-Greek-courses at the Sprachzentrum do not exceed the beginners’ level and therefore are not suitable for Greek native speakers. Non-native speakers of greek origin please contact Ms. Rassidakis before enrolling in order to check if the course is not too easy for them.

**Literature**

- **Polski krok po kroku 1** (Iwona Stempek, Anna Stelmach, Sylwia Dawidek, Aneta Szymkiewicz), ISBN 978-83-930731-0-8. mp3 with audio materials. Free access to interactive Polish course e.polish.eu
- The coursebook will be available at Büchleraden und Studentenladen Zentrum. Schönb ergasse 2, 8001 Zürich, tel: 044 634 45 23, email: ladenz@zsuz.uzh.ch

**Prerequisites / Notice**

- Students are expected to attend regularly and participate actively in class. Completion of this course requires active and continuous participation. Students should be able to dedicate at least 3 hours a week to independent study activities.
- The use of the open-source Learning Management System OLAT will be part of the course.
- Registration for the course at sprachenzentrum.uzh.ch is obligatory!

**Assessment:**

- The assessment will embrace a portfolio including exercises done throughout the semester, a final test assessing the different skills trained.

**Requirements for the award of 2 ECTS credits and:**

- learning achievement assessed and documented as successful
- no more than 3 absences

**Lecture notes**

Objective
The participants will be able to adequately respond to selected situations of everyday life. Conversations in everyday life and typical situations while traveling will be taught and exercised. Another important focus is the learning of the Arabic script.

Content
Embedded into communicative situations we will work on the following contents: to greet, to present oneself, to talk about oneself (personal identity, occupation, place of living, etc.), simple telephone calls, to ask for information, to book a room. We will pay special attention to cultural aspects.

Literature
Arabisch Intensiv. Grundstufe. Landesspracheninstitut in der Ruhr-Universität Bochum; Buske Verlag (www.buske.de), 2011

Das Lehrmittel ist kurz vor Semesterbeginn erhältlich beim Bücherladen und Studentenladen Zentrum, Schönberggasse 2, 8001 Zürich, Tel: 044 634 45 23, Fax: 044 634 45 26, email: ladenz@zsuz.uzh.ch
geliefert: Mo - Fr 09.00-17.00 Uhr

851-0861-01L Arabic I (A1.1) ■ W 2 credits 3U U. Gösken
Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Abstract
This class aims at acquiring the elementary language competence on the level of speaking, listening and understanding as well as reading and writing of the Arabic script.

Objective
The participants are able to behave adequately in regard to language and culture in simple, but important everyday situations. Learning and practicing vocabulary and grammar are tailor made to acquire sufficient confidence to meet elementary communication needs orally and in writing.

Content
The communicative needs which the practical contents and situations are designed to meet relate to: saying hello, asking about somebody’s wellbeing, introducing each other, simple statements about objects and persons, asking for information and services. The participants are expected to do some of their homework on OLAT.

Lecture notes
All teaching material besides the reader will be distributed in the lessons and downloaded on OLAT.

Literature
Textbook:

Grundstufe
Landesspracheninstitut in der Ruhr-Universität Bochum

Jahr: 2011
Auflage: 3., völlig überarb. Aufl

Prerequisites / notice
The course is open for students, post-graduate students and staff of both Zurich university and ETH without any knowledge of the Arabic language.

851-0863-00L Arabic III (A2.1) ■ W 2 credits 2U U. Göksen
Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Abstract
This course forms the third semester of a five semesters’ Arabic curriculum. We will work on the following topics: Talking about one's life, daily routines, comparisons, wishes, orders, eventualities, preferences. Furthermore, we will pay special attention to acquiring a basic vocabulary and work on the Arabic verbal system.

Objective
The participants are able to show a culturally and linguistically appropriate behavior in common situations of everyday life. They acquire a basic vocabulary and know the important verbal constructions (present and past tense, imperative, conjunctive).

851-0861-03L Following Arabic Massmedia (B1) ■ W 2 credits 2U E. Youssef-Grob
Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Abstract
Arabic authentic texts or programs from audiovisual media. Introduction into the Arabic media landscape and its peculiarities.

Objective
Participants are able to understand easy authentic texts (reports, news, interviews) of Arabic mass media and discuss them in Arabic. Strategies of textual interpretation, vocabulary building or the use of a grammar will enable students further to develop their own, autonomous approach to Arabic media.

851-0877-00L Chinese I (A1.1) ■ W 3 credits 4U A.L. Achermann
Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Abstract
This course is designed for students with a general interest in learning the modern Chinese language or students who are planning to study in China.

Objective
The course aims at promoting various everyday communication skills without neglecting their cultural context.

Content
Introduction to the modern standard Chinese language (Mandarin) and script, concentrating on basic vocabulary in Pinyin and Chinese characters, elementary grammar and conversation. The main focus will be on colloquial language.

Literature
Im Kurs wird mit folgenden beiden Lehrmitteln gearbeitet:

1) Zhongguoehua, shangzhe (Band 1). Lehrwerk für Chinesisch als Fremdsprache.
2) Zhongguozhi, shuxie.

Beide Lehrmittel können am ersten Kurstag erworben werden.

This will be sold shortly before the beginning of the semester at book shops and the Studentenladen Zentrum (Schönberggasse 2, 8001 Zürich, Tel 044 634 45 23, ladenz@zsuz.uzh.ch).

851-0883-00L Japanese III (A2.1) W 2 credits 2U I. Mosimann-Nakanishi

Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Abstract Training in colloquial Japanese / Reading of common texts in Japanese / Application, consolidation and expansion of the basic vocabulary and sentence structures / Training in hearing

Objective The participants consolidate and broaden the basic knowledge of the modern colloquial language in Japan. One of the focuses is on the acquisition of speech methods for important everyday standard situations. At the same time the grammar knowledge will be repeated and broadened. Higher reading skills will also be strived for by learning approx. 60 new Kanji.

Content For details see www.sprachenzentrum.uzh.ch

Lecture notes We will be using this textbook: "Japanisch Intensiv Grundkurs", LSI, Buske Verlag

Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Abstract The focus of this course is on the reading of challenging original texts from Japanese media and Japanese contemporary literature. The texts are analyzed and discussed in terms of their content and linguistic features.

Objective By reading selected original texts, students learn strategies for reading texts analytically. The aim is that they are able to handle Japanese sources independently, using appropriate tools.

851-0890-00L Reading Course Latin: Augustus - The First Roman Princeps W 2 credits 2U C. Utzinger

Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Abstract The general topic of the course is Augustus. On the basis of didactically prepared texts written by various Latin authors (including Sueton, Augustus) this enigmatic figure who became the first emperor of the Roman Empire is examined. Students mostly prepare the texts at home for class discussion. Furthermore, important topics of basic grammar are reviewed (exercises).

Objective Students gain an understanding of various aspects of a new topic and are able to analyze and contrast these aspects within a wider context. Participants reactivate, review, and improve their language skills (vocabulary, morphology, morphosyntax) by applying these skills to texts and in exercises (translation competence, text analysis).

851-0900-01L Norwegian (Beginners) W 3 credits 2U E. Berg

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: 360256

Number of participants limited to 20. No simultaneous online registration at the language center necessary.

Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract This language course is an introduction to Norwegian (Bokmål) as well as to the country and its culture.

Objective By the end of the course, you will have read some easy Norwegian texts, have written your first own texts, and be able to conduct simple conversations.

Prerequisites / notice European Global Scale grading: A2 (basic user)

You are recommended to take part in the tutorial offered for this course.

851-0900-03L Norwegian III (University of Zürich) W 3 credits 2U E. Berg

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: 360267

Number of participants limited to 20. No simultaneous online registration at the language center necessary.

Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract The third part of the Norwegian-course aims at a further development of your active and passive language competence. You will finish the textbook and round it off by an individual assignment on a Norwegian theme.

European Global Scale grading: B2 (independent user)

Objective You will be reading Norwegian literature with ease and discussing various themes both in speech and in writing.

851-0900-02L Norwegian II W 3 credits 2U E. Berg

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: 360260

Number of participants limited to 20. No simultaneous online registration at the language center necessary.

Mind the enrolment deadlines at UZH:
Abstract

This course is a continuation of the introductory course and is suited for students with elementary knowledge of Norwegian. By means of various media like articles, music and films, you will also get to know more about Norway.

European Global Scale grading: B1 (independent user)

Objective

The aim of this course is to expand your knowledge of the Norwegian grammar and vocabulary and train your oral and written skills.

<tr>
<td></td>
<td>In teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturer in this course. Basic conceptual and methodological issues are the topic of a series of plenary meetings; however, the major part of the work is done in small-group meetings with the advising researcher, and in self-directed research projects.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Objective</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The course is targeted at advanced students who have taken an interest in gathering practical research experience in the field of Learning &amp; Instruction. In teams of two, students conduct their own research projects (planning, conducting, analyzing, interpreting, and presenting research); thus, the course requires a high amount of self-directed working. Students are personally advised, and supported in their research project, by one of the researchers serving as lecturers in this course. During the first half the semester, relevant methodological knowledge and skills are practiced during plenary meetings and in students’ independent reading (e.g. generating and testing research questions, designing experiments, and analyzing data in the field of Learning and Instruction)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Learning goals include:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can illustrate and explain basic methods and concepts for research in the fields of Learning and Instruction, e.g. with the help of practical examples.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can generate testable research questions for a topic relevant in the fields of Learning and Instruction.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can design and conduct a study that is relevant for answering their research question.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Participants can summarize and evaluate the main results from a study in the field of learning and Instruction, with regard to the research question being asked.</td>
<td></td>
<td></td>
<td></td>
<td></td>

Prerequisites / notice: Fachdidaktik-Prüfung ist eine 15 minütige mündliche Prüfung. Sie findet am selben Tag wie die praktische Prüfung (2 Prüfungslektionen plus Kolloquium) statt.

Prerequisites / notice: Frühestens parallel zum Fachdidaktik- Modul III zu belegen (Pflicht für ETH-Studierende)
Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract
The Subject Didactics III course unit comprises two blocks: one "Specialisation" block with key subjects from courses I and II and a block on "Information technology in geography teaching" with specific applications.

Objective
- In Subject Didactics III, students take a more in-depth, application-oriented look at geography. Students learn about the options for using ICT to design their geography teaching and also the integral furtherance of pupils’ IT competence. They plan an IT lesson, hold it and then evaluate it.
- Identify the opportunities and limits of illustrating their geography teaching with films, models and experiments.
- Look into the significance of the subjective theories for learning success and failure and discuss tuition options for a concept change (geographical case studies).

Content
Inhalt
- Fachdidaktik III Block "Vertiefung" (1/2 Semester)
  - Planung von Unterrichtseinheiten.
  - Fachdidaktik III Block "ICT im Geografieunterricht" (1/2 Semester)
  - Fachspezifische Einsatzmöglichkeiten, Unterrichtshilfen, konkrete Anwendungen und Resultate an Beispielen kritisch reflektieren.

Lecture notes
- Lernformen

Literature
- Weitere Literaturangaben.

Prerequisites / notice
- Fachdidaktik III kann im Frühlingssemester parallel zu Fachdidaktik II besucht werden, aber erst nach Fachdidaktik I.

Data: 06.09.2017 12:54 Autumn Semester 2016 Page 692 of 1570
In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

On the basis of a specified topic, the candidate shows that they are in a position
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Die Studierenden erfahren das Lektionsthema in der Regel 14 Tage vor dem Prüfungstermin. Von der zuständigen Lehrperson erhalten sie Informationen über den Wissensstand der zu unterrichtenden Klasse und können sie vor dem Prüfungstermin besuchen. Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie spätestens 2 Tage vor der Prüfung (bis 18 Uhr) den beiden Prüfungsexperten ein.

Die gehaltene Lektion wird kriteriernbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/ der Kandidatin über die gehaltene Lektion im Rahmen eines Kolloquiums (15 min).

651-2520-02L Examination Lesson II Geography

Simultaneous enrolment in "Examination Lesson I Geography" (651-2520-01L) is compulsory.

Abstract
In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

Objective
On the basis of a specified topic, the candidate shows that they are in a position
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Die Studierenden erfahren das Lektionsthema in der Regel 14 Tage vor dem Prüfungstermin. Von der zuständigen Lehrperson erhalten sie Informationen über den Wissensstand der zu unterrichtenden Klasse und können sie vor dem Prüfungstermin besuchen. Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie spätestens 2 Tage vor der Prüfung (bis 18 Uhr) den beiden Prüfungsexperten ein.

Die gehaltene Lektion wird kriteriernbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/ der Kandidatin über die gehaltene Lektion im Rahmen eines Kolloquiums (15 min).

Lecture notes
Dokument: Schriftliche Vorbereitung für Prüfungslektionen.

Prerequisites / notice
Bitte bei der Prüfungsanmeldung den schriftlichen Nachweis erbringen, dass die ganze Ausbildung abgeschlossen ist.

651-4137-00L Semester Paper within the Teaching Internship Geography (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

Lecture notes
Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Only for Geography Teaching Diploma.

Simultaneous enrolment in "Teaching Internship Geography" (651-2517-00L) is compulsory.

Abstract
In the context of their teaching practice, students compile a portfolio in which they analyse and document selected aspects of their teaching experience.

Objective
The provision of insight into their personal, selected and also theoretically-founded:
- study of tuition elements and the compilation of a personal method profile based on subject-didactics assignments.
- processing of key events/happenings experienced during their teaching or teaching practice period (e.g. specialist content; didactic planning, conducting teaching, interaction with the class or individual pupils; communication with the teacher responsible for the teaching practice) in line with the instructions and the advice given in the guide for practical professional training (IGB UZH).

Content
- Erstellen eines Portfolios zum Praktikum mit Praktikumsjournal (6-8 Seiten) und den dazu gehörenden Dokumenten (z.B. einem Beobachtungsprotokoll; einer Unterrichtsplanung; einer Lernaufgabe; einer Prüfung)
- Vorgängige Überlegungen (Problemstellung bzw. Vorbereitung einzelner Lektionen) werden schriftlich dokumentiert sowie die Erfahrungen reflektiert, die bei der Umsetzung und Durchführung des Unterrichts gemacht wurden.
- Im Praktikumsjournal sollen fachwissenschaftliche Aspekte, allgemein- und fachdidaktische Überlegungen, fachlich-pädagogische und didaktische Aspekte sowie konkrete Erfahrungen aus dem Praktikum einbezogen und angemessen miteinander in Verbindung gebracht werden.
- Die Art der Darstellung des Portfolios wird durch die Studierenden bestimmt.
- Der Hauptteil des Praktikumsjournals umfasst ca. sechs bis acht Seiten.
- Formal muss das Praktikumsjournal die Struktur einer wissenschaftlichen Arbeit entsprechen (Titelblatt, Inhaltsverzeichnis, Hauptteil, Schlusswort, Literatur- und Materialienangaben).

Lecture notes
Arbeitung für das Unterrichtspraktikum und die unterrichtspraktischen Übungen:
- Die berufspraktische Ausbildung am IEF LLBM; Wegleitung und Instrumente zur Vorbereitung, Durchführung und Reflexion sowie zur Beratung, Beobachtung und Beurteilung von Unterricht auf der Sekundarstufe II (Version 2012).
- Merkblatt Praktikumsjournal IEF LLBM
- Aufgabenstellungen für die berufspraktische Ausbildung aus der Fachdidaktik Geografie.

651-4237-01L Specialised Courses in the Respective Subject with an Educational Focus Geography

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: GEO891
Abstract  
Current approaches to research which are of relevance to society are presented on the basis of examples and critically examined in respect of their significance for a high-school education in the subject of geography.

Objective  
Students  
- look at the subject knowledge in its full breadth, on the basis of current approaches to research and with the consideration of specific examples, thereby creating a specialised basis on which to critically examine specialist contents for the school subject of geography, as part of a general education, over the course of time.  
- see whether and where current topics from the specialist subject (research) can be incorporated in secondary-school tuition.  
- familiarise themselves with questions and forms of cognition-oriented, moderately constructivist tuition.  
- can reflect on geography teaching in an aware and theory-based manner.

Content  
Vorlesung:  
In jeweils in sich geschlossenen Vorlesungen beleuchten Dozierende die gesellschaftliche Relevanz ihrer aktuellen Forschungsansätze an konkreten Beispielen aus der Physischen Geografie und den Erdwissenschaften, der Humangeografie sowie der Methodischen Geografie. Sie thematisieren dabei die Bedeutung der Ansätze für die Gesellschaft, die Auseinandersetzung mit räumlichen Fragestellungen und Problemlösungen und diskutieren die aus ihrem Forschungsansatz und den Ergebnissen resultierenden ethischen Fragen. Sie beleuchten damit die Breite des Fachverständnisses und legen das Fundament für die kritische Auseinandersetzung mit allgemein bildenden Fachinhalten (Kompetenzen, Fachwissen, Einstellungen), die insbesondere in der gymnasialen Ausbildung im Fach Geographie vermittelt werden sollen.

Lecture notes / Literature  
Zu jeder Vorlesung werden Folien/ Unterlagen abgegeben.  
Wird von den jeweils verantwortlichen Dozierenden zusammengestellt.

Prerequisites / notice  

It is recommended to attend the lecture series and seminar after Geography Didactics I - III.

Abstract  
Current approaches to research which are of relevance to society are presented on the basis of examples and critically examined in respect of their significance for a high-school education in the subject of geography.

Objective  
Students  
- look at the subject knowledge in its full breadth, on the basis of current approaches to research and with the consideration of specific examples, thereby creating a specialised basis on which to critically examine specialist contents for the school subject of geography, as part of a general education, over the course of time.  
- see whether and where current topics from the specialist subject (research) can be incorporated in secondary-school tuition.  
- familiarise themselves with questions and forms of cognition-oriented, moderately constructivist tuition.  
- can reflect on geography teaching in an aware and theory-based manner.

Prerequisites / notice  

It is recommended to attend the lecture series and seminar after Geography Didactics I - III.
Participants conduct a critical examination of regional geography in terms of the understanding of the subject and teaching in schools, and its potential for substantiated tuition is established.

Regional geography observes delimited partial areas, mapped to different scales, considering thematic and exemplary aspects. Regional geography features in this form on a large number of geography syllabuses. Against this background, the module comprises two parts. A specialist lecture on the subject takes a specific regional example to highlight current, interdisciplinary topics and case studies. The aim here is to compile specialist contextual knowledge about a region. In an accompanying seminar, this contextual knowledge is then put in the correct practical form for teaching in a school, thus ensuring that the teachers are in a position to configure regional geography teaching that has been duly reflected on from the specialist-subject, didactic and pedagogical angle.

Vorlesung
- Übersicht über Themen, die für eine Region typisch sind oder sich in einer Region abspielen (z. B. Arabische Halbinsel, Afrika südlich der Sahara, Asien)
- Regionale Fallstudien mit interdisziplinärem Charakter
- Differenzierte Auseinandersetzung mit kulturellen und politischen Fragen und Entwicklungen in einer Region
- Erarbeiten von bedeutenden fachwissenschaftlichen Debatten zu einer Region

Seminar
- Regional-thematische Geografie versus traditionelle Länderkunde
- Geografisches Orientierungswissen: Stellenwert
- Werteerziehung und Interdisziplinarität im regionalgeografischen Kontext
- Didaktische Analyse und Planung regionalgeografischen Unterrichts: Von der Sachanalyse über den Einstieg bis zur Bewertung
- Methoden und Recherche in der Regionalgeografie

Lernformen
Fachwissenschaftliche Aspekte werden in der Form einer Vorlesung präsentiert. Die Studierenden vertiefen nach jeder Stunde die Inhalte und setzen diese im Hinblick auf die Schulpraxis um. Dabei wird ein elektronisches Lernangebot geführt und über eine Lernplattform über die schulpraktische Umsetzung reflektiert. Es werden auch Materialien zusammengestellt.

Folie werden zur Verfügung gestellt.

Wird je nach regionalen Fokus zusammengestellt.

Abstract

Objective
- Sie vertiefen ihre theoretischen, empirischen und methodischen Fähigkeiten in folgenden Themebereichen:
  - Gesellschaft und Raum
  - Gesellschaft und Entwicklung
  - Gesellschaft und natürliche Umwelt/Ressourcen
  - Offenheit und Geschlossenheit in Wirtschaft und Gesellschaft
  - Chancen und Herausforderungen einer globalisierten Weltwirtschaft
- Sie sind in der Lage, Verknüpfungen zwischen grundlegenden sozial- und wirtschaftswissenschaftlichen Theorien und deren Konkretisierung in der Geographie herzustellen.
- Sie können die erwähnten Themen mit ausgewählten Faktenwissen verknüpfen und diskutieren
- Sie schulen Ihre analytischen und theoretischen Fähigkeiten und können diese in Diskussionen einbringen
- Sie können die Relevanz von weiterführenden wissenschaftlichen Texten diskutieren und mit einem Ausgangstext verknüpfen
- Sie sind in der Lage, eine Diskussion über wissenschaftliche Themen zu strukturieren und - mit einfachen Moderationstechniken - zu moderieren

Prerequisites / notice
Besuch von GEO122.

| Abstract | The course demonstrates geography's interdisciplinary approach to contribute solving urgent challenges ahead of society. Students are encouraged to reflect on the value of interdisciplinary research at discipline level and on their individual interdisciplinary curricula. The course creates awareness of ways that concepts structure our thinking, and how they figure in research and practice. |

### Overview in Business Administration

- Financial Accounting
  - Balance sheet, income statement
  - Accounts, double-entry bookkeeping
  - Year-end closing and financial statements
- Financial Management
  - Financial statement analysis
  - Financial planning
  - Investment decisions
- Management Accounting
  - Full costing and marginal costing
  - Product costing
  - Management decisions

#### Content

651-0032-00L  Geology and Petrography  O  4 credits  2V+1U  C. A. Heinrich, S. Löw, K. Rauchenstein

**Abstract**

This course gives an overview of the basic concepts of geology and petrography and shows some links to the application of these concepts. The course consists of lectures and exercises in groups. The lectures cover all aspects of the dynamic earth, from the history of the earth, to the formation of rocks, mountains, and oceans, and the degradation processes shaping the uppermost earth's crust.

**Objective**

This course gives an overview of the basic concepts of geology and petrography and shows some links to the application of these concepts.

**Content**

- Geologie der Erde, Mineralien - Baustoffe der Gesteine, Gesteine und ihr Kreislauf, Magmatische Gesteine, Vulkane und ihre Gesteine,
- Verwitterung und Erosion, Sedimentgesteine, Metamorphe Gesteine, Historische Geologie, Strukturgeologie und Gesteinsverformung,
- Bergstürze und Rutschungen, Grundwasser, Flüsse, Wind und Gletscher, Prozesse im Erdinnern, die Schatzkammer Erde und ihre Bewirtschaftung.

**Lecture notes**

Übungen zum Gesteinsbestimmen und Lesen von geologischen, tektonischen und geotechnischen Karten, einfache Konstruktionen.

**Literature**

Press, F.; Siever, R.: Allgemeine Geologie, Spektrum Akademischer Verlag, Heidelberg

---

**Abstract**

This lecture presents an introduction to ecology. It includes basic ecological concepts and the most important levels of complexity in ecological research. Ecological concepts are exemplified by using aquatic and terrestrial systems; corresponding methodological approaches are demonstrated. In a more applied part of the lecture threats to biodiversity and the appropriate management are discussed.

**Objective**

The objective of this lecture is to teach basic ecological concepts and the different levels of complexity in ecological research: the individual, the population, the community and the ecosystem level.

**Content**

- Übersicht der aquatischen und terrestrischen Lebensräume mit ihren Bewohnern
- Einfluss von Umweltfaktoren (Temperatur, Strahlung, Wasser, Nährstoffe etc.) auf Organismen; Anpassung an bestimmte Umweltbedingungen
- Populationsdynamik: Ursachen, Beschreibung, Vorhersage und Regulation
- Interaktionen zwischen Arten (Konkurrenz, Koexistenz, Prädatation, Parasitismus, Nahrungsnetze)
- Lebensgemeinschaften: Struktur, Stabilität, Sukzession
- Ökosysteme: Kompartimente, Stoff- und Energieflüsse
- Biodiversität: Variation, Ursachen, Gefährdung und Erhaltung
- Aktuelle Naturschutzprobleme und -massnahmen
- Evolutionäre Ökologie: Methodik, Spezialisierung, Koevolution

**Lecture notes**

Unterlagen, Vorlesungsskripten und relevante Literatur sind in der Lehrdokumentenablage abrufbar. Die Unterlagen für die nächste Vorlesung stehen jeweils spätestens am Freitagmorgen zur Verfügung.

**Literature**

Generelle Ökologie:
- Aquatische Ökologie:
- Bohle 1995. Limnische Systeme. Springer, ca. Fr. 50.-
- Naturschutzbiologie:

**Abstract**

This course will cover the basic topics in Physics and will show/display/explain with a variety of experiments the most important physical effects. The course will address classical as well as modern physics, and the interplay between basic research and applications.

**Objective**

**Content**

- Electromagnetismus: Elektrostatik und Magnetostatik, Strom, Spannung und Widerstand, Maxwell-Gleichungen, elektromagnetische Wellen, elektromagnetische Eigenschaften der Materie,
- Thermodynamik: Temperatur und Wärme, Zustandsgleichungen, erster und zweiter Hauptsatz der Wärmelehre, Entropie, Transportvorgänge,
- Quantenphysik und Atomphysik,
- Schwingungen und Wellen. Grundlagen der speziellen Relativitätstheorie.

**Lecture notes**

Manuskript und Übungsbilder
Einleitung - Was ist Raumplanung (Begriffe)

Title

Geomatics workflow

Objective

The students are capable of analysing measurements with with appropriate methods. They can optimally extract model parameters from real measurements and are able to analyse and to retrieve additional information from time series. They understand the underlying algorithms of different geodetic analysis tools and processing methods. The dynamic properties of geodetic systems can be considered in their analysis.

Content

Mathematical modeling of engineering problems, general adjustment, minimization principles, propagation of variances, uncertainty of measurements, dealing with heterogeneous measurement types, linear/non linear regression, autocorrelation and colocation

Lecture notes

Parameter estimation and Adjustment

Prerequisites / notice

Linear Algebra, Statistics

103-0214-00L

Abstract

Basic knowhow about communication with spatial information by using plans and maps, about the most important design rules and production methods for map graphics.

Objective

Acquire basic knowhow about communication with spatial information by using plans and maps, about the most important design rules and production methods for map graphics. Ability to assess existing products with respect to their content-related and design quality. Ability to design proper plans and well designed legends for basic maps.

Content

Definitions "map" and "cartography", map types, current tasks and situation of cartography, map history, spatial reference systems, map projections, map conception and workflow planning, map design, analog and digital map production technology, prepossess technology, printing technology, topographic maps, map critics.

Lecture notes

Will be distributed module by module

Literature

- Umweltverträglichkeitsprüfung, vdf, Zürich 1995.

For further literature see the references/bibliography in the script.

103-0300-00L

Abstract

The lecture introduce into the main-features of spatial planning. Attended will be the themes planning as a national responsibility, instruments of spatial planning, techniques for problem-solutions in spatial planning and the swiss concept for regional planning.

Objective

To follow shortly;please note the German description.

Content

Einleitung - Was ist Raumplanung (Begriffe)

Die Raumplanung als staatliche Aufgabe - Raumordnungspolitik

Instruments of the Raumplanung (Richtplanung, Nutzungsplanung)

Problemlosungsverfahren in der Raumplanung - systemtechnisches Vorgehen

Der Schwerpunkt der Vorlesung liegt auf der Erläuterung der Raumplanung als Problemlosungsverfahren. Das dabei vermittelte theoretische Wissen wird direkt an einer konkreten, praxisorientierten Übungsaufgabe umgesetzt.

Lecture notes

Examination Block 2

Number

103-0115-00L

Title

Geodetic Metrology II

Objective

The students acquire enhanced knowledge regarding the operating mode, the application and the limitations of modern geodetic standard instruments. They will be able to properly select, test and apply these instruments for geodetic tasks with higher accuracy requirements. They will get acquainted with the typical workflow from the preparation of the field works to the digital or plotted plan. Finally, the students will be introduced to specific geodetic tasks related to construction and civil engineering.

Content

- The geomatics workflow
- Propagation of light in the atmosphere
- The modern total station
- Terrestrial Laserscanning
- Digital levels
- Field tests
- Transformations and Centering
- Trigonometric leveling
- Precision leveling
- Route planning and transition curves
- Earthworks: Area and cubature

Lecture notes

The slides and documents for enhanced study and further reading will be provided online.

Literature

103-0233-01L

Title

GIS I

Objective

The students acquire enhanced knowledge regarding the operating mode, the application and the limitations of modern geodetic standard instruments. They will be able to properly select, test and apply these instruments for geodetic tasks with higher accuracy requirements. They will get acquainted with the typical workflow from the preparation of the field works to the digital or plotted plan. Finally, the students will be introduced to specific geodetic tasks related to construction and civil engineering.

Content

- The geomatics workflow
- Propagation of light in the atmosphere
- The modern total station
- Terrestrial Laserscanning
- Digital levels
- Field tests
- Transformations and Centering
- Trigonometric leveling
- Precision leveling
- Route planning and transition curves
- Earthworks: Area and cubature

Lecture notes

The slides and documents for enhanced study and further reading will be provided online.

Literature

**ECTS**

Fundamentals and theory of geodetic reference systems and frames. Introduction to current international systems as well as to systems for the Swiss national geodetic survey. Various coordinate systems and transformations; introduction to Earth rotation theory; time systems; Swiss national geodetic survey. Students who have attended or will attend the lecture "Introduction to Law for Architecture" (851-0703-01L) cannot register for this course unit.

**Objective**

This class introduces students to basic features of the legal system. Questions of constitutional and administrative law, contract law, tort law, corporate law, as well as litigation are covered.

**Content**

1. Public Law
   - Constitutional law: sources of law, organization of the state, fundamental rights. Administrative law: administrative decisions, organization of administrative decisions, procedural law, basics of police, environmental and zoning law.
   - Introduction to fundamental questions of public and private law which serves as a foundation for more advanced law classes.

2. Private law

**Literature**

Further information is available at http://www.hertig.ethz.ch/education/grundzuege-des-rechts-fuer-baug-und-arch.html

---

**Introduction to Law for Civil Engineering**

In place of the German course 851-0703-03L Introduction to Law for Civil Engineering students can take the French course 851-0709-00L Droit civil.

**Number**

851-0703-03L

**Title**

Introduction to Law for Civil Engineering

**Type**

Only for Civil Engineering BSc, Geomatic Engineering and Planning BSc, Environmental Engineering BSc and Spatial Development and Infrastructure Systems MSc

**ECTS**

W 2 credits

2V

G. Hertig

- Examen au 1er propédeutique; convient pour travail de semestre.
- Les examens peuvent se faire en français ou en italien.
- Le cours de droit civil et le cours de droit public (2e sem.) sont l’équivalent des cours "Recht I" et "Recht II" en langue allemande et des exerces y relatifs.
- Remarques

- Sont indispensables:
  - le Code civil et le Code des obligations;
  - Sont conséquents:
    - Nef, Urs Ch.: Le droit des obligations à l’usage des ingénieurs et des architectes, trad. Bovay, J., éd. Payot, Lausanne
    - Bollond, J.-P.; Manuel de droit, éd Slatkine, Genève

**Number**

851-0709-00L

**Title**

Introduction to Civil Law

**Abstract**

The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

**Objective**

**Content**

Le cours de droit civil porte notamment sur le droit des obligations (droit des contrats et responsabilité civile) et sur les droits réels (propriété, gages et servitudes). De plus, il est donné un bref aperçu du droit de la procédure et de l’exécution forcée.

**Literature**

Editions officielles récentes des lois fédérales, en langue française (Code civil et Code des obligations) ou italienne (Codice civile e Codice delle obbligazioni), disponibles auprès de la plupart des librairies.

Sont indispensables:
- le Code civil et le Code des obligations;
- Sont conséquents:
  - Nef, Urs Ch.: Le droit des obligations à l’usage des ingénieurs et des architectes, trad. Bovay, J., éd. Payot, Lausanne
  - Bollond, J.-P.; Manuel de droit, éd Slatkine, Genève

**Prerequisites / notice**

- Le cours de droit civil et le cours de droit public (2e sem.) sont l’équivalent des cours "Recht I" et "Recht II" en langue allemande et des exercices y relatifs.
- Les examens peuvent se faire en français ou en italien.
- Examen au 1er propédeutique; convient pour travail de semestre.

---

**5. Semester**

**Compulsory Courses 5. Semester**

**Examination Block 4**

**Number**

103-0126-00L

**Title**

Geodetic Reference Systems

**Abstract**

Fundamentals and theory of geodetic reference systems and frames. Introduction to current international systems as well as to systems for the Swiss national geodetic survey.

**Objective**

Provision of fundamental knowledge and theory to get familiar with the applications of geodetic reference systems. Special emphasis will be placed on international global systems as well as on the systems of the Swiss national geodetic survey.

**Content**

Various coordinate systems and transformations; reference systems and frames (inertial, Earth-fixed, topocentric) and associated transformations between the systems; introduction to Earth rotation theory; time systems; Swiss national geodetic survey.

**Lecture notes**

Script will be provided electronically as pdf file.

**Prerequisites / notice**

If possible, a field trip to the geodetic fundamental station Zimmerwald (Bern) will be offered.

**Number**

103-0184-00L

**Title**

Higher Geodesy

**Abstract**

Knowing the fundamentals of geoinformation technologies for the realization, application and operation of geographic information systems in engineering projects.

**Content**

Geodetic Reference Systems

Vorlesungsspräsentationen werden digital zur Verfügung gestellt.

**Literature**

Teaches the basic principles of public transport network and topology design, geometrical design, dimensioning and construction as well as ECTS.

To introduce the methods and tools of project management. To impart knowledge in the areas of project organisation and structure, project planning, resource management, project controlling and on team leadership and team work.

Content

PART 1: Spatial Planning and Special Land Use Management
- Overview about Spatial Planning on the commune level
- workflows and planning methods on the commune level
- comprehension of the public
- getting knowledge of the special land use management

PART 2: Methods of Land Re-Allocation
- Intensions and principles of land re-allocation
- implementation of the land re-allocation
- land re-allocation in construction zones
- amelioration

PART 3: Agricultural Planning

Lecture notes
Lecture notes and slides (in German) can be downloaded from the PLUS homepage.

Download: http://www.irl.ethz.ch/plus/education

References in the lecture notes

Prerequisites / notice

No remarks.

References to technical literature will be included in the course script. An additional list of literature will be given during the course.

The transparencies will be available for download from the website at least one week before each class.

Copies of all necessary documents will be distributed at appropriate times.

Thematic Cartography

M. Kersting, L. Hurni

Abstract

Objective
Overview over the entire spectrum of Higher Geodesy

Content
Actual methods of Higher Geodesy. Basics of Shape of the Earth: Geoid determination and deflection of the vertical. Introduction into the most important topics: Satellite Geodesy (GPS) and Navigation; Physical Geodesy and gravity field of the Earth; Astronomical Geodesy and Positioning; Mathematical Geodesy and basics of Geodynamics. Reference systems and applications in National and Global Geomatics.

Lecture notes

103-0435-01L Land Management O 5 credits 4G G. Nussbaumer, F. Frei, M. Huhmann, R. Michelon

Abstract
First part: Spatial planning on the Commune level with focus on the special land use management
Second part: land re-allocation as an instrument of spatial planning; specific explanations for land re-allocations in rural regions and in construction zones.
Third part: land marketing; the view of investors.

Objective
Getting knowledge in spatial planning and land re-allocation as an interactive process.

Content
PART 1: Spatial Planning and Special Land Use Management
- Overview about Spatial Planning on the commune level
- workflows and planning methods on the commune level
- comprehension of the public
- getting knowledge of the special land use management

PART 2: Methods of Land Re-Allocation
- Intensions and principles of land re-allocation
- implementation of the land re-allocation
- land re-allocation in construction zones
- amelioration

PART 3: Agricultural Planning

Download: http://www.irl.ethz.ch/plus/education

References in the lecture notes

Literature

101-0515-00L Project Management O 2 credits 2G M. Kersting

Abstract
General introduction to the development, the life cycle and the characteristics of projects. Introduction to, and experience with, the methods and tools to help with the preparation, evaluation, organisation, planning, controlling and completion of projects.

Objective
To introduce the methods and tools of project management. To impart knowledge in the areas of project organisation and structure, project planning, resource management, project controlling and on team leadership and team work.

Content
- From strategic planning to implementation (Project phases, goals, constraints, and feasibility)
- Project leadership (Leadership, Teams)
- Project organization (Structure)
- Project planning (Schedule, cost and resource planning)
- Project controlling
- Risk and Quality Management
- Project completion

Lecture notes
Yes

The transparencies will be available for download from the website at least one week before each class.

Copies of all necessary documents will be distributed at appropriate times.

101-0415-01L Railway Infrastructures (Transportation II) O 3 credits 2G U. A. Weidmann

Abstract
Fundamentals of railroad technology and interactions between track and vehicles, network development and infrastructure planning, planning of rail infrastructure, planning and design of railway stations, construction and dimensioning of tracks, approval and beginning service on complex infrastructure facilities, special issues of maintenance.

Objective
Teaches the basic principles of public transport network and topology design, geometrical design, dimensioning and construction as well as the maintenance of rail infrastructures. Teaches students to recognize the interactions between the infrastructure design and the production processes. Provides the background for Masters degree study.

Content
- (1) Fundamentals: Infrastructures of public transport systems; interaction between track and vehicles; passengers and goods as infrastructure users; management and financing of networks; railway standards and norms. (2) Infrastructure planning: Planning processes and decision levels in network development and infrastructure planning, planning of railway tracks and rail topologies; planning of the passenger parts of stations. (3) Infrastructure design: Fundamentals of the layout of a line; track geometry; switches and crossings; design of station platforms. (4) Construction of railway infrastructures: Assembly and evolution of the railway track; elements of the railway track; dimensioning of the track; track stability. (5) Approval and beginning service on complex infrastructure facilities: Definitions and limitations; fundamentals of the legal situation; test and approval processes; processes of putting railway systems into operation. (6) Maintenance of railway infrastructures: Fundamentals of infrastructure maintenance; kinds of deprivations; supervision methods; steps of infrastructure maintenance; estimation of maintenance need; methods to minimize maintenance costs.

Lecture notes
Course notes will be provided in German. Slides are made available some days before each lecture.

Literature
References to technical literature will be included in the course script. An additional list of literature will be given during the course.

103-0245-01L Thematic Cartography W 2 credits 2G L. Hurni

Abstract
Thematic map types (focus on quantitative information), analysis of themes and application, base maps, generalisation

Objective
Knowing of most important thematic map types.
Ability to design adequate thematic maps from statistical data.
### Elective Block: Geodesy and Geodetic Metrology

<table>

<tr>
<td>103-0125-00L</td>
<td>Geodetic Networks and Parameter Estimation</td>
<td>W</td>
<td>3</td>
<td>3G</td>
<td>S. Guillaume</td>
</tr>
</tbody>
</table>

*Abstract:* This course provides knowledge for parameter estimation and data analysis in geodetic networks. The necessary mathematical and statistical methods are explained and applied by means of concrete examples.

*Objective:* The students are able to plan, pre-analyse and perform analysis of geodetic networks for practical problems. They are able to understand and develop geodetic software.

*Content:* Refreshment of statistical and probabilistic basics (simulations with random number generators, correlated random noise, empirical density functions, hypothesis tests), 2D +1 and 3D terrestrial and satellite based observation equations, coordinate transformation (Helmert, affine), geodetic datum problem (free networks, stochastic datum, constrained datum), quality indicators of geodetic networks (global and local accuracy resp. reliability), robust estimators (M-estimators, L-estimators, LMS-estimator), network optimization (manual, semi-automatic), deformation measurements (congruence test, S-transformations).

*Prerequisites / notice:* Linear algebra, statistic and probability, geoprocessing and parameter estimation, geodetic metrology

### Elective Block: Spatial Development and Environmental Planning

</table>

*Abstract:* Independent development of a basis for decision-making and preparation of specific project documents in the context of practical spatial and environmental problems.

*Objective:* The students know different GIS-based techniques and methods for analysis of landscape and urban areas as well as GIS-based process models and can implement these for quantifying urban qualities in planning processes.

*Content:* Current topics from planning practice lead to a practical task in the context of sustainable urban development. A systematic approach of choosing suitable planning and analysis methods is shown and implemented on a concrete project. The results of the GIS-based analysis serve for developing possible solutions. Different alternatives are evaluated with selected indicators and discussed.

*Prerequisites / notice:* GIS-skills would be advantageous.

Introduction to Mathematical Optimization

401-0647-00L

Abstract
Introduction to basic techniques and problems in mathematical optimization, and their applications to problems in engineering.

Objective
The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

Content
Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, network flows, knapsack problem, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

Literature
Information about relevant literature will be given in the lecture.

Prerequisites / notice
This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics and more.

363-0503-00L

Abstract
The course introduces basic principles, problems and approaches of microeconomics.

Objective
The learning objectives of the course are:
(1) Students must be able to discuss basic principles, problems and approaches in microeconomics. (2) Students can analyse and explain simple economic principles in a market using supply and demand graphs. (3) Students can contrast different market structures and describe firm and consumer behaviour. (4) Students can identify market failures such as externalities related to market activities and illustrate how these affect the economy as a whole. (5) Students can apply simple mathematical treatment of some basic concepts and can solve utility maximization and cost minimization problems.

Lecture notes
Lecture notes, exercises and references can be downloaded from Moodle.

Literature
The book can also be used for the course "Principles of Macroeconomics" (Sturm)

For students taking only the course 'Principles of Microeconomics' there is a shorter version of the same book:

Complementary:

GESS Science in Perspective

Recommended GESS Science in Perspective (Type B) for D-BAUG:

see GESS Science in Perspective: Type A: Enhancement of Reflection Capability

see GESS Science in Perspective: Language Courses ETH/UZH

Electives

The entire course programs of ETH Zurich and the University of Zurich are open to the students to individual selection.

</tbody>
</table>

Abstract
Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them algorithmically. The lecture addresses theoretical foundations concerning geometric structures. Central objects of interest are planar triangulations. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?)

Objective
The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area and in various application domains. In particular, we want to prepare students for conducting independent research, for instance, within the scope of a thesis project.

Content
Planar and geometric graphs, embeddings and their representation (Whitney's Theorem, canonical orderings, DCEL), polygon triangulations and the art gallery theorem, convexity in R^d, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chan's Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction), Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.

Literature

Prerequisites / notice
Prerequisites: The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH.

Outlook: In the following spring semester there is a seminar *Geometry: Combinatorics and Algorithms* that builds on this course. There are ample possibilities for Semester-, Bachelor- and Master Thesis projects in the area.

103-0240-00L

Abstract
Independent scholarly piece based on up-to-date papers, text books, and internet sources. The thematic topic will be defined together with the supervision in the beginning.

Objective
Analysis and evaluation of text and other sources; structuring and writing a concise and reader-friendly seminar Report.

Content
German

Literature
An information sheet will be distributed in the beginning by the supervisor.

Prerequisites / notice
Cartography I

103-0241-00L

**Abstract**

Introduction to interactive, semi-automatic and automatic methods for image interpretation; methodological aspects of computer-assisted remote sensing, including semantic image classification and segmentation; detection and extraction of individual objects; estimation of physical parameters.

**Objective**

Understanding the tasks, problems, and applications of image interpretation; basic introduction of computational methods for image-based classification and parameter estimation (clustering, classification, regression), with focus on remote sensing.

**Content**

Image (and point-cloud) interpretation tasks; semantic classification (e.g. land-cover mapping), physical parameter estimation (e.g. forest biomass), object extraction (e.g. roads, buildings), visual driver assistance; Image coding and features; probabilistic inference, generative and discriminative models; clustering and segmentation; continuous parameter estimation, regression; classification and labeling; atmospheric influences in satellite remote sensing;

**Abstract**

Introduction to Engineering Geodesy: methods, instruments, and applications.

**Objective**

The students will be introduced to the methods, instruments and applications in Engineering Geodesy with a focus on end-to-end quality assessment, sensor and multi-sensor-systems, setting out, and monitoring of engineering objects. They will be able to acquire enhanced knowledge and fundamental competences in high-precision angle, distance and height measurements. They will be introduced to aspects of interdisciplinary work in particular related to construction processes and civil engineering.

**Content**

- Introduction: Definition, methods, and tasks
- Planning and realizing geodetic networks
- High precision distance, angle and height measurements
- Sensors and multi-sensor-systems
- Calibration and testing
- Engineering Geodesy in construction above and below ground
- Tunnel surveying
- Building Information Modeling (BIM)
- Deformation monitoring: Models, methods, and applications

**Lecture notes**

The slides and additional documents will be provided in electronic form.

**Literature**

**Prerequisites / notice**

Fundamental knowledge in geodetic metrology (applied geodesy), physical geodesy, reference systems, GNSS and parameter estimation is required for this course. This knowledge can for instance been acquired within the appropriate courses of the bachelor studies in Geomatics and Planning.

</table>

**Abstract**

The course deals with selected topics of close-range photogrammetry and geometric computer vision, including wide-baseline image matching and reconstruction, dense surface reconstruction, image search and indexing; emphasis is put on reading and self-study and on practical project work, typically in groups.

**Objective**

The aim of the course is to get to know the methods and practice of close-range photogrammetric reconstruction, and an in-depth understanding of selected topics in modern close-range photogrammetry and computer vision.

**Content**

This course builds in part on the courses "Photogrammetrie", "Bildverarbeitung" and "Photogrammetrie II" from the Bachelor program. It focuses on the particular challenges of automated close-range photogrammetry.

**Lecture notes**

Presentation slides, necessary publications and complementary learning materials will be provided through a dedicated course web-site.

**Literature**

Recommended textbooks:
- T. Luhmann. Nahbereichsphotogrammetrie (also available in English)
- R. Hartley and A. Zisserman. Multi-view geometry in computer vision
- R. Szelski. Computer Vision

**Prerequisites / notice**

A recommended prerequisite for taking this course are the Bachelor courses "Photogrammetrie", "Bildverarbeitung" and "Photogrammetrie II". If you have not passed them, please contact the main lecturer of the course before enrolling. The course will include both practical work with commercial software, and programming in Matlab.

**Abstract**

Development of concepts and solutions for challenging tasks in Engineering Geodesy using real-world examples

**Objective**

The students learn to develop, assess and realize concepts and solutions for real-world problems in Engineering Geodesy. They advance the knowledge and skills which they have acquired in relation with geodetic metrology, engineering geodesy. They establish links between these subjects. Particular attention is paid to the selection of appropriate sensors and measurement systems, selection of appropriate measurement and data processing methods, end-to-end quality control, fulfillment of non-technical criteria, and to the documentation of the work.

**Content**

Actual real-world problems are chosen for this lab depending on the number, background and experience of the students.

In Fall 2016 one of the problems will be a study of the layout of railway tracks associated with changes of a train station, carried out under various technical and legal restrictions.

An additional problem will be chosen in connection with current research projects within the Geosensors and Engineering Geodesy Group.

Examples of such problems are:
- high-precision transfer of coordinates and orientation through a long vertical shaft
- monitoring of the deformation of an ice-palace
- development of a 2D-machine-control-and guidance system
- bridge vibration monitoring
Prerequisites / notice

Successful participation in the lab requires knowledge and experiences conveyed within the related course "Engineering Geodesy".

Students who have not already passed that course and who are not participating in that course will only be admitted to the lab after discussion with the instructors.

If the timetable of the participants allows it, the 3-hourly lab units will partially be combined to individual full-time units.

103-0787-00L Project Parameter Estimation

Abstract

Solving engineering problems with modern methods of parameter estimation for network adjustment in a real-world scenario; choosing adequate mathematical models, suitable data-flow and performing software

Objective

Learn to solve engineering problems with modern methods of parameter estimation in a real-world scenario.

Content

Analysis of the given problem, selection of effective mathematical models, use of appropriate software.

Lecture notes / notice

Assignment of tasks; selected documentation

Prerequisite: Statistics and Probability Theory, Geoprocessing and Parameterestimation, Geodetic Reference Systems and Networks

102-0617-00L Basics and Principles of Radar Remote Sensing for Environmental Applications

Abstract

The course will provide the basics and principles of Radar Remote Sensing (specifically Synthetic Aperture Radar (SAR)) and its imaging techniques for the use of environmental parameter estimation.

Objective

The course should provide an understanding of SAR techniques and the use of the imaging tools for bio/geophysical parameter estimation.

Content

At the end of the course the student has the understanding of SAR basics and principles, SAR polarimetry, SAR interferometry and environmental parameter estimation from multi-parametric SAR data

The course is giving an introduction into SAR techniques, the interpretation of SAR imaging responses and the use of SAR for different environmental applications. The outline of the course is the following:

1. Introduction into SAR basics and principles
2. Introduction into electromagnetic wave theory
3. Introduction into scattering theory and decomposition techniques
4. Introduction into SAR interferometry
5. Introduction into polarimetric SAR interferometry
6. Introduction into bio/geophysical parameter estimation (classification/segmentation, soil moisture estimation, earth quake and volcanic monitoring, forest height inversion, wood biomass estimation etc.)

Lecture notes / notice

Handouts for each topic will be provided

101-0724-00L Property Law for Geometers: Land Registry and Geoinformation Law

Abstract

Particularly suitable for students of D-ARCH, D-BAUG, D-USYS

Objective

Fundamental concepts of Land Register Law and Land Surveying Law (substantive and procedural rules of Land Register Law, the parts and the relevance of the Land Register, process of registration with the Land Register, legal problems of land surveying, reform of the official land surveying).

Content

Overview of the legal norms of land registry and surveying law.

Basic principles of material and formal land registry law, components of the land register, consequences of the land register, the registration process, legal problems of surveying, the reform of official surveying, liability of the geom-eter. The lecture unit is carried out within a frame of 8 sessions (2 hours); the first hour of each is given in the form of a lecture, the second in the form of a case-study.

Lecture notes / notice

Abgegebene Unterlagen: Skript in digitaler Form

Prerequisites / notice

Pflichtlektüre: Meinrad Huser, Schweizerisches Vermessungsrecht, unter besonderer Berücksichtigung des Geoinformationsrechts und des Grundbuchrechts, Beiträge aus dem Institut für schweizerisches und internationales Baurecht der Universität Freiburg/Schweiz, Zürich 2014

Literature

- Meinrad Huser, Schweizerisches Vermessungsrecht, unter besonderer Berücksichtigung des Geoinformationsrechts und des Grundbuchrechts, Zürich 2014
- Meinrad Huser, Geo-Informationsrecht, Rechtlicher Rahmen für Geographische Informationssysteme, Zürich 2005
- Meinrad Huser, Darstellung von Grenzen zur Sicherung dinglicher Rechte, in ZBGR 2013, 238 ff.
- Meinrad Huser, Datenschutz bei Geodaten
- Meinrad Huser, Datenschutz bei Geodaten

Requirements: Property Law (12-722)

103-0687-00L Cadastral Systems

Abstract

Nature, role and importance of cadastral systems and related concepts such as land administration, land registration and spatial data infrastructures (SDIs).

Objective

The students will get an understanding of the nature, role and importance of cadastral systems and related concepts such as land administration, land registration and spatial data infrastructures (SDIs). The Swiss cadastral system as well as a range of international approaches both in developed and developing countries will be reviewed.

Prerequisites / notice

Successful participation in the lab requires knowledge and experiences conveyed within the related course "Engineering Geodesy".

Students who have not already passed that course and who are not participating in that course will only be admitted to the lab after discussion with the instructors.

If the timetable of the participants allows it, the 3-hourly lab units will partially be combined to individual full-time units.
### Content

- Origins and purposes of cadastral systems
- Importance of documentation
- Basic concepts of cadastral systems (real estate, legal basis, conceptual principles, property-ownership, property types)
- Swiss cadastral system:
  - legal basis
  - organization
  - technical elements
  - methods of data acquisition and maintenance
  - profession
  - quality assurance
- Digital revolution, access to data
- Benchmarking and evaluation of cadastral systems
- International trends, developments and initiatives

### 263-5902-00L

- **Computer Vision**
- **W** 6 credits
- **3V+1U+1A**
- L. Van Gool, V. Ferrari, A. Geiger

#### Abstract

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored during the exercises.

#### Objective

- The objectives of this course are:
  1. To introduce the fundamental problems of computer vision.
  2. To introduce the main concepts and techniques used to solve those.
  3. To enable participants to implement solutions for reasonably complex problems.
  4. To enable participants to make sense of the computer vision literature.

#### Content

- Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition

#### Prerequisites / notice

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

### 051-0203-16L

- **360° - Reality to Virtuality**
- **W** 4 credits
- **4G**
- K. Sander, A. Wieser

#### Abstract

Basics of 3D-scanning of rooms and bodies, individual scan projects, 3D-visualizations and animations. Working alone and in groups.

#### Objective

- Understanding of 3D-technologies, handling positive and negative spaces, handling hardware and software, processing 3D-data (registering of scans, precision, interconnecting, filtering, visualizations and animations), interpretation of the generated data.

#### Content

1. Introduction in hardware and software (getting to know technologies and context, administer tests)
2. Project development within the group (idea, concept, target, intention, election of methods, strategies)
3. Project implementation within the group (possible results, videos, pictures, prints, publications, web, blog, forum etc.)
4. Project presentation (exhibition incl. critiques, discussions)

Prerequisites / notice

651-4016-00L  Geophysical Geodesy  W  3 credits  2G  N. Houlié

Objective

a) Students are introduced to various geodetic techniques and to their most famous applications in Earth Sciences;
b) Students are able to independently conceptualize 1) the inter seismic strain accumulation for an earthquake and 2) inflation of a spherical reservoir (i.e. magma chamber of a volcano) or 3) water level change within aquifier. c) Students are then introduced to news techniques linking seismology and geodesy.

Content

1. Plate Tectonics before Space Geodesy.
2. Space geodetic techniques (VLBL, gravity, etc.)
3. The seismic cycle monitoring (Moment release, seismology, Stress transfer)
4.  Presentation of GPS and Applications 1 (positioning, rigid plate motions)
5. GPS networks in the world. Development of tectonic geodesy and Applications 2 (Practical on inter-seismic deformation)
6. GIS applied to subsidence and small deformation.
7. GPS deformation related to volcanoes (Practical on Mogi source)
8. GPS, Strain, Stress and Plate motion.
9. InSAR applied to subsidence and small deformation.
10. InSAR and deformation related to volcanoes.
11. Troposphere sounding. Accuracies of GPS and InSAR.
12. GPS and geodynamics
13. Future of GPS. Future of InSAR.
14. GPS and normal modes?

Lecture notes

Slides. Script in English is planned. PDF of articles cited.

Prerequisites / notice

GEOGRAPHY III

The course deals with advanced topics in GIS; GIS project lifecycle, Managing GIS, Legal issues, GIS assets & constraints; Geospatial Web Services; technical basics, architecture, functions, interoperability, standards, mashups, portals, applications; Geostatistics; Sensor Web Enablement; Human-Computer Interaction; Cognitive Issues in GIS.

Objective

Students will get a detailed overview of advanced GIS topics. They will go through all steps of setting up a Web-GIS application in the labs and perform other practical tasks relating to Sensor Web Enablement, Human-Computer Interaction, Geostatistics, and Web Processing Services.

Lecture notes

Lecture notes will be available in digital form.

### 851-0724-00L Property Law for Geometers: Land Registry and Geoinformation Law

**Objective**
Particularly suitable for students of D-ARCH, D-BAUG, D-USYS

**Abstract**
Fundamental concepts of Land Register Law and Land Surveying Law (substantive and procedural rules of Land Register Law, the parts and the relevance of the Land Register, process of registration with the Land Register, legal problems of land surveying, reform of the official land surveying).

**Content**
Overview of the legal norms of land registry and surveying law.

**Lecture notes**
Abgegebene Unterlagen: Skript in digitaler Form

**Prerequisites / notice**
Pflichtlektüre: Meinrad Huser, Schweizerisches Vermessungsrecht, unter besonderer Berücksichtigung des Geoinformationsrechts und des Grundbuchrechts, Beiträge aus dem Institut für schweizerisches und internationales Baurecht der Universität Freiburg/Schweiz, Zürich 2014

**Literature**

---

### 103-0258-00L Interoperability of GIS

**Objective**
- Explain and apply the model-driven approach based on standards
- Know and use interoperability types
- Know transfer formats and reformat with 1:1 processors
- Know object-oriented modelling (with graphic and text)
- Know and use communication technologies and OGC Web services
- UML, EBNF, INTERLIS, ITF, XML, awk, FME
- Know and apply appropriate software tools

**Content**
Semantic interoperability of GIS is in the main part of this lecture and means to transform back and forth (geo-)data with same content but different structure. The reduction of the necessary programming amount to a modest minimum is provided by the system-independent model-driven approach. Its elements reality selection, conceptual modelling, flexible standard formats, 1:1 processors and semantic transformation are presented and used. As generally useful tools are introduced and applied the conceptual schema languages UML and INTERLIS, the flexible transfer formats ITF, XML the ILI-Checker, the efficient reformatting tool awk and for the semantic transformation UMLT and FME.

**Prerequisites / notice**
Requirements: Property Law (12-722)

---

### 103-0778-00L GIS and Geoinformatics Lab

**Objective**
Learn how to work with (mobile) geoinformation technologies (including application design and programming).

---

## Major in Planning

### 103-0347-00L Landscape Planning and Environmental Systems

**Abstract**
In the course, methods for the identification and measurement of landscape characteristics, as well as measures and implementation of landscape planning are taught. Landscape planning is put into the context of the environmental systems (soil, water, air, climate, flora and fauna) and discussed with regard to socio-political questions of the future.
### Objective

The aims of this course are:

1. To illustrate the concept of landscape planning, the economic relevance of landscape and nature in the context of the environmental systems (soil, water, air, climate, flora and fauna).
2. To show landscape planning as an integral information system for the coordination of different instruments by illustrating the aims, methods, instruments and their functions in landscape planning.
3. To show the importance of ecosystem services.
4. To point out basic information about nature and landscape: Analysis and assessment of the complex interactions between landscape elements, effects of existing and foreseeable utilization of space (nature goods and services and landscape functions).
5. To identify and measure the characteristics of landscape.
6. Learn how to use the instrument of GIS appropriately in landscape planning.

### Content

In this course, the following topics are discussed:

- Definition of the concept of landscape
- Landscape change
- Landscape planning
- Methods, instruments and aims of landscape planning (politics)
- Socio-political questions of the future
- Environmental systems, IUCN Red List, ecological connectivity
- Urban landscape services
- Practice of landscape planning
- Use of GIS in landscape planning

### Lecture notes

No script. The documentation, consisting of presentation slides are partly handed out and are provided for download on the PLUS website.

### Prerequisites / notice

The contents of the course will be illustrated in the associated lecture 103-0347-01 U (Landscape Planning and Environmental Systems (GIS Exercises)). An combination of courses is recommended.

The course provides the necessary knowledge to develop models supporting the solution of given planning problems. Examples of such models are commonly used in transport planning: deterministic models, optimal transport networks, and traffic assignment models. This part takes place in form of a tutorial and consists in the development of a computer program. The programming part is closely associated with the contents of the lectures on system and network planning and includes the implementation of algorithms such as the shortest path algorithm and the method of successive averages. To cope with the forecasting problem it is first divided into sub-problems. Then, these are solved using various algorithms like iterative proportional fitting, shortest path algorithms and the method of successive averages.

The course content of the lecture Landscape Planning and Environmental Systems (103-0347-00 V) will be illustrated. To show the importance of ecosystem services. Analysis and assessment of the complex interactions between landscape elements. To identify and measure the characteristics of landscape. Learn how to use the instrument of GIS appropriately in landscape planning.

- Landscape analysis
- Landscape metrics

Lecture notes
No script. The documentation, consisting of presentation slides are partly handed out and are provided for download on the PLUS website.

Literature
Will be named in the lecture.

Prerequisites / notice
Basic GIS skills are recommended. A brief introduction to GIS will be given in the first exercise.

103-0569-00L European Aspects of Spatial Development

Abstract
Following the insight into historical perspective and contemporary models of governance and planning, the course focuses on the international dimension of spatial planning in Europe. This includes a discussion of how European spatial policy is made and by whom, how planners can participate in such process and how they can address transnational challenges of spatial development cooperatively.

Objective
Keeping the general aim of exploring the European dimension of spatial planning in mind, the specific course learning objectives are as follows:
- to interpret the history of spatial planning at the transnational scale
- to understand and explain the content of the European spatial policy agenda
- to describe and analyse the role of territorial cooperation in making European spatial development patterns and planning procedures
- to discuss the changing role of planners and evaluate the ways of their engagement in European spatial policy-making

Content
- European spatial policy agenda: introduction and basic directives
- governance models
- planning models; collaborative planning model (main concepts & critics)
- post-positivist approach to spatial planning
- transnational spatial planning in Europe; questioning the European spatial planning; spatial development trends in Europe
- EU as a political system: EU institutions & non-EU actors
- planning families in Europe; the European spatial planning agenda
- spatial planning strategies and programmes on territorial cooperation
- the notion of planning culture and planning system; planning cultures in Europe
- basic characteristics of planning systems in Europe
- the relevance of European transnational cooperation for spatial planning
- European transnational initiatives: CODE 24 (Rotterdam-Genoa), Orient/east-Med corridor (Hamburg-Athens), Danube region

Lecture notes
The documents for the lecture will be provided at the moodle, https://moodle-app2.let.ethz.ch/course/view.php?id=2298.

Obligatory literature:

Recommended literature:
- Governance models:

EU as a political context:

Territorial cooperation in Europe:

Planning families and cultures:

Planning systems in Europe:

Prerequisites / notice
Only for master students, otherwise a special permission by the lecturer is required.

Electives
The entire course programs of ETH Zurich and the University of Zurich are open to the students to individual selection.

Recommended Electives of Bachelor Degree Programme

Approach with Cost Benefit Analysis in Transport

**Abstract**
The course presents cost benefit analysis and related evaluation methods in transport and introduces the survey methods used to derive the monetary values of non-market goods.

**Objective**
Familiarity with the essential methods of project appraisal

**Content**
Cost-Benefit Analysis; multi-criteria analysis; European guidelines; stated response methods; travel cost approach and others; Valuation of travel time savings; valuation of travel safety

**Lecture notes**
Handouts

**Literature**

**Prerequisites / notice**

### 101-0449-00L Management, Marketing, Quality

- **Type** Geomatics Seminar
- **ECTS** 363-1065-00L
- **Hours** 10 credits
- **Lecturers** U. A. Weidmann

**Objective**
Transport and administrative policy, international and national regulation, business management of public transport companies, marketing, advertising and pricing; quality management

**Content**
Comprehension of the transport and administrative policy as well as of the regulation of public transport companies. To develop a full understanding of the three important public transport system operations management processes: (1) Business management; (2) Marketing; and (3) Quality control. The course will teach essential working techniques in each of these processes.

(1) Transport and administrative policy: Goals of the state related to public transports, governmental activities in public transport, regulation.

(2) Business management in public transport enterprises: goals of public transport companies, goals of the business management, management of public transport on the different management levels, business organization.

(3) Marketing, advertising and pricing: Fundamentals and goals; marketing strategies and concepts in public transports; marketing tools; putting marketing into action. (4) Quality control: Quality in transport systems; goals of quality management; structuring quality control measures; collecting quality data in an operating service; use of quality control systems for service optimization.

**Lecture notes**
Course notes will be provided in German. Slides will be made available.

**Literature**
References to technical literature will be included in the course script. An additional list of literature will be given during the course.

### 363-1065-00L Design Thinking: Human-Centred Solutions to Real World Challenges

- **Type** Electives ETH Zurich
- **ECTS** 5 credits
- **Hours** 4 credits
- **Lecturers** A. Cabello Llamas, F. Rittiner, S. Brusoni, C. Hölscher, M. Meboldt

**Objective**
During the course, students will learn about different design thinking methods and tools. This will enable them to:
- Generate deep insights through the systematic observation and interaction of key stakeholders.
- Engage in collaborative ideation with a multidisciplinary (student) team.
- Rapidly prototype and iteratively test ideas and concepts by using various materials and techniques.

**Content**
The purpose of this course is to equip the students with methods and tools to tackle a broad range of problems. Following a Design Thinking approach, the students will learn how to observe and interact with key stakeholders in order to develop an in-depth understanding of what is truly important and emotionally meaningful to the people at the center of a problem. Based on these insights, the students ideate on possible solutions and immediately validated them through quick iterations of prototyping and testing using different tools and materials. The students will work in multidisciplinary teams on a set of challenges that are organized as a one-week, a three-week, and a final six-week project in collaboration with an external project partner.

Design Thinking is a deeply human process that taps into the creative abilities we all have, but that get often overlooked by more conventional problem solving practices. It relies on our ability to be intuitive, to recognize patterns, to construct ideas that are emotionally meaningful as well as functional, and to express ourselves through means beyond words or symbols. Design Thinking provides an integrated way by incorporating tools, processes and techniques from design, engineering, the humanities and social sciences to identify, define and address diverse challenges. This integration leads to a highly productive collaboration between different disciplines.

**Prerequisites / notice**
Class attendance and active participation is crucial as much of the learning occurs through the work in teams during class. Therefore, attendance is obligatory for every session. Please also note that the group work outside class is an essential element of this course, so that students must expect an above-average workload.

### Electives ETH Zurich

**Course Catalogue of ETH Zurich**

**Seminar Work**

<table>
<thead>
<tr>
<th>Number</th>
<th>Title</th>
<th>Type</th>
<th>ECTS</th>
<th>Hours</th>
<th>Lecturers</th>
</tr>
</thead>
</table>

**Abstract**
Introduction to general scientific working methods and skills in the core fields of geomatics. It includes a literature study, a review of one of the articles, a presentation and a report about the literature study.

**Objective**
Learn how to search for literature, how to write a scientific report, how to present scientific results, and how to critically read and review a scientific article.
A list of themes for the literature study are made available at the beginning of the semester. A theme can be selected based on a moodle. Agreement with one of the responsible Professors is necessary.

Abstract: Working on a concrete interdisciplinary task in Geomatics

Objective: Promote independent, structured and scientific work in an interdisciplinary context; learn to apply engineering methods; deepen the knowledge in the field of the treated task.

Content: The project work is supervised by a professor. Students can choose from different subjects and tasks. The project can be carried out in German upon mutual agreement between supervisor and student.

---

### GESS Science in Perspective

Recommended GESS Science in Perspective (Type B) for D-BAUG.

- see GESS Science in Perspective: Type A: Enhancement of Reflection Capability
- see GESS Science in Perspective: Language Courses ETH/UFHZ

---

### Master's Thesis

Before starting the Master's thesis, students must have
a. obtained the Bachelor's degree;  
b. fulfilled all specified admission conditions, if any;  
c. acquired at least 90 credits in the Master's programme, including 12 credits in the area of the interdisciplinary project.

Abstract: The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 16 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

Objective: To work independently and to produce a scientifically structured work.

Content: The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

<tbody>
<tr>
<td>103-0115-AAL</td>
<td>Geodetic Metrology II</td>
<td>E-</td>
<td>5 credits</td>
<td>4R</td>
<td>A. Wieser</td>
</tr>
</tbody>
</table>

Abstract: Advanced topics in geodetic metrology with focus on instrumental and methodic aspects for applications with higher accuracy demands.

Objective: The students acquire enhanced knowledge regarding the operating mode, the application and the limitations of modern geodetic standard instruments. They will be able to properly select, test and apply these instruments for geodetic tasks with higher accuracy requirements. They will get acquainted with the typical workflow from the preparation of the field works to the digital or plotted plan. Finally, the students will be introduced to specific geodetic tasks related to construction and civil engineering.

Content:
- The geomatics workflow
- Propagation of light in the atmosphere
- The modern total station
- Terrestrial Laserscanning
- Digital levels
- Field tests
- Traverses
- Trigonometric leveling
- Precision leveling
- Route planing and transition curves
- Earthworks: Area and cubature

Lecture notes: Slides and documents for enhanced study and further reading will be provided online.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction to the most important sensors, operation and calculation methods of Geodetic Metrology

Objective
Getting to know the most important sensors, operation and calculation methods of Geodetic Metrology

Content
Overview on the different domains of geodetic metrology
Geodetic instruments and sensors
Determination of 3D-coordinates with GNSS, total station and levelling
Calculation methods of geodetic metrology
Survey and staking-out methods

Lecture notes
Slides and additional material used in the associated regular course Geodätische Messtechnik GZ (in German) are provided in electronic form.

Literature

Prerequisites / notice
The field course is part of this lecture. Practical exercises complete the subjects taught during the semester.

If evidence of equivalent practical experience in surveying cannot be provided by the student, participation in the field course during the respective next available period (i.e. 1 week in the beginning of the summer holidays) is required.

101-0414-AAL Transport Planning (Transportation I) E- 3 credits 2R K. W. Axhausen

Abstract
The lecture course discusses the basic concepts, approaches and methods of transport planning in both their theoretical and practical contexts.

Objective
The course introduces the basic theories and methods of transport planning.

Content
Basic theoretical links between transport, space and economic development; basic terminology; measurement and observation of travel behaviour; methods of the four stage approach; cost-benefit analysis.

Literature

103-0153-AAL Cartography II E- 5 credits 4R L. Hurni

Abstract
Basic knowhow about communication with spatial information by using plans and maps, about the most important design rules and production methods for map graphics.

Objective
Acquire basic knowhow about communication with spatial information by using plans and maps, about the most important design rules and production methods for map graphics. Ability to assess existing products with respect to their content-related and design quality. Ability to design proper plans and well designed legends for basic maps.

Content
Definitions "map" and "cartography", map types, current tasks and situation of cartography, map history, spatial reference systems, map projections, map conception and workflow planning, map design, analog and digital map production technology, prepress technology, printing technology, topographic maps, map critics.

Lecture notes
Will be distributed module by module

Literature
References and other materials will be distributed by the supervisors.

103-0184-AAL Higher Geodesy E- 5 credits 4R M. Rothacher

Abstract

Objective
Overview over the entire spectrum of Higher Geodesy
The objective of this lecture is to introduce the basic concepts of image formation and explain the basic methods of signal and image processing.

Objective

Understanding core methods and algorithms in image processing and computer vision and the underlying signal processing foundations. Applying image processing algorithms to relevant problems in photogrammetry and remote sensing.

Literature

Content
- Image segmentation
The following topics will be covered in the course:
- Properties of digital images
- Signal processing/Sampling
- Image enhancement
- Image restoration: Spatial domain
- Image restoration: Fourier domain
- Color/Demosaicing
- Image compression
- Feature extraction
- Texture analysis

Lecture notes
A script will be provided as PDF files on the lecture website.

Literature
We suggest the following textbooks for further reading:
Rafael C. Gonzalez, Richard E. Woods
Digital Image Processing
ISBN: 013168728X

Rafael C. Gonzalez, Steven L. Eddins, Richard E. Woods:
Digital Image Processing Using MATLAB
Prentice Hall, 2003
ISBN: 0130085197

Prerequisites / notice
The course is accompanied by programming assignments, that need to be completed in order to pass the semester performance.

103-0313-AAL Planning I
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
The lecture introduce into the main-features of spatial planning. Attended will be the themes planning as a national responsibility, instruments of spatial planning, techniques for problem-solutions in spatial planning and the swiss concept for regional planning.

Objective
- To get to know the interaction between the community and our living space and their resulting conflicts.
- Link theory and practice in spatial planning.
- To get to know instruments and facilities to process problems in spatial planning.

103-0325-AAL Planning II
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
The lecture imparts methodological and instrumental fundamentals for spatial planning and will be exemplified by exploring two Zurich city quarters.

Objective
Spatial planning is concerned with the foresighted design of the built and un-built environment. Starting points are spatially relevant problems that need to be explored, clarified and solved. The cornerstone of the course is formed by an independent exploration by the student of two Zurich city quarters that involves investigating specific spatially relevant conditions, recognizing regularities and relevant problems.

Content
The self-study course compromises the following readings:
Chapters of:
- Lynch, Kevin: «The Image of the City»,
- Alexander, Christopher et al.: «A Pattern Language»,
- Mikoleit, Anne and Pürckhauer, Moritz: «Urban Code», and
- «SIDAIA - Spatial and Infrastructure Development: An Integrated Approach».

The graded semester performance comprises a condensed paper to be written by the student reflecting both the literature read as well as exemplarily applying the knowledge gained from the literature by independently exploring the two city quarters.

103-0435-AAL Landmanagement
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Spatial planning on the Commune level with focus on the special land use management. Land re-allocation as an instrument of spatial planning; specific explanations for land re-allocations in rural regions and in construction zones. Land marketing: the view of investors.

Objective
Getting knowledge in spatial planning and land re-allocation as an interactive process.

252-0846-AAL Computer Science II
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
Introduction to programming in Java. Procedural foundations of programming and outlook to object oriented programming. Variables, types, assignments, control structures (branch, loop), data structures, algorithms, line graphics, graphical user interface. Writing small programs. Working with a professional programming environment (Eclipse).

Objective
The students will be able to write simple programs and to modify existing programs.

Content
This course offers an introduction to variables, control structures (branch, loop), algorithms and data structures, as well as an outlook to modularisation and object oriented techniques.
In the exercises students train programming skills (in the programming language JAVA). Students can solve the exercises on their own laptop or in the computer labs at ETH. The software used in this course runs on MS Windows, MacOS X and Linux.

### Abstract

Introduction to basic methods and fundamental concepts of statistics and probability theory for non-mathematicians. The concepts are presented on the basis of some descriptive examples. Learning the statistical program R for applying the acquired concepts will be a central theme.

### Objective

The objective of this course is to build a solid fundament in probability and statistics. The student should understand some fundamental concepts and be able to apply these concepts to applications in the real world. Furthermore, the student should have a basic knowledge of the statistical programming language "R".

### Content

From "Statistics for research" (online)
- Ch 1: The Role of Statistics
- Ch 2: Populations, Samples, and Probability Distributions
- Ch 3: Binomial Distributions
- Ch 6: Sampling Distribution of Averages
- Ch 7: Normal Distributions
- Ch 8: Student’s t Distribution
- Ch 9: Distributions of Two Variables

From "Introductory Statistics with R (online)"
- Ch 1: Basics
- Ch 2: The R Environment
- Ch 3: Probability and distributions
- Ch 4: Descriptive statistics and tables
- Ch 5: One- and two-sample tests
- Ch 6: Regression and correlation

- European Credit Transfer and Accumulation System

- Special students and auditors need special permission from the lecturers.
In the last 2500 years, the mind-brain relationship has been articulated in various ways. In these lectures, I will explore the scientific and philosophical aspects of this relationship in the context of relevant cultural, historical and technological processes, with a focus on the problems of self-ownership today concerning property in one's body and intellectual property. Critical alternatives to the property paradigm will be discussed.

Participants will have the opportunity to gain access to unfamiliar texts from the philosophical tradition and to see their relevance today. They experience the consequences of a certain use of concepts and orient themselves in current bioethical, juridical and political discussions.

Participants will have the opportunity to discuss difficulties occurring within the procedures of thesis-writing. The series should provide and secure a substantial, methodological and formal orientation within the disciplines taught in the M.A.-program.

*Abstract* The last 2500 years, the mind-brain relationship has been articulated in various ways. In these lectures, I will explore the scientific and philosophical aspects of this relationship in the context of relevant cultural, historical and technological processes, with a focus on the problems of self-ownership today concerning property in one's body and intellectual property. Critical alternatives to the property paradigm will be discussed.

*Objective* Participants will have the opportunity to gain access to unfamiliar texts from the philosophical tradition and to see their relevance today. They experience the consequences of a certain use of concepts and orient themselves in current bioethical, juridical and political discussions.

*Content* Participants will have the opportunity to discuss difficulties occurring within the procedures of thesis-writing. The series should provide and secure a substantial, methodological and formal orientation within the disciplines taught in the M.A.-program.
This course addresses the role of policy and its underlying politics in the transformation of the energy sector. It covers historical, socio-economic, and political perspectives and applies various theoretical concepts to specific aspects of governing the energy transition.

Objective
- To gain an overview of the history of the transition of large technical systems
- To recognize current challenges in the energy system to understand the theoretical frameworks and concepts for studying transitions
- To demonstrate knowledge on the role of policy and politics in energy transitions

Content
Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the recent United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of the energy system necessary.

This course introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for the rate and direction of technical change in the energy sector. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It then introduces theoretical frameworks and concepts for studying innovation and transitions. It then focuses on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions and policy feedback.

The course has a highly interactive (seminar-like) character. Students are expected to actively engage in the weekly discussions and to give a presentation (15-20 minutes) on one of the weekly topics during that particular session. The presentation (30%) and participation in the discussions (20%) will form one part of the final grade, the remaining 50% of the final grade will be formed by a final exam.

Lecture notes Literatur
Slides and reading material will be made available via moodle.ethz.ch (only for registered students).

851-0069-06L Governing the Energy Transition W 2 credits 2V T. Schmidt

851-0144-19L Philosophy of Time W 3 credits 2V N. Sieroka

851-0125-61L What is the Value of Truth? W 3 credits 2G L. Wingert

851-0101-18L "Bollywood and Beyond" - A Cultural History of Indian Cinema in the 20th Century W 3 credits 2V H. Fischer-Tiné

Since antiquity philosophy reflects about and evaluates technology. The technical developments in the 19th and 20th century have led to a autonomous philosophy of technology, which had become important also for other philosophical disciplines (e.g. in Heidegger's philosophy).

The course gives an overview on the main schools in the philosophy of technology. Students should learn to analyse and evaluate different philosophies of technology (compensation, objectification, externalisation). For credit point a critical protocol is to be written.

Primarily suited for Master and PhD level

This course addresses the role of policy and its underlying politics in the transformation of the energy sector. It covers historical, socio-economic, and political perspectives and applies various theoretical concepts to specific aspects of governing the energy transition.

- To gain an overview of the history of the transition of large technical systems
- To recognize current challenges in the energy system to understand the theoretical frameworks and concepts for studying transitions
- To demonstrate knowledge on the role of policy and politics in energy transitions

Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the recent United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of the energy system necessary.

This course introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for the rate and direction of technical change in the energy sector. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It then introduces theoretical frameworks and concepts for studying innovation and transitions. It then focuses on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions and policy feedback.

The course has a highly interactive (seminar-like) character. Students are expected to actively engage in the weekly discussions and to give a presentation (15-20 minutes) on one of the weekly topics during that particular session. The presentation (30%) and participation in the discussions (20%) will form one part of the final grade, the remaining 50% of the final grade will be formed by a final exam.

A reading list will be provided via moodle.ethz.ch at the beginning of the semester.

This course provides an introduction to philosophical issues surrounding the concept of time. We will treat topics such as: the existence of past, present, and future; the possibility of time travel; the constitution of time consciousness and its possible neurophysiological counterparts; temporal biases in the conduct of our lives; responsibility to future and past generations.

By the end of the course students are able to describe and compare different theories and concepts of time (physical time, perceptual time, historical time ...). They are able to identify and examine issues concerning time as they occur in various philosophical subdisciplines - especially in philosophy of science, philosophy of mind, metaphysics, and ethics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific and social contexts.

Part of the course reflects on methods and contents from physics, neuroscience/cognitive science, and logic.

Primarily suitable for students of D-BIOL, D-INFK, D-MATH, D-PHYS

This course provides an introduction to philosophical issues surrounding the concept of time. We will treat topics such as: the existence of past, present, and future; the possibility of time travel; the constitution of time consciousness and its possible neurophysiological counterparts; temporal biases in the conduct of our lives; responsibility to future and past generations.

By the end of the course students are able to describe and compare different theories and concepts of time (physical time, perceptual time, historical time ...). They are able to identify and examine issues concerning time as they occur in various philosophical subdisciplines - especially in philosophy of science, philosophy of mind, metaphysics, and ethics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific and social contexts.

851-0512-05L  Development Cooperation from a Biographical Point of View  W  3 credits  2U  G. Spuhler

Abstract  The Archives of Contemporary History provide 75 video interviews with contemporary witnesses who report on their missions abroad for Swiss humanitarian aid and development cooperation. Based on selected interviews the motives of their commitment and the experience in a foreign country are examined.

Objective  The course provides basic knowledge about the beginnings of modern development aid and its increasing professionalism. It aims for an critical and historically informed reflection on the transfer of knowledge and technology between the first and the third world. Furthermore it sharpens the critical awareness of the possibilities and limitations of retrospective accounts of eyewitnesses.

851-0125-63L  Images of Mathematics  W  3 credits  2G  M. Hampe, A. Schubbach

Abstract  The lecture series "Images of Mathematics" deals with the formalization of the objects and the logical language of mathematics from Hilbert to Gödel and considers its consequences in view of our conception of mathematical practice and knowledge, the limits of calculability and computability in mathematics, and the relation between the logical proof procedures and the involved intuitive aspects.

Objective  The lecture series will present philosophical problems of theoretical mathematics in the 20th century and will discuss the consequences of formalization and axiomatization. It aims at a critical reflection on the modern images of mathematics.

Content  How we understand Mathematics is probably strongly influenced by the Mathematics lessons we participated in during our school days. The common image of mathematics is therefore often characterized by the impression of a very stable form of knowledge with clear-cut problems and suitable recipes for finding the solution. It is a very static image which is very much in conflict with the rapid series of innovations that the discipline has experienced especially since the 19th century: Mathematics as a field of research has been highly innovative and even revolutionary as few other scientific disciplines in the last 200 hundred years.

These mathematical innovations did not only contribute to a progress amassing more and more knowledge. They very often changed how mathematicians conceived of their discipline. Even a contribution to a specific research question that appears at first sight to be minor can sometimes establish new connections to other fields, found a whole research field of its own or introduce new methods thereby changing the whole image of mathematics in the same way that a small addition to a picture can alter radically what we take it to represent.

Moreover, Gödel’s theorems open many far-reaching and intriguing questions in view of our image of mathematics, questions concerning the conception of mathematical practice and knowledge, the limits of calculability and machines in mathematics, the relation between the logical proof procedures and the involved intuitive aspects. In short, the image of mathematics is not as static as we sometimes expect it to be, it was radically redrawn by the mathematicians of the 20th century and has since then again been open to diverging interpretations.

851-0125-51L  Man and Machine  W  3 credits  2G  M. Hampe

Abstract  The lecture gives an overview about the different Man-Machine-Relations since the 16th century. Different models of machines will be important here: the clockwork, the steam engine and the computer.

Objective  On the one hand modells of machines had a heuristical value in research on man, e.g. in Harvey’s discovery of blood circulation in the 17th century or in brain research in the 20th century. On the other hand these modells were always criticised, sometimes polemically, because they are supposedly not adequate for man.

Students should learn about the connections between the history of anthropology and technology and be able at the end of the course to evaluate the critical philosophical arguments that are connected with the metaphor of the machine.

851-0300-85L  The Knowledge of Literature. An Introduction  W  3 credits  2V  A. Kilcher

Abstract  This lecture provides a general introduction to literary theory and presents the important theories dealing with knowledge and its role in and as literature.

Objective  Students are introduced to the various approaches and methods of literature studies and gain an overview of literary theory.

Content  This lecture has two aims: Firstly, it serves as a general introduction into the field of literary theory (thereby looking into "knowledge about literature"). Secondly, there will be a special emphasis on recent theoretical approaches that take seriously literature and knowledge as one of its components (thus investigating the "knowledge of literature"). Even though traditional criticism disagrees, a number of recent approaches, based on literature and culture studies, hold that literature is not to be conceived of as standing in opposition to the world and the classificatory system of the academic disciplines, particularly the sciences (e.g. Foucauldian discourse analysis and New Historicism). Instead, these approaches understand literature in terms of its epistemological forms and functions. Thus, the main thesis is that literature actively participates in the constitution and formation of knowledge. Literature itself generates models of knowledge, sometimes with critical or even utopian intentions. Moreover, it draws attention to the fundamental role of order and representation (systematization, narrative rendering, linguistic and pictorial representation) in both humanities and sciences.

851-0125-60L  Introduction to Epistemology  W  3 credits  2G  N. El Kassar

Abstract  In this course we will examine fundamental questions of epistemology, e.g. What is knowledge? How are we to conceive of perception? Which beliefs are rational and justified? How do we acquire knowledge? By discussing a selection of seminal philosophical texts we will study fundamental epistemological theories.
Objective - conceptions of fundamental epistemological concepts
- sensitivity to epistemological questions
- capacity to reflect epistemological theories
- capacity to discuss epistemological theories
- reading philosophical texts (including English texts)

<td>Readings in Environmental Thinking</td>
<td>W</td>
<td>3</td>
<td>2S</td>
<td>J. Ghanou, G. Hirsch Hadorn, A. Patt</td>
</tr>
<tr>
<td>Abstract</td>
<td>This course introduces students to foundational texts that led to the emergence of the environment as a subject of scientific importance, and shaped its relevance to society. Above all, the course seeks to give confidence and raise enthusiasm among students to read more widely around the broad subject of environmental sciences and management both during the course and beyond.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The course will provide students with opportunities to read, discuss, evaluate and interpret key texts that have shaped the environmental movement and, more specifically, the environmental sciences. Students will gain familiarity with the foundational texts, but also understand the historical context within which their academic and future professional work is based. More directly, the course will encourage debate and discussion of each text, and the course will be studied from both the original context as well as the modern context. In so doing students will be forced to consider and justify the current societal relevance of their work.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The course will be run as a book reading club. The first session will provide a short introduction as to how to explore a particular text (that is not a scientific paper) to identify the key points for discussion.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Literature</td>
<td>Thereafter, in each week a text (typically a chapter from a book or a paper) considered to be seminal or foundational will be assigned by a course lecturer. The lecturer will introduce the selected text with a brief background of the historical and cultural context in which it was written, with some additional biographical information about the author. He/she will also briefly explain the justification for selecting the particular text.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The students will read the text, with two to four students (depending on class size) being assigned to present it at the next session.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Presentation of the text requires the students to prepare by, for example:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- identifying the key points made within the text</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- identifying issues of particular personal interest and resonance</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- considering the impact of the text at the time of publication, and its importance now</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- evaluating the text from the perspective of our current societal and environmental position</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Such preparation would be supported by a mid-week tutorial discussion (about 1 hour) with the assigning lecturer.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>These students will then present the text (for about 15 minutes) to the rest of the class during the scheduled class session, with the lecturer facilitating the subsequent class discussion (about 45 minutes). Towards the end of the session the presenting students will summarise the emerging points (5 minutes) and the lecturer will finish with a brief discussion of how valuable and interesting the text was (10 minutes). In the remaining 15 minutes the next text will be presented by the assigning lecturer for the following week.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The specific texts selected for discussion will vary, but examples include:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Leopold (1949) A Sand County Almanach</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 726 of 1570
This course provides an introduction to philosophical issues surrounding quantum physics. In particular, we will examine different interpretations of quantum mechanics (such as the many-world interpretation) and the transition between the quantum and the classical physical realm (here phenomena such as decoherence will be highlighted).

By the end of the course students are able to describe and compare different interpretations of quantum mechanics. They are able to identify and examine issues concerning these different interpretations and issues concerning the transition between quantum and classical descriptions in physics. Students are in a position to critically discuss and evaluate the repercussions of these issues in broader scientific contexts.

**851-0301-05L**

**Beginnings**

*W* 3 credits 2S C. Jany

**Abstract**

"All beginnings are difficult," goes the saying, "but without them there wouldn't be an end." However, what makes beginnings so difficult? What kind of action is that? Which knowledge does it presuppose? And what would a beginning say about the end? We will pursue these questions by reading sacred, philosophical, literary, and scientific texts that, each in its own way, make a beginning.

**Objective**

- thorough reading and critical analysis of the texts
- reflection upon the conditions and practice of beginnings in terms of their epistemology and rhetorical strategy (i.e. as an intellectual and literary operation)
- consider the cultural and historical function of fictions that tell of origins, such as cosmological myths, foundationalist philosophy, or poetic incantations

**Literature**

Myths of Creation and First Origins (Genesis und Gospel of St. John, Theogony, Upanishads), philosophy (Fichte, Hegel), literature and poetry (Wieland, Hölderlin, Novalis, Wordsworth, Melville, Richard Wagner, Beckett). For an introduction, see Wolfgang Iser, Emergenz: Nachgelassene und verstreut publizierte Essays (Konstanz 2013).

**Prerequisites / notice**

readings partly in English

**851-0306-05L**

**Literature and Technology - Simulations, Prototypes, Machines**

*W* 3 credits 2S E. Edelmann-Ohler

**Abstract**

Literature about technology transposes models, products, and procedures of scientific progress into the logic of poetry. This literature converts not only technology into fiction, but it also creates new cultural and social contextualisations, which reveal alternative readings of configurations of knowledge.

**Objective**

Students are familiar with different relations between literature and technology. They can verbalise and analyse central contents.

**Content**

**851-0551-03L**

**Postal Knowledge and the History of Digital Societies**

*W* 3 credits 2S D. F. Zetti

**Abstract**

In the second half of the 20th century, postal services have dramatically changed. Communication today is computer-based. The lecture offers problem oriented insights into this sociotechnical process of translation.

**Objective**

Students become familiar with the mutual interdependence of social and technological change that characterises the history of computing and communication.

**Content**

**851-0157-66L**

**Who was Sigmund Freud?**

*W* 3 credits 2S M. Hagner

**Abstract**

This seminar is devoted to the introduction into the ideas and concepts of one of the most influential thinkers of the 20th century. We will read selected texts by Freud for getting an overview over his medical, psychological and cultural thinking.

**Objective**

30 years ago it would have been bizarre to ask the question: Who was Sigmund Freud? The influence of psychoanalysis on twentieth century thinking was taken for granted even by those ones who rejected Freud's ideas. In contrast, the question today would be: What are Freud's central theories? We will tackle this question in the seminar and reconstruct Freud's thinking from his early medical writings to those writings, in which he developed a critical view of his time. The aim of the seminar is not only to understand Freud's thinking in historical context, but also to reflect, what it could mean to us in early twentyfirst century.

**851-0127-28L**

**Death - The Secret Problem of Life**

*W* 3 credits 2S H. Wiedebach

**Abstract**

No detective novel without a corpse, no religion without knowledge about death and life, no large transplantation of an organ without certificate for the donor's death. Is a dead person always a corpse? - Death is part of life and yet stands simultaneously in opposition to it. We cling to life and nonetheless wish to have the option to commit suicide. Do we know what we really want in that case?

**Objective**

Discussion of 1) several conceptions of death in history, 2) determination of death in a medical sense (brain-death, etc.). 3) The search for a personal view about life and death. 4) The practice of a precise manner of speaking based on reflection.

**Literature**

Texte als Diskussionsgrundlage werden zu Beginn des Semesters genannt bzw. als PDF unter "Lernmaterialien" veröffentlicht.

**Prerequisites / notice**

- Organisatorische Rückfragen bitte an den Assistenten Raphael Salvi: raphael.salvi@phil.gess.ethz.ch
- Vor- und Nachname, Matrikelnummer, Veranstaltungsname, Dozent, E-Mail-Adr., Studiengang.
- Ihre Texte schicken Sie bitte an die eigens eingerichtete Email-Adresse: grundproblem-tod@ethz.ch
- Formalia (Minimalanforderungen):
  - Schriftbild: Zeilenabstand 1.5, Schriftgrösse 12, Seitenabstand 2.5cm, Schriftart: Arial, Times New Roman.
  - Vor- und Nachname, Matrikelnummer, Veranstaltungsname, Dozent, E-Mail-Adr., Studiengang.
- Gottfried Wilhelm Leibniz: "Das Gegenwart des Todes im Leben".

**851-0125-57L**

**Values in Science**

*W* 3 credits 2S K. Bschir

**Abstract**

Number of participants limited to 25

This seminar is devoted to the introduction into the ideas and concepts of one of the most influential thinkers of the 20th century. We will read selected texts by Freud for getting an overview over his medical, psychological and cultural thinking.

**Objective**

This seminar is devoted to the introduction into the ideas and concepts of one of the most influential thinkers of the 20th century. We will read selected texts by Freud for getting an overview over his medical, psychological and cultural thinking.
Creativity

A. Teicher

Publish or Perish, 1800-2016: On the History of Scientific Publishing

In the past decades, philosophers of science have begun to challenge the value-free ideal in science. With the help of recent literature from the philosophy of science, students will be introduced to the debate on values in science and the reasons for why the value-free ideal has come under attack. They will be familiarized with the distinction between epistemic (truth-conducive) values and so-called non-epistemic values. The course aims at enabling students to critically reflect the potential role of non-epistemic values in science.

**Abstract**

Should science be free from moral, political or ideological influences? According to the so-called value-free ideal it should. Many scientists think of themselves as committed to truth and objectivity and nothing else. In this seminar, we will track the history of the value-free ideal and engage in a debate about the potential role of so-called non-epistemic values in science.

**Prerequisites**

None

**Number of participants limited to 40.**

**Literature**

www.blogs.ethz.ch/valuesincience/

**851-0157-67L**

**Creativity**

W 3 credits 2S M. Wulz, V. Wolff

**Objective**

In the past decades, philosophers of science have begun to challenge the value-free ideal in science. With the help of recent literature from the philosophy of science, students will be introduced to the debate on values in science and the reasons for why the value-free ideal has come under attack. They will be familiarized with the distinction between epistemic (truth-conducive) values and so-called non-epistemic values. The course aims at enabling students to critically reflect the potential role of non-epistemic values in science.

**Abstract**

Being creative may appear to be the most important requirement of the present age: creative thinking, start-ups, project development all seem to promise an ongoing innovation of work and life. Instead of repeating that promise once again, this course asks for the historical conditions of discourses of creativity.

**Objective**

We will deal with historical and contemporary theories of inventive imagination, fantasy, and creativity. Looking at artistic, psychological, pedagogical, economic, and entrepreneurial discourses of creativity from the 18th to the 21st century we will discuss their specific contexts in order to uncover historical differences and changes. Is it indeed possible to identify conjunctions between the economization, scientification and normalization of creativity? Are there any alternatives to the reigning paradigm of creativity? And if so, what are those?

**Prerequisites**

None

**Number of participants limited to 40.**

**Literature**

www.blogs.ethz.ch/valuesincience/

**851-0157-68L**

**Publish or Perish, 1800-2016: On the History of Scientific Publishing**

W 3 credits 2S N. Guettler, M. Stadler

**Abstract**

This seminar deals with the present, past, and imaginary futures of scientific publishing. We shall discuss the origins and trajectories of specific formats, conventions, and genres as well as examine exemplary historical developments as regards scientific publishing and associated cultures of science.

**Objective**

The technological upheavals wrought by the "digital age" have put the subject of scientific publishing on the map (again). Open access, copyright, etc. are just a few of the buzzwords that have defined controversies in recent years. The aim of this seminar is assist students in developing critical perspectives on these contemporary debates - by learning about the history of scientific publishing, including the role of specific publishers and journals, the footnote, or the malleable nature of authorship.

**Prerequisites**

Please note that the seminar will be held in English and most texts will be in English. However, a small portion of the reading material will be in German.

**851-0157-70L**

**The Mathematics of Scientific Racism**

W 2 credits 1S A. Teicher

**Abstract**

How did racial scientists determine racial affiliation? In the seminar we will examine the practical challenges and anthropological arguments from 1850 to the present. By scrutinizing the scientific toolbox of racial scientists, we will reveal how national affiliation, anti-Semitic perceptions and gender identity shaped scholars' choices of graphical and computational methods.

**Objective**

The aim of the course is to analyze the mutual relations between scientific theories and social perceptions, and to follow the formation of the "scientific mind". The course focuses on racial scientists and on the way their practices of computation and statistical analysis influenced their world-views - and vice versa. The students will be instructed on the way historians of science analyze scientific sources. They will gain a better understanding of the complexities of disciplinary dynamics, social biases and institutional pressures shaping scientific ideas, and learn on the influences such scientific ideas may have on the society as a whole.

**Prerequisites**

Please note that the seminar will be held in English and most texts will be in English. However, a small portion of the reading material will be in German.

**851-0157-69L**

**History of Astronomy**

W 3 credits 2S S. Mastorakou

**Abstract**

The course is designed to provide an overview of the astronomical developments from the ancient Greek world to the 16th century. We are going to use primary sources tackling historical, technical and philosophical questions. Special attention will be paid to the dramatic change in the way people understood the structure of the heavens and the nature of the physical world.

**Objective**

The course aims at providing a working knowledge of astronomy and cosmology from the ancient world to the 16th century. Upon its completion the students will be able to describe how our knowledge of the heavens changed from Aristotle's system to the Copernican Revolution. In addition, they will also have acquired an appreciation of the debates about man's place in the cosmos and the philosophical principles underpinning cosmology.

**851-0300-79L**

**Theories of Joke**

W 3 credits 2S A. Kilcher

**Abstract**

From Plato, Aristotle and Cicero, philosophers have tried to find the core principle of wit (or the joke, as both meanings are contained in the German term "Witz"). Even during the 20th century, the philosophy of life and psychoanalysis struggle with it. The seminar provides an overview of this history.

**Objective**

This seminar deals with the meaning and history of "Witz" (wit, joke) as a form of knowledge. It places "Witz" as a switch or transitional figure within the development of modern theories of knowledge in particular.

**Content**

Contrary to intuitive expectations, the German term "Witz" is not only an instance of the comical, but also a form of knowledge that plays on principles underpinning cosmology.

**851-0101-53L**

**Collections in Context: What Do Historians and Scientists Learn from Butterflies, Stones, and Bones?**

W 3 credits 2S B. Schar, M. Greeff

**Abstract**

Zurich holds huge scientific collections. They contain objects from around the world, some of them dating back to the 18th century. This interdisciplinary seminar combines perspectives from the history of science and from current scientific disciplines. What do these objects tell us about Zurich's place in the global history of science? What potentials do old collections hold for scientists today?

**Objective**

The aim of this seminar is threefold: Firstly, students will become familiarised with historiographical approaches to scientific collections. Among them are constructivist approaches that seek to understand scientific knowledge not primarily as a system of objective truths, but rather as an outcome of human 'constructions'. Other approaches deal with the problem of how scientific objects are related to systems of power and oppression, namely in the case of objects collected during the time of European colonialism overseas. Secondly, students will become familiarized with how old collections can yeald new insights for current scientists working, e.g., on questions of ecology. Thirdly, the seminar shall serve as a plattform to discuss ways of dialogue and possible collaboration between these different approaches.

Students will be expected to read theoretical texts and case studies during semester, participate in discussions with external experts (historians, curators, and scientists), and to write a summarizing essay at the end of the term.

### Major Courses

#### Essays

In each subject of the master reading lists are handed out. The books on these lists are the subject of the tutorials one has to attend with the teachers that are named in the Leitaden. In three subjects essays are to be written about works on these lists.

Abstract
The colloquium of the ZGW focuses on present developments, debates and perspectives in the field of history of knowledge. On the second and fourth date there will be public events in the Cabaret Voltaire.

Objective
The colloquium deals with the general problems, questions and methods of the interdisciplinary research field “The History of Knowledge”. Knowledge has become one of the existential conditions of modern societies and it increasingly determines their dynamics. Therefore, it is getting more and more relevant to develop a differentiated analysis of the epistemic, social and cultural constraints of the production, circulation and the decay of knowledge. In addition, the colloquium asks after the cultural and ethical resonances of knowledge not only within science but also in relation to art, literature, technology, everyday life, and so on.

Prerequisites / notice
Short notice about program changes are possible and will be communicated through the ZGW newsletter. Please register with www.zgw.ethz.ch/de/newsletter.html
Credit points can be gained by regular attending and by writing an essay. In addition to the five colloquia there will be a deepening seminar on offer (lecturer K. Esphahangiz).

Free childcare available.

862-0078-02L Research Colloquium. Extra-European History and Global History (HS 2016)
For PhD students and postdoctoral. Masterstudents are welcome.

Abstract
The fortnightly colloquium provides a forum for PhD students and postdoctoral researchers to present and discuss their current work. Half of the slots are reserved for presentations by invited external scholars.

Objective
PhD students will have an opportunity to improve their presentation skills and obtain an important chance to receive feedback both from peers and more advanced scholars.

862-0004-03L Philosophical Colloquium (HS 2016)
Ph.D. students, post docs, members of staff, and senior colleagues from other philosophy departments will report on their work in progress. Furthermore, promising new philosophical articles and parts of new philosophical books will be studied.

Objective
Ideas and arguments dealing with systematic problems especially in epistemology, ethics, political philosophy, and the philosophy of mind will be scrutinized and elaborated.

Master’s Thesis
The work on the master-thesis is supervised by one of the teachers that are allowed to offer tutorials for it, named in the Leitfaden.

Number Title Type ECTS Hours Lecturers
862-0500-00L Master’s Thesis O 30 credits 64D Supervisors

Abstract
A student is only permitted to commence the Master thesis if
a. the Bachelor degree programme has been completed
b. any additional requirements for admission to the degree programme have been fulfilled
c. all credits have been acquired in the category research colloquium

Abstract
The Master’s thesis gives a thorough historical, philological or philosophical analysis of a topic related to the experimental or formal sciences or to technology. It incorporates the relevant research literature on this topic as well as first attempts at original research.

Objective
The master thesis gives a thorough historical, philological or philosophical analysis of a topic related to the experimental or formal sciences or to technology. It incorporates the relevant research literature on this topic as well as first attempts at original research.

Data: 06.09.2017 12:54 Autumn Semester 2016 Page 731 of 1570
The text-book "Biology" (Campbell, Reece) (10th edition) is the basis of the course.

C. Thilgen

Students understand mathematics as a language for modeling and as a tool for solving practical problems in natural sciences. Students can analyze models, describe solutions qualitatively or calculate them explicitly if need be. They can solve examples as well as their practical applications manually and using computer algebra systems.

Einführung in die Differential- und Integralrechnung von Funktionen einer Variablen und Anwendungen:

L. Papula, Mathematik für Ingenieure und Naturwissenschaftler, 11. Auflage, Vieweg und Teubner

Th. Wähler, Mathematik für Naturwissenschaften, 2 Bände: Einführung in die Analysis, Einführung in die Lineare Algebra; Haupt-Verlag Bern, UTB

Ch. Blatter, Lineare Algebra; VDF

H. H. Storrer: Einführung in die mathematische Behandlung der Naturwissenschaften I; Birkhäuser.
Prerequisites / notice
Der Zugang zu den Übungsgruppen erfolgt online. Vorlesungsverzeichnis > Lernmaterialien > Material zur Vorlesung

252-0852-00L Foundations of Computer Science 4 credits 2V+2U L. E. Fässler, H.J. Böckenhauer, M. Dahinden, D. Komm, H. Lehner

Abstract
Students learn to apply selected concepts and tools from computer science for working on interdisciplinary projects.

The following topics are covered: modeling and simulations, introduction to programming, visualizing multi-dimensional data, introduction matrices, managing data with lists and tables and with relational databases, universal methods for algorithm design.

Objective
The students learn to
- understand the role of computer science in science,
- to control computer and automate processes of problem solving by programming,
- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data,
- know universal methods for algorithm design.

Content
1. The role of computer science in science
2. Introduction to Programming with Python
3. Modeling and simulations
4. Introduction to Matrices with Matlab
5. Visualizing multidimensional data
6. Data management with lists and tables
7. Data management with a relational database
8. Universal methods for algorithm design

Lecture notes
All materials for the lecture are available at www.gdi.ethz.ch

Prerequisites / notice
This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

376-0003-00L Introduction to Health Sciences and Technology I 4 credits 2V+2U R. Müller

Abstract
Overview on various aspects of health and disease (health models, classification of diseases, prevention and rehabilitation, therapy, epidemiology); introduction to technical aspects (diagnostics, measurement technique); fundamentals of scientific working (ethics, literature search, study design, data collection, data analysis and data presentation).

Objective
Students should know the terms, models and classification systems used in health and disease; in addition, they should understand the methods of scientific working.

Content
- Health: biomedical model and classification of diseases, salutogenesis and ICF, prevention and rehabilitation, therapy, epidemiology.
- Technology: diagnostics, measurement technology, automatic control engineering.
- Science: ethics, literature search, study design, tests, data analysis, data presentation

First Year Laboratory Courses

Number Title Type ECTS Hours Lecturers
376-0003-01L Demonstration Week Health Sciences and Technology I O 1 credit 2P R. Müller, W. Langhans, S. Lorenzetti, R. Rainer, M. Ristow, M. E. Schwab, N. Wenderoth, further lecturers

Abstract
Delivery of practical insight into research methods relevant to the field by means of demonstrations and small projects in the areas of Human Movement Science and Sport, Medical Technology, Molecular Health Sciences, and Neurosciences.

Objective
Students can experience research methods that may arise in the field of Health Sciences and Technology.

Content
- Human Movement Science and Sport: movement analysis, biomechanical measurement techniques
- Medical Technology: prostheses
- Molecular Health Sciences: metabolism, behaviour
- Neurosciences: neurological measurement techniques, neurorehabilitation
- Clinical Research

Second Year Compulsory Subjects

Examination Blocks

Examination Block 1

Number Title Type ECTS Hours Lecturers
551-0103-00L Fundamentals of Biology II: Cell Biology O 5 credits 5V E. Hafen, U. Kutay, J. Matos, G. Schertler, U. Suter, S. Werner

Abstract
The goal of this course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Objective
The goal of this course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Content
The focus is animal cells and the development of multicellular organisms with a clear emphasis on the molecular basis of cellular structures and phenomena. The topics include biological membranes, the cytoskeleton, protein sorting, energy metabolism, cell cycle and division, viruses, extracellular matrix, cell signaling, embryonic development and cancer research.

Lecture notes
The lectures are presented in the Powerpoint format. These are available on the WEB for ETH students over the nethz (Moodle). Some lectures are available on the ETH WEB site in a live format (Livestream) at the above WEB site.

Literature

Prerequisites / notice
Some of the lectures are given in the English language. Certain sections of the text-book must be studied by self-instruction.
**Product Design in Medical Engineering**

**O** 4 credits  **2V+2U**  **S. J. Ferguson**

**Abstract**
This course will provide insight into various aspects of medical device design such as patient needs assessment, product specification, research and technical design, validation, regulatory affairs and clinical evaluation.

**Objective**
The goal of this lecture series is to enable the students to (i) identify the principal functional requirements for a medical device, (ii) to understand the mechanical properties of natural tissues and synthetic biomaterials, (iii) to apply this information and a basic knowledge of mechanics in the calculation of implant performance, (iv) to develop a plan for the pre-clinical evaluation and regulation of a new device.

**Content**
1. Introduction to Medical Technology
2. Design Process
3. Mechanics
4. Mechanics of Materials
5. Tissue Mechanics
6. Prostheses: Biomechanics and Design
7. Prostheses: Biomaterials, Surfaces and Wear
8. Allografts: Heart Valves
9. Preclinical Evaluation
10. Regulatory Affairs (MepV, FDA, CE)
11. Intellectual Property
12. Group Work and Presentation

**Abstract**
Vertiefung der mehrdimensionalen Analysis mit Schwerpunkt in der Anwendung der partiellen Differentialgleichungen, Vertiefung der Linearen Algebra und Einführung in die Systemanalyse und Modellbildung.

**Objective**
+ verstehen Mathematik als Sprache zur Modellbildung und als Werkzeug zur Lösung angewandter Probleme in den Naturwissenschaften.
+ können anspruchsvolle Modelle analysieren, Lösungen qualitativ beschreiben oder allenfalls explizit berechnen: diskret/kontinuierlich in Zeit, Ebene und Raum.
+ können Beispiele und konkrete arithmetische und geometrische Situationen der Anwendungen mit Methoden der höheren Mathematik interpretieren und bearbeiten.

**Content**
#### Modellbildung ####
- Einführung und Beispiele
- Mehdimensionale Modelle
- Pocken-Modell
- SIR-Modell

#### Lineare Modelle ####
- Vektorräume
- Diagonalisierbarkeit
- Normalformen
- Exponential einer Matrix
- Lösungsraum eines Linearen DGL-Systems

#### Fourier-Reihen ####
- Euklidische Vektorräume
- Orthogonale Projektion
- Anwendungen

#### Nichtlineare Modelle ####
- Stationäre Lösungen, Qualitative Aussagen
- Mehdimensionale Modelle: Räuber-Beute, Lotka-Volterra

#### Partielle Differentialgleichungen ####
- Einführung, Repetition, Beispiele
- Fourier-Methoden: Wärmeleitung, Laplace, Wellengleichung, Filter, Computertomographie

#### Laplace-Transformation ####
- Definition und Notation
- Rechensituationen
- Anwendungsbeispiel

Abstract
Basic knowledge of the anatomy and physiology of tissues, of the embryonal and postnatal development, of the basic terminology of pathology, the neuro-muscular system, the cardiovascular system and the respiratory system.

Objective
Basic knowledge of human anatomy and physiology and basics of clinical pathophysiology.

Content
Short overview of human anatomy, physiology and general pathology.

Anatomy and Physiology I (fall term):
Basics of cytology, histology, embryology, general pathology; nervous system, muscles, cardiovascular system, respiratory system

Anatomy and Physiology II (spring term):
Digestive system, kidney and urinary tract, endocrine system, skin, thermoregulation, sensory organs, male and female reproductive system, pregnancy and child birth.

Abstract
Introduction to the concepts and tools in physics with the help of demonstration experiments: mechanics of point-like and ridged bodies, periodic motion and mechanical waves.

Objective
The concepts and tools in physics, as well as the methods of an experimental science are taught. The student should learn to identify, communicate and solve physical problems in his/her own field of science.

Content
Mechanics (motion, Newton's laws, work and energy, conservation of momentum, rotation, gravitation, fluids), Periodic Motion and Waves (periodic motion, mechanical waves, acoustics).

Lecture notes
The lecture follows the book "Physics" by Paul A. Tipler.

Literature
Paul A. Tipler and Gene P. Mosca, Physics (for Scientists and Engineers), W. H. Freeman and Company

Prerequisites / notice
Prerequisites: Mathematics I & II

Abstract
Advanced knowledge of anatomy and physiology, molecular mechanisms and cellular function of tissues as well as pathophysiological aspects of different organ systems.

Objective
Advanced knowledge of human anatomy and physiology and of molecular and pathophysiological aspects.

Content
Advanced Anatomy and Physiology I (fall term): Closer look to the nervous system, Advanced Anatomy and Physiology II (spring term): Introduction to Molecular Biology; Closer look to muscles, cardiovascular system, and respiratory system as well as immunology.

Abstract
Learning to view the human body as a (bio-) mechanical system. Making the connections between everyday movements and sports activity with injury, discomfort, prevention and rehabilitation.

Objective
Students are able to describe the human body as a mechanical system. They analyse and describe human movement according to the laws of mechanics.

Content
Movement- and sports biomechanics deals with the attributes of the human body and their link to mechanics. The course includes topics such as functional anatomy, biomechanics of daily activities (gait, running, etc.) and looks at movement in sport from a mechanical point of view. Furthermore, simple reflections on the loading analysis of joints in various situations are discussed. Additionally, questions covering the statics and dynamics of rigid bodies, and inverse dynamics, relevant to biomechanics are investigated.

Abstract
This course provides an overview over molecular and systemic aspects of neuromuscular, cardiovascular and respiratory adaptations to acute and chronic exercise as well as the interactions of the different systems influencing factors, e.g. genetics, gender, age, altitude/depth, heat/cold, with respect to performance and health.

Objective
The aim of this course is to understand molecular and systemic aspects of neuromuscular, cardiovascular and respiratory adaptations to acute and chronic exercise as well as the interaction of the different systems regarding health-relevant aspects and performance in healthy people and persons with selected diseases. Furthermore, students will understand the influence of genetics, gender, age, altitude/depth, heat and cold on the named factors.

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 735 of 1570
Content: History of Exercise Physiology, research methods, fibertype heterogeneity and its functional significance, neural control of muscle force, molecular nad cellular mechanisms of muscle adaptation to resistance, endurance and stretching exercise, interindividual variability in the response to training, cardiorespiratory and metabolic responses to acute and chronic exercise, sexi differences relevant to exercise performance, exercise in hot and cold environment, children and adolescents in sport and exercise, exercise at altitude and depth, aging and exercise performance, exercise for health, exercise in the context of disease.

Lecture notes: Online material is provided during the course.

Literature: Recommended textbooks:

Abstract: The course covers the development of the nervous system (NS) with a focus on neurogenesis and migration, axon growth, synapse formation, mol. & cell. mechanisms, and diseases of the developing NS.
### Lecture notes

- **Structure, Plasticity and Repair of the Nervous System**
  - **W 3 credits 2V**
  - **M. E. Schwab, L. Fili, K. A. Martin, further lecturers**
  - **Objective**: The aim is to give a deepened insight into the structure, plasticity and regeneration of the nervous system.
  - **Content**: Sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.
  - **Lecture notes**: Lecture notes are distributed and are mentioned on OLAT.
  - **Prerequisites / notice**: None. Bring something to write and your student ID.

**Description**: The course covers the structure, plasticity and regeneration of the adult nervous system (NS) with focus on: sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.

**Objective**: The aim is to give a deepened insight into the structure, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

**Content**: Sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.

**Lecture notes**: Lecture notes are distributed and are mentioned on OLAT.

**Prerequisites / notice**: None. Bring something to write and your student ID.
Abstract
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

Objective
This course presents the fundamentals of transport phenomena with emphasis on mass transfer. The physical significance of basic principles is elucidated and quantitatively described. Furthermore, the application of these principles to important engineering problems is demonstrated.

Content
Fick's laws; application and significance of mass transfer; comparison of Fick's laws with Newton's and Fourier's laws; derivation of Fick's 2nd law; diffusion in dilute and concentrated solutions; rotating disk; dispersion; diffusion coefficients, viscosity and heat conduction (Pr and Sc numbers); Brownian motion; Stokes-Einstein equation; mass transfer coefficients (Nu and Sh numbers); mass transfer across interfaces; Reynolds- and Chilton-Colburn analogies for mass-, heat-, and momentum transfer in turbulent flows; film-, penetration-, and surface renewal theories; simultaneous mass, heat and momentum transfer (boundary layers); homogenous and heterogenous reversible and irreversible reactions; diffusion-controlled reactions; mass transfer and first order heterogenous reaction. Applications.

Literature

Prerequisites / notice
Two tests are offered for practicing the course material. Participation is mandatory.

### 376-1117-00L Sport Psychology

**Objective**
To gain basic knowledge of sports pedagogy and to recognize starting points for applied sports pedagogical intervention in schools.

**Content**
- Inhaltliche Schwerpunkte der Vorlesung sind:
  - Einführung in die Sportpädagogik und die pädagogische Psychologie des Sportunterrichts
  - Bedeutung des Sports im Jugendalter
  - Zeitgemässer Sportunterricht
  - Sport und Leistung
  - Heterogenität im Sportunterricht
  - Sport und Gesundheit
  - Geschlechterfragen im Sport
  - Soziale und moralische Entwicklung im Sportunterricht

**Lecture notes**
Unterrichtsmaterialien zu den einzelnen Veranstaltungen werden den Studierenden zur Verfügung gestellt.

**Literature**
- Unterrichtsmaterialien zu den einzelnen Veranstaltungen werden den Studierenden zur Verfügung gestellt.

**376-1127-00L Sociology of Sport**

**Objective**
The lectures set out to:
- provide an introduction to the central theories and models of (sport) sociology
- show how far sport reflects society and how it changes and becomes more differentiated in the process
- take current examples from newspapers, magazines and television to highlight the sociological view of sport.

**Content**
- Main Topics
  - Introduction to sport sociology
  - Cognitions in sports: mental rehearsal and mental training
  - Emotions and stress
  - Motivation: goal-setting in sports
  - Career and career transition in elite sport
  - Coach-Athlete-Interaction
  - Psychological aspects of sport-injury rehabilitation
  - Group dynamics in sport

**Lecture notes**
Selected materials for the lecture are available under www.LSSFB.ch --> Lehre

**Literature**

A detailed program with additional references will be delivered at the beginning of the lecture.

---

**376-1155-00L The Musculoskeletal System and Work**

**Objective**
Consolidated findings of movement sciences concerning deterioration, overload and regeneration of the musculoskeletal system are an important basis for an ergonomic working environment. The following topics are covered: Muscle fatigue during the 8-hour day, use of the computer mouse, backaches, Tendinitis, nerve compression, epidemiology, prevention, rehabilitation, laws, measuring procedures.

**Content**
- Goal of the course is the activation of physiological and patho-physiological insights for the understanding of loads of the musculoskeletal system during work.
- Prevention and rehabilitation of work related musculoskeletal disease will be discussed with the help of a bio-psychoso-social model.
- Furthermore, evidence based methods for a healthy work design will be presented.

**Lecture notes**
Skript und Folien auf NETZ als PDF-Datei zur Verfügung

**Prerequisites / notice**

---

**376-1581-00L Cancer: Fundamentals, Origin and Therapy**

**Objective**
Students are able to describe selected chemicals, biological and molecular processes that occur in cells spontaneously or after physical or chemical exposure and resulting in a tumor. They are able to list important cancer-inducing agents and explain the respective mechanism of action. They have knowledge of significant risk factors for cancer diseases. They are confronted with the basics of toxicology and they can explain the principle of the most common therapeutic strategies.
The lecture deals with problems of tumor epidemiology (causes, mortality, incidence). Cancer is delineated as a multi-step process. Classes of chemical compounds that induce cancer are discussed as well as the reactive metabolites that may be built from. Covalent binding to DNA is discussed and different types of mutations resulting thereof. A selection of proto-oncogenes and tumor suppressor genes is presented. Their function will be discussed as well as the changes which are found in these genes in tumor cells, starting from single nucleotide exchanges up to large deletions. The reason for genetic predisposition to cancer will be discussed as well as cancer relevant aspects of cell cycle regulation. Phenomenons like angiogenesis and metastasis are presented as well as the mechanisms that protect the genome from mutagenic damage. Further subjects address old and new strategies of cancer treatment. Personalised cancer treatment.

Additional informations are given during the lecture.

The combining of training and coaching as in the example of sport analysis, which has an effect on youth training and athlete development

To develop basics for a differentiate analyses of sports (model)

To develop a profile of requirements for specific sports

To develop competencies of training with youth and talents

To develop the basics of talent training in theory and practice

To observe athletes in case studies, make judgments and conclusion

The lecture requires an active participation of the students. All students will participate in individual or group work focussing on specific subject of the lecture. Students will have ample time for preparation during lecture time.
The members are able to transform the knowledge from the previous courses in practical situations of Sports and Exercise Therapy. They learn basic aspects to design therapy lessons.

Knowledge of the pathophysiology and the concomitant complications of a spinal cord injury and the consequences for physical exercise and trainability during rehabilitation as well as in recreational and elite sport.

Galenic Pharmacy I

W 2 credits 2G J.C. Leroux, B. A. Gander

Abstract
Principles and technologies for the manufacturing of dosage forms and drug delivery systems. Knowledge of pharm. excipients, materials, containers, liquid and semi-solid dosage forms, their production, function, quality and application. Comprehension of molecular interactions in solution and colloidal systems. Comprehension of interfacial phenomena and stabilization measures in dosage forms.

Objective
Knowledge of the most important pharmaceutical excipients, materials, containers, liquid and semi-solid dosage forms, of their production, function, quality, stability and application. Comprehension of the molecular interactions in solution and colloidal systems. Comprehension of interfacial phenomena and stabilization measures in dispersive dosage forms.

Content
Introduction and overview of important fundamentals, principles and technologies for the development and manufacturing of dosage forms and drug delivery systems. Overview of the most important pharmaceutical excipients and polymers, their structure, properties and processing; importance of materials properties for containers. Pharmaceutical solvents, fundamentals of solubility and solubilization of drugs. Water treatment processes, sterilization techniques and quality requirements of pharmaceutical water. Parenteral dosage forms and liquid opthalmics. Surfactants, micel formation and colloidal systems. Liquid suspensions and emulsions. Stabilization measures in dosage forms.

Prerequisites / notice
Language: German and English
1. Antibody phage technology
   The antibody molecule
   V genes, CDRs, basics of antibody engineering
   Principles of phage display
   Phagemid and phage vectors
   Antibody libraries
   Phage display selection methodologies
   Other phage libraries (peptides, globular proteins, enzymes)
   Alternative screening/selection methodologies
   DNA-encoded chemical libraries

2. Proteins: chemical modification and detection of biomolecular interactions
   Homodimerization of proteins
   Antibody-drug conjugates
   Radioactive labeling of proteins
   Kinetic association and dissociation constants
   Affinity constant: definition and its experimental measurement

3. Genomics: Applications to Human Biology
   Protein cloning and expression
   DNA sequencing
   Some foundations of genetic analysis
   Knock-out technologies
   Transcriptomics
   Proteomics
   Recombinant vaccines

4. Pharmaceuticals: Focus on Discovery
   Ligand discovery
   Half-life extension
   Cancer therapy
   Gene therapy

Lecture notes
   Skript "Gene Technology" by Prof. Dario Neri and slides of the lecture
Objective

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bb.biol.ethz.ch)

Prerequisites / notice

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

551-1003-00L

Methods of Biological Analysis

W 3 credits 3G

R. Aebersold, M. Badertscher, K. Weis

Abstract

Principles of the most important separation techniques and the interpretation of molecular spectra.

551-1003-00

The course will teach the basis and typical applications of methods for the analysis of nucleic acid sequences, mass spectrometric analysis of proteins and proteomes and advanced light and fluorescent imaging methods.

Objective

Knowledge of the necessary basics and the possibilities of application of the relevant spectroscopical and separation methods in analytical chemistry.

Content

Knowledge of the theoretical basis of the methods for nucleic acid sequence analysis, mass spectrometry based protein and proteome analysis and advanced light and fluorescent imaging methods, and an understanding of the application of these principles in experimental biology.

551-1003-00L

Lecture notes

A comprehensive script is available in the HCI-Shop. A summary of the part "Spektroskopie" defines the relevant material for the exam.

Introduction to Bioinformatics: Concepts and Applications

W 6 credits 4G

W. Gruissem, K. Bärenfeller, A. Callisch, G. Captanli, J. Fütterer, M. Robinson, A. Wagner

Abstract

Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

Objective

Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.
Content

Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

551-1323-00L Fundamentals of Biology II: Biochemistry and Molecular Biology

| W | 4 credits | 4V | K. Locher, N. Ban, R. Glockshuber, E. Weber-Ban |

Abstract

The course provides an introduction to Biochemistry / Molecular Biology with some emphasis on chemical and biophysical aspects.

Objective

Topics include the structure-function relationship of proteins / nucleic acids, protein folding, enzymatic catalysis, cellular pathways involved in bioenergetics and the biosynthesis and breakdown of amino acids, glycans, nucleotides, fatty acids and phospholipids, and steroids. There will also be a discussion of DNA replication and repair, transcription, and translation.

Lecture notes

none

Literature

Prerequisites / notice

752-2101-00L Consumer Behaviour I

| W | 2 credits | 2V | M. Siegrist, C. Keller, B. S. Sütterlin |

Abstract

Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior

Objective

Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior

752-4005-00L Food Microbiology I

For students of the study programme Biology BSc the course can only be selected as 4th concept course.

| W | 3 credits | 2V | M. Loessner |

Abstract

This lecture is the first part of a one-year course. It offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

Objective

The lecture offers insights into the basics, practical consequences and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts, molds and protozoa in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

The focus of this first part of the lecture will be on the organisms, but also on the factors which determine spoilage and foodborne disease.

Content

1. History of Food Microbiology
   1.1. Short synopsis of foodborne microorganisms
   1.2. Spoilage of Foods
   1.3. Foodborne Disease
   1.4. Food Preservation
   1.5. VIP's of Food Microbiology
2. Overview of Microorganisms in Foods
   2.1 Origin of foodborne Microorganisms
   2.2. Bacteria
   2.3. Yeasts
   2.4. Molds
3. Microbial Spoilage of Foods
   3.1. Intrinsic and Extrinsic Parameters
   3.2. Meats, Seafoods, Eggs
   3.3. Milk and Milk Products
   3.4. Vegetable and Fruit Products
   3.5. Miscellaneous (baked goods, nuts, spices, ready-to-eat products)
   3.6. Drinks and Canned Foods
4. Foodborne Disease
   4.1. Significance and Transmission of Foodborne pathogens
   4.2. Staphylococcus aureus
   4.3. Gram-positive Sporeformers (Bacillus & Clostridium)
   4.4. Listeria monocytogenes
   4.5. Salmonella, Shigella, Escherichia coli
   4.6. Vibrio, Yersinia, Campylobacter
   4.7. Brucella, Mycobacterium
   4.8. Parasites
   4.9. Viruses and Bacteriophages
   4.10. Mycotoxins
   4.11. Bioactive Amines
   4.12. Miscellaneous (Antibiotic-resistant Bacteria, Biofilms)

Lecture notes

Electronic copies of the presentation slides (PDF) and additional material will be made available for download.

Literature

Recommendations will be given in the first lecture

752-6001-00L Introduction to Nutritional Science

| W | 3 credits | 2V | M. B. Zimmermann, C. Wolfrum |

Abstract

This course introduces basic concepts of micro- and macronutrient nutrition. Micronutrients studied include fat-soluble and water-soluble vitamins, minerals and trace elements. Macronutrients include proteins, fat and carbohydrates. Special attention is given to nutrient digestion, bioavailability, metabolism and excretion with some focus on energy metabolism.

Objective

To introduce the students to the both macro- and micronutrients in relation to food and metabolism.
The lectures "Leadership I" (WS) and "Leadership II" (SS) have been designed as a two-semester lecture series, but may also be followed individually. Prof. Wolfrum discusses the micronutrients, including fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. Prof. Wolfrum introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism. The nutrients are described in relation to digestion, absorption and metabolism. Special aspects of homeostasis and homeorhesis are emphasized.

Lecture slides and required handouts will be available on the ETH website.

Objective

Gives the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand.

Some basic knowledge in physiology is recommended for this course, which revisits important physiological topics, emphasizing their relation to nutrition. The aim is to give the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand. For students with a background in medicine, pharmacy or biology, the course is useful as a review of previously acquired knowledge. Major topics are basic neuroanatomy and neurophysiology; general endocrinology; the physiology of taste and smell; nutrient digestion and absorption; intermediary metabolism and energy homeostasis; and some aspects of cardiovascular physiology and water balance.

Handouts for each lecture will be made available every week: http://www.fpb.ethz.ch/teaching/handouts.html

The course is divided into two parts. The lectures on micronutrients are given by Prof. Zimmermann and the lectures on macronutrients are given by Prof. Wolfrum. Prof. Zimmermann discusses the micronutrients, including fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. Prof. Wolfrum introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism. The nutrients are described in relation to digestion, absorption and metabolism. Special aspects of homeostasis and homeorhesis are emphasized.

Lecture slides and required handouts will be available on the ETH website.

Objective

To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.

The course introduces basic concepts of the interaction between nutrition and exercise and cognitive performance.

The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

Language: English

It is strongly recommended to attend the lectures. The lecture (including the handouts) is not designed for distance education.

Assessments

The 1-hour written exam will take place during the last lecture in the semester.

**Abstract**<br>This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

**Objective**<br>Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

**Content**<br>The scientific fundamentals of performance measurement and educational diagnostics and study them on the basis of different current issues.

**Prerequisites / notice**<br>This lecture is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

**Lecture notes**<br>Im Verlaufe des Semesters werden einzelne Unterlagen in den Veranstaltungen abgegeben. Dazu gehören auch die Handouts der verschiedenen, studentischen Vorträge.

**Prerequisites / notice**<br>Die Leistungsanforderungen richten sich im Umfang nach der Zahl zu erwerbender ECTS-Punkte, wobei 1 ECTS-Punkt einem Zeitaufwand von ca. 30 Arbeitsstunden entspricht. ETHZ-Studierende können im Rahmen dieser Veranstaltung 3 ECTS-Punkte erwerben.

**Prerequisites / notice**<br>Weitere Angaben zu den Leistungsanforderungen werden im Rahmen der Startveranstaltung abgegeben und erläutert.

**Lecture notes**<br>Foliens werden zur Verfügung gestellt.

**Prerequisites / notice**<br>Die konkreten Inhalte des Seminars ergeben sich aufgrund der Präferenzen der Teilnehmenden und der daraus abgeleiteten Themenübersicht für Vorträge und Seminararbeiten. Im Rahmen der Startveranstaltung wird eine Liste mit möglichen Themen abgegeben und erläutert. Schwerpunkte der Themenvorschläge sind:
- Testentwicklung<br>- Gütekriterien von Tests<br>- Aufgabenkonstruktion<br>- Datenauswertung<br>- Rasch-Modell<br>- Internationale Vergleichstests<br>- Zulassungsverfahren

**Prerequisites / notice**<br>No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: 200a968

**Prerequisites / notice**<br>Mind the enrolment deadlines at UZH:<br>http://www.uzh.ch/studies/application/mobilitaet_en.html

**Prerequisites / notice**<br>This lecture is only apt for students who intend to enrol in the programs "Lehrdiplom" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.
In this class, students will learn to prepare, conduct, and reflect single lessons based on educational requirements. Students know how to simplify and present complex contents of their subject area. They are able to apply diverse techniques of classroom management and know relevant authorities for further information.

- Understand findings relevant for education
- Getting to know intelligence tests
- Understanding findings relevant for education

This seminar focuses on teaching units in chemistry, physics, and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine, and optimize a teaching unit following an initial set in advance.

- Understanding research methods used in the empirical human sciences
- Getting information about recent literature on learning and instruction
- Understanding relevant findings from the empirical educational sciences

Students apply the insights, abilities, and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are assessed as Examination Lessons.

- Understand pedagogically relevant findings from the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand and critically examine information from scientific journals and media

Number of participants limited to 20.
The successful participation in EW1 (“Human Learning”) and EW2 (“Designing Learning Environments for School”) is recommended, but not a mandatory prerequisite.

- They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).
- They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions).

- Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.
- They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).

This course unit can only be enrolled after successful participation in, or during enrollment in the course “Human Learning (EW 1)”. In this class, students will learn to prepare, conduct, and reflect single lessons based on educational requirements. Students know how to simplify and present complex contents of their subject area. They are able to apply diverse techniques of classroom management and know relevant authorities for further information.

- They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions).

- Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.
Objective

Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.

- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Abstract

The mentored paper is designed to bring together the findings from the FD1 and the FD2. By using various teaching techniques and methods a semester plan, which is based on various curricula will be elaborated for a given topic.

Objective

1. The students have planned a curriculum for a semester course.
2. Students reflect on formative and summative ways such a teaching unit to examine and implement parts of it.
3. The students have implemented parts of the semester curriculum.
4. The students deal with the question to what extend teaching techniques, teaching methods but also sequences of self-study must be involved in the planning.

**Abstract**

Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people. The course should help to clarify basics of translational science, illustrate successful applications and should enable students to integrate key features into their future projects.

**Objective**

After completing this course, students will be able to understand:
- Principles of translational science (including project planning, ethics application, basics of resource management and interdisciplinary communication)

**Content**

What is translational science and what is it not?
- How to identify need?
- Disease concepts and consequences for research
- Basics about incidence, prevalence etc., and orphan indications
- How to choose the appropriate research type and methodology
- Ethical considerations including ethics application
- Pros and cons of different types of research
- Coordination of complex approaches incl. timing and resources
- How to measure success?
- Outcome variables
- Improving the translational process
- Challenges of communication?
- How independent is translational science?
- Academic boundary conditions vs. industrial influences

Positive and negative examples will be illustrated by distinguished guest speakers.

</tbody>
</table>

**Abstract**

This course provides hands-on experience with measurement and analysis methods relevant for Humans Systems Neuroscience and Motor control (nerve/brain stimulation, EMG, EEG, psycho-physical paradigms etc). Students read scientific material, set up experiments, perform measurements in the lab, analyse data, apply statistics and write short reports or essays.

**Objective**

This course will prepare students for experimental work as it is typically done during the master thesis. The goal is to gain hands-on experience with measurement and analysis methods relevant for Humans Systems Neuroscience and Motor control (for example peripheral nerve stimulation, electrical and magnetic brain stimulation, EMG, EEG, psycho-physical paradigms etc). Students will learn how to perform small scientific projects in this area. Students will work individually or in small groups and solve scientific problems which require them to perform measurements in human participants, extract relevant readouts from the data, apply appropriate statistics and interpret the results. They will also be required to write small essays and reports and they will get feedback on their writing throughout the course.

**Prerequisites / notice**

Students are required to have successfully completed the course "Neural control of movement and motor learning" and to have basic knowledge of applied statistics. Self-study material about applied statistics will be available at the beginning of the course and statistical knowledge will be tested (central element) in the second course week. Passing this test is a requirement for continuing the course. Students will have to solve scientific problems, requiring them to independently study scientific material, apply statistics and report their results in the form of written reports and essays. Assessments will be made on the basis of the completed theoretical and practical work that will be performed either in small groups or individually.

**Abstract**

In this course, students read, present and discuss seminal publications in the area of exercise physiology. The focus lies on critical analysis of scientific content, conceptual as well as ethical aspects of publications. Students are trained in the most common scientific presentation techniques such as oral and poster presentations.

**Objective**

Students gain further knowledge and a deeper understanding of concepts in exercise physiology. Emphasis is put on critical analysis and discussion of scientific publications as well as on improving scientific presentation skills.

**Literature**

Material will be provided in moodle.

**Prerequisites / notice**

Successful completion of the Exercise Physiology Course.

**Abstract**

This course introduces/explores the complex relationship between physical activity, sedentary behavior and health. It will discuss the evolution of current physical activity recommendations. It will examine the current evidence base that has informed physical activity recommendations and that identified physical activity as a key modifiable lifestyle behavior contributing to disease and mortality.

**Objective**

On completion of this course students will be able to demonstrate:
1. knowledge of and critical awareness of the role of physical activity and sedentary behavior in the maintenance of health and the aetiology, prevention and treatment of disease.
2. thorough knowledge and critical awareness of current recommendations for physical activity, and current prevalence and trends of physical activity and associated diseases
3. awareness of current national and international physical activity policies and how these impact on global challenges

**Content**

Introduction to Physical Activity for Health, including sedentary behavior
- Physical activity epidemiology; concepts principles and approaches
- Physical activity and all cause morbidity and mortality
- Physical activity and chronic disease; Coronary heart disease, diabetes, bone health, cancer and obesity
- Physical activity and brain health
- Physical activity and sedentary behavior recommendations
- Population prevalence of physical activity and sedentary behavior
- Physical activity policies
- Physical activity assessment
Uncertainty Quantification for Engineering & Life Sciences

Objective
The course will teach fundamental concepts of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in engineering and life sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content
Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Lecture notes
There is no script. Powerpoint presentations will be made available on-line to students.

Literature
To be provided by the individual lecturers, at their discretion.

Prerequisites / notice
No compulsory prerequisites, but prior completion of Human Nutrition I + II (Humanernährung I+II) is strongly advised.

Fundamentals of Probability, Fundamentals of Computational Modeling

227-0385-10L | Biomedical Imaging                                      | W    | 6    | 5G    | S. Kozerke, K. P. Prüssmann, M. Rudin |

Abstract
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

Objective
To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

Content
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

Abstract
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Objective
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

Introduction to Biomedical Engineering by Enderle, Banchard, and Bronzino

Lecture notes

Microscopy Training TEM I - Introduction to TEM

Course material Script, computer demonstrations, exercises and problem solutions

A. G. Bittermann, Image Analysis and Computer Vision

Abstract

During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, Light and perception. Digital image formation. Image enhancement and feature extraction. Unitary transformations. Color and texture.

Objective

Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content

The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Prerequisites / notice

Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C. The course language is English.

Lecture notes

Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites: Basic concepts of mathematical analysis and linear algebra.

Literature

Prerequisites / notice

No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

Microscopy Training SEM I - Introduction to SEM

W 6 credits 3V+1U L. Van Gool, O. Göksel, E. Konukoglu

Abstract

The introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using 2 SEM instruments, students have the opportunity to study their own samples, or standard test samples, as well as solving exercises provided by ScopeM scientists.

Objective

Number of participants limited to 6.

Content

During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, including low-vacuum and low-voltage applications. This course gives basic skills for students new to SEM. At the end of the course, students with no prior experience are able to align a SEM, to obtain secondary electron (SE) and backscatter electron (BSE) micrographs and to perform energy dispersive X-ray spectroscopy (EDX) qualitative and semi-quantitative analysis. The procedures to better utilize SEM to solve practical problems and to optimize SEM analysis for a wide range of materials will be emphasized.

Prerequisites / notice

Prerequisite: Basic concepts of mathematical analysis and linear algebra.

Literature

- Discussion of students' sample/interest
- Introduction and discussion on Electron Microscopy and instrumentation
- Lectures on electron sources, electron lenses and probe formation
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on sample preparation techniques for EM
- Brief description and demonstration of the SEM microscope
- Practice on beam/specimen interaction, image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Lecture and demonstrations on X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, linescans and spectral mapping
- Practice on real-world samples and report results

Microscopy Training TEM I - Introduction to TEM

W 1 credit 3P S. Rodighiero, A. G. Bittermann, K. Kunze, J. Reuteler

Abstract

The participants will be chosen based on a short motivation letter. Please send this letter to S. Rodighiero (main lecturer) as soon as possible.

Objective

The introductory course on Transmission Electron Microscopy (TEM) provides theoretical and hands-on learning for new operators, utilizing lectures, demonstrations, and hands-on sessions.

Prerequisites / notice

Basic concepts of mathematical analysis and linear algebra.

Literature

Prerequisites / notice

No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

https://www1.ethz.ch/lbb/Education/BME
Objective

- Overview of TEM theory, instrumentation, operation and applications.
- Alignment and operation of a TEM, as well as acquisition and interpretation of images, diffraction patterns, accomplishing basic tasks successfully.
- Knowledge of electron imaging modes (including Scanning Transmission Electron Microscopy), magnification calibration, and image acquisition using CCD cameras.
- To set up the TEM to acquire diffraction patterns, perform camera length calibration, as well as measure and interpret diffraction patterns.
- Overview of techniques for specimen preparation.

Content

Using two Transmission Electron Microscopes the students learn how to align a TEM, select parameters for acquisition of images in bright field (BF) and dark field (DF), perform scanning transmission electron microscopy (STEM) imaging, phase contrast imaging, and acquire electron diffraction patterns. The participants will also learn basic and advanced use of digital cameras and digital imaging methods.

- Introduction and discussion on Electron Microscopy and instrumentation.
- Lectures on electron sources, electron lenses and probe formation.
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on sample preparation techniques for EM.
- Brief description and demonstration of the TEM microscope.
- Practice on beam/specimen interaction, image formation, image contrast (and image processing).
- Demonstration of Transmission Electron Microscopes and imaging modes (Phase contrast, BF, DF, STEM).
- Student participation on sample preparation techniques.
- Transmission Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities.
- TEM alignment, calibration, correction to improve image contrast and quality.
- Electron diffraction.
- Practice on real-world samples and report results.

Literature

- Detailed course manual

Prerequisites / notice

No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

363-0301-00L Work Design and Organizational Change

W 3 credits 2G G. Grote

Abstract

Good work design is crucial for individual and company effectiveness and a core element to be considered in organizational change. Meaning of work, organization-technology interaction, and uncertainty management are discussed with respect to work design and sustainable organizational change. As course project, students learn and apply a method for analyzing and designing work in business settings.

Objective

- Know effects of work design on competence, motivation, and well-being
- Understand links between design of individual jobs and work processes
- Know basic processes involved in systematic organizational change
- Understand the interaction between organization and technology and its impact on organizational change
- Understand relevance of work design for company performance and strategy
- Know and apply methods for analyzing and designing work

Content

- Work design: From Adam Smith to job crafting
- Effects of work design on performance and well-being
- Approaches to analyzing and designing work
- Modes of organizational change and change methods
- Balancing stability and flexibility in organizations as design criterion
- The organization-technology interaction and its impact on work design and organizational change
- Example Flexible working arrangements
- Strategic choices for work design

Literature

Prerequisites / notice

The course includes the completion of a course project to be conducted in groups of four students. The project entails applying a particular method for analyzing and designing work processes and is carried out by means of interviews and observations in companies chosen by the students.

4P

363-0790-00L Technology Entrepreneurship

W 2 credits 2V U. Claesson, B. Clarysse

Abstract

Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

Objective

This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

Content

See course website: http://www.entrepreneurship.ethz.ch/sresources/courses/tech-entrepreneurship.html

376-0130-00L Laboratory Course in Exercise Physiology

■ W 3 credits 4P C. Spengler

Number of participants limited to 48.

BWS: Mandatory for “Exercise physiology”.
HST: Possible from the 5th semester on.

Abstract

Conduct physical performance tests and measurements that are typically used to assess performance of athletes and/or patients and that deepen the understanding of physiological processes in response to physical exertion.

Objective

Gain hands-on experience in exercise physiology and consolidate knowledge on physiological adaptations to different types and degrees of physical activity and climatic influences. Learn fundamental assessment techniques of the muscular system, the cardio-respiratory system and of whole-body performance, learn scientifically correct data analysis and interpretation of results. Insight into today’s Sports Medicine.

Content

Laboratory course:
Various exercise tests assessing human performance and assessments of physiological responses to activity (examples are VO2max-test, Conconi-Tests, Determination of anaerobic threshold, Cooper-Test, 1-repetition maximum test, lactate minimum test), dynamometry, mechanography, body composition etc.). Insight into measurements in Sports Medicine.

Content
To gain basic knowledge of sports pedagogy and to recognize starting points for applied sports pedagogical intervention in schools.

376-0203-00L Movement and Sport Biomechanics

Abstract
Learning to view the human body as a (bio-) mechanical system. Making the connections between everyday movements and sports activity

Objective
Students are able to describe the human body as a mechanical system.

Content
Movement- and sports biomechanics deals with the attributes of the human body and their link to mechanics. The course includes topics

376-0815-00L Writing your Master's Thesis: Natural Sciences and Engineering C1-C2

Abstract
Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Objective
We’ll prepare you to produce your MSc thesis. You’ll learn how to structure your thesis, write scientific English, and manage your writing

Content
The course covers the writing context; the writing process; structuring sentences, paragraphs, longer sections (such as introduction, methods, results, and discussion), and whole texts; presenting and integrating non-textual elements such as graphs and tables; and editing and correcting drafts and proofs. Each lesson comprises a mixture of elements, including specialist input, individual tasks, pairwork, and groupwork. Active participation is expected.

376-1107-00L Sport Pedagogy

Abstract
Central aspects of Sport related pedagogy will be handled in these lectures. These aspects cover, amongst others, the subject and tasks of

Objective
To gain basic knowledge of sports pedagogy and to recognize starting points for applied sports pedagogical intervention in schools.

Literature

Number of participants limited to 15 (3 courses are available).

Attention: Registration is only possible from 12.9. (from 11.30h) - 15.9.2016
Inhaltliche Schwerpunkte der Vorlesung sind:
- Einführung in die Sportpädagogik und die pädagogische Psychologie des Sportunterrichts
- Bedeutung des Sports im Jugendalter
- Zeitgemäßer Sportunterricht
- Sport und Leistung
- Heterogenität im Sportunterricht
- Sport und Gesundheit
- Geschlechterfragen im Sport
- Soziale und moralische Entwicklung im Sportunterricht

Lecture notes
Unterrichtsmaterialien zu den einzelnen Veranstaltungen werden den Studierenden zur Verfügung gestellt.

376-1127-00L Sociology of Sport
W 2 credits 2V M. Lamprech
Abstract
These lectures deal with the current changes in society and sport and provide an overview of the many different problems and perspectives of sport sociology.

Objective
The lectures set out to:
- present the different dimensions, functions and interrelationships of present-day sport
- provide an introduction to the central theories and models of (sport) sociology
- show how far sport reflects society and how it changes and becomes more differentiated in the process
- take current examples from newspapers, magazines and television to highlight the sociological view of sport.

Content
Sport and social change: developments and trends
The economy and the media: dependencies, consequences, scandals
Social inequalities and distinctions: gender differences and group behavior
Conflicts and politics: sports organizations, doping, violence

Literature

A detailed program with additional references will be delivered at the beginning of the lecture.

376-1117-00L Sport Psychology
W 2 credits 2V H. Gubelmann
Abstract
This lecture is intended as an introduction to sport psychology and imparts knowledge on selected areas of the subject.

Objective
Students are given insight into different work areas of sport psychology. In order to understand what «sport psychology» is, it is necessary to explain the essence and tasks of sport psychology and what it relates to, and to work out an underlying basis for key topics, such as cognition and emotions. Students' expertise is furthered by presenting and providing selected intervention forms are intended to provide insight into applied sport psychology and ensure that mental processes and their impact in sport can be recognised. Case studies and practical exercises (e.g. objective training) are intended to prompt students to reflect to a greater extent on the forms in which sport psychology can be applied in their practice of sports and to integrate these in their teaching.

Content
Main Topics
- Introduction to sport psychology
- Cognitions in sports: mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

Literature

376-1177-00L Human Factors I
W 2 credits 2V M. Menozzi Jäckli, R. Huang, M. Siegrist
Abstract
Every day humans interact with various systems. Strategies of interaction, individual needs, physical & mental abilities, and system properties are important factors in controlling the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction & overall performance.

Objective
The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

Content
- Physiological, physical, and cognitive factors in sensation and perception
- Body spaces and functional anthropometry, Digital Human Models
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

Literature
- Gabriel Salveny, Handbuch of Human Factors and Ergonomics, 4th edition (2012), is available on NEBiS as electronic version and for free to ETH students
- Further textbooks are introduced in the lecture
- Brouchures, checklists, key articles etc. are uploaded in ILIAS

376-1179-00L Applications of Cybernetics in Ergonomics
W 1 credit 1U Y. Y. Hedinger Huang, R. Huang
Abstract
Cybernetics systems have been studied and applied in various research fields, such as applications in the ergonomics domain. Research interests include the man-machine interaction (MMI) topic which involving the performance in multi-model interactions, quantification in gestalt principles in product development; or the information processing matter.

Objective
To learn and practice cybernetics principles in interface designs and product development.

Content
- Fitt's law applied in manipulation tasks
- Hick-Hyman law applied in design of the driver assistance systems - Vigilance applied in quality inspection
- Accommodationvergence crosslink function
- Cross-link models in neurobiology: the ocular motor control system
- Human performance in optimization of production lines
Abstract
Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Content
Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

376-1714-00L Biocompatible Materials W 4 credits 3G K. Maniura, J. Möller, M. Zenobi-Wong

Abstract

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Objective

The class consists of three parts:

1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

Content

Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

Lecture notes

Handouts can be accessed online.
Students will acquire the ability to independently load, plot, and process kinematic, kinetic and electromyographical data using the MATLAB computing environment. Handouts will be made available.

Introduction to the basic principles of trauma biomechanics. The following issues will be discussed: Epidemiology and etiology of spinal cord injury; complications and consequences of spinal cord injury; trainability/exercise physiology and spinal cord injury; history and organisation of wheelchair sports; elite sport and spinal cord injury prevention measures. Topics include: accident statistics and accident reconstruction, biomechanical response of the human to impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations using multi-body and finite element modelling techniques, aspects of passive safety of vehicles (focusing on restraint systems and vehicle compatibility). Real world examples mainly from automobile safety are used to augment lecture material.

Furthermore possibilities to prevent injuries are discussed. Thereby the lecture focuses on sports injuries. Examples mainly from automobile safety are used to augment lecture material.

Within the scope of this lecture you will learn the basic principles of injury mechanics and rehabilitation focussing on sports injuries. This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented. Furthermore possibilities to prevent injuries are discussed. Handouts will be made available.

A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

Handouts provided during the classes and references therin.

376-1720-00L Application of MATLAB in the Human Movement Sciences

Abstract
Students will learn to import, process and graphically present experimental data using the MATLAB computing environment. Both the data and the methods of analysis will be typical for experiments in Human Movement Science (i.e. kinematics, kinetics and electromyography).

Objective
Students will acquire the ability to independently load, plot, and process kinematic, kinetic and electromyographical data using the MATLAB computing environment.

Content
Drawbacks of Excel; Possibilities in MATLAB; Import of several data formats; Plot of one and more signals; Removing of an offset and filtering of data based on self-written functions; Normalisation and parametrisation of data; Reliability; Interpolation, Differentiation and Integration in MATLAB.

Literature
During the lecture, several electronically available MATLAB introductions are indicated. Course-specific scripts will be provided by the lecturer.

Prerequisites / notice
A Laptop with MATLAB installed (v2009 or higher) and wireless internet access is mandatory. Two students can share a laptop if necessary. A MATLAB student version can be obtained at Stud-IDES for free.

376-1722-00L Spinal Cord Injury and Exercise

Prerequisite: Anatomy and Physiology

Abstract
Intensive discussion concerning complications of a spinal cord injury and their consequences on trainability and exercise performance of persons sitting in a wheelchair. Overview on the clinical application of exercise testing as well as on the implementation of sport scientific findings to optimise performance of spinal cord injured subjects in rehabilitation and elite sports.

Objective
Knowledge of the pathophysiology and the concomitant complications of a spinal cord injury and the consequences for physical exercise and trainability during rehabilitation as well as in recreational and elite sport.

Content
The following issues will be discussed: Epidemiology and etiology of spinal cord injury; complications and consequences of spinal cord injury; trainability/exercise physiology and spinal cord injury; history and organisation of wheelchair sports; elite sport and spinal cord injury prevention measures. Topics include: accident statistics and accident reconstruction, biomechanical response of the human to impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations using multi-body and finite element modelling techniques, aspects of passive safety of vehicles (focusing on restraint systems and vehicle compatibility). Real world examples mainly from automobile safety are used to augment lecture material.

Furthermore possibilities to prevent injuries are discussed. Thereby the lecture focuses on sports injuries. Examples mainly from automobile safety are used to augment lecture material.

Current topics in biomechanics presented by speakers from academia and industry.

376-1974-00L Colloquium in Biomechanics

Abstract
Getting insight into actual areas and problems of biomechanics.

Objective
Current topics in biomechanics presented by speakers from academia and industry.

Literature

Handouts will be made available.

376-1985-00L Trauma Biomechanics

Abstract
Trauma biomechanics in an interdisciplinary research field investigating the biomechanics of injuries and related subjects such as prevention. The lecture provides an introduction to the basic principles of trauma biomechanics.

Objective
Introduction to the basic principles of trauma biomechanics.

Content
This lecture serves as an introduction to the field of trauma biomechanics. Emphasis is placed on the interdisciplinary nature of impact biomechanics, which uses the combination of fundamental engineering principles and advanced medical technologies to develop injury prevention measures. Topics include: accident statistics and accident reconstruction, biomechanical response of the human to impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations using multi-body and finite element modelling techniques, aspects of passive safety of vehicles (focusing on restraint systems and vehicle compatibility). Real world examples mainly from automobile safety are used to augment lecture material.

Handouts will be made available.

Handouts will be made available.

376-2017-00L Biomechanics of Sports Injuries and Rehabilitation

Abstract
This lecture introduces the basic principles of injury mechanics and rehabilitation focussing on sports injuries. Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

Objective
This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented. Furthermore possibilities to prevent injuries are discussed. Handouts will be made available.

Literature

Prerequisites / notice
A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

**Abstract**

- **Applied Movement Analysis**: Based on practical examples out of sport, everyday movement and therapy, students use and compare different methods of movement analysis.
- **Systems Biology of Metabolism**: Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.
- **Epidemiology and Prevention**: The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics.
- **Public Health Concepts**: The module "public health concepts" offers an introduction to key principles of public health. Students get acquainted with the concepts and develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.
- **Nutrition and Performance**: The course introduces basic concepts of the interaction between nutrition and exercise and cognitive performance.

**Objective**

- Students are able to assess human movement using different methods of movement analysis.
- Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.
- Enrolment to this course unit only possible at ETH. No enrolment to module CS16_101 at UZH.
- The module "public health concepts" offers an introduction to key principles of public health. Students get acquainted with the concepts and methods of epidemiology. Students also learn to use epidemiological data for prevention and health promotion purposes. Public health concepts and intervention strategies are presented, using examples from infectious and chronic diseases.
- To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.
- The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise.
- The course builds on basic nutrition and biochemistry knowledge to address exercise and performance related aspects of nutrition.

**Content**

- Based on practical examples, these methods are used and compared. The examples range from sport, everyday movement and therapy, such as hockey, gymnastics, acrobatics, badminton, gait / running and strength training. In the first phase of the class, the different approaches are applied. In the second phase, small teams are working on individual projects. These will be discussed and presented in plenum.
- The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.
- The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.
- The module "public health concepts" offers an introduction to key principles of public health. Students get acquainted with the concepts and methods of epidemiology. Students also learn to use epidemiological data for prevention and health promotion purposes. Public health concepts and intervention strategies are presented, using examples from infectious and chronic diseases.
- The course introduces basic concepts of the interaction between nutrition and exercise and cognitive performance.
- The course builds on basic nutrition and biochemistry knowledge to address exercise and performance related aspects of nutrition.

**Lecture notes**

- Class material will be distributed using the moodle platform.
- Script and original publications will be supplied during the course.
- Handouts are provided to students in the classroom.
- Information on further reading will be announced during the lecture. There will be some mandatory as well as voluntary readings.
- Lecture slides and required handouts will be available on the ETH website.
- Information on further reading will be announced during the lecture. There will be some mandatory as well as voluntary readings.
- The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

**Language**

- English

It is strongly recommended to attend the lectures. The lecture (including the handouts) is not designed for distance education.

The module Epidemicology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.

**Abstract**

The module Epidemicology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health.

**Objective**

The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware of how epidemiological facts are used in prevention, practice and politics.

**Content**

The module Epidemicology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples form nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

**Abstract**

Writing of a review paper of scientific quality on a topic in the domain of Human Health, Nutrition and Environment based on critical evaluation of scientific literature.

**Objective**

- Acquisition of knowledge in the field of the review paper
- Assessment of original literature as well as synthesis and analysis of the findings
- Practising of academic writing in English
- Giving an oral presentation with discussion on the topic of the review paper

**Content**

Topics are offered in the domains of the major ‘Human Health, Nutrition and Environment’ covering ‘Public Health’, ‘Infectious Diseases’, ‘Nutrition and Health’ and ‘Environment and Health’.

**Lecture notes**

Guidelines will be handed out in the beginning.

**Literature**

Literature will be identified based on the topic chosen.

Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people. The course should help to clarify basics of translational science, illustrate successful applications and should enable students to integrate key features into their future projects.

**Objective**

After completing this course, students will be able to understand:

- Principles of translational science (including project planning, ethics application, basics of resource management and interdisciplinary communication)

**Content**

What is translational science and what is it not?

- How to identify need?
- Disease concepts and consequences for research
- Basics about incidence, prevalence etc., and orphan indications
- How to choose the appropriate research type and methodology
- Ethical considerations including ethics application
- Pros and cons of different types of research
- Coordination of complex approaches incl. timing and resources
- How to measure success?
- Outcome variables
- Improving the translational process

**Challenges of communication?**

- How independent is translational science?
- Academic boundary conditions vs. industrial influences

Positive and negative examples will be illustrated by distinguished guest speakers.

**Prerequisites / notice**

If you are unfamiliar with R, I highly recommend the online R course etutoR.
Lecturers: S. Bonhoeffer, R. R. Regös

Attendees will learn which information is contained in genetic sequencing data and how to extract information from them using computational algorithms. Handouts are provided to students in the classroom.

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze this alignment (such as BLAST algorithm, GWAS approaches). Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Key experimental results will be shown to help understanding how immunological text book knowledge has evolved. Students will learn how to understand and critically assess scientific literature, as well as how to plan the evaluation of studies and health promotion projects.

The language of the course is English.

**Abstract**

This course provides a detailed understanding of:

- development of T and B cells
- the dynamics of a immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.

**Objective**

Obtain a detailed understanding of:

- the development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses, e.g. CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- recognition of pathogenic microorganisms by the host cells and molecular events thereafter, e.g. development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- events and signals for maturation of naïve B cells to antibody producing plasma cells and memory B cells
- optimization of B cell responses by intelligent design of new vaccines

**Content**

- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

**Literature**

Documents of the lectures are available for download at: https://www.bsse.ethz.ch/cevo/education/cb-materials.html

**Prerequisites / notice**

Immunology I and II recommended but not compulsory

**Abstract**

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

**Objective**

Attendees will learn which information is contained in genetic sequencing data and how to extract information from them using computational tools. The main concepts introduced are:

- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

**Content**

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze this alignment (such as BLAST algorithm, GWAS approaches). Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phyldynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

**Lecture notes**

Slides of the lecture will be available online.

https://www.bsse.ethz.ch/cevo/education/cb-materials.html

**Literature**

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST

**Prerequisites / notice**

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Some programming experience will be useful for the exercises, but it is not required. Programming skills will not be tested in the examination.

**Abstract**

Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.
Objective This is an advanced course that will require significant student participation. Students will learn to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Lecture notes Publications and class notes can be downloaded from a web page announced during the lecture.

Literature Papers will be assigned and downloaded from a web page announced during the lecture.

701-1703-00L Evolutionary Medicine for Infectious Diseases W 3 credits 2G A. Hall

Abstract This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

Objective Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for protecting the health of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

Content We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (< 30 minutes) introductory lecture, before students independently research the primary literature and develop half a page of discussion points and questions, followed by interactive discussion in class.

Literature Students will read the primary literature on each topic, and in places we will use the following books:

- Schmid Hempel 2011 Evolutionary Parasitology
- Stearns & Medzhitov 2016 Evolutionary Medicine

Prerequisites / notice A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.

752-4009-00L Molecular Biology of Foodborne Pathogens W 3 credits 2V M. Loessner, M. Schuppler

Abstract The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganism or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content Molecular biology of infectious foodborne pathogens (Listeria, Vibrio, E. coli, Campylobacter, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Lecture notes Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Literature Recommendations will be given in the first lecture

Prerequisites / notice Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), with no break !

Module: Nutrition and Health

752-2122-00L Food and Consumer Behaviour W 2 credits 2V M. Siegrist, C. Hartmann

Abstract This course focuses on food consumer behavior, consumer's decision-making processes and consumer's attitudes towards food products.

Objective The course provides an overview about the following topics: Factors influencing consumer's food choice, food and health, attitudes towards new foods and food technologies, labeling and food policy issues

752-5103-00L Functional Microorganisms in Foods W 3 credits 2G C. Lacroix, T. de Wouters, L. Meile, C. Schwab

Abstract This integration course will discuss new applications of microorganisms with functional properties in food and functional food products. Selected topics will be used to illustrate the rapid development but also limits of basic knowledge for applications of functional microorganisms to produce food with high quality, safety and potential health benefits for consumers.

Objective To understand the principles, roles and mechanisms of microorganisms with metabolic activities of high potential for application in traditional and functional foods utilization with high quality, safety and potential health benefits for the consumers. This course will integrate basic knowledge in food microbiology, microbial physiology, biochemistry, and technology.

Content This course will address selected and current topics on new applications of microorganisms with functional properties in food and functional food products and characterization of functionality and safety of food bacteria. Specialists from the Laboratory of Food Biotechnology, as well as invited speakers from the industry will contribute to the selected topics as follows:

- Probiotics and Prebiotics: Probiotics, functional foods and health, towards understanding molecular modes of probiotic action; Challenges for the production and addition of probiotics to foods; Prebiotics and other microbial substrates for gut functionality.
- Bioprotective Cultures and Antimicrobial Metabolites: Antifungal cultures and applications in foods; Antimicrobial peptide-producing cultures (bacteriocins) for enhancing food quality and safety; Development of new protective cultures, the long path from research to industry.
- Legal and Protection Issues Related Functional Foods
- Industrial Biotechnology of Flavor and Taste Development
- Safety of Food Starter Cultures and Probiotics

Literature Students will be required to complete a group project on food products and ingredients with of from functional bacteria. The project will involve research and analysis followed by an oral presentation and short written report.

752-6101-00L Dietary Etiologies of Chronic Disease W 3 credits 2V M. B. Zimmermann

Abstract A list of references will be given at the beginning of the course for the different topics presented during this course.

Notice
Water Resources and Drinking Water

Objectives
- To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.
- To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

Abstract
The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. Natural processes, anthropogenic pollution, legislation of groundwater and surface water and of drinking water as well as water treatment will be discussed for industrialized and developing countries.

Content
Various water resources, particularly groundwater and surface water, are discussed as part of the natural water cycle influenced by anthropogenic activities such as agriculture, industry, urban water systems. Furthermore legislation related to water resources and drinking water will be discussed. The lecture is focused on industrialized countries, but also addresses global water issues and problems in the developing world. Finally unit processes for drinking water treatment (filtration, adsorption, oxidation, disinfection etc.) will be presented and discussed.

Lecture notes
There is no script. Presentation materials will be available on-line to students.

Literature
To be provided by the individual lecturers, at their discretion.

Prerequisites / notice
No compulsory prerequisites, but prior completion of Human Nutrition I + II (Humanernährung I+II) is strongly advised.

Module: Environment and Health

Module A
From biochemical nutrition research to nutrigenomics

Module B
Nutritional genomics

Module C
Nutrigenetics

Module D
Nutri-epigenomics

Module E
Transcriptomics in nutrition research

Module F
Proteomics in nutrition research

Module G
Metabolomics in nutrition research

Module H
Nutritional systems biology

Module I
Individualized nutrition - opportunities and challenges

Literature
Basic training in biochemistry, molecular biology, physiology, and human nutrition. Interest in interdisciplinary sciences linking molecular biology to human health. Interest in the application of analytical laboratory methods to the understanding of human biology, in particular nutrition.

Major in Medical Technology

Abstract
Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people. The course should help to clarify basics of translational science, illustrate successful applications and should enable students to integrate key features into their future projects.
After completing this course, students will be able to understand:
Principles of translational science (including project planning, ethics application, basics of resource management and interdisciplinary communication)

What is translational science and what is it not?
How to identify need?
- Disease concepts and consequences for research
- Basics about incidence, prevalence etc., and orphan indications
- Disease modeling
- How to choose the appropriate research type and methodology
-Ethical considerations including ethics application
- Pros and cons of different types of research
- Coordination of complex approaches incl. timing and resources
How to measure success?
- Outcome variables
- Improving the translational process
- Challenges of communication
How independent is translational science?
- Academic boundary conditions vs. industrial influences
Positive and negative examples will be illustrated by distinguished guest speakers.

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 765 of 1570
Objective

The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content

Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes

The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

Prerequisites / notice

The lecture will be taught in English.

---

**227-0385-10L Biomedical Imaging**

*W 6 credits 5G S. Kozerke, K. P. Prüssmann, M. Rudin*

**Abstract**

Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

**Objective**

To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

**Content**

- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

**Lecture notes**

Lecture notes and handouts

**Literature**

Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011 Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

**Prerequisites / notice**

Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

---

**227-0391-00L Medical Image Analysis**

*W 3 credits 2G P. C. Cattin, M. A. Reyes Aguirre*

**Abstract**

It is the objective of this lecture to introduce the basic concepts used in Medical Image Analysis. In particular the lecture focuses on shape representation schemes, segmentation techniques, and the various image registration methods commonly used in Medical Image Analysis applications.

**Objective**

This lecture aims to give an overview of the basic concepts of Medical Image Analysis and its application areas. Basic knowledge of computer vision would be helpful.

**Lecture notes**

Lecture notes and handouts

**Literature**

Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011 Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

**Prerequisites / notice**

Basic knowledge of computer vision would be helpful.

---

**227-0393-10L Bioelectronics and Biosensors**

*W 6 credits 2V+2U J. Vörös, M. F. Yanik, T. Zambelli*

**Abstract**

The course introduces the concepts of bioelectricity and biosensing. The sources and use of electrical fields and currents in the context of biological systems and problems are discussed. The fundamental challenges of measuring biological signals are introduced. The most important biosensing techniques and their physical concepts are introduced in a quantitative fashion.

**Objective**

During this course the students will:
- learn the basic concepts in biosensing and bioelectronics
- be able to solve typical problems in biosensing and bioelectronics
- learn about the remaining challenges in this field

**Note**

New course. Not to be confounded with 227-0393-00L last offered in the Spring Semester 2015.
## Content

L1. Bioelectronics history, its applications and overview of the field
- Volta and Galvani dispute
- BMI, pacemaker, cochlear implant, retinal implant, limb replacement devices
- Fundamentals of biosensing
- Glucometer and ELISA

L2. Fundamentals of quantum and classical noise in measuring biological signals

L3. Biomeasurement techniques with photons

L4. Acoustics sensors
- Differential equation for quartz crystal resonance
- Acoustic sensors and their applications

L5. Engineering principles of optical probes for measuring and manipulating molecular and cellular processes

L6. Optical biosensors
- Differential equation for optical waveguides
- Optical sensors and their applications
- Plasmonic sensing

L7. Basic notions of molecular adsorption and electron transfer
- Quantum mechanics: Schrödinger equation energy levels from H atom to crystals, energy bands
- Electron transfer: Marcus theory, Gerischer theory

L8. Potentiometric sensors
- Fundamentals of the electrochemical cell at equilibrium (Nernst equation)
- Principles of operation of ion-selective electrodes

L9. Amperometric sensors and bioelectric potentials
- Fundamentals of the electrochemical cell with an applied overpotential to generate a faraday current
- Principles of operation of amperometric sensors
- Ion flow through a membrane (Fick equation, Nernst equation, Donnan equilibrium, Goldman equation)

L10. Channels, amplification, signal gating, and patch clamp Y4

L11. Action potentials and impulse propagation

L12. Functional electric stimulation and recording
- MEA and CMOS based recording
- Applying potential in liquid - simulation of fields and relevance to electric stimulation

L13. Neural networks memory and learning

## Literature

- M. Stampanoni

## Prerequisites / notice

- Supervised exercises solving real-world problems. Some Matlab based exercises in groups.

## Course material

- Script, computer demonstrations, exercises and problem solutions

## Abstract

## Objective

- Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

## Content

The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

## Lecture notes

- Course material Script, computer demonstrations, exercises and problem solutions

## Prerequisites / notice

- Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.
- The course language is English.

- The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

## Objective

- Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

## Content

- Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

- The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

- The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.
This course teaches methods and models for fMRI data analysis, covering all aspects of statistical parametric mapping (SPM), including pre-processing, the general linear model, statistical inference, multiple comparison corrections, event-related designs, and Dynamic Causal Modelling (DCM), a Bayesian framework for identification of nonlinear neuronal systems from neurophysiological data.

After being introduced to the physical/chemical principles and importance of surfaces and interfaces, the student is introduced to the most important techniques that can be used to characterize surfaces. Later, liquid interfaces are treated, followed by an introduction to the fields of tribology (friction, lubrication, and wear) and corrosion.

The introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using 2 SEM instruments, students have the opportunity to study their own samples, or standard test samples, as well as solving exercises provided by ScopeM scientists. This course gives basic skills for students new to SEM. At the end of the course, students with no prior experience are able to align a SEM, to obtain secondary electron (SE) and backscatter electron (BSE) micrographs and to perform energy dispersive X-ray spectroscopy (EDX) qualitative and semi-quantitative analysis. The procedures to better utilize SEM to solve practical problems and to optimize SEM analysis for a wide range of materials will be emphasized.

The participants will be chosen based on a short motivation letter. Please send this letter to S. Rodighiero (main lecturer) as soon as possible.

No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

The participants will be chosen based on a short motivation letter. Please send this letter to S. Rodighiero (main lecturer) as soon as possible.
During the course, students will learn about different design thinking methods and tools. This will enable them to:

- Rapidly prototype and iteratively test ideas and concepts by using various materials and techniques.
- Engage in collaborative ideation with a multidisciplinary (student) team.
- Generate deep insights through the systematic observation and interaction of key stakeholders.

Information and application: www.sparklabs.ch/ethz

The introductory course on Transmission Electron Microscopy (TEM) provides theoretical and hands-on learning for new operators, utilizing lectures, demonstrations, and hands-on sessions.

**Objective**

- Overview of TEM theory, instrumentation, operation and applications.
- Alignment and operation of a TEM, as well as acquisition and interpretation of images, diffraction patterns, accomplishing basic tasks successfully.
- Knowledge of electron imaging modes (including Scanning Transmission Electron Microscopy), magnification calibration, and image acquisition using CCD cameras.
- To set up the TEM to acquire diffraction patterns, perform camera length calibration, as well as measure and interpret diffraction patterns.
- Overview of techniques for specimen preparation.

**Content**

Using two Transmission Electron Microscopes the students learn how to align a TEM, select parameters for acquisition of images in bright field (BF) and dark field (DF), perform scanning transmission electron microscopy (STEM) imaging, phase contrast imaging, and acquire electron diffraction patterns. The participants will also learn basic and advanced use of digital cameras and digital imaging methods.

- Introduction and discussion on Electron Microscopy and instrumentation.
- Lectures on electron sources, electron probe and probe formation.
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on sample preparation techniques for EM
- Brief description and demonstration of the TEM microscope.
- Practice on beam/specimen interaction, image formation, image contrast (and image processing).
- Demonstration of Transmission Electron Microscopes Imaging modes (Phase contrast, BF, DF, STEM).
- Student participation on sample preparation techniques.
- Transmission Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities.
- TEM alignment, calibration, correction to improve image contrast and quality.
- Electron diffraction.
- Practice on real-world samples and report results.

**Literature**

**Prerequisites / notice**

No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

**Technology Entrepreneurship**

**Abstract**

Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding.

This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing new ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

**Objective**

This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures.

**Literature**

- S. Brusoni, C. Hölscher, M. Meboldt
- B. Clarysse
- A. Cabello Llamas, F. Rittiner, S. Brusoni, C. Hölscher, M. Meboldt

**Writing your Master’s Thesis: Natural Sciences and Engineering C1-C2**

**Abstract**

Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Number of participants limited to 15 (3 courses are available).

Attention: Registration is only possible from 12.9. (from 11.30h) - 15.9.2016

**Objective**

We’ll prepare you to produce your MSc thesis. You’ll learn how to structure your thesis, write scientific English, and manage your writing efficiently. You’ll receive detailed feedback on work in progress.

**Content**

By the end of the course students are able to plan, draft, and edit academic English papers and theses; structure and write clear texts in a style which is acceptable to their academic discourse community; manage the writing process efficiently; select formal vocabulary and use it in a generally accurate and correct manner; choose and use generally suitable grammatical structures, punctuation, and orthographic conventions, assess their own effectiveness as writers of academic English, and identify areas in which further development is needed.

The course covers the writing context; the writing process; structuring sentences, paragraphs, longer sections (such as introduction, methods, results, and discussion), and whole texts; presenting and integrating non-textual elements such as graphs and tables; and editing and correcting drafts and proofs. Each lesson comprises a mixture of elements, including specialist input, individual tasks, pairwork, and groupwork. Active participation is expected.

**Design Thinking: Human-Centred Solutions to Real World Challenges**

**Abstract**

All interested students are invited to apply for this course by sending a one-page motivation letter until 14.9.16 to Florian Rittiner (rittiner@ethz.ch).

Additionally please enrol via mystudies. Places will be assigned after the first lecture on the basis of your motivation letter and commitment for the class.

**Objective**

The goal of this course is to engage students in a multidisciplinary collaboration to tackle real world problems. Following a design thinking approach, students will work in teams to solve a set of design challenges that are organized as a one-week, a three-week, and a final six-week project in collaboration with an external project partner.

Information and application: www.sparklabs.ch/ethz

During the course, students will learn about different design thinking methods and tools. This will enable them to:

- Generate deep insights through the systematic observation and interaction of key stakeholders.
- Engage in collaborative ideation with a multidisciplinary (student) team.
- Rapidly prototype and iteratively test ideas and concepts by using various materials and techniques.

**Prerequisites / notice**

Due to didactic reasons, the number of participants is limited to 30.

All interested students are invited to apply for this course by sending a one-page motivation letter until 14.9.16 to Florian Rittiner (rittiner@ethz.ch).

Additionally please enrol via mystudies. Places will be assigned after the first lecture on the basis of your motivation letter and commitment for the class.

**Literature**

- Faludi, A.: Empathy: Its role in our evolving brain and in innovative design, Harvard University Press, 2015
- A. Cabello Llamas, F. Rittiner, S. Brusoni, C. Hölscher, M. Meboldt
- S. Rodighiero
The purpose of this course is to equip the students with methods and tools to tackle a broad range of problems. Following a Design Thinking approach, the students will learn how to observe and interact with key stakeholders in order to develop an in-depth understanding of what is truly important and emotionally meaningful to the people at the center of a problem. Based on these insights, the students ideate on possible solutions and immediately validated them through quick iterations of prototyping and testing using different tools and materials.

Design Thinking is a deeply human process that taps into the creative abilities we all have, but that get often overlooked by more conventional problem solving practices. It relies on our ability to be intuitive, to recognize patterns, to construct ideas that are emotionally meaningful as well as functional, and to express ourselves through means beyond words or symbols. Design Thinking provides an integrated way by incorporating tools, processes and techniques from design, engineering, the humanities and social sciences to identify, define and address diverse challenges. This integration leads to a highly productive collaboration between different disciplines.

For more information and the application visit: http://sparklabs.ethz

Class attendance and active participation is crucial as much of the learning occurs through the work in teams during class. Therefore, attendance is mandatory for every session. Please also note that the group work outside class is an essential element of this course, so that students must expect an above-average workload.

<tr>
<td>376-1103-00L Frontiers in Nanotechnology</td>
<td></td>
<td>Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.</td>
<td>Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within mammade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.</td>
<td>The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges, learn the vocabulary that is necessary to communicate effectively across departmental boundaries.</td>
<td>Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.</td>
</tr>
<tr>
<td>376-1177-00L Human Factors I</td>
<td></td>
<td>Every day humans interact with various systems. Strategies of interaction, individual needs, physical &amp; mental abilities, and system properties are important factors in controlling the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction &amp; overall performance.</td>
<td>The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.</td>
<td>Physiological, physical, and cognitive factors in sensation and perception - Body spaces and functional anthropometry, Digital Human Models - Experimental techniques in assessing human performance and well-being - Human factors and ergonomics in system designs, product development and innovation - Human information processing and biological cybernetics - Interaction among consumers, environments, behavior, and tasks</td>
<td>Gavriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students - Further textbooks are introduced in the lecture - Brouchures, checklists, key articles etc. are uploaded in ILIAS</td>
</tr>

</tbody>
</table>
Objective

Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Content

Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

This course will provide theoretical and practical knowledge of new principles and applications of multi-modal simulation and interface technologies in medical education, therapy, and rehabilitation.

**Objective**
Virtual Reality has the potential to provide descriptive and practical information for medical training and therapy while relieving the patient and/or the physician. Multi-modal interactions between the user and the virtual environment facilitate the generation of high-fidelity sensory impressions, by using not only visual and auditory modalities, but also kinesthetic, tactile, and even olfactory feedback. On the basis of the existing physiological constraints, this lecture will derive the technical requirements of multi-modal input devices, displays, and rendering techniques. Several examples are presented that are currently being developed or already applied for surgical training, intra-operative augmentation, and rehabilitation. The lecture will be accompanied by several practical courses on graphical and haptic display devices as well as excursions to facilities equipped with large-scale VR equipment.

**Literature**

**Prerequisites / notice**
The course language is English. Basic experience in Information Technology and Computer Science will be of advantage. More details will be announced in the lecture.

402-0674-00L

**Abstract**

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

**Objective**

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

**Literature**

The website also displays additional information on peroral delivery systems, transdermal systems and systems for alternative routes (nasal, pulmonary) of delivery. These fields are covered in detail in the course Galenische Pharmazie II (Galenical Pharmacy II).

http://www.galenik.ethz.ch/teaching/drug_del_drug_targ

Further references will be provided in the course.
**551-0319-00L**  
**Cellular Biochemistry (Part I)**  
Type: W  
ECTS: 3 credits  
Lecturers: U. Kutay, R. I. Enchev, B. Kornmann, M. Peter, I. Zemp, further lecturers  
**Abstract**  
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.  
**Objective**  
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and Signaling pathways into cellular and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.  
**Content**  
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.  
Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.  
**Lecture notes**  
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)  
**Literature**  
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.  
**Prerequisites / notice**  
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

**Abstract**  
Translational science is a cross disciplinary scientific research that is motivated by the need for practical applications that help people. The course should help to clarify basics of translational science, illustrate successful applications and should enable students to integrate key features into their future projects.  
**Objective**  
After completing this course, students will be able to understand:  
- Principles of translational science (including project planning, ethics application, basics of resource management and interdisciplinary communication)  
**Content**  
What is translational science and what is it not?  
- How to identify need?  
  - Disease concepts and consequences for research  
  - Basics about incidence, prevalence etc., and orphan indications  
  - How to choose the appropriate research type and methodology  
  - Ethical considerations including ethics application  
  - Pros and cons of different types of research  
  - Coordination of complex approaches incl. timing and resources  
- How to measure success?  
  - Outcome variables  
  - Improving the translational process  
  - Challenges of communication?  
- How independent is translational science?  
  - Academic boundary conditions vs. industrial influences  
**Electives**

**Abstract**  
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.  
**Objective**  
This course focuses on the concepts of classical and modern genetics and genomics.
Using two Transmission Electron Microscopes the students learn how to align a TEM, select parameters for acquisition of images in bright field (BF) and dark field (DF), perform scanning transmission electron microscopy (STEM) imaging, phase contrast imaging, and acquire electron diffraction patterns. The participants will also learn basic and advanced use of digital cameras and digital imaging methods.

Objective
- Alignment and operation of a TEM, as well as acquisition and interpretation of images, diffraction patterns, accomplishing basic tasks successfully.
- Knowledge of electron imaging modes (including Scanning Transmission Electron Microscopy), magnification calibration, and image acquisition using CCD cameras.
- To set up the TEM to acquire diffraction patterns, perform camera length calibration, as well as measure and interpret diffraction patterns.
- Overview of techniques for specimen preparation.

Content
Using two Transmission Electron Microscopes the students learn how to align a TEM, select parameters for acquisition of images in bright field (BF) and dark field (DF), perform scanning transmission electron microscopy (STEM) imaging, phase contrast imaging, and acquire electron diffraction patterns. The participants will also learn basic and advanced use of digital cameras and digital imaging methods.

- Introduction and discussion on Electron Microscopy and instrumentation.
- Lectures on electron sources, electron lenses and probe formation.
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on sample preparation techniques for EM.
- Brief description and demonstration of the TEM microscope.
- Practice on beam/specimen interaction, image formation, image contrast (and image processing).
- Student participation on sample preparation techniques.
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities.

- Lecture and demonstrations on X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, line scans and spectral mapping.
- Practice on real-world samples and report results.

Literature
- Detailed course manual.

Prerequisites / notice
No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.

327-2126-00L Microscopy Training SEM I - Introduction to SEM

Number of participants limited to 6.

The participants will be chosen based on a short motivation letter. Please send this letter to S. Rodighiero (main lecturer) as soon as possible.

Abstract
The introductory course on Transmission Electron Microscopy (TEM) provides theoretical and hands-on learning for new operators, utilizing lectures, demonstrations, and hands-on sessions.

Objective
- Overview of TEM theory, instrumentation, operation and applications.
- Alignment and operation of a TEM, as well as acquisition and interpretation of images, diffraction patterns, accomplishing basic tasks successfully.
- Knowledge of electron imaging modes (including Scanning Transmission Electron Microscopy), magnification calibration, and image acquisition using CCD cameras.
- To set up the TEM to acquire diffraction patterns, perform camera length calibration, as well as measure and interpret diffraction patterns.
- Overview of techniques for specimen preparation.

Content
Using two Transmission Electron Microscopes the students learn how to align a TEM, select parameters for acquisition of images in bright field (BF) and dark field (DF), perform scanning transmission electron microscopy (STEM) imaging, phase contrast imaging, and acquire electron diffraction patterns. The participants will also learn basic and advanced use of digital cameras and digital imaging methods.

- Introduction and discussion on Electron Microscopy and instrumentation.
- Lectures on electron sources, electron lenses and probe formation.
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on sample preparation techniques for EM.
- Brief description and demonstration of the TEM microscope.
- Practice on beam/specimen interaction, image formation, Image contrast (and image processing).
- Demonstration of Transmission Electron Microscopes and imaging modes (Phase contrast, BF, DF, STEM).
- Student participation on sample preparation techniques.
- Transmission Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities.
- TEM alignment, calibration, correction to improve image contrast and quality.
- Electron diffraction.
- Practice on real-world samples and report results.

Literature
- Detailed course manual.

Prerequisites / notice
No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L; 327-0703-00L) as suggested prerequisite.
Writing your Master’s Thesis: Natural Sciences and Engineering C1-C2

Your course registration is only valid with a simultaneous online registration at the language center (www.sprachenzentrum.uzh.ch).

Number of participants limited to 15 (3 courses are available).

Abstract
We’ll prepare you to produce your MSc thesis. You’ll learn how to structure your thesis, write scientific English, and manage your writing efficiently. You’ll receive detailed feedback on work in progress.

Objective
By the end of the course students are able to plan, draft, and edit academic English papers and theses; structure and write clear texts in a style which is acceptable to their academic discourse community; manage the writing process efficiently; select formal vocabulary and use it in a generally accurate and correct manner; choose and use generally suitable grammatical structures, punctuation, and orthographic conventions, assess their own effectiveness as writers of academic English, and identify areas in which further development is needed.

Content
The course covers the writing context; the writing process; structuring sentences, paragraphs, longer sections (such as introduction, methods, results, and discussion); and whole texts; presenting and integrating non-textual elements such as graphs and tables; and editing and correcting drafts and proofs. Each lesson comprises a mixture of elements, including specialist input, individual work, pairwork, and groupwork. Active participation is expected.

Immunology III

551-0223-00L

W 4 credits 2V M. Kopf, M. Bachmann, J. Kisielow, A. Lanzavecchia, S. R. Leibundgut, A. Oxenius, R. Spörri

Abstract
This course provides a detailed understanding of
- development of T and B cells
- the dynamics of a immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

Key experimental results will be shown to help understanding how immunological text book knowledge has evolved.

Objective
Obtain a detailed understanding of
- the development, activation, and differentiation of different types of T cells and their effectormechanisms during immune responses,
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- Optimization of B cell responses by intelligent design of new vaccines

Content
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the “Danger” concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

Literature
Documents of the lectures are available for download at: https://moodle-app2.let.ethz.ch/course/view.php?id=2581&notifyedittingon=1

Prerequisites / notice
Immunology I and II recommended but not compulsory

Immunology I

551-0317-00L

W 3 credits 2V A. Oxenius, M. Kopf

Abstract
Introduction into structural and functional aspects of the immune system.
Basic knowledge of the mechanisms and the regulation of an immune response.

Objective
Introduction into structural and functional aspects of the immune system.
Basic knowledge of the mechanisms and the regulation of an immune response.

Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histocompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

Literature

Prerequisites / notice
Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung".

Current Topics in Molecular and Cellular Neurobiology

551-0512-00L

W 2 credits 1S U. Suter

Number of participants limited to 8.

Abstract
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Objective
The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

Content
You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance. You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Data: 06.09.2017 12:54 Autumn Semester 2016 Page 777 of 1570
Structural principles, nomenclature and different classes of glycosylation. The different pathways of N- and O-linked protein glycosylation. The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly analysed model organisms. By the end of this module, each student should be able to - recognize the universal principles underlying the development of different animal body plans. - explain how the genes encoding the molecular toolkit have evolved to create animal diversity. - relate changes in gene structure or function to evolutionary changes in animal development. Key skills: By the end of this module, each student should be able to - present and discuss a relevant evolutionary topic in an oral presentation - select and integrate key concepts in animal evolution from primary literature - participate in discussions on topics presented by others.

Lecture notes
Presentations will be made available after the seminars. You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

551-0571-00L
From DNA to Diversity (University of Zurich) W 2 credits 2V A. Hajnal, D. Bopp, E. Hafen

Abstract
The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly analysed model organisms.

Objective
By the end of this module, each student should be able to - recognize the universal principles underlying the development of different animal body plans. - explain how the genes encoding the molecular toolkit have evolved to create animal diversity. - relate changes in gene structure or function to evolutionary changes in animal development.

Key skills:
By the end of this module, each student should be able to - present and discuss a relevant evolutionary topic in an oral presentation - select and integrate key concepts in animal evolution from primary literature - participate in discussions on topics presented by others.

551-1003-00L
Methods of Biological Analysis W 3 credits 3G R. Aebersold, M. Badertscher, K. Weis

Abstract
529-1042-00 Principles of the most important separation techniques and the interpretation of molecular spectra.

551-1003-00 The course will teach the basis and typical applications of methods for the analysis of nucleic acid sequences, mass spectrometric analysis of proteins and proteomes and advanced light and fluorescent imaging methods.

Objective
529-1042-00 Knowledge of the necessary basics and the possibilities of application of the relevant spectroscopical and separation methods in analytical chemistry.

Content
529-1042-00 Application oriented basics of instrumental analysis in organic chemistry and the empirical employment of the methods of structure elucidation (mass spectrometry, NMR-, IR-, UV/VIS spectroscopy). Basics and application of chromatographic and electrophoretic separation methods. Application of the knowledge by practising.

551-1003-00 The course will consist of lectures covering the theoretical and technical base of the respective analytical methods and of exercises where typical applications of the methods in modern experimental biology are discussed.

Lecture notes
529-1042-00 A comprehensive script is available in the HCI-Shop. A summary of the part "Spektroskopie" defines the relevant material for the exam.

551-1003-00 Materials supporting the lectures and exercises will be made available via Moodle.

551-1105-00L
Glycobiology W 4 credits 2V M. Aeberli, T. Hennet

Abstract
Structural principles, nomenclature and different classes of glycosylation. The different pathways of N- and O-linked protein glycosylation and glycolipid biosynthesis in prokaryotes and eukaryotes are discussed. Specific glycan binding proteins and their role in deciphering the glycan code are presented. The role of glycans in infectious diseases, antigen mimicry and autoimmunity are discussed.

Objective
Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glycobiology, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

Content
Structure and linkages; analytical approaches; N-linked protein glycosylation (ER, Golgi); glycan-assisted protein folding and quality control; O-linked protein glycosylation; glucosaminoglycans; glycolipids; prokaryotic glycosylation pathways; lectins; glycans and infectious disease

Lecture notes
handouts

Literature
The course will be in English. It will include the preparation of short essays (marked) about defined topics in Glycobiology.

The course provides an introduction to Biochemistry / Molecular Biology with some emphasis on chemical and biophysical aspects.

Basic aspects of virology, the viral mechanisms for transfer of genetic material into cells, different vector-systems and target cells, animal models, specific applications for inborn diseases of the immune system and of metabolism, adverse effects, and new developments of vector systems will be taught.

Knowledge of important viral and non-viral vector systems.

Knowledge of application in human diseases.

Knowledge of limiting factors.

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.
The students are supposed to acquire a deep understanding of the process of biological design including model representation of a biological system, its thorough analysis, and the subsequent experimental implementation of the system and the related problems. They will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

Computational Biology 636-0017-00L

Objective 1. Insight Into The Mammalian Cell Cycle. Cycling, The Balance Between Proliferation and Cancer - Implications For Biopharmaceutical Manufacturing.
2. The Licence To Kill. Apoptosis Regulatory Networks - Engineering of Survival Pathways To Increase Robustness of Production Cell Lines.
5. From Target To Market. An Antibody’s Journey From Cell Culture to The Clinics.
6. Biotherapy and Malign Applications. Do Life Sciences Enable the Development of Biological Weapons?
7. Functional Food. Enjoy your Meal!

Abstract The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective Attendees will learn which information is contained in genetic sequencing data and how to extract information from them using computational tools. The main concepts introduced are:
- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:
- epidemiology,
- pathogen evolution
- macroevolution of species

Content The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze this alignment (such as BLAST algorithm, GWAS approach). Second, we introduce how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes Slides of the lecture will be available online.
https://www.bse.ehtz.ch/cevo/education/db-materials.html

Synthetic Biology II 636-0507-00L

Abstract 7 months biological design project, during which the students are required to give presentations on advanced topics in synthetic biology (specifically genetic circuit design) and then select their own biological system to design. The system is subsequently modeled, analyzed, and experimentally implemented. Results are presented at an international student competition at the MIT (Cambridge).

Objective The students are supposed to acquire a deep understanding of the process of biological design including model representation of a biological system, its thorough analysis, and the subsequent experimental implementation of the system and the related problems.

Content Presentations on advanced synthetic biology topics (eg genetic circuit design, adaptation of systems dynamics, analytical concepts, large scale de novo DNA synthesis), project selection, modeling of selected biological system, design space exploration, sensitivity analysis, conversion into DNA sequence, implementation and analysis of design, summary of results in form of scientific presentation and poster, presentation of results at the iGEM international student competition (www.igem.org).

Lecture notes Handouts during course

Prerequisites / notice Basic knowledge in linear algebra, analysis, and statistics will be helpful. Some programming experience will be useful for the exercises, but is not required. Programming skills will not be tested in the examination.

Evolutionary Medicine for Infectious Diseases 701-1703-00L

Abstract This course explores infectious disease from both the host and pathogen perspective. Through short lectures, reading and active discussion, students will identify areas where evolutionary thinking can improve our understanding of infectious diseases and, ultimately, our ability to treat them effectively.

Objective Students will learn to (i) identify evolutionary explanations for the origins and characteristics of infectious diseases in a range of organisms and (ii) evaluate ways of integrating evolutionary thinking into improved strategies for treating infections of humans and animals. This will incorporate principles that apply across any host-pathogen interaction, as well as system-specific mechanistic information, with particular emphasis on bacteria and viruses.

Content We will cover several topics where evolutionary thinking is relevant to understanding or treating infectious diseases. This includes: (i) determinants of pathogen host range and virulence, (ii) dynamics of host-parasite coevolution, (iii) pathogen adaptation to evade or suppress immune responses, (iv) antimicrobial resistance, (v) evolution-proof medicine. For each topic there will be a short (~30 minutes) introductory lecture, before students independently research the primary literature and develop half a page of discussion points and questions, followed by interactive discussion in class.

Literature Students will read the primary literature on each topic, and in places we will use the following books:
- Schmid Hempel 2011 Evolutionary Parasitology
- Stearns & Medzhitov 2016 Evolutionary Medicine

Prerequisites / notice A basic understanding of evolutionary biology, microbiology or parasitology will be advantageous but is not essential.
The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health. Students will also become aware on how epidemiological facts are used in prevention, practice and politics. The goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware on how epidemiological facts are used in prevention, practice and politics. Examples form nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware on how epidemiological facts are used in prevention, practice and politics.

The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health. Students will also become aware on how epidemiological facts are used in prevention, practice and politics. Examples form nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

The course covers the development of the nervous system (NS) with a focus on neurogenesis and migration, axon growth, synapse formation, mol. & cell. mechanisms, and diseases of the developing NS.
Objective: The aim is to give a deepened insight on the normal development of the nervous system based on molecular, cellular and biochemical approaches.

Content: The main focus is on the development of the NS: Early development of the NS, cellular processes, nerve fiber growth, building of synapses and neuronal networks.

Lecture notes: Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz/ as BIOC34

Literature: The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

Prerequisites / notice: None. Bring something to write and your student ID

Abstract: The course covers the structure, plasticity and regeneration of the adult nervous system (NS) with focus on: sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.

Objective: The aim is to give a deepened insight into the structure, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

Content: The main focus is on the structure, plasticity and regeneration of the NS: biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

Lecture notes: ETH students: Lecture notes will be provided on Moodle https://moodle-app2.let.ethz.ch/course/view.php?id=694

Password will be provided at the beginning of the lecture.

UZH students: Lecture notes will be provided on OLAT: https://www.olat.uzh.ch/olat/dmz/

Literature: The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle / OLAT.

Abstract: Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective: This course focuses on the concepts of classical and modern genetics and genomics.

Content: The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes: Scripts and additional material will be provided during the semester.

Prerequisites / notice: This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hönggerberg, and on Tuesday morning at UZH Irchel.

Abstract: Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective: The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content: Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Lecture notes: The course will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Literature: 1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia

2. Probability Theory: The Logic of Science by E. T. Jaynes

3. Class Notes

Prerequisites / notice: Fundamentals of Probability, Fundamentals of Computational Modeling

Objective: Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content: The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Lecture notes: Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites: Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.

The course language is English.
Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, math, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchants and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

**Objective**

This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the brain can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

**Content**

It is a commonplace that scientists rarely cite literature that is older than 10 years and when they do, they usually cite one paper that serves as the representative for a larger body of work that has long since been incorporated anonymously in textbooks. Worse than that, many authors have not even read the papers they cite in their own publications. This course, Foundations of Neuroscience is one antidote. Thirteen major areas of research have been selected, which cover the key concepts that have led to our current ideas of how the nervous system is built and functions. We will read both original papers and explore the conceptual links between them and discuss the ‘society of science’, the pursuit of basic science questions over a century of research.

Thirteen major areas of research have been selected, which cover the key concepts that have led to our current ideas of how the nervous system is built and functions. Unusually, we will explore these areas of research by reading the original publications, instead of reading someone else’s digested summary from a textbook or review. By doing this, we will learn how the discoveries were made, what instrumentation was used, how the scientists interpreted their own findings, and how their work, often over many decades and linked together with related findings from many different scientists, generate the current views of mechanism and structure of the nervous system.

To give one concrete example, in 1890 Roy and Sherrington showed that there was a neural activity-dependent regulation of blood flow in the brain. One hundred years later, Ogawa discovered that they could use Nuclear Magnetic Resonance (NMR) to measure a blood oxygen-level dependent (BOLD) signal, which they showed was neural activity-dependent. This discovery led to the development of human functional Magnetic Resonance Imaging (fMRI), which has revolutionized neuropsychology and neuropsychiatry. We will read both these original papers and explore the conceptual links between them and discuss the sociology of science, which in this case, the pursuit of basic science questions over a century of research, led to an explosion in applications. We will also explore the personalities of the scientists and the context in which they made their seminal discoveries. Each week the course members will be given original papers to read for homework, they will have to write a short abstract for each paper. We will then meet weekly with the course leader (KACM) and an assistant for an hour-or-so long interactive seminar. An intimate knowledge of the papers will be assumed so that the discussion does not center simply on an explication of the contents of the papers. Assessment will in the form of a written exam in which the students will be given a paper and asked to write a short abstract of the contents.

Microscopy Training SEM I - Introduction to SEM

Number of participants limited to 6.

The participants will be chosen based on a short motivation letter. Please send this letter to S. Rodighiero (main lecturer) as soon as possible.

Abstract

The introductory course on Scanning Electron Microscopy (SEM) emphasizes hands-on learning. Using 2 SEM instruments, students have the opportunity to study their own samples, or standard test samples, as well as solving exercises provided by ScopEM scientists.

Objective

- Set-up, align and operate a SEM successfully and safely.
- Accomplish imaging tasks successfully and optimize microscope performances.
- Master the operation of a low-vacuum and field-emission SEM and EDX instrument.
- Perform sample preparation with corresponding techniques and equipment for imaging and analysis
- Acquire techniques in obtaining secondary electron and backscatter electron micrographs
- Perform EDX qualitative and semi-quantitative analysis

Content

During the course, students learn through lectures, demonstrations, and hands-on sessions how to setup and operate SEM instruments, including low-vacuum and low-voltage applications.

This course gives basic skills for students new to SEM. At the end of the course, students with no prior experience are able to align a SEM, to obtain secondary electron (SE) and backscatter electron (BSE) micrographs and to perform energy dispersive X-ray spectroscopy (EDX) qualitative and semi-quantitative analysis. The procedures to better utilize SEM to solve practical problems and to optimize SEM analysis for a wide range of materials will be emphasized.

- Discussion of students’ sample/interest
- Introduction and discussion on Electron Microscopy and instrumentation
- Lectures on electron sources, electron lenses and probe formation
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on sample preparation techniques for EM
- Brief description and demonstration of the SEM microscope
- Practice on beam/specimen interaction, image formation, image contrast (and image processing)
- Student participation on sample preparation techniques
- Scanning Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities
- Lecture and demonstrations on X-ray micro-analysis (theory and detection), qualitative and semi-quantitative EDX and point analysis, line-scans and spectral mapping
- Practice on real-world samples and report results

Literature

Prerequisites / notice

No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L, 327-0703-00L) as suggested prerequisite.

Microscopy Training TEM I - Introduction to TEM

Number of participants limited to 6.

The participants will be chosen based on a short motivation letter. Please send this letter to S. Rodighiero (main lecturer).

Abstract

The introductory course on Transmission Electron Microscopy (TEM) provides theoretical and hands-on learning for new operators, utilizing lectures, demonstrations, and hands-on sessions.

Objective

- Overview of TEM theory, instrumentation, operation and applications.
- Alignment and operation of a TEM, as well as acquisition and interpretation of images, diffraction patterns, accomplishing basic tasks successfully.
- Knowledge of electron imaging modes (including Scanning Transmission Electron Microscopy), magnification calibration, and image acquisition using CCD cameras.
- To set up the TEM to acquire diffraction patterns, perform camera length calibration, as well as measure and interpret diffraction patterns.
- Overview of techniques for specimen preparation.

Content

Using two Transmission Electron Microscopes the students learn how to align a TEM, select parameters for acquisition of images in bright field (BF) and dark field (DF), perform scanning transmission electron microscopy (STEM) imaging, phase contrast imaging, and acquire electron diffraction patterns. The participants will also learn basic and advanced use of digital cameras and digital imaging methods.

- Introduction and discussion on Electron Microscopy and instrumentation.
- Lectures on electron sources, electron lenses and probe formation.
- Lectures on beam/specimen interaction, image formation, image contrast and imaging modes.
- Lectures on sample preparation techniques for EM.
- Brief description and demonstration of the TEM microscope.
- Practice on beam/specimen interaction, image formation, Image contrast (and image processing).
- Demonstration of Transmission Electron Microscopes and imaging modes (Phase contrast, BF, DF, STEM).
- Student participation on sample preparation techniques.
- Transmission Electron Microscopy lab exercises: setup and operate the instrument under various imaging modalities.
- TEM alignment, calibration, correction to improve image contrast and quality.
- Electron diffraction.
- Practice on real-world samples and report results.

Literature

Prerequisites / notice

No mandatory prerequisites. Please consider the prior attendance to EM Basic lectures (551-1618-00V; 227-0390-00L, 327-0703-00L) as suggested prerequisite.
### 376-0815-00L Writing your Master's Thesis: Natural Sciences and Engineering C1-C2

| Objective | This course will prepare students for experimental work as it is typically done during the master thesis. The goal is to gain hands-on experience with measurement and analysis methods relevant for Humans Systems Neuroscience and Motor control (for example peripheral nerve stimulation, electrical and magnetic brain stimulation, EMG, EEG, psycho-physical paradigms etc). Students will learn how to perform small scientific projects in this area. Students will work individually or in small groups and solve scientific problems which require them to perform measurements in human participants, extract relevant readouts from the data, apply appropriate statistics and interpret the results. They will also be required to write small essays and reports and they will get feedback on their work throughout the course. |
| Prerequisites / notice | Students are required to have successfully completed the course "Neural control of movement and motor learning" and to have basic knowledge of applied statistics. Self-study material about applied statistics will be available at the beginning of the course and statistical knowledge will be tested (central element) in the second course week. Passing this test is a requirement for continuing the course. Students will have to solve scientific problems, requiring them to independently study scientific material, apply statistics and report their results in the form of written reports and essays. Assessments will be made on the basis of the completed theoretical and practical work that will be performed either in small groups or individually. |
| Abstract | We'll prepare you to produce your Master's thesis. You'll learn how to structure your thesis, write scientific English, and manage your writing efficiently. You'll receive detailed feedback on your work in progress. |
| Content | The course covers the writing context; the writing process; structuring sentences, paragraphs, longer sections (such as introduction, methods, results, and discussion), and whole texts; presenting and integrating non-textual elements such as graphs and tables; and editing and correcting drafts and proofs. Each lesson comprises a mixture of elements, including specialist input, individual tasks, pairwork, and groupwork. Active participation is expected. |
| Literature | - Gavriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students |
| Notes | - Brouchures, checklists, key articles etc. are uploaded in ILIAS |

### 376-1177-00L Human Factors I

| Objective | Every day humans interact with various systems. Strategies of interaction, individual needs, physical & mental abilities, and system properties are important factors in controlling the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction & overall performance. |
| Content | - Physiological, physical, and cognitive factors in sensation and perception - Body spaces and functional anthropometry, Digital Human Models - Experimental techniques in assessing human performance and well-being - Human factors and ergonomics in system designs, product development and innovation - Human information processing and biological cybernetics - Interaction among consumers, environments, behavior, and tasks |
| Literature | - Gavriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students - Further textbooks are introduced in the lecture - Brouchures, checklists, key articles etc. are uploaded in ILIAS |

### 376-1179-00L Applications of Cybernetics in Ergonomics

| Objective | Cybernetics systems have been studied and applied in various research fields, such as applications in the ergonomics domain. Research interests include the man-machine interaction (MMI) topic which involving the performance in multi-model interactions, quantification in gestalt principles in product development; or the information processing matter. |
| Content | - Fitt's law applied in manipulation tasks - Hick-Hyman law applied in design of the driver assistance systems - Vigilance applied in quality inspection - Accommodation/vergence crosslink function - Cross-link models in neurobiology- the ocular motor control system - Human performance in optimization of production lines |

### 376-1414-00L Current Topics in Brain Research (HS)

| Objective | Different national and international scientific guests are invited to present and discuss their actual scientific results. |
| Content | For students: Critical discussion of current research. Students aiming at getting a credit point for this colloquium choose one topic and write a critical essay on the presented research topic. |
| Literature | no handout |

### 376-1504-00L Physical Human Robot Interaction (pHRI)

| Objective | This course focuses on the emerging, interdisciplinary field of physical human-robot interaction, bringing together themes from robotics, real-time control, human factors, haptics, virtual environments, interaction design and other fields to enable the development of human-oriented robotic systems. |
| Literature | no literature |

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 785 of 1570
Objective

The objective of this course is to give an introduction to the fundamentals of physical human robot interaction, through lectures on the underlying theoretical/mechatronics aspects and application fields, in combination with a hands-on lab tutorial. The course will guide students through the design and evaluation process of such systems.

By the end of this course, you should understand the critical elements in human-robot interactions - both in terms of engineering and human factors - and use these to evaluate and de-sign safe and efficient assistive and rehabilitative robotic systems. Specifically, you should be able to:

1) identify critical human factors in physical human-robot interaction and use these to derive design requirements;
2) compare and select mechatronic components that optimally fulfill the defined design requirements;
3) derive a model of the device dynamics to guide and optimize the selection and integration of selected components into a functional system;
4) design control hardware and software and implement and test human-interactive control strategies on the physical setup;
5) characterize and optimize such systems using both engineering and psychophysical evaluation metrics;
6) investigate and optimize one aspect of the physical setup and convey and defend the gained insights in a technical presentation.

Content

This course provides an introduction to fundamental aspects of physical human-robot interaction. After an overview of human haptic, visual and auditory sensing, neurophysiology and psychophysics, principles of human-robot interaction systems (kinematics, mechanical transmissions, robot sensors and actuators used in these systems) will be introduced. Throughout the course, students will gain knowledge of interaction control strategies including impedance/admittance and force control, haptic rendering basics and issues in device design for humans such as transparency and stability analysis, safety hardware and procedures. The course is organized into lectures that aim to bring students up to speed with the basics of these systems, readings on classical and current topics in physical human-robot interaction, laboratory sessions and lab visits.

Students will attend the laboratory sessions where they will implement the theoretical aspects learned during the lectures. Here the salient features of haptic device design will be identified and theoretical aspects will be implemented in a haptic system based on the haptic paddle (http://www.relab.ethz.ch/education/courses/phri/request-ethz-haptic-paddle-hardware-documentation.html), by creating simple dynamic haptic virtual environments and understanding the performance limitations and causes of instabilities (direct/virtual coupling, friction, damping, time delays, sampling rate, sensor quantization, etc.) during rendering of different mechanical properties.

Lecture notes

Will be distributed through the document repository before the lectures.

http://www.relab.ethz.ch/education/courses/phri.html

Literature

Prerequisites / notice

Notice: The registration is limited to 26 students
There are 4 credit points for this lecture.
The lecture will be held in English.
The students are expected to have basic control knowledge from previous classes.
http://www.relab.ethz.ch/education/courses/phri.html

551-0317-00L

Immunology I

Objective

Introduction into structural and functional aspects of the immune system.
Basic knowledge of the mechanisms and the regulation of an immune response.

W 3 credits 2V A. Ozenius, M. Kopf

Abstract

Introduction into structural and functional aspects of the immune system.

Data: 06.09.2017 12:54 Autumn Semester 2016 Page 786 of 1570
Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

Literature

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

551-0319-00L Cellular Biochemistry (Part I)  W  3 credits  2V  U. Kutay, R. I. Enchev, B. Kommann, M. Peter, I. Zemp, further lecturers

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

551-1145-00L Viral and non-Viral Vectors for Human Gene-Therapy - from Pathogens to Safe Medical Applications  W  2 credits  3V  University lecturers

Abstract
Basic aspects of virology, the viral mechanisms for transfer of genetic material into cells, different vector-systems and target cells, animal models, specific applications for inborn diseases of the immune system and of metabolism, adverse effects, and new developments of vector systems will be taught.

Objective

Literature

Prerequisites / notice
No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: BIO708

Mind the enrolment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

572-4009-00L Molecular Biology of Foodborne Pathogens  W  3 credits  2V  M. Loessner, M. Schuppler

Abstract
The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Objective
Detailed and current status of research and insights into the molecular basis of foodborne diseases, with focus on interactions of the microorganisms or the toxins they produce with the human system. Understanding the relationship between specific types of food and the associated pathogens and microbial risks. Another focus lies on the currently available methods and techniques useful for the various purposes, i.e., detection, differentiation (typing), and antimicrobial agents.

Content
Molecular biology of infectious foodborne pathogens (Listeria, Vibrio, E. coli, Campylobacter, etc) and toxin-producing organisms (Bacillus, Clostridium, Staphylococcus). How and under which conditions will toxins and virulence factors be produced, and how do they work? How is the interaction between the human host and the microbial pathogen? What are the roles of food and the environment? What can be done to interfere with the potential risks? Which methods are best suited for what approach? Last, but not least, the role of bacteriophages in microbial pathogenicity will be highlighted, in addition to various applications of bacteriophage for both diagnostics and antimicrobial intervention.

Lecture notes
Electronic copies of the presentation slides (PDF) and additional material will be made available for download to registered students.

Literature
Recommendations will be given in the first lecture

Prerequisites / notice
Lectures (2 hours) will be held as a single session of approximately 60+ minutes (10:15 until approx. 11:15 h), with no break !

572-6403-00L Nutrition and Performance  W  2 credits  2V  S. Mettler, M. B. Zimmermann

Abstract
The course introduces basic concepts of the interaction between nutrition and exercise and cognitive performance.

Objective
To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.

Content
The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition examples.

Lecture notes
Lecture slides and required handouts will be available on the ETH website.

Literature
Information on further reading will be announced during the lecture. There will be some mandatory as well as voluntary readings.
Prerequisites / notice
General knowledge about nutrition, human biology, physiology and biochemistry is a prerequisite for this course. The course builds on basic nutrition and biochemistry knowledge to address exercise and performance related aspects of nutrition.

The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

Language: English

It is strongly recommended to attend the lectures. The lecture (including the handouts) is not designed for distance education.

Practical Training and Semester Project

Practical Training and Semester Project only for majors below-mentioned:
- Human Movement Science and Sport
- Health Technologies
- Molecular Health Sciences
- Neurosciences

Practical Training Internships are either research-oriented for exercising scientific (laboratory) methods or job-related for giving insight into the future world of work (industry, services, school).

Prerequisites / notice
This version of internships lasts for at least 12 weeks full time equivalent.

Practical Training Internships are either research-oriented for exercising scientific (laboratory) methods or job-related for giving insight into the future world of work (industry, services, school).

Prerequisites / notice
This version of internships lasts for at least 8 weeks full time equivalent.

Practical Training Internships are either research-oriented for exercising scientific (laboratory) methods or job-related for giving insight into the future world of work (industry, services, school).

Prerequisites / notice
This version of internships lasts for at least 4 weeks full time equivalent.

Recommended Science in Perspective (Type B) for D-HEST.

see Science in Perspective: Type A: Enhancement of Reflection Capability

see Science in Perspective: Language Courses ETH/UZH

Research Internship

12-week internship intended for exercising (independent) scientific working.

Prerequisites / notice
The Research Internship lasts for at least 12 weeks full time equivalent. It can be combined with the Master Thesis.

Master’s Thesis

Only students fulfilling the following criteria can start with their master thesis:

a. successful completion of the bachelor programme;
b. fulfillment of any additional requirements necessary to gain admission to the master programme.

6-months research study with topics from the chosen major within the field of Health Sciences and Technology. In general, it includes the study of existing literature, the specification of the research question, the choice of the methodological approach, the collection, analysis and interpretation of data, and the written and oral reporting of the findings.

Course Units for Additional Admission Requirements

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Mathematics I covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems - notably through ordinary differential equations.

Main focus of Mathematics II: multivariable calculus and partial differential equations.
Objective
Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of both of these courses.

Content
1. Linear Algebra and Complex Numbers:
systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.

2. Single-Variable Calculus:
review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.

3. Ordinary Differential Equations:
separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

4. Multivariable Differential Calculus:
functions of several variables, partial differentiation, curves and surfaces in space, scalar and vector fields, gradient, curl and divergence.

5. Multivariable Integral Calculus:
multiple integrals, line and surface integrals, work and flow, Green, Gauss and Stokes theorems, applications.

6. Partial Differential Equations:
separation of variables, Fourier series, heat equation, wave equation, Laplace equation, Fourier transform.

Literature
- Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).
- Thomas, G. B.: Thomas’ Calculus, Parts 2 (Pearson Addison-Wesley).

Prerequisites / notice
Prerequisites: familiarity with the basic notions from Calculus, in particular those of function and derivative.

Assistance:
Tuesdays and Wednesdays 17-19h, in Room HG E 41.

Abstract
This course discusses the quantisation of fields in order to introduce a coherent formalism for the combination of quantum mechanics and special relativity.
Topics include:
- Relativistic quantum mechanics
- Quantisation of bosonic and fermionic fields
- Interactions in perturbation theory
- Scattering processes and decays
- Radiative corrections

Objective
The goal of this course is to provide a solid introduction to the formalism, the techniques, and important physical applications of quantum field theory. Furthermore, it prepares students for the advanced course in quantum field theory (Quantum Field Theory II), and for work on research projects in theoretical physics, particle physics, and condensed-matter physics.

Abstract
Low energy particle physics provides complementary information to high energy physics with colliders. In this lecture, we will concentrate on selected experiments, using mainly neutrons and muons, which have significantly improved our understanding of particle physics today.

Objective
The course aims to provide an introduction to selected advanced topics in low energy particle physics with neutrons and muons.

Content
Low energy particle physics provides complementary information to high energy physics with colliders. At the Large Hadron Collider one directly searches for new particles at energies up to the TeV range. In a complementary way, low energy particle physics indirectly probes the existence of such particles and provides constraints for "new physics", making use of precision and high intensities.

Besides the sensitivity to effects related with new physics (e.g., lepton flavor violation, symmetry violations, CPT tests, search for electric dipole moments, new low mass exchange bosons etc.), low energy physics provides the best test of QED (electron g-2), the best tests of bound-state QED (atomic physics and exotic atoms), precise determinations of fundamental constants, information about the CKM matrix, precise information on the weak and strong force even in the non-perturbative regime etc.

In this lecture, we will concentrate on selected experiments, using mainly neutrons and muons, which have significantly improved our understanding of particle physics today. Starting from a general introduction on high intensity/high precision particle physics and the main characteristics of muons and neutrons and their production, we will then focus on the discussion of fundamental problems and ground-breaking experiments:
- Production and characteristics of muon and neutron beams
- Ultracold neutron production
- Measurement of the neutron lifetime and electric dipole moment
- The neutron in the gravitational field and its electric charge
- Muon and neutron decay correlations
- Lepton flavour violations with muons to search for new physics
- What atomic physics can do for particle physics and vice versa
- Laser experiments at accelerators
- From myonic hydrogen to the proton structure and bound-state QED
- From pionic hydrogen to the strong interaction and effective field theories
- etc.

Abstract
Manifold, Riemannian metric, connection, curvature; Special Relativity; Lorentzian metric; Equivalence principle; Tidal force and spacetime curvature; Energy-momentum tensor, field equations, Newtonian limit; Post-Newtonian approximation; Schwarzschild solution; Mercury's perihelion precession, light deflection.

Objective
Basic understanding of general relativity, its mathematical foundations, and some of the interesting phenomena it predicts.

Literature
Suggested textbooks:
C. Misner, K, Thorne and J. Wheeler: Gravitation
S. Carroll - Spacetime and Geometry: An Introduction to General Relativity
R. Wald - General Relativity

N. Straumann - General Relativity with applications to Astrophysics

402-0898-00L The Physics of Electroweak Symmetry Breaking
-Abstract
The aim is to understand the need of physics beyond the Standard Model, the basic techniques of model building in theories BSM and the elements of collider physics required to analyze their phenomenological implications. After an introduction to the SM and alternative theories of electroweak symmetry breaking, we will investigate these issues in the context of models with warped extra dimensions.

-Objective
After the course the student should have a good knowledge of some of the most relevant theories beyond the Standard Model and have the techniques to understand those theories that have not been surveyed in the course. He or she should be able to compute the constraints on any model of new physics, its successes explaining current experimental data and its main phenomenological implications at colliders.

-Prerequisites / notice
The former title of this course unit was "The Physics Beyond the Standard Model". If you already got credits for "The Physics Beyond the Standard Model" (402-0898-00L), you cannot get credits for "The Physics of Electroweak Symmetry Breaking" (402-0898-00L).

402-0899-65L Higgs Physics
-Abstract
The course introduces the theory and phenomenology of the recently discovered Higgs boson. With this course the students will receive a detailed introduction to the physics of the Higgs boson in the Standard Model. They will acquire the necessary theoretical background to understand the main production and decay channels of the Higgs boson at high-energy colliders, and the corresponding experimental signatures.

-Objective
With this course the students will receive a detailed introduction to the physics of the Higgs boson in the Standard Model. They will acquire the necessary theoretical background to understand the main production and decay channels of the Higgs boson at high-energy colliders, and the corresponding experimental signatures.

-Content
Theory part:
- the Standard Model and the mass problem: WW scattering and the no-lose theorem
- the Higgs mechanism and its implementation in the Standard Model
- radiative corrections and the screening theorem
- theoretical constraints on the Higgs mass; the hierarchy problem
- Higgs production in e+e- collisions
- Higgs production at hadron colliders
- Higgs decays to fermions and vector bosons
- Higgs differential distributions, rapidity distribution, pt spectrum and jet vetoes
- Higgs properties and beyond the Standard Model perspective
- Outlook: The Higgs sector in weakly coupled and strongly coupled new physics scenarios.

Experimental part:
* Introductory material:
  - reminders of detectors/accelerators
  - reminders of statistics: likelihoods, hypothesis testing
  - reminders of multivariate techniques: Neural Networks, Decision Trees
* Main topics:
  - pre-history (pre-LEP)
  - LEP1: measurements at the Z-pole
  - LEP2: towards the limit mH<114 GeV
  - TeVatron searches
  - LHC:
    -- main channels overview
    -- dissect on analysis
    -- combine information from all channels
    -- differential measurements
    -- off-shell measurements
  - Future:
    -- pseudo-observables / EFT
    -- Beyond Standard Model

-Literature
- Higgs Hunter's Guide (by S.Dawson, J. Gunion, H. Haber and G. Kane)

-Prerequisites / notice
Prerequisites: Quantum Field Theory I, Phenomenology of Particle Physics I

402-0777-00L Particle Accelerator Physics and Modeling I
-Abstract
This is the first of two courses, introducing particle accelerators from a theoretical point of view and covers state-of-the-art modeling techniques. It emphasizes the multidisciplinary aspect of the field, both in methodology (numerical and computational methods) and with regard to applications such as medical, industrial, material research and particle physics.

-Objective
You understand the building blocks of particle accelerators. Modern analysis tools allows you to model state-of-the art particle accelerators. In some of the exercises you will be confronted with next generation machines. We will develop a Python simulation tool (AcceLEGrator) that reflects the theory from the lecture.
Content
Here is the rough plan of the topics, however the actual pace may vary relative to this plan.

- Particle Accelerators an Overview
- Relativity for Accelerator Physicists
- Building Blocks of Particle Accelerators
- Lie Algebraic Structure of Classical Mechanics and Applications to Particle Accelerators
- Symplectic Maps & Analysis of Maps
- Particle Tracking
- Linear & Circular Machines
- Cyclotrons
- Free Electron Lasers
- Collective effects in linear approximation
- Preview of Particle Accelerator Physics and Modeling II

Literature
Particle Accelerator Physics, H. Wiedemann, ISBN-13 978-3-540-49043-2, Springer

Prequisites / notice
This lecture is also suited for PhD. students

402-0851-00L QCD: Theory and Experiment W 3 credits 3G G. Dissertori, University lecturers

Abstract
An introduction to the theoretical aspects and experimental tests of QCD, with emphasis on perturbative QCD and related experiments at colliders.

Objective
Knowledge acquired on basics of perturbative QCD, both of theoretical and experimental nature. Ability to perform simple calculations of perturbative QCD, as well as to understand modern publications on theoretical and experimental aspects of perturbative QCD.

Content
QCD Lagrangian and Feynman Rules
QCD running coupling
Parton model
Altarelli-Parisi equations
Basic processes
Experimental tests at lepton and hadron colliders
Measurements of the strong coupling constant

Literature
2) R. K. Ellis, W. J. Stirling, B. R. Webber : "QCD and Collider Physics" (Cambridge Monographs on Particle Physics, Nuclear Physics & Cosmology)

Prequisites / notice
will be given as block course, language: English.
For students of both ETH and University of Zurich.

402-0845-66L The BFKL Equation Reloaded and the Multi-Regge Kinematics in QCD and in N=4 SYM W 1 credit 2G V. Del Duca

Abstract
The goal of the course is to help the audience to keep abreast of the strong advances there have been in the study of the high energy limit of scattering amplitudes in the last decade.

Objective
The goal of the course is to help the audience to keep abreast of the strong advances there have been in the study of the high energy limit of scattering amplitudes in the last decade.

Content
- the BFKL Hamiltonian as an integrable model
- the analytic structure of the Mueller-Navelet jet cross sections in QCD
- the analytic properties of N=4 SYM amplitudes in multi-Regge kinematics

Follow-up of the block course "An Introduction to the Perturbative Pomeron and to the BFKL Equation in QCD and in N=4 SYM"

This course counts as a core course in the Bachelor's
degree programme in Mathematics. Holders of an ETH
Zurich Bachelor's degree in Mathematics who didn't use
credits from neither 401-3531-00L Differential Geometry I
nor 401-3532-00L Differential Geometry II for their
Bachelor's degree still can have recognised this course for
the Master's degree.
Furthermore, at most one of the three course units
401-3461-00L Functional Analysis I
401-3531-00L Differential Geometry I
401-3601-00L Probability Theory
can be recognised for the Master's degree in Mathematics
or Applied Mathematics.

Abstract
Curves in $\mathbb{R}^n$, inner geometry of hypersurfaces in $\mathbb{R}^n$, curvature, Theorema Egregium, special classes of surfaces, Theorem of Gauss-Bonnet, Hyperbolic space. Differentiable manifolds, tangent bundle, immersions and embeddings, Sard's Theorem, mapping degree and intersection number, vector bundles, vector fields and flows, differential forms, Stokes' Theorem.

Objective
Introduction to elementary differential geometry and differential topology.

Content
- Differential geometry in $\mathbb{R}^n$: theory of curves, submanifolds and immersions, inner geometry of hypersurfaces, Gauss map and curvature, Theorema Egregium, special classes of surfaces, Theorem of Gauss-Bonnet, Poincaré Index Theorem.
- The hyperbolic space.
- Differential topology: differentiable manifolds, tangent bundle, immersions and embeddings in $\mathbb{R}^n$, Sard's Theorem, transversality, mapping degree and intersection number, vector bundles, vector fields and flows, differential forms, Stokes' Theorem.

Literature
Differential Geometry in $\mathbb{R}^n$:
- Manfredo P. do Carmo: Differential geometry of curves and surfaces
- Wolfgang Kühnel: Differentialgeometrie. Curves-surfaces-manifolds
- Christian Bär: Elementary differential geometry
- Dennis Barden & Charles Thomas: An Introduction to Differential Manifolds
- Victor Guillemin & Alan Pollack: Differential Topology
- Morris W. Hirsch: Differential Topology

401-3461-00L Functional Analysis I
This course counts as a core course in the Bachelor’s degree programme in Mathematics. Holders of an ETH Zurich Bachelor's degree in Mathematics who didn't use credits from neither 401-3461-00L Functional Analysis I nor 401-3462-00L Functional Analysis II for their Bachelor's degree still can have recognised this course for the Master's degree.
Furthermore, at most one of the three course units 401-3461-00L Functional Analysis I 401-3531-00L Differential Geometry I 401-3601-00L Probability Theory
can be recognised for the Master's degree in Mathematics or Applied Mathematics.

Abstract
Baire category; Banach and Hilbert spaces, bounded linear operators; three fundamental principles: Uniform boundedness, open mapping/closed graph theorem, Hahn-Banach; convexity; dual spaces; weak and weak* topologies; Banach-Alaoglu; reflexive spaces; compact operators and Fredholm theory; closed range theorem; spectral theory of self-adjoint operators in Hilbert spaces.

Abstract

Foundations of information systems from a user's viewpoint. The focus is on structured data: relational databases, the data language SQL, designating relational databases. Additional topics: Information Retrieval (searching documents), and estimating their relevance and authority with respect to free-text queries; XML as a format for data exchange; Characteristics and processing of "Big Data".

Objective

Following the course should enable students to

1. answer non-trivial queries on existing relational databases by formulating (entry-level) SQL statements, as well as to add new database content and to update or delete existing content,
2. formalize facts as perceived in the real world in terms of the entity-relationship model, and derive a set of normalized relations (tables) which define the structure of a relational database
3. explain how a database management system (DBMS) essentially works and what kind of services it provides
4. understand how a web search engine such as Google basically works
5. know and apply the core concepts to structure and query XML-documents
6. list the characteristics of "Big Data" and know the basics of processing "Big Data"

Content

Die Lehrveranstaltung vermittelt Grundlagen und Konzepte von Informationssystemen aus der Sicht eines Anwenders.

Im Zentrum stehen relationale Datenbanksysteme, die Abfrage- und Datenmanipulationssprache SQL, sowie der Entwurf bzw. die Strukturierung relationaler Datenbanken. Dieser Stoff wird auch in praktischen Übungen vertieft.

Weitere Themen sind der Umgang mit unstrukturierten und semistrukurierten Daten, die Integration von Daten aus verschiedenen autonomen Informationssystemen, sowie eine Übersicht der Architektur von Datenbanksystemen.

Inhalt:

1. Einleitung,
2. Das Relationenmodell,
3. Die Abfrage- und Datenmanipulationssprache SQL.
5. Architektur relationaler Datenbanksysteme.

Literature

Vorlesungsunterlagen (PowerPoint Folien, teilweise auch zusätzlicher Text) werden auf der Web-Site publiziert. Der Kauf eines Buches wird nicht vorausgesetzt.

Abstract

The course covers the fundamental concepts of computer programming with a focus on systematic algorithmic problem solving. Taught language is C++. No programming experience is required.

Objective

Primary educational objective is to learn programming with C++. When successfully attended the course, students have a good command of the mechanisms to construct a program. They know the fundamental control and data structures and understand how an algorithmic problem is mapped to a computer program. They have an idea of what happens "behind the scenes" when a program is translated and executed.

Secondary goals are an algorithmic computational thinking, understanding the possibilities and limits of programming and to impart the way of thinking of a computer scientist.

Content

The course covers fundamental data types, expressions and statements, (Limits of) computer arithmetic, control statements, functions, arrays, structural types and pointers. The part on object orientation deals with classes, inheritance and polymorphism, simple dynamic data types are introduced as examples, in general, the concepts provided in the course are motivated and illustrated with algorithms and applications.

Lecture notes

A script written in English will be provided during the semester. The script and slides will be made available for download on the course web page.

Literature

Bjarne Stroustrup: Einführung in die Programmierung mit C++, Pearson Studium, 2010

Prerequisites / notice

From AS 2013, an admission to the exam does not any more formally require an attending of the recitation sessions. Handing in solutions to the weekly exercise sheets is thus not mandatory, but we strongly recommend it.

Examination is a one hour-long written test.
The goal of this lecture is an algorithmically oriented introduction to programming. The students learn to

- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data,
- know universal methods for algorithm design.

The following topics are covered: modeling and simulations, visualizing multi-dimensional data, managing data with lists and tables and with relational databases, introduction to programming, universal methods for algorithm design.

Lecture notes
All materials for the lecture are available at www.evim.ethz.ch

Prerequisites / notice
This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.
The unit “Computer Science in Secondary School Mathematics” addresses key contributions of computer science to general education, the tight relations between the algorithmic and the mathematical way of thinking, and the thoughtful choice of computer science topics for high school mathematics classes.

The general goal of the course consists in presenting ways to teach fundamentals of computer science, which are closely related to contents and methods of mathematics. After attending the course unit, a mathematics teacher is able to teach selected fundamentals of computer science in mathematics classes.

The students understand the fundamental concepts of computer science in the context of a broad and deep knowledge. Through this understanding, they manage to prepare teaching materials for a successful knowledge transfer and to pass their passion for the subject on to their pupils.

The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners inside a class. Besides holding classes, the students do care about the individual pupil support.

They encourage the autonomy of the learners, manage to work with diverse target groups and to establish a positive learning environment.

The students are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.

The main topics of the course unit “Computer Science in Secondary School Mathematics” represent a scientific and didactic added value for mathematics classes.

The course covers the didactics of logic, of cryptography, of finite state automata, of computability and of the introduction to programming. The students develop the understanding of fundamental scientific concepts such as algorithm, program, complexity, determinism, computation, automata, verification, testing, security of a cryptosystem and secure communication. They reflect on ways to embed them into a scientifically sound and didactically sustainable mathematics course.

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester. Literature wird angegeben. Zusätzliche Unterlagen und Folien werden zur Verfügung gestellt.

Special students and auditors need special permission from the lecturers.
This course is about fundamental algorithm design paradigms, classic algorithmic problems, and data structures. The connection between application oriented introduction to linear algebra (vector spaces, linear transformations, matrices) and algorithm theory is illustrated. Here, the fundamental concepts of linear algebra are introduced.

Learning outcomes:
- An understanding of the design and analysis of fundamental algorithms and data structures.
- Appreciation for the role of abstraction and mathematical proofs.
- A discussion of a number of applications, e.g., in cryptography, coding theory, and algorithm theory.

Prerequisites:
The relevant high school material is reviewed briefly at the beginning.

Lecture notes:
Lecture notes "Linear Algebra" (Gutknecht) in German, with English expressions for all technical terms.

Lecturers:
O. Immagoli, O. Sorkine Hornung

Notes:
See the course page for up-to-date information.

**Abstract**

Concepts to cope with: a) what can be accomplished in a fully automated fashion (algorithmically solvable) b) How to measure the inherent difficulty of tasks (problems) c) What is randomness and how can it be useful? d) What is nondeterminism and what role does it play in CS? e) How to represent infinite objects by finite automata and grammars?

**Objective**

Learning the basic concepts of computer science along their historical development

**Content**

This lecture gives an introduction to theoretical computer science, presenting the basic concepts and methods of computer science in its historical context. We present computer science as an interdisciplinary science which, on the one hand, investigates the border between the possible and the impossible and the quantitative laws of information processing, and, on the other hand, designs, analyzes, verifies, and implements computer systems.

The main topics of the lecture are:

- alphabets, words, languages, measuring the information content of words, representation of algorithmic tasks
- finite automata, regular and context-free grammars
- complexity theory and NP-completeness
- design of algorithms for hard problems

**Lecture notes**

The lecture is covered in detail by the textbook "Theoretical Computer Science".

**Literature**

Basic literature:

Further reading:

More exercises and examples in:

6. A. Asteroth, Ch. Baier: Theoretische Informatik

**Prerequisites / notice**

During the semester, two non-obligatory test exams will be offered.

**Abstract**

Introducing computer architecture and system programming:

Instruction sets, storage hierarchies, runtime structures with an emphasis on computers as engines for the execution of compiled programs. Interaction between system software and the hardware. Problems that arise from the final representation, performance measurement and tuning, and program portability issues are covered.

**Objective**

The objective is to allow students to understand all aspects of the execution of compiled (C) programs on modern architectures -- the instruction set, the storage resources (registers, stack, memory), input/output, the impact of compiler decisions, and the interaction between the operating system and hardware. Two main themes are correctness issues (esp. those that arise from the finite representation of data) and performance issues (incl. measurement and tuning issues). The interface to the operating system is discussed to prepare for subsequent classes on more advanced systems topics.

The two key goals are:

1) To equip students with a thorough understanding of how to write correct programs that run fast on modern computer, and
2) How to write correct and efficient low-level systems code.

This course does not cover how to design or build a processor or computer.
This course provides an overview of "computers" as a platform for the execution of (compiled) computer programs. This course provides a programmer's view of how computer systems execute programs, store information, and communicate. The course introduces the major computer architecture structures that have direct influence on the execution of programs (processors with registers, caches, other levels of the memory hierarchy, supervisor/kernel mode, and I/O structures) and covers implementation and representation issues only to the extent that they are necessary to understand the structure and operation of a computer system.

The course attempts to expose students to the practical issues that affect performance, portability, security, robustness, and extensibility. This course provides a foundation for subsequent courses on operating systems, networks, compilers and many other courses that require an understanding of the system-level issues. Topics covered include: machine-level code and its generation by optimizing compilers, address translation, input and output, trap/event handlers, performance evaluation and optimization (with a focus on the practical aspects of data collection and analysis).

The course is based in part on "Computer Systems: A Programmer's Perspective" (2nd Edition) by R. Bryant and D. O'Hallaron, with some additional material.

**Content**

### Probability and Statistics

- Basic concepts from probability and statistics:
  - introduction to probability theory
  - short introduction to basic concepts and methods from statistics
- Objective
  - a) ability to understand the covered methods from probability theory and to apply them in other contexts
  - b) probabilistic thinking and stochastic modelling
  - c) ability to perform basic statistical tests and to interpret the results
- Content
  - the laws of randomness and probabilistic thinking (thinking in probabilities)
  - understanding and intuition for stochastic modelling
  - simple and basic methods from statistics
- Literature
  - The course is based in part on "Computer Systems: A Programmer's Perspective" (2nd Edition) by R. Bryant and D. O'Hallaron, with some additional material.

### Numerical Methods for CSE

- The course gives an introduction into fundamental techniques and algorithms of numerical mathematics which play a central role in numerical simulations in science and technology. The course focuses on fundamental ideas and algorithmic aspects of numerical methods.
- Objective
  - Knowledge of the fundamental algorithms in numerical mathematics
  - Knowledge of the essential terms in numerical mathematics and the techniques used for the analysis of numerical algorithms
  - Ability to choose the appropriate numerical method for concrete problems
  - Ability to interpret numerical results
  - Ability to implement numerical algorithms efficiently
- Content
  1. Direct Methods for linear systems of equations
  2. Least Squares Techniques
  3. Data Interpolation and Fitting
  4. Filtering Algorithms
  5. Approximation of Functions
  6. Numerical Quadrature
  7. Iterative Methods for non-linear systems of equations
  8. Single Step Methods for ODEs
  9. Stiff Integrators
- Lecture notes
  - Lecture materials (PDF documents and codes) will be made available to participants:
    - Lecture Git repository: https://gitlab.math.ethz.ch/NumCSE/NumCSE
    - Tablet classroom notes: http://www.sam.math.ethz.ch/~grsam/HS16/NumCSE/NCSE16_Notes/

**Prerequisites / notice**
- 252-0024-00L Parallel Programming
- 252-0014-00L Digital Circuits
- 401-0613-00L Probability and Statistics
- O 6 credits 3V+2U J. Teichmann
- O 7 credits 4V+2U R. Hiptmair

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 802 of 1570
This course provides an in-depth introduction to the core concepts of computer graphics, image processing, multimedia and computer software engineering. The course uses compilers as example to expose modern software development techniques. The course introduces the students to the fundamentals of compiler construction. Students will implement a simple yet complete compiler for an object-oriented programming language for a realistic target machine. Students will learn the use of appropriate tools (parser generators); the implementation language is Java. Throughout the course, students learn to apply their knowledge of theory (automata, grammars, stack machines, program transformation) and well-known programming techniques (module definitions, design patterns, frameworks, software reuse) in a software project.

Literature

Prerequisites / notice
Prior exposure to modern techniques for program construction, knowledge of at least one processor architecture at the assembly language level.

---

### Compensatory Courses

Abstract
The course provides an introduction to the field of human-computer interaction, emphasising the central role of the user in system design. Through detailed case studies, students will be introduced to different methods used to analyse the user experience and shown how these can inform the design of new interfaces, systems and technologies.

Objective
The goal of the course is that students should understand the principles of user-centred design and be able to apply these in practice.

Content
The course will introduce students to various methods of analysing the user experience, showing how these can be used at different stages of system development from requirements analysis through to usability testing. Students will get experience of designing and carrying out user studies as well as analysing results. The course will also cover the basic principles of interaction design. Practical exercises related to touch and gesture-based interaction will be used to reinforce the concepts introduced in the lecture. To get students to further think beyond traditional system design, we will discuss issues related to ambient information and awareness.

151-0107-20L | High Performance Computing for Science and Engineering (HPCSE) I | W    | 4    | 4G   | M. Troyer, P. Chatzidoukas   |

Abstract
This course gives an introduction into algorithms and numerical methods for parallel computing for multi and many-core architectures and for applications from problems in science and engineering.

Objective
Introduction to HPC for scientists and engineers
Fundamental of:
1. Parallel Computing Architectures
2. MultiCores
3. ManyCores

Content
Programming models and languages:
1. C++ threading (2 weeks)
2. OpenMP (4 weeks)
3. MPI (5 weeks)

Computers and methods:
1. Hardware and architectures
2. Libraries
3. Particles: N-body solvers
4. Fields: PDEs
5. Stochastics: Monte Carlo

227-0627-00L | Applied Computer Architecture               | W    | 6    | 4G   | A. Gunzinger                  |

Abstract
This lecture gives an overview of the requirements and the architecture of parallel computer systems, performance, reliability and costs.

Objective
Understand the function, the design and the performance modeling of parallel computer systems.

Content
The lecture "Applied Computer Architecture" gives technical and corporate insights in the innovative Computer Systems/Architectures (CPU, GPU, FPGA, special processors) and their real implementations and applications. Often the designs have to deal with technical limits. Which computer architecture allows the control of the over 1000 magnets at the Swiss Light Source (SLS)? Which architecture is behind the alarm center of the Swiss Railway (SBB)? Which computer architectures are applied for driver assistance systems? Which computer architecture is hidden behind a professional digital audio mixing desk? How can data streams of about 30 TB/s, produced by a protone accelerator, be processed in real time? Can the weather forecast also be processed with GPUs? How can a good computer architecture be found? Which are the driving factors in successful computer architecture design?
Cell and Molecular Biology for Engineers I

**Abstract**
The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

**Objective**
After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

**Content**
Lectures will include the following topics: DNA, chromosomes, RNA, protein, genetics, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytoskeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer, development and stem cells.

In addition, three journal clubs will be held, where one/two publications will be discussed (part I: 1 Journal club, part II: 2 Journal Clubs). For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication. These written documents will be graded and count as 25% for the final grade.

**Lecture notes**
Scripts of all lectures will be available.

**Literature**

---

**Introduction to Neuroinformatics**

**Abstract**
The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

**Objective**
Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monologues of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

**Content**
This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

**Prerequisites**
- Basics of computer architecture.

**ECTS**
W 3 credits 3G  C. Frei

---

**ACM-Lab**

**Abstract**
Solve programming problems from previous ACM Programming Contests (see http://acm.uva.es/problemset/); learn and use efficient programming methods and algorithms.

**Objective**
The objective of this course is to learn how to solve algorithmic problems given as descriptions in natural language, similar to those posed in ACM Programming Contests. This includes appropriate problem modeling, choice of suitable (combinatorial) algorithms, and their efficient implementation using C/C++ and the STL.

**Abstract**
The course is an introduction to research in software engineering, based on reading and presenting high quality research papers in the field. The instructor may choose a variety of topics or one topic that is explored through several papers.

**Objective**
The main goals of this seminar are 1) learning how to read and understand a recent research paper in computer science; and 2) learning how to present a technical topic in computer science to an audience of peers.

**Content**
The technical content of this course falls into the general area of software engineering but will vary from semester to semester.

---

**Foundations of Eiffel-Programming**

**Abstract**
Number of participants limited to 22.

**Objective**
The Students - know Eiffel-specific language concepts and terminology - understand the basic concepts of object-oriented programming using Eiffel - are able to apply this knowledge to solve algorithmic tasks on their own - can write software specifications using Eiffel contracts

**Content**
Complementary service for the lecture "Einführung in die Programmierung" of the fall semester 2015 for students in the bachelor regulations 08.

### Abstract
The Bachelor thesis is the final requirement of the BSc program and is supervised by one of the D-INFK professors. The thesis encourages students to show and produce a scientifically structured work.

### Objective
In their BSc thesis students should demonstrate their ability to carry out independent, structured scientific work.

### Prerequisites / notice
The supervisor of the thesis defines the task, start and end date. A written report will be prepared on the scientific studies carried out, followed by a final presentation. The thesis must be handed in within 6 months.

**Autumn Semester 2016**

**Page 807 of 1570**

Data: 06.09.2017 12:54
Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

(1) They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).

(2) They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions).

851-0242-06L

**Cognitively Activating Instructions in MINT Subjects**

- **Enrollment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).**

**Abstract**

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

**Objective**

- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

**Prerequisites / notice**

Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

851-0242-07L

**Human Intelligence**

Enrollment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

**Abstract**

The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

**Objective**

- Understanding research methods used in the empirical sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

851-0242-08L

**Research Methods in Educational Science**

**Abstract**

Literature from the learning sciences is critically discussed with a focus on research methods.

At the first meeting, working groups will be assembled and meetings with those will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

**Objective**

- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

### Subject Didactics and Professional Training

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The unit "Subject Didactics of Computer Science I" addresses key contributions of computer science to general education. The course deals with the thoughtful choice of educational contents for computer science classes, which takes into account its comprehensibility for different age groups as well as didactic approaches suitable for a successful knowledge transfer.

The general objective of the course consists in highlighting the tight connection between the mathematical and algorithmic way of thinking and the approaches adopted by engineering disciplines, and in reflecting on teaching approaches for sustainable computer science teaching activities.

The students understand the fundamental concepts of computer science in the context of a broad and deep knowledge. Through this understanding, they manage to prepare teaching materials for a successful knowledge transfer and to pass their passion for the subject on to their pupils.

The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners inside a class. Besides holding classes, the students do care about the individual pupil support.

They encourage the autonomy of the learners, manage to work with diverse target groups and to establish a positive learning environment.

The students are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.
### 271-0102-00L Teaching Internship Including Examination Lessons in Computer Science

- **Objective**: Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- **Content**: Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons independently. Two of them are as assessed as Examination Lessons.

### 272-0103-00L Mentored Work Subject Didactics Computer Science

- **Objective**: The objective is for the students:
  - Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.
  - They learn to assess pupils’ work.
  - They learn the skills of the teaching trade.
  - They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
  - They learn the skills of the teaching trade.
  - They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
  - They learn to assess pupils’ work.

### Specialized Courses in Respective Subject with Educational Focus

</tr>
<tr>
<td></td>
<td>Subject with Educational Focus Sc A</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Abstract**

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

**Objective**

The aim is for the students - to familiarize themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.

- To independently develop a text with, special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.

- To try out different options for specialist further training in their profession.

**Content**

Thematicsche Schwerpunkte:

Die mentorierte Arbeit in FV besteht in der Regel in einer Literaturarbeit über ein Thema, das einen Bezug zum gymnasialen Unterricht oder seiner Weiterentwicklung hat. Die Studierenden setzen darin Erkenntnisse aus den Vorlesungen in FV praktisch um. Lernformen:

**Literature**

Die Literatur ist themenspezifisch. Sie muss je nach Situation selber beschafft werden oder wird zur Verfügung gestellt.

**Prerequisites / notice**

Die Arbeit vor Beginn des Praktikums abgeschlossen werden.

<table>

</tr>
</tbody>
</table>

**Abstract**

Advanced topics in parallel / concurrent programming.

**Objective**

Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large concurrent software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

**Content**

Introduction to information retrieval with a focus on text documents and images. Main topics comprise extraction of characteristic features from documents, index structures, retrieval models, search algorithms, benchmarking, and feedback mechanisms. Searching the web, images and XML collections demonstrate recent applications of information retrieval and their implementation.

In depth understanding of managing, indexing, and retrieving documents with text, image and XML content. Knowledge about basic search algorithms on the web, benchmarking of search algorithms, and relevance feedback methods.

**Prerequisites / notice**

Students should at least have followed one previous course offered by the Machine Learning Institute (e.g., CIL or LIS) or an equivalent course offered by another institution.

**Literature**

No lecture notes, but slides will be made available on the course webpage.

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should at least have followed one previous course offered by the Machine Learning Institute (e.g., CIL or LIS) or an equivalent course offered by another institution.

**Abstract**

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

**Objective**

Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensible to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous machine learning algorithms to real-world data.

Topics covered in the lecture include:

- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

**Lecture notes**

**Abstract**

Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory.

**Objective**

Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.
The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a particularly well-suited model for the behavior and interaction of such selfish users and programs. Classic game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

Outline:
- Introduction to classic game-theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- Speed of convergence of natural game playing dynamics such as best-response dynamics or regret minimization.
- Techniques for bounding the quality-loss due to selfish behavior versus optimal outcomes under central control (a.k.a. the 'Price of Anarchy').
- Design and analysis of mechanisms that induce truthful behavior or near-optimal outcomes at equilibrium.
- Selected current research topics, such as Google's Sponsored Search Auction, the U.S. FCC Spectrum Auction, Kidney Exchange.

Lecture notes
No lecture notes.

Literature
"Game Theory and Strategy", Philip D. Straffin, The Mathematical Association of America, 5th printing, 2004

Several copies of both books are available in the Computer Science library.

Prerequisites / notice
Audience: Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.
Requirements: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.

Abstract
The unit “Subject Didactics of Computer Science I” addresses key contributions of computer science to general education. The course deals with the thoughtful choice of educational contents for computer science classes, which takes into account its comprehensibility for different age groups as well as didactic approaches suitable for a successful knowledge transfer.

Objective
The main objective of the course consists in highlighting the tight connection between the mathematical and algorithmic way of thinking and the approaches adopted by engineering disciplines, and in reflecting on teaching approaches for sustainable computer science teaching activities.

The students understand the fundamental concepts of computer science in the context of a broad and deep knowledge. Through this understanding, they manage to prepare teaching materials for a successful knowledge transfer and to pass their passion for the subject on to their pupils.

The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners inside a class. Besides holding classes, the students do care about the individual pupil support.

They encourage the autonomy of the learners, manage to work with diverse target groups and to establish a positive learning environment.

The students are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.

The course “Subject Didactics of Computer Science I” addresses key contributions of computer science to general education. The main topics support the young learners in developing a unique and indispensable way of thinking, in enhancing their understanding of our world as well as in achieving university education entrance qualifications.

The main topics of the course unit “Subject Didactics of Computer Science I” are the didactics of finite state automata, of formal languages and of the introduction to programming. The unit focuses on contents of computer science that contribute to general education. This involves the understanding of fundamental scientific concepts such as algorithm, complexity, determinism, computation, automata, verification, testing and programming language as well as the way to embed them into a scientifically sound and didactically sustainable computer science course.

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

Objective

The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Teaching Internship in Computer Science

Introductory Practical in Computer Science

Simultaneous enrollment in Subject Didactics of Computer Science I - course 272-0101-00L - is compulsory.

Abstract

During the introductory teaching practice, the students sit in on five lessons given by the teacher responsible for their teaching practice, and teach five practice lessons themselves. The students are given observation and reflection assignments by the teacher responsible for their teaching practice.

Objective

Right at the start of their training, students acquire initial experience with the observation of teaching, the establishment of concepts for teaching and the implementation of teaching. This early confrontation with the complexity of everything that teaching involves helps students decide whether they wish to and, indeed, ought to, continue with the training. It forms a basis for the subsequent pedagogical and subject-didactics training.

Content

Teaching Internship Computer Science for Teaching Diploma Computer Science as Major Subject

Teaching Internship for students upgrading TC to Teaching Diploma

The teaching practice takes in 50 lessons: 30 are taught by the students, and the students sit in on 20 lessons. The teaching practice lasts 4-6 weeks. It gives students the opportunity to implement the contents of their specialist-subject, educational science and subject-didactics training in the classroom. Students also conduct work assignments in parallel to their teaching practice.

Objective

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics in their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They acquire the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content

Teaching Internship Computer Science I - course 272-0101-00L - is compulsory.

Simultaneous enrolment in Subject Didactics of Computer Science I - course 272-0101-00L - is compulsory.

Abstract

This is a supplement to the Teaching Internship required to obtain a Teaching Diploma in the corresponding subject. It is aimed at enlarging the already acquired teaching experience. Students observe 10 lessons and teach 15 lessons independently.

Objective

The students are supported by the lecturers or by experienced teachers. They assist teachers at school, they create training systems and tests, correct the written homework of pupils and evaluate the progress of a class. The students create explanations and detailed solutions to exercises with respect to the actual knowledge of the pupils. A written assignment states the exact scope of the activity.

Examination Lesson I in Computer Science

Simultaneous enrolment in "Examination Lesson II in Computer Science" (272-0205-01L) is compulsory.

Abstract

In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-

matter-based and didactic skills they have acquired in the course of their training.

Objective

On the basis of a specified topic, the candidate shows that they are in a position

- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from

the didactic angle

- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Content

Die Studierenden erfahren das Lektionsthema in der Regel eine Woche vor dem Prüfungstermin. Von der zuständigen Lehrperson erhalten

sie Informationen über den Wissensstand der zu unterrichtenden Klasse und können sie vor dem Prüfungstermin besuchen. Sie

erstellen eine Vorbereitung gemäss Anleitung und reichen sie bis am Vortag um 12 Uhr den beiden Prüfungsexperten ein. Die

gehaltene Lektion wird kriteriernbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche

Reflexion des Kandidaten/ der Kandidatin über die gehaltene Lektion im Rahmen eines kurzen Kolloquiums.

Abstract

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening

their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under

supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

Objective

The aim is for the students

- to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their

specialist competence in this way.

- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge

of the targeted readership.

- To try out different options for specialist further training in their profession.

272-0401-00L Mentored Work Specialised Courses in the Respective O Subject with Educational Focus Computer Sc B O 2 credits 4A J. Hromkovic, G. Serafini

Abstract

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening

their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under

supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

Objective

The aim is for the students

- to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their

specialist competence in this way.

- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge

of the targeted readership.

- To try out different options for specialist further training in their profession.

252-0341-01L Information Retrieval

W 4 credits 2V+1U T. Hofmann

Abstract

Introduction to information retrieval with a focus on text documents and images. Main topics comprise extraction of characteristic features from documents, index structures, retrieval models, search algorithms, benchmarking, and feedback mechanisms. Searching the web, images and XML collections demonstrate recent applications of information retrieval and their implementation.

Objective

In depth understanding of managing, indexing, and retrieving documents with text, image and XML content. Knowledge about basic search algorithms on the web, benchmarking of search algorithms, and relevance feedback methods.

252-0417-00L Randomized Algorithms and Probabilistic Methods

W 7 credits 3V+2U+1A A. Steger, E. Welzl

Abstract

Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, SSAT, card shuffling, random walks

Objective

After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.

Content

Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas.

Lecture notes

Yes.

Literature

252-0353-00L Machine Learning

W 8 credits 3V+2U+2A J. M. Buhmann

Abstract

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective

Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the experience for solving assignments.

Content

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions; Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond
- Dimension reduction: principal component analysis (PCA) and beyond
- Random walks

Lecture notes

No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. Students should at least have followed one previous course offered by the Machine Learning Institute (e.g., CIL or LIS) or an equivalent course offered by another institution.

252-1407-00L Algorithmic Game Theory

W 7 credits 3V+2U+1A P. Widmayer, P. Penna

Abstract

Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory.

Objective

Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.
The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a particularly well-suited model for the behavior and interaction of such selfish users and programs. Classic game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

Outline:
- Introduction to classic game-theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- Speed of convergence of natural game playing dynamics such as best-response dynamics or regret minimization.
- Techniques for bounding the quality-loss due to selfish behavior versus optimal outcomes under central control (a.k.a. the 'Price of Anarchy').
- Design and analysis of mechanisms that induce truthful behavior or near-optimal outcomes at equilibrium.
- Selected current research topics, such as Google's Sponsored Search Auction, the U.S. FCC Spectrum Auction, Kidney Exchange.

Lecture notes
No lecture notes.

Literature
"Game Theory and Strategy", Philip D. Straffin, The Mathematical Association of America, 5th printing, 2004

Prerequisites / notice
Several copies of both books are available in the Computer Science library.
Audience: Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.
Requirements: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.

263-2800-00L
Design of Parallel and High-Performance Computing
Advanced topics in parallel / concurrent programming.
Understand concurrency paradigms and models from a higher perspective and acquire skills for designing, structuring and developing possibly large concurrent software systems. Become able to distinguish parallelism in problem space and in machine space. Become familiar with important technical concepts and with concurrency folklore.

Compulsory Elective Courses
Further course offerings from the category Educational Science are listed under "Programme: Educational Science for Teaching Diploma and TC'.

Additional Requirements (ETH-Masterstudents in PHYS/MATH/CSE)

Theoretical Computer Science
Concepts to cope with: a) what can be accomplished in a fully automated fashion (algorithmically solvable) b) How to measure the inherent difficulty of tasks (problems) c) What is randomness and how can it be useful? d) What is nondeterminism and what role does it play in CS? e) How to represent infinite objects by finite automata and grammars?
Learning the basic concepts of computer science along their historical development
This lecture gives an introduction to theoretical computer science, presenting the basic concepts and methods of computer science in its historical context. We present computer science as an interdisciplinary science which, on the one hand, investigates the border between the possible and the impossible and the quantitative laws of information processing, and, on the other hand, designs, analyzes, verifies, and implements computer systems.

The main topics of the lecture are:
- alphabets, words, languages, measuring the information content of words, representation of algorithmic tasks
- finite automata, regular and context-free grammars
- Turing machines and computability
- complexity theory and NP-completeness
- design of algorithms for hard problems

The lecture is covered in detail by the textbook "Theoretical Computer Science".

Basic literature:

Further reading:

More exercises and examples in:
6. A. Aseroth, Ch. Baier: Theoretische Informatik

During the semester, two non-obligatory test exams will be offered.

Systems Programming and Computer Architecture
The lecture notes
The lecture is covered in detail by the textbook "Theoretical Computer Science".

Basic literature:

Further reading:

More exercises and examples in:
6. A. Aseroth, Ch. Baier: Theoretische Informatik

During the semester, two non-obligatory test exams will be offered.
Abstract

Introduction to computer architecture and system programming:

Instruction sets, storage hierarchies, runtime structures with an emphasis on computers as engines for the execution of compiled programs. Interaction between system software and the hardware. Problems that arise from the final representation, performance measurement and tuning, and program portability issues are covered.

Objective

The objective is to allow students to understand all aspects of the execution of compiled (C) programs on modern architectures — the instruction set, the storage resources (registers, stack, memory), input/output, the impact of compiler decisions, and the interaction between the operating system and hardware. Two main themes are correctness issues (esp. those that arise from the finite representation of data) and performance issues (incl. measurement and tuning issues). The interface to the operating system is discussed to prepare for subsequent classes on more advanced systems topics.

The two key goals are:

1) To equip students with a thorough understanding of how to write correct programs that run fast on modern computer, and
2) How to write correct and efficient low-level systems code.

This course does not cover how to design or build a processor or computer.

Content

This course provides an overview of “computers” as a platform for the execution of (compiled) computer programs. This course provides a programmer’s view of how computer systems execute programs, store information, and communicate. The course introduces the major computer architecture structures that have direct influence on the execution of programs (processors with registers, caches, other levels of the memory hierarchy, supervisor/kernel mode, and I/O structures) and covers implementation and representation issues only to the extend that they are necessary to understand the structure and operation of a computer system.

The course attempts to expose students to the practical issues that affect performance, portability, security, robustness, and extensibility. This course provides a foundation for subsequent courses on operating systems, networks, compilers and many other courses that require an understanding of the system-level issues. Topics covered include: machine-level code and its generation by optimizing compilers, address translation, input and output, trap/event handlers, performance evaluation and optimization (with a focus on the practical aspects of data collection and analysis).

Literature

The course is based in part on “Computer Systems: A Programmer’s Perspective” (2nd Edition) by R. Bryant and D. O’Hallaron, with some additional material.

Simultaneous enrolment in Introductory Practical in
Abstract

The unit "Subject Didactics of Computer Science I" addresses key contributions of computer science to general education. The course deals with the thoughtful choice of educational contents for computer science classes, which takes into account its comprehensibility for different age groups as well as didactic approaches suitable for a successful knowledge transfer.

Objective

The general objective of the course consists in highlighting the tight connection between the mathematical and algorithmic way of thinking and the approaches adopted by engineering disciplines, and in reflecting on teaching approaches for sustainable computer science teaching activities.

The students understand the fundamental concepts of computer science in the context of a broad and deep knowledge. Through this understanding, they manage to prepare teaching materials for a successful knowledge transfer and to pass their passion for the subject on to their pupils.

The students know various teaching methods as well as their advantages and disadvantages. They can handle inhomogeneous prior knowledge of the learners inside a class. Besides holding classes, the students do care about the individual pupil support.

They encourage the autonomy of the learners, manage to work with diverse target groups and to establish a positive learning environment.

The students are able to express themselves using a comprehensible and refined professional language, both in a spoken and a written way, and they master the basic terminology of computer science. Besides the English terms, they are familiar with the corresponding German expressions. The students are able to produce detailed, matured, linguistically correct and design-wise appealing teaching materials.

Content

The course "Subject Didactics of Computer Science I" addresses key contributions of computer science to general education. The chosen topics support the young learners in developing a unique and indispensable way of thinking, in enhancing their understanding of our world as well as in achieving university education entrance qualifications.

The main topics of the course unit "Subject Didactics of Computer Science I" are the didactics of finite state automata, of formal languages and of the introduction to programming. The unit focuses on contents of computer science that contribute to general education. This involves the understanding of fundamental scientific concepts such as algorithm, complexity, determinism, computation, automata, verification, testing and programming language as well as the way to embed them into a scientifically sound and didactically sustainable computer science course.

In a semester exercise, the students develop and document an adaptive teaching unit for computer science. They learn to employ the didactics methods and techniques that are introduced at the beginning of the semester.

Prerequisites / notice

Mentored Work Subject Didactics in Computer Science for Teaching Diploma and for students upgrading TC to Teaching Diploma Computer Science as Minor Subject

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

The objective is for the students:

- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Abstract

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Objective

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils’ work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

Content

Anlässlich der Hospitationen erläutert die Praktikumslehrperson ihre fachlichen, fachdidaktischen und pädagogischen Überlegungen, auf deren Basis sie den Unterricht geplant hat und tauscht sich mit dem/der Studierenden aus. Die von dem/der Studierenden gehaltenen Lektionen werden vor- und nachbesprochen.

Die Themen für die beiden Prüfungslektionen am Schluss des Praktikums erfahren die Studierenden in der Regel eine Woche vor dem Prüfungstermin. Sie erstellen eine Vorbereitung gemäss Anleitung und reichen sie bis am Vortrag um 12 Uhr den beiden Prüfungsexperten (Fachdidaktiker/-in, Departementsvertreter/-in) ein. Die gehaltenen Lektionen werden kriteriumsbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/der Kandidatin über die gehaltenen Lektionen im Rahmen eines kurzen Kolloquiums.

**Abstract**

Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

**Objective**

The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks. Furthermore, the modeling of systems with the help of queueing network systems is explained.

**Content**

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

263-5001-00L Introduction to Finite Elements and Sparse Linear System Solving

Abstract
The finite element (FE) method is the method of choice for (approximately) solving partial differential equations on complicated domains. In the first third of the lecture, we give an introduction to the method. The rest of the lecture will be devoted to methods for solving the large sparse linear systems of equation that a typical for the FE method. We will consider direct and iterative methods.

Objective
Students will know the most important direct and iterative solvers for sparse linear systems. They will be able to determine which solver to choose in particular situations.

Content
I. THE FINITE ELEMENT METHOD
(1) Introduction. model problems.
(2) 1D problems. Piecewise polynomials in 1D.
(3) 2D problems. Triangulations. Piecewise polynomials in 2D.
(4) Variational formulations. Galerkin finite element method.
(5) Implementation aspects.

II. DIRECT SOLUTION METHODS
(6) LU and Cholesky decomposition.
(7) Sparse matrices.
(8) Fill-reducing orderings.

III. ITERATIVE SOLUTION METHODS
(9) Stationary iterative methods, preconditioning.
(10) Preconditioned conjugate gradient method (PCG).
(11) Incomplete factorization preconditioning.
(12) Multigrid preconditioning.
(13) Nonsymmetric problems (GMRES, BiCGstab).
(14) Indefinite problems (SYMMLQ, MINRES).

Literature

Prerequisites / notice
Prerequisites: Linear Algebra, Analysis, Computational Science. The exercises are made with Matlab.
Objective: Attendees will learn which information is contained in genetic sequencing data and how to extract information from them using computational tools. The main concepts introduced are:

- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

Content: The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze this alignment (such as BLAST algorithm, GWAS approaches). Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylogenetics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes: Slides of the lecture will be available online.
https://www.bsse.ethz.ch/cevo/education/cb-materials.html

Literature:
The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST

Prerequisites:
Basic knowledge in linear algebra, analysis, and statistics will be helpful. Some programming experience will be useful for the exercises, but is not required. Programming skills will not be tested in the examination.

ECTS: 4 credits

151-0104-00L Uncertainty Quantification for Engineering & Life Sciences
W 4 credits 3G P. Koumoutsakos

Number of participants limited to 60.

Abstract: Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective: The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures such as modeling, parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Content: Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Lecture notes: The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Literature:
1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes
3. Class Notes

Prerequisites:
Fundamentals of Probability, Fundamentals of Computational Modeling

252-5701-00L Advanced Topics in Computer Graphics and Vision
W 2 credits 2S M. Gross, O. Sorkine Hornung

Abstract: This seminar covers advanced topics in computer graphics, such as modeling, rendering, animation, real-time graphics, physical simulation, and computational photography. Each time the course is offered, a collection of research papers is selected and each student presents one paper to the class and leads a discussion about the paper and related topics.

Objective: The goal is to get an in-depth understanding of actual problems and research topics in the field of computer graphics as well as improve presentations and critical analysis skills.

Content: This seminar covers advanced topics in computer graphics, including both seminal research papers as well as the latest research results. Each time the course is offered, a collection of research papers are selected covering topics such as modeling, rendering, animation, real-time graphics, physical simulation, and computational photography. Each student presents one paper to the class and leads a discussion about the paper and related topics. All students read the papers and participate in the discussion.

Lecture notes: no script

Literature: Individual research papers are selected each term. See http://graphics.ethz.ch/ for the current list.

Prerequisites:
The courses "Computer Graphics I and II" (GDV I & II) are recommended, but not mandatory.

253-3800-00L Advanced Operating Systems
W 6 credits 2V+2U+1A T. Roscoe

Abstract: This course is intended to give students a thorough understanding of design and implementation issues for modern operating systems, with a particular emphasis on the challenges of modern hardware features. We will cover key design issues in implementing an operating system, such as memory management, scheduling, protection, inter-process communication, device drivers, and file systems.
**Objective**

The goals of the course are, firstly, to give students a broader perspective on OS design than that provided by knowledge of Unix or Windows, building on the material in a standard undergraduate operating systems class, and secondly, to provide them with practical experience in dealing directly with the concurrency, resource management, and abstraction problems confronting OS designers and implementers.

---

**Content**

This course is intended to give students a thorough understanding of design and implementation issues for modern operating systems, with a particular emphasis on the challenges of modern hardware features. We will cover key design issues in implementing an operating system, such as memory management, scheduling, protection, inter-process communication, device drivers, and file systems.

---

**Prerequisites / notice**

The course is based around a milestone-oriented project, where students work in small groups to implement major components of a microkernel-based operating system. The final assessment will be a combination grades awarded for milestones during the course of the project, a final written report on the work, and a set of test cases on the final code.

---

**252-1414-00L System Security**

**Abstract**

The first part of the lecture covers individual system aspects starting with tamperproof or tamper-resistant hardware in general over operating system related security mechanisms to application software systems, such as host based intrusion detection systems. In the second part, the focus is on system design and methodologies for building secure systems.

**Objective**

In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.

**Content**

The first part of the lecture covers individual system’s aspects starting with tamperproof or tamperresistant hardware in general over operating system related security mechanisms to application software systems such as host based intrusion detection systems. The main topics covered are: tamper resistant hardware, CPU support for security, protection mechanisms in the kernel, file system security (permissions / ACLs / network filesystem issues), IPC Security, mechanisms in more modern OS, such as Capabilities and Zones, Libraries and Software tools for security assurance, etc.

---

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security, logging and auditing (BSM audit, drace, ...), cryptographic support, and trustworthy computing (TGG, SGX).

---

Along the lectures, model cases will be elaborated and evaluated in the exercises.

---

Objective
The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

Content
The general application areas are big data and machine learning. The systems covered will include systems from computer architecture, high performance computing, data appliances, and data centers.

Prerequisites / notice
Students taking this seminar should have the necessary background in systems and low level programming.

227-0559-00L Seminar in Distributed Computing  W  2 credits  2S  R. Wattenhofer

Abstract
In this seminar participating students present and discuss recent research papers in the area of distributed computing. The seminar consists of algorithmic as well as systems papers in distributed computing theory, peer-to-peer computing, ad hoc and sensor networking, or multi-core computing.

Objective
In the last two decades, we have experienced an unprecedented growth in the area of distributed systems and networks; distributed computing now encompasses many of the activities occurring in today's computer and communications world. This course introduces the basics of distributed computing, highlighting common themes and techniques. We study the fundamental issues underlying the design of distributed systems: communication, coordination, synchronization, uncertainty. We explore essential algorithmic ideas and lower bound techniques.

In this seminar, students present the latest work in this domain.

Seminar language: English

Content
Different each year. For details see: www.disco.ethz.ch/courses.html

Lecture notes
Slides of presentations will be made available.

Literature
Papers.
The actual paper selection can be found on www.disco.ethz.ch/courses.html.

Abstract
Subject of the class are engineering techniques for developing secure systems. We examine concepts, methods and tools, applied within the different activities of the SW development process to improve security of the system. Topics: security requirements & risk analysis, system modeling & model-based development methods, implementation-level security, and evaluation criteria for secure systems.

Objective
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software. Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

* security requirements & risk analysis,
* system modeling and model-based development methods,
* implementation-level security, and
* evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class
2. Requirements Engineering: Security Requirements and some Analysis
   - overview: functional and non-functional requirements
   - use cases, misuse cases, sequence diagrams
   - safety and security
   - FMEA, FTA, attack trees
3. Modeling in the design activities
   - structure, behavior, and data flow
   - class diagrams, statecharts
4. Model-driven security for access control (design)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience
5. Model-driven security (Part II)
   - Continuation of above topics
6. Security patterns (design and implementation)
7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks
8. Testing
   - overview
   - model-based testing
   - testing security properties
9. Risk analysis and management 1 (project management)
   - "risk": assets, threats, vulnerabilities, risk
   - risk assessment: quantitative and qualitative
   - safeguards
   - generic risk analysis procedure
   - The OCTAVE approach
10. Risk analysis: IT baseline protection
   - Overview
   - Example
11. Evaluation criteria
   - CMM
   - systems security engineering CMM
   - common criteria
12. Guest lecture
   - TBA

Literature
- Further relevant books and journal/conference articles will be announced in the lecture.

Prerequisites / notice
Prerequisite: Class on Information Security
Content
The first part of the lecture covers individual system’s aspects starting with tamperproof or tamperresistant hardware in general over operating systems related security mechanisms to application software systems such as host based intrusion detection systems. The main topics covered are: tamper resistant hardware, CPU support for security, protection mechanisms in the kernel, file system security (permissions / ACLs / network filesystem issues), IPC Security, mechanisms in more modern OS, such as Capabilities and Zones, Libraries and Software tools for security assurance, etc.

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security, logging and auditing (BSM audit, dtrace, ...), cryptogaphic support, and trustworthy computing (TGG, SGX).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

Abstract
This lecture discusses fundamental concepts and technologies in the area of network security. Several case studies illustrate the dark side of the Internet and explain how to protect against such threats. A hands-on computer lab that accompanies the lecture gives a deep dive on firewalls, penetration testing and intrusion detection.

Objective
Students are aware of current threats that Internet services and networked devices face and can explain appropriate countermeasures. Students can identify and assess known vulnerabilities in a software system that is connected to the Internet. Students know fundamental network security concepts. Students have an in-depth understanding of important security technologies. Students know how to configure a real firewall and know some penetration testing tools from their own experience.

Content
Risk management and the vulnerability lifecycle of software and networked services are discussed. Threats like denial of service, spam, worms, and viruses are studied in-depth. Fundamental security related concepts like identity, availability, authentication and secure channels are introduced. State of the art technologies like secure shell, network and transport layer security, intrusion detection and prevention systems, cross-site scripting, secure implementation techniques and more for securing the Internet and web applications are presented. Several case studies illustrate the dark side of the Internet and explain how to protect against current threats. A hands-on computer lab that accompanies the lecture gives a deep dive on firewalls, penetration testing and intrusion detection.

Prerequisites / notice
Knowledge in computer networking and Internet protocols (e.g. course Communication Networks (D-ITET) or Operating Systems and Networks (D-INFK)).

Due to recent changes in the Swiss law, ETH requires each student of this course to sign a written declaration that he/she will not use the information given in this for illegal purposes. This declaration will have to be signed and submitted no later than at the beginning of the second lesson.

Abstract
This hands-on course focuses on applied aspects of information security. Applied information security, operating system security, OS hardening, computer forensics, web application security, project work, design, implementation, and configuration of security mechanisms, risk analysis, system review.

Objective
The Applied Security Laboratory addresses four major topics: operating system security (hardening, vulnerability scanning, access control, logging), application security with an emphasis on web applications (web server setup, common web exploits, authentication, session handling, code security), computer forensics, and risk analysis and risk management.

Content
This course emphasizes applied aspects of Information Security. The students will study a number of topics in a hands-on fashion and carry out experiments in order to better understand the need for secure implementation and configuration of IT systems and to assess the effectiveness and impact of security measures. This part is based on a book and virtual machines that include example applications, questions, and answers.

Lecture notes
The students will also complete an independent project: based on a set of functional requirements, they will design and implement a prototypical IT system. In addition, they will conduct a thorough security analysis and devise appropriate security measures for their systems. Finally, they will carry out a technical and conceptual review of another system. All project work will be performed in teams and must be properly documented.

Literature
Recommended reading includes:

- Various: OWASP Guide to Building Secure Web Applications, available online
- O'Reilly, Loukides: Unix Power Tools, O'Reilly & Associates.
- Frisch: Essential System Administration, O'Reilly & Associates.
- NIST: Risk Management Guide for Information Technology Systems, available online as PDF
- BSI: IT-Grundschutzhandbuch, available online

Prerequisites / notice
- The lab allows flexible working since there are only few mandatory meetings during the semester.
- The lab covers a variety of different techniques. Thus, participating students should have a solid foundation in the following areas: information security, operating system administration (especially Unix/Linux), and networking. Students are also expected to have a basic understanding of HTML, PHP, JavaScript, and MySQL because several examples are implemented in these languages.
- Students must be prepared to spend more than three hours per week to complete the lab assignments and the project. This applies particularly to students who do not meet the recommended requirements given above. Successful participants of the course receive 8 credits as compensation for their effort.
- All participants must sign the lab's charter and usage policy during the introduction lecture.

Abstract
Core Element: Wireless communication channel, Wireless network architectures and protocols, Attacks on wireless networks, Protection techniques.

Objective
After this course, the students should be able to: describe and classify security goals and attacks in wireless networks; describe security architectures of the following wireless systems and networks: 802.11, GSM/UMTS, RFID, ad hoc/sensor networks; reason about security protocols for wireless network; implement mechanisms to secure 802.11 networks.
The course will introduce participants to semantic models for probabilistic programs. The semantics will provide the fundamental model for deriving generic properties of probabilistic systems, and as a context for proving soundness and completeness of proof techniques.

Students in this course will learn new ways to specify and reason about quantitative properties of probabilistic programs. Both probabilistic programs' functional behaviour and their information-flow properties are important aspects of modern systems building, complementing existing methods of abstraction, nondeterminism and refinement. This course's objective is to give the students the necessary intellectual skills for rigorous reasoning about building such systems.

The first part of the course will concentrate on program-semantics foundations that to support rigorous specification and reasoning about such quantitative programs. The second part of the course will demonstrate how these techniques can be used for analysing both qualitative- and quantitative information flow as they apply to leakage of secure information.

The course will follow the book “Abstraction, Refinement and Proof for Probabilistic Systems”. Other material will consist of research papers which will be available in the secured area.

The course is intended for MSc and PhD students.

263-4650-00L Specification and Proof of Probabilistic Programs with W 4 credits 2V+1U A. McIver, C. C. Morgan

Abstract
The course will introduce probabilistic programs. The semantics will provide the fundamental model for deriving generic properties of probabilistic programs, and as a context for proving soundness and completeness of proof techniques.

Objective
Students in this course will learn new ways to specify and reason about quantitative properties of probabilistic programs. Both probabilistic programs' functional behaviour and their information-flow properties are important aspects of modern systems building, complementing existing methods of abstraction, nondeterminism and refinement. This course's objective is to give the students the necessary intellectual skills for rigorous reasoning about building such systems.

The first part of the course will concentrate on program-semantics foundations that to support rigorous specification and reasoning about such quantitative programs. The second part of the course will demonstrate how these techniques can be used for analysing both qualitative- and quantitative information flow as they apply to leakage of secure information.

Literature
The course will follow the book “Abstraction, Refinement and Proof for Probabilistic Systems”. Other material will consist of research papers which will be available in the secured area.

Prerequisites / Notice
The course is intended for MSc and PhD students.

263-4655-00L Lattice Cryptography W 4 credits 2V+1U V. Lyubashevsky

Abstract
The course will introduce lattice-based cryptography, which is one of the main candidates for quantum-resistant cryptography.

Objective
The objective of the course is to bring the students up to a level where they should be able to read academic papers on state-of-the-art designs of lattice-based primitives.

Content
In this course, we will study lattice-based cryptography. We will cover the basic algorithms associated with integer lattices such as Gram-Schmidt orthogonalization, algorithms for finding short and near lattice vectors, as well as the critical algorithm for sampling lattice points according to a discrete Gaussian distribution. We will then proceed to build up a toolbox of lattice-based cryptographic primitives beginning from collision-resistant hash functions, then moving on to digital signatures, encryption, identity-based encryption, and fully-homomorphic encryption. Particular emphasis will be placed on concrete parameters and practical instantiations. For this purpose, we will also study cryptographic constructions based on the hardness of ideal lattices, which are ideals of polynomial rings.

Prerequisites / Notice
There are no formal mathematical pre-requisites, but students should have "mathematical maturity", which entails dealing with abstract concepts and being comfortable with doing mathematical proofs. Some previous exposure to linear algebra, abstract algebra, and cryptography would be useful.

Seminar Information Security

Number Title ECTS Hours Lecturers
252-4601-00L Current Topics in Information Security W 2 credits 2S D. Basin, S. Capkun, A. Perrig

Abstract
The seminar covers various topics in information security: security protocols (models, specification & verification), trust management, access control, non-interference, side-channel attacks, identity-based cryptography, host-based attack detection, anomaly detection in backbone networks, key-management for sensor networks.

Objective
The main goals of the seminar are the independent study of scientific literature and assessment of its contributions as well as learning and practicing presentation techniques.

Content
The seminar covers various topics in information security, including network security, cryptography and security protocols. The participants are expected to read a scientific paper and present it in a 35-40 min talk. At the beginning of the semester a short introduction to presentation techniques will be given.

Selected Topics
- security protocols: models, specification & verification
- trust management, access control and non-interference
- side-channel attacks
- identity-based cryptography
- host-based attack detection
- anomaly detection in backbone networks
- key-management for sensor networks

Literature
The reading list will be published on the course web site.

   - Overview of this class

2. Requirements Engineering: Security Requirements and some Analysis
   - overview: functional and non-functional requirements
   - use cases, misuse cases, sequence diagrams
   - safety and security
   - FMEA, FTA, attack trees

3. Modeling in the design activities
   - structure, behavior, and data flow
   - class diagrams, statecharts

4. Model-driven security for access control (design)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience

5. Model-driven security (Part II)
   - Continuation of above topics

6. Security patterns (design and implementation)

7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks

8. Testing
   - overview
   - model-based testing
   - testing security properties

9. Risk analysis and management 1 (project management)
   - "risk": assets, threats, vulnerabilities, risk
   - risk assessment: quantitative and qualitative
   - safeguards
   - generic risk analysis procedure
   - The OCTAVE approach

10. Risk analysis: IT baseline protection
    - Overview
    - Example

11. Evaluation criteria
    - CMM
    - systems security engineering CMM
    - common criteria

12. Guest lecture
    - TBA

Literature

- Further relevant books and journal/conference articles will be announced in the lecture.

Prerequisites / notice

Prerequisite: Class on Information Security

252-0535-00L Machine Learning W 8 credits 3V+2U+2A J. M. Buhmann

Abstract

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective

Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non-parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should at least have followed one previous course offered by the Machine Learning Institute (e.g., CIL or LIS) or an equivalent course offered by another institution.

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Advances in mobile devices and communication technologies have led to a rapid increase in demands for various forms of mobile information systems where the users, the applications and the databases themselves may be mobile. Based on both lectures and breakout sessions, this course examines the impact of the different forms of mobility and collaboration that systems require nowadays and how these influence the design of systems at the database, the application and the user interface level. For example, traditional data management techniques have to be adapted to meet the requirements of such systems and cope with new connection, access and synchronisation issues. As mobile devices have increasingly become integrated into the users' lives and are expected to support a range of activities in different environments, applications should be context-aware, adapting functionality, information delivery and the user interfaces to the current environment and task. Various forms of software and hardware sensors may be used to determine the current context, raising interesting issues for discussion. Finally, user mobility, and the varying and intermittent connectivity that it implies, gives rise to new forms of dynamic collaboration that require lightweight, but flexible, mechanisms for information synchronisation and consistency maintenance. Here, the interplay of mobile, personal and social context will receive special attention.</td>

<td>2V+2U+1A</td>
<td>G. Fourny</td>
</tr>
<tr>
<td>Abstract</td>
<td>The key challenge of the information society is to turn data into information to knowledge, knowledge into value. This has become increasingly complex. Data comes in larger volumes, diverse shapes, from different sources. Data is more heterogeneous and less structured than forty years ago. Nevertheless, it still needs to be processed fast, with support for complex operations.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>This combination of requirements, together with the technologies that have emerged in order to address them, is typically referred to as &quot;Big Data.&quot; This revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the &quot;fourth paradigm&quot;.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it were and are still needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (r)evolutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today’s technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each business use case efficiently and consistently.
This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. The material is organized along three axes: data in the large, data in the small, and data in the very small. A broad range of aspects is covered with a focus on how they fit all together in the big picture of the Big Data ecosystem.

- physical storage (HDFS, S3)
- logical storage (key-value stores, document stores, column stores, key-value stores, data warehouses)
- data formats and syntaxes (XML, JSON, CSV, XBRL)
- data shapes and models (tables, trees, graphs, cubes)
- an overview of programming languages with a focus on their type systems (SQL, XQuery, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing (MapReduce) and technologies (Hadoop, Spark)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

We will also host two guest lectures to get insights from the industry: UBS and Google.

### Literature

Large scale analytics and machine learning are outside of the scope of this course. Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

#### Content

This course introduces principled, state-of-the-art techniques from statistics, algorithms and discrete and convex optimization for learning from such large data sets. The course both covers theoretical foundations and practical applications.

#### Abstract

Many scientific and commercial applications require insights from massive, high-dimensional data sets. This courses introduces principled, state-of-the-art techniques from statistics, algorithms and discrete and convex optimization for learning from such large data sets. The course both covers theoretical foundations and practical applications.

#### Objective

In recent years, deep learning and deep networks have significantly improved the state-of-the-art in many application domains such as computer vision, speech recognition, and natural language processing. This class will cover the fundamentals of deep learning and provide a rich set of hands-on tasks and practical projects to familiarize students with this emerging technology.

#### Prerequisites / notice

The participation in the course is subject to the following conditions:

1. The number of participants is limited to 120 students (MSc and PhDs).
2. Students must have taken the exam in Machine Learning (252-0535-00) or have acquired equivalent knowledge.

---

**Seminar Information Systems**

### Number of participants limited to 120.

2. Students must have taken the exam in Machine Learning (252-0535-00) or have acquired equivalent knowledge.

---

**Seminar Information Systems**

### Content

This course introduces core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as sensor networks, robotics, and the Internet.

### Objective

How can we build systems that perform well in uncertain environments and unforeseen situations? How can we develop systems that exhibit "intelligent" behavior, without prescribing explicit rules? How can we build systems that learn from experience in order to improve their performance? We will study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as sensor networks, robotics, and the Internet. The course is designed for upper-level undergraduate and graduate students.

### Prerequisites / notice

Solid basic knowledge in statistics, algorithms and programming. Background in machine learning is helpful but not required.

---

**Seminar Information Systems**

### Content

This seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

### Objective

The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

### Prerequisites / notice

Students taking this seminar should have the necessary background in systems and low level programming.

---

**Seminar Information Systems**

### Content

The general application areas are big data and machine learning. The systems covered will include systems from computer architecture, high performance computing, data appliances, and data centers.

### Objective

The seminar will cover topics related to data processing using new hardware in general and hardware accelerators (GPU, FPGA, specialized processors) in particular.

### Prerequisites / notice

Students taking this seminar should have the necessary background in systems and low level programming.
In this seminar, recent papers of the pattern recognition and machine learning literature are presented and discussed. Possible topics cover statistical models in computer vision, graphical models and machine learning.

The goal is to introduce students to current research, and to enable them to read, understand, and present scientific papers.

The main goal of this course is to convey a deep understanding of the key concepts of sequential object-oriented programming and their support through various language features.

The lecture intends to supplement more abstract views of software construction, and to contribute to a better understanding of "how it really works" behind the scenes.

After this course, students will:

- Be able to learn new languages more rapidly.
- Be aware of many subtle problems of object-oriented programming and know how to avoid them.
- Have a deep understanding of advanced concepts of object-oriented programming and their support through various language features.
- Be able to understand language concepts on a semantic level and be able to compare and evaluate language designs.
- Be able to give a presentation of about 30 mins followed by a discussion on an assigned topic.
- Be able to maintain the consistency of data structures.
- Be able to learn new languages more rapidly.
- Have a deep understanding of advanced concepts of object-oriented programming and their support through various language features.
- Become able to distinguish parallelism in problem space and in machine space.
- Become familiar with important technical concepts and with concurrency folklore.
- Understand concurrency paradigms and models from a higher perspective.

Abstract
This seminar is an opportunity to become familiar with current research in software engineering and more generally with the methods and challenges of scientific research.

Objective
Each student will be asked to study some papers from the recent software engineering literature and review them. This is an exercise in critical review and analysis. Active participation is required (a presentation of a paper as well as participation in discussions).

Content
The aim of this seminar is to introduce students to recent research results in the area of programming languages and software engineering. To accomplish that, students will study and present research papers in the area as well as participate in paper discussions. The papers will span topics in both theory and practice, including papers on program verification, program analysis, testing, programming language design, and development tools. A particular focus will be on domain-specific languages.

Literature
The publications to be presented will be announced on the seminar home page at least one week before the first session.

Prerequisites / notice
Organizational note: the seminar will meet only when there is a scheduled presentation. Please consult the seminar's home page for information.

Focus Courses in Theoretical Computer Science

Randomized Algorithms and Probabilistic Methods

Las Vegas & Monte Carlo algorithms; inequalities of Markov, Chebyshev, Chernoff; negative correlation; Markov chains: convergence, rapidly mixing; generating functions; Examples include: min cut, median, balls and bins, routing in hypercubes, 3SAT, card shuffling, random walks

After this course students will know fundamental techniques from probabilistic combinatorics for designing randomized algorithms and will be able to apply them to solve typical problems in these areas.
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the importance of algorithms which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.

The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:

- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalty estimation, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour search
- Dimension reduction: principal component analysis (PCA) and beyond

No lecture notes, but slides will be made available on the course webpage.

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

Students should at least have followed one previous course offered by the Machine Learning Institute (e.g., CIL or LIS) or an equivalent course offered by another institution.

|              | Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory.

Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.

The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a particularly well-suited model for the behavior and interaction of such selfish users and programs. Classic game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

Outline:
- Introduction to classic game-theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- Speed of convergence of natural game playing dynamics such as best-response dynamics or regret minimization.
- Techniques for bounding the quality-loss due to selfish behavior versus optimal outcomes under central control (a.k.a. the 'Price of Anarchy').
- Design and analysis of mechanisms that induce truthful behavior or near-optimal outcomes at equilibrium.
- Selected current research topics, such as Google's Sponsored Search Auction, the U.S. FCC Spectrum Auction, Kidney Exchange.

Several copies of both books are available in the Computer Science library.

Audience: Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.

Requirements: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.
Abstract
Geometric structures are useful in many areas, and there is a need to understand their structural properties, and to work with them algorithmically. The lecture addresses theoretical foundations concerning geometric structures. Central objects of interest are triangulations. We study combinatorial (Does a certain object exist?) and algorithmic questions (Can we find a certain object efficiently?)

Objective
The goal is to make students familiar with fundamental concepts, techniques and results in combinatorial and computational geometry, so as to enable them to model, analyze, and solve theoretical and practical problems in the area and in various application domains.

Content
Planar and geometric graphs, embeddings and their representation (Whitney's Theorem, canonical orderings, DCEL), polygon triangulations and the art gallery theorem, convexity in R^d, planar convex hull algorithms (Jarvis Wrap, Graham Scan, Chan's Algorithm), point set triangulations, Delaunay triangulations (Lawson flips, lifting map, randomized incremental construction), Voronoi diagrams, the Crossing Lemma and incidence bounds, line arrangements (duality, Zone Theorem, ham-sandwich cuts), 3-SUM hardness, counting planar triangulations.

Lecture notes
Yes

Literature

Prerequisites / notice
Prerequisites: The course assumes basic knowledge of discrete mathematics and algorithms, as supplied in the first semesters of Bachelor Studies at ETH.
Outlook: In the following spring semester there is a seminar "Geometry: Combinatorics and Algorithms" that builds on this course. There are ample possibilities for Semester-, Bachelor- and Master Thesis projects in the area.

Abstract
The course will introduce lattice-based cryptography, which is one of the main candidates for quantum-resistant cryptography.

Objective
The objective of the course is to bring the students up to a level where they should be able to read academic papers on state-of-the-art designs of lattice-based primitives.

Content
In this course, we will study lattice-based cryptography. We will cover the basic algorithms associated with integer lattices such as Gram-Schmidt orthogonalization, algorithms for finding short and near lattice vectors, as well as the critical algorithm for sampling lattice points according to a discrete Gaussian distribution. We will then proceed to build up a toolbox of lattice-based cryptographic primitives beginning from collision-resistant hash functions, then moving on to digital signatures, encryption, identity-based encryption, and fully-homomorphic encryption. Particular emphasis will be placed on concrete parameters and practical instantiations. For this purpose, we will also study cryptographic constructions based on the hardness of ideal lattices, which are ideals of polynomial rings.

Prerequisites / notice
There are no formal mathematical pre-requisites, but students should have "mathematical maturity", which entails dealing with abstract concepts and being comfortable with doing mathematical proofs. Some previous exposure to linear algebra, abstract algebra, and cryptography would be useful.

Abstract
Mathematical treatment of diverse optimization techniques.

Objective
Advanced optimization theory and algorithms.

Content
1. Linear optimization: The geometry of linear programming, the simplex method for solving linear programming problems, Farkas' Lemma and infeasibility certificates, duality theory of linear programming.
3. Integer optimization: Ties between linear and integer optimization, total unimodularity, complexity theory, cutting plane theory.
4. Combinatorial optimization: Network flow problems, structural results and algorithms for matroids, matchings and, more generally, independence systems.

**Abstract**

The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

**Objective**

The objectives of this course are:

1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve those.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

**Content**

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition.

**Prerequisites**

- It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

**Abstract**

This course covers some of the fundamental concepts of computer graphics, namely 3D object representations and generation of photorealistic images from digital representations of 3D scenes.

**Objective**

At the end of the course the students will be able to build a rendering system. The students will study the basic principles of rendering and image synthesis. In addition, the course is intended to stimulate the students' curiosity to explore the field of computer graphics in subsequent courses or on their own.

**Content**

This course covers fundamental concepts of modern computer graphics. Students will learn about 3D object representations and the details of how to generate photorealistic images from digital representations of 3D scenes. Starting with an introduction to 3D shape modeling and representation, texture mapping and ray-tracing, we will move on to acceleration structures, the physics of light transport, appearance modeling and global illumination principles and algorithms. We will end with an overview of modern image-based image synthesis techniques, covering topics such as lightfields and depth-image based rendering.

**Prerequisites**

- Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++, Visual Computing course recommended.
- The programming assignments will be in C++. This will not be taught in the class.

Data: 06.09.2017 12:54  Autumn Semester 2016  Page 836 of 1570
This course introduces core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications of such large datasets. The course both covers theoretical foundations and practical applications.

Content
- Dealing with large data (Data centers; Map-Reduce/Hadoop; Amazon Mechanical Turk)
- Fast nearest neighbor methods (Shingling, locality sensitive hashing)
- Online learning (Online optimization and regret minimization, online convex programming, applications to large-scale Support Vector Machines)
- Multi-armed bandits (exploration-exploitation tradeoffs, applications to online advertising and relevance feedback)
- Active learning (uncertainty sampling, pool-based methods, label complexity)
- Dimension reduction (random projections, nonlinear methods)
- Data streams (Sketches, coresets, applications to online clustering)
- Recommender systems

Prerequisites / notice
Prerequisites: Solid basic knowledge in statistics, algorithms and programming. Background in machine learning is helpful but not required.
The script will be made available from the course webpage. The course covers the following subjects: (a) Models for describing hardware and software components (specification), (b) Hardware-Software Codesign (requiring background on energy generation and consumption; characteristics, potential, and limitations of renewable energy sources), and (c) System design (hardware-software partitioning and design space exploration).

Software Interfaces (instruction set, hardware and software components, reconfigurable computing, heterogeneous computer architectures, methods are discussed that are fundamental for systems that consist of software and hardware components. Students develop their own add-on mobile computing algorithms to improve the behavior of the systems, using a Java-based event-driven simulator. We also hand out embedded systems that can be used for experiments for optical communication.

Modern applications of wireless communication techniques (Wi-Fi, Bluetooth, ZigBee, Standards, Regulation, Algorithms, Radio Spectrum, Cognitive Radio, Mesh Networks, Optical Communication, Visible Light Communication) are discussed in this course. The course provides advanced knowledge in the design of complex computer systems, in particular embedded systems. Models and methods are discussed that are fundamental for systems that consist of software and hardware components. Students should have interest in wireless communication, and should be familiar with Java programming.

The lecture includes interactive exercises, case studies and practical examples. Each student presents one paper to the class. 

The courses "Computer Graphics I and II" (GDV I & II) are recommended, but not mandatory.

## Computer Science Elective Courses

The Elective Computer Science Courses can be selected from all Master level courses offered by D-INFK.

### Number 252-0293-00L Wireless and Mobile Computing for Entertainment

**Title:** Wireless and Mobile Computing for Entertainment Applications

**Type:** W

**ECTS:** 4 credits

**Hours:** 2V+1U

**Lecturers:** S. Mangold

**Abstract:** This course gives a detailed overview about the 802 standards and summarizes the state of the art for WLANs, WPANs, and WMANs, including new topics such as mesh networks, cognitive radio, and visible light communications. The course combines lectures with a set of assignments in which students are asked to work with a simple JAVA simulation software.

**Objective:** The objective of the course is to learn about the general principles of wireless communications, including physics, frequency spectrum regulation, and standards. Further, the most up-to-date standards and protocols used for wireless LAN IEEE 802.11, Bluetooth and Wi-Fi, mesh networks, sensor networks, cellular networks, visible light communication, and cognitive radios, are analyzed and evaluated.

**Content:** Wireless Communication, Wi-Fi, Bluetooth, ZigBee, Standards, Regulation, Algorithms, Radio Spectrum, Cognitive Radio, Mesh Networks, Optical Communication, Visible Light Communication

**Lecture notes:** The script will be made available from the course webpage.

**Literature:**
1. The course webpage at http://www.lst.inf.ethz.ch/education/wireless.html
2. The Java 802 protocol emulator "JEmula802"

**Prerequisites / notice:** Students should have interest in wireless communication, and should be familiar with Java programming.

### Number 252-3610-00L Smart Energy

**Title:** Smart Energy

**Type:** W

**ECTS:** 3 credits

**Hours:** 2G

**Lecturers:** F. Mattern, V. Tiefenbeck

**Abstract:** The lecture covers the role of ICT for sustainable energy usage. Concepts of the emerging smart grid are outlined and approaches to motivate sustainable consumer choices are explained. The lecture combines technologies from ubiquitous computing and traditional ICT with insights from socio-psychological concepts and illustrates them with examples from actual applications.

**Objective:** Participants become familiar with the challenges related to sustainable energy usage, understand the principles of a smart grid infrastructure and its applications, know the role of ubiquitous computing technologies, can explain the challenges regarding security and privacy, can reflect the basics cues to induce changes in consumer behavior, develop a general understanding of the effects of a smart grid infrastructure on energy efficiency, and know how to apply the learning to related design projects.

**Content:**
- Background on energy generation and consumption; characteristics, potential, and limitations of renewable energy sources
- Introduction to energy economics
- Smart grid and smart metering infrastructures, virtual power plants, security challenges
- Demand management and home automation using ubiquitous computing technologies
- Changing consumer behavior with smart ICT
- Benefits challenges of a smart energy system

**Literature:** Will be provided during the course, though a good starting point is "ICT for green: how computers can help us to conserve energy" from Friedemann Mattern, Thosten Staake, and Markus Weiss (available at http://www.vs.inf.ethz.ch/publ/papers/ICT-for-Green.pdf).

**Prerequisites / notice:** The lecture includes interactive exercises, case studies and practical examples. Students should have interest in wireless communication, and should be familiar with Java programming.

### Number 263-0600-00L Research in Computer Science

**Title:** Research in Computer Science

**Type:** W

**ECTS:** 5 credits

**Hours:** 11A

**Lecturers:** Professors

**Abstract:** Independent project work under the supervision of a Computer Science Professor.

**Objective:** Independent project work under the supervision of a Computer Science Professor.

**Prerequisites / notice:** Only students who fulfill one of the following requirements are allowed to begin a research project:
- 1 lab (interfocus course) and 1 focus course
- 2 core focus courses
- 2 labs (interfocus courses)

A task description must be submitted to the Student Administration Office at the beginning of the work.

### Number 227-0778-00L Hardware/Software Codesign

**Title:** Hardware/Software Codesign

**Type:** W

**ECTS:** 6 credits

**Hours:** 2V+2U

**Lecturers:** L. Thiele

**Abstract:** The course provides advanced knowledge in the design of complex computer systems, in particular embedded systems. Models and methods are discussed that are fundamental for systems that consist of software and hardware components.

**Objective:** The course provides advanced knowledge in the design of complex computer systems, in particular embedded systems. Models and methods are discussed that are fundamental for systems that consist of software and hardware components.

**Content:** The course covers the following subjects: (a) Models for describing hardware and software components (specification), (b) Hardware-Software Interfaces (instruction set, hardware and software components, reconfigurable computing, heterogeneous computer architectures, System-on-Chip), (c) Application specific instruction sets, code generation and retargetable compilation, (d) Performance analysis and estimation techniques, (e) System design (hardware-software partitioning and design space exploration).
Prerequisites / notice

Prerequisites for the course is a basic knowledge in the following areas: computer architecture, digital design, software design, embedded systems.

103-0237-00L GIS III  

Abstract

The course deals with advanced topics in GIS: GIS project lifecycle, Managing GIS, Legal issues, GIS assets & constraints; Geospatial Web Services; technical basics, architecture, functions, interoperability, standards, mashups, portals, applications; Geostatistics; Sensor Web Enablement; Human-Computer Interaction; Cognitive Issues in GIS.

Objective

Students will get a detailed overview of advanced GIS topics. They will go through all steps of setting up a Web-GIS application in the labs and perform other practical tasks relating to Sensor Web Enablement, Human-Computer Interaction, Geostatistics, and Web Processing Services.

Lecture notes

Lecture slides will be made available in digital form.

Literature

Elective Courses  

Students can individually chose from the entire Master course offerings from ETH Zurich, EPF Lausanne, the University of Zurich and - with the consent of the mentor - from all other Swiss universities.

For further details, refer to Art. 31 of the Regulations 2009 for the Master Program in Computer Science.

Internship

Only for Computer Science MSc.

Number  Title  Type  ECTS  Hours  Lecturers
252-0700-00L  Internship  W  0 credits  external organisers

GESS Science in Perspective

Recommended GESS Science in Perspective (Type B) for D-INFK.

see GESS Science in Perspective: Type A: Enhancement of Reflection Capability

see GESS Science in Perspective: Language Courses ETH/UZH

Master's Thesis

Only students who fulfill the following criteria are allowed to begin with their master thesis:

a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract

Independent project work supervised by a Computer Science professor. Duration 6 months.

Objective

Independent project work supervised by a Computer Science professor.

| 066-0411-00L   | Structural Design I          | W    | 2    | 2V   | P. Block, J. Schwartz |
| Abstract       | The course is an introduction to structural design using graphical methods and structural models, with a focus on a creative approach rather than repetitive calculations. Cable and membrane structures, arch and shell structures and combined arch and cable systems will be used to demonstrate these methods. |
| Objective      | The objective is to encourage students to develop an intuitive understanding of the relationship between the shape of a structure, the load it needs to carry and the forces in it. |
| Content        | To achieve this, the teaching is based on graphic statics, which allow the visualization of internal and external forces in structural systems, therefore illustrating the relationship between shape (form) and stress (force) in load bearing elements. This understanding is directly applied to the students' design projects, in which issues of statics and design overlap. |
| Content        | After a general introduction of basic concepts, structural systems such as cable and arch structures will be analyzed with the help of graphic statics. The students will learn to understand the flow of forces in a structural system in relation to the system's form. They will be able to modify this force flow and give dimension to the structural components. |
| Lecture notes  | All concepts, approaches and methods will be introduced in the weekly lectures and practiced in subsequent exercises. |
| Literature     | on eQuilibrium: http://www.block.arch.ethz.ch/equilibrium and http://www.schwartz.arch.ethz.ch/ |
| Literature     | "Faustformel Tragwerksentwurf" (Philippe Block, Christoph Gengangel, Stefan Peters, DVA Deutsche Verlags-Anstalt 2013, ISBN: 978-3-421-03904-0) |

| 151-1633-00L   | Energy Conversion            | W    | 4    | 3G   | H. G. Park |
| Abstract       | This course is intended for students outside of D-MAVT. |
| Objective      | Fundamentals of Thermal Sciences in association with Energy Conversion |
| Content        | To become acquainted and familiarized with basic principles of fundamental thermal sciences (Thermodynamics, Heat Transfer, etc.) as well as their linkage to energy conversion technologies. |
| Content        | Thermodynamics (first and second laws), Heat Transfer (conduction/convection/radiation), Technical Applications |
| Lecture notes  | Slides will be distributed by e-mail every week. |

| 401-0203-00L   | Mathematics                  | W    | 4    | 2V+1U| C. Busch |
| Abstract       | This course gives an introduction to the following subjects: linear algebra (systems of linear equations, matrices), calculus, multivariable calculus, differential equations. |
| Objective      | Basic mathematical knowledge for engineers. Mathematics as a tool to solve engineering problems. |
| Content        | This course gives an introduction to the following subjects: linear algebra (systems of linear equations, matrices), calculus, multivariable calculus, differential equations. |

| 066-0427-00L   | Design and Building Process MBS | W    | 2    | 2V   | A. Paulus |
| Abstract       | "Design and Building Process MBS" is a brief manual for prospective architects and engineers covering the competencies and the responsibilities of all involved parties through the design and building process. Lectures on twelve compact aspects gaining importance in a increasingly specialised, complex and international surrounding. |
| Objective      | Participants will come to understand how they can best navigate the design and building process, especially in relation to understanding their profession, gaining a thorough knowledge of rules and regulations, as well as understanding how involved parties’ minds work. They will also have the opportunity to investigate ways in which they can relate to, understand, and best respond to their clients’ wants and needs. Finally, course participants will come to appreciate the various tools and instruments, which are available to them when implementing their projects. The course will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship. |

**Data:** 06.09.2017 12:54  **Autumn Semester 2016**  **Page 842 of 1570**
This course looks at technology and innovation management as a process. Continuously, organizations are faced with a fundamental decision: they have to allocate resources between well-known tasks that reliably generate positive results; or explore new ways of doing things, new technologies, products and services. The latter is a high risk choice. Its rewards can be high, but the chances of success are small.

How do firms organize to take these decisions? What kind of management skills are necessary to take them? What kind of tools and methods are deployed to sustain managerial decision-making in highly volatile environments? These are the central questions on which this course focuses, relying on a combination of lectures, case-based discussion, guest speakers, simulations and group work.

Lecture notes
Slides will be available on the TIMGROUP website.

Literature
Readings will be available on the TIMGROUP website.

Prerequisites / notice
No specific background in economics or management is required.

#### Content
- Climate Change. The Global Picture: global energy balance, global climate models, the IPCC process. Towards regional climate scenarios: role of spatial resolution, overview of approaches, hydrostatic RCMS, cloud-resolving RCMS
- Urban micro climate and comfort: urban heat island effect, wind flow and radiation in the built environment, convective heat transport modelling, heat balance and ventilation of urban spaces - impact of morphology, outdoor wind comfort, outdoor thermal comfort,
- Urban energy and urban design. Energy performance of building quarters and cities, decentralized urban energy production and storage technologies, district heating networks, optimization of energy consumption at district level, effect of the micro, urban heat islands, and climate change on the energy performance of buildings and building blocks.
- Wind driving rain (WDR): WDR phenomena, WDR experimental and modeling, wind blocking effect, applications and moisture durability
- Pollutant dispersion, pollutant cycle: emission, transport and deposition, air quality
- Urban acoustics, noise propagation through the urban environment, meteorological effects, urban acoustic modeling, noise reduction measures, urban vegetation

#### Lecture notes
All material is provided via the website of the chair (www.carmeliet.arch.ethz.ch/Education/). Lecture slides will be made available. Lecture notes will be available for some topics (in English).

151-0103-00L  Fluid Dynamics II  W  3 credits  2V+1U  P. Jenny
Abstract  Two-dimensional irrotational (potential) flows: stream function and potential, unsteady flow, aerodynamic concepts.
Vorticity dynamics: vorticity and circulation, vorticity equation, vortex theorems of Helmholtz and Kelvin.
Compressible flows: isentropic flow along stream tube, normal and oblique shocks, Laval nozzle, Prandtl-Meyer expansion, viscous effects.
Concepts, phenomena and quantitative description of irrotational (potential), rotational, and one-dimensional compressible flows.
Content  Expand basic knowledge of fluid dynamics.
Vorticity dynamics: vorticity and circulation, vorticity equation, vortex theorems of Helmholtz and Kelvin.
Compressible flows: isentropic flow along stream tube, normal and oblique shocks, Laval nozzle, Prandtl-Meyer expansion, viscous effects.
Lecture notes  Lecture notes are available (in German).
(See also info on literature below.)
Literature  Relevant chapters (corresponding to lecture notes) from the textbook
Prerequisites / notice

401-0647-00L  Introduction to Mathematical Optimization  W  5 credits  2V+1U  D. Adjiaeshvili
Abstract  Introduction to basic techniques and problems in mathematical optimization, and their applications to problems in engineering.
Objective  The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to
solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to
problems in engineering.
Content  Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, network flows, knapsack problem, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.
Literature  Information about relevant literature will be given in the lecture.
Prerequisites / notice  This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture
covering similar topics and more.

227-0477-00L  Acoustics I  W  6 credits  4G  K. Heutschi
Abstract  Introduction to the fundamentals of acoustics in the area of sound field calculations, measurement of acoustical events, outdoor sound
propagation and room acoustics of large and small enclosures.
Objective  Introduction to acoustics. Understanding of basic acoustical mechanisms. Survey of the technical literature. Illustration of measurement
techniques in the laboratory.
Content  Fundamentals of acoustics, measuring and analyzing of acoustical events, anatomy and properties of the ear. Outdoor sound propagation,
absorption and transmission of sound, room acoustics of large and small enclosures, architectural acoustics, noise and noise control,
calculation of sound fields.
Lecture notes  yes

101-0579-00L  Infrastructure Maintenance Processes  W  3 credits  2G  B. T. Adey
Abstract  This course provides an introduction to the tools that can be used to evaluate infrastructure. In particular tools:
- to measure the level of service being obtained from infrastructure,
- to predict slow changes in infrastructure over time, and
- to predict fast changes in infrastructure over time, fits of monitoring.
Objective  to equip students with tools to be used to evaluate infrastructure and the level of service being provided from infrastructure
Content  Introduction
Levels of service
Reliability of infrastructure
Availability and maintainability of infrastructure
Mechanistic-empirical models
Regression analysis
Event trees
Fault trees
Markov chains
Neural networks
Bayesian networks
Conclusion
Lecture notes  All necessary materials (e.g. transparencies and hand-outs) will be distributed before class.
Literature  Appropriate reading material will be assigned when necessary.

101-0577-00L  An Introduction to Sustainable Development in the Built Environment  W  3 credits  2G  G. Habert
Abstract  This year the UN Conference in Paris will shape future world objectives to tackle climate change.
This course provides an introduction to the notion of sustainable development when applied to our built environment.
At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmetal aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focusing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development
- Synthesis 1: Climate Change mitigation and adaptation in cities
- Synthesis 2: Transition to sustainable development
- Case Study 1: Sustainable construction, the role of construction industry (national/international)
- Case Study 2: Cities, forms of settlements
- Case Study 3: Material resources, scenarios, energy, construction materials, urban metabolism
- Case Study 4: Buildings, heating/cooling, consumers, prosumers and other stakeholder, cooperations
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Economics for sustainable construction
- Method 3: Construction, flexibility, modularity
- Case Study 4: Buildings, heating/cooling, consumers, prosumers and other stakeholder, cooperations
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Economics for sustainable construction
- Method 3: Construction, flexibility, modularity
- Method 3: Construction, flexibility, modularity

The course provides the necessary knowledge to develop models supporting the solution of given planning problems. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with the forecasting problem it is first divided into sub-problems. Then, these are solved using various algorithms like iterative proportional fitting, shortest path algorithms and the method of successive averages.

The course is composed of a lecture part, providing the theoretical knowledge, and a applied part, in which students develop their own models.

Lecture notes
All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Lecture notes
The slides of the lecture are provided electronically.

Literature
A list of the basic literature will be offered on a specific online platform that could be used by all students attending the lectures.

Transport Planning Methods
W 6 credits 4G K. W. Axhausen
Abstract
The course provides the necessary knowledge to develop models supporting the solution of given planning problems. This is done by dividing the forecasting problem into sub-problems.

Objective
- Knowledge of methods and algorithms commonly used in transport planning
- Ability to independently develop a transport model able to solve / answer the given problem / questions
- Understanding of algorithms and their implementations commonly used in transport planning

Content
The course provides the necessary knowledge to develop models supporting the solution of given planning problems. Examples of such planning problems are the estimation of traffic volumes, prediction of estimated utilization of new public transport lines, and evaluation of effects (e.g. change in emissions of a city) triggered by building new infrastructure and changes to operational regulations.

To cope with the forecasting problem it is first divided into sub-problems. Then, these are solved using various algorithms like iterative proportional fitting, shortest path algorithms and the method of successive averages.

The course is composed of a lecture part, providing the theoretical knowledge, and an applied part, in which students create their own models.

Corporate Sustainability
W 3 credits 2G V. Hoffmann
Abstract
The lectures addresses the assessment of corporate sustainability and its links to strategy, technology, and finance. Students learn why sustainability matters for managers and how businesses can act towards it. E-modules allow students to train critical thinking skills. In the 2nd half of the semester, sustainability challenges on water, energy, mobility, and food are explored in group projects.

Objective
Understand the limits and the potential of corporate sustainability for sustainable development

Develop critical thinking skills (argumentation, communication, evaluative judgment) that are useful in the context of corporate sustainability using an innovative writing and peer review method.

Content
- Overview of the key concepts of corporate sustainability and topics related to Water, Energy, Mobility, and Food
- Business implications of sustainable development, in particular for the assessment of sustainability performance, strategic change towards sustainability, technological innovations and sustainability, and finance and corporate sustainability.
- Critical thinking skills for corporate sustainability.
- In-depth case studies of corporate sustainability challenges in the track phase: How to deal with environmental pressure groups? How to use the strengths of business to solve pressing sustainability problems? How to catalyze technological innovations for sustainability? How to invest money in a sustainable way?

Lecture notes
Presentation slides will be made available on moodle prior to lectures.
This course offers an introduction to computer simulation methods for physics problems and their implementation on PCs and supercomputers: classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell’s equation), Monte Carlo simulations, percolation, phase transitions.

Content

Prerequisites / notice
Lecture and exercise lessons in English.

101-0187-00L Structural Reliability and Risk Analysis

Abstract
Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.

Objective
The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. After this course the students will have refreshed their knowledge of probability theory and statistics to model uncertainties in view of engineering applications. They will be able to analyze the reliability of a structure and to develop risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.

Content
Engineers are confronted every day to decision making under flexible amount of information and uncertain conditions. When designing new structures and systems, the design codes such as SIA or Euro-codes usually provide a framework that guarantees safety and reliability. However the level of safety is not quantified explicitly, which does not allow the analyst to properly choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is set up. Reliability indices are introduced together with the first order-second moment method (FOSM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and pre-post risk assessment methods are presented.

Prerequisites / notice
Basic course on probability theory and statistics.

Lecture notes
The course also includes a tutorial using the UQLab software dedicated to real world structural reliability analysis. Slides of the lectures are available online every week. A printed version of the full set of slides is proposed to the students at the beginning of the semester.

Literature
S. Marelli, R. Schöbi, B. Sudret, UQLab user manual - Structural reliability (rare events estimation), Report UQLab-V0.92-107.

S. Marelli, R. Schöbi, B. Sudret, UQLab user manual - Structural reliability (rare events estimation), Report UQLab-V0.92-107.

701-1346-00L Carbon Mitigation

Abstract
Future climate change can only kept within reasonable bounds when CO2 emissions are drastically reduced. In this course, we will discuss a portfolio of options involving the alteration of natural carbon sinks and carbon sequestration. The course includes introductory lectures, presentations from guest speakers from industry and the public sector, and final presentations by the students.

Objective
The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences.

Content
From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.

Lecture notes
None

Literature
Will be identified based on the chosen topic.

Prerequisites / notice
Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion.

051-0723-16L Information Architecture and Future Cities: SmartCities

Abstract
What are SMART CITIES and how do they emerge? What is the role of architects and urban designers in this process? How do data turn into information as a building material for the future city? The course covers concepts, methods and techniques in design, simulation and communication of cities. The goal is to learn principles and preconditions for the design of sustainable and smart cities.
Students gain insight into the next generation of design processes for architects and urban designers, and into concepts of the Information Architecture of SMART CITIES, including the influence of Big Data. They learn about the expanded roles of information and of architecture: information and simulation in architecture as means to make the invisible visible, and architecture as a metaphor and ordering system to structure the immense amounts of data of the Information Society. The seminar is highly interactive and discusses visionary case studies in Europe and Asia and new techniques in Big Data informed smart urban design. Apart from learning about and experiencing Information Architecture and SMART CITIES, the course also introduces research and management skills that will distinguish the future ETH architect.

Content
SMART CITIES - What will happen when cities change from static configurations into responsive and dynamic structures? What does it mean for buildings that undergo the same changes? What is the impact on architectural and urban design education? How can citizens influence this development? The SMART CITIES course will answer these questions and supply you with the necessary skills and knowledge to understand and design such dynamic structures. The intelligent use of data and information are at the core of this course.

Data and information are new building materials of future cities. Citizens produce increasing amounts of data in their daily life, with stationary sensors and mobile smartphones. Using these data, citizens begin to influence the design of future cities and the re-design of existing ones. The course will be a first step towards the emerging citizen design science and cognitive design computing. Those will be the next generation of participatory design and design computing.

Lecture notes
iBook INFORMATION CITIES

Literature
The necessary texts will be found on the Chair's website at: http://www.ia.arch.ethz.ch. We specifically recommend the consultation of the Future Cities Website at: http://www.futurecities.ethz.ch during the entire course. The iBook INFORMATION CITIES is available in the iBooks Store for free.

Prerequisites / notice
Interactive seminar including 3 exercises

051-0725-16L  Digital Urban Visualization: People as Flows  W  2 credits  2U  G. Schmitt

Abstract
We examine patterns of crowd-flows in an extraordinary urbanisation phenomena: festivals.

Objective
The course participants will learn how to program simulations using Processing/Java. Previous programming knowledge is not necessary. Furthermore they will gain insights into other analysis methods and learn about their significance, strengths and weaknesses.

Content
We will look at those patterns from two sides. One being the view of a planer asking to find bottle necks or the ideal place for amenities such as booths, toilets etc. Another being the view of visitors. We will program different behaviours that should compete against each other in order to compare their different strategies. As a case study we will use the Caliente Festival in Zurich. For deepening the learnt in a semester thesis we offer to optimise the created simulations to make them available in interactive planning workshops. Additionally they could be converted into interactive web apps.

063-1357-16L  Digital Urban Simulation  W  4 credits  4G  E. Tapias Pedraza

Abstract
In this teaching unit architectural and urban design are analyzed by current computational methods. Based on these analyses the effects of plannings can be simulated and understood. An important focus of this course is the interpretation of the analysis and simulation results and the application of these correspondent methods in early planning phases.

Objective
The students learn how the design and planning of cities can be evidence based by using scientific methods. The teaching unit conveys knowledge in state-of-the-art and emerging spatial analysis and simulation methods and equip students with skills in modern software systems. The course consists of lectures, associated exercises and workshops, as well as of one integral project work.

Content
In a series of theory lectures we explore how the design and planning of cities can be evidence based by using scientific methods. By various exercises the students are equipped with skills in modern software systems. In an integral project work knowledge in state-of-the-art and emerging spatial analysis and simulation methods is deepened. Based on the imparted methods the effects of planning and design interventions can be simulated and understood. An important focus of this course is the interpretation of the analysis and simulation results and the application of the correspondent computational methods in early planning phases.

Abstract
The semester project focuses on solving specific research questions in the field of integrated building systems.
### Objective

The semester project is designed to train students in solving specific research questions in the field of integrated building systems. The goal is to apply acquired knowledge which is gained throughout the first year of the master's program. The semester project is advised by a professor who is affiliated with one of the partner departments of the Master program "Integrated building systems".

### Content

**Abstract**

A 6-months Master thesis completes the Master's program of Integrated Building Systems. With the thesis project students are expected to demonstrate their ability to independent and structured scientific thinking.

**Objective**

A 6-months Master thesis completes the Master's program of Integrated Building Systems. With the thesis project students are expected to demonstrate their ability to independent and structured scientific thinking.

**Content**

A 6-months Master thesis completes the Master's program of Integrated Building Systems. With the thesis project students are expected to demonstrate their ability to independent and structured scientific thinking. The thesis can be performed either at ETH Zurich, an industrial enterprise, or in a research institution, but has to be advised by one or more professors affiliated with the Master program "Integrated building systems". The responsible supervisor defines the topic in consultation with the student, together with the scope of work, criteria of assessment, and dates of beginning and delivery of the work.

#### Course Units for Additional Admission Requirements

Data: 06.09.2017 12:54
Autumn Semester 2016
Page 851 of 1570
Abstract
Qualitative analysis (determination of cations and anions), acid-base-equilibria (pH-values, titrations, buffer), precipitation equilibria (gravimetry, potentiometry, conductivity), redox reactions (syntheses, redox titrations, galvanic elements), metal complexes (syntheses, complexometric titration)

Objective
Qualitative analysis (simple cation and anion separation process, determination of cations and anions), acid-base-equilibria (strengths of acids and bases, pH- and pKa-values, titrations, buffer systems, Kielohl determination), precipitation equilibria (gravimetry, potentiometry, conductivity), oxidation state and redox behaviour (syntheses), redox titrations, galvanic elements, metal complexes (syntheses of complexes, ligand exchange reactions, complexometric titration)

Content
The general aim for the students of the practical course in general chemistry is an introduction in the scientific work and to get familiar with simple experimental procedures in a chemical laboratory. In general, first experiences with the principal reaction behaviour of a variety of different substances will be made. The chemical characteristics of these will be elucidated by a series of quantitative experiments alongside with the corresponding qualitative analyses. In order to get an overview of classes of substances as well as some general phenomena in chemistry suitable experiments have been chosen. In the second part of the practical course, i.e. physical chemistry, the behaviour of substances in their states of aggregation as well as changes of selected physical values will be recorded and discussed.

Lecture notes
http://www.gruetzacher.ethz.ch/education/labcourses

Prerequisites / notice
Compulsory: online enrolment latest one week prior to the semester
Basic concepts of metal physics, ceramics, polymers and their technology.

The goal of this lecture is an algorithmically oriented introduction to programming. Students are expected to enroll in the other courses offered to first-year students of computer science.

For the Bachelor in Interdisciplinary Sciences students can in principle choose from all subjects taught at the Bachelor level at ETH Zurich.

At the beginning of the 2. year an individual study program is established for every student in discussion with the Director of Studies in interdisciplinary sciences. For details see Programme Regulations 2010.

Fundamental knowledge and understanding of the atomistic and macroscopic concepts of material science.

There are no special prerequisites. Students are expected to enroll in the other courses offered to first-year students of computer science.

There are no special prerequisites. Students are expected to enroll in the other courses offered to first-year students of computer science.
**Objective**

Based on the lecture 'Introduction to Materials Science' this lecture aims to give a detailed understanding of important aspects of materials science, with special emphasis on metallic and ceramic materials.

**Content**

Thermodynamics and phase diagrams, crystal interfaces and microstructure, diffusional transformations in solids, and diffusionless transformations will be presented for metallic alloys. The basics of the ionic and covalent chemical bonds, the bond energy, the crystalline structure, four important structural ceramics, and the properties of glasses and glass ceramics will be presented for ceramic materials.

**Lecture notes**

For metals see:
http://www.metphys.mat.ethz.ch/education/lectures/materialwissenschaft-i.html

For ceramics see:

**Literature**

- C. Cohen-Tannoudji: Quantum mechanics I
- B. Palka: "An introduction to complex function theory."

**Methods of Mathematical Physics I**

**Prerequisites / notice**

**Quantum Mechanics I**

Introduction to non-relativistic single-particle quantum mechanics. In particular, the basic concepts of quantum mechanics, such as the quantisation of classical systems, wave functions and the description of observables as operators on a Hilbert space, and the formulation of symmetries will be discussed. Basic phenomena will be analysed and illustrated by generic examples.

**Objective**

Introduction to single-particle quantum mechanics. Familiarity with basic ideas and concepts (quantisation, operator formalism, symmetries, perturbation theory) and generic examples and applications (bound states, tunneling, scattering states, in one- and three-dimensional settings). Ability to solve simple problems.

**Content**

Keywords: Schrödinger equation, basic formalism of quantum mechanics (states, operators, commutators, measuring process), symmetries (translations, rotations), quantum mechanics in one dimension, spherically symmetric problems in three dimensions, scattering theory, perturbation theory, variational techniques, spin, addition of angular momenta, relation between QM and classical physics.

**Literature**

- F. Schwab: Quantum mechanics
- J.J. Sakurai: Modern Quantum Mechanics
- C. Cohen-Tannoudji: Quantum mechanics I

**Phase Transformations in Metals and Alloys**

**Prerequisites / notice**

- "Brevieral Ceramics" published by the "Verband der Keramischen Industrie e.V.", ISBN 3-924158-77-0, partly its contents may be found in the internet @ http://www.keramverband.de/brevier_eng/brevier.htm or on our homepage
**402-0255-00L**  Introduction to Solid State Physics  
W  
10 credits  
3V+2U  
K. Ensslin  

**Abstract**  
The course provides an introduction to solid state physics, covering several topics that are later discussed in more detail in other more specialized lectures. The central topics are: solids and their lattice structures; interatomic bindings; lattice dynamics, electronic properties of insulators, metals, semiconductors, transport properties, magnetism, superconductivity.

**Objective**  
Introduction to Solid State Physics.

**Content**
