Abstract
Introduction to general and inorganic chemistry. Basics of the composition and the change of the material world. Introduction to the thermodynamically controlled physico-chemical processes. Macroscopic phenomena and their explanation through atomic and molecular properties. Using the theories to solve qualitatively and quantitatively chemical and ecologically relevant problems.

Objective
1. Stoichiometry
2. Atoms and Elements (Quantenmechanical Model of the Atom)
3. Chemical Bonding
4. Thermodynamics
5. Chemical Kinetics
6. Chemical Equilibrium (Acids and Bases, Solubility Equilibria)

Lecture notes
Online-Skript mit durchgerechneten Beispielen.

Literature

401-0251-00L | Mathematics I | O    | 6 credits | 4V+2U | A. Cannas da Silva |

Abstract
This course covers mathematical concepts and techniques necessary to model, solve and discuss scientific problems - notably through ordinary differential equations.

Objective
Mathematics is of ever increasing importance to the Natural Sciences and Engineering. The key is the so-called mathematical modelling cycle, i.e. the translation of problems from outside of mathematics into mathematics, the study of the mathematical problems (often with the help of high level mathematical software packages) and the interpretation of the results in the original environment.

The goal of Mathematics I and II is to provide the mathematical foundations relevant for this paradigm. Differential equations are by far the most important tool for modelling and are therefore a main focus of both of these courses.

Content
1. Single-Variable Calculus:
   review of differentiation, linearisation, Taylor polynomials, maxima and minima, antiderivative, fundamental theorem of calculus, integration methods, improper integrals.

2. Linear Algebra and Complex Numbers:
   systems of linear equations, Gauss-Jordan elimination, matrices, determinants, eigenvalues and eigenvectors, cartesian and polar forms for complex numbers, complex powers, complex roots, fundamental theorem of algebra.

3. Ordinary Differential Equations:
   separable ordinary differential equations (ODEs), integration by substitution, 1st and 2nd order linear ODEs, homogeneous systems of linear ODEs with constant coefficients, introduction to 2-dimensional dynamical systems.

Literature
- Bretscher, O.: Linear Algebra with Applications (Pearson Prentice Hall).

Prerequisites / notice
Prerequisites: familiarity with the basic notions from Calculus, in particular those of function and derivative.

Mathe-Lab (Assistance):
Mondays 12-14, Tuesdays 17-19, Wednesdays 17-19, in Room HG E 41.

551-0001-00L | General Biology I | O    | 3 credits | 3V   | U. Sauer, O. Y. Martin, A. Widmer |

Abstract
Organismic biology to teach the basic principles of classical and molecular genetics, evolutionary biology and phylogeny. First in a series of two lectures given over two semesters for students of agricultural and food sciences, as well as of environmental sciences.

Objective
The understanding of some basic principles of biology (inheritance, evolution and phylogeny) and an overview of the diversity of life.
The first semester focuses on the organismal biology aspects of genetics, evolution and diversity of life in the Campbell chapters 12-34.

Week 1-7 by Alex Widmer, Chapters 12-25
12 Cell biology Mitosis
13 Genetics Sexual life cycles and meiosis
14 Genetics Mendelian genetics
15 Genetics Linkage and chromosomes
20 Genetics Evolution of genomes
21 Evolution How evolution works
22 Evolution Phylogenetic reconstructions
23 Evolution Microevolution
24 Evolution Species and specialization
25 Evolution Macroevolution

Week 8-14 by Oliver Martin, Chapters 26-34
26 Diversity of Life Introduction to viruses
27 Diversity of Life Prokaryotes
28 Diversity of Life Origin & evolution of eukaryotes
29 Diversity of Life Nonvascular&seedless vascular plants
30 Diversity of Life Seed plants
31 Diversity of Life Introduction to fungi
32 Diversity of Life Overview of animal diversity
33 Diversity of Life Introduction to invertebrates
34 Diversity of Life Origin & evolution of vertebrates

Biology III: Essentials of Ecology

Abstract
This lecture presents an introduction to ecology. It includes basic ecological concepts and the most important levels of complexity in ecological research. Ecological concepts are exemplified by using aquatic and terrestrial systems; corresponding methodological approaches are demonstrated. In a more applied part of the lecture threats to biodiversity and the appropriate management are discussed.

Objective
The objective of this lecture is to teach basic ecological concepts and the different levels of complexity in ecological research: the individual, the population, the community and the ecosystem level.

Content
- Einfluss von Umweltfaktoren (Temperatur, Strahlung, Wasser, Nährstoffe etc.) auf Organismen; Anpassung an bestimmte Umweltbedingungen
- Populationsdynamik: Ursachen, Beschreibung, Vorhersage und Regulation
- Interaktionen zwischen Arten (Konkurrenz, Koexistenz, Prädation, Parasitismus, Nahrungsnetze)
- Lebensgemeinschaften: Struktur, Stabilität, Sukzession
- Ökosysteme: Kompartimente, Stoff- und Energieflüsse
- Biodiversität: Variation, Ursachen, Gefährdung und Erhaltung
- Aktuelle Naturschutzprobleme und -massnahmen
- Evolutionäre Ökologie: Methodik, Spezialisierung, Koevolution

Lecture notes
Unterlagen, Vorlesungsfolien und relevante Literatur sind in der Lehrdokumentenablage abrufbar. Die Unterlagen für die nächste Vorlesung stehen jeweils spätestens am Freitagmorgen zur Verfügung.

Literature
- Aquatische Ökologie: Lampert & Sommer 1999. Limnökologie. Thieme, 2 Aufl., ca. Fr. 55.-;
- Bohle 1995. Limnische Systeme. Springer, ca. Fr. 50.-

Environmental Systems I

Abstract
The lecture provides a science-based exploration of environmental aspects from three research fields: earth, climate, and health sciences. The students are able to explain important properties of the three environmental systems, to discuss critical drivers, trends and conflicts of their use, and to compare potential solutions.

Objective
The lecture discusses the role of the environmental systems based on selected environmental problems, among these the exploration of raw materials and fossil fuels, climate change and its impacts on man and environment, and the spread and control of infectious diseases in the human population and agricultural systems.

Content
- Interdependende Regelungsmechanismen der natürlichen und technischen Lebensräume, die auf die Lebensräume der Organismen eingehen
- Umweltfaktoren: Temperatur, Strahlung, Wasser, Nährstoffe etc.
- Methoden: Geo- und Landschaftsökologie, Ökologie, Biodiversitat und Ökosysteme

Lecture notes
Slides are provided by instructors and are accessible via moodle.

Principles of Economics

Abstract
This course covers the bases for understanding micro- and macroeconomic issues and theories. Participants are given the tools to argue in economic and political terms and to evaluate the corresponding measures. Group and individual exercises deepen the knowledge gained.

Objective
Students are able to:
- describe fundamental micro- and macroeconomic issues and theories.
- apply suitable economic arguments to a given theme.
- evaluate economic measures.

Content
Supply and demand behaviour of firm and households; market equilibrium and taxation; national income and indicators; inflation; unemployment; growth; macroeconomic policies

Lecture notes
available on electronic platform

Laboratory Course: Elementary Chemical Techniques

L. E. Fässler

A thorough study of all script materials is requested before the course starts.

E. B. Truernit

Attending this course, the students will recognize the elements of the World Food System (WFS) approach and the problems that it is supposed to treat. They will especially comprehend the four pillars of global food security, namely (I) food availability (including sustainable production and processing), (II) access to food (physical and monetary), (III) food use (including quality and safety as well as the impact on human health and well being) and (IV) resilience to the boundary conditions (environmental, economic and political). This insight will make them aware of the global driving forces behind our ETH research on food security and is expected to alleviate motivation and understanding for the association of subsequent specific courses within a general context. The course equivalently implements agricultural and food sciences, thus supporting the interdisciplinary view on the WFS scope.

Case studies on certain foods of plant and animal origin serve to demonstrate the entire food value chain from the production of raw material to processed food and corresponding aspects for developed, emerging and developing countries are demonstrated, by use of engineering as well as natural and social science approaches.

Handouts and links are provided online.

Information on books and other literature references is communicated during the course.

The course shall particularly elucidate the cross section of Agro- and Food Sciences in the context of important global problems to be solved. Furthermore the students in the first year of studies shall be given some insight and outlook supporting the development of their views and interests in agricultural and food sciences further.

The course is part of the block exam after the first study year. Paper copies can be used ("Open Book") during the on-line exam, but no other means are not allowed. The course is taught in German.

Abstract

This practical course provides an introduction to elementary laboratory techniques. The experiments cover a wide range of techniques, including analytical and synthetic techniques (e.g. investigation of soil and water samples or the preparation of simple compounds). Furthermore, the handling of gaseous substances is practised.

Objective

This course is intended to provide an overview of experimental chemical methods.

Content

The classification and analysis of natural and artificial compounds is a key subject of this course. It provides an introduction to elementary laboratory techniques, and the experiments cover a wide range of analytic and synthetic tasks:

- Selected samples (e.g. soil and water) will be analysed with various methods, such as titrations, spectroscopy or ion chromatography. The chemistry of aqueous solutions (acid-base equilibria and solvatisation or precipitation processes) is studied.
- The synthesis of simple inorganic complexes or organic molecules is practised. Furthermore, the preparation and handling of environmentally relevant gaseous species like carbon dioxide or nitrogen oxides is a central subject of the Praktikum.

Lecture notes

The script will be published on the web. Details will be provided on the first day of the semester.

Literature

A thorough study of all script materials is requested before the course starts.

Abstract

Students learn to apply selected concepts and tools from computer science for working on interdisciplinary projects. The following topics are covered: modeling and simulations, visualizing multi-dimensional data, managing data with lists and tables and with relational databases, introduction to programming, universal methods for algorithm design.

Objective

The students learn to:

- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data,
- know universal methods for algorithm design.

Content

1. Modeling and simulations
2. Visualizing multidimensional data
3. Data management with lists and tables
4. Data management with a relational database
5. Introduction to macro programming
6. Introduction to programming with Python
Bachelor Studies (Programme Regulations 2010)

| Abstract      | Building on the biology courses in the 1st and 2nd semesters, this course covers basic biochemical knowledge in the areas of enzymology and metabolism. Those completing the course are able to describe and understand fundamental cellular metabolic processes. |
| Objective     | Students are able to understand:  
|               | - the structure and function of biological macromolecules  
|               | - the kinetic bases of enzyme reactions  
|               | - thermodynamic and mechanistic basics of relevant metabolic processes  
|               | Students are able to describe the relevant metabolic reactions in detail |
Content

Program
Introduction, basics, composition of cells, biochemical units, repetition of relevant organic chemistry
Structure and function of proteins
Carbohydrates
Lipids and biological membranes
Enzymes and enzyme kinetics
Catalytic strategies
Metabolism: Basic concepts and design. Repetition of basic thermodynamics
Glycolysis, fermentation
The citric acid cycle
Oxidative phosphorylation
Fatty acid metabolism

Introduction, basics, composition of cells, biochemical units, repetition of relevant organic chemistry
Structure and function of proteins
Carbohydrates
Lipids and biological membranes
Enzymes and enzyme kinetics
Catalytic strategies
Metabolism: Basic concepts and design. Repetition of basic thermodynamics
Glycolysis, fermentation
The citric acid cycle
Oxidative phosphorylation
Fatty acid metabolism

Lecture notes
Horton et al. (Pearson) serves as lecture notes.

Prerequisites / notice
Basic knowledge in biology and chemistry is a precondition.
Objective
Understanding of the basic issues and methods in resource and environmental economics; ability to solve typical problems in the field using the appropriate tools, which are concise verbal explanations, diagrams or mathematical expressions.

Topics are:
- Introduction to resource and environmental economics
- Importance of resource and environmental economics
- Main issues of resource and environmental economics
- Normative basis
- Utilitarianism
- Fairness according to Rawls
- Economic growth and environment
- Externalities in the environmental sphere
- Governmental internalisation of externalities
- Private internalisation of externalities: the Coase theorem
- Free rider problem and public goods
- Types of public policy
- Efficient level of pollution
- Tax vs. permits
- Command and Control Instruments
- Empirical data on non-renewable natural resources
- Optimal price development: the Hotelling-rule
- Effects of exploration and Backstop-technology
- Effects of different types of markets.
- Biological growth function
- Optimal depletion of renewable resources
- Social inefficiency as result of over-use of open-access resources
- Cost-benefit analysis and the environment
- Measuring environmental benefit
- Measuring costs
- Concept of sustainability
- Technological feasibility
- Conflicts sustainability / optimality
- Indicators of sustainability
- Problem of climate change
- Cost and benefit of climate change
- Climate change as international ecological externality
- International climate policy: Kyoto protocol
- Implementation of the Kyoto protocol in Switzerland

Content
Economy and natural environment, welfare concepts and market failure, external effects and public goods, measuring externalities and contingent valuation, internalising external effects and environmental policy, economics of non-renewable resources, renewable resources, cost-benefit-analysis, sustainability issues, international aspects of resource and environmental problems, selected examples and case studies.

Lecture notes
The script and lecture material are provided at: https://moodle-app2.let.ethz.ch/course/view.php?id=140

Literature

751-6101-00L
Anatomy and Physiology of Man and Animals I

Objective
Imparts a basic understanding of physiology an anatomy in man and domestic animals, focusing on the interrelations between morphology and function of the organism, in particular of domestic animals. This is fostered by discussing all subjects from a functional point of view.

The lecture consists of two consecutive parts.

751-3401-00L
Plant Nutrition I

Objective
The aim of these lecture is to present the processes controlling the uptake and transport of nutrients and water by the plant, the assimilation of nutrients in the plant, the effect of nutrients on crop yield and quality, the role of the soil as a source of nutrients for crops, and the basic principles of fertilization of different crop types using mineral and organic fertilizers.

Content
At the end of the lecture, students know how mineral nutrients and water are taken up through roots and circulate in the plants and what their roles in plants are. They understand the importance of nutrients for yield formation and for crop product quality. They are able to propose fertilization plans adapted for field crops growing under Swiss conditions.

Lecture notes
We will distribute a script for the part dealing with the physiology of plant nutrition. For the part on fertilization we will use the booklet of ACW and ART presenting the recommendations for the fertilization of crops and grassland in Switzerland (GRUDAF/DBF).

Phytomedicine: Entomology

Abstract
Applied Entomology: key insect pests and their antagonists in crops, arthropods in storage and public health systems, insect ecology, and pest control strategies
Goals:

Phytomedicine: Plant Pathology

Type
W
1 credit
1V
1.

Abstract
Plant Pathology topics: plant diseases in agroecosystems, categories of pathogens, pathogen life histories, pathogen attack and plant defense, gene-for-gene systems, and disease control strategies.

Objective
Gain an understanding of the causes and consequences of plant diseases in agroecosystems.

Content

Lecture notes
Lecture notes will be available for purchase at the cost of reproduction.

Literature

Animal Breeding

Type
W
2 credits
2V

Abstract
Introduction to basics of animal breeding. Importance of animal production. Species of livestock and their products, performance recording, functional traits, genetic diversity, breeding goals. Qualitative and quantitative traits. Basic knowledge of breeding methods: genetic and environmental variation, heritability, genetic correlation, estimation of breeding values, selection, mating systems.

Objective
Show the importance of animal production for Swiss and international agriculture. Name the livestock species, their products, systematic classification and breeding and production goals. Describe methods to measure animal performance (performance recording) and functional traits. Define the most important parameters and methods in animal breeding.

Content
Evolution, domestication, history of animal breeding.
Definition, models of animal production, species of livestock, numbers, distribution.
Genetic polymorphisms and their applications in animal breeding.
Genetic diversity, breeds, production and breeding goals.
Traits: performance, functional.
Performance recording, herd replacement.
Qualitative (monogenic) and quantitative (polygenic) traits. Mendelian genetics, quantitative genetics.
Genetic and environmentally variation, heritability, genetic correlation, selection, selection response.

Lecture notes
Transparencies and single chapters of textbook are made available on homepage.

Literature
Tierzucht (Willam/Simianer) UTB 3526 (2011)
Additional literature to be announced in the lecture.

Title
Area Planning and Regional Development

Type
W

ECTS
2

Hours
2V

Lecturers
C. Lüscher, B. Buser

Abstract
Introduction into Area Planning in Switzerland, basics, legal aspects and instruments. Overview and state of the art.
Practical regional development based on concrete experience and projects; basics, legal aspects and state of the art.

Objective
Goals:
The student gets an overview over Area Planning in Switzerland with legal aspects, instruments and the actual state of the art.
Awareness rising for complex regional planning and developing questions. Introduction in regional development and politics, based on existing and future regulations and their effects on different political levels.

Content
Area Planning:
- Basics of area planning
- Overview over existing regulations in Switzerland
- State of the art in Switzerland
- links between area planning and environmental protection
 REGIONAL development:
- Basics for a successful regional development based on personal field experience
- Discussion of the different instruments
- Stake holders and their role in regional politics
- Case studies for developing strategies (in small study groups)

Lecture notes
No script will be delivered, mainly for technical reasons; all necessary stuff will be delivered as papers or via internet.

Literature
No literature

Prerequisites / notice
German spoken (with translation of french and italian technical terms)

Introduction to Agricultural Management

Type
W+

ECTS
2

Hours
2V

Lecturers
R. Finger

Abstract
Vermittlung von betriebswirtschaftlichen Grundlagenwissen und Analyse- und Planungsinstrumenten mit Anwendung auf Unternehmen der Agrar- und Ernährungswirtschaft

Objective
Teilnehmer des Kurses sollen am Ende der Vorlesung i) grundlegende Unternehmensentscheidere skizzieren und analysieren können, ii) verschiedene Analyse- und Planungsinstrumente auf Fragestellungen der Produktionsplanung, Investition und Finanzierung an Beispielen anwenden zu können, iii) verschiedene Werkzeuge zur unternehmerischen Entscheidungsunterstützung anwenden können und iv) die Spezifika von Unternehmen in der Agrar- und Ernährungswirtschaft kennen.

Content
Die Vorlesung geht auf folgende Inhalte, mit spezifischen Anwendungen im Agrar- und Ernährungssektors ein:
- Grundlagen und Ziele unternehmerischen Entscheidens
- Kosten und Leistungsrechnung
- Planungstheorie
- Produktionsprogrammplanung
- Investitionsplanung und Finanzierung
- Entscheidungen unter Unsicherheit und Risikomanagement

Lecture notes
Vorlesungsunterlagen werden im Laufe des Semesters zur Verfügung gestellt

The knowledge of the nutrition of ruminants and of the feeds used is deepened. Particular emphasis is put on the variety of home-grown feeds, their production and conservation and their application in the nutrition of dairy cows, cattle and small ruminants. Finally, information on specific problems of animal nutrition is communicated.

Objective
Purchase of basic skills in agricultural livestock nutrition.

Content

Lecture notes
Script is available in German language and will be provided by each lecturer when starting his part the lecture.

Prerequisites / notice
Fach mit benoteter Semesterendprüfung

751-6121-00L Regulatory Physiology

Abstract

Objective
Die Grundlagen zu aktuellen Problemen der Tiersgesundheit und Tierhaltung werden vor diesem Hintergrund verstanden. Die Studierenden sind fähig, mit fundierten Kenntnissen aktuelle Themen zu diskutieren.

751-4504-00L Plant Pathology I

Abstract
Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Objective
Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.

Content
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1 No Lecture: First day of autumn semester

Week 2 The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nematode attack strategies and types of damage.

Week 5 Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6 Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7 Pisatin and pisatin demethylase. Local and systemic acquired resistance, signal molecules.

Week 8 Pathogen effects on food quality and safety.

Week 9 Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 10 Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11 Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELISA, PCR, rDNA and rep-PCR.

Week 12 Strategies for minimizing disease risks: principles of disease control and management.

Week 13 Disease control strategies: economic thresholds, physical control methods.

Week 14 Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

Lecture notes
Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

751-5003-00L Sustainable Agroecosystems II

Abstract
This class is intended to convey methods of agroecological research through selected case studies from current research projects and hands-on exercises. Students will gain an overview on actors in the field of sustainable agricultural development.

Objective
(1) Get to know methods for field and laboratory investigations in agroecology, (2) Analyze case studies from current agroecological research, (3) Place institutions and related projects into the context of sustainable agricultural development.

Literature

Prerequisites / notice
Prior participation in the lecture Nachhaltige Agrarökosysteme I (Sustainable Agroecosystems I) 751-5000-00G (in spring semester) recommended; classes taught mostly in English

Basics of strategy & strategic concepts

Learn and exercise strategic concepts in the Agri-Food chain, i.e. theories of economics based decision making combined with entrepreneurial practice.

Objective
The main objective is to understand strategic decisions along the value chain in the Agri-Food Chain.

Content
- Basics of strategy & strategic concepts
- Classic process of strategy process
- Selected alternative processes
- Case studies

Literature
Dokuments will be distributed per lecture.

752-2120-00L Consumer Behaviour I

Abstract
Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior.

Objective
Introduction in consumer research. The following aspects will be emphasized in the course: Consumer decision making, individual determinants of consumer behavior, environmental influences on consumer behavior, influencing consumer behavior.

Literature

751-8001-00L Agricultural Engineering I

Abstract
Presentation of basics in planning of agricultural buildings, work economics. This lecture forms the basis for the Agrartechnik II course (indoor and outdoor work processes).

Objective
Main objectives: The students acquire comprehensive functional knowledge about agricultural engineering systems (including construction) enabling them to plan and assess the use of those systems in practice.

Subobjectives:
- Basics in agricultural construction will show that a professional implementation of functional, animal-friendly, environmentally sound (and economically advantageous) construction of buildings is feasible.
- Profound knowledge of planning tools based on work economics will help the students to correctly plan the substitution of agricultural work by efficient technical solutions.

Content
Part 1: Agricultural building
- Basics of structural engineering. Dimensioning of simple supported and cantilevered beams and roof structures. Tension, compression, bending.
- Reinforcement of concrete
- Physical properties of building materials: timber, steel, concrete.
- Housing systems for cattle, pigs, poultry, horses
- Storage plants for slurry, manure, feed.
- Planning. Space and functioning programme, building concepts, financing, permit of building, detailed plans, contractors
- Planning and designing exercise.

P.S.: Indoor work processes: ‘Agrartechnik II’ spring term 2009

Part 2: Work economics
- Work-economics-related guiding figures (time measurements, statistical processing, data recording using a work diary, sources of work-economics-related planning data, application for ‘Agroscope FAT’ machine costs lists, ‘LBL’ planning basics, etc.)
- Working time models (work and production process level, process comparisons, process optimisation through growth and/or specialisation of farm, cooperation with others, work productivity) including PROOF model to calculate time consumption off different procedures
- ‘Agroscope FAT’ (agricultural research station in Tänikon) work budget (integrated in entire farm, available field work days and weather risk, farm management-related work and special tasks, use of a detailed or global work budget, comparison of target and actual situation in terms of work economics

Focus Agricultural and Resource Economics

751-0401-00L | Optimization of Agricultural Production Systems | W+ | 2 credits | 2G | R. Huber

Abstract
Introduction in to optimization of agricultural production systems with linear and non-linear programming models.

Objective
Students will be able to a) solve linear and non-linear optimization problems in the context of agricultural production; b) properly interpret the results; and c) critically discuss the economic implications.

Content
The course is an application of Operations Research (OR). First, the theory and application of linear programming (LP) is presented. Students will learn the underlying principles (Optimization, Duality, Simplex) and solve exercises in the context of agricultural production. In the second part of the course, the foundation of non-linear programming (NLP) is introduced (Lagrange, Kuhn-Tucker) and illustrated with various examples.

Abstract: This course is an introduction into forage cropping and grassland sciences. Topics include: extensive/intensive use, grassland evaluation, grassland maintenance, management using fertilization, cutting, etc. Relationships between site, vegetation composition and management will be explored.

Objective: Die Studierenden werden wichtige Mischungen und Pflanzenverbünde mitteleuropäischer Graslandökosysteme kennen, klassische und aktuelle Arbeiten der Bestandserkundung und -beurteilung in der Lage sein, den Einfluss von Umweltfaktoren und Bewirtschaftung nicht nur auf Einzelobjekte, sondern auf Pflanzenbestände und ihre Erträge abzuschätzen, und üben, ein wissenschaftliches Thema schriftlich prägnant zu formulieren.

D. Mazzi
2 credits

Objective
During this course, students acquire essential knowledge on agriculturally relevant aspects of crop biology. Via lectures and 'hands-on'
teaching elements, differences between species as well as common aspects of different species will be experienced. Thereby, the
foundation will be laid for a more intense examination of alternative crops, cropping systems and of procedures to characterize geno-
and phenotype.

751-4201-00L Horticulture I

Abstract
Overview on horticulture (international and national), insights into principles of practical fruit production (pre- and post-harvest), viticulture
(incl. some hints on wine making), berry production and vegetable production in Switzerland.

Objective
Insights into fruit production (world and Switzerland), particularly ...
- Main production areas (international & national)
- Relevance (international & national)
- Key aspects of production (Switzerland), i.e. selected aspects referring to varieties, production techniques incl. physiology and plant
protection, economics
- Key challenges (Switzerland)
- Selected, interesting research and development projects

Content
The relevance of horticulture at the international level will be treated in the first block. During the semester in autumn (Horticultural Crops I), past harvest aspects in fruit production are discussed in 2 blocks of 4h. Following on
this, viticulture (incl. some aspects of wine making) will be looked at in 3 blocks of 4h. During the spring semester (Horticultural Crops II), 3
blocks of 4h deal with vegetable production, and 2 blocks of 4h are addressing berry production.

Lecture notes
Delivered during the lectures by the different teachers, ELBA upload.

Literature
Language and script: German or French, maybe selected parts in English.

751-4801-00L System-Oriented Management of Herbivore Insects I

Abstract
The focus is on the potential to assess strategies and tactics of pest management, taking into account the demands from the economy, the
environment and the society. Significant agricultural approaches will be explained using practical examples, including prevention using
natural resources, surveillance and forecasting, resistance management, as well as product registration, incl. ecotoxicology.

Objective
The students gain a good understanding of fundamental aspects of pest management in agroecosystems. They will have the ability to
assess options for action in view of requirements from the economy, the ecology and the society. Further, they will learn to perform
searches on relevant issues in pest management, and to critically evaluate case studies.

Content
During this course, students acquire essential knowledge on agriculturally relevant aspects of crop biology. Via lectures and 'hands-on'
teaching elements, differences between species as well as common aspects of different species will be experienced. Thereby, the

Abstract

Die Studierenden kennen die Grundlagen und die Konventionen des wissenschaftlichen Schreibens in den Naturwissenschaften, können wissenschaftliche Literatur suchen und verwalten sowie wissenschaftliche Publikationen analysieren. Sie setzen das Gelernte beim Schreiben eines eigenen Textes um.

Objective

Die Studierenden kennen die Grundlagen und die Konventionen des wissenschaftlichen Schreibens in den Naturwissenschaften. Sie setzen das Gelernte beim Schreiben eines kritischen Literaturberichtes in deutscher Sprache zu einem agrarwissenschaftlichen Thema ihrer Wahl um. Die Lehrveranstaltung bereitet die Studierenden auf weitere schriftliche Arbeiten im Studium der Agrarwissenschaften vor, beispielsweise auf die Bachelor-Arbeit.

Lecture notes

Es wird ein Skript abgegeben.

Autumn Semester 2016
Tentative Programme:

1. Introduction
2. Data acquisition, data organization, data storage, working with data
3. Graphical presentations I - Spreadsheets
5. Correct and problematic graphical data displays
6. Introduction to 'R'
7. Data import and graphical presentation
8. Statistical distribution and confidence intervals
9. Statistical tests - Repetition and hands-on applications
10. Linear regressions
11./12. Analysis of Variance
13. ANOVA - Discussion of results with Prof. E. Frossard

Last week of semester: examination (Leistungskontrolle)

Lecture notes
Mainly German (with some English passages from text books)
Prerequisites / notice
Theoretical background in ensemble statistics from the mandatory course in the 4th semester; students should have cleared the examination of that fundamental course to be able to follow

Abstract
Das agrarwissenschaftliche Praktikum besteht aus dem Betriebsaufenthalt, der Betriebsaufnahme (Betriebsheft) und der agronomischen Fachaufgabe. Die Leistungskontrolle erfolgt über die Rückmeldung zu den einzelnen Bestandteilen des Praktikums.

Objective
The farm placement aims to motivate students towards a system oriented approach to agricultural science, connecting science and practice.

Lecture notes
Das Betriebsheft zur Betriebsaufnahme und weitere Dokumente werden vom Praktikantendienst nach Anfrage zur Verfügung gestellt.

Literature
Merkblätter, Lehrbücher und Software stehen den Studierenden beim Praktikantendienst Agarwissenschaft zur Verfügung.

Prerequisites / notice
Für die Jahrgänge mit Eintritt HS 13, HS14 und HS15 ind Bachelor-Studium gilt ein Übergangsreglement zum Agrarwissenschaftlichen Praktikum.

Special students and auditors need special permission from the lecturers.
Introduction to Test Theory and Test Construction in 

In the course of the semester, single documents will be handed out. This includes handouts by the

The concrete contents of the seminar are determined on the basis of the preferences of the participants and the conclusions drawn therefrom.

The following works are recommended as basic literature:

This lecture is only suitable for students who participate in or during enrollment in the course "Human Learning (EW 1)."

Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Abstract

This course looks into scientific theories and also empirical studies on human learning and relates them to the school.

Objective

Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings on the way humans process information and on human behaviour are prepared in such a manner that they can be used for planning and conducting lessons. Students additionally gain an understanding of what is going on in learning and behavioural research so that teachers are put in a position where they can further educate themselves in the field of research into teaching and learning.

Content

Thematical focal points:

- Lernen als Verhaltensänderung und als Informationsverarbeitung: Das menschliche Gedächtnis unter besonderer Berücksichtigung der Verarbeitung symbolischer Information; Lernen als Wissenskonstruktion und Kompetenzentwicklung unter besonderer Berücksichtigung des Wissenstransfers; Lernen durch Instruktion und Erklärungen; Die Rolle von Emotion und Motivation beim Lernen; Interindividuelle Unterschiede in der Lernfähigkeit und ihre Ursachen: Intelligenztheorien, Geschlechtsunterschiede beim Lernen

- Lernformen:

Lecture notes

Foliendruck wird der Verfügung gestellt.

Texts and lecture notes are uploaded on the course website.

Prerequisites / notice

This course is only suitable for students who intend to enrol in the programs "Teaching Diploma" or "Didaktisches Zertifikat". It is about learning in childhood and adolescence.

Human Learning (EW1)

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)."

This lecture is only suitable for students who participate in or during enrollment in the course "Human Learning (EW 1)."

In this seminar, students establish the scientific fundamentals of performance measurement and educational diagnostics and study them on the basis of different current issues.

Abstract

At the end of the seminar, participants will be in a position to:

- describe scientific fundamentals of test theory and test structure.
- evaluate examples of scientifically-developed tests in their application context.
- if necessary, critically question the performance assessment that they employ in practice and professionalise it still further.

Objective

The concrete contents of the seminars result from the preferences of the participants and the conclusions drawn therefrom.

Content

- the study of the scientific fundamentals of test theory and test structure.
- the study of educational diagnostics and test measurement.
- the study of different current issues.

Lecture notes

The learning experience of the seminars will be used in the respective seminars and the lecture notes will be used in different formats.

Literature

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)."

This lecture is only suitable for students who participate in or during enrollment in the course "Human Learning (EW 1)."
Abstract

This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

Objective

- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice

Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

851-0242-07L Human Intelligence

W 1 credit 1S  E. Stern, P. Edelsbrunner, B. Rütsche

Abstract

The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objective

- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

851-0242-08L Research Methods in Educational Science

W 1 credit 1S  P. Edelsbrunner, B. Rütsche, E. Stern, E. Ziegler

Abstract

Literature from the learning sciences is critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and meetings with those will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

Objective

- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

851-0240-16L Colloquium on the Science of Learning and Instruction

W 1 credit 1K  E. Stern, P. Greutmann, further lecturers

Abstract

In the colloquium we discuss scientific projects concerning the teaching in mathematics, computer science, natural sciences and technology (STEM). The colloquium is conducted by the professorships participating in the Competence Center EducETH (ETH) and in the Institute for Educational Sciences (UZH).

Objective

Students possess theoretical knowledge and practical competences to be able to cope with the psychosocial demands of teaching.

- They know the basic rules of negotiation and conflict management (e.g., mediation) and can apply them in the school context (e.g., in conversations with parents).
- They can apply diverse techniques of classroom management (e.g., prevention of disciplinary problems in the classroom) and know relevant authorities for further information (e.g., legal conditions).

The teaching internship can just be visited if all other courses of TC are completed. Repetition of the teaching internship is excluded even if the examination lessons are to be repeated.

Abstract

Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are as assessed as Examination Lessons.

Objective

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

**Abstract**

In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

**Objective**

- The aim is for the students
  - to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
  - to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
  - To try out different options for specialist further training in their profession.

**Content**

- Thematische Schwerpunkte:

- Lernformen:
  - Alle Studierenden erhalten ein individuelles Thema und erstellen dazu eine eigenständige Arbeit. Sie werden dabei von ihrer Betreuungsperson begleitet.

**Lecture notes**

Eine Anleitung zur mentorierten Arbeit in FV wird zur Verfügung gestellt.

**Literature**

Die Literatur ist themenspezifisch. Sie muss je nach Situation selber beschafft werden oder wird zur Verfügung gestellt.

**Prerequisites / notice**

Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

</table>
The lecture corresponds with the lecture "Ruminant Science" and knowledge in animal health, nutrition and breeding as well as applied ethology and animal welfare are recommended. The lecture usually is in German, but there is always the possibility to change to English.

**Niches in Animal Production**

**Abstract**
This course deals with unconventional animals or production forms and specific aspects of keeping them in Europe or, more specifically, in Switzerland. This includes e.g. rare breeds, wild cattle, deer, camels, ostrich and fish. Particular emphasis will be given to the regulations and problems occurring with import, housing and marketing of the products.

**Objective**
At the end of the course the students are able to describe the conditions of keeping unconventional livestock and to develop recommendations for farmers intending to include niche production into the farm enterprise.

**Content**
The contact hour part of the course (16 h) is conceptually a block course which is subdivided into one day of lecture and one day of excursion.

**Lecture notes**
The non-contact hour part (14 h) is to comprehend the information given and to prepare for the examination

**Literature**
A documentation will be provided at the start of the course.

**Prerequisites / notice**
Will be communicated at the start of the course.

Will be communicated at the start of the course.

**Prerequisites / notice**
The course is a balanced mixture of blackboard exercise, laboratory exercise, group exercise, lecture and student seminar presentation.

**Conservation of Animal Genetic Resources**

**Abstract**
Conservation of Animal Genetic Resources overviews the distribution, endangerment and conservation of farm animal genetic resources in Switzerland and abroad. The theory is illustrated with numerous examples and the knowledge is deepened in exercises.
Objective
The students
- overview the distribution and endangerment of animal genetic resources on national and international level and they know, where to find the relevant information.
- can explain, what value can be assigned to biodiversity and name reasons, why biodiversity should be conserved.
- know the national and international efforts of the present and the past to conserve biodiversity in the livestock sector.
- can explain what is important concerning the management of small populations.
- can explain differences between species and breeds concerning biodiversity conservation.
- can describe different conservation activities, in particular in situ and ex situ conservation
- can describe current national and international conservation programmes for species and breeds.

751-6305-00L Livestock Breeding and Genomics W 3 credits 3G P. von Rohr
Abstract
Methods for analysing livestock data, in particular for the estimation of breeding values: principles of selection index, introduction to BLUP, application of common models used to link relationship matrix, methods for the estimation of variance components, basics of breeding programs. The material will be illustrated via exercises and assignments.

Objective
The students are able to set up design matrices, the relationship matrix and its inverse as well as the Mixed Model equations to estimate BLUP breeding values for smaller examples.

Content
- Selection index (various sources of information, one trait, multiple traits)
- Relationship matrix and its inverse
- BLUP: one trait, repeated observations, multiple traits, economic indices
- Introduction to methods for the estimation of variance components
- Assignments

Lecture notes
Copies of the slides are available on the net.

Literature
To be announced in the lectures.

- Sequencing of DNA
- Marker-/microsatellite analyses
- Forensics
- Cytogenetics
- Cell cultures
- Inheritance of coat colour
- Gene expression and animal biotechnology

Contact hours: 42 h
Self-study (preparation for courses and examination): additionally

Lecture notes
Handouts/scripts will be distributed by the lecturers.

Literature

Specific literature will be indicated individually by the lecturers.

Abstract
In this course, different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem sciences. Both manipulative (field and laboratory) experiments and surveys are addressed and students work with a selection of basic techniques and methods to analyse data using a hands-on approach. Methods range from simple t-tests to multi-factoria

Objective
Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.
The course program uses a learning-by-doing approach ("hands-on minds-on"). New topics are introduced in the lecture hall, but most of the work is done in the computer lab to allow for the different speeds of progress of the student while working with data and analyzing results. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule containsthe following topics:

Introduction To Experimental Design and Applied Statistics
Introduction to ‘R’ / Revival of ‘R’ Skills
Designs of Field and Growth Chamber Experiments
Nonlinear Regression Fits
Multivariate Techniques: Principle Component Analysis, Canonical Correpondence Analysis (CCA), Cluster Analysis
ANOVA using linear and mixed effect models
Error Analysis, Error Propagation and Error Estimation
Introduction to autoregression and autocorrelations in temporal and spatial data and how to consider them in ANOVA-type analysis

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

Handouts will be available (in English)

A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture.

This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor’s course "Wissenschaftliche Datenauswertung und Datenpräsentation" (751-0441-00L)

### Practical Course in Molecular Physiology

**W+ 3 credits 3P**

**S. Bausersachs, S. E. Ulbrich**

**Abstract**

This course is intended to intensify and broaden the knowledge of molecular biology gained during the bachelor lab practical course. It directly allows students to commence a master thesis with a detailed knowledge of pitfalls in experimental setup. It will also sensitize for the awareness of biological and technical variance in experimental research.

**Objective**

The course will be divided in two parts:

Experimental part:
- Isolation of leukocytes from blood and milk (cattle)
- Culture of isolated cells and stimulation, e.g., with LPS
- Extraction of RNA
- Quantification and quality control of RNA (Nanodrop, Fluorometer, Bioanalyzer)
- Analysis of gene expression by the use of quantitative real-time RT-PCR

Theoretical part:
- Principles of primary cell culture and transcriptional regulation, methods for analytical detection
- Bioinformatics (scientific databases, sequence analysis, biostatistics)
- Presentations by the students (e.g. techniques for analysis of physiological regulatory processes, application examples)

In this practical course the students will achieve a comprehensive understanding of molecular physiology in livestock research. A cell culture experiment using blood and milk leukocytes under pathogen-associated treatment will be performed and the analysis of differential gene expression undertaken. The primary cell culture study will give insights into the laboratory work undertaken in animal physiology research. It will include the general discussion of strategies for an appropriate experimental setup in livestock research and possible methods and tools for the analysis. Hands-on cell culture and harvesting, preanalytical sample preparation and measurement implementation as well as the analysis of differential gene expression, data analysis and statistical evaluation using bioinformatics will be performed. In addition, the students will present talks based on state-of-the-art primary literature about related topics to prepare for the course and to complement the provided information. The course will enable the students to design, perform and evaluate laboratory in vitro investigations of physiological regulatory processes on a cellular level.

### Practical course in Microscopy of Functional Histology

**W+ 3 credits 6P**

**S. E. Ulbrich**

### Project Management for Scientific Research

</tbody>
</table>

#### Abstract

This forum is a platform for the critical reflection of highly relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

#### Objective

In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.

#### Content

The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

Element 1. Oral Presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturers are the audience.

Element 2. Scientific writing: Option 1: preparation of a short scientific type of paper from a result table offered by the lecturers; Option 2: preparation of an abstract with limited word count from a scientific paper; Option 3: writing of a critical review of a paper. The students have to select 2 of the three options each. There will be a discussion be a discussion in small groups at two dates.

Introductions to both forms of presentation will be offered by lecturers.

The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

#### Lecture notes

no scriptum

#### Prerequisites / notice

Requirements for allocation of the two credit points:
- Theatre presentation (with handout) at the forum
- Delivery of written documents of sufficient quality
- Active participation during the presentations by the other participants

### Training Course in Research Groups (Large)

Abstract
The students will learn the conceptual and methodological background of research in the animal science groups of the Institute of Plant, Animal and Agroecosystem Science. In addition to teaching the theoretical background, the major aim of the course is to integrate the students into the research groups (on job training) and, hence, to focus on the practical application of the knowledge.

Objective
- Introduction into the conceptual and methodological basis of research
- Integration of the students into the research groups (on job training)
- Application of the gained knowledge

Content
The students will be integrated into the research groups day-to-day work and will thus deal with all aspects of scientific work. This comprises the planning (conceptually and logistically), execution (data collection, laboratory analyses) and evaluation (statistics, data presentation) of experiments as well as the basics of scientific writing (aim: later publication, Master thesis). The research topics and the range of methodologies vary between the animal science research groups in the Institute of Plant, Animal and Agroecosystem Sciences.

Lecture notes
None

Literature
Specific readings after enlisting in a particular research group.

Prerequisites / notice
The number of training slots in the various groups is limited. It is therefore highly recommended to contact the group leaders early enough (first come first serve).

The full integration in a research group often means to work on weekends.

The total time budget is equivalent to about 90 hours. Active participation in group meetings (discussion, presentation) and short written reports about the work conducted are required for the 3 credit points. There are no grades, it is only pass or fail.

751-3603-00L
Current Challenges in Plant Breeding
W+  2 credits  2G
B. Studer, A. Hund, University lecturers

Abstract
The seminar 'Current challenges in plant breeding' aims to bring together national and international experts in plant breeding to discuss current activities, latest achievements and future prospective of a selected topic/area in plant breeding.

The topic this year will be: 'Genome editing: potential and challenges for plant breeding'.

Data: 06.10.2017 12:53  Autumn Semester 2016  Page 22 of 1570
The educational objectives cover both thematic competences and soft skills:

Thematic competences:
- Deepening of scientific knowledge in plant breeding
- Critical evaluation of current challenges and new concepts in plant breeding
- Promotion of collaboration and Master thesis projects with practical plant breeders

Soft skills:
- Independent literature research to get familiar with the selected topic
- Critical evaluation and consolidation of the acquired knowledge in an interdisciplinary team
- Establishment of a scientific presentation in an interdisciplinary team
- Presentation and discussion of the teamwork outcome
- Establishing contacts and strengthening the network to national and international plant breeders and scientists

The course will be in German (specific nomenclature)

Prerequisites / notice

The course is designed for a maximum of 15 Master students and 10 PhD students (advertised and recruited via the Zurich-Basel Plant Science Center). For full and active participation, a total of 2 credits/ECTS points will be provided.

Lecture notes

Material will be distributed during the course

Lecture notes

Data: 06.10.2017 12:53  Autumn Semester 2016  Page 23 of 1570
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small (interdisciplinary) teams.

Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, etc.). They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotope work.

At the end of this course the students are familiar with the principles on which radioisotope works are based and they have learned from research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.

Handouts will be available on the webpage of the course. Will be discussed in class.

Will be distributed during the lecture

The lecture will be taught in English.

The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine element availability. Finally, published studies from other groups will be analyzed and presented by the students.

At the end of this course the students are familiar with the principles on which radioisotope works are based and they have learned from case studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotope work.

Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, radionuclides) within a given system and to assess the importance of processes controlling these fluxes (e.g. exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.). The course will present the first principles, the basic assumptions and the theoretical framework that underlay the work with radioisotopes. It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g. number and size of compartments). Secondly, case studies on isotopic dilution and tracer work will be presented for instance on the isotopic exchange kinetics method to determine nutrients or pollutants availability. The case studies will be adapted to the ongoing research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.

Documents will be distributed during the lecture

The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at: http://www.pe.ipw.agr.ethz.ch/about/reach

This course is about the physical, chemical, and biological processes in the rhizosphere and their effect on plant growth. Effects of fertilisers, companion plants, and microbial symbionts, and other microbes on nutrient cycling and plant uptake are discussed. An "intercropping" experiment in the glasshouse is used as a model to check for rhizosphere effects on plant growth and mineral nutrition.

To gain a holistic understanding of resource-driven and regulatory processes in agricultural and natural ecosystems.

Number of participants limited to 18.

This course is about the physical, chemical, and biological processes in the rhizosphere and their effect on plant growth. ### Prerequisites / notice
We ask all course attendees of the agricultural sciences to have passed the exams at the end of the lectures Plant Nutrition I and II (Nutrient cycling in agroecosystems) by Prof. E. Frossard. All others, have to have successfully worked through the e-learning module Plant Nutrition I by Prof. E. Frossard: https://moodle-app2.let.ethz.ch/course/view.php?id=279

Remark: The course is designed to be complementary to those on Radioisotopes in Plant Nutrition (751-3405-00L), and Nutrient Fluxes in Soil-Plant Systems (751-3404-00L), although some thematic overlaps cannot be avoided. Special emphasis is given to plant-microbe-soil interactions and an appreciation of whole plant functioning in the ecological context. You will familiarize yourself with bacterial isolation, cultivation, enumeration, as well as, molecular detection, discrimination and identification techniques for rhizosphere and root-associated microbes.

Marking will consider the efforts and outcome of work by the individual participant as well as results of work in small groups. Activities for the course will result in posters and reports in the format of a conference and scientific paper. Reports will be due on Friday January 6, 2017.

Maximum number of participants: 18 (Attention: Admission will be on a first come first served basis - inscribe early!).

Students of D-USYS will be reimbursed via bank transfer for train and bus tickets of the zones 121 and 122 (Please send all tickets with the bank details to Christiane Gujan (http://www.plantnutrition.ethz.ch/the-group/people-a-z/person-detail.html?persid=85593)).

#### 751-5125-00L Stable Isotope Ecology of Terrestrial Ecosystems

</tr>
</tbody>
</table>

**Abstract**
This course provides an overview about the applicability of stable isopes (carbon 13C, nitrogen 15N, oxygen 18O and water 2H) to process-oriented ecological research. Topics focus on stable isopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

**Objective**
Students will be familiar with basic and advanced applications of stable isopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small isopProject, practice to search and analyze literature as well as to give an oral presentation.

**Content**
The analyses of stable isopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

**Prerequisites / notice**
This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

**Lecture notes**
Handouts will be available on the webpage of the course.

**Literature**
Will be discussed in class.

**Prerequisites / notice**
This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

#### 751-5201-00L Tropical Soils and Land Use

</tbody>
</table>

**Abstract**
This course guides students in analyzing and comprehending tropical agroecosystems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in southern Ethiopia, which is co-organized with Arba Minch University (Ethiopia) and KU Leuven (Belgium).

**Objective**
Lectures and exercises:
1. Introduction to international soil classification with focus on tropical soils
2. Soil suitability (chemical, physical and biological fertility) for tropical crops
3. Soil conservation practices and stakeholder involvement
4. Approaches to analyzing tropical agroecosystems

Field project:
5. Overview of the major land use systems in the South Ethiopian Rift Valley
6. Analysis of agricultural production systems in the Gamo-Gofa region in southern Ethiopia
7. Hands-on training on the use of field methods, diagnostic tools and survey methods
8. Collaboration in international student teams (MSC students from Switzerland, Belgium and Ethiopia)

**Literature**

**Prerequisites / notice**
The number of participants is limited to 12 students due to capacity limitations for the field project in Ethiopia. Selection of participants will be based on (1) the student's motivation statement, (2) successful participation in the BSc lectures "Sustainable Agroecosystems I + II" and (3) related topic for BSc thesis/ tentative topic for MSc thesis. The motivation statement is due in the first week of the semester.

In this seminar students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

Objective

1. Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
2. Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
4. Students develop their science communication skills by producing science communication materials in the context of the given case study.

Prerequisites / notice

Students signing up for this class should have a strong interest in tropical agriculture and science communication.

751-5115-00L Current Aspects of Nutrient Cycle in Agro-Ecosystems

Abstract

The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. It offers to deepen the knowledge on a specific theme related to nutrients. It is composed by presentations of national and international speakers and by an excursion. The students write a report where they compile the obtained information, relate it to their own knowledge and include literature.

Objective

Listen and understand expert's presentations. Ask questions and contribute to the discussion during the talk sessions and the excursion.

Link the information obtained during the seminar with previous knowledge from previous lessons and with literature searched to complement the matter. Expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem.

751-4003-01L Current Topics in Grassland Sciences (HS)

Abstract

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Objective

Students will be able to understand and evaluate experimental design and data interpretation of on-going studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

Content

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Lecture notes

none

Prerequisites / notice

Prerequisites: Basic knowledge of plant ecophysiology, terrestrial ecology and management of agro- and forest ecosystems. Course will be taught in English.

Design, Analysis and Communication of Science

<table>
<thead>
<tr>
<th>Number</th>
<th>Title</th>
<th>Type</th>
<th>ECTS</th>
<th>Hours</th>
<th>Lecturers</th>
</tr>
</thead>
</table>

Abstract

In this course, different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem sciences. Both manipulative (field and laboratory) experiments and surveys are addressed and students work with a selection of basic techniques and methods to analyse data using a hands-on approach. Methods range from simple t-tests to multi-factorial ANOVA using linear and mixed effect models.

Objective

Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.

Content

The course program uses a learning-by-doing approach ("hands-on minds-on"). New topics are introduced in the lecture hall, but most of the work is done in the computer lab to allow for the different speeds of progress of the student while working with data and analyzing results. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contains the following topics:

- Introduction To Experimental Design and Applied Statistics
- Introduction to 'R' / Revival of 'R' Skills
- Designs of Field and Growth Chamber Experiments
- Nonlinear Regression Fits
- Multivariate Techniques: Principle Component Analysis, Canonical Correspondence Analysis (CCA), Cluster Analysis
- Error Analysis, Error Propagation and Error Estimation
- Introduction to autoregression and autocorrelations in temporal and spatial data and how to consider them in ANOVA-type analysis

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

Lecture notes

Handouts will be available (in English)

Literature

A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture.

Prerequisites / notice

This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor's course "Wissenschaftliche Datenanalyse und Datenpräsentation" (751-0441-00L)

The course is designed to convey a profound understanding of marketing's role in modern firms, its interactions and interfaces with other disciplines, its main instruments and recent trends. Particular attention is given to emerging marketing concepts and instruments, and the role of marketing in technology firms.
After the lecture, students should have knowledge on
1) The definition and role of marketing (marketing basics)
2) Creating marketing insights - understanding customer behavior
   - Theoretical concepts in customer behavior (customer behavior)
   - Analytical means to extend knowledge on customer behavior (marketing research)
   - Strategic tools to quantify customer behavior (CLV, CE)
3) Strategic marketing - translating marketing insights into actionable marketing strategies
   - Segmentation, Targeting, and Positioning
   - Attracting customers (marketing mix, 4Ps)
   - Maintaining profitable customer relations (CRM)

The course is designed to convey a profound understanding of marketing’s role in modern firms, its interactions and interfaces with other disciplines, its main instruments and recent trends. Particular attention is given to emerging marketing concepts and instruments, and the role of marketing in technology firms.

The lecture features a short tutorial that is held at irregularly spaced intervals throughout the semester (approximately every third week). The tutorial is embedded within the lecture and consists of short sessions of about 30 minutes. It serves to illustrate theoretical and methodological concepts from the lecture by walking students through the analysis of real-world data from the telecommunications industry. The case data will be provided so that students practice and apply the concepts of the lecture on their own. The tutorial is held jointly by two Teaching Assistants (Zhiying Cui and Jana Gross) and the professor (Prof. F. v. Wangenheim).

The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.
Objective: To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

To analyze the evolution as well as the key elements of environmental governance.

Content: Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of 'environmental governance' and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Prerequisites / notice: A detailed course schedule will be made available at the beginning of the semester.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy).

This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

**Lecture notes**
Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based system of ETH is compulsory.

Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link ‘Registered students, please click here for course materials’ at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike.Hudecheck@student.ethz.ch). All assigned papers must be read ahead of the respective meeting. Following the course on the basis of on-line slides and papers alone is not sufficient. Physical presence in the classroom is essential. Many books and journals covering international environmental policy issues can be found at the D-GESS library at the IFW building, Haldeneggstegi 4, B-floor, or in the library of D-USYS.

**Literature**

### Literature

Articles and papers (will be provided during the class)

### Objective

- Students learn the basic theory and practice of dynamic simulation
- Students can develop, analyze and extend a dynamic simulation model and interpret its results.
- By applying the developed simulation model, students gain insights into food security issues. They also learn to recognize the benefits and pitfalls of dynamic simulation, both from a theoretical and an applied perspective.

### Content

Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical systems dynamics, nonlinear dynamics and macroeconomic modeling.

The course is structured along three main tasks:

1. Finding solutions
2. Implementing solutions
3. Controlling solutions

PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

### Prerequisites / notice

Self-study tasks (discussion exercises, Vensim exercises) are provided as home work. Weekly exercise sessions (45 min) are used to discuss selected topics. Regular participation in the exercises is an efficient way to understand the concepts relevant for the final exam.

### Literature

The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

### Content

Topics covered in this course include:

- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, network flows, knapsack problem, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

### Literature

Information about relevant literature will be given in the lecture.

### Prerequisites / notice

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advanced lecture covering similar topics and more.

### Abstract
The course focuses on agricultural economic research with particular focus on policy evaluation. We impart insights in the issue of policy evaluation as part of agricultural economics research.

### Objective
Focus: Policy Evaluation

The students are to:
- have a critical look at different angles of agri-economic research
- study scientific literature of the focus theme
- consider strengths, weaknesses and the application of research approaches
- apply knowledge gained from other courses with respect to the focus theme
- get insights in agricultural economic research of the national research institutions by visiting Agroscope and the Research Institute of Organic Agriculture (FiBL)
- be capable to conduct evaluations and critically reflect evaluation results

### Content
Unit: Subject

01: Introduction in the issue of policy evaluation
02: The normative frame for policy evaluation
03: Evaluation of public policies
04: Context and use of evaluations
05: Quantitative policy evaluation
06: Qualitative policy evaluation
07: Group work
08: Agricultural Economics Research at ART
09: Agricultural Economics Research at FiBL
10: Examination, Feedback

### Lecture notes
Handouts (power point presentations)

### Course Details
- **751-2205-00L** Advanced Management in the Agri-Food-Chain
  - **Abstract**: Advanced Management in the Agri-Food-Chain (Vorlesung wird in deutscher Sprache abgehalten.)
  - **Objective**: After the lecture the students ...
  - **Content**: In the lecture the following contents will be treated:
    - know the characteristics and consequences of complexity in the organizational world.
    - know and can apply selected comprehensive models for managing in complex situations,
    - know possible practical applications and examples of the treated contents to organizations in the Agri-Food Chain and...
  - **Lecture notes**:
    - Reader with selected contents.
  - **Prerequisites / notice**:
    - Vorlesung “Managerial” in D-USYS

- **752-2122-00L** Food and Consumer Behaviour
  - **Abstract**: This course focuses on food consumer behavior, consumer’s decision-making processes and consumer’s attitudes towards food products.
  - **Objective**: The course provides an overview about the following topics: Factors influencing consumer's food choice, food and health, attitudes towards new foods and food technologies, labeling and food policy issues

- **751-2103-00L** Socioeconomics of Agriculture
  - **Abstract**: The main part of this lecture will examine constellations where hierarchies, markets or cooperation have been observed and described in the agricultural sector. On a more aggregated level, different agricultural systems will be evaluated in terms of main socioeconomic parameters like social capital or perceptions.
  - **Objective**: Students should be able to describe the dynamics of hierarchies, markets and cooperation in an agricultural context.
  - **Content**: Groups, identities and utility maximization - some conceptual foundations
  - Micro-Socioeconomics: Hierarchy, cooperation and markets
  - Macro-Socioeconomics: Varieties of Capitalism
  - Agricultural Administration: Path dependencies and efficiency issues
  - Causes and Impacts of farm succession
  - Occupational Choice in the farming sector
  - System Choice and segregation (organic, GMO etc.)
  - The economics of rural areas
  - Common Resource Management in Alpine Farming
  - Agricultural Cooperatives
  - Societal perceptions of agriculture
  - Perceptions of farming from within
  - Varieties of agricultural systems and policies

- **751-1573-00L** Dynamic Simulation in Agricultural and Regional Economics
  - **Abstract**: Students in this class develop a dynamic simulation model that represents the basic mechanisms underlying food security in developing countries in a highly aggregated way. Students then proceed to extending the simulation model with one policy to improve food security and they analyze the dynamic impacts of this policy on production and environmental outcomes.
Ability to formulate research questions and designing an appropriate study

The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine element availability. Finally, published studies from other groups will be analyzed and presented by the students.

Objective
- to develop a better understanding of decision making under uncertainty and risk;
- to gain experience in different approaches to analyze risky decisions;
- to develop an understanding for different sources of risk in agricultural production;
- to understand the crucial role of subjective perceptions and preferences for risk management decisions;
- to get an overview on risk management in the agricultural sector, with a particular focus on insurance solutions

Content
- Quantification and measurement of risk
- Risk preferences, expected utility theory and alternative models of risk behavior
- Concepts on the decision making under risk
- Production, investment and diversification decisions under risk
- Risk management in agriculture

751-0423-00L Risk Analysis and Risk Management in Agriculture W 3 credits 2G R. Finger

Abstract
Agricultural production is exposed to various risks which are important for decisions taken by farmers and other actors in the agri-food sector. Moreover, risk management is indispensable for all actors. This course introduces modern concepts on decision making under risk and recent developments in risk management. The focus of this course is on agriculture applications.

Objective
- Ability to formulate research questions and designing an appropriate study
- Ability to collect and analyze data using a variety of methods
- Ability to critically assess the quality of empirical research in management
- Applied knowledge of empirical methods through out-of-class assignments

Content
1) Introduction to empirical management research
2) Research designs: exploratory, descriptive, experimental
3) Measurement and scaling
4) Data collection and sampling
5) Data analysis methods
6) Reporting and presenting empirical research

Prerequisites
Assignments and projects: This course includes out-of-class assignments and projects to give students some hands-on experience in conducting empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Students will have at least one week to work on each assignment. Students are expected to work on these assignments individually. Duplicate answers will receive no credit and will be subject to a disciplinary review. Assignments will be graded and need to be turned in on time.

Class participation: Class participation is encouraged and can greatly improve students' learning in this class. In this spirit, students are expected to attend class regularly and come to class prepared.

<td>Abstract</td>
<td>This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems. Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small (interdisciplinary) teams.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>Students gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.</td>

751-3405-00L Radio-Isotopes in Plant Nutrition W 3 credits 2G E. Frossard

Abstract
The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine element availability. Finally, published studies from other groups will be analyzed and presented by the students.

Objective
At the end of this course the students are familiar with the principles on which radioisotope works are based and they have learned from case studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotope work.
Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, radionuclides) within a given system and to assess the importance of processes controlling these fluxes (e.g., exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.). The course will present the principles, the basic assumptions and the theoretical framework that underlay the work with radioisotopes. It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g., number and size of compartments). Secondly, case studies on isotopic dilution and tracer work will be presented for instance on the isotopic exchange kinetics method to determine nutrients or pollutants availability. The case studies will be adapted to the ongoing research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.

This course is about the physical, chemical, and biological processes in the rhizosphere and their effect on plant growth. Effects of fertilisers, companion plants, and microbial symbionts, and other microbes on nutrient cycling and plant uptake are discussed. An “intercropping” experiment in the glasshouse is used as a model to check for rhizosphere effects on plant growth and mineral nutrition. In short, the processes dealt with in this course occur on a small-scale and are generally (bio)chemical and microbiological in nature.

Information for Students

This course is designed to stimulate thinking and promote critical analysis of important processes that occur in the rhizosphere. As part of this course, the knowledge acquired will be used for analysing and interpreting experimental data, as well as, preparing a scientific report and conference-type poster.

4 credits

An “intercropping” experiment in the glasshouse is used as a model to check for rhizosphere effects on plant growth and mineral nutrition.

Objective

To gain a holistic understanding of resource-driven and regulatory processes in agricultural and natural ecosystems.

- Develop skills on the critical analysis of scientific papers.
- Define explanatory hypotheses, identify knowledge gaps for further investigations.
- Carry out a multi-disciplinary experiment that involves aspects of soil, (micro-)biology, plant physiology, pathology, and ecology.
- Develop manual skills in the set up of a glasshouse experiment, in soil and plant analyses, and in isolation and DNA-based characterisation of rhizobia.
- Gain insights on basic methods to analyse (bio-)chemical, molecular genetic, and graphical data.
- Discuss and interpret data in the context of the literature.
- Prepare a research report in the format of a scientific paper and a poster in the format of a conference paper, partially alone and partially in small groups, using data obtained from the glasshouse experiment.

Content

This course is designed to stimulate thinking and promote critical analysis of important processes that occur in the rhizosphere. As part of this course, the knowledge acquired will be used for analysing and interpreting experimental data, as well as, preparing a scientific report and conference-type poster.

The course will cover the relative importance of spatial scales and various physicochemical and microbiological dynamics as influenced by roots. We will discuss root traits and activities that influence the immediately root-surrounding soil and thereby contribute to mineral nutrient mobilization and immobilization. An overview of the most relevant root-microbe symbioses for agroecosystems will be provided and root and microbial traits discussed, which could be of use in efforts towards utilization of intercropping and bioinoculants as a possible means of reducing energetically expensive inputs to farming systems. A special emphasis will be given to the importance of physicochemical features of soils and the chemical forms (= species) of elements important for plant uptake.

Practical experience will be gained with setting up a glasshouse experiment, soil and root sampling, basic soil and plant analyses, isolation of rhizobia, determination of the number of colony forming units (CFU), assays to screen for phosphorus and zinc solubilizing bacteria, DNA extraction, PCR amplification, and restriction fragment length polymorphism analysis (RFLP) of host range determining symbiosis-specific genes.

In short, the processes dealt with in this course occur on a small-scale and are generally (bio)chemical and microbiological in nature. Furthermore, they are generally not taken into account using current methods of agronomic management for plant production. However, they are increasingly being recognized as a potentially useful means of obtaining a resource-efficient and hence, economically and environmentally sustainable agricultural system, including for ecosystem restoration. Therefore, the course will invite for critical reflections and exemplify challenges in translating knowledge from scientific studies and ecology into application for plant production.

Lecture notes

For documentation, lecture slides and laboratory protocols will continuously be uploaded to the directory ’751-5123-00L Rhizosphere Ecology’ on the electronic document exchange platform ILIAS, LDA-ELBA: https://ilias.app2.let.ethz.ch/ilias.php?ref_id=109651&cmd=view&cmdClass=ilobjcoursegui&cmdNode=ef:tv&baseClass=ilRepositoryGUI
This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and water 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

We ask all course attendees of the agricultural sciences to have passed the exams at the end of the lectures Plant Nutrition I and II (Nutrient cycling in agroecosystems) by Prof. E. Frossard. All others, have to have successfully worked through the e-learning module Plant Nutrition I by Prof. E. Frossard: https://moodle-app2.let.ethz.ch/course/view.php?id=279

Remark: The course is designed to be complementary to those on Radioisotopes in Plant Nutrition (751-3405-00L), and Nutrient Fluxes in Soil-Plant Systems (751-3404-00L), although some thematic overlaps cannot be avoided. Special emphasis is given to plant-microbe-soil interactions and an appreciation of whole plant functioning in the ecological context. You will familiarize yourself with bacterial isolation, cultivation, enumeration, as well as, molecular detection, discrimination and identification techniques for rhizosphere and root-associated microbes. Marking will consider the efforts and outcome of work by the individual participant as well as results of work in small groups. Activities for the course will result in posters and reports in the format of a conference and scientific paper. Reports will be due on Friday January 6, 2017.

Maximum number of participants: 18 (Attention: Admission will be on a first come first served basis - inscribe early!).

Students of D-USYS will be reimbursed via bank transfer for train and bus tickets of the zones 121 and 122 (Please send all tickets with the bank details to Christiane Gujan (http://www.plantnutrition.ethz.ch/the-group/people-a-z/person-detail.html?persid=85593).

The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

Handouts will be available on the webpage of the course.

Lectures will be discussed in class.

This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

### Content

**Abstract**

Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.

**Objective**

During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

### Content

**Abstract**

The seminar ‘Current challenges in plant breeding’ aims to bring together national and international experts in plant breeding to discuss current activities, latest achievements and future prospective of a selected topic/area in plant breeding. The topic this year will be: ‘Genome editing: potential and challenges for plant breeding’.

**Objective**

The educational objectives cover both thematic competences and soft skills:

- Thematic competences:
  - Deepening of scientific knowledge in plant breeding
  - Critical evaluation of current challenges and new concepts in plant breeding
  - Promotion of collaboration and Master thesis projects with practical plant breeders
  - Soft skills:
    - Independent literature research to get familiar with the selected topic
    - Critical evaluation and consolidation of the acquired knowledge in an interdisciplinary team
    - Establishment of a scientific presentation in an interdisciplinary team
    - Presentation and discussion of the teamwork outcome
    - Establishing contacts and strengthening the network to national and international plant breeders and scientists

**Content**

Interesting topics related to plant breeding will be selected in close collaboration with the working group for plant breeding of the Swiss Society of Agronomy (SSA). For this year, the topic ‘Genome editing: potential and challenges for plant breeding’ was selected.

In the fall semester (November 29, 2016), the enrolled students will meet with the lecturers as well as four to six tutors, selected according to their expertise in the selected topic (one afternoon, for about three hours). After an input talk by the lecturers, four to six specific questions/aspects will be identified and phrased. The tutors and the enrolled students will be assigned to four to six different groups, to critically evaluate one question/aspect of the selected topic. The students, guided by tutors, will prepare a presentation of 15 minutes (plus 5 minutes discussion) covering their specific question/aspect. Participation on that afternoon will be mandatory.

End of January (January 31, 2017), a one-day seminar on the selected topic will be organized. After one to two keynote speakers (international experts), four invited talks will link the selected topic to practical plant breeding. In the afternoon, the four to six students groups will present and discuss with the experts their specific questions on the selected topic/area. These presentations will be evaluated by the lecturers. The seminar will be public and serve as annual meeting of the SSA working group for plant breeding, bringing together the experts in plant breeding.

The course is designed for a maximum of 15 Master students and 10 PhD students (advertised and recruited via the Zurich-Basel Plant Science Center). For full and active participation, a total of 2 credit/ECTS points will be provided.
751-5121-00L  Insect Ecology  W  2 credits  2V  R. R. Kariyat Ramachandran, C. De Moraes, M. Mescher

Abstract
This is an introductory course in insect ecology. Students will learn about the ways in which insects interact with and adapt to their abiotic & biotic environments and their roles in diverse ecosystems. The course will entail lectures, outside readings, and critical analysis of contemporary literature.

Objective
Students completing this course should become familiar with the application of ecological principles to the study of insects, as well as major areas of inquiry in this field. Highlighted topics will include insect behavior, chemical and sensory ecology, physiological responses to biotic and abiotic stressors, plant-insect interactions, community and food-web dynamics, and disease ecology. The course will emphasize insect evolution and adaptation in the context of specific interactions with other organisms and the abiotic environment. Examples from the literature incorporated into lectures will highlight the methods used to study insect ecology.

Lecture notes
Provided to students through ILIAS

Literature
Selected required readings (peer reviewed literature, selected book chapters). Optional recommended readings with additional information.

751-4811-00L  Alien Organisms in Agriculture  W  2 credits  2G  J. Collatz, M. Meissie

Abstract
The course focuses on alien organisms in agriculture as well as the scientific assessment and regulatory management of their effects on the environment and agricultural production.

Objective
Students will understand the consequences arising from the unintentional or deliberate introduction of alien organisms into agricultural systems. They will be able to understand the concept of environmental risk assessment and be able to evaluate risk management options.

Content
Alien organisms in agriculture is a topic that receives an increasing awareness among farmers, agricultural scientists, regulators and the general public. Students of this course will learn about the nature of alien organisms such as invasive species, biocontrol organisms and genetically modified organisms. With a particular focus on arthropods, plants and their interactions we will look at the potential threats the novel organisms pose, the benefits they provide and how both of these effects can be scientifically assessed. Students will learn how the topic of alien organisms in agriculture is intrinsically tied to policy making and regulation and get to know current examples and future challenges in research. In the last part of the course students will be able to apply the acquired knowledge in a practical exercise (case study).

Lecture notes
Material will be distributed during the course

701-0263-01L  Seminar in Evolutionary Ecology of Infectious Diseases  W  3 credits  2G  D. Croll, S. Bonhoeffer, R. R. Regös

Abstract
Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Objective
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content
A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Lecture notes
Publications and class notes can be downloaded from a web page announced during the lecture.

Literature
Papers will be assigned and downloaded from a web page announced during the lecture.

751-4506-00L  Plant Pathology III  W  2 credits  2G  U. Merz, M. Maurhofer Bringolf

Abstract
Identification based on host, symptoms and micro-morphology, completed with life cycles and related control measures of the most important fungal diseases and their causal pathogens of annual and perennial crops with agricultural significance.

Objective
Students will learn and train preparation skills for microscopy, acquire knowledge of selected diseases (identification, biology of pathogen, epidemiology) and understand the corresponding integrated control measures practiced in Swiss agriculture.

Content
The course will partly be an e-learning exercise (with computers).

Lecture notes
A script will be used on annual and perennial crops and their most important diseases. It will be updated stepwise

701-5001-00L  Functioning of Soil Systems

Number  Title  Type  ECTS  Hours  Lecturers
751-5001-00L  Agroecologists without Borders  W  2 credits  2S  C. Decock, A. Hofmann, J. Six

Abstract
In this seminar students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

Objective
(1) Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
(2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
(3) Students articulate complexity and challenges in agricultural development interventions.
(4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

Prerequisites / notice
Students signing up for this class should have a strong interest in tropical agriculture and science communication.

751-5201-00L  Tropical Soils and Land Use  W  2 credits  2G  J. Six, A. Hofmann

Abstract
This course guides students in analyzing and comprehending tropical agroecosystems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in southern Ethiopia, which is co-organized with Arba Minch University (Ethiopia) and KU Leuven (Belgium).

Objective
Lectures and exercises:
(1) Introduction to international soil classification with focus on tropical soils
(2) Soil suitability (chemical, physical and biological fertility) for tropical crops
(3) Soil conservation practices and stakeholder involvement
(4) Approaches to analyzing tropical agroecosystems

Field project:
(5) Overview of the major land use systems in the South Ethiopian Rift Valley
(6) Analysis of agricultural production systems in the Gamo-Gofa region in southern Ethiopia
(7) Hands-on training on the use of field methods, diagnostic tools and survey methods
(8) Collaboration in international student teams (MSc students from Switzerland, Belgium and Ethiopia)
The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of
radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals,
biogeochemistry and sustainable management.
Handouts will be available on the webpage of the course.
Documents will be distributed during the lecture.
Prerequisites / notice
The number of participants is limited to 12 students due to capacity limitations for the field project in Ethiopia. Selection of participants will
be based on (1) the student's motivation statement, (2) successful participation in the BSc lectures "Sustainable Agroecosystems I + II" and
(3) related topic for BSc thesis/ tentative topic for MSc thesis. The motivation statement is due in the first week of the semester.

751-5101-00L Biogeochemistry and Sustainable Management W 2 credits 2G N. Buchmann, L. Hörtnagl
Abstract
This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled
human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by
effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.
Objective
Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and
forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental
conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small interdisciplinary teams.
Content
Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for
recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of
global change impacts also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the
interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland
and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate,
anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also
feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be
investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental
regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the
complex interactions of a coupled human-environmental system.
Lecture notes, Literature
Handouts will be available on the webpage of the course.
Prerequisites / notice
Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Course will be taught
in English.

751-5115-00L Current Aspects of Nutrient Cycle in Agro-
Ecosystems W 2 credits 1S E. Frossard, A. Oberson Dräger
Abstract
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. It offers to deepen the knowledge on a
specific theme related to nutrients. It is composed by presentations of national and international speakers and an excursion. The
students write a report where they compile the obtained information, relate it to their own knowledge and include literature.
Objective
Listen and understand expert's presentations. Ask questions and contribute to the discussion during the talk sessions and the excursion.
Link the information obtained during the seminar with knowledge from previous lessons and with literature searched to complement the
matter. Expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem.

751-3405-00L Radio-Isotopes in Plant Nutrition W 3 credits 2G E. Frossard
Abstract
The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an
isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine
element availability. Finally, published studies from other groups will be analyzed and presented by the students.
Objective
At the end of this course students are familiar with the principles on which radioisotope works are based and they have learned from
case studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in
element cycling studies, but also of the risks and open questions related to isotope work.
Content
Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals,
radionuclides) within a given system and to assess the importance of processes controlling these fluxes (e.g. exchange reactions between the
soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.).
The course will first present the principles, the basic assumptions and the theoretical framework that underlay the work with radioisotopes.
It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g.
number and size of compartments). Secondly, case studies on isotopic dilution and tracer work will be presented for instance on the
isotopic exchange kinetics method to determine nutrients or pollutants availability. The case studies will be adapted to the ongoing
research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed
and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.
Lecture notes, Literature
Documents will be distributed during the lecture
Prerequisites / notice
The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at:
http://www.pe.ipw.agrli.ethz.ch/about/reach

751-5123-00L Rhizosphere Ecology W 4 credits 4G H. A. Gamper, T. I. McLaren
Number of participants limited to 18.
Prerequisites: Only students who have passed the courses 751-3401-00L Pflanzennährung I and 751-3402-00L Pflanzennährung II - Integriertes
Nährstoffmanagement can be admitted to this course.
Abstract
This course is about the physical, chemical, and biological processes in the rhizosphere and their effect on plant growth. Effects of
fertilisers, companion plants, and microbial symbionts, and other microbes on nutrient cycling and plant uptake are discussed. An
"intercropping" experiment in the glasshouse is used as a model to check for rhizosphere effects on plant growth and mineral nutrition.
Objective

To gain a holistic understanding of resource-driven and regulatory processes in agricultural and natural ecosystems.

Develop skills on the critical analysis of scientific papers.

Define explanatory hypotheses, identify knowledge gaps for further investigations.

Carry out a multi-disciplinary experiment that involves aspects of soil, (micro-)biology, plant physiology, pathology, and ecology.

Develop manual skills in the set up of a glasshouse experiment, in soil and plant analyses, and in isolation and DNA-based characterisation of rhizobia.

Gain insights on basic methods to analyse (bio-)chemical, molecular genetic, and graphical data.

Discuss and interpret data in the context of the literature.

Prepare a research report in the format of a scientific paper and a poster in the format of a conference paper, partially alone and partially in small groups, using data obtained from the glasshouse experiment.

Content

This course is designed to stimulate thinking and promote critical analysis of important processes that occur in the rhizosphere. As part of this course, the knowledge acquired will be used for analysing and interpreting experimental data, as well as, preparing a scientific report and conference-type poster.

The course will cover the relative importance of spatial scales and various physicochemical and microbiological dynamics as influenced by roots. We will discuss root traits and activities that influence the immediately root-surrounding soil and thereby contribute to mineral nutrient mobilization and immobilization. An overview of the most relevant root-microbe symbioses for agroecosystems will be provided and root and microbial traits discussed, which could be of use in efforts towards utilization of intercropping and bioinoculants as a possible means of reducing energetically expensive inputs to farming systems. A special emphasis will be given to the importance of physicochemical features of soils and the chemical forms (= species) of elements important for plant uptake.

Practical experience will be gained with setting up a glasshouse experiment, soil and root sampling, basic soil and plant analyses, isolation of rhizobia, determination of the number of colony forming units (CFU), assays to screen for phosphorus and zinc solubilizing bacteria, DNA extraction, PCR amplification, and restriction fragment length polymorphism analysis (RFLP) of host range determining symbiosis-specific genes.

In short, the processes dealt with in this course occur on a small-scale and are generally (bio)chemical and microbiological in nature. Furthermore, they are generally not taken into account using current methods of agronomic management for plant production. However, they are increasingly being recognized as a potentially useful means of obtaining a resource-efficient and hence, economically and environmentally sustainable agricultural system, including for ecosystem restoration. Therefore, the course will invite for critical reflections and exemplify challenges in translating knowledge from scientific studies and ecology into application for plant production.

Lecture notes

For documentation, lecture slides and laboratory protocols will continuously be uploaded to the directory '751-5123-00L Rhizosphere Ecology' on the electronic document exchange platform ILIAS, LDA-ELBA:

**Abstract**
The course discusses chemical and biogeochemical processes in soils and their influence on the behavior and cycling of nutrients and pollutants in terrestrial systems. Approaches for quantitative modeling of the processes are introduced.

**Objective**
Understanding of important chemical soil properties and processes and their influence on the behavior (e.g., speciation, bioavailability, mobility) of nutrients and pollutants.

**Content**
Important topics include the structure and properties of clays and oxides, the chemistry of the soil solution, gas equilibria, dissolution and precipitation of mineral phases, cation exchange, surface complexation, chemistry of soil organic matter, redox reactions in flooded soils, soil acidification and soil salinization.

**Lecture notes**

**Abstract**
The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.

**Objective**
Students are able to
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media;
- quantify driving forces and resulting fluxes of water, solute, and heat in soils;
- apply modern measurement methods and analytical tools for hydrological data collection;
- conduct and interpret a limited number of experimental studies;
- explain links between physical processes in the vadose-zone and major societal and environmental challenges.

**Content**
Weeks 1 to 3: Physical Properties of Soils and Other Porous Media
- Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure.
- Soil colloids and clay behavior.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics)
- The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis.
- Modern aspects of capillarity.

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing.

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:
- Part 1: Laminar flow in tubes (Poiseuille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.
- Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.
- Part 2: Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.
- Midterm exam.
- Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.

Additional topics:
- Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.
- Biological Processes in the Vadose Zone - An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.

**Lecture notes**
Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller (available at the beginning of the semester)
- http://www.step.ethz.ch/education/active-courses/vadose-zone-hydrology

**Supplemental textbook (not mandatory)**
- Environmental Soil Physics, by: D. Hillel
Insect Ecology

### General Crop Science

#### Objective

- Establishing contacts and strengthening the network to national and international plant breeders and scientists
- Establishment of a scientific presentation in an interdisciplinary team
- Critical evaluation and consolidation of the acquired knowledge in an interdisciplinary team
- Independent literature research to get familiar with the selected topic
- Critical evaluation and consolidation of the acquired knowledge in an interdisciplinary team
- Promotion of collaboration and Master thesis projects with practical plant breeders
- Critical evaluation of current challenges and new concepts in plant breeding
- Deepening of scientific knowledge in plant breeding
- Thematic competences:
  - Deepening of scientific knowledge in plant breeding
  - Critical evaluation of current challenges and new concepts in plant breeding
  - Promotion of collaboration and Master thesis projects with practical plant breeders
  - Independent literature research to get familiar with the selected topic
  - Critical evaluation and consolidation of the acquired knowledge in an interdisciplinary team
  - Establishment of a scientific presentation in an interdisciplinary team
  - Presentation and discussion of the teamwork outcome
- Establishing contacts and strengthening the network to national and international plant breeders and scientists
- Interesting topics related to plant breeding will be selected in close collaboration with the working group for plant breeding of the Swiss Society of Agronomy (SSA).
- For this year, the topic ‘Genome editing: potential and challenges for plant breeding’ was selected.

#### Content

- The course is designed for a maximum of 15 Master students and 10 PhD students (advertised and recruited via the Zurich-Basel Plant Science Center). For full and active participation, a total of 2 credit/ECTS points will be provided.
- In the fall semester (November 29, 2016), the enrolled students will meet with the lecturers as well as four to six tutors, selected according to their expertise in the selected topic (one afternoon, for about three hours). After an input talk by the lecturers, four to six specific questions/aspect will be identified and phrased. The tutors and the enrolled students will be assigned to four to six different groups, to critically evaluate one question/aspect of the selected topic. The students, guided by tutors, will prepare a presentation of 15 minutes (plus 5 minutes discussion) covering their specific question/aspect. Participation on that afternoon will be mandatory.
- End of January (January 31, 2017), a one-day seminar on the selected topic will be organized. After one to two keynote speakers (international experts), four invited talks will link the selected topic to practical plant breeding. In the afternoon, the four to six students groups will present and discuss with the experts their specific questions on the selected topic/area. These presentations will be evaluated by the lecturers. The seminar will be public and serve as annual meeting of the SSA working group for plant breeding, bringing together the experts in plant breeding.

#### Literature

- Seminar abstracts
- Peer-reviewed research articles, selected according to the selected topic/area.
- Participation in the BSc course 'Pflanzenzüchtung' is strongly recommended; a completed course in 'Molecular Plant Breeding' is highly advantageous.

#### Prerequisites / notice

- Students completing this course should become familiar with the application of ecological principles to the study of insects, as well as major areas of inquiry in this field. Highlighted topics will include insect behavior, chemical and sensory ecology, physiological responses to biotic and abiotic stressors, plant-insect interactions, community and food-web dynamics, and disease ecology. The course will emphasize insect evolution and adaptation in the context of specific interactions with other organisms and the abiotic environment. Examples from the literature incorporated into lectures will highlight the methods used to study insect ecology.

#### Event

- Provided to students through ILIAS
- Selected required readings (peer reviewed literature, selected book chapters). Optional recommended readings with additional information.

---

Data: 06.10.2017 12:53  Autumn Semester 2016  Page 42 of 1570
The course focuses on alien organisms in agriculture as well as the scientific assessment and regulatory management of their effects on the environment and agricultural production.

Objective

Students will understand the consequences arising from the unintentional or deliberate introduction of alien organisms into agricultural systems. They will be able to understand the concept of environmental risk assessment and be able to evaluate risk management options.

Content

Alien organisms in agriculture is a topic that receives an increasing awareness among farmers, agricultural scientists, regulators and the general public. Students of this course will learn about the nature of alien organisms such as invasive species, biocontrol organisms and genetically modified organisms. With a particular focus on arthropods, plants and their interactions we will look at the potential threats the novel organisms pose, the benefits they provide and how both of these effects can be scientifically assessed. Students will learn how the topic of alien organisms in agriculture is intrinsically tied to policy making and regulation and get to know current examples and future challenges in research. In the last part of the course students will be able to apply the acquired knowledge in a practical exercise (case study).

Most Handouts will be available on the webpage of the course.

The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g. the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.). The course will first present the principles, the basic assumptions and the theoretical framework that underlay the work with radioisotopes. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems. Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small interdisciplinary teams.

Objective

This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content

A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Objective

Students will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Objective

This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Lecture notes

Material will be distributed during the course.

701-2063-01L Seminar in Evolutionary Ecology of Infectious Diseases

Objective

Students will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Abstract

Students will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Prerequisites / notice

Papers will be assigned and downloaded from a web page announced during the lecture.

Lecture notes

Papers and class notes can be downloaded from a web page announced during the lecture.

Literature

Publications and class notes can be downloaded from a web page announced during the lecture.

751-5101-00L Biogeochemistry and Sustainable Management

Abstract

This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems. Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small interdisciplinary teams.

Objective

Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Content

Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Literature

Handouts will be available on the webpage of the course.

Prerequisites / notice

Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Course will be taught in English.

751-3405-00L Radio-Isotopes in Plant Nutrition

Abstract

The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine element cycling studies, but also of the risks and open questions related to isotope work.

Objective

At the end of the course the students are familiar with the principles on which radioisotope works are based and they have learned from case studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotope work.

Content

Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, radionuclides) within a given system and to assess the importance of processes controlling these fluxes (e.g. exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.). The course will first present the principles, the basic assumptions and the theoretical framework that underlay the work with radioisotopes. It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g. number and size of compartments). Secondly, case studies on isotopic dilution and tracer work will be presented for instance on the isotopic exchange kinetics method to determine nutrients or pollutants availability. The case studies will be adapted to the ongoing research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.

Literature

Documents will be distributed during the lecture

Lecture notes

Will be given during the lecture

751-5125-00L Stable Isotope Ecology of Terrestrial Ecosystems

Abstract

This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and water 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions.

Objective

Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve ecophysiological or ecological problems, learn to design, carry out and interpret a small IsotopeProject, practice to search and analyze literature as well as to give an oral presentation.
Content

The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that would otherwise not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

Lecture notes

Handouts will be available on the webpage of the course.

751-4805-00L Recent Advances in Biocommunication

Number of participants limited to 25

Abstract

Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods.

Objective

Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods. Students will engage in discussion and critical analyses of relevant papers and present their evaluations in a seminar setting.

Prerequisites / notice

This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

751-5001-00L Agroecologists without Borders

Abstract

In this seminar students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

Objective

(1) Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
(2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
(3) Students articulate complexity and challenges in agricultural development interventions.
(4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

Prerequisites / notice

Students signing up for this class should have a strong interest in tropical agriculture and science communication.

751-5115-00L Current Aspects of Nutrient Cycle in Agro-Ecosystems

Abstract

The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. It offers to deepen the knowledge on a specific theme related to nutrients. It is composed by presentations of national and international speakers and by an excursion. The students write a report where they compile the obtained information, relate it to their own knowledge and include literature.

Objective

Listen and understand expert's presentations. Ask questions and contribute to the discussion during the talk sessions and the excursion. Link the information obtained during the seminar with knowledge from previous lessons and with literature searched to complement the matter. Expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem.

Prerequisites / notice

This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

751-4003-01L Current Topics in Grassland Sciences (HS)

Abstract

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Objective

Students will be able to understand and evaluate experimental design and data interpretation of on-going studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

Content

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Lecture notes

none

Prerequisites / notice

Prerequisites: Basic knowledge of plant ecophysiology, terrestrial ecology and management of agro- and forest ecosystems. Course will be taught in English.

751-3801-00L Experimental Design and Applied Statistics in Agroecosystem Science

Abstract

In this course, different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem sciences. Both descriptive (field and laboratory) experiments and surveys are addressed and students work with a selection of basic techniques and methods to analyse data using a hands-on approach. Methods range from simple t-tests to multi-fac tor analysis of variance (ANOVA) using linear and mixed effect models.

Objective

Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.

Content

The course program uses a learning-by-doing approach ("hands-on minds-on"). New topics are introduced in the lecture hall, but most of the work is done in the computer lab to allow for the different speeds of progress of the student while working with data and analyzing results. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contain the following topics:

- Introduction To Experimental Design and Applied Statistics
- Introduction to "R" / Revival of "R" Skills
- Designs of Field and Growth Chamber Experiments
- Nonlinear Regression Fits
- Multivariate Techniques: Principle Component Analysis, Canonical Correpondence Analysis (CCA), Cluster Analysis
- ANOVA using linear and mixed effect models
- Error Analysis, Error Propagation and Error Estimation
- Introduction to autoregression and autocorrelations in temporal and spatial data and how to consider them in ANOVA-type analysis

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

Lecture notes

Handouts will be available (in English)
Specific literature is indicated by the lecturers.

Lecturers

W. E. Hillmann
M. Maurhofer Bringolf
U. Merz
M. Kreuzer

Will be communicated at the start of the course.

ECTS

Plant Pathology III
H. Signer-Hasler

Students will
- learn and train preparation skills for microscopy,
- acquire knowledge of selected diseases (identification, biology of pathogen, epidemiology) and understand the corresponding integrated control measures practiced in Swiss agriculture.

Content

The course will partly be an e-learning exercise (with computers).

A script will be used on annual and perennial crops and their most important diseases. It will be updated stepwise

The contact hour part of the course (16 h) is conceptually a block course which is subdivided into one day of lecture and one day of excursion.

The non-contact hour part (14 h) is to comprehend the information given and to prepare for the examination.

The overall goal of the course is to provide the essential scientific knowledge of the genetic, physiological and special nutritional aspects of pigs metabolism, animal health and behaviour, and of the implications for environment, product quality, housing and animal welfare, and breeding programs.

Objective

Students will
- understand the complex interactions of nutrition, quality traits of products, breeding and reproduction, health management, behaviour and husbandry;
- be trained to understand interdisciplinary and disciplinary research.
- be able to critically analyze published research data.
- be able to present precise scientific reports in oral and written form.

Content

Four main topics in Pig Science:

- Behaviour and Husbandry of pigs: behavioral needs, husbandry related behavioral disorders, design and construction of housing systems in accordance with welfare requirements and legal regulations.
- Planning of reproductive cycle in practice
- Welfare monitoring in practice
- Pigs in organic farming
- Animal Health and Diseases: animal hygiene, immunology/vaccinations, metabolic diseases, diarrhoe, legislation, thermoregulation, important infections, prophylaxis.
- Poster, exam and evaluation

FS

Special Physiology of Pig Nutrition: food intake; growth; metabolism and digestion at different growth stages; energy and specific nutritional requirements; feeding systems; environmental aspects, effed.
- Genetics: Breeding systems, reproductive techniques, performance tests and recording, etc.
- Oral presentation, exam, evaluation

Lecture notes

Handouts/scripts are distributed by the lecturers.

Literature

Specific literature is indicated by the lecturers.

Prerequisites / notice

The lecture corresponds with the lecture "Ruminant Science" and knowledge in animal health, nutrition and breeding as well as applied ethology and animal welfare are recommended.

The lecture usually is in German (spec. nomenclature)

The course will be in German (spec. nomenclature)

Non-Ruminant Science

| Abstract   | Conservation of Animal Genetic Resources overviews the distribution, endangerment and conservation of farm animal genetic resources in Switzerland and abroad. The theory is illustrated with numerous examples and the knowledge is deepened in exercises. |
| Objective  | The students
- overview the distribution and endangerment of animal genetic resources on national and international level and they know, where to find the relevant information.
- can explain, what value can be assigned to biodiversity and name reasons, why biodiversity should be conserved.
- know the national and international efforts of the present and the past to conserve biodiversity in the livestock sector.
- can explain what is important concerning the management of small populations.
- can explain differences between species and breeds concerning biodiversity conservation.
- can describe different conservation activities, in particular in situ and ex situ conservation
- can describe current national and international conservation programmes for species and breeds. |
| 751-6001-00L | Forum: Livestock in the World Food System | W    | 2    | 1S    | M. Kreuzer, S. Bauersachs, |
Abstract
This forum is a platform for the critical reflection of highly relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

Objective
In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.

Content
The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

Element 1. Oral Presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturers are the audience.

Element 2. Scientific writing: Option 1: preparation of a short scientific type of paper from a result table offered by the lecturers; Option 2: preparation of an abstract with limited word count from a scientific paper; Option 3: writing of a critical review of a paper. The students have to select 2 of the three options each. There will be a discussion be a discussion in small groups at two dates.

Introductions to both forms of presentation will be offered by lecturers.

The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

Prerequisites
Requirements for allocation of the two credit points:
- Theatre presentation (with handout) at the forum
- Delivery of written documents of sufficient quality
- Active participation during the presentations by the other participants

Tropical Animal Nutrition

Abstract
Farm animals play an important role in most agro-eco - systems, but conditions for a successful management and nutrition in the tropics are diverse. In this course a wide range of aspects are examined.

Objective
The aim of this course is to know and understand animal production systems in the different zones of the tropics taking into consideration the local and social structure of the population. We will deal with different aspects of animal nutrition in the tropics.

Content
- Introduction to the tropics
- Special problems and challenges in tropical regions
- Importance of livestock in the tropics
- Animal production and livestock production systems in the tropics
- Special challenges for livestock in the tropics
- Feeds available in the tropics
- Tropical pasture systems and their characteristics
- Quality of feeds in the tropics
- Problems and challenges of animal nutrition in the tropics

Conservation of Animal Genetic Resources

Abstract
Conservation of Animal Genetic Resources overviews the distribution, endangerment and conservation of farm animal genetic resources in Switzerland and abroad. The theory is illustrated with numerous examples and the knowledge is deepened in exercises.

Objective
- overview the distribution and endangerment of animal genetic resources on national and international level and they know, where to find the relevant information.
- can explain, what value can be assigned to biodiversity and name reasons, why biodiversity should be conserved.
- know the national and international efforts of the present and the past to conserve biodiversity in the livestock sector.
- can explain what is important concerning the management of small populations.
- can explain differences between species and breeds concerning biodiversity conservation.
- can describe different conservation activities, in particular in situ and ex situ conservation
- can describe current national and international conservation programmes for species and breeds.

Practical Course in Molecular Physiology

Abstract
This course is intended to intensify and broaden the knowledge of molecular biology gained during the bachelor lab practical course. It directly allows students to commence a master thesis with a detailed knowledge of pitfalls in experimental setup. It will also sensitize for the awareness of biological and technical variance in experimental research.

Objective
The course will be divided in two parts:

Experimental part:
- Isolation of leukocytes from blood and milk (cattle)
- Culture of isolated cells and stimulation, e.g., with LPS
- Extraction of RNA
- Quantification and quality control of RNA (Nanodrop, Fluorometer, Bioanalyzer)
- Analysis of gene expression by the use of quantitative real-time RT-PCR

Theoretical part:
- Principles of primary cell culture and transcripcional regulation, methods for analytical detection
- Bioinformatics (scientific databases, sequence analysis, biostatistics)
- Presentations by the students (e.g. techniques for analysis of physiological regulatory processes, application examples)
Content

In this practical course the students will achieve a comprehensive understanding of molecular physiology in livestock research. A cell culture experiment using blood and milk leucocytes under pathogen-associated treatment will be performed and the analysis of differential gene expression undertaken. The primary cell culture study will give insights into the laboratory work undertaken in animal physiology research. It will include the general discussion of strategies for an appropriate experimental setup in livestock research and possible methods and tools for the analysis. Hands-on cell culture and harvesting, preanalytical sample preparation and measurement implementation as well as the analysis of differential gene expression, data analysis and statistical evaluation using bioinformatics will be performed. In addition, the students will present talks based on state-of-the-art primary literature about related topics to prepare for the course and to complement the provided information. The course will enable the students to design, perform and evaluate laboratory in vitro investigations of physiological regulatory processes on a cellular level.

Ruminant Science

Number | Title | Type | ECTS | Hours | Lecturers
---|---|---|------|-------|-------
751-6501-00L | Ruminant Science (HS) | W | 4 credits | 4G | M. Kreuzer, M. C. Härdi-Landerer, E. Hillmann, U. Witschi

Abstract

The course provides the scientific basis of the central aspects of reproduction, husbandry and nutrition physiology of ruminants, and of the implications for animal welfare, product quality, breeding programs, and organic livestock systems. Means of knowledge transfer include interdisciplinary approaches, disciplinary parts, web-based learning and self-study.

Objective

At the end of the course the students are able to apply, by a comprehensive understanding of the underlying mechanisms, their knowledge in various fields of ruminant science. They will be able to develop and recommend best strategies for breeding programs, feed formulation, improving forage quality, increasing animal health and welfare etc. They will be trained to carry out interdisciplinary and disciplinary research at the highest level. The course Ruminant Science (FS) offered in spring has a similar structure but is complementary to this course.

Content

Fields (contact hours)
- Introduction: 2 h
- Special topics: 12 h
- Lameness
- Fertility in Cows
- Food Intake of Ruminants
- Disciplinary topics: 36 h
- Ruminant Husbandry: 16 h
- Ruminant Nutrition Physiology: 10 h
- Reproduction in Ruminants: 8 h
- Lectures held by the students: 4 h

In summary
- Contact hours: 52 h
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)
- Self-study in semester break: 38 h
Total: 120 h

Lecture notes

Information on books and other references will be communicated during the course

Literature

The specialty of this course is that for the first time the animal science disciplines are unified. This is realised with a particular emphasis on interdisciplinary special topics and new forms of teaching. At the same time the essential basics in the central fields are communicated.

The field of Ruminant Science will also be a part of the spring semester (special topics: Organic Ruminant Systems, Tropical Ruminant Systems, Mastitis; disciplinary courses: Cattle, Sheep and Goat Breeding, Ruminant Diseases and Prophylaxis, Ruminant Nutrition and the Environment). However both courses are organized independently.

Conditions for successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as 'optional courses' in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.

The control of performance will consist of:
- an own lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details

751-7211-00L Ruminal Digestion

Abstract

This course broadens the knowledge in one of the most important aspects of ruminant nutrition: the microbial digestion in the rumen (and in the hindgut). For a comprehensive understanding of the rumen microbial ecosystem, the mechanisms of nutrient fermentation and the synthesis of microbial protein, thorough basics are provided. Apart from lectures, group and laboratory exercises are included.

Objective

The course enables students to understand in detail how ruminal digestion works and how this knowledge can be applied to design optimal feeding diets using highly fibrous forages and a variety of other feeds. The students also are able to show how to modify the most important rumen microbes beneficially by nutritional means.
Structure of the contact hour part of the course (14 h):

- 2 h Introduction and blackboard exercise
- 8 h Basic topics in ruminal digestion, lectures and group exercises:
  - Systematics of the microbes involved in microbial digestion
  - Measurement of microbial digestion
  - Interactions of microbes and epithelium of the digestive tract
  - Differences between ruminal and hindgut microbial digestion
  - Microbial nutrient degradation and its modification
  - Efficiency of microbial protein synthesis
  - Manipulation of the ruminal digestion
- 2 h Laboratory exercise with a rumen fistulated cow and the Rumen Simulation Technique
- 2 h Final seminar

The non-contact hour part is to comprehend the information given and to prepare either the written report or the oral presentation (cf. "Besonderes").

Credit point associated with grade of either a written report or an oral presentation in the final seminar (both on a self-chosen related topic)

Students should be able to:

- apply these criteria when assessing the effects of selected processing technologies on nutritional quality.
- describe and compare the major concepts/criteria used for the evaluation of the nutritional quality of food processing.
- evaluate recent formulation strategies aimed to achieve additional physiological benefits for targeted population groups (i.e. functional foods).

Content

- The selected topics address challenges with regard to ecological intensification, resource efficiency or climate change and branch into ongoing research and development projects.
- The course builds on basic knowledge delivered in 'Horticultural Crops I' and 'Horticultural Crops II'. If these courses have not been followed by interested participants, equivalent knowledge and experience will greatly support a successful and productive participation of the participating student.

Language: spoken E, G or F, Documents: Preferably English, G/F possible.

Abstract
The course deals with transdisciplinary (td) methods, concepts and their applications in the context of case studies and other problem oriented research projects. Td methods are used in research at the science-society interface and when collaborating across scientific disciplines. Students learn to apply methods within a functional framework. The format of the course is seminar-like, interactive.

Objective
At the end of the course students should:

Know:
- Function, purpose and algorithm of a selected number of transdisciplinary methods

Understand:
- Functional application in case studies and other problem oriented projects

Be able to reflect on:
- Potential, limits, and necessity of transdisciplinary methods

Be prepared for:
- Transdisciplinary Case Study 2017

Content
The lecture is structured as follows:
- Overview of concepts and methods of inter-/transdisciplinary integration of knowledge, values and interests (approx. 20%)
- Analysis of a selected number of transdisciplinary methods focusing problem framing, problem analysis, and impact (approx. 50%)
- Practical application of the methods in a broader project setting (approx. 30%)

Lecture notes
Handouts are provided by the lecturers

Literature
Selected scientific articles and book-chapters

Prerequisites / notice
This course is recommended and helpful for students participating in the Transdisciplinary Case Study 2017.

### 751-7211-00L Ruminal Digestion

**Abstract**
This course broadens the knowledge in one of the most important aspects of ruminant nutrition: the microbial digestion in the rumen (and in the hindgut). For a comprehensive understanding of the rumen microbial ecosystem, the mechanisms of nutrient fermentation and the synthesis of microbial protein, thorough basics are provided. Apart from lectures, group and laboratory exercises are included.

**Objective**
The course enables students to understand in detail how ruminal digestion works and how this knowledge can be applied to design optimal feeding diets using highly fibrous forages and a variety of other feeds. The students also are able to show how to modify the most important rumen microbes beneficially by nutritional means.

**Content**

Structure of the contact hour part of the course (14 h):

- 2 h Introduction and blackboard exercise
- 8 h Basic topics in ruminal digestion, lectures and group exercises:
  - Systematics of the microbes involved in microbial digestion
  - Measurement of microbial digestion
  - Interactions of microbes and epithelium of the digestive tract
  - Differences between ruminal and hindgut microbial digestion
  - Microbial nutrient degradation and its modification
  - Efficiency of microbial protein synthesis
  - Manipulation of the ruminal digestion
- 2 h Laboratory exercise with a rumen fistulated cow and the Rumen Simulation Technique
- 2 h Final seminar

The non-contact hour part is to comprehend the information given and to prepare either the written report or the oral presentation (cf. "Besonderes")

**Lecture notes**
Lecture notes are provided via Moodle.

**Literature**
Will be communicated at the start of the course.

**Prerequisites / notice**
The course is a balanced mixture of blackboard exercise, laboratory exercise, group exercise, lecture and student seminar presentation.

Credit point associated with grade of either a written report or an oral presentation in the final seminar (both on a self-chosen related topic)

### Non-Ruminant Science

<table>

</tr>
</tbody>
</table>

**Abstract**
The overall goal of the course is to provide the essential scientific knowledge of the genetic, physiological and special nutritional aspects of pigs metabolism, animal health and behaviour, and of the implications for environment, product quality, housing and animal welfare, and breeding programs.

**Objective**
- Students will understand the complex interactions of nutrition, quality traits of products, breeding and reproduction, health management, behaviour and husbandry.
- be trained to understand interdisciplinary and disciplinary research.
- be able to critically analyze published research data.
- be able to present precise scientific reports in oral and written form.
Four main topics in Pig Science:
- Behaviour and Husbandry of pigs: behavioral needs, husbandry related behavioral disorders, design and construction of housing systems in accordance with welfare requirements and legal regulations.
- Planning of reproductive cycle in practice - welfare monitoring in practice
- Pigs in organic farming
- Animal Health and Diseases: animal hygiene, immunology/vaccinations, metabolic diseases, diarrhoe, legislation, thermoregulation, important infections, prophylaxis.
- Poster, exam and evaluation

FS
- Special Physiology of Pig Nutrition: food intake; growth; metabolism and digestion at different growth stages; energy and specific nutritional requirements; feeding systems; environmental aspects, effed.
- Genetics: Breeding systems, reproductive techniques, performance tests and recording, etc.
- Oral presentation, exam, evaluation

Handouts/scripts are distributed by the lecturers.
Specific literature is indicated by the lecturers.
The lecture corresponds with the lecture "Ruminant Science" and knowledge in animal health, nutrition and breeding as well as applied ethology and animal welfare are recommended.
The lecture usually is in German, but there is always the possibility to change to English.

Introduction into the conceptual and methodological basis of research

Methods for analysing livestock data, in particular for the estimation of breeding values: principles of selection index, introduction to BLUP, application of common models used, relationship matrix, methods for the estimation of variance components, basics of breeding programs. The material will be illustrated via exercises and assignments.

The students are able to set up design matrices, the relationship matrix and its inverse as well as the Mixed Model equations to estimate BLUP breeding values for smaller examples.

- Selection index (various sources of information, one trait, multiple traits)
- Relationship matrix and its inverse
- BLUP: one trait, repeated observations, multiple traits, economic indices
- Introduction to methods for the estimation of variance components
- Assignments

Copies of the slides are available on the net. To be announced in the lectures.

Conservation of Animal Genetic Resources overviews the distribution, endangerment and conservation of farm animal genetic resources in Switzerland and abroad. The theory is illustrated with numerous examples and the knowledge is deepened in exercises.

Endocrinology and Biology of Reproduction

The students will learn the conceptual and methodological background of research in the animal science groups of the Institute of Plant, Animal and Agroecosystem Science. In addition to teaching the theoretical background, the major aim of the course is to integrate the students into the research groups (on job training) and, hence, to focus on the practical application of the knowledge.

Specific literature will be indicated individually by the lecturers.

Methods in Animal Science

Methodology Competences

Objective

The students will be integrated into the research groups day-to-day work and will thus deal with all aspects of scientific work. This comprises the planning (conceptually and logically), execution (data collection, laboratory analyses) and evaluation (statistics, data presentation) of experiments as well as the basics of scientific writing (aim: later publication, Master thesis). The research topics and the range of methodologies vary between the animal science research groups in the Institute of Plant, Animal and Agroecosystem Sciences.

Endocrinologie und Reproduktionsbiologie der Säugetiere und des Menschen (Anatomie, Morphologie, Physiologie, Regelmechanismen) Die Systematik der Reproduktionshormone und der Hormonrezeptoren wird erläutert, die Wirkungsmechanismen (Bildung; orale Bioverfügbarkeit; Elimination) erklärt. Mit diesen Grundlagen wird das Verständnis der Regulation der Fortpflanzung umfassend erörtert.

Die Studierenden erlangen das grundlegende theoretische Verständnis und Fachwissen zur Endokrinologie der Reproduktion und zur weiblichen und männlichen Reproduktionsbiologie. Sie können darüber hinaus pathologische Situationen (Fortpflanzungsstörungen) und deren vielfältige Ursachen in den physiologischen Kontext einordnen.

Objective

The students will perform laboratory tests for genome analysis (identification of gene loci, gene mapping), gene expression (mRNA, proteins), diagnostics (analysis of hereditary diseases) and verification of animals and animal products (parentage control, forensics).

The students will learn to describe current national and international conservation programmes for species and breeds.

The students are able to set up design matrices, the relationship matrix and its inverse as well as the Mixed Model equations to estimate BLUP breeding values for smaller examples.

- can describe different conservation activities, in particular in situ and ex situ conservation
- can describe current national and international conservation programmes for species and breeds.
- can explain, what value can be assigned to biodiversity and name reasons, why biodiversity should be conserved.
- can explain differences between species and breeds concerning biodiversity conservation.

Endokrinologie und Reproduktionsbiologie der Säugetiere und des Menschen (Anatomie, Morphologie, Physiologie, Regelmechanismen)

Objective

The students will perform laboratory tests for genome analysis (identification of gene loci, gene mapping), gene expression (mRNA, proteins), diagnostics (analysis of hereditary diseases) and verification of animals and animal products (parentage control, forensics).

Contact hours: 42 h

Specific literature will be indicated individually by the lecturers.

Methods in Animal Science

Methodology Competences

Objective

The students will learn the conceptual and methodological background of research in the animal science groups of the Institute of Plant, Animal and Agroecosystem Science. In addition to teaching the theoretical background, the major aim of the course is to integrate the students into the research groups (on job training) and, hence, to focus on the practical application of the knowledge.

Specific literature will be indicated individually by the lecturers.

Methods in Animal Science

Methodology Competences
The course program uses a learning-by-doing approach ("hands-on minds-on"). New topics are introduced in the lecture hall, but most of the training will be done in the computer lab to allow for the different speeds of progress of the student while working with data and analyzing results. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contains the following topics:

- Introduction To Experimental Design and Applied Statistics
- Introduction to 'R' / Revival of 'R' Skills
- Designs of Field and Growth Chamber Experiments
- Nonlinear Regression Fits
- Multivariate Techniques: Principle Component Analysis, Canonical Correpondence Analysis (CCA), Cluster Analysis
- ANOVA using linear and mixed effect models
- Error Analysis, Error Propagation and Error Estimation
- Introduction to autoregression and autocorrelations in temporal and spatial data and how to consider them in ANOVA-type analysis

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

Lecture notes Handouts will be available (in English)

Literature A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture.

Prerequisites / notice This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor’s course "Wissenschaftliche Datenauswertung und Datenpräsentation" (751-0441-00L)

**Abstract**

The students will learn the conceptual and methodological background of research in the animal science groups of the Institute of Plant, Animal and Agroecosystem Science. In addition to teaching the theoretical background, the major aim of the course is to integrate the students into the research groups (on job training) and, hence, to focus on the practical application of the knowledge.

**Objective**

- Introduction into the conceptual and methodological basis of research
- Integration of the students into the research groups (on job training)
- Application of the gained knowledge

**Content**

The students will be integrated into the research groups day-to-day work and will thus deal with all aspects of scientific work. This comprises the planning (conceptually and logistically), execution (data collection, laboratory analyses) and evaluation (statistics, data presentation) of experiments as well as the basics of scientific writing (aim: later publication, Master thesis). The research topics and the range of methodologies vary between the animal science research groups in the Institute of Plant, Animal and Agroecosystem Sciences.

The number of training slots in the various groups is limited. It is therefore highly recommended to contact the group leaders early enough (first come first serve).

The full integration in a research group often means to work on weekends. The total time budget is equivalent to about 180 hours. Active participation in group meetings (discussion, presentation) and short written reports about the work conducted are required for the 6 credit points. There are no grades, it is only pass or fail.

The course program uses a learning-by-doing approach ("hands-on minds-on"). New topics are introduced in the lecture hall, but most of the training will be done in the computer lab to allow for the different speeds of progress of the student while working with data and analyzing results. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contains the following topics:

Active participation in group meetings (discussion, presentation) and short written reports about the work conducted are required for the 6 credit points. There are no grades, it is only pass or fail.
In this practical course the students will achieve a comprehensive understanding of molecular physiology in livestock research. A cell culture experiment using blood and milk leukocytes under pathogen-associated treatment will be performed and the analysis of differential gene expression undertaken. The primary cell culture study will give insights into the laboratory work undertaken in animal physiology research. It will include the general discussion of strategies for an appropriate experimental setup in livestock research and possible methods and tools for the analysis. Hands-on cell culture and harvesting, preanalytical sample preparation and measurement implementation as well as the analysis of differential gene expression, data analysis and statistical evaluation using bioinformatic tools will be performed. In addition, the students will present talks based on state-of-the-art primary literature about related topics to prepare for the course and to complement the provided information. The course will enable the students to design, perform and evaluate laboratory in vitro investigations of physiological regulatory processes on a cellular level.

### Major in Crop Science

**Abstract**

Lectures address 2 horticultural cropping systems and value chains, each one in 4 2-hour-lecture blocks. Afterwards, the students split in 2 groups for addressing a case study focusing on one of the cropping systems treated before. An excursion to a research site might be included. In a final colloquium, each group presents a report on their case study and their conclusions.

**Objective**

Achieve a deepened understanding of horticultural value chain challenges relating to ecological intensification, resource efficiency, climate change and healthy and safe food, and the problem solution strategies and scientific principles behind. Deliver in a team effort a report and a presentation providing a comprehensive insight into a problem of the horticultural value chain and its science-based solution strategy.

**Content**

In the autumn semester, the two addressed cropping systems and value chains are fruit-production and viticulture. In the spring semester, the two addressed cropping systems and value chains are vegetable-production- and berry-production or glasshouse-horticulture.

The selected topics address challenges with regard to ecological intensification, resource efficiency or climate change and branch into ongoing research and development projects.

**Lecture notes**

Documents handed out during the case studies.

**Literature**

As provided by the case study leaders.

**Prerequisites / notice**

The course builds on basic knowledge delivered in ‘Horticultural Crops I’ and ‘Horticultural Crops II’. If these courses have not been followed by interested participants, equivalent knowledge and experience will greatly support a successful and productive participation of the participating student.

Language: spoken E, G or F. Documents: Preferably English, German/French possible.

**Abstract**

Few crops dominate the crop rotations worldwide. Following the goal of an increased agricultural biodiversity, species such as buckwheat but also medicinal plants might become more important in future. The biology, physiology, stress tolerance and central aspects of the value-added chain of the above-mentioned and of other alternative crops will be depicted.

**Objective**

During this course, students learn to assess the potential of different minor or alternative crops compared to the dominant major crops based on their biological and agronomical features. Each student will assess and present a specific alternative crop of his or her choice based on information from scientific articles and Wikipedia. Wikipedia-entries will be generated.

**Abstract**

The seminar ‘Current challenges in plant breeding’ aims to bring together national and international experts in plant breeding to discuss current activities, latest achievements and future perspective of a selected topic/area in plant breeding. The topic this year will be: ‘Genome editing: potential and challenges for plant breeding’.

**Objective**

The educational objectives cover both thematic competences and soft skills:

- Thematic competences:
  - Deepening of scientific knowledge in plant breeding
  - Critical evaluation of current challenges and new concepts in plant breeding
  - Promotion of collaboration and Master thesis projects with practical plant breeders

- Soft skills:
  - Independent literature research to get familiar with the selected topic
  - Critical evaluation and consolidation of the acquired knowledge in an interdisciplinary team
  - Establishment of a scientific presentation in an interdisciplinary team
  - Presentation and discussion of the teamwork outcome
  - Establishing contacts and strengthening the network to national and international plant breeders and scientist

**Content**

Interesting topics related to plant breeding will be selected in close collaboration with the working group for plant breeding of the Swiss Society of Agronomy (SSA). For this year, the topic ‘Genome editing: potential and challenges for plant breeding’ was selected.

In the fall semester (November 29, 2016), the enrolled students will meet with the lecturers as well as four to six tutors, selected according to their expertise in the selected topic (one afternoon, for about three hours). After an input talk by the lecturers, four to six specific questions/aspects will be identified and phrased. The tutors and the enrolled students will be assigned to four to six different groups, to critically evaluate one question/aspect of the selected topic. The students, guided by tutors, will prepare a presentation of 15 minutes (plus 5 minutes discussion) covering their specific question/aspect. Participation on that afternoon will be mandatory.

End of January (January 31, 2017), a one-day seminar on the selected topic will be organized. After one to two keynote speakers (international experts), four invited talks will link the selected topic to practical plant breeding. In the afternoon, the four to six students groups will present and discuss with the experts their specific questions on the selected topic/area. These presentations will be evaluated by the lecturers. The seminar will be public and serve as annual meeting of the SSA working group for plant breeding, bringing together the experts in plant breeding.

The course is designed for a maximum of 15 Master students and 10 PhD students (advertised and recruited via the Zurich-Basel Plant Science Center). For full and active participation, a total of 2 credit/ECTS points will be provided.

**Lecture notes**

Seminar abstracts

**Literature**

Peer-reviewed research articles, selected according to the selected topic/area.

**Prerequisites / notice**

Participation in the BSc course ‘Pflanzenzüchtung’ is strongly recommended, a completed course in ‘Molecular Plant Breeding’ is highly advantageous.

Data: 06.10.2017 12:53 Autumn Semester 2016 Page 55 of 1570
Students completing this course should become familiar with the application of ecological principles to the study of insects, as well as major areas of inquiry in this field. Highlighted topics will include insect behavior, chemical and sensory ecology, physiological responses to biotic and abiotic stressors, plant-insect interactions, community and food-web dynamics, and disease ecology. The course will emphasize insect evolution and adaptation in the context of specific interactions with other organisms and the abiotic environment. Examples from the literature incorporated into lectures will highlight the methods used to study insect ecology.

Lecturers
Provided to students through ILIAS

Literature
Selected required readings (peer reviewed literature, selected book chapters). Optional recommended readings with additional information.

Seminar in Evolutionary Ecology of Infectious Diseases

Students of this course will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.

Objective
This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.

Content
A core set of 10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

Lecture notes
Publications and class notes can be downloaded from a web page announced during the lecture.

Literature
Papers will be assigned and downloaded from a web page announced during the lecture.

Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Objective
Students will understand the consequences arising from the unintentional or deliberate introduction of alien organisms into agricultural systems. They will be able to understand the concept of environmental risk assessment and be able to evaluate risk management options.

Content
Alien organisms in agriculture is a topic that receives an increasing awareness among farmers, agricultural scientists, regulators and the general public. Students of this course will learn about the nature of alien organisms such as invasive species, biocontrol organisms and genetically modified organisms. With a particular focus on arthropods, plants and their interactions we will look at the potential threats the novel organisms pose, the benefits they provide and how both of these effects can be scientifically assessed. Students will learn how the topic of alien organisms in agriculture is intrinsically tied to policy making and regulation and get to know current examples and future challenges in research. In the last part of the course students will be able to apply the acquired knowledge in a practical exercise (case study).

Lecture notes
Material will be distributed during the course.

Biogeochemistry and Sustainable Management

This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Objective
Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Content
Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Literature
Handouts will be available on the webpage of the course.

Prerequisites
Will be discussed in class.

Current Aspects of Nutrient Cycle in Agro-Ecosystems

The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. It offers to deepen the knowledge on a specific theme related to nutrients. It is composed by presentations of national and international speakers and by an excursion. The students write a report where they compile the obtained information, relate it to their own knowledge and include literature.

Objective
Listen and understand expert's presentations. Ask questions and contribute to the discussion during the talk sessions and the excursion. Link the information obtained during the seminar with knowledge from previous lessons and with literature searched to complement the matter. Expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem.

Literature
Handouts will be available on the webpage of the course.

Prerequisites
Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Course will be taught in English.

Current Topics in Grassland Sciences (HS)

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecophysiology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Literature
Handouts will be available on the webpage of the course.

Prerequisites
Will be discussed in class.
Objective

Students will be able to understand and evaluate experimental design and data interpretation of on-going studies, be able to critically analyze published research results, practice to present and discuss results in the public, and gain a broad knowledge of recent research and current topics in agro- and forest ecosystem sciences.

Content

Research results in agro- and forest ecosystem sciences will be presented by experienced researchers as well as Ph.D. and graduate students. Citation classics as well as recent research results will be discussed. Topics will range from plant ecology, biodiversity and biogeochemistry to management aspects in agro- and forest ecosystems.

Lecture notes

none

Prerequisites / notice

Prerequisites: Basic knowledge of plant ecophysiology, terrestrial ecology and management of agro- and forest ecosystems. Course will be taught in English.

---

751-5001-00L

Agroecologists without Borders

W 2 credits 2G 2S C. Decock, A. Hofmann, J. Six

Abstract

In this seminar students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

Objective

(1) Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
(2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
(3) Students articulate complexity and challenges in agricultural development interventions.
(4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

Prerequisites / notice

Students signing up for this class should have a strong interest in tropical agriculture and science communication.

---

751-5201-00L

Tropical Soils and Land Use

W 2 credits 2G J. Six, A. Hofmann

Abstract

This course guides students in analyzing and comprehending tropical agroecosystems. Students gain practical knowledge of field methods, diagnostic tools and survey methods for tropical soils and agroecosystems. An integral part of the course is the two-week field project in southern Ethiopia, which is co-organized with Arba Minch University (Ethiopia) and KU Leuven (Belgium).

Objective

Lectures and exercises:
(1) Introduction to international soil classification with focus on tropical soils
(2) Soil suitability (chemical, physical and biological fertility) for tropical crops
(3) Soil conservation practices and stakeholder involvement
(4) Approaches to analyzing tropical agroecosystems
Field project:
(5) Overview of the major land use systems in the South Ethiopian Rift Valley
(6) Analysis of agricultural production systems in the Gamo-Gofa region in southern Ethiopia
(7) Hands-on training on the use of field methods, diagnostic tools and survey methods
(8) Collaboration in international student teams (MSc students from Switzerland, Belgium and Ethiopia)

Literature

Prerequisites / notice

The number of participants is limited to 12 students due to capacity limitations for the field project in Ethiopia. Selection of participants will be based on (1) the student’s motivation statement, (2) successful participation in the BSc lectures “Sustainable Agroecosystems I + II” and (3) related topic for BSc thesis/ tentative topic for MSc thesis. The motivation statement is due in the first week of the semester.

### Content
Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, radionuclides) within a given system and to assess the importance of processes controlling these fluxes (e.g., exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.). The course will first present the principles, the basic assumptions and the theoretical framework that underlay the work with radioisotopes. It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g., number and size of compartments). Secondly, case studies on isotopic dilution and tracer work will be presented for instance on the isotopic exchange kinetics method to determine nutrients or pollutants availability. The case studies will be adapted to the ongoing research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.

### Lecture notes
Documents will be distributed during the lecture.

### Literature
Will be given during the lecture.

### Prerequisites / notice
The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at: http://www.pe.ipw.agrl.ethz.ch/about/reach

**Prerequisites:** Only students who have passed the courses 751-3401-00L Pflanzennährung I and 751-3402-00L Pflanzennährung II - Integriertes Nährstoffmanagement can be admitted to this course.

### Abstract
This course is about the physical, chemical, and biological processes in the rhizosphere and their effect on plant growth. Effects of fertilisers, companion plants, and microbial symbionts, and other microbes on nutrient cycling and plant uptake are discussed. An “intercropping” experiment in the glasshouse is used as a model to check for rhizosphere effects on plant growth and mineral nutrition.

### Objective
To gain a holistic understanding of resource-driven and regulatory processes in agricultural and natural ecosystems. Develop skills on the critical analysis of scientific papers. Define explanatory hypotheses, identify knowledge gaps for further investigations. Carry out a multi-disciplinary experiment that involves aspects of soil, (micro-)biology, plant physiology, pathology, and ecology. Develop manual skills in the set up of a glasshouse experiment, in soil and plant analyses, and in isolation and DNA-based characterisation of rhizobia. Gain insights on basic methods to analyse (bio-)chemical, molecular genetic, and graphical data. Discuss and interpret data in the context of the literature. Prepare a research report in the format of a scientific paper and a poster in the format of a conference paper, partially alone and partially in small groups, using data obtained from the glasshouse experiment.

### Content
This course is designed to stimulate thinking and promote critical analysis of important processes that occur in the rhizosphere. As part of this course, the knowledge acquired will be used for analysing and interpreting experimental data, as well as, preparing a scientific report and conference-type poster.

The course will cover the relative importance of spatial scales and various physicochemical and microbiological dynamics as influenced by roots. We will discuss root traits and activities that influence the immediately root-surrounding soil and thereby contribute to mineral nutrient mobilization and immobilization. An overview of the most relevant root-microbe symbioses for agroecosystems will be provided and root and microbial traits discussed, which could be of use in efforts towards utilization of intercropping and bioinoculants as a possible means of reducing energetically expensive inputs to farming systems. A special emphasis will be given to the importance of physicochemical features of soils and the chemical forms (= species) of elements important for plant uptake.

Practical experience will be gained with setting up a glasshouse experiment, soil and root sampling, basic soil and plant analyses, isolation of rhizobia, determination of the number of colony forming units (CFU), assays to screen for phosphorus and zinc solubilizing bacteria, DNA extraction, PCR amplification, and restriction fragment length polymorphism analysis (RFLP) of host range determining symbiosis-specific genes.

In short, the processes dealt with in this course occur on a small-scale and are generally (bio)chemical and microbiological in nature. Furthermore, they are generally not taken into account using current methods of agronomic management for plant production. However, they are increasingly being recognized as a potentially useful means of obtaining a resource-efficient and hence, economically and environmentally sustainable agricultural system, including for ecosystem restoration. Therefore, the course will invite for critical reflections and exemplify challenges in translating knowledge from scientific studies and ecology into application for plant production.

### Lecture notes
For documentation, lecture slides and laboratory protocols will continuously be uploaded to the directory '751-5123-00L Rhizosphere Ecology' on the electronic document exchange platform ILIAS, LDA-ELBA:
Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know

<th>Lecturers</th>
</tr>
</thead>
</table>

**Abstract**

In this course, different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystem sciences. Both manipulative (field and laboratory) experiments and surveys are addressed and students work with a selection of basic techniques and methods to analyse data using a hands-on approach. Methods range from simple t-tests to multi-factorial ANOVA using linear and mixed effect models.

**Objective**

Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.

**Content**

The course program uses a learning-by-doing approach ("hands-on minds-on"). New topics are introduced in the lecture hall, but most of the work is done in the computer lab to allow for the different speeds of progress of the student while working with data and analyzing results. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contains the following topics:

- Introduction To Experimental Design and Applied Statistics
- Designs of Field and Growth Chamber Experiments
- Nonlinear Regression Fits
- Multivariate Techniques: Principle Component Analysis, Canonical Correpondence Analysis (CCA), Cluster Analysis
- Error Analysis, Error Propagation and Error Estimation
- Introduction to autoregression and autocorrelations in temporal and spatial data and how to consider them in ANOVA-type analysis

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

Autumn Semester 2016
**Objective**

To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.

To analyze the evolution as well as the key elements of environmental governance.

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

**Content**

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human use of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

**Lecture notes**

Lecture slides and additional course material will be provided throughout the semester.

**Literature**

We will mostly work with readings from the following books:

A detailed course schedule will be made available at the beginning of the semester.

**Prerequisites / notice**

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy).

**751-2103-00L**

**Socioeconomics of Agriculture**

**W**

2 credits

2V

S. Mann

**Abstract**

The main part of this lecture will examine constellations where hierarchies, markets or cooperation have been observed and described in the agricultural sector. On a more aggregated level, different agricultural systems will be evaluated in terms of main socioeconomic parameters like social capital or perceptions.

**Objective**

Students should be able to describe the dynamics of hierarchies, markets and cooperation in an agricultural context.

**Content**

- Groups, identities and utility maximization - some conceptual foundations
- Micro-Socioeconomics: Hierarchy, cooperation and markets
- Macro-Socioeconomics: Varieties of Capitalism
- Agricultural Administration: Path dependencies and efficiency issues
- Causes and Impacts of farm succession
- Occupational Choice in the farming sector
- System Choice and segregation (organic, GMO etc.)
- The economics of rural areas
- Common Resource Management in Alpine Farming
- Agricultural Cooperatives
- Societal perceptions of agriculture
- Perceptions of farming from within
- Varieties of agricultural systems and policies

**Lecture notes**

**Literature**

see script

**Prerequisites / notice**

Basic economic knowledge is expected.

**851-0594-00L**

**International Environmental Politics**

**W**

3 credits

2V

T. Bernauer

**Abstract**

This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

**Objective**

The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.

**Content**

This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc. The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

**Lecture notes**

Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link ‘Registered students, please click here for course materials’ at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike.Hudecheck<student.ethz.ch>.). All assigned papers must be read ahead of the respective meeting. Following the course on the basis of on-line slides and papers alone is not sufficient. Physical presence in the classroom is essential. Many books and journals covering international environmental policy issues can be found at the D-GESS library at the IFW building, Haldeneggstr 4, B-floor, or in the library of D-USYS.

**Abstract**
The course focuses on agricultural economic research with particular focus on policy evaluation. We impart insights in the issue of policy evaluation as part of agricultural economics research.

**Objective**
Focus: Policy Evaluation

- The students are to...
  - have a critical look at different angles of agri-economic research
  - study scientific literature of the focus theme
  - consider strengths, weaknesses and the application of research approaches
  - apply knowledge gained from other courses with respect to the focus theme
  - get insights in agricultural economic research of the national research institutions by visiting Agroscope and the Research Institute of Organic Agriculture (FiBL)
  - be capable to conduct evaluations and critically reflect evaluation results

**Content**
Unit: Subject

- 01: Introduction in the issue of policy evaluation
- 02: The normative frame for policy evaluation
- 03: Evaluation of public policies
- 04: Context and use of evaluations
- 05: Quantitative policy evaluation
- 06: Qualitative policy evaluation
- 07: Group work

**Abstract**
In this course, different experimental designs will be discussed and various statistical tools will be applied to research questions in agroecosystems sciences. Both manipulative (field and laboratory) experiments and surveys are addressed and students work with a selection of basic techniques and methods to analyse data using a hands-on approach. Methods range from simple t-tests to multi-facility analysis.

**Objective**
Students will know various statistical analyses and their application to science problems in their study area as well as a wide range of experimental design options used in environmental and agricultural sciences. They will practice to use statistical software packages (R), understand pros and cons of various designs and statistics, and be able to statistically evaluate their own results as well as those of published studies.

**Content**
The course program uses a learning-by-doing approach ("hands-on minds-on"). New topics are introduced in the lecture hall, but most of the work is done in the computer lab to allow for the different speeds of progress of the student while working with data and analyzing results. In addition to contact hours exercises must be finalized and handed in for grading. The credit points will be given based on successful assessments of selected exercises.

The tentative schedule contains the following topics:

- Introduction To Experimental Design and Applied Statistics
- Introduction to 'R'/ Revival of 'R' Skills
- Designs of Field and Growth Chamber Experiments
- Nonlinear Regression Fits
- Multivariate Techniques: Principle Component Analysis, Canonical Correpondence Analysis (CCA), Cluster Analysis
- ANOVA using linear and mixed effect models
- Error Analysis, Error Propagation and Error Estimation
- Introduction to autoregression and autocorrelations in temporal and spatial data and how to consider them in ANOVA-type analysis

This course does not provide the mathematical background that students are expected to bring along when signing up to this course. Alternatively, students can consider some aspects of this course as a first exposure to solutions in experimental design and applied statistics and then deepen their understanding in follow-up statistical courses.

**Lecture notes**
Handouts will be available (in English)

**Literature**
A selection of suggested additional literature, especially for German speaking students will be presented in the introductory lecture.

**Prerequisites / notice**
This course is based on the course Mathematik IV: Statistik, passed in the 2nd year and the Bachelor's course "Wissenschaftliche Datenauswertung und Datenpräsentation" (751-0441-00L)
A successful participant of the course is able to:

- understand why most real problems are not simple, but require solution methods that go beyond algorithmic and mathematical approaches
- apply the problem solving cycle as a systematic approach to identify problems and their solutions
- calculate project schedules according to the critical path method
- setup and run systems dynamics models by means of the Vensim software
- identify feedback cycles and reasons for unintended systems behavior
- analyze the stability of nonlinear dynamical systems and apply this to macroeconomic dynamics

Why are problems not simple? Why do some systems behave in an unintended way? How can we model and control their dynamics? The course provides answers to these questions by using a broad range of methods encompassing systems oriented management, classical systems dynamics, nonlinear dynamics and macroeconomic modeling.

The course is structured along three main tasks:
1. Finding solutions
2. Implementing solutions
3. Controlling solutions

PART 1 introduces complexity as a system immanent property that cannot be simplified. It introduces the problem solving cycle, used in systems oriented management, as an approach to structure problems and to find solutions.

PART 2 discusses selected problems of project management when implementing solutions. Methods for identifying the critical path of subtasks in a project and for calculating the allocation of resources are provided. The role of quality control as an additional feedback loop and the consequences of small changes are discussed.

PART 3, by far the largest part of the course, provides more insight into the dynamics of existing systems. Examples come from biology (population dynamics), management (inventory modeling, technology adoption, production systems) and economics (supply and demand, investment and consumption). For systems dynamics models, the software program VENSIM is used to evaluate the dynamics. For economic models analytical approaches, also used in nonlinear dynamics and control theory, are applied. These together provide a systematic understanding of the role of feedback loops and instabilities in the dynamics of systems. Emphasis is on oscillating phenomena, such as business cycles and other life cycles.

Weekly self-study tasks are used to apply the concepts introduced in the lectures and to come to grips with the software program VENSIM. The lecture slides are provided as handouts - including notes and literature sources - to registered students only. All material is to be found on the Moodle platform. More details during the first lecture.

This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advanced lecture covering similar topics and more.

Handouts will be distributed in the lecture and available on the moodle.

Students in this class develop a dynamic simulation model that represents the basic mechanisms underlying food security in developing countries in a highly aggregated way. Students then proceed to extending the simulation model with one policy to improve food security and they analyze the dynamic impacts of this policy on production and environmental outcomes.

Students can develop, analyze and extend a dynamic simulation model and interpret its results.

By applying the developed simulation model, students gain insights into food security issues. They also learn to recognize the benefits and pitfalls of dynamic simulation, both from a theoretical and an applied perspective.
I will provide STATA programs and show the execution thereof. After having participated in this course, students will be able to carry out empirical research in management. Projects will focus on one particular aspect of empirical research, like the formulation of a research question or the design of a study. Students will have at least one week to work on each assignment. Students are expected to work on these assignments individually. Duplicate answers will receive no credit and will be subject to a disciplinary review. Assignments will be graded and need to be turned-in on time.

Class participation: Class participation is encouraged and can greatly improve students' learning in this class. In this spirit, students are expected to attend class regularly and come to class prepared.

The idea of this course is to familiarize students with instrumental variables estimation of linear regression models and the estimation of models with limited dependent variables as well as nonlinear regression models. While most of the material covered will pertain to cross-sectional data, we will also work on selected issues with panel data. I will provide STATA programs and show the execution thereof. After having participated in this course, students will be able to carry out simple research projects and understand the basics of intermediate econometrics. In particular, they will be able to write simple programs in STATA and to qualify their own and others’ regression output relating to problems covered.

The goal of this course is to provide students with the fundamentals of data collection and statistical methods to analyze the data acquired in social science research. Students are expected to apply their knowledge in class discussions and out-of-class assignments.

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors’ behavior and can occur at the local, regional, national or international level.

To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples. Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors’ behavior and can occur at the local, regional, national or international level.

Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors’ behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of ‘environmental governance’ and how legitimate and effective are these approaches in addressing persistent environmental challenges?

We will mostly work with readings from the following books:

Lecture notes: Lecture slides and additional course material will be provided throughout the semester.

Literature: We will mostly work with readings from the following books:
This course focuses on food consumer behavior, consumer's decision-making processes and consumer's attitudes towards food products.

After the lecture the students ...

The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy)

- Vorlesung “Managerial Economics Agri-Food Chain: Strategische Konzepte” in D-USYS

**751-5001-00L**  
**AgroScientists without Borders**  
**Objective**

In this seminar students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

Students signing up for this class should have a strong interest in tropical agriculture and science communication.

(1) Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
(2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
(3) Students articulate complexity and challenges in agricultural development.
(4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

**Prerequisites / notice**

- particularly suitable for students of D-ITET, D-USYS

**851-0594-00L**  
**International Environmental Politics**  
**Objective**

This course focuses on the conditions under which cooperation in international environmental politics emerges and the conditions under which such cooperation and the respective public policies are effective and/or efficient.

The objectives of this course are to (1) gain an overview of relevant questions in the area of international environmental politics from a social sciences viewpoint; (2) learn how to identify interesting/innovative questions concerning this policy area and how to answer them in a methodologically sophisticated way; (3) gain an overview of important global and regional environmental problems.
Content
This course deals with how and why international cooperation in environmental politics emerges, and under what circumstances such cooperation is effective and efficient. Based on theories of international political economy and theories of government regulation various examples of international environmental politics are discussed: the management of international water resources, the problem of unsafe nuclear power plants in eastern Europe, political responses to global warming, the protection of the stratospheric ozone layer, the reduction of long-range transboundary air pollution in Europe, the prevention of pollution of the oceans, etc.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Lecture notes
Assigning reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link 'Registered students, please click here for course materials’ at top of that page). Log in with your nethz name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike Hudecheck <michaehu@student.ethz.ch>). All assigned papers must be read ahead of the respective meeting. Following the course on the basis of on-line slides and papers alone is not sufficient. Physical presence in the classroom is essential. Many books and journals covering international environmental policy issues can be found at the D-GESS library at the IFW building, Haldeneggsteig 4, B-floor, or in the library of D-USYS.

701-0263-01L  Seminar in Evolutionary Ecology of Infectious Diseases
Abstract: This seminar will discuss current topics from the field of infectious disease biology. From a list of publications, each student chooses some themes that he/she is going to explain and discuss with all other participants and under supervision. The actual topics will change from year to year corresponding to the progress and new results occurring in the field.
Objective: This is an advanced course that will require significant student participation. Students will learn how to evaluate and present scientific literature and trace the development of ideas related to understanding the ecology and evolutionary biology of infectious diseases.
Content: A core set of ~10 classic publications encompassing unifying themes in infectious disease ecology and evolution, such as virulence, resistance, metapopulations, networks, and competition will be presented and discussed. Pathogens will include bacteria, viruses and fungi. Hosts will include animals, plants and humans.

751-4811-00L  Alien Organisms in Agriculture
Abstract: The course focuses on alien organisms in agriculture as well as the scientific assessment and regulatory management of their effects on the environment and agricultural production.
Objective: Students will understand the consequences arising from the unintentional or deliberate introduction of alien organisms into agricultural systems. They will be able to understand the concept of environmental risk assessment and be able to evaluate risk management options.
Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, etc.) within a system and to assess the importance of processes controlling these fluxes (e.g., exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization, etc.).

At the end of this course, students will be familiar with the principles on which radioisotope works are based and they have learned from case studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotope work.

Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, etc.) within a system and to assess the importance of processes controlling these fluxes (e.g., exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization, etc.).

The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine element availability. Finally, published studies from other groups will be analyzed and presented by the students.

At the end of this course, the students are familiar with the principles on which radioisotope works are based.

At the end of this course, the students are familiar with the principles on which radioisotope works are based.
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. It offers to deepen the knowledge on a specific theme related to nutrients. It is composed by presentations of national and international speakers and by an excursion. The students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Prerequisites / notice

Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Course will be taught in English.

Abstract

This course is about the physical, chemical, and biological processes in the rhizosphere and their effect on plant growth. Effects of fertilisers, companion plants, and microbial symbionts, and other microbes on nutrient cycling and plant uptake are discussed. An “intercropping” experiment in the glasshouse is used as a model to check for rhizosphere effects on plant growth and mineral nutrition.

Objective

To gain a holistic understanding of resource-driven and regulatory processes in agricultural and natural ecosystems.

Develop skills on the critical analysis of scientific papers.

Carry out a multi-disciplinary experiment that involves aspects of soil, (micro-)biology, plant physiology, pathology, and ecology.

Develop manual skills in the set up of a glasshouse experiment, in soil and plant analyses, and in isolation and DNA-based characterisation of rhizobia.

Gain insights on basic methods to analyse (bio-)chemical, molecular genetic, and graphical data.

Discuss and interpret data in the context of the literature.

Prepare a research report in the format of a scientific paper and a poster in the format of a conference paper, partially alone and partially in small groups, using data obtained from the glasshouse experiment.

Content

This course is designed to stimulate thinking and promote critical analysis of important processes that occur in the rhizosphere. As part of this course, the knowledge acquired will be used for analysing and interpreting experimental data, as well as, preparing a scientific report and conference-type poster.

The course will cover the relative importance of spatial scales and various physicochemical and microbiological dynamics as influenced by roots. We will discuss root traits and activities that influence the immediately root-surrounding soil and thereby contribute to mineral nutrient mobilization and immobilization. An overview of the most relevant root-microbe symbioses for agroecosystems will be provided and root and microbial traits discussed, which could be of use in efforts towards utilization of intercropping and bioinoculants as a possible means of reducing energetically expensive inputs to farming systems. A special emphasis will be given to the importance of physicochemical features of soils and the chemical forms (± species) of elements important for plant uptake.

Practical experience will be gained with setting up a glasshouse experiment, soil and root sampling, basic soil and plant analyses, isolation of rhizobia, determination of the number of colony forming units (CFU), assays to screen for phosphorus and zinc solubilizing bacteria, DNA extraction, PCR amplification, and restriction fragment length polymorphism analysis (RFLP) of host range determining symbiosis-specific genes.

In short, the processes dealt with in this course occur on a small-scale and are generally (bio)chemical and microbiological in nature. Furthermore, they are generally not taken into account using current methods of agronomic management for plant production. However, they are increasingly being recognized as a potentially useful means of obtaining a resource-efficient and hence, economically and environmentally sustainable agricultural system, including for ecosystem restoration. Therefore, the course will invite for critical reflections and exemplify challenges in translating knowledge from scientific studies and ecology into application for plant production.
Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know

Objective

This course provides an overview about the applicability of stable isotopes (carbon 13C, nitrogen 15N, oxygen 18O and water 2H) to process-oriented ecological research. Topics focus on stable isotopes as indicators for the origin of pools and fluxes, partitioning of composite fluxes as well as to trace and integrate processes. In addition, students carry out a small project during lab sessions. Students will be familiar with basic and advanced applications of stable isotopes in studies on plants, soils, water and trace gases, know the relevant approaches, concepts and recent results in stable isotope ecology, know how to combine classical and modern techniques to solve eco Physiological or ecological problems, learn to design, carry out and interpret a small IsoProject, practice to search and analyze literature as well as to give an oral presentation.

Ecological understanding (Second Edition)
The nature of theory and the theory of nature http://www.crcnetbase.com/isbn/9780849338557

Prerequisites / notice

We ask all course attendees of the agricultural sciences to have passed the exams at the end of the lectures Plant Nutrition I and II (Nutrient cycling in agroecosystems) by Prof. E. Frossard. All others, have to have successfully worked through the e-learning module Plant Nutrition I by Prof. E. Frossard: https://moodle-app2.let.ethz.ch/course/view.php?id=279

Remark: The course is designed to be complementary to those on Radioisotopes in Plant Nutrition (751-3405-00L), and Nutrient Fluxes in Soil-Plant Systems (751-3404-00L), although some thematic overlaps cannot be avoided. Special emphasis is given to plant-microbe-soil interactions and an appreciation of whole plant functioning in the ecological context. You will familiarize yourself with bacterial isolation, cultivation, enumeration, as well as, molecular detection, discrimination and identification techniques for rhizosphere and root-associated microbes.

Marking will consider the efforts and outcome of work by the individual participant as well as results of work in small groups. Activities for the course will result in posters and reports in the format of a conference and scientific paper. Reports will be due on Friday January 6, 2017.

Maximum number of participants: 18 (Attention: Admission will be on a first come first served basis - inscribe early!).

Students of D-USYS will be reimbursed via bank transfer for train and bus tickets of the zones 121 and 122 (Please send all tickets with the bank details to Christiane Gujan (http://www.plantnutrition.ethz.ch/the-group/people-a-z/person-detail.html/?persid=85593)).
This course will provide an introduction to the applicability of stable isotopes to ecological research questions. Topics will focus on carbon (13C), nitrogen (15N), oxygen (18O) and hydrogen (2H) at natural isotope abundance and tracer levels. Lectures will be supplemented by intensive laboratory sessions, short presentations by students and computer exercises.

Handouts will be available on the webpage of the course.

This course is based on fundamental knowledge about plant ecophysiology, soil science, and ecology in general. Course will be taught in English.

The analyses of stable isotopes often provide insights into ecophysiological and ecological processes that otherwise would not be available with classical methods only. Stable isotopes proved useful to determine origin of pools and fluxes in ecosystems, to partition composite fluxes and to integrate processes spatially and temporally.

The course 'Current challenges in plant breeding' aims to bring together national and international experts in plant breeding to discuss current activities, latest achievements and future prospective of a selected topic/area in plant breeding. The topic this year will be: 'Genome editing: potential and challenges for plant breeding'.

The educational objectives cover both thematic competences and soft skills:
- Deepening of scientific knowledge in plant breeding
- Critical evaluation of current challenges and new concepts in plant breeding
- Promotion of collaboration and Master thesis projects with practical plant breeders
- Soft skills:
  - Independent literature research to get familiar with the selected topic
  - Critical evaluation and consolidation of the acquired knowledge in an interdisciplinary team
  - Establishment of a scientific presentation in an interdisciplinary team
  - Establishment of contacts and strengthening the network to national and international plant breeders and scientist

Interesting topics related to plant breeding will be selected in close collaboration with the working group for plant breeding of the Swiss Society of Agronomy (SSA). For this year, the topic 'Genome editing: potential and challenges for plant breeding' was selected.

In the fall semester (November 29, 2016), the enrolled students will meet with the lecturers as well as four to six tutors, selected according to their expertise in the selected topic (one afternoon, for about three hours). After an input talk by the lecturers, four to six specific questions/aspects will be identified and phrased. The tutors and the enrolled students will be assigned to four to six different groups, to critically evaluate one question/aspect of the selected topic. The students, guided by tutors, will prepare a presentation of 15 minutes (plus 5 minutes discussion) covering their specific question/aspect. Participation on that afternoon will be mandatory.

End of January (January 31, 2017), a one-day seminar on the selected topic will be organized. After one to two keynote speakers (international experts), four invited talks will link the selected topic to practical plant breeding. In the afternoon, the four to six students groups will present and discuss with the experts their specific questions on the selected topic/area. These presentations will be evaluated by the lecturers. The seminar will be public and serve as annual meeting of the SSA working group for plant breeding, bringing together the experts in plant breeding.

The course is designed for a maximum of 15 Master students and 10 PhD students (advertised and recruited via the Zurich-Basel Plant Science Center). For full and active participation, a total of 2 credit/ECTS points will be provided.

The course is designed for a maximum of 15 Master students and 10 PhD students (advertised and recruited via the Zurich-Basel Plant Science Center). For full and active participation, a total of 2 credit/ECTS points will be provided.

In this semester students apply their knowledge on sustainable agriculture, tropical soils and land use to a case study related to a current research project from the Sustainable Agroecosystems group. The seminar offers interactions with researchers and extension specialists working in the context of agricultural development.

(1) Students analyze concrete examples of agricultural development projects in tropical agroecosystems.
(2) Students broaden their understanding of environmental and socio-economic challenges of smallholder farmers.
(3) Students articulate complexity and challenges in agricultural development interventions.
(4) Students develop their science communication skills by producing science communication materials in the context of the given case study.

Students signing up for this class should have a strong interest in tropical agriculture and science communication.

The course provides theoretical and practical foundations for understanding and characterizing physical and transport properties of soils/near-surface earth materials, and quantifying hydrological processes and fluxes of mass and energy at multiple scales. Emphasis is given to land-atmosphere interactions, the role of plants on hydrological cycles, and biophysical processes in soils.
Objective

Students are able to:
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media.
- quantify driving forces and resulting fluxes of water, solute, and heat in soils.
- apply modern measurement methods and analytical tools for hydrological data collection.
- conduct and interpret a limited number of experimental studies.
- explain links between physical processes in the vadose-zone and major societal and environmental challenges.

Content

Weeks 1 to 3: Physical Properties of Soils and Other Porous Media. Units and dimensions, definitions and basic mass-volume relationships between the solid, liquid and gaseous phases; soil texture; particle size distributions; surface area; soil structure. Soil colloids and clay behavior.

Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity.

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing.

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:

Part 1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.

Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.

Part 2: Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.

Midterm exam.

Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.

Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:

Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

Biological Processes in the Vadose Zone An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange, and challenges for bio- and phytoremediation.

Lecture notes

Supplemental textbook (not mandatory) - Environmental Soil Physics, by: D. Hillel

751-5101-00L Biogeochemistry and Sustainable Management W+ 2 credits 2G N. Buchmann, L. Hörtnagl

Abstract

This course focuses on the interactions between ecology, biogeochemistry and management of agro- and forest ecosystems, thus, coupled human-environmental systems. Students learn how human impacts on ecosystems via management or global change are mainly driven by effects on biogeochemical cycles and thus ecosystem functioning, but also about feedback mechanisms of terrestrial ecosystems.

Objective

Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small (interdisciplinary) teams.

Content

Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course.

Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competition of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Lecture notes

Literature

Will be discussed in class.

Prerequisites / notice

Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Course will be taught in English.
Abstract
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. It offers to deepen the knowledge on a specific theme related to nutrients. It is composed by presentations of national and international speakers and by an excursion. The students write a report where they compile the obtained information, relate it to their own knowledge and include literature.

Objective
Listen and understand expert's presentations. Ask questions and contribute to the discussion during the talk sessions and the excursion. Link the information obtained during the seminar with knowledge from previous lessons and with literature searched to complement the matter. Expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem.

751-5123-00L Rhizosphere Ecology
Number of participants limited to 18.

Prerequisites: Only students who have passed the courses 751-3401-00L Pflanzenernährung I and 751-3402-00L Pflanzenernährung II - Integriertes Nährstoffmanagement can be admitted to this course.

Abstract
This course is about the physical, chemical, and biological processes in the rhizosphere and their effect on plant growth. Effects of fertilisers, companion plants, and microbial symbions, and other microbes on nutrient cycling and plant uptake are discussed. An "intercropping" experiment in the glasshouse is used as a model to check for rhizosphere effects on plant growth and mineral nutrition.

Objective
To gain a holistic understanding of resource-driven and regulatory processes in agricultural and natural ecosystems.

Develop skills on the critical analysis of scientific papers.

Define explanatory hypotheses, identify knowledge gaps for further investigations.

Carry out a multi-disciplinary experiment that involves aspects of soil, (micro-)biology, plant physiology, pathology, and ecology.

Develop manual skills in the set up of a glasshouse experiment, in soil and plant analyses, and in isolation and DNA-based characterisation of rhizobia.

Gain insights on basic methods to analyse (bio-)chemical, molecular genetic, and graphical data.

Discuss and interpret data in the context of the literature.

Prepare a research report in the format of a scientific paper and a poster in the format of a conference paper, partially alone and partially in small groups, using data obtained from the glasshouse experiment.

Content

### Radio-Isotopes in Plant Nutrition

- **W 3 credits**
- **ECTS**
- **2G**
- **English**
- **E. Frossard**

**Abstract**

The course will present the principles underlying the use of radioisotopes in soil/plant systems. It will present how the introduction of an isotope into a system can be done to get some information on the structure of the system. Case studies will be presented to determine the availability of elements. Finally, published studies from other groups will be analyzed and presented by the students.

**Objective**

At the end of this course the students are familiar with the principles on which radioisotope works are based and they have learned from case studies how radioisotopes can be used to obtain meaningful data. They are aware of the advantages of using radioisotopes in element cycling studies, but also of the risks and open questions related to isotope work.

**Content**

Radio-isotopes are extensively used at the soil/plant or ecosystem level to quantify the fluxes of elements (phosphorus (P), heavy metals, radionuclides) within a given system and to assess the importance of processes controlling these fluxes (e.g. exchange reactions between the soil solution and the soil solid phase, element turnover through the microbial biomass, organic matter mineralization etc.). The course will first present the principles, the basic assumptions and the theoretical framework that underlie the work with radioisotopes. It will present how the introduction of an isotope into a system can be done so as to get information on the structure of the system (e.g. number and size of compartments). Secondly, case studies on isotopic dilution and tracer work will be presented for instance on the isotopic exchange kinetics method to determine nutrients or pollutants availability. These case studies will be adapted to the ongoing research of the group of plant nutrition and will thus give an insight into our current research. In addition, published studies will be analyzed and presented by the students. Finally, the advantages and disadvantages of work with radioisotopes will be analyzed and discussed critically.

**Lecture notes**

Documents will be distributed during the lecture

**Literature**

The lecture will take place at the ETH experimental station in Eschikon Lindau. See the location of the station at: http://www.pe.ipw.agrl.ethz.ch/about/reach

### General Crop Science

**Number**

751-4203-00L

**Title**

Horticultural Science: Case Studies (HS)

**Type**

W

**ECTS**

2 credits

**2G**

**Lecturers**

L. Bertschinger, J. Rösti, V. J. U. Zufferey

**Abstract**

Lectures address 2 horticultural cropping systems and value chains, each one in 4 2h-lecture blocks. Afterwards, the students split in 2 groups for addressing a case study focusing on one of the cropping systems treated before. An excursion to a research site might be included. In a final colloquium, each group presents a report on their case study and their conclusions.
Achieve a deepened understanding of horticultural value chain challenges relating to ecological intensification, resource efficiency, climate change and healthy and safe food, and the problem solution strategies and scientific principles behind. Deliver in a team effort a report and a presentation providing a comprehensive insight into a problem of the horticultural value chain and its science-based solution strategy.

In the autumn semester, the two addressed cropping systems and value chains are fruit-production and viticulture. In the spring semester, the two addressed cropping systems and value chains are vegetable-production- and berry-production or grasshose-horticulture. The selected topics address challenges with regard to ecological intensification, resource efficiency or climate change and branch into ongoing research and development projects.

Lecture notes
Documents handed out during the case studies.

Literature
As provided by the case study leaders.

Prerequisites / notice
The course builds on basic knowledge delivered in ‘Horticultural Crops I’ and ‘Horticultural Crops II’. If these courses have not been followed by interested participants, equivalent knowledge and experience will greatly support a successful and productive participation of the participating student.

Language: spoken E, G or F, Documents: Preferably English, G/F possible.

Objective
Students will know and understand the complex and interacting processes of ecology, biogeochemistry and management of agro- and forest ecosystems, be able to analyze and evaluate the various impacts of different management practices under different environmental conditions, search literature, write and evaluate scientific reports, and be able to coordinate and work successfully in small interdisciplinary teams.

Content
Agroecosystems and forest ecosystems play a major role in all landscapes, either for production purposes, ecological areas or for recreation. The human impact of any management on the environment is mainly driven by effects on biogeochemical cycles. Effects of global change impacts will also act via biogeochemistry at the soil-biosphere-atmosphere-interface. Thus, ecosystem functioning, i.e., the interactions between ecology, biogeochemistry and management of terrestrial systems, is the science topic for this course. Students will gain profound knowledge about nutrient cycles and population dynamics in managed and unmanaged grassland, cropland and forest ecosystems in the field and in the lab. Responses of agro- and forest ecosystems to the environment, e.g., to climate, anthropogenic deposition, major disturbances, soil nutrients or competitors of plants (including invasives) and microorganisms, but also feedback mechanisms of ecosystems on (micro)climate, soils or vegetation patterns will be studied. Different management practices will be investigated and assessed in terms of production and quality of yield (ecosystem goods and services), but also in regard to environmental regulations (including subsidies) and their effect on the environment, e.g., greenhouse gas budgets. Thus, students will learn about the complex interactions of a coupled human-environmental system.

Lecture notes
Handouts will be available on the webpage of the course.

Literature
Will be discussed in class.

Prerequisites / notice
Prerequisites: Attendance of introductory courses in plant ecophysiology, ecology, and grassland or forest sciences. Course will be taught in English.

Objective
Listen and understand expert’s presentations. Ask questions and contribute to the discussion during the talk sessions and the excursion. Link the information obtained during the seminar with knowledge from previous lessons and with literature searched to complement the matter. Expand the knowledge on nutrient cycles and nutrient management in the agro-ecosystem.

Abstract
The seminar concerns current aspects and research related to nutrient cycles in agro-ecosystems. It offers to deepen the knowledge on a specific theme related to nutrients. It is composed by presentations of national and international speakers and by an excursion. The students write a report where they compile the obtained information, relate it to their own knowledge and include literature.

Element 2. Scientific writing: Option 1: preparation of a short scientific type of paper from a result table offered by the lecturers; Option 2: preparation of an abstract with limited word count from a scientific paper; Option 3: writing of a critical review of a paper. The students have to select 2 of the three options each. There will be a discussion be a discussion in small groups at two dates. Introductions to both forms of presentation will be offered by lecturers. The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

Data: 06.10.2017 12:53  Autumn Semester 2016  Page 76 of 1570
The students are able to set up design matrices, the relationship matrix and its inverse as well as the Mixed Model equations to estimate BLUP.

The overall goal of the course is to provide the essential scientific knowledge of the genetic, physiological and special nutritional aspects of pig nutrition, animal health and behaviour, and of the implications for environment, product quality, housing and animal welfare, and breeding programs.

Students will understand the complex interactions of nutrition, quality traits of products, breeding and reproduction, health management, behaviour and husbandry.

- Selection index (various sources of information, one trait, multiple traits)
- Relationship matrix and its inverse
- BLUP: one trait, repeated observations, multiple traits, economic indices
- Introduction to methods for the estimation of variance components
- Assignments

Lecture notes
Copies of the slides are available on the net.

751-6601-00L Pig Science (HS) W 3 credits 3V E. Hillmann, M. C. Härdi-Landerer

Abstract
The overall goal of the course is to provide the essential scientific knowledge of the genetic, physiological and special nutritional aspects of pig nutrition, animal health and behaviour, and of the implications for environment, product quality, housing and animal welfare, and breeding programs.

Objective
Students will understand the complex interactions of nutrition, quality traits of products, breeding and reproduction, health management, behaviour and husbandry.

Content
- Introduction to the tropics
- Problems and challenges of animal nutrition in the tropics
- Quality of feeds in the tropics
- Tropical pasture systems and their characteristics
- Feeds available in the tropics
- Special challenges for livestock in the tropics
- Importance of livestock in the tropics

Literature
Specific literature is indicated by the lecturers.

751-7703-00L Tropical Animal Nutrition W 1 credit 1G S. Marquardt

Abstract
Farm animals play an important role in most agro/eco - systems, but conditions for a successful management and nutrition in the tropics are diverse. In this course a wide range of aspects are examined.

Objective
The aim of this course is to know and understand animal production systems in the different zones of the tropics taking into consideration the local and social structure of the population. We will deal with different aspects of animal nutrition in the tropics.

Content
- Introduction to the tropics
- Special problems and challenges in tropical regions
- Importance of livestock in the tropics
- Animal production and livestock production systems in the tropics
- Special challenges for livestock in the tropics
- Feeds available in the tropics
- Tropical pasture systems and their characteristics
- Quality of feeds in the tropics
- Problems and challenges of animal nutrition in the tropics

Analysis of livestock data, in particular for the estimation of breeding values: principles of selection index, introduction to BLUP, application of common models used, relationship matrix, methods for the estimation of variance components, basics of breeding programs.

The material will be illustrated via exercises and assignments.

Objective
The students are able to set up design matrices, the relationship matrix and its inverse as well as the Mixed Model equations to estimate BLUP breeding values for smaller examples.

Content
- Selection index (various sources of information, one trait, multiple traits)
- Relationship matrix and its inverse
- BLUP: one trait, repeated observations, multiple traits, economic indices
- Introduction to methods for the estimation of variance components
- Assignments

Lecture notes
To be announced in the lectures.

751-6113-00L Endocrinology and Biology of Reproduction W 3 credits 2V S. E. Ulbrich

Abstract
Endokrinologie und Reproduktionsbiologie der Säugetiere und des Menschen (Anatomie, Morphologie, Physiologie, Regelmechanismen) Die Systematik der Reproduktionhormone und der Hormonrezeptoren wird erläutert, die Wirkungsmechanismen (Bildung; orale Bioverfügbarkeit; Elimination) erklärt. Mit diesen Grundlagen wird das Verständnis der Regulation der Fortpflanzung umfassend erörtert.

Objective
Die Studierenden erlangen das grundlegende theoretische Verständnis und Fachwissen zur Endokrinologie der Reproduktion und zur weiblichen und männlichen Reproduktionsbiologie. Sie können darüber hinaus pathologische Situationen (Fortpflanzungsstörungen) und deren vielfältige Ursachen in den physiologischen Kontext einordnen.

Ruminant Science

Number Title Type ECTS Hours Lecturers
751-6001-00L Forum: Livestock in the World Food System W 2 credits 1S M. Kreuzer, S. Bauersachs, E. Hillmann, S. Neuenschwander

Abstract
This forum is a platform for the critical reflection of highly relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.
Objective
In the Forum "Livestock in the World Food System", a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects and to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.

Content
The Forum "Livestock in the World Food System" will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

Element 1. Oral Presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturers are the audience.

Element 2. Scientific writing: Option 1: preparation of a short scientific type of paper from a result table offered by the lecturers; Option 2: preparation of an abstract with limited word count from a scientific paper; Option 3: writing of a critical review of a paper. The students have to select 2 of the three options each. There will be a discussion be a discussion in small groups at two dates.

Introductions to both forms of presentation will be offered by lecturers.

The preparation of the oral and written presentations takes place to a small part during the 2-h blocks and mainly outside of this time.

Lecture notes
no scriptum

Prerequisites / notice
Requirements for allocation of the two credit points:
- Theatre presentation (with handout) at the forum
- Delivery of written documents of sufficient quality
- Active participation during the presentations by the other participants

751-6305-00L Livestock Breeding and Genomics  W  3 credits  3G  P. von Rohr

Abstract
Methods for analysing livestock data, in particular for the estimation of breeding values: principles of selection index, introduction to BLUP, application of common models used, relationship matrix, methods for the estimation of variance components, basics of breeding programs.

Objective
The students are able to set up design matrices, the relationship matrix and its inverse as well as the Mixed Model equations to estimate BLUP breeding values for smaller examples.

Content
- Selection index (various sources of information, one trait, multiple traits)
- Relationship matrix and its inverse
- BLUP: one trait, repeated observations, multiple traits, economic indices
- Introduction to methods for the estimation of variance components
- Assignments

Lecture notes
Copies of the slides are available on the net.

Literature
To be announced in the lectures.

751-6501-00L Ruminant Science (HS)  W+  4 credits  4G  M. Kreuzer, M. C. Härdi-Landerer, E. Hillmann, U. Witschi

Abstract
The course provides the scientific basis of the central aspects of reproduction, husbandry and nutrition physiology of ruminants, and of the implications for animal welfare, product quality, breeding programs, and organic livestock systems. Means of knowledge transfer include interdisciplinary approaches, disciplinary parts, web-based learning and self-study.

Objective
At the end of the course the students are able to apply, by a comprehensive understanding of the underlying mechanisms, their knowledge in various fields of ruminant science. They will be able to develop and recommend best strategies for breeding programs, feed formulation, improving forage quality, increasing animal health and welfare etc. They will be trained to carry out interdisciplinary and disciplinary research at the highest level. The course Ruminant Science (FS) offered in spring has a similar structure but is complementary to this course.

Content
Fields (contact hours)
- Introduction: 2 h
- Special topics: 12 h
  - Lameness
  - Fertility in Cows
  - Food Intake of Ruminants
- Disciplinary topics: 36 h
  - Ruminant Husbandry: 16 h
  - Ruminant Nutrition Physiology: 10 h
  - Reproduction in Ruminants: 8 h
- Lectures held by the students: 4 h

In summary
- Contact hours: 52 h
- Self-study within semester: 30 h (especially preparation for the interdisciplinary courses and the own lecture)
- Self-study in semester break: 38 h
Total: 120 h

Lecture notes
Documents, links and other materials will be provided at the start of the course

Literature
Information on books and other references will be communicated during the course

Prerequisites / notice
The specialty of this course is that for the first time the animal science disciplines are unified. This is realised with a particular emphasis on interdisciplinary special topics and new forms of teaching. At the same time the essential basics in the central fields are communicated.

The field of Ruminant Science will also be a part of the spring semester (special topics: Organic Ruminant Systems, Tropical Ruminant Systems, Mastitis; disciplinary courses: Cattle, Sheep and Goat Breeding, Ruminant Diseases and Prophylaxis, Ruminant Nutrition and the Environment). However both courses are organized independently.

Conditions for successful participation: Background on animal science from the Bachelor is desired. In order to attend the Minor in Ruminant Science without any animal science background, a realistic self-assessment concerning the need for additional self-study is recommended (e.g. by choosing an appropriate bachelor course which then may be counted as 'optional courses' in the master). These efforts depend on the extent to which animal science courses have already been attended in the bachelor.

The control of performance will consist of:
- an own lecture
- a final oral examination with focus on comprehension of the fundamental linkages rather than of specific details

751-7211-00L Ruminal Digestion  W+  1 credit  1G  A. Schwarm

Abstract
This course broadens the knowledge in one of the most important aspects of ruminant nutrition: the microbial digestion in the rumen (and in the hindgut). For a comprehensive understanding of the rumen microbial ecosystem, the mechanisms of nutrient fermentation and the synthesis of microbial protein, thorough basics are provided. Apart from lectures, group and laboratory exercises are included.
Objective
The course enables students to understand in detail how ruminal digestion works and how this knowledge can be applied to design optimal feeding diets using highly fibrous forages and a variety of other feeds. The students also are able to show how to modify the most important rumen microbes beneficially by nutritional means.

Content
Structure of the contact hour part of the course (14 h):

2 h Introduction and blackboard exercise

8 h Basic topics in ruminal digestion, lectures and group exercises:
- Systematics of the microbes involved in microbial digestion
- Measurement of microbial digestion
- Interactions of microbes and epithelium of the digestive tract
- Differences between ruminal and hindgut microbial digestion
- Microbial nutrient degradation and its modification
- Efficiency of microbial protein synthesis
- Manipulation of the ruminal digestion

2 h Laboratory exercise with a rumen fistulated cow and the Rumen Simulation Technique

2 h Final seminar

The non-contact hour part is to comprehend the information given and to prepare either the written report or the oral presentation (cf. "Besonderes")

Lecture notes
Lecture notes are provided via Moodle.

Literature
Will be communicated at the start of the course.

Prerequisites / notice
The course is a balanced mixture of blackboard exercise, laboratory exercise, group exercise, lecture and student seminar presentation.

Credit point associated with grade of either a written report or an oral presentation in the final seminar (both on a self-chosen related topic)

751-7703-00L Tropical Animal Nutrition W 1 credit 1G S. Marquardt

Abstract
Farm animals play an important role in most agro/eco - systems, but conditions for a successful management and nutrition in the tropics are diverse. In this course a wide range of aspects are examined.

Objective
The aim of this course is to know and understand animal production systems in the different zones of the tropics taking into consideration the local and social structure of the population. We will deal with different aspects of animal nutrition in the tropics.

Content
- Introduction to the tropics
- Special problems and challenges in tropical regions
- Importance of livestock in the tropics
- Animal production and livestock production systems in the tropics
- Special challenges for livestock in the tropics
- Feeds available in the tropics
- Tropical pasture systems and their characteristics
- Quality of feeds in the tropics
- Problems and challenges associated with animal nutrition in the tropics

751-6113-00L Endocrinology and Biology of Reproduction W 3 credits 2V S. E. Ulbrich

Abstract
Endokrinologie und Reproduktionsbiologie der Säugetiere und des Menschen (Anatomie, Morphologie, Physiologie, Regelmechanismen) Die Systematik der Reproduktionshormone und der Hormonrezeptoren wird erläutert, die Wirkungsmechanismen (Bildung; orale Bioverfügbarkeit; Elimination) erklärt. Mit diesen Grundlagen wird das Verständnis der Regulation der Fortpflanzung umfassend erörtert.

Objective
Die Studierenden erlangen das grundlegende theoretische Verständnis und Fachwissen zur Endokrinologie der Reproduktion und zur weiblichen und männlichen Reproduktionsbiologie. Sie können darüber hinaus pathologische Situationen (Fortpflanzungsstörungen) und deren vielfältige Ursachen in den physiologischen Kontext einordnen.

751-1555-00L Applied Food Industrial Organisation W+ 3 credits 2G to be announced

Abstract
Concepts of microeconomics and Industrial Organization and their application to the European food sector. Aspects include industry structure as well as strategic performance of food sector firms.

Objective
Understanding and application of theoretical concepts along the Structure-Conduct-Performance paradigm. Ability to apply theory to empirical settings: understand and critically evaluate empirical industrial organization research and to replicate the results of such research using econometric methods

Content
- Introduction IO
  - Relevant topics for the food sector
  - high competition and market saturation
  - low R&D intensity
  - bargaining power of retailers
  - Private label introduction
- Theoretical Approaches
  o Structure Conduct Performance
  o Market Based View
  o Porter Five Forces
  o Resource Based View
  o Knowledge Based View
- Empirical Issues (Based on published research papers)
  o Competition / Concentration
  o Profitability
  o Impact of Innovation / R&D
  o Efficiency
  o Market power
  o Econometric Approaches

Literature
Several theoretical and empirical IO related research papers

752-2122-00L Food and Consumer Behaviour W 2 credits 2V M. Siegrist, C. Hartmann

Abstract
This course focuses on food consumer behavior, consumer's decision-making processes and consumer's attitudes towards food products.

Objective
The course provides an overview about the following topics: Factors influencing consumer's food choice, food and health, attitudes towards new foods and food technologies, labeling and food policy issues.

752-3207-00L
**Abstract:** Lecture type course with an interdisciplinary approach for the evaluation of nutritional aspects of changes in food composition due to processing.

**Objective:**
- Students should be able to:
  - describe and compare the major concepts/criteria used for the evaluation of the nutritional quality of food
  - apply these criteria when assessing the effects of selected processing technologies on nutritional quality.
  - evaluate recent formulation strategies aimed to achieve additional physiological benefits for targeted population groups (i.e. functional foods).

**Content:**
The course gives inputs on compositional changes in food due to processing (with focus on thermal/chilling, enzymatic, chemical, emerging technologies) or new formulation strategies. Possible evaluation methods for these changes (e.g. nutritional profile) will be addressed.

**Lecture notes:** There is no script. Powerpoint presentations and relevant scientific articles will be available on-line for students. A selection of recommended readings will be given at the beginning of the course.

**Prerequisites / notice:** The course is open to Master and MAS students in food and science and nutrition or related. Basic knowledge of food chemistry and nutrition is expected, as well as an understanding of food processing.

---

751-4203-00L
**Abstract:** Lectures address 2 horticultural cropping systems and value chains, each one in 4 2h-lecture blocks. Afterwards, the students split in 2 groups for addressing a case study focusing on one of the cropping systems treated before. An excursion to a research site might be included. In a final colloquium, each group presents a report on their case study and their conclusions.

**Objective:**
Achieve a deepened understanding of horticultural value chain challenges relating to ecological intensification, resource efficiency, climate change and healthy and safe food, and the problem solution strategies and scientific principles behind.

**Content:**
Deliver in a team effort a report and a presentation providing a comprehensive insight into a problem of the horticultural value chain and its science-based solution strategy.

**Prerequisites / notice:**
The course builds on basic knowledge delivered in ‘Horticultural Crops I’ and ’Horticultural Crops II’. If these courses have not been followed by interested participating students, equivalent knowledge and experience will greatly support a successful and productive participation of the participating student. Language: spoken E, G or F. Documents: Preferably English, G/F possible.

---

751-6001-00L
**Abstract:** This course is a platform for the critical reflection of highly relevant topics of livestock in the frame of the world food system comprising issues from basic knowledge to acceptance in society. The exchange is operated by scientific writing and presentation.

**Objective:**
In the Forum “Livestock in the World Food System”, a topic of significance for livestock agriculture is selected by the students and subsequently dealt with from various angles (from scientific basis to production systems, environmental aspects to the acceptance by society). The students learn to present a scientific subject in writing and orally to an audience and to defend the presentation in a discussion.

**Content:**
The Forum “Livestock in the World Food System” will take place in blocks of 2 hours each. Once the general topic has been selected, it comprises two elements:

Element 1. Oral Presentation: The students form small groups and are lecturers. There are chair persons (moderators) from outside of these small groups and they also head the discussion. The remaining students and lecturers are the audience.

Element 2. Scientific writing: Option 1: preparation of a short scientific type of paper from a result table offered by the lecturers; Option 2: preparation of an abstract with limited word count from a scientific paper; Option 3: writing of a critical review of a paper. The students have to select 2 of the three options each. There will be a discussion be a discussion in small groups at two dates.

**Prerequisites / notice:**
Requirements for allocation of the two credit points:
- Theatre presentation (with handout) at the forum
- Delivery of written documents of sufficient quality
- Active participation during the presentations by the other participants

---

752-5111-00L
**Abstract:** This course will increase basic knowledge on biotechnological constructions and application of genetically modified organisms (GMO) which are used worldwide in food production systems. The course discusses health issues, the legislation frame and food safety aspects of GMO applications in agriculture, food production and consumption in Switzerland and EU-countries.

**Objective:**
This course will provide knowledge and biological background on genetically modified organisms (GMO) and food produced with the help of GMO, especially on the molecular basis of GMO constructions with emphasis on genetically modified food in Switzerland and the EU. Criteria of rationale food safety and health assessment in agriculture and food consumption will be elaborated.

**Content:**
Overview on application in gene technology, the gene transfer potential of bacteria, plants and other organisms and the mostly used transgenes in food as well as on GMO used for food production and their detection technologies in food; food safety assessment of GMO food; information on the legislation in Switzerland and EU-countries.

**Lecture notes:**
Copies of slides from lectures will be provided.

**Prerequisites / notice:**
Good knowledge in biology, especially in microbiology and molecular biology are prerequisites. Some contents will be provided by registred students who will individually or as a group present an actual publication.

---

751-0021-00L
**Abstract:**
**Number of participants limited to 25.**

**Objective:**
It is necessary to apply and be selected in order to participate in this course. This also applies to ETH Zurich.
provide the opportunity for young scientists and practitioners to understand the challenges and opportunities of sustainable agriculture and organic production systems and to connect these to the broader context of the world food system. During the two week summer school at the Gut Rheinau, one of Switzerland’s largest organic farms, participants will engage in lectures, workshops, group work, case studies and smallholder livelihoods and rural development; Agroforestry systems; labeling; International policy and trade; Processing, distribution, and retail; Nutrition and health; National policy and state interventions. The course will conclude with a group work on food system challenges.

Further information available:
http://www.worldfoodsystem.ethz.ch/education/summer-schools/upcoming.html

Abstract
Provide the opportunity for young scientists and practitioners to understand the challenges and opportunities of sustainable agriculture and organic production systems and to connect these to the broader context of the world food system. During the two week summer school at the Gut Rheinau, one of Switzerland’s largest organic farms, participants will engage in lectures, workshops, group work, case studies and smallholder livelihoods and rural development; Agroforestry systems; labeling; International policy and trade; Processing, distribution, and retail; Nutrition and health; National policy and state interventions. The course will conclude with a group work on food system challenges.

Objective
Understand: the science, relationships, interactions and trade-offs in food systems; the role and potential of organic production systems; potential interventions; the cultural, socio-political, economic and environmental factors to be incorporated into solutions. Build skills in systems thinking, multi-cultural and multi-disciplinary collaboration, participatory processes. Connect to a network of expert faculty/scientists/practitioners

Content
The content framework includes the following modules: world food system overview; agricultural production; Global change drivers; smallholder livelihoods and rural development; Agroforestry systems; labeling; International policy and trade; Processing, distribution, and retail; Nutrition and health; National policy and state interventions. The course will conclude with a group work on food system challenges.

Literature
Handouts. Participants will receive pre-reading material before the course commences.

Prerequisites / notice
No prerequisites. Program is open to Masters, PhD and upper level Bachelor students.

Transdisciplinary Methods and Applications

Objective
At the end of the course students should:

Know:
- Function, purpose and algorithm of a selected number of transdisciplinary methods

Understand:
- Functional application in case studies and other problem oriented projects

Be able to reflect on:
- Potential, limits, and necessity of transdisciplinary methods

Be prepared for:
- Transdisciplinary Case Study 2017

Content
The lecture is structured as follows:

- Overview of concepts and methods of inter-transdisciplinary integration of knowledge, values and interests (approx. 20%)
- Analysis of a selected number of transdisciplinary methods focusing problem framing, problem analysis, and impact (approx. 50%)
- Practical application of the methods in a broader project setting (approx. 30%)

Lecture notes
Handouts are provided by the lecturers

Literature
Selected scientific articles and book-chapters

Sustainability Assessment

Objective
At the end of the course students should:

Know:
- core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

Content
The course is structured as follows:

- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;
- Trade-offs in selected examples.

Only students who fulfill the following criteria are allowed to begin with their master thesis:

- successful completion of the bachelor programme;
- fulfilling of any additional requirements necessary to
gain admission to the master programme.

Abstract
The Master thesis is an independent scientific work. Normally the subject is selected among the topics of the core subject. It is written under the guidance of an agricultural science professor.

Objective
The independent writing of a scientific paper/thesis

The course in economics extends over two semesters. The focus during the Fall term is on an introduction to economic thought. These understanding of the basic economic concepts and models and of their application to real world situations, notably on property markets.

The course "Economics II (real estate and urban economics) follows in the Spring term.

The first one-year course aims at these goals in the form of exemplary epoch representations which through light upon the historical continuities. The main focus will be laid on the architecture of the Greco-Roman antiquity, the Middle Ages, the Renaissance and the era between Baroque, Enlightenment, and Modernity.

The fall semester focuses on the economic way of thinking. We shall discover why A. Marshall defined economics as "a study of mankind in the ordinary business of life". The course introduces the student to the "big questions" in economics, such as the concept of rationality and its limits, factors driving supply and demand, the working of markets, the importance of the price system and the reasons why markets may fail.

There are many interactions between economic and social phenomena on the one hand, and the built environment on the other. Our knowledge of the fundamental economic principles will allow us to understand the workings of the housing, land, credit and real estate markets - markets of fundamental importance for the future architect. We consider questions such as: which are the major problems of the land market? Which factors determine the price of land? What are the economic drivers that shape the form of our cities? Which are the primary difficulties in designing a reasonable housing policy. Finally, the courses discusses the main determinants of real estate investment, both its risk and its opportunities.

Elaboration of construction principles on the basis of solid and filigree structure theories.
After a review of essential facts from the first year the course will examine the interplay of architectural concept and structural system by analyzing buildings of exemplary quality. The focus will be on the integration of specifics of structural systems made out reinforced concrete or steel into architectural design. Students are enabled to integrate essential characteristics of structural systems made out reinforced concrete or steel into their architectural design. The lecture contains concepts, physics and components of building technologies for the efficient and sustainable energy supply and demand. Learning and practicing methods of quantifying demand and supply allows identifying parameters relevant for design. The focus will be on the integration of specifics of structural systems made out reinforced concrete or steel into architectural design.

Notice: Students who have attended or will attend the lecture "Introduction to Law for Civil Engineering" *(851-0703-03L)* cannot register for this course unit.

Abstract: This class introduces students to basic features of the legal system. Questions of constitutional and administrative law, contract law, tort law, corporate law, as well as litigation are covered. 1. Public Law Constitutional law: sources of law, organization of the state, fundamental rights. Administrative law: administrative decisions, organization of the administration, enforcement of administrative decisions, procedural law, basics of police, environmental and zoning law. 2. Private law Contracts: contractual freedom, formation and breach of contracts, basics of sales and lease contracts. Tort law: negligence and strict liability, liability limitations. Basics of corporate and civil procedure law.

Lecture notes: There are ‘Lecture Notes’ (in German) for this course.

Further information is available at http://www.hertig.ethz.ch/education/gz-des-rechts-fuer-architektur.html
Further recommended literature to consult is listed within the script.

**Abstract**

The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

The course covers the time from the beginning of urban culture until the mid 19th century. With selected examples it emphasizes on the specific urban development will be presented within a broader context.

This course analyzes the history of urban architecture primarily in its existing three dimensional form as a complex human artefact. It also explores the inspirations that prompted the creation of this artefact: philosophical and religious concepts, social conditions, property relationships and the mechanisms that exploit the economics of real estate and the influence of building technology. Intellectual, literary or artistic modes of thought will also be assessed with regard to their impact on urban development. Urbanism has its own distinctive approach as a discipline, but it is also clearly responsive to the influence of related disciplines. Study is made of actual cities and urban expansion plans which are in the process of implementation, as well as unrealized projects and visions of the future. These projects sometimes illustrate ways of thinking that are equal to, or clearer than, actual urban situations.

In the first semester an introduction to the discipline and the methods are given along the thematic issues from the beginning of urban culture until the mid-19th century.

- Athens and Rome in the ancient world: Myth, self-portrayal and speculation
- From the spirit of equality to the colonial module: Greek and Roman City foundings
- From the urban ideal to new cities in the Middle Ages and the Renaissance
- Baroque strategies: The new organisation of Rome under Sixtus V, the production of Versailles under Louis XIV and the invention of St. Petersburg
- The city between Absolutism and Enlightenment: baroque defence-designs, the European colonization of the American continent and the reconstruction of Lisbon
- Ideology and speculation after the Glorious Revolution: landscapegardens and urban figurations in England from 1650-1850
- Between modernization, Grandeur and repression: Embellishment in Paris from 1750-1830
- The construction of the bourgeois city: Georges-Eugène Haussmann transforms Paris into the capital of the 19th century
- Architectural insertion and plan for the expansion of the city: From the Berlin of Karl Friedrich Schinkel to James Hobrecht

The lectures are accompanied by a script (two semesters of the bachelor studies), that can be purchased at the chair for the history of urban design (HIL D 75.2), at the price of CHF 30.-. The script serves as an auxiliary means to the attended lecture compiling the most important illustrations showed and the names and dates of the buildings and its builders along with a short introductory note.
Content

Historic buildings are historic documents testifying to the living conditions and mindset of our ancestors. They complement other historic sources such as written documents and pictorial records. They are important testimony to the history of art, science, and social conditions. Furthermore, historic monuments constitute important landmarks. Every generation develops its own attitude towards their artistic expression. In western civilizations, there is a general consensus on the conservation of historic architecture.

The architect is often at the forefront of interventions in the immediate context of historic buildings, both as a designer of new buildings adjacent to historic ones and as a conservationalist. The present lecture strives to enable him to cope with these tasks competently and adequately.

Part I of the lecture series deals with constructions in natural and artificial stone as well as concrete: stoneworking, masonry, arches, vaults, foundations

</tr>
<tr>
<td></td>
<td>The brochures published by the chair offer additional help. Knowledge of these brochures and their key subjects is recommended for the exam. The brochures can be ordered at the chair after the last lecture before the exam date. However, the subject matters of the brochures and the lectures are not identical, the brochures provide information for a deeper understanding of the lectures. Apart from additional articles written by the chair, the brochures are composed of three modules: Project documentation, crucial texts on the work reception as well as theoretical articles about the particular thematic priorities by various authors. Concerning their content these anthologies allow insights into a wide range of theories, lines of reasoning and fields of research up to diverging point of views of specific problems.</td>

<tr>
<td></td>
<td>Architectural theory emerged as a product of the Renaissance worldview, which was both holistic and critical. Having developed alongside science, it shared the former's principles and premises. It aimed to explain the objective laws of beauty and to develop rules for their creation by architectural means. In the early twentieth century, modernism supplanted Classical architectural theory and attempted to replace it with the methods and axioms of the most cutting-edge branches of science, including engineering and psychology. Modernism's own principles were, however, soon condemned and rejected by its discontents. From the early 1970s onward, a variety of approaches have dominated architecture, none of them able to become its primary theory. Today, architectural theories no longer prescribe the rules of design. Instead, they offer solutions to the different problems that society poses for architecture, relying on methods and approaches of fields of inquiry that directly relate to these problems. In the course of the semester, we will seek to delineate this expansive space of contemporary architectural theory within the various intellectual contexts in which it operates in order to understand its role in architectural practice. The readings will introduce architectural theories written at different historical periods, while the lectures will situate them both theoretically and historically.</td>

|             | Handouts and a reading list will be provided. A reading list will be provided for the exams. General Information for the final exam: Bachelor students: The content of the lectures as well as texts and exam-relevant literature provided by the Chair make up the basis for preparing for the exam. The lecture series is conceived as a yearlong course. Since the written session examination will test knowledge from both semesters, it is necessary to fully attend the lectures of both courses "Landscape Architecture I" and "Landscape Architecture II". The themes of the examination will be announced at the end of the semester. The Chair will provide literature and texts available for download as pdfs. These allow a more in-depth understanding of the lecture material. Exchange students or students from other departments: Students, who are attending only one semester, may pass the oral end-of-semester examination. Test-relevant literature will also be made available for download for this purpose. The students are requested to get in touch by email with the Chair. |

Exercises will involve design and construction, from the definition of a concept to the execution of the detailed work. Work will include procedural methods for spatial designs through form, function, technology, and materials. To promote interdisciplinarity through integrated teaching.

**Objective**

Conveying a way of thinking that is also able to understand complex contexts and act on various levels is one of the focuses of the chair. This networked thinking relates to praxis and educates the students to be competent architects. Achieving this goal requires a method that teaches a clearly structured, precisely formulated approach and communicates the simultaneity of complex tasks and processes.

**Content**

The design course is built on various exercises. During Fall Term, the students are concerned with the conversion and densification of existing building structures at three different sites in Zurich. The exercises are divided into a City Level and a House Level. At the City Level a group of students examines the three building sites according to each theme. At the House Level the students develop designs addressing the themes in groups of two.

**Architectural Design V-IX: Burda (C. Kerez; Co-Teaching with S. Radic)**

- **Number:** 051-1103-16L
- **Title:** Architectural Design V-IX: Burda (C. Kerez; Co-Teaching with S. Radic)
- **Type:** W
- **ECTS:** 13
- **Hours:** 16U
- **Lecturers:** C. Kerez, S. Radic Clarke

**Abstract**

Several contradictory notions of 'burda' will guide us through a semester that regards itself as a search for the textile, raw, ephemeral, adaptable, and sensual space. The students participating in the atelier will design three autonomous projects in various scales.

**Objective**

Design skills in different parts of architecture and urbanism.
This studio will be conducted one single time in Fall 2016 as a collaboration between the Chilean architect Smiljan Radic and Christian Kerez.

Burda (from Wikipedia, the free encyclopedia. 2016) Burda Style (formerly: Burda Moden) is a fashion magazine published in 17 different languages and distributed in over 99 countries. It was founded in 1950 by Aenne Burda and is published today by Hubert Burda Media. The magazine appears monthly and contains patterns to sew women's and children's clothes, at time also mens clothes.

burda (from Williams diccionario español-inglés inglées-español, 1991) burdo -da: adj coarse, clumsy, rough; f (naut:) backstay

Both contradictory notions of 'burda' will guide us through a semester that regards itself as a search for the textile, raw, ephemeral, adaptable, and sensual space. The students participating in the atelier will design three autonomous projects in various scales.

### 051-1121-16L Architectural Design V-IX: Amsterdam Waterfront

**K. W. Christiaanse**

This semester we will be designing a future-oriented, sustainable accommodation complex on the rural west coast of Greece. The ambition of the project Living Lab Hotel is to test how our future lives could be led in a world without consumption and destruction of natural resources. It is expected that the outcome of the studio will be realized by the client.

**Objective**

The goal is to communicate a broad-based systemic knowledge base, methodologies and strategies, which helps to enable students to evaluate complex urban design and planning problems and to synthesize their knowledge in an urban design project.

**Content**

Amsterdam Waterfront

Whether London, Boston or Copenhagen, the centers of cities move towards the water. Amsterdam too is looking for a new relationship with its fast developing areas on the north-side of the estuary IJ, which separates Amsterdam’s north from its south.

Concurring with the closing of two big shipyards in the 1980s a transformation process started along the waterfront. Nowadays new developments cover almost the entire shoreline of the IJ. Its central location right next to the central station, its proximity to the water and the vast areas abandoned by the former industries, make the waterfront an attractive development area and field of experimentation for new actors and for the implementation of new uses. The planning vision of the ‘spring over het IJ’ - the jump over the IJ is within reach but the question what kind of city should emerge there is still open.

Supported by the Chair of Cognitive Science (professorship Christoph Hölscher) we will search for innovative approaches and transformation strategies for the waterfront's possible development. Hereby both superordinate connections as well as specific on-site conditions will be part of our consideration.

The design studio includes a four day trip to Amsterdam at the beginning of the semester (participation recommended). The processing of the design task takes place in teams of 3-4 students. Details on design studio will be announced in advance to the registration process on the homepage of the chair of Architectural Design V-IX.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

**Prerequisites / notice**

The number of participants is limited to max. 36 students.

### 051-1123-16L Architectural Design V-IX: A Policy Whispering Practice

**GD P. Swinnen**

This semester we will be designing a future-oriented, sustainable accommodation complex on the rural west coast of Greece. The ambition of the project Living Lab Hotel is to test how our future lives could be led in a world without consumption and destruction of natural resources. It is expected that the outcome of the studio will be realized by the client.

**Objective**

As a studio we are interested in educating future architects who understand that architecture is by definition a political practice, and that the architect must become a vigorous policy-whisperer, if anything.

**Content**

Our 2016 fall semester will focus on the social and spatial possibilities of massive energy production in dense and socially challenged areas; investigating how architectural strategies of energetic abundance can produce unseen yet fruitful concepts for metropolitan habitation. The first testing site will be Brussels.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

**Prerequisites / notice**

The number of participants is limited to max. 36 students.
The politics and economics of renewable energy are society's contemporary topicality par excellence; a market-driven urgency around which some of the most unabashed politicized lobbying is performed.

However, the technological savvy of wind, solar, hydro, tidal, geothermal, and biomass energy hold - without exception - no fundamental spatial intelligence. These technologies are commonly applied onto the most efficient territories or structures available. The spatial output is residual and secondary. The juxtaposition of all these individual decisions clutter exponentially the limited space at hand. Moreover policy guidelines related to the spatial application of renewable energy are chiefly defensive, passive and reluctant in their ambition. Behind this political lassitude lies - amongst others - a fundamental shortage of spatial and architectural imagination on how these new technologies can strengthen and steer near-future metropolitan landscapes.

### 051-1125-16L Architectural Design V-IX: Arrival "Stadtwald" Cable Car Stettbach-Zurich

- **W** 13 credits 16U M. Sik

#### Abstract
Architectural design based on place, category, modification and built form.

#### Objective
This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).

#### Content
A new cable car will connect the public transport hub Stettbach directly with the new terminal station of the number 5 and 6 trams to the zoo. This calls for the design of a new type of terminal building with additional commercial spaces that can serve as an attractive center for every day and recreational activities.

The outdoor and landscape design includes arrival, parking and common spaces.

#### Prerequisites / notice
- Integrated Discipline Landscape Architecture (G.Vogt) 051-1235-16L
- Integrated Discipline Construction (D.Mettler/D.Studer) 051-1201-16L
- Critics every 2 weeks
- Professur Miroslav Sik, HIL G75.2, Tel 044 633 28 13, Fax 044 633 10 81, sik@arch.ethz.ch
- Introduction 20.09.16, 10.00 Uhr, HIL G61

### 051-1129-16L Architectural Design: Apartment Building, Scale and City Shape (M.Peter/C.Dumont d'Ayat)

- **W** 13 credits 16U M. Peter, C. Dumont d'Ayat

#### Abstract
This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).

#### Objective
Qualification to control the design process increasingly independent and with sole responsibility and to find to an individual design methodology and attitude.

### 051-1131-16L Architectural Design V-IX: Hermitage (GD Van Hee)

- **W** 13 credits 16U M. J. Van Hee

#### Abstract
Each student individually designs a space as an alternative environment apart from the ordinary and the daily routine. The intervention reflects on the dramaturgy of the topography, on the verge between the sacred buildings of the hermitage like the Chapel of St. Verena or the St. Martin’s Chapel and the secular buildings in the existing context of a beautiful gorge.

#### Objective
The aim of this term is to enable and assist students to take charge of their own design process. Our thematic focus lies on sacral and secular structures and on the integration of a project in the landscape. A small sized building or construction should be technically developed.

#### Content
For as long as there has been civilization, there have been people who want to get away from it. A hermitage usually refers to a place where a person lives for religious or ideological reasons in seclusion from society. In contrast to that way of life the idea of the 'ornamental hermits' or the 'garden hermits' enjoyed growing popularity in the English landscape gardens of the 18th century where they served mainly as entertainment to the high society.

In this semester we want to consider the role of the hermitage in a post-metaphysical world in order to reflect about nowadays retreats. We will work in the St.Verena Schlucht, a gorge that connects the city of Solothurn to the village of Rüttenen at the southern foot of the first Jura chain. The actual hermitage is an enclosed space at the end of an 800m long scenic pathway that leads through a gorge filled with pastoral romance typical for the late 18th century French romantic landscape gardening. Until this day the St. Verena Schlucht, with its steep forest slopes and its slow-flowing ditch, offers to tourists, to excursionists as well as to inhabitants of Solothurn a place for recreation in a landscape where borders between nature and architecture are vanishing.

### 051-1133-16L Architectural Design V-IX: Topic (N.N. Professor)

- **W** 13 credits 16U to be announced

#### Abstract
The semester will start with the development of an urban vision in groups of six, which will then evolve into a proposition for a master-plan. The latter will be the base for individual projects, developed in groups of two. Working with references will be an important aspect of the studio: the typological collection of buildings gathered by the chair will provide the raw material for the own projects. Model photography will be the primary design tool, which will be professionally assisted by the photograph Roman Keller. A workshop will take place in Brussels during the second studio week, from the 22nd to the 24th of September. The trip and accommodation costs will be taken in charge by the chair.

### 051-1135-16L Architectural Design V-IX: Ljubljana. A Collection of Alpine Landscapes (Vogt)

- **W** 13 credits 16U G. Vogt

#### Abstract
The Alps as Common Ground

With each design semester the Chair of Professor Vogt is working its way around the Alpine arc with the thesis that it can be read as an urban Common Ground. The task of each design semester is to verify this thesis by focusing on a metropolitan region and enquiring as to its specific relationship with the Alps.
The first aim of the studio is to allow a shift of focus on architecture, to see the buildings from the outside and their relation both to the surrounding neighborhoods to the waterfront, while generating an overall urban vision that tackles issues related to tourism, infrastructure, gentrification.

The task of the semester consists of the redefinition of the meaning and use of the alpine landscape ranging between extensification (landscape as a museum) and intensification (e.g. tourism, agriculture or energy production) with the purpose to establish a productive relation to the region of Ljubljana.

We understand design not as an end product but as a process. Our first step is to investigate Ljubljana's large-scale relationships. A six-day long field trip complements this analytical gaze with a personal take on the area. Students then develop an individual programme as the foundation for their design. The proposed interventions can vary between urban planning and landscape scenarios and concrete architectural proposals.

**Lecture notes**
The Workbook is released in the first week.

**Literature**
The relevant literature is included in the workbook.

**Prerequisites / notice**
Process Cartography
Chair of Günther Vogt
www.vogt.arch.ethz.ch
Contact: kissling@arch.ethz.ch

Assistant: Thomas Kissling, Ilkay Tanrisever, Sebastiano Brandolini

Design (051-1135-15 U - 13 KP) and integrated discipline planning / landscape architecture (051-1235-15 U - 3KP)
week 1-3 analysis (in groups), design project (individual work)
There will be a visit to Ljubljana 07.10.16 - 12.10.16.
The contribution towards expenses will be 240 CHF.

**051-1137-16L** Architectural Design V-IX: High-Rise and Public Space W (GD X. De Geyter) [Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php)].

**Abstract**
The first aim of the studio is to allow a shift of focus on architecture, to see the buildings from the outside and their relation both to the exterior and to the public interest. This displacement opens new fields of possibilities for architecture.

**Objective**
The first aim of the studio is to allow a shift of focus on architecture, to see the buildings from the outside and their relation both to the exterior and to the public interest. This displacement opens new fields of possibilities for architecture. It is also about providing the students with the necessary understanding to consider public space as an architectural project itself in order to liberate the same creative process that they already have considered for building design.

**Content**
The studio will focus on the design of a university campus building and its immediate surrounding, the architecture will result from the dialogue and relationship to the campus and the urban environment. The aim of the project will be to investigate concepts of campus buildings including their public space. The designs will not necessarily concern an entire building, depending on the situation; students will possibly elaborate a critical part of the campus building such as a lobby, a roof, a basement, a plaza or an interior circulation. One of three campus situations can be chosen: one in 'splendid isolation', one submerged in the city fabric and one dominating a small town. After a short-exercise (1 week) and a masterplan conducted in groups (4 weeks), the project will be developed individually (10 weeks). The production will include models, collages and drawings, amongst others medias.

**Prerequisites / notice**
After a short-exercise (1 week) and a masterplan conducted in groups (4 weeks), the project will be developed individually (10 weeks). The production will include models, collages and drawings, amongst others medias.

**051-1139-16L** Architectural Design V-IX: Port of Havana (A.Brillembourg/H.Klumper) [Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php)].

**Abstract**
Working directly with the Havana city government and local institutions, students will design alternative architectural typologies and inclusive urban visions that challenge conventional approaches of urban development characterized by privatization, fragmentation and gentrification.

**Objective**
With an end to the U.S. embargo in sight, fifty-six years after the Cuban Revolution, Havana is confronted with probably the most challenging opportunity for urban development in the Americas. At the heart of this development -- and the site of our studio -- is Havana's recently decommissioned harbor, consisting of 1000 hectares of state-owned land currently lacking any comprehensive plan. Working directly with the Havana city government and local institutions, students will design alternative architectural typologies and inclusive urban visions that challenge conventional approaches of urban development characterized by privatization, fragmentation and gentrification.

Students will propose architectural projects that react to the existing built legacy, absorb the influx of capital investment, and connect the surrounding neighborhoods to the waterfront, while generating an overall urban vision that tackles issues related to tourism, infrastructure, preservation, environment, mobility, and resource.
Havana is a unique urban case study. Its strategic location in the Gulf of Mexico made Cuba one of the most important trading hubs of the Americas, a key node between the New and the Old World. At the center of the city is Havana's harbor. Through the centuries, it remained a crossroad of cultural exchange, generating wealth and a cosmopolitan flavor. With the imposition of the US embargo in 1960, however, as well as the economic difficulties that followed from the dissolution of the Soviet bloc, international trade suffered immensely. The harbor transitioned slowly into a vast area lined with vacant factories, abandoned piers, and rusted cranes.

Today, with the relocation of all industrial activities to the newly opened port of Mariel on the outskirts of the city, and the possibility of the U.S. blockade being lifted at any moment, a wealth of investment is being directed at the port of Havana presenting a new challenge for this vast stretch of latent land in the center of the city. Because the political system means that the state owns all of the land, the direction of the development is up to them. Struggling between globalization, modernization, and the country's revolutionary socialist tradition, an alternative solution to the global commercially driven development is needed.

Can the city accept and direct this global investment while preserving its local cultural ideals? Will it learn from its specific experiences and develop its own creative urban solutions for a sustainable growth? Or will it replicate the usual mistakes of rapid urban development seen in many cities of today? Can we define this new urban agenda, together?

Students will undertake research by studying existing test cases, formulating their design hypothesis, planning individual urban scenarios, modeling their designs through various formats, and communicating their intentions in a series of critiques and reviews. Students will be encouraged to develop an individual and critical position on the potential role of the architect to guide a design process within broader social, political and economic systems.

A series of lectures, screenings, readings and discussions will accompany the design program. Workshops and in-studio tutorials will also be provided to train students in effective methods of representing complex ideas through visual media. These will be given by selected experts from the fields of architecture, urbanism, landscape, building technologies and associated disciplines, as well as experts from the Urban-Think Tank Chair.

Reading material will be provided throughout the semester, as well as references to similar case studies.

The class material can be downloaded from the student-server.

The development of this studio will benefit from the findings of our "Learning from Havana" summer school, which will be held from 22 August to 2 September, developed in close partnership with Prof. Christian Schmid (Chair of Sociology at D-ARCH ETH) and Prof. Jorge Peña Díaz (Faculty of Architecture of CUJAE, La Habana) who have been mapping and studying Havana over the past ten years.

The seminar week to Havana, Cuba is not obligatory but highly recommended.

Integrated Discipline: Planning
Language: English / German
Work: Groups (2 per)
Location: ONA, E25

Chair: Prof. Brillembourg & Prof. Klumpner
Assistants: Danny Wills, Hans-Christian Rufer

Architectural Design V-IX: Lac Léman - Metropolitan Countryside (M. Topalovic)  ●

Number of participants limited to 18 (6-9 teams of 2-3 students).

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Abstract
The studio series European Countryside investigates the terra incognita of the countryside, and its mutations. During the HS16 we will focus on Lac Léman and the concept of Metropolitan Countryside, investigating the possibilities of bringing the countryside and the metropolis closer together.

Objective
The semester offers an intensive fieldwork and studio program, with an opportunity for students to focus on large-scale territorial research and design projects. Architecture of Territory’s approach enables students to work with a wide range of methods and sources pertaining to territory, including ethnographic research, literature, architectural and urban design precedents, urban theory, photography and visual art.

Content
Students will work in groups of two. All projects will compose a common vision for Lac Léman. The work will be represented in the form of drawings, physical models and a book. All projects will be made public on Architecture of Territory website.

Lecture notes
Start: Tue 20 Sept, 10 am, ONA
Travel: Integrated trip 8-12 October (cost frame B)  
Integrated Discipline: Planung 063-1402-16

Contact: markaki@arch.ethz.ch  
www.topalovic.arch.ethz.ch

Investigative journey constitutes the core of the project. The field research will be organised in form of several group and individual excursions. The mandatory group trip will take place from 8-12 October 2016. Students who have obligatory courses on Monday, October 10, are required to organize their substitution or dispensation, in order to enrol. Additional 2-3 day individual trip to the research site will be required, and planned with the teaching team depending on the project task. Cost frame B.

Architecture of Territory is looking for avid travellers and team workers with high motivation and independent position.

Architectural Design V-IX: Idyll and Ideology IV: Household (A. Lehnerer)  ●

“Idyll and Ideology” is a series of critical studies that speculates about, while also reinterpreting, the structural inventory found within our towns and countryside.

Abstract
The conceptual development of an architectural and urban design and its elaboration as a specific project. The appreciation of architecture as a cultural practice with a strong but unstable connection towards society i.e. the city and the history of the built environment. The ability to produce a critical contribution to a specific discourse within the discipline by successfully employing the discursive tools and techniques of architecture. Development of the capacity to work with the speculative reality of architecture.

Objective
“Idyll and Ideology” is a series of critical studies that speculates about, while also reinterpreting, the structural inventory found within our towns and countryside.

Content
The design project is rooted within the context of the discipline between the theory of architecture and the stories of the built environment - an architecture that claims to be both cultural and contextual while simultaneously pursuing the desire for the autonomy of form. The city as a cultural expression has always been the critical project of architecture. By focusing on individual elements that make up the whole, a precise architectural discussion can be developed about collective form. The design process describes the ideological reshaping of a constructed idyll and the related negotiation of its resulting contradictions. The outcome is a third typology between house and city.

Architectural Design V-IX: Special Projects  ●

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Architectural Design V-IX: Idyll and Ideology IV: Household (A. Lehnerer)  ●

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).

Architectural Design V-IX: Idyll and Ideology IV: Household (A. Lehnerer)  ●

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php).
Abstract
This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).

Objective
Qualification to control the design process increasingly independent and with sole responsibility and to find to an individual design methodology and attitude.

Content
To follow

051-1105-16L
Architectural Design V-IX: Built Territories / Añana
Salt Valley (J. M. Sánchez García)

Abstract
'Built Territories Añana' explores the complementary relationship between territory and urban context, prompting students to create efficient structures for visitors and residents of Añana, but more importantly to engage in an ongoing discussion on how the construction of architecture informs cultural, social and physical landscapes.

Objective
1. Identify and analyze research resources that are adequate for the development of the project.
2. Acknowledge theoretical issues in order to develop a critical posture related to the design process.
3. Acknowledge the needs of inhabitants and translate them into a creative and sensible proposal.
4. Demonstrate advanced knowledge in representing architecture according to/challenging existing conventions.
5. Defend creative proposals in reference to various contextual issues informing architectural design.

Content
The idea that humans are the main geological agent on Earth has been around for some time now, especially since in 2000 the atmospheric chemist Paul Crutzen coined the term Anthropocene to refer to the influence of human behavior on Earth’s lithosphere in recent centuries.

The Salt Flats of Añana, in Northern Spain, were naturally formed in the Triassic Period as a result of a process known as diapir, a type of geologic intrusion in which a more mobile and deformable material is forced into overlying rocks, allowing the salty water of the sea to emerge in this inland valley of the Basque Country.

Romans are believed to have operated this landscape industrially, though the first documented use dates back to 822, when Añana was started to be used with economic purposes. The landscape commenced then to be transformed in order to maximize the surface area exposed to the sun, turning the valley into a territory of platforms, subtly supported underneath by an architecture of timber-frame structures. At the time of maximum splendor, there were in the valley more than five thousand platforms for evaporation, occupying an area of 95,233m². Adjacent to the exploitation, the village of Añana was progressively built as a satellite rather than as a center, turning the salt flats into the very civic space of the valley.

'Built Territories Añana' explores the complementary relationship between territory and urban context, prompting students to create efficient structures for visitors and residents of Añana, but more importantly to engage in an ongoing discussion on how the construction of architecture informs cultural, social and physical landscapes. Due to the economic development of the region over the last decades, the population of Añana has diminished. However, the role of this territory as the definer of the collective memory of the site and its society remains untouched. Far from a nostalgic vision, the salt flats behave as an elastic territory that can shrink or expand at demand.

Thematic and methodic focus:
- Design architectural landscapes taking into account a wide range of urban, socio-cultural, economic and historical issues that are inherently connected with architectural practices.
- Recognize environmental and landscape issues that are relevant to contemporary architectural agendas.
- Consider and negotiate structural, material, functional, interior and exterior space aspects as well as all urban issues that concern the project simultaneously.
- Represent idea(s) appropriately using effective means of presentation, including digital tools.

Research Work: The Seminar Week features visits to Añana + 6 built territories in Spain. In the first three weeks of the semester each student will research and compare Añana + 1 built territory, focusing on the way the encounters between city and territory, nature and artifice, topography and construction are addressed in different scales and contexts. This will help students understand the transformation of these territories, their construction and geometry as technical and economical rather than stylistic phenomena, irrespective of the particular time frame of each site.

051-1183-16L
Architectural Design V-IX: Architecture & Building
Structure: Bridges! A Circle Road for Egisau

Abstract
The course will focus on the constructive and structural challenges of the realization. Main topic is the quality of the architectural space in the area between physical necessity and the freedom of design. The competences of all elective courses and main courses have been merged into a single, extensive course.

Objective
As a didactic target a profound debate on supporting structure, on construction and on room creation is declared.

Content
In consequence of the historic fact that the builder's profession has been divided into the professions of an engineer and an architect, a bisection of fields came up which reflects in the various types of building tasks. Hence, nowadays engineers realize a number of structures without considering an architect's expertise. However, the professional expertise of the engineers should be merged with the design ideas of architects. That opens a field between freedom of design and functional/technical requirements. As such buildings characterize our environment exceedingly and represent a substantial part of it, a high sophisticated design is very important for our society.

Therefore structural aspects are evaluated to their spatial and tectonic qualities. For this reason the course does not deal with classic architectural design tasks. The focus is on engineering structures.

Integrated Discipline Construction
The integrated Discipline Construction can also be completed as "additional integrated Discipline", but the integrated Discipline Construction must be chosen at least once.

Abstract
Presence on the first day (initial course event) to the integrated discipline construction is compulsory for participating in this course.

In the context of the semester-long design projects, the reciprocity between design, construction and materiality is reinforced.

One focus is the coherence of design and construction.

In the process of developing a project's constructional aspects, design intentions become formulated in a more precise and binding way.

The integration of knowledge gained in the basic courses lends the work an additional dimension and demands of the students an increasingly integrative ability to think and design.

This part of the curriculum addresses design work in different areas of architecture and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).

#### Prerequisites / notice

- For students who attend the architectural design only.
- Students interested in this course are required to enroll via mystudies.ethz.ch and apply via e-mail at the chair until end of the first week of the semester. Students are asked to develop a (textual or diagrammatic) concept sketch explaining the content and the form.
- The formal framework needs to be discussed with the assistants.
- The integrated focal work has to accompany the design, though the focal work has to be an autonomous work. The formal framework needs to be discussed with the assistants.
- The integrated focal work has to accompany the design, though the focal work has to be an autonomous work. The formal framework needs to be discussed with the assistants.
- The formal framework needs to be discussed with the staff members.

#### Objective

- A case study with a clear topic and a clear formulation of a question. The findings and the discoveries shall be part of the base of the design.
- Obtain competence in the field of construction and constructive design.
- The integrated focal work has to accompany the design, though the focal work has to be an autonomous work. The formal framework needs to be discussed with the assistants.
- Work on a current design project with focus on construction.
- Work on a current design project with focus on construction.
- A study in building research and preservation of building heritage with a clear topic.
- The integrated focal work has to accompany the design, though the focal work has to be an autonomous work. The written essay should be at least 10 pages. The formal framework needs to be discussed with the assistants.
- A short written essay and/or design work will be integrated in the design project.
- The aim is a profound examination of a topic of history of art and architecture. The gained insights will be converted into the design process.
- Students are asked to develop a (textual or diagrammatic) concept sketch explaining the content and the form.
- The theoretical perspective will be critically debated. The theoretical perspective will be discussed in the midterm and/or final design studio criticism.
- The theoretical perspective will be discussed in the midterm and/or final design studio criticism.
Alongside a discussion of the basic principles, trends and terminologies, a closer look will be taken at each topic.

2U Integrated Discipline Building Physics (J.Carmeliet)

The Integrated Discipline deals with the interrelation between material and algorithmic design. The direct control of production data opens up new possibilities for design strategies that are exempt from the limitations of standard CAD software. The Integration of process, function and design allows for a new approach to the production of architecture.

This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).

Today architectural sketching without the employment of information technologies is only meaningful in exceptional cases. CAD plans, three-dimensional rendering, CNC model construction etc. are pervasive media for the development and presentation of architectural drafts. This elective course tries to follow questions on a new plateau: Which are the common traits of current design methods and modern information technologies and how can they symbiotically lead to a new architectural expressions in formal and constructional regard. Draft-accompanying, these questions are pursuit on a theoretical level, in order to be able to find its expression in the concrete draft. Ascertainment of hygrothermal performance.

Enrolment under mystudies and per email to the chair is compulsory by the end of the 1st semester week at the latest! Please specify your design theme as well as the name of the supervising chair.

Grant by lecturer is required.

Having passed the lecture series of Energy and Climate Systems I & II or Technical Installations I & II respectively is required for attending the Integrated Discipline.

The integrated design is organized and operated by both chairs engaged in close cooperation.

**Notice**

Interested students may enroll at mystudies.ethz.ch and by an email to the chair until the end of the second week of the semester. The topic and the design chair should be mentioned in this email.

Enrolment under mystudies and per email to the chair is compulsory by the end of the 1st semester week at the latest! Please specify your design theme as well as the name of the supervising chair.

Grant by lecturer is required.
Content
We use the term digital materiality to describe an emergent transformation in the expression of materiality. Materiality is increasingly being enriched with digital characteristics, which substantially affect architectures physis. Digital materiality evolves through the interplay between digital and material processes in design and construction. The synthesis of the two seemingly distinct worlds of the digital and the material generates new, self-evident realities. Data and material, programming and construction are interwoven. This synthesis is enabled by the techniques of digital fabrication, which allows the architect to control the manufacturing process through design data. Material is thus enriched by information; material becomes informed. In the future, architects ideas will permeate the fabrication process in its entirety. This new situation transforms the possibilities and thus the professional scope of the architect.

051-1227-16L
Integrated Discipline Information Architecture (G. Schmitt) W 3 credits 2U G. Schmitt
Abstract
This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).
Objective
Apart from learning about and experiencing Information Architecture, the course also introduces research and management skills that will distinguish the future trained ETH architect.
Content
This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates the knowledge acquired in previous years. It involves the active participation of specialists from related disciplines (e.g. building structures, landscape architecture, history of art and architecture, monuments conservation etc.).

051-1231-16L
Integrated Discipline Sociology (C. Schmid) W 3 credits 2U C. Schmid
Abstract
This part of the curriculum addresses design work in different areas of architecture and urbanism and integrates sociological questions and research methods.
Objective
To consider the social context in the design process!
Content
The content is related to the design process and is defined accordingly to the individual project.

051-1233-16L
Integrated Discipline Architecture and Urban Design (C. Christiaanse) W 3 credits 2U K. Christiaanse
Abstract
Enrolment only with contemporaneous enrolment of the design course of Prof. Christiaanse!
The integrated focal work has to accompany the design, though the focal work has to be an autonomous work. The formal framework needs to be discussed with the assistants.
Objective
An urban design case study with a clear topic and a clear formulation of a question. The findings and the discoveries shall be part of the base of the design.
Content
The integrated focal work has to accompany the design, though the focal work has to be an autonomous work. The formal framework needs to be discussed with the assistants.

051-1235-16L
Integrated Discipline Landscape Architecture (G. Vogt) W 3 credits 2U G. Vogt
Abstract
Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php)
Objective
Subject by arrangement
Content
Learning objectives: introduction into landscape architectural issues and design approaches; designing in urban planning dimensions.

051-1237-16L
Integrated Discipline Landscape Architecture (C. Girot) W 3 credits 2U C. Girot
Abstract
Design concepts ranging from architectural objects to urban planning are developed together with the discipline of landscape architecture. Dependent on the task at hand different themes are investigated. The goal of the integrated discipline is to develop design solutions of a specific topic in landscape architecture, which have to be incorporated into the overall design submission.
Objective
Students gain an insight into the integrated disciplines of design in architecture together with landscape architecture.
Content
Design concepts ranging from architectural objects to urban planning are developed together with the discipline of landscape architecture. Dependent on the task at hand different themes are investigated. The goal of the integrated discipline is to develop design solutions of a specific topic in landscape architecture, which have to be incorporated into the overall design submission.
Prerequisites / notice
In order to complete the subject Integrated Discipline it is necessary that students apply at the Chair of C. Girot within the first three weeks of the semester. Thereafter no applications will be processed.
Learning aids: Pamphlets Design of the Chair of Prof. Girot.

Integrated Discipline Structural Construction (P. Block) W 3 credits 2U P. Block
Abstract
Implementation into architectural design of the gained structural construction knowledge, in order to find best possible and holistic solutions for a construction task.
Objective
The integrated course achievement is allocated to the design course and is fulfilled under the supervision of professionals out of the field of structural teaching. The main focus, the form and the scope of the thesis are specified in agreement with the chair.
Content
The integrated course achievement is shown within the design course and is performed under conducted cooperation of structure teaching experts. The work's focus, its form and scope are up to the agreement with the chair.
Prerequisites / notice
Die Anzahl Plätze ist beschränkt!

051-1247-16L
Integrated Discipline Architecture and Art (K. Sander) W 3 credits 2U K. Sander
Abstract
The integrated discipline and the building design will be juxtaposed by artistic thinking and working. The conceptional approach will in particular be rendered more precise in the dialogue between architectural and artistic methods. There is also a focus on the technique of describing the context precisely.
Objective
Art is the discipline that is constantly creating new realities of terminology and perception. The purpose of the integrated discipline is to use this knowledge, that is produced by art, and to concern it by making design decisions.
Content
A systematic procedure for every step in the design will be supported in the integrated discipline, from the generation of new ideas through to detailing and up to presentation. Reflections on method flow into the design in an integrated manner. There will also be an emphasis on giving expression to the results of the design process using artistic means. In addition a publication should be compiled, presenting the conceptual steps developing the design.
Prerequisites / notice
Application for the coursework with the lecuturer: Nikolai von Rosen, vonrosen@arch.ethz.ch

Data: 06.10.2017 12:53 Autumn Semester 2016 Page 101 of 1570
Abstract
The Integrated Discipline LCA is based on the core idea of the overall design task - the thinking of a project within its complete life cycle. The method of LCA allows to quantify the environmental sustainability of different life stages of a building (raw materials - construction - operation - decommissioning) and thus recognize their relevance to each other as well as present them clearly.

Objective
Introduction to the topic of sustainability and teaching of fundamental method of life cycle assessment as well as its application in architecture and construction. Practical use of these method in a simplified form to assess your own planning activities within the parameters of the design studio.

Content
The Integrated Discipline LCA is divided into two phases - the first phase will convey the methods of LCA through a mix of lectures, examples and an exercise, in order to be applied in the second phase in a simplified, yet meaningful manner in close connection with the central task of the design studio. In the center of the 2nd exercise is the specific design and constructive approach of the individual student group. Building on there design, the results of exercise 2 should be prepared so that they are suitable for integration into the final presentation wall. For this exercise should be seen as part of the overall task and relevant input for the whole semester.

Abstract
The seminar week is obligatory for students of all semesters. There are many and varied study contents.

Objective
The students will be enabled to discuss narrowly formulated factual questions in small groups and in direct contact with the professors.

GESS Science in Perspective

Abstract
The integrated focal work has to accompany the design, though the focal work has to be an autonomous work. The formal framework needs to be discussed with the assistants.

Objective
Work on a current or a passed design project in a large scale.

Content
The integrated focal work has to accompany the design, though the focal work has to be an autonomous work. The formal framework needs to be discussed with the assistants.

Work on a current or a passed design project in a large scale.

► Major Courses

Major courses deal with architectural problems and questions in relation to other fields and they enable students to complete their expert knowledge and their theoretical know-how apart from the architectural design courses. Details of performance assessments are defined in Art. 28 of the 2011 Master curriculum D-ARCH.

Abstract
The lecture covers the time of the 20th century and describes with theories, projects and implemented plannings the history of the modern city. The lectures emphasizes on the historical plannings and methods and presents each specific urban development within a broader context.

Objective
This course analyzes the history of urban architecture primarily in its existing three dimensional form as a complex human artefact. It also explores the inspirations that prompted the creation of this artefact: philosophical and religious concepts, social conditions, property relationships and the mechanisms that exploit the economics of real estate and the influence of building technology. Intellectual, literary or artistic modes of thought will also be assessed with regard to their impact on urban development. Urbanism has its own distinctive approach as a discipline, but it is also clearly responsive to the influence of related disciplines. Study is made of actual cities and urban expansion plans which are in the process of implementation, as well as unrealized projects and visions of the future. These projects sometimes illustrate ways of thinking that are equal to, or clearer than, actual urban situations.

Content
The lecture which will be hold only in one semester includes the developments of the 20th century

1. Le Corbusier: theories, visions and clearcuts in the name of he autorité
2. The United States in the Jazz Age: Between Metropolis of Tomorrow and Broadacre City
3. Italy in the Fascist Era: Monumental ensembles and new town between assiduousness of modernization and obsession of representation
4. Urban design under totalitarian regimes: The architects of the "Tausendjährige Reich" and the "engineers of luck" of the Soviet Union of Stalin
5. Coming to terms with the past and the Cold War: Reconstruction in the two German states
6. The myth of the human scale: the 1950s in Spain, Great Britain, Scandinavia and Italy
7. Postwar Experiments: Rationalistic classicism in France
8. Two new towns in the 20th century: Chandigarh and Brasilia
9. Fictions and visions: The international utopia of the city
10. The second conquest of the North American territorium: The automobile and the city in the USA
11. Analysis, analogy and renewal: The adventure of the typological city

Lecture notes
To each lecture an overview is listet within a script, that can be purchased at the chair for the history of urban design (HIL D 75.2) at the price of CHF 25.-. The script serves as an auxiliary means to the attended lecture compiling the most important illustrations showed and the names and dates of the buildings and its builders along with a short introductory note. Aside this script the chair offers the Quellentextbände‘ (sourcetexts) which help to extend the knowledge of theoretical discourses in the field of urban design. For the master program the institute offers one volume of texts at the price of CHF 5.-. The script is in German, the Quellentextbände are reprinted in their original languages.

Literature
Further recommended literature to consult is listet within the script.

**Objective**

- Participants will come to understand how they can best navigate the design and building process, especially in relation to understanding their profession, gaining a thorough knowledge of rules and regulations, as well as understanding how involved parties' minds work. They will also have the opportunity to investigate ways in which they can relate to, understand, and best respond to their clients' wants and needs. Finally, course participants will come to appreciate the various tools and instruments, which are available to them when implementing their projects. The course will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship.

**Content**

- "Design and Building Process MBS" is a brief manual for prospective architects and engineers covering the competencies and the responsibilities of involved parties through the design and building process. Twelve compact aspects regarding the establishment building culture are gaining importance in an increasingly specialised, complex and international surrounding. Lectures on the topics of profession, service model, organisation, project, design quality, coordination, costing, tendering, construction management, contracts and agreements, life cycle, real estate market, and getting started will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship. The course introduces the key figures, depicts the criteria of the project and highlights the provided services of the consultants. In addition to discussing the basics, the terminologies and the tendencies, the lecture units will refer to the studies as well as to the practice: Teaching-based case studies will compliment and deepen the understanding of the twelve selected aspects. The course is presented as a moderated seminar to allow students the opportunity for individual input: active collaboration between the students and their tutor therefore required.

**Lecture notes / Literature / Prerequisites / Notice**

- The three blocks of the course are related to the lecture «The history of the architecture of the city». The course can be attended in two modes, either in combination with the above-mentioned lecture or independently as a single course. The entire course is held in German.
- **Abstract**
  - No course in HS16
  - No course in HS16
  - No course in HS16
  - No additional reader is on offer for this course.
- **Literature**
  - To prepare for the exam the lecture of the following book is recommended: Vittorio Magnago Lampugnani, Die Stadt im 20. Jahrhundert, Visionen, Entwürfe, Gebautes, 2 vol., Berlin 2010.
- **Prerequisites / Notice**
  - All material is provided via the website of the chair (www.carmeliet.arch.ethz.ch/Education/).
  - To grasp the coherences of costs, income and income return.
  - Urban acoustics, noise propagation through the urban environment, meteorological effects, urban acoustic modeling, noise reduction measures, urban vegetation.
  - No prior knowledge is required.
  - All material is provided via the website of the chair (www.carmeliet.arch.ethz.ch/Education/).
  - "Economic model for real estate development" http://www.bauoek-model.ethz.ch
  - Enrolments of students not showing up on 17.9.15 are deleted without delay.

**Course Codes**

- 063-0363-00L
- 063-0313-16L

**Course Descriptions**

- **Urban History Online. Methods for Text and Plan Analysis**
  - W 2 credits 2U
  - No course in HS16
  - No course in HS16
  - No course in HS16
  - No additional reader is on offer for this course.
  - To prepare for the exam the lecture of the following book is recommended: Vittorio Magnago Lampugnani, Die Stadt im 20. Jahrhundert, Visionen, Entwürfe, Gebautes, 2 vol., Berlin 2010.
  - The three blocks of the course are related to the lecture «The history of the architecture of the city». The course can be attended in two modes, either in combination with the above-mentioned lecture or independently as a single course. The entire course is held in German.
- **Building Physics IV: Urban Physics**
  - W 3 credits 3G
  - Urban physics: wind, wind comfort, pollutant dispersion, natural ventilation, driving rain, heat islands, climate change and weather conditions, urban acoustics and energy use in the urban context.
  - - Basic knowledge of the global climate and the local microclimate around buildings
  - - Impact of urban environment on wind, ventilation, rain, pollutants, acoustics and energy, and their relation to comfort, durability, air quality and energy demand
  - - Application of urban physics concepts in urban design
  - - Climate Change. The Global Picture: global energy balance, global climate models, the IPCC process. Towards regional climate scenarios: role of spatial resolution, overview of approaches, hydrostatic RCMs, cloud-resolving RCMs
  - - Urban micro climate and comfort: urban heat island effect, wind flow and radiation in the built environment, convective heat transport modelling, heat balance and ventilation of urban spaces - impact of morphology, outdoor wind comfort, outdoor thermal comfort, urban energy and urban design. Energy performance of building quarters and cities, decentralized urban energy production and storage technologies, district heating networks, optimization of energy consumption at district level, effect of the micro climate, urban heat islands, and climate change on the energy performance of buildings and building blocks.
  - - Wind driving rain (WDR): WDR phenomena, WDR experimental and modeling, wind blocking effect, applications and moisture durability
  - - Pollutant dispersion, pollutant cycle: emission, transport and deposition, air quality
  - - Urban acoustics. noise propagation through the urban environment, meteorological effects, urban acoustic modeling, noise reduction measures, urban vegetation
  - All material is provided via the website of the chair (www.carmeliet.arch.ethz.ch/Education/).
  - No prior knowledge is required.
  - "Economic model for real estate development" http://www.bauoek-model.ethz.ch
  - Enrolments of students not showing up on 17.9.15 are deleted without delay.
- **Building Process: Economy**
  - W 2 credits 2G
  - The demonstration of economic considerations within the design and construction process of buildings is the main focus of the diploma elective subject.
  - - To grasp the coherences of costs, income and income return.
  - - The demonstration of economic considerations within the design and construction process of buildings is the main focus of the diploma elective subject. Alongside determining basic principles, case studies play an important role in teaching. The economic factors of building construction are examined and the specific decision process is simulated.
  - - The case studies in the lectures as well as the processing of individual topics within the framework of elective work permit and require students active participation.
  - - Bauökonomie ("construction economics"), Ausgabe 1.5
  - - Lecture script for students of architecture, ETH Zurich, spring 2010
  - - Chair of Architecture and Building Process (ed.), Manfred Nussbaum
  - - http://www.bauoek-model.ethz.ch
  - - "Economic model for real estate development" http://www.bauoek-model.ethz.ch
- **Theory of Architecture III: Architectural Theories of the 20th Century Today**
  - W 2 credits 1V
  - The lecture course discusses the relevance of 19th- and 20th-century theories of architecture for present-day architectural practice.
  - - Understanding of historical and political contingencies of theoretical issues in architecture.
  - - The lecture course, divided into two semesters, discusses theories of architecture of the last two centuries in view of current architectural practice. Theoretical issues will be analysed in context of their historical contingencies, present-day buildings confronted with historical ones. Spring semester (Architectural theories of the 19th century today) and autumn semester (Architectural theories of the 20th century today) can be attended independently. During autumn semester, topics include urbanism; organic architecture; modern architecture; technicism; anthropology; semiotics and structuralism; deconstruction, postmodernism, post-structuralism; Marxism and critical regionalism; globalisation and postcolonialism; anthropology and material culture.
- **History of Art and Architecture V: Architecture and the W**

#### Objective:
- Deepen the basic knowledge
- The idea of the future not as a divinely predetermined, but as a designable space in time, was developed since the early modern period.
- The discovery of the future opened a rich field of activity also for architects: beyond traditional building tasks, dealing with future designs such as “The House of the Future” and “The City of the Future” have become leitmotifs of architectural production.
- Beginning in the Renaissance the lecture uses case studies to retrace the appropriation of the principle of the future by architects. Besides well-known designs for homes of the future, as of Alison and Peter Smithson (1956), and the presentation of futuristic living arrangements at exhibitions (“Homes of Tomorrow”, Chicago, 1933), the creation and transformation of the concept of the future will be discussed, that, as in the case of the Italian Futurism (1909-1944), was decisive for certain phases of Western cultural history.

#### Content:
- Art and Architecture of the United States.
- Understanding of structural design as translation of structural concepts into building materials with respect to design concepts.

#### Prerequisites / notice:
- The lecture is held in English.

### Construction History: Bâtir la ville du 19ème siècle: Paris

</tr>
</tbody>
</table>

#### Objective:
- Construction history of a nineteenth century metropolis, Paris. From urban planning and infrastructure development to innovative architecture in new materials such as iron, glass and concrete.
- The participants will acquire an in-depth understanding of 19th century construction history, between neo-classical and classical modernism, from contemporary treatises to preserved monuments, and including modern challenges of preservation.
- Paris is the 19th century metropolis par excellence. There is hardly any city with a more abundant architectural, urban and infrastructural development in the 19th century, and hardly anywhere more monuments of his period have been preserved. Furthermore, an outstanding amount of contemporary scientific and architectural discussion has been published which allows us to reconstruct the details of the design and planning processes. The variety of preserved monuments includes late examples of classical French construction highlights such as coupes des pierres architecture like the flat vaults of the Odéon, innovative uses of traditional materials like timber (timber vaults of the neo-classical churches following Saint-Philippe-du-Roule, de l'Orme roofs inspired by the Halles du Blé, etc.), experimental iron architecture (roofs of Bourse and Bibliothèque Sainte-Geneviève, iron churches of Saint-Eugène, Saint-Augustin and Notre-Dame-du-Travail), extensive infrastructural developments (Belgrand's water supply and sewer systems) and historicist architecture with hidden technical innovations (Sainte-Trinité, Opéra). All these projects have been discussed extensively in contemporary monographs and journal articles.
- The lecture will cover all these aspects and provide a general introduction to 19th century construction history, including the echoes of French ideas in neighbouring countries such as Prussia. The lecture will include a seminar week dedicated to the on-site study of surviving monuments (including access to monuments not normally open to the public).

#### Objective:
- Introduction into an experimental approach to architectural design based on the application of methods that integrate structural and spatial parameters.
- The focus is on structural and statical issues with respect to realization. Exemplary buildings are analyzed using graphic statics and specific properties of different materials discussed.

#### Content:
- Basic understanding of the experimentation with design methods in architecture. Ability to build up models throughout digital and physical exploration integrating space and structure.
- In recent decades, new methodologies have emerged in architectural design that exploits the implementation of different parameters as generators of the design concept. Building on the programmatic idea of the Chair of Structural Design of reconciliation of the disciplines of engineering and architecture, the course experiments with the application of design methods that integrate structural and spatial principles from the early stages of the design process. These methods are based on simple geometrical rules that relate spatial and structural parameters. The experimental process will be carried out through the development and construction of physical and digital models. This will allow for the exploration of the permeability of the boundary between the physical and the digital realm.

#### Prerequisites / notice:
- Enrolment on agreement with the lecturer only.

#### Objective:
- In this teaching unit architectural and urban design are analyzed by current computational methods. Based on these analyses the effects of planning can be simulated and understood. An important focus of this course is the interpretation of the analysis and simulation results and the application of these correspondent methods in early planning phases.

#### Content:
- The students learn how the design and planning of cities can be evidence based by using scientific methods. The teaching unit convey knowledge in state-of-the-art and emerging spatial analysis and simulation methods and equip students with skills in modern software systems. The course consists of lectures, associated exercises and workshops, as well as of one integral project work.

### Transitional Periods: Political Iconology - Architecture in Central Europe 1450-1800

</table>

#### Objective:
- In a series of theory lectures we explore how the design and planning of cities can be evidence based by using scientific methods. By various exercises the students are equipped with skills in modern software systems. In an integral project work knowledge in state-of-the-art and emerging spatial analysis and simulation methods is deepened. Based on the imparted methods the effects of planning and design interventions can be simulated and understood. An important focus of this course is the interpretation of the analysis and simulation results and the application of the correspondent computational methods in early planning phases.

#### Prerequisites / notice:
- The lecture is held in English.
Understanding of political contingencies in architecture and its history. B. Emo Nax

Students should come away with a clearer sense of the stakes of climate change for architecture and of architecture for climate change, as European Aspects of Spatial Development

Taking the perspectives of the end user (occupants and visitors) is vital for a human-centered design approach. Students will learn about relevant theory and methods in cognitive science and environmental psychology that can be used to address human cognitive and behavioral needs in built environments. The foundations of environmental psychology and human spatial cognition will be introduced. A focus of the course will be on how people perceive their surroundings and orient in space. Students will learn about a range of methods including real-world observation, and methods of architectural analysis such as space syntax. Students will also be exposed to behavior simulation in design, virtual reality experiments, and eye-tracking. Students will reflect the roles of designers and other stakeholders with respect to human-centered design as well as an evidence-based design perspective. The course is tailored for students from a relevant design studio. Upon registering, students should send an email about their design studio to b.emo@gess.ethz.ch. As an alternative to obtaining D-GESS credit, architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".

851-0252-08L Cognition in Studio Design - Analytic Tools for Evidence-Based Design W 3 credits 2S B. Emo Nax, M. Brösmalie, C. Hölscaler

Number of participants limited to 25.

How can Behavioral and Cognitive Science inform architecture? In this project-oriented course, students are introduced to cognitive and analytical methods to evaluate their design projects. Existing theories are introduced and complemented with hands-on sessions, in which students learn how to implement a range of methods. The course is tailored for students from relevant design studios.

Taking the perspectives of the end user (occupants and visitors) is vital for a human-centered design approach. 051-0317-16L History of Art and Architecture: Architecture and Climate Change (P. Ursprung) W 4 credits 3G E. E. Scott

This seminar will investigate intersections between architecture and climate change, one of the defining phenomena of our age. We will begin to map out the spectrum of manners in which architecture already engages with this vast and highly unsettling topic as well as how they might be more fully interrogated, invented, and instituted.

Students should come away with a clearer sense of the stakes of climate change for architecture and of architecture for climate change, as well as a deepened familiarity with relevant projects from the present and recent past.

Students should come away with a clearer sense of the stakes of climate change for architecture and of architecture for climate change, as well as a deepened familiarity with relevant projects from the present and recent past.

Lecture notes

A syllabus, required readings, and other course materials will be published/downloadable from the website of Professor Ursprung's chair at the beginning of the semester.

Literature

For further information, including literature, see: http://www.ursprung.arch.ethz.ch/lehreventanstaltungen

Prerequisites / notice

All lectures, readings and discussions will be held in English. If you wish to participate in the course, attendance at this first meeting is compulsory. For any questions, please contact Dr. Emily Etiza Scott (emily.scott@gt.aarch.ethz.ch).

103-0569-00L European Aspects of Spatial Development W 3 credits 2G A. Peric Momiclović

Following the insight into historical perspective and contemporary models of governance and planning, the course focuses on the international dimension of spatial planning in Europe. This includes a discussion of how European spatial policy is made and by whom, how planners can participate in such process and how they can address transnational challenges of spatial development cooperatively.

Keeping the general aim of exploring the European dimension of spatial planning in mind, the specific course learning objectives are as follows:

- to interpret the history of spatial planning at the transnational scale
- to understand and explain the content of the European spatial policy agenda
- to describe and analyse the role of territorial cooperation in making European spatial development patterns and planning procedures
- to discuss the changing role of planners and evaluate the ways of their engagement in European spatial policy-making

European spatial policy agenda: introduction and basic directives

- governance models
- planning models; collaborative planning model (main concepts & critics)
- post-positivist approach to spatial planning
- transnational spatial planning in Europe; questioning the European spatial planning; spatial development trends in Europe

EU as a political system: EU institutions & non-EU actors
- planning families in Europe; the European spatial planning agenda
- spatial planning strategies and programmes on territorial cooperation
- the notion of planning culture and planning system; planning cultures in Europe
- basic characteristics of planning systems in Europe
- the relevance of European transnational cooperation for spatial planning
- European transnational initiatives: CODE 24 (Rotterdam–Genoa); Orient-east–Med corridor (Hamburg–Athens), Danube region

Lecture notes

The documents for the lecture will be provided at the moodle, https://moodle-app2.let.ethz.ch/course/view.php?id=2298.
The course deals with spatial phenomena at the interface of film and architecture. The alternating influence of these two media will be analyzed, the dispositions of perception and effect will be compared and thus will sharpen the view for a architectural way of looking at space.

The objective of the course is twofold: On the one hand, students will get to know and to apply a critical approach to architecture by means of such media as oral discourse, written reviews, and the image as a tool of criticism. On the other hand, the practice of architectural criticism itself shall be reflected upon by reading and discussing theoretical and historical texts on the subject.

The seminar is structured in three sections. In a first step, theoretical foundations will be established based on reading and discussing seminal texts, as well as guest lectures by established critics. A second phase will include site visits of selected buildings in order to develop a critical vocabulary based on immediate spatial experience. The third part will be devoted to the craft of writing; students will be authoring their own arguments and hold a public discussion.

Lecture notes
Will be handed out at the beginning of the semester.

Against the background of my self-developed ten-line-format we are going to discover thematically partly fee, partly architecture related topics, by writing.

History, theory and practice in architectural photography

Knowledge of architectural photography

Sudabeh Mohafez, das zehn-zeilen-buch; Dresden 2016 (2010)

Queneau, Raymond: Stilübungen; Frankfurt am Main 1990 (1947)

Enrolment on agreement with the Assistant, Ms. Sudabeh Mohafez mohafez@arch.ethz.ch.

Photography ■

Limited number of participants.

Enrolment by agreement with the lecturer - Motivation letter to be sent to eydel@arch.ethz.ch by 2nd September 2016 at the latest.

The aim of the course is to reach a higher competence level of the media through applying cultural techniques of photography. Through critical discussions and analyses of the medium, participants will develop their concept of photography and confront its theoretical and practical challenges.

Participants will analyze the motivations, strategies, and technical methods of artists and photographers. These analyses will also include the effectiveness and the history of reception of the given work or artist. Based on practical examples, theories of photography will be applied, i.e. through discussing reference, reproducibility, image time, etc.

For participation a motivation letter has to be handed in until Friday 16th September 2016, 12:00 noon, to send to Mr. T. Wootton, Email: wootton@arch.ethz.ch.

3D Scanning and Freeform Modeling

Limited number of participants.

Enrolment in agreement with the lecturer only.

The department of Architecture and Fine Arts has a 3D-Bodyscanner available for the digitalization of persons and objects, and is complimented by a special software for modeling the 3D data.

After a period of training and practice, participants are asked to develop ideas and concepts for their own projects. These concepts should be used to lead and expand the system and the possibilities of its application. The process of readjustment and its realization will be a continual part of developing the individual projects.

For participation a motivation letter has to be sent to eydel@arch.ethz.ch by 2nd September

Artistic and Conceptual Thinking and Working ■

We approach the prelinguistic space of artistic thinking and agency from its context, which supports, mediates, criticizes, sells and preserves its artworks. We listen to the various protagonists of this space - cultural agents in civil service institutions, art mediators, critics, curators, gallerists, custodians; for in this space surrounding the prelinguistic one, nothing is left to chance.

This seminar aims at providing access to the prelinguistic space of artistic thinking and agency, in order to be able to observe the artists in their immediate working process. This space can only be entered if we successfully leave all layers of mediation behind us and cease to force an understanding.

The seminar, of course, with its claim to teach the critical faculty to be astonished, is also part of these layers of mediation. We will measure this paradox of art directly up against our own ambitions. A productive tension will be established within us when we open up to artistic practices potentially contradicting our own.

We will approach the prelinguistic space of artistic thinking and agency from its context, which supports, mediates, criticizes, sells and preserves its productions - the artworks. We will listen to the various protagonists of this space - cultural agents in civil service institutions, art mediators, critics, curators, gallerists, custodians; for in this space surrounding the prelinguistic one, nothing is left to chance.

When these essays first appeared in Artforum in 1976, their impact was immediate. They were discussed, annotated, cited, collected, and translated; the three issues of Artforum in which they appeared have become nearly impossible to obtain. Having Brian O’Doherty’s provocative essays available again is a signal event for the art world. This edition also includes “The Gallery as Gesture,” a critically important piece published ten years after the others.

Enrolment on agreement with the Assistant, Ms. Sudabeh Mohafez mohafez@arch.ethz.ch.

Free Drawing ■

Application for the course with the lecuturer also via e-mail: stefan.keller@arch.ethz.ch.

The number if participants is limited to 14 students and enrolments need the lecturer's allowance! We Works with a 3D Touch Mouse, see Youtube
https://www.youtube.com/watch?v=NF7nfktef2Q

Proficiency in Windows systems is a precondition for participation. To enroll in the course, please consult the lecturer: Adi Grüninger: grueninger@arch.ethz.ch.

Digital Sculpture. Experimental use of a system for digitalizing and modeling 3D objects.

Experimentation with digital tools and various design processes of 3D forms in fine arts, design and architecture. Practicing and playing with dimensionality and sense of space.

The number if participants is limited to 14 students and enrolments need the lecturer's allowance! We Works with a 3D Touch Mouse, see Youtube

The seminar enables students to work out concise and coherent texts of high linguistic expression to various topics within very short time.
Number of participants limited to 35.

Abstract
Drawing is used to ascertain and develop the artistic ideas and abilities of students. Different techniques and methods will be tested.

Objective
Development of individual expression in the realm of drawing; artistic flexibility and skill in the areas of working strategy and aesthetic impact.

Content
Development of individual expression in the realm of drawing; artistic flexibility and skill in the areas of working strategy and aesthetic impact.

Prerequisites / notice

051-0227-16L Architectural Drawing
Number of participants limited to 136

W 2 credits 2G R. Fässer

Abstract
With the architectural drawing we can refer to one of the most important and primary design tools. Imaginations, ideas, as also the observation of important scenarios and impressions could be visualized with the appropriate technique.

Objective
Based on the process of the concrete, practical drawing, we can sensitize our perception and enhance also the interaction between head and hand. Also the digital drawing with Wacom tablet (if available) should not be missed out as an additional challenge.

Content
The focus of the drawings are determined in the study of architectural references as: figure, plasticity, body, space, light, atmosphere, etc.

The second hour of lecture is booked for the review of the weekly exercises.

Prerequisites / notice

Objective

W 2 credits 2S A. Vronskaya

Abstract
In the course of this seminar, we will collectively prepare the exhibition "The Architecture of Russian Revolution" (included in the "gta 50" exhibition series, to be open in February 2017).

Objective
To commemorate the 100-year anniversary of the Russian revolution (1917), this seminar examines the impact of the political revolution upon architectural education. We focus on teaching architecture at Moscow Higher Art and Technical Studios (VKhUTEMAS; 1920-1927), a school that railed the Bauhaus as one of the earliest and most important "avant-garde" pedagogical institutions. This experimental-format seminar will serve as a preparation for the exhibition "The Architecture of Russian Revolution," which will open in February 2017 a part of the series of exhibitions devoted to the 50th anniversary of the gta (Institute for the History and Theory of Architecture at ETHZ). The exhibition's particular focus will be on the importance of VKhUTEMAS legacy for architectural pedagogy (especially, at ETHZ) today. Collectively, we will develop the concept of the exhibition and make curatorial and installation decisions.

Content
The Russian Revolution (1917) dramatically changed not only political system, but also the lifestyle and culture in the country, including approaches to architectural education. Student protests against old, academic system of education followed the revolution, leading to a creation, in 1920, of one of the earliest "avant-garde" architectural institutions, the Higher Art and Technical Studios (VKhUTEMAS) in Moscow.

Instead of the old practice of moving from drawing details to smaller buildings and finally finishing their education by designing a large building, the students now started by analyzing formal elements important for different arts: "Color" served an introduction to painting, "Volume" -to sculpture, "Space" -to architecture, and "Drawing" (that is, line) as an introduction to graphic design. The most developed of the introductory courses, Ladovski's course "Space," analyzed three-dimensional reality as a combination of "elements of sensation": the basic physical, geometrical, and spatial properties of form, such as mass, volume, gravity, or dynamics. This course will be at a particular focus of our attention. We will approach it from a variety of contexts: the political situation in the aftermath of the Revolution; the changes in Russian culture and society; the developments in science (in particular, experimental psychology) and the new concept of the human that they entailed; the emergence of modernist approaches to architecture and its pedagogy; the challenges that these changes and developments posed for architectural education. As a result of our study, we will develop the concept of an exhibition on VKhUTEMAS and its importance for architectural pedagogy today.

Prerequisites / notice
This is not a lecture course. Attendance and active participation is required. There will be weekly mandatory reading and creative assignments (expect circa two hours per week of homework).

Enrollment limited to 20.

051-0621-16L Architecture and Digital Fabrication
Limited number of participants.

W 4 credits 4G F. Gramazio, M. Kohler

Abstract
Advance in technology revolutionizes design and fabrication processes within architecture. Digital fabrication allows immediate production from design data. The architect as author of these data takes a key role in this development. This course focuses on strategies for architectural production by means of algorithmic design tools and computer controlled fabrication methods.

Objective
The goal of the Wahtlach is to learn basic approaches to designing with the knowledge about digital fabrication techniques and their creative application within a specific task.

Content
We use the term digital materiality to describe an emergent transformation in the expression of architecture. Materiality is increasingly being enriched with digital characteristics, which substantially affect architectures physis. Digital materiality evolves through the interplay between digital and material processes in design and construction. The synthesis of two seemingly distinct worlds: the digital and the material generates new, self-evident realities. Data and material, programming and construction are interwoven. This synthesis is enabled by the techniques of digital fabrication, which allows the architect to control the manufacturing process through design data. Material is thus enriched by information; material becomes informed. In the future, architects ideas will permeate the fabrication process in its entirety. This new situation transforms the possibilities and thus the professional scope of the architect.

Lecture notes
The script is provided by the teaching chair and can be purchased the day the elective course starts.

Prerequisites / notice
Limited places (enrolment on lecturer's acceptance only).

Data: 06.10.2017 12:53 Autumn Semester 2016 Page 109 of 1570
Building labels are used to certify buildings and neighbourhoods in terms of sustainability. Many different labels have been developed and are in use in Switzerland (LEED, DGNB, SNBS, Minergie). In this course the differences between the certification labels and its application on 3 emblematic case study buildings will be discussed.

This alternation of working session on one specific criteria for one specific building followed by a group presentation and discussion to end with a presentation and a discussion where we will highlight differences between the labels.

After this overall general presentation and in order to have a closer look to specific aspects of sustainability, students will work in groups and assess building labels. They will show how models and theories, emerging mainly during the 19th and 20th centuries, present leapfrogging correspondences with more ancient conceptions of the city, when observed from an informational perspective. We will establish a refreshing dialogue in times where we seem to be overwhelmed by the wide range of possibilities that technology and the abundance of information are opening up. We are bored by the overused debates around urbanization as a threat, energy crisis, climate change, smart cities: the same problematic is elucidated, no matter which city you are looking at. Instead, we will explore the possibilities that the digital has to offer to us, the world citizens. Such transformations have taken place since the very inception of cities, and this is why we are convinced that each era including our own has to reinvent its City within its corresponding cultural galaxies.

Throughout this tutorial we will learn to code in Python and further learn to put together a number of custom-made and open source algorithms in order to operate the web programmatically.
101-0177-00L Building Physics: Moisture and Durability W 3 credits 2G J. Carmeliet, T. Defraeye

Abstract
Moisture transport and related degradation processes in building and civil engineering materials and structures; concepts of poromechanics and multiscale analysis; analysis of damage cases.

Objective
- Basic knowledge of moisture transport and related degradation processes in building and civil engineering materials and structures
- Introduction to concepts of poromechanics and multiscale analysis
- Application of knowledge by the analysis of damage cases

Content
1. Introduction
Moisture damage: problem statement
Durability

2. Moisture Transport
Description of moisture transport
Determination of moisture transport properties
Hysteresis
Transport in cracked materials
Damage and moisture transport in cracked media

3. Poromechanics
Moisture and mechanics: poro-elasticity
Poro-elasticity and salt crystallisation
Poro-elasticity and damage
Case studies

4. Multiscale analysis
Problem statement
Multiscale transport model
Multiscale coupled transport - damage model

101-0577-00L An Introduction to Sustainable Development in the Built Environment W 3 credits 2G G. Habert

Abstract
This year the UN Conference in Paris will shape future world objectives to tackle climate change.

This course provides an introduction to the notion of sustainable development when applied to our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmental aspects.

The course aims to promote an integral view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

Content
The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development
- Case Study 1: Sustainable construction, the role of construction industry (national/international)
- Case Study 2: Cities, forms of settlements
- Case Study 3: Material resources, scenarios, energy, construction materials, urban metabolism
- Case Study 4: Buildings, heating/cooling, consumers, prosumers and other stakeholder, cooperations
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Economics for sustainable construction
- Method 3: Construction, flexibility, modularity
- Synthesis 1: Climate Change mitigation and adaptation in cities
- Synthesis 2: Transition to sustainable development

Lecture notes
All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature
A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

051-0415-16L Negotiating Structural Forms: History of Structural Design W 2 credits 2G J. Schwartz

Prerequisite: Successful completion of Structural Design I-IV.

Abstract
Dealing with the structural necessity against the background of the formal intent often lead, besides discourses, to architectural and technical enrichment as well as unique buildings. This seminar focuses on the work of key figures, that will be discussed on the basis of texts, concepts and buildings.

Objective
Getting to know key designers on the borderline between architecture and structural engineering, their positions, concepts and most important buildings.

Content
Seminar focusing on the discussion of important essays and buildings of distinguished builders and architects on the basis of short presentations, models, input lectures and invited guests, as well as films and excursions.

051-0761-16L History, Theory and Methods in Historic Building W 2 credits 2G to be announced
### Conservation and Building Research (NF Hassler)

**Abstract**
Timber and metal structures (historical development, manufacturing technology, documentation and evaluation, historic building construction)

**Objective**
Timber and metal structures (historical development, manufacturing technology, documentation and evaluation, historic building construction)

**Content**
Timber and metal structures (historical development, manufacturing technology, documentation and evaluation, historic building construction)

**051-0763-16L** New Focal Points of Construction

**Abstract**
The elective subject "New focal points of construction" investigates the complex interaction of construction elements by means of exemplary architectural tender points such as base, wall, chamber, roof etc.

**Objective**
The comparative analysis of built constructions serves as a basis for further development of hypothetical future constructions.

**Content**
Lecture:
1. Comparative analysis for derivation and understanding of the constructive points base, wall, chamber, roof etc.
2. Description of current level of technique, typical methods, and set of problems.
3. Final colloquia with guests of producing and processing companies.

**Exercise**
New formulation of a future constructive point as a result of a diagnostic work.

**051-0777-16L** Building Process: Realization

**Abstract**
Visits to construction sites and interdisciplinary lectures on the topics of communication, complexity, landscape and investment are the main focus of the workshop. In addition, the term process is to be depicted by means of visits to manufacturers of construction components.

**Objective**
The main focus of the diploma elective subject is in showing the building process by means of current examples of urban design with architectural relevance. The Chair views itself as the facilitator between those involved in construction and students. Active participation is a prerequisite.

**Content**

**Prerequisites / notice**
The number of participants is limited and enrolment is only possible in agreement with the chair!

**051-0781-16L** Costruire correttamente/Constructing Correctly:

**Abstract**
In line with the approach of P.L. Nervi's book, our study is based on factors that, outlined by him, are still today all the more relevant as a lesson for architecturally and structurally justified buildings. We will observe selected buildings both of our time and of the past for their space, architecture and construction, understand them and interpret them according to universal values of design.

**Objective**
"Costruire correttamente" (Constructing Correctly), the 1955 book published by Pier Luigi Nervi, covers crucial factors for building that, outlined by him, are still today all the more relevant as a lesson for architecturally and structurally justified buildings. His thoughts represent valuable criteria and indispensable tools for observation and carrying out investigations of the built environment.

Lessons learned from this can enrich the design work of today's and tomorrow's architects.

All of these (see abstract) i.e. analyses, observances, hypotheses, groupings and cross-comparisons, will help the students in their careers to find their own strategies and approaches to design and to be aware of them. And so, according to the advice of Pier Luigi Nervi: "...At every stage of his training, the future architect should be constantly and methodically guided to search for essential elements in each problem, be it large or small. The study of the architectural works of the past should consist in the critical examination of their functional and structural solutions and of the relation between these and form, in order to show that form is a consequence and not a determinant of functional and structural needs." [P.L. Nervi: Costruire correttamente, Milano 1955; English version titled "Structures", 1956, p.28].

**Content**
The main thread of this course, that runs over two semesters (*), are buildings of all ages that could be categorised under notions such as »most viewed«, »most technically daring«, »most unknown«, »most discussed« or »most worthy of discussion«, and carry instructive aspects of the teachings of Pier Luigi Nervi ("costruire correttamente"). In the lecture, these buildings will be investigated on-the-spot, described from the designers' point-of-view and will be commented on with reference to any redesign resulting from the interplay of architectural and structural concepts. Harmonies and discord should be discovered.

Occasionally there will be guest lectures. These people, who were directly involved with a certain building, will portray the emergence and development of the project.

In this sense, the course is also intended for civil / structural engineering students and presents a possible bridge between the two prospective project partners - architect and engineer.

(*) Begins in the autumn semester. Entry into the course in the spring is possible.

**Lecture notes**
None for the time being

**051-0823-16L** Material-Workshop

**Abstract**
The elective is organised as a laboratory where one particular material will be explored on a theoretical and practical level. During this study the contemporary architectural potential of the material will be tested and applied.

**Objective**
Experience, know-how and interest are the basis to explore a material and develop new ways to construct and form architecture. The objective of this course aims at exploring the correlation between material, construction and artistic expression.

**Content**
The elective is organised as a laboratory where one particular material will be explored on a theoretical and practical level. During this study the contemporary architectural potential of the material will be tested and applied.

**Prerequisites / notice**
http://www.spiro.arch.ethz.ch/de/lehre/wahlfach-materialwerkstatt.html

**051-0855-16L** Masterclass Construction: Steelwork

**Abstract**

**Data: 06.10.2017 12:53  Autumn Semester 2016  Page 112 of 1570**
Abstract
The ‘Meisterkurs Konstruktion’ is seeking a critical discussion on relevant constructive (and energetic) questions of our time. Alternating each semester, one of the typical construction methods will be examined: masonry, concrete, steel, woodwork and curtain wall facades. In the autumn semester 2016 we’ll focus on contemporary steel constructions.

Objective
The prospective architect shall develop necessary skills to be able to think construction in its complex relationships and to face future discussions in practice competently.

Content
The structure of the course contains:
1. Impartation of basic knowledge of construction
2. Seminar / exercises on the state of technology / research
3. Integration of practical case studies and problems

Prerequisites / Notice
Enrolment on agreement with lecturer only.

---

051-1219-16L
Integrated Discipline Building Systems (A. Schlüter) – W 3 credits 2U A. Schlüter

Abstract
The integrated discipline Building Systems addresses specific questions about building systems and system concepts. Energetic analysis and system designs are carried out on the students individual design projects.

Objective
The course aims for an ability to understand concepts of sustainable building technology coherently integrated into an architectural design. The focus lies on LowEx-systems.

Content
The integrated discipline Building Systems addresses specific questions about building systems and system concepts. Energetic analysis and system designs are carried out on the students individual design projects.

Lecture notes
Skripts are specific to the design task and distributed at the beginning of the course.

Prerequisites / Notice
Please contact the tutor as soon as possible at the beginning of the semester; we will set the task according to your chosen design studio. Having passed the lecture series of Energy and Climate Systems I & II or Technical Installations I & II respectively is required for attending the Integrated Discipline.

051-0369-16L
Theory of Urban Design: – W 2 credits 2G to be announced

Abstract
The focus of the seminar is to understand the urban history of Zurich through selected case studies.

Objective
The aim of the seminar is to discuss the selected Zurich case studies against the background of the history of urban design.

Content
The City of Zurich rises there where Celtic tribes settled and the Romans founded a the city. In the past two millennia authorities, planners of different disciplines, merchants and craftsmen, institutions and investors have shaped the city upon the Limmat. The physical outcome of these interventions stand in close relationship with the knowledge of the time that reflect the prevailing positions and theories, which were thought, published and built elsewhere. For that matter, the history of urban design of Zurich can be well understood as a branch of the history of European urban design, as well as the individual steps of development are offsprings of international reflexions and tendencies.

Presentations in the seminar room and the visit of the selected ensembles in Zurich will help to tell the story of the urban development from the Middle Ages up to today. With this basic knowledge gained in the seminar and the walks the students will have to discuss the historical theories and developments as well as the urban qualities of the ensembles.

This will help the students not only to better understand the city but will also allow them to sample different urban situations and gather spatial experiences, which can also facilitate their design process.

Prerequisites / Notice
The number of participants is limited to 24 persons.

---

051-0625-16L
Serendipity: Audiovisual Fieldwork - Gotthard Soundwalking (Ch.Girot) – W 2 credits 4G C. Girot

Limited number of participants (limitation due to technical equipment).

Abstract
We will map the landscape above the new Gotthard Base Tunnel with sound recorders and photo cameras, and landscape interventions. Back in our AudioVisual Lab, we will work with audio editing tools, spatial sound design and photographic processing in order to compose a collective multisensory map of the Gotthard.

Objective
The goal of this elective course is to explore the perception, use and representation of landscape through the use audiovisual tools. In this process, spatial, dynamic and cultural aspects are highlighted.

Content
Above the new high-speed Gotthard Base Tunnel lies a fascinating mountain landscape steeped in myths and stories. On an alpine walking tour, we will trace the tunnel's course and mark points a hundred meters higher: alpine pastures, rugged mountains, deep forests, clear lakes, weekend cottages.

We will discover the audiovisual qualities of the mountain landscape, map our overground "tunnel journey" with sound recorders and photo cameras, and intervene in the environment at vertical points of intersection. How is our perception on the surface shaped through the awareness of the tunnel below? How do we experience the vast and lonesome mountain area at a walking pace instead of rushing through it in a secure enclosure? Using techniques from sound art, land art and "strollology", we want to examine the Gotthard, understood as both archaic nature and cultivated alpine landscape, a hightech transit area and a pre-modern refuge, the "center of Europe" and the periphery of Switzerland.

Back in our AudioVisual Lab, we will work with audio editing tools, spatial sound design and photographic processing in order to explore new ways of perceiving and portraying landscape. Through audiovisual journeys and mixed media installations we will compose a collective multisensory map of the Gotthard.

Prerequisites / Notice
The course will be limited to 16 students. Participation on all dates of the course is mandatory. The costs for the excursion (traveling, overnight stay, food and drinks, ca. 200 CHF) are asked to be paid by the participants. Basic trekking experience and equipment are required (latter can be rented for ca 30 CHF).

Introduction: 22.09.2016, 12:45h, AudioVisual Lab (HIL H 40.9 / 40.5).
Weekly course dates: on Thursdays, 12:45-14:30h.
Weekend Workshop/Exkursion: 8./9.10.2016 (further information and costs will follow).
Final Crt: 1.12.2016 (End of the course)

No course: 27.10.2016 (Seminar Week)
For further details see website: http://girot.arch.ethz.ch/blog/
Until now this site has not been documented. The goal is to produce material for a publication and exhibition on the theme of the food system. The production, processing, distribution, consumption, and disposal of food have perpetually affected the relationship between city and countryside. In that sense, the industrialization and globalization of food systems contributed to the urbanization of the landscape. On the other hand, logistic systems and consumer behavior are strongly affected by processes of urbanization, which shows that the city and its countryside. This semester, students will deal with the appropriation of landscape as a common resource in Ljubljana and design a metropolitan park for the capital of Slovenia.

The elective course serves as an introduction to landscape architectural design on various scales including the topics of border, threshold, water, vegetation, topography, choreography, and metaphor. Architecture students develop a project based on the perception of place, knowledge of landscape-architectonic typologies, and conception of public space. They become familiar with GIS as an analytical tool, model building as a design methodology and the representation of landscape through plans. The design process is accompanied by workshops, lectures, excursions, critiques and a workbook.

Limited number of participants. The course is fully booked!
Enrolment in agreement with the lecturer only: Roland Shaw shaw@arch.ethz.ch

The term ‘pairi-daeza’, Persian for ‘a wall surrounding a garden’, is the point of origin for an elective series addressing basic elements and typologies of landscape architecture. This semester, students will deal with the appropriation of landscape as a common resource in Ljubljana and design a metropolitan park for the capital of Slovenia.

The elective course serves as an introduction to landscape architectural design on various scales including the topics of border, threshold, water, vegetation, topography, choreography, and metaphor. Architecture students develop a project based on the perception of place, knowledge of landscape-architectonic typologies, and conception of public space. They become familiar with GIS as an analytical tool, model building as a design methodology and the representation of landscape through plans. The design process is accompanied by workshops, lectures, excursions, critiques and a workbook.

The term 'paradise' and its religious implications originate from 'pairi-daeza', Old Persian for 'a wall surrounding a garden'. Pairi-daeza is the title of an elective course series addressing the appropriation of landscape as a common resource in European Metropolises while exploring new forms and types of public spaces. The elective course serves as an introduction to landscape architectural design on various scales including the topics of border, threshold, water, vegetation, topography, choreography, and metaphor. Architecture students develop a project based on the perception of place, knowledge of landscape-architectonic typologies, and conception of public space. They become familiar with GIS as an analytical tool, model building as a design methodology and the representation of landscape through plans. The design process is accompanied by workshops, lectures, excursions, critiques and a workbook.

The participation in the course is subject to the following three conditions:
1) The course is limited to 12 students. The restriction follows the time of the inscription according to the first-come-first-served-principle.
2) A two-days trip to Ljubljana from the 7th to the 9th of October is mandatory for all students.
3) The contribution to expenses will be 200.- CHF per student.

THE COURSE IS FULLY BOOKED!

Introduction to the workshop week in February 2017:
5th December 2016, 6 pm, HIL H 40.9.
Workshop week: 6th to 14th February 2017;
Trip to Ljubljana: 6th to 9th February 2017;
Final critics: 14th February 2017.
“What is the ideal city (...) that best expresses the power and beauty of modern technology and the most enlightened ideas of social justice?” - asks Robert Fishman in his opus, Urban Utopias in the Twentieth Century (1977). For Fishman, Ebenezer Howard’s Garden City (1898), Le Corbusier’s Ville Radieuse (1924) and Frank Lloyd Wright’s Broadacre City (1932) stand out among utopian projects for their radically original urban designs, their revolutionary program for social change, and their authors’ sustained personal commitment to realize the plans. Besides these ideal cities, Fishman suggests that utopian projects fell into two further categories: they are either utopian romances, that is, technical exercises without explicit social agenda, such as the technological utopias of Archigram or Yona Friedman; or urban ideologies, that is, projects that might bear social content but could still be carried out without revolutionary social change, as they tend to preserve an already powerful class. Such are designs produced by totalitarian regimes or dictated by powerful market conditions. Following Fishman’s theoretical grid, we will read excerpts from each of his rubrics, while considering utopian design thinking within a broader and more fundamental discussion about the means and ends of urban design. Kevin Lynch asserts that the purpose of urban design is the ‘good city’ (1981). What is then the role of utopias in achieving this goal? While exploring this question, we will also confront utopias with critical approaches that could be described as tragic. Jane Jacobs, for example, argues that utopias demand totalitarian control, whereas urban neighborhoods should be developed and rejuvenated employing bottom-up approaches.

We will ultimately link the studied concepts with various urban forms, such as the megastructure in relation to technological utopias or the Manhattan block in Rem Koolhaas’ interpretation. In his book Finding Lost Space (1986) Roger Trancik identifies three major approaches to theories of urban form: the figure-ground, linkage, and place theories. We will classify each of the discussed forms into the above three categories. Thus, we will wrap up the class with a basic grid on form theories - after having started it with another one regarding utopian visions.

After an introductory lecture, we will discuss one edited text each week, and confront the different positions they represent with each other. Accordingly, participants will be expected to read one text and write a half-page response each week, to once prepare and hold a 15-minute presentation of a text (including a compact handout), and to actively participate in the discussions. Optionally, 10 to 15-page position papers can be written after the semester as elective theses, honored by additional credit points. A reader with selected texts and thematic introductions will be provided.

**Systematic Principles of Urban Design: Learn from the European City**

**W 2 credits 2G V. Magnago Lampugnani, H. Stühlinger**

**Corriculum**

**Abstract**

Urban Ensembles of the Modern City. Strategies for Dealing with the Twentieth-Century City

**Objective**

The seminar will focus on case studies in order to reveal strategies for dealing with the modern city. Built urban-development ensembles from the twentieth century will be embedded in their architectural and historical context, studied with an eye to their constitutive elements and discussed in connection with current urban-planning projects. In addition to various forms of methodological engagement with urban contexts, students will experience how the disciplines of urban-planning history and urban development can be considered in a more integrated way. Moreover, they will receive feedback on how to present the result of their analyses in concise, well-structured talks and in drawings.

**Content**

The approach to urban-planning ensembles of the twentieth-century city is characterized by their enormous quantity - which also makes dealing with them more difficult. The building stock dating from this era is immense. There is little discussion currently of how larger spatial contexts - housing estates, neighbourhoods, entire cities - can be not just designed and planned but also continuously developed as overall ensembles. Moreover, strategies, instruments and procedures for dealing with the vestiges of twentieth-century urban planning have yet to be established. In the seminar we will discuss how specific approaches to analysing, assessing and further developing of specific case studies have been formulated and explored recently as well as the extent to which they are experimental and deviate from traditional means for preserving and developing the city. Any discussion of an example of urban planning from the previous century must begin with an understanding of the particular conditions of the time. The seminar will also focus on the role of architects and urban designers in this process. The intelligent use of data and information are at the core of this course.

**Lecture notes**

There will be no script handed out.

**051-0723-16L**

**Information Architecture and Future Cities: Smart Cities**

**W 2 credits 1V G. Schmitt**

**Corriculum**

**Abstract**

What are SMART CITIES and how do they emerge? What is the role of architects and urban designers in this process? How do data turn into information and how to use them as a building material for the future city? The course covers concepts, methods and techniques in design, simulation and communication of cities. The goal is to learn principles and preconditions for the design of sustainable and smart cities.

**Objective**

Students gain insight into the next generation of design processes for architects and urban designers, and into concepts of the Information Architecture of SMART CITIES, including the influence of Big Data. They learn about the expanded roles of information and architecture: information and simulation in architecture as means to make the invisible visible, and architecture as a metaphor and ordering system to structure the immense amounts of data of the Information Society. The seminar is highly interactive and discusses visionary case studies in Europe and Asia and new techniques in Big Data informed smart urban design. Apart from learning about and experiencing Information Architecture and SMART CITIES, the course also introduces research methods and skills that will distinguish the future ETH architect. An iBook and the edX Massive Open Online Course (MOOC) Future Cities support the course.

**Content**

SMART CITIES - What will happen when cities change from static configurations into responsive and dynamic structures? What does it mean for buildings that undergo the same changes? What is the impact on architectural and urban design education? How can citizens influence this development? The SMART CITIES course will answer these questions and supply you with the necessary skills and knowledge to understand and design such dynamic structures. The intelligent use of data and information are at the core of this course.

Data and information are now building materials of future cities. Citizens produce increasing amounts of data in their daily life, with stationary sensors and mobile smartphones. Using those data, citizens can influence the design of their cities and the re-design of existing ones. The course will be first step towards the emerging citizen design science and cognitive design computing. Those will be the next generation of participatory design and design computing.

**Digital Urban Visualization: People as Flows**

**W 2 credits 2U G. Schmitt**

**Corriculum**

**Abstract**

We examine patterns of crowd-flows in an extraordinary urbanisation phenomena: festivals.

**Objective**

The course participants will learn how to program simulations using Processing/Java. Previous programming knowledge is not necessary. Furthermore they will gain insights into other analysis methods and learn about their significance, strengths and weaknesses.
### Content
We will look at those patterns from two sides. One being the view of a planner asking to find bottle necks or the ideal place for amenities such as booths, toilets etc. Another being the view of visitors. We will program different behaviours that should compete against each other in order to compare their different strategies. As a case study we will use the Caliente Festival in Zurich.

For deepening the learnt in a semester thesis we offer to optimise the created simulations to make them available in interactive planning workshops. Additionally they could be converted into interactive web apps.

**Literature**
http://www.ia.arch.ethz.ch

**Prerequisites / notice**
No programming skills are required.

<td></td>
</tr>
<tr>
<td></td>
<td>The E4D summer school 2016 aims to develop an integrated vision to a global challenge of today's construction industry. The programme revolves around the depleting resource sand and the question of how to develop alternative building materials for future cities. Led by different experts from around the world, students will not only learn the theoretic background of this resource but experiment with current and future technologies to transform sand and building waste. In the workshops the acquired knowledge will be tested and applied. The summer school presents three areas that could mobilise sand alternatives for construction and other applications: (i) I. Microbiologically induced Calcite Precipitation (MICP), (ii) Chemical Crystallization Processes and (iii) 3D printing.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Sand is the most commonly used raw material for the production of goods on our planet. It is found in concrete, glass, computers, detergents and toothpaste. Sand is the megastar of the industrial and digital era - our culture is literally built upon this resource. But sand is not equal to sand: the construction industry requires grain sizes and rough shapes that are only found in river beds, lakes and the oceans. Mining of aquatic sand comes at high environmental and social costs; its growing demand cannot be met sustainably. Sand is mostly composed of quartz, a mineral form of silicon dioxide. Silicon is one of the most abundant elements on earth and also one of the strongest. These properties make it valuable to various industries. Since a few years demand for sand has risen exponentially. Alternatives for sand for construction have yet to be developed.

Sustainability is often referred to as an interaction of social, cultural, economic, and ecological aspects. In the construction industry sustainability has been perceived as the optimisation of existing material and energy uses, yet the fundamental energetic and material character of these base resources has not been questioned. The speed of consumption of these resources increases constantly due to demographic pressure and resulting construction, as seen around the world and in particular in developing and emerging countries. A fundamental understanding of metabolic processes is required to frame the question of material and energetic sustainability. At the same time the definition of resources expands to include previously undervalued materials and waste. Finally, advances in digital technology and science have opened new avenues for alternative materials and processes.

The summer school presents three areas that could mobilise sand alternatives for construction and other applications:

I. Microbiologically Induced Calcite Precipitation (MICP): Also known as bio-cementation it is a process utilised in self-healing concrete and soil stabilisation. The application to sand will produce naturally grown structural sand bricks. This workshop will compare MICP for various sand types, building wastes and bacterial cultures.

II. Chemical Crystallization Processes: Based on material computation experiments pioneered by architect and engineer Frei Otto, this workshop combines form finding properties of sand with structural and thinking and chemical crystallization processes.

III. 3D Printing: 3D Printing with sand and building waste, finally, explores the potential of sand as a substrate within a binding agent. In combination with a robotic arm, 3D printing of sand is an in situ digitally controlled construction process. It overcomes the need for traditional form-work and transportation of material, thereby reducing the grey energy.

Prerequisites / notice

Taking place from 4 to 22 July 2016 at the TU Delft in The Netherlands.

Costs: CHF 500, including board and accommodation. All participants are responsible for organising and financing their own domestic or international travel to Delft, The Netherlands.

The Engineering for Development (E4D) Winter School 2016 will invite 30 master and doctoral students from different disciplines related to the topic of the summer school. Applicants will be selected based on their academic record and previous work experiences. Applicants must send a one-page CV and one-page letter of motivation in PDF format stating their interest, to Ms. María Ubierna Aparicio (ubierna@ifu.baug.ethz.ch)

Deadline: 31 March 2016

Notification: 15 April 2016

051-0829-16L Summer School: Assembling Cities. Studying Urban Matters in Practice W 2 credits 4U D. Eberle

Abstract

In particular, the summer school addresses research exploring the borderlands of the diverse fields of STS and urban studies. It will be of particular interest to PhD candidates who have already begun their research and are in the stages before or after conducting field studies. As participants are required to enrol in one of three thematic groups, their stages of research may differ per group.

Objective

The objective of the summer school is to support PhD researchers in their individual research and specific research stages by sharing their work with keynotes and colleagues. Accordingly, participants are expected to develop their skills of articulating and communicating their ideas, examine various STS methods and techniques of approaching cities, and to discuss their research and obstacles in an academic setting over the three sessions; problematizing, describing and assembling stages of their research to learn about the relevance of STS methodologies and concepts of urban research in general, and for their particular interest and research stage. They are also aimed at researchers not yet familiar with the approach and interested in learning a subset of its concepts (eg. networks/artefacts) and methodologies (e.g. ethnography/digital methods). Throughout the sessions participants will learn to: question the city from a STS perspective (problematising), they will be introduced to the methodologies that tackle these questions (describing), and they will encounter ways of thinking through questions and answers (assembling). Specifically, participants are to write a full paper, design a poster and make a presentation. All deliverables will be evaluated by the keynote speakers, four external reviewers, and the organizers. The poster presentation will take place in front of a full audience, while paper presentations in the workgroup only. The organizers are inquiring for publishing opportunities of outstanding papers (e.g. plaNext from the AESOP YA, Contour at the EPFL or Spatium at the IAUS). The website will be updated with the posters and a review of following the event.

The Assembling Cities summer school aims to bring together an interdisciplinary group of doctoral students who treat the city as their empirical site. Academic backgrounds include, but are not limited to: anthropology, architecture, geography, history, philosophy, political science, sociology, visual arts, and urban planning. In particular, the summer school addresses research exploring the borderlands of the diverse fields of STS and urban studies. It will be of particular interest to PhD candidates who have already begun their research and are in the stages before or after conducting field studies. As participants are required to enrol in one of three thematic groups, their stages of research may differ per group. In other words, the three themes can be interpreted to speak to various stages of research (problematising, describing, and assembling respectively). The summer school is positioned at the intersection of science and technology studies (STS), urban studies and planning studies. The program emphasizes the development of conceptual and methodological insights as part of innovative approaches to contemporary urban phenomena. To the fields of urban studies it provides a more varied and dynamic conceptualisation of the city; it does not reduce urban phenomena to the logic of a capitalist mode of production. This endeavour relating urban studies with STS presents new, cross-cutting ways of examining arising planning issues. Planning studies can benefit from new tools of interpreting problems of interconnection and expertise. A website will be created to advertise the summer school and will be distributed to various mailing lists (BESTS, EASST, s-architecture etc.) in our own networks and on posters at Swiss universities. It will be maintained until after the summer school in order to keep those interested and the participants informed about follow up activities.

Content

The relevance of STS in urban research is explored with three themes: problematising, describing and assembling (cities). Participants will be distributed in thematic groups, and lectures will be held by keynote speakers according to theme. Following the call, participants are required to indicate which theme fits their paper best as they will be shared within the thematic groups. The first day will include a keynote presentation followed by an informal poster session for each thematic group. The poster sessions are a chance for the other two groups to learn about participants' research and ask questions. The following day two sessions will be held with the support of the respective keynote. During the first (morning) session the participants will present their papers (max 15 min) within their thematic groups followed by a general 20 min discussion. During this time, key points will be noted and later discussed in the second (afternoon) session in which each group will prepare a plenary discussion and a final day the final day presentation for the final day. The final day will conclude with a discussion of each theme opened by the respective keynote and moderated by members of the thematic group. Each thematic group will summarize their discussions and findings in a final presentation. The framework for the discussion and presentations will be defined together with the keynotes and could be, for example, a specific question and/or obstacle, a clear toolbox, or excerpts from selected presentations related to each respective theme. The summer school will open with an excursion to the housing project Hunzikerareal by the housing cooperative Mehr als wohnen in Zurich. This large mixed-use area development is used as an illustration of how institutions, individuals and artefacts mediate the planning process towards an inclusionary and diverse project.
The course will function as an inter-disciplinary think-tank exploring the requisites for sustainable urban development of the Old Havana Port (UNESCO World Heritage site) through the lens of architecture, engineering, and social sciences. The challenge is to work in an intensive cross-cultural setting and develop solutions in a complex, real-life context with local practitioners and stakeholders.

You will receive full support on-site from the Polytechnic University José Antonio Echeverría, La Habana (PUJAE) and ETH tutors from your discipline. In developing the scenarios you will work side by side with young professionals with a grounded knowledge of the field, and be joined by a wide variety of local stakeholders. The program will combine site visits, expert lectures and workshops to allow you to develop the following skills:

- Conduct your own research within a limited time frame and through quantitative and qualitative analysis.
- Develop integrated and sustainable urban development strategies.
- Cross cultural understanding and skills in an international collaboration.
- Mechanisms to collaborate and communicate with practitioners and stakeholders.

Cities on the border or an outpost of Western European influence, struggling between globalization, modernization and local traditions, are characterized by great social and spatial disparity. Havana is a characteristic case of such a city, which is currently undergoing rapid urbanization and experiences a critical moment of transition.

At this very moment, the political and economical situation is changing rapidly, with a contradictory process of economic and social opening that becomes now more and more visible in the streets of Havana, with new businesses, restaurants and street activities, announcing further changes in everyday life. How can such fragmented conditions within cities be tackled by integrated and inclusive solutions, rather than fragmented interventions that exclude the challenged local communities?

Moreover, the lack of resources in cities of the Global South often prevents the gathering of modern, digitalized data, while the unstable political structures prevent the implementation of durable planning strategies. These cities need a rapid assessment procedure, in order to identify relevant priorities and potentials. How can we create a comprehensive understanding of the system and propose appropriate solutions, while using quantitative and qualitative data?

The summer school will build on the current "Atlas Urbanas de La Habana - Urban Atlas of Havana" and on the project SeDUT (Seminario Internacional de Desarrollo Urbano y Transporte), a three-year Swiss-Cuban cooperative research project on the urban development of Havana and its mobility potentials. The SeDUT project involved many academic, governmental and private stakeholders, such as the Polytechnic University José Antonio Echeverría, the Centro de Estudios Urbanos de La Habana, the Instituto de Planificación Física, the Dirección Provincial de Planificación Física de la Ciudad de La Habana and the design office of Metron AG. Together they represent an important expertise and a high degree of accumulated knowledge.

In a team, you will produce alternative urban scenarios for the planned redevelopment of the Old Port of Havana. You will contribute your expertise and unpack the realities of sustainable development in a tropical climate. How can knowledge from the ETH be combined with Cuban research and translated to a Caribbean context? Through debate, controversy and collaboration it is expected you produce scenarios that integrate your different disciplines and question the preconceptions of sustainable urban development.

This immersive summer school will be structured in three interlocking modules:

In the first module you will investigate the Old Port and gain a strong understanding of the social, environmental and built context in Havana. You will employ analytical mapping to integrate and synthesize different disciplinary knowledge, ranging from quantitative data to subjective observation.

In the second module, you will develop a series of scenarios for the Old Port, proposing alternatives for its sustainable future. You will build on the research from the first module, and explore the potential of your ideas with local stakeholders and professionals from your field. You will document these scenarios using creative and varied representational methods.

In the final module you will pitch your scenarios to decision makers. During this event you will measure their preferences, debate the associated trade-offs, and provide a series of orientations for those planning the future of Havana.

More information on: http://u-it.com/teaching/havana-summer-school

Who should apply?

Enthusiastic students currently enrolled in a masters program in ETH Zurich and PUJAE Havana. A balanced group of 15 ETH master students from the D-ARCH, D-BAUG, D-GESS and D-USYS departments will be selected. They will be joined by 15 Cuban students from our partner university.

Applicants should have a strong interest in sustainable urban development and transdisciplinary collaborative research. They should be able to demonstrate their academic strength, motivation, interest and expertise. Knowledge of Spanish is welcome but not obligatory.

Dates in Cuba: 21 August to 1st of September.
Contact: Marie Grob at grob@arch.ethz.ch, enrollment procedure on our webpage.
The architectural ways of looking, concepts and techniques are unstable at large territorial scales, and yet, urban territories can be seen as

Project: El Portico de los Huéspedes

El Portico de los Huéspedes is the first permanent structure to be proposed in the Open City in nearly 12 years and was begun through the collaboration between Summer Chantier and the e[ad]PUCV in 2014. An initial program for the structure was developed by the Open City members and responds to a need within the community for permanent space for both the administrative secretary of the Open City and for guests conducting research. In addition, the program responded to a desire to create a space large enough for the entire e[ad] PUCV community to assemble within the Open City itself. This program is not a set of fixed guidelines but served, and serves, to guide the project at its origins. Similarly, le Portico de los Huéspedes has no fixed plan or finality. During the summer, and in the intervening school year, groups and students and faculty respond to the existing conditions with tests and interventions that develop the project. This development is also influenced by poetic acts that take place on the project site that open up or introduce new prerogatives or potentials into the work.

Project History 2014/15:
Poetic act defining the amplitude of the necessary site;
Definition of the site location, development of principal structure based on a study of Gunnar Asplund's Woodland chapel;
Replacement of wooden pile foundations with concrete foundations;
Poetic Act defining points within the site that became manifested through flexible form-work columns;
Development of secondary structure in wood and brick plazas on northeast and south west corner of site.

Program Outline:
Lausanne Week (late July): The Lausanne week is an intense period of analysis of the existing site conditions. This first encounter with the Open City and le Portico de los Huéspedes is supplemented with lectures that introduce students to some of the ideas defining practice and pedagogy at the Open City: the role of poetry and poiesis, observation and the open-ended project. Site analysis is done through drawing (by hand with tools supplied by the workshop) and model making. Work-days finish with informal critiques where findings are discussed. During the week there will also be an introduction to the working and safety issues related to the chantier and to living near the Open City. Students will work in teams and one of the goals of the week is to already to create a group spirit that will develop throughout the workshop.

Open City (August): The first days of the chantier is meant as a practical introduction to some of the ideas encountered during the Lausanne week. Lectures and events by members of the Open City community introduce students to the pedagogical and poetic

Applications should be sent via email to summerchantier@epfl.ch and should comprise a brief letter that describes why you are interested in the project and expectations for the Summer Chantier. All candidates will also be interviewed as part of the selection process.

Summer Chantier is looking for self-motivated students who are interested in an experience that provides human, intellectual and physical challenges.

Applications will be expected until 18th March with interviews conducted in early April and decisions made shortly afterwards

051-0623-16L Travellers, Ocean Territories - Mapping Maritime Geopolitics, Migration and Global Trade

Travellers is a series of five lectures and conversations about ways of perceiving, studying and portraying urban territories. Each of the guest speakers is a traveler - a person who places the direct observation and experience of urban landscapes in the core of their practice. During the autumn of 2016, we will investigate the ocean as a territory.

The architectural ways of looking, concepts and techniques are unstable at large territorial scales, and yet, urban territories can be seen as crucial contexts for the production of architecture. Seeing an extended urban territory as part of the city - its mirror - can reflect back in the ways we see the city itself, and its architectures.

Once a year in autumn, with students and invited guests, we will consider: How can architects look at, study and design urban territories or the "city's constitutive outside": the periphery, the agglomeration, the countryside and the hinterland? What are the motives (aesthetic, political) architects can have in engaging with these territories? The aim is to discuss concepts and techniques for territorial investigations and projects.

During the autumn of 2016, we will investigate the ocean as a territory through the lens of artists, researchers and architects focusing on mapping maritime geopolitics, migration and global trade.
Content

What is the ocean as a territory? Once imagined as a boundless space, largely untouched by human activity, are oceans still a common horizon bringing together the cities and peoples along their shores? Can the open nature of the sea resist the transformative forces of the carved and conflicted earthly masses it is enclosing? Is the ocean space shaped by the strategic control of resources and trade routes? What is the role of the architects in investigating, describing and visualising the urban dynamic of the ocean space? Can ocean territories be designed?

Taking different perspectives, from history, to activism, geopolitics, and design, travellers who have been crossing the global ocean following refugee migrations, onboard container ships and along ancient maritime routes, contribute elements for an urban portrait of ocean territories.

03.10.2016 On Migration: MANUEL HERZ architect/researcher

</tr>
<tr>
<td>Abstract</td>
<td>The seminar analyses the conditions of contemporary architectural production. In doing so, the importance and meaning of architectural conventions for the design, construction as well as for the transformation of single buildings is systematically challenged.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Objective</td>
<td>The seminar aims at a critical analysis of both material and ideological conventions of the architectural practice. On the basis of the historical analysis the students will acquire instruments for a critical examination of the conditions of the current production of the built environment, in order to develop a sovereign theoretical position on the contemporary architecture.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>The seminar will deal with the conventions of the contemporary architectural practice. The proposed topics should be researched out of a twofold, historical as well as systematic perspective. A detailed description of the syllabus can be found on the homepage of the professorship: <a href="http://stalder.gta.arch.ethz.ch/seminarien.php">http://stalder.gta.arch.ethz.ch/seminarien.php</a></td>

<tr>
<td>Objective</td>
<td>The topics consider historical periods more deeply. Personalities or specific themes will be examined paradigmatically. Besides the transmission of knowledge the main intention is an introduction into the methodology of historical research. Active participation by students is required.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>In the last third of the 19th Century Chicago became center of attraction for a whole generation of American architects, William Le Baron Jenney, Louis Sullivan and Frank Lloyd Wright - based in Chicago - formed the image of an American large town in the 20th Century. 1893 Chicago was the site of the World's Columbian Exposition in honour of America's discovery 400 years ago. Chicago, the city in the middle west, had competed successfully against New York, Cincinnati and Washington D.C to get this once-in-a-hundred-years-event. In historical view this is less than understandable, because not even 25 years before that Chicago hardly counted 220'000 inhabitants. Upon connection to the railway net and the subsequent settlement of meat manufacture industries the city had a cometlike rise which couldn't even be stopped by a conflagration in 1871. In the shade of the technical and industrial progress social circumstances which were critizised severely arose. The seminar investigates Chicago’s role as model for the American large city in the 20th Century. Particularly, the influence of property speculation and technical improvement - responsible for the nearly unlimited growth of the city (mainly into the height) - are critically analyzed. At the same time we investigate the architects’ handling with new technical possibilities, bus also with social problems related to it, as Louis Sullivan did in a exemplary way in «The tall office building artistically considered» in 1896.</td>
<td></td>
<td></td>

Data: 06.10.2017 12:53 Autumn Semester 2016 Page 120 of 1570
The turn of the 19th century is defining Zurich still today. Even though the older core of the town overlooking the Limmat with its two cathedrals is likewise shaping image and perception, it was through major architectural and structural interventions of the waning 19th century such as the train station, Bahnhofstrasse, Seeufer and larger constructions as the Opera House and Tonhalle, office and commercial buildings, residential quarters and administration and infrastructure buildings that the major city of today was accomplished.

Lectures will provide a first introduction into construction activities of these years, followed by property inspections that will investigate the preserved historism of Zurich and its restorations. In brief statements, the students will present literature, inventories or single prominent buildings such as the Zurich Stadthaus, but also the large-scale urban planning concepts. A further emphasis of the seminar is set on the constructional and technical developments of the period.

**051-0367-16L** Seminar History of Urban Design: Elements of Urban Space

**Abstract**
Within our series »Elements of the urban space« we will focus on urban housing. In the parishes Niederdorf, Stadelhofen, Untertor, Fluntern und Hirslanden, we will look at numerous housing types on the level of the metropolis, the neighborhood, the building and the urban detail.

**Objective**
The aim of the seminar series is to provide a sound methodological approach in analyzing urban space on the scale of the metropolis, the neighborhood, the building and the urban detail. Through a series of neighborhood walks and excursions to the four major city archives, our students gain a methodological approach to city analysis. In the discourse of the seminar, we will gain fundamental criteria for the design of urban situations.

**Lecture notes**
Our students will be provided with all material in digital form. All readings will be available on the course website at the beginning of the semester: http://www.ursprung.arch.ethz.ch/lehrveranstaltungen

**Prerequisites / notice**
The number of students is limited to 60. After the introduction on 22/09 between 14.45-16.30 we will meet on 29/9 (city walk), 6/10 (discussion of the analysis results), 13/10. (consultation - doodle), 3/11 (examination plan), 10/11 and 1/12 (consultation - doodle) and final presentation on 8/12.

**051-0783-16L** Special Questions in History of Art and Architecture: Making of the gta

**Abstract**
In this seminar we will document with video interviews how the Institute for the History and theory of architecture (gta) has studied and shaped the Swiss and international history of architecture and its debates in the past fifty years.

**Objective**
We will explore the history of the gta as well as the historical and theoretical dimensions of the interview as a research and documentary tool while also developing practical interview skills.

**Content**
Interviews with architects and artists are popular and versatile. They are a means of research as well as mediation in books and exhibitions. In this seminar we will discuss the many forms and functions of interviews. The occasion is the jubilee of the Institute for the History and Theory of Architecture (gta), which was founded in 1967. We will interview the protagonists who shaped its formation and development. The video interviews we will conduct will be present at the jubilee exhibition in 2017. We will explore how the gta studied and shaped the Swiss and international history of architecture and its debates. We will further discuss different formats of video in exhibitions and develop our own practice.

**Lecture notes**
The relevant texts will be available for download.

**051-0779-16L** History of Architecture: Colonialism, Architecture & Urbanism in Africa (P. Ursprung)

**Abstract**
In the 19th and 20th centuries Belgium, Britain, France, Germany, Italy, Portugal, and Spain invaded and colonized the great majority of the African continent. This was coupled with the invention of an unprecedented European modern architecture that was expected to face Africa's climates and to satisfy colonial administrators, military officers, settlers, tourists, and in rare cases Africans.

**Objective**
The course examines the multifaceted relationships between colonialism, architecture, and urbanism in Africa under European rule. The aim is to explore and discuss European production, transfer, adaptation, transformation, and exchange of modern architecture and urbanism within and among African colonies and protectorates ruled by the various European powers. Specific examples will be drawn from across the African continent in order to examine the formal, spatial, social, and political characteristics and impacts of new towns, villages, buildings, and elements designed by European architects and planners.

**Content**
The course is delivered through a series of weekly lectures, discussions of assigned readings, and students' presentations, which are centered around key themes and specific contexts. Students will be expected to complete one reading per week and one presentation per semester. Each student is invited to choose a town, a building, a personage, a construction material, or an aspect of colonialism in Africa and present it to the class.

**Literature**
All readings will be available on the course website at the beginning of the semester: http://www.ursprung.arch.ethz.ch/lehrveranstaltungen

**Prerequisites / notice**
All lectures, readings, presentations, and discussions will be held in English. Those who wish to participate in the course must attend the first introductory lecture on 22 September 2016.

**Abstract**
How can behavioral and cognitive science inform architecture? This project-oriented seminar investigates contributions of cognitive science to architectural design with an emphasis on orientation and navigation in complex buildings and urban settings. It includes theories on spatial memory and decision-making as well as hands-on observations of behavior in real and virtual reality.

**Objective**
Taking the perspectives of building users (occupants and visitors) is vital for a human-centered design approach. Students will learn about relevant theory and methods in cognitive science and environmental psychology that can be used to understand human behavior in built environments. The foundations of environmental psychology and human spatial cognition will be introduced. A focus of the seminar will be on how people perceive their surroundings, how they orient in a building, how they memorize the environment and how they find their way from A to B. Students will also learn about a range of methods, including real-world observation, virtual reality experiments, eye-tracking, and behavior simulation for design. Students will reflect on the roles of designers and other stakeholders with respect to human-centered design and an evidence-based design perspective. The seminar is geared towards a mix of students from architecture / planning, engineering, computer science and behavioral science as well as anybody interested in the relation between design and cognition. Architecture students can obtain course credit in "Vertiefungsfach" or "Wahlfach".

**Abstract**
Module 1: Suburban Housing
Module 2: Urban Housing

**Objective**
Students should be able to recognize and place in context the characteristic features of suburban and urban housing. They will get to know the architectural, socio-cultural aspects of suburban and urban housing.
Content

Housing considered in context: architectural, cultural, social, technical and economic conditions and processes influence housing and modes of habitation. To what extent have they changed in the last century? The construction and renovation of domestic space is a cultural process. What forces construct that space, and according to which criteria? What are the constructional and organizational solutions with which they confront the diversity and metamorphosis of contemporary modes of habitation? How can postulates concerning a sustainable development be implemented? Insights culled from housing research and practice, podium discussions with guests and current examples of innovative housing are included.

Urban Mutations on the Edge: Commoning ■ W 2 credits 2S M. Angéll

Abstract

The Urban Mutations on the Edge seminar is a series of public lectures by ETH faculty and invited guests addressing the dynamic global peripheries that we believe are most actively changing our conception of the city.

Objective

Participants should leave the course with an understanding of current urban research issues and an introduction to the political dimension of contemporary architectural production.

Content

The Urban Mutations on the Edge seminar is a series of public lectures by ETH faculty and invited guests addressing the dynamic global peripheries that we believe are most actively changing our conception of the city.

Lecture notes

Texts to accompany and provide context for each lecture are sent weekly by email.

Sociology: Urban Quality of Life - Ethnological Field Research in District 5 and in Zurich North ■ W 2 credits 2S C. Schmid, H. Nigg

Abstract

In this ethnographic field research we examine the question, how people are perceiving and creating their environment, and how an urban quality of life is forming. We investigate four neighborhoods in the Zurich Region: upper District 5, Zurich West, Seebach and Glattpark.

Objective

This elective course highlights the sociological perspective on architectural practice and provides an introduction to sociological research.

Content

The knowledge gained from the lecture series of technical installations will be applied in this elective course work. Focusing on specific questions, this knowledge will be deepened. Each topic will be individually discussed with each student. Based on the design of studios or other projects, a building will be examined with the goal of emissions-free building operation.

Language: German or English

Prerequisites / notice

Having passed the lecture series of Energy and Climate Systems I & II or Technical Installations I & II respectively is required for attending the Integrated Discipline.

063-0115-16L

Architecture and Building Systems (Thesis Elective) ■ W 6 credits 11A A. Schlüter

Abstract

The knowledge gained from the lecture series of technical installations will be applied in this elective course work. Focusing on specific questions, this knowledge will be deepened. Each topic will be individually discussed with each student. Based on the design of studios or other projects, a building will be examined with the goal of emissions-free building operation.

Objective

The objectives are to understand the challenges that arise with these aspects of sustainability, to dimension the resulting technical systems and components, and to implement this in architecture.

Housing (Elective Thesis) ■ W 6 credits 11A G. Precht

Abstract

The seminar aims to analyse housing in context. Group discussions, working with literature and data material as well as the elective thesis focus on architectural, cultural, social and economic conditions and processes that influence housing and the modes of habitation.

Objective

The students will provide a differentiated analysis on the subject housing within its social, cultural and economic context. By working scientifically on a individually chosen subject in their elective thesis, they reflect and analyse on the major problems and determine the players and practices, as well as they depict well structured outcomes.

**Objective**
The aim of the Thesis Elective is an independent engagement with the subjects of the related Elective Course.

**Content**
The contents of these elective studies are expected to link to the subject matter of the attended course.

### 063-0197-16L Photography (Thesis Elective)
**Prerequisites**
K. Sander

**Abstract**
Individual completion of an artistic project with photography and public presentation (elective coursework).

**Objective**
Creative Experience: Definition of ones own interests and realization of an artistic project based on photography. Development of an advanced concept of photography.

**Content**
The contents of these elective studies are expected to link to the subject matter of the attended course.

### 063-0201-16L 3D Scanning and Freeform Modeling (Thesis Elective)
**Prerequisites**
K. Sander

**Abstract**
Individual completion of an artistic project with 3-d photography (scanning) and digital modeling (elective coursework).

**Objective**
Creative Experience: Definition of ones own interests and realization of an artistic project using 3d photography and digital modeling. Experimental research for expanded usage of this tools.

**Content**
The contents of these elective studies are expected to link to the subject matter of the attended course.

### 063-0219-16L Artistic and Conceptual Thinking and Working (Thesis Elective)
**Prerequisites**
S. Keller Roca

**Abstract**
Thesis Elective for Master class students.

**Objective**
Creative Experience: Definition of ones own interests, development, and realization of an artistic project. The ideas, questions, and above all the actual (partial) results of the artistic project will be discussed collectively. Input sessions are organized according to individual requirement.

**Content**
The contents of these elective studies are expected to link to the subject matter of the attended course.

### 063-0223-16L Free Drawing (Thesis Elective)
**Prerequisites**
Z. Leutenegger Küng

**Abstract**
An elective project in drawing is an assignment with the characteristics of research. A topic, a graphic assignment or problem, selected by the student is furthered through independent work and its evolution documented.

**Objective**
Combining craft-based and technical processes with aesthetic reflection / developing creativity through structured praxis / solving formal and aesthetic problems / originality, productivity and flexibility.

**Content**
The contents of these elective studies are expected to link to the subject matter of the attended course.

### 063-0227-16L Architectural Drawing - Image Lab (Thesis Elective)
**Prerequisites**
R. Fässer

**Abstract**
Practical application and realization of the elective study in collaboration with the current architectural design project, or as a separate independent project.

**Objective**
The architectural visualization, from the first sketch to the substantial image, establishes itself as an important "decision-maker" for the progress of the design project. The essential intensity, technique and experimental keen, as the search for new forms of representations should be sought.

**Content**
The students determine themselves the content of their work.
The aim of the elective work is to gain comprehensive insight in specific issues related to urban physics and low-energy buildings.

S. Holzer
6 credits

The contents of these elective studies are expected to link to the subject matter of the attended course.

Prerequisites / notice
Consultation for the individual elective thesis will be available during semester as well as during the free period. The oral examination at the end of the semester break is based on the written thesis, handled in before the the examination (watch the deadline in summer/winter). Appointments for consultation with the junior faculty by arrangement.

063-0235-16L
Theory of Architecture (Thesis Elective) ■ W 6 credits 11A A. Vronskaya

Abstract
An elective master thesis in architectural theory is a written student assignment of an architectural problem or question, which is to be elaborated into a scientific paper in consultation with the advisors of the chair. The examination of a specific problem asks for a conscious and critical reflection of interdisciplinary approaches and methods.

Objective
Within the framework of an elective master thesis the student can enhance the acquired knowledge in architectural theory in written form. The main objective is to write a scientific paper focused on a specific topic. The paper will be written in a collaborative and iterative process with the advisor and the assistant lecturer(s). In addition to original ideas, positions taken in the history of research on the subject should also be discussed. It is important to use the correct scholarly format and clear language. The work should cover 36'000 signs as well as image material if needed. At the beginning and before delivery of the work an elaborate discussion will take place.

Content
The objective of the elective subject is, in coordination with the advisors, to work autonomously on a subject from the history of architecture. Beside own ideas also positions of research should be considered; we set value on a correct scientific form as well as a clear language.

063-0317-16L
History of Art and Architecture (Thesis Elective) ■ W 6 credits 11A P. Ursprung

Abstract
Independent and scientific thesis on a monographic or thematic topic within the scope of the history of art and architecture.

Objective
The objective is to write an independent thesis on a monographic or thematic topic within the scope of the history of art and architecture. The focus is to thus exemplify a comprehensive view of the approach and methods towards the modern history of art.

Content
The object of the elective subject is, in coordination with the advisors, to work autonomously on a subject from the history of architecture. Beside own ideas also positions of research should be considered; we set value on a correct scientific form as well as a clear language. The work should cover 36'000 signs as well as image material if needed. At the beginning and before delivery of the work an elaborate discussion will take place.

063-0319-16L

Abstract
Essay on a Subject from the Field of Architectural History.

Objective
Independent preparation of a scholarly essay on a topic from the field of architectural history.

Content
The aim of the elective course paper is to discuss a topic freely selected from the field of architectural history, in agreement with the assistant lecturer(s). In addition to original ideas, positions taken in the history of research on the subject should also be discussed. It is important to use the correct scholarly format and clear language. The paper should be approximately 40'000 characters in length and should also include as much pictorial material as needed.

063-0355-16L
Preservation of Cultural Heritage (Thesis Elective) ■ W 6 credits 11A S. Holzer

Abstract
The Elective Subject Degree Tests are meant to enable a deeper level of individual engagement with the contents of the elective subjects. Topics of electives can be elaborated into elective degree tests.

Objective
The general aim of this intensification is teaching competency in analysis and interpretation in the following areas: knowledge of artifacts, dynamics of systems, historical contexts, history of knowledge and theory as well as an approach to scholarly work.

Content
Contents depend on the specific curriculum of each semester and will be determined in consultation with the faculty advisor. Independent study is possible, however, only after consultation.

063-0367-16L
History of Urban Design (Thesis Elective) ■ W 6 credits 11A V. Magnago Lampugnani

Abstract
Within three elective courses the students need to fulfill an elective work (seminar work). Elective works serve the independent way of dealing with the contents of the according elective course.

Objective
The aim of this seminar work is to learn how to write a small thesis on a case study. This work should include a creative text, but also to obey certain rules, which turn a regular text into a scientific one.

Content
The contents of these elective studies are expected to link to the subject matter of the attended course.

Prerequisites / notice
Einer Anmeldung zum Wahlfach muss ein Gespräch mit einem der Assistenten des Lehrstuhls vorangehen. Es ist daher vor einer Studienanmeldung ratsam Kontakt zu einem der Betreuungsassistenten aufzunehmen.

063-0369-16L

Abstract
Feminine theory of urban design (18th-21st century). The task of this seminar is working with texts about the city written by women. The texts will be analysed, compared and examined employing different scientific methods.

Objective
The main aim of this seminar is learning the scientific handling of theoretical texts on the city. These texts range from pamphlets, to commentaries and literary products.

Content
The contents of these elective studies are expected to link to the subject matter of the attended course.

063-0415-16L
Trial of Structural Forms: History of Structural Design (Elective Thesis) ■ W 6 credits 11A J. Schwartz, M. Rinke

Abstract
The efforts for entanglements of architectonic and constructive concepts had resulted in wide discussions and in unique buildings during different time periods (i.e. ferroconcrete in the nineteen-thirties and nineteen-fifties), furthermore to architectonic and technical enrichments.

Objective
Getting to know important critical figures between architecture and engineering as well as their attitudes and concepts and the most distinguished buildings.

Content
Seminar to the studies and for discussion of important texts and buildings of the most famous construction engineers and architects by listening to reviews, presentations and models, input lectures and guest speeches, films and joint surveys.

063-0515-16L
Building Physics (Thesis Elective) ■ W 6 credits 11A J. Carmeliet

Prerequisites for Urban Physics: successful termination of "Building Physics IV: Urban Physics". For Building Physics in general: Knowledge in the relevant field.

Abstract
Within three elective courses the students need to fulfill an elective work (seminar work). Elective works serve the independent way of dealing with the contents of the according elective course.

Objective
The aim of the elective work is to gain comprehensive insight in specific issues related to urban physics and low-energy buildings. These issues may concern: wind & thermal comfort in the built environment, heat islands, cross-ventilation, driving rain, pollution dispersion, new technologies for low-energy buildings, design of building systems, optimal control. The work may include computational modelling and prototype testing in laboratory.

Content
The contents of these elective studies are expected to link to the subject matter of the attended course.
The goal of the Wahlfacharbeit is the in-depth analysis of a topic in the field of digital design and fabrication. The students should develop a personal algorithmic design system till fabrication. A theoretic placement of the work within the current research discourse is desirable.

The students can explore an ongoing subject from teaching or research of the chair “Information Architecture” in detail. In consultation with the chair’s webpage, the elective thesis HS15 will be held as part of the current edition of the Swisspearl® Summerschool, 31.08. to 11.09.2015, thus on site, in the Eternit production facilities in Payerne! Everybody can participate in the Summerschool, enrolment details will be given within due time on the chair’s webpage.

Advance in technology revolutionizes design and fabrication processes within architecture. Digital fabrication allows immediate production from design data. The architect as author of these data takes a key role in this development. This course focuses on strategies for architectural production by means of algorithmic design tools and computer controlled fabrication methods.

We use the term digital materiality to describe an emergent transformation in the expression of architecture. Materiality is increasingly being enriched with digital characteristics, which substantially affect architectures physis. Digital materiality evolves through the interplay between digital and material processes in design and construction. The synthesis of two seemingly distinct worlds - the digital and the material generates new, self-evident realities. Data and material, programming and construction are interwoven. This synthesis is enabled by the techniques of digital fabrication, which allows the architect to control the manufacturing process through design data. Material is thus enriched by information; material becomes informed. In the future, architects ideas will permeate the fabrication process in its entirety. This new situation transforms the possibilities and thus the professional scope of the architect.

The elective thesis HS15 will be held as part of the current edition of the Swisspearl® Summerschool, 31.08. to 11.09.2015, thus on site, in the Eternit production facilities in Payerne! Everybody can participate in the Summerschool, enrolment details will be given within due time on the chair’s webpage.

The ability to recognize, understand and interpret connections in the built environment between architecture, the design of spaces and construction.

The Elective Subject Degree Tests are meant to enable a deeper level of individual engagement with the contents of the elective subjects. In consultation with the faculty advisor, Independent study is possible, however, only after consultation.

To apply for a thesis elective (possible alone or in a pair), please speak with the lecturers about the topic, approach and time plan.
Health care buildings are subject to constant change. In a new hospital building 60% of the diagnostic and treatment areas are subject to independent in depth study and examination of the contents according to the elective course. D. Hebel

C. Vogt

The goal of this course is to engage students in a multidisciplinary collaboration to tackle real world problems. Following a design thinking approach, students will work in teams to solve a set of design challenges that are organized as a one-week, a three-week, and a final six-week project in collaboration with an external project partner. Information and application: www.sparklabs.ch/ethz

Additionally please enroll via mystudies. Places will be assigned after the first lecture on the basis of your motivation letter and commitment for the class. By sending a one-page motivation letter until 14.9.16 to Florian Rittiner (frittiner@ethz.ch). Due to didactic reasons, the number of participants is limited to 30. All interested students are invited to apply for this course by sending a one-page motivation letter until 14.9.16 to Florian Rittiner (frittiner@ethz.ch).

Hence, a consequent argumentation with regard to the base, the wall, the chamber, the roof etc. follow. Target of this self-dependent thesis is to rethink the constructive points base, wall, chamber, roof etc. on the basis of the newly acquired skills. A structurally engineered, well-founded hypothesis is formulated, thus serving as an initial position for the conception of future constructions.

In the elective thesis "New focal points of constructions" constructive points as base, wall, chamber, roof etc. are rethought reflecting the latest learning matters. A structurally engineered, well-founded hypothesis is formulated, thus serving as a initial position for the conception of future constructions.

Elective works serve an in depth case study through the construction of a 1:1 mock-up. Content and output of the study to be agreed with the lecturer of the elective course.

The contents of these elective studies are expected to link to the subject matter of the attended course content. In the coming years this need for adaptability is going to be challenges even further by the even more reducing health care resources. The paper should discuss in this context a specific question in detail by analysing problems and developing and discussing potential planning solutions.

The purpose of this course is to equip the students with methods and tools to tackle a broad range of problems. Following a Design Thinking approach, the students will learn how to observe and interact with key stakeholders in order to develop an in-depth understanding of what is truly important and emotionally meaningful to the people at the center of a problem. Based on these insights, the students ideate on possible solutions and immediately validated them through quick iterations of prototyping and testing using different tools and materials. The students will work in multidisciplinary teams on a set of challenges that are organized as a one-week, a three-week, and a final six-week project with an external project partner. In this course, the students will learn about the different Design Thinking methods and tools that are needed to generate deep insights, to engage in collaborative ideation, rapid prototyping and iterative testing.

Design Thinking is a deeply human process that taps into the creative abilities we all have, but that get often overlooked by more conventional problem solving practices. It relies on our ability to be intuitive, to recognize patterns, to construct ideas that are emotionally meaningful as well as functional, and to express ourselves through means beyond words or symbols. Design Thinking provides an integrated way by incorporating tools, processes and techniques from design, engineering, the humanities and social sciences to identify, define and address diverse challenges. This integration leads to a highly productive collaboration between different disciplines.

For more information and the application visit: http://sparklabs.ch/ethz

Prerequisites / notice
Class attendance and active participation is crucial as much of the learning occurs through the work in teams during class. Therefore, attendance is obligatory for every session. Please also note that the group work outside class is an essential element of this course, so that students must expect an above-average workload.

Abstract
The Master-Thesis contains a written proposal due to a given master-programme within the work-field of an architect.

Objective
The Master-Thesis has to be an individual work by the students and be proof of the ability to independent design work.

Abstract
Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Please register (www.mystudies.ethz.ch) only after the internal enrolment for the design classes (see http://www.einschreibung.arch.ethz.ch/design.php)

Objective
For Master students with additional obligations only! - Out of the offered courses "Architectural Design V-IX" the student is required to achieve 13 ECTS. There are 2 attempts only.

Content
Qualification to control the design process increasingly independent and with sole responsibility and to find to an individual design methodology and attitude.

Architecture Master - Key for Type

| Q | Compulsory |
| W+ | Eligible for credits and recommended |
| W | Eligible for credits |
| E- | Recommended, not eligible for credits |
| Z | Courses outside the curriculum |

ECTS European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
Understanding the dynamics of large-scale atmospheric flow

S. Seneviratne

The students can understand the role of land processes and associated feedbacks for the climate system.

Cloud Microphysics

2V+1U

Aerosols I deals with basic physical and chemical properties of aerosol particles. The importance of aerosols in the atmosphere and in Clouds are a fascinating atmospheric phenomenon central to the hydrological cycle and the Earth`s climate. Interactions between cloud Dynamics of large-scale atmospheric flow

Dynamics of Large-Scale Atmospheric Flow

W

4 credits

2V+1U

H. Wernli, S. Pflahl

The lecture course provides a derivation of the mathematical basis along with some interpretations and applications of the concept.

Lecture notes

Dynamics of large-scale atmospheric flow

Literature

- Pichler H., Dynamik der Atmosphäre, Bibliographisches Institut, 456 pp. 1997

Environmental Fluid Dynamics

Physics I, II

The learning objective of this course is that students understand the formation of clouds and precipitation and can apply learned principles to interpret atmospheric observations of clouds and precipitation.

Cloud Microphysics

W

4 credits

2V+1U

U. Lohmann, Z. H. A. Kanji

This course will be designed as a reading course in 1-2 small groups of 8 students maximum. It will be based on the textbook below. The students are expected to read chapters of this textbook prior to the class so that open issues, fascinating and/or difficult aspects can be discussed in depth.

Objective

Overall goals of this course are given below. Focus is on the theoretical background and idealised concepts.

Content

- Introduction
  - Turbulence
  - Statistical treatment of turbulence, turbulent transport
  - Conservation equations in a turbulent flow
  - Closure problem and closure assumptions
  - Scaling and similarity theory
  - Spectral characteristics
  - Concepts for non-ideal boundary layer conditions

Lecture notes

available (i.e. in English)

Literature

Prerequisites / notice

Umwelt-Fluiddynamik (701-0479-00L) (environment fluid dynamics) or equivalent and basic knowledge in atmospheric science

Climate Processes and Feedbacks

Cloud Microphysics

W

4 credits

2V+1U

U. Lohmann, Z. H. A. Kanji

Clouds are a fascinating atmospheric phenomenon central to the hydrological cycle and the Earth`s climate. Interactions between cloud particles can result in precipitation, glaciation or evaporation of the cloud depending on its microstructure and microphysical processes.

Objective

The learning objective of this course is that students understand the formation of clouds and precipitation and can apply learned principles to interpret atmospheric observations of clouds and precipitation.

Content

see: http://www.iac.ethz.ch/edu/courses/master/modules/cloud-microphysics.html

Lecture notes

This course will be designed as a reading course in 1-2 small groups of 8 students maximum. It will be based on the textbook below. The students are expected to read chapters of this textbook prior to the class so that open issues, fascinating and/or difficult aspects can be discussed in depth.

Literature

Target group: Master students in Atmosphere and Climate

Land-Climate Dynamics

W

3 credits

2G

S. Seneviratne, E. L. Davin

The purpose of this course is to provide fundamental background on the role of land surface processes (vegetation, soil moisture dynamics, land energy and water balances) for the climate system. The course consists of 2 contact hours per week, including 2 computer exercises.

Objective

The students can understand the role of land processes and associated feedbacks for the climate system.

Lecture notes

Powerpoint slides will be made available

Prerequisites / notice

Prerequisites: Introductory lectures in atmospheric and climate science.

and/or

Atmospheric Composition and Cycles

Aerosols I: Physical and Chemical Principles

W

4 credits

2V+1U

M. Gysel, U. Baltensperger, H. Burtscher

Aerosols I deals with basic physical and chemical properties of aerosol particles. The importance of aerosols in the atmosphere and in other fields is discussed.

Objective

Knowledge of basic physical and chemical properties of aerosol particles and their importance in the atmosphere and in other fields is discussed.

Content

physical and chemical properties of aerosol, aerosol dynamics (diffusion, coagulation...), optical properties (light scattering, -absorption, -extinction), aerosol production, physical and chemical characterization.
Lecture notes material is distributed during the lecture

<table>
<thead>
<tr>
<th>102-0635-01L</th>
<th>Air Pollution Control</th>
<th>W 6 credits 4G</th>
<th>B. Buchmann, P. Hofer</th>
</tr>
</thead>
</table>

**Abstract**
The lecture provides in the first part an introduction to the formation of air pollutants by technical processes, the emission of these chemicals into the atmosphere and their impact on air quality. The second part covers different strategies and techniques for emission reduction. The basic knowledge is deepened by the discussion of specific air pollution problems, scrubbers with their different mechanisms (field forces, impaction and diffusion processes) and the modelling of these mechanisms.

**Objective**
- The students gain general knowledge of the factors resulting in air pollution and the techniques used for air pollution control. The students can identify major air pollution sources and understand the methods for measurement, data collection and analysis.
- The students can evaluate possible control methods and equipment, design a control system and estimate the efficiency and cost.
- The students know the different techniques of air pollution control and their scientific basements. They are able to incorporate goals concerning the air quality into their engineering work.

**Content**
- Part 1 Emission, Immission, Transmission
- Fluxes of pollutants and their environmental impact
- Physical and chemical processes leading to emission of pollutants
- Mass and energy of processes
- Emission measurement techniques and concepts
- Quantification of emissions from individual and aggregated sources
- Extent and development of the emissions (Switzerland and global)
- Propagation and transport of pollutants (transmission)
- Meteorological parameters influencing air pollution dispersion
- Deterministic and stochastic models, describing the air pollution dispersion
- Dispersion models (Gaussian model, box model, receptor model)
- Measurement concepts for ambient air (immersion level)
- Extent and development of ambient air mixing ratios
- Goal and instrument of air pollution control

Part 2 Air Pollution Control Technologies
- The reduction of the formation of pollutants is done by modifying the processes (pro-cess-integrated measures) and by different engineering operations for the cleaning of waste gas (downstream pollution control).
- It will be demonstrated, that the variety of these procedures can be traced back on the application of a few basic principles of physical chemistry.
- Procedures for the removal of particles (inertial separator, filter, cyclones, scrubbers) with their different mechanisms (field forces, impaction and diffusion processes) and the modelling of these mechanisms.
- Procedures for the removal of gaseous pollutants and the description of the driving forces involved, as well as the equilibrium and the kinetics of the relevant processes (absorption, adsorption as well as thermal, catalytic and biological conversions).
- Discussion of the technical possibilities to solve the actual air pollution problems.

**Lecture notes**
- Brititte Buchmann, Air pollution control, Part I
- Peter Hofer, Air pollution control, Part II
- Lecture slides and exercises

**Literature**
List of literature included in scrip

**Prerequisites / notice**
College lectures on basic physics, chemistry and mathematics

**Abstract**
The lecture gives an overview on the manifold reactions which occur in the gas phase, in stratospheric aerosol droplets and in polar cloud particles. The focus is on the chemistry of stratospheric ozone and its influence through natural and anthropogenic effects. Especially the intercontinental air traffic and the ozone depletion caused by CFCs affect the ozone hole and its regional parts. The greenhouse effect.

**Objective**
- Short presentation of thermodynamical and kinetic basics of chemical reactions: bi- and thermochemical reactions, photo-dissociation.
- Introduction to the chemical family concept: active species, their source gases and reservoir gases. Detailed treatment of the pure oxygen family (odd oxygen) according to the Chapman chemistry. Radical reactions of the oxygen species with nitric oxide, active halogens and odd hydrogen. Ozone depletion cycles. Methane depletion and ozone production in the lower stratosphere. Heterogeneous chemistry on background aerosol. Chemistry and dynamics of the ozone hole and its regional parts.

**Content**
- The lecture gives an overview on the manifold reactions which occur in the gas phase, in stratospheric aerosol droplets and in polar cloud particles. The focus is on the chemistry of stratospheric ozone and its influence through natural and anthropogenic effects. Especially the intercontinental air traffic and the ozone depletion caused by CFCs affect the ozone hole and its regional parts. The greenhouse effect.

**Lecture notes**
Documents are provided in the contact hours.

**Literature**

**Prerequisites / notice**
Prerequisites: Basics in physical chemistry are required and an overview equivalent to the bachelor course in atmospheric chemistry (lecture 701-0471-01) is expected.

- 701-1233-00 V starts in the first week of the semester. The exercises 701-1233-00 U will start only in the 2nd week of the semester.

**Abstract**
For this course the successful completion of the BSc-course "Geochemistry" (651-3400-00L) is a condition.

This course will introduce some of the main quantitative methods available for the quantitative treatment of geochemical data, as well as the main modelling tools. Emphasis will be on conceptual understanding of these methods as well as on their practical application, using key software packages to analyse real geochemical datasets.

**Objective**
Development of a basic knowledge and understanding of the main tools available for the quantitative analysis of geochemical data.
Content
The following approaches will be discussed in detail: major and trace element modelling of magmas, with application to igneous systems; methods and statistics for calculation of isochrons and model ages; reservoir dynamics and one-dimensional modelling of ocean chemistry; modelling speciation in aqueous (hydrothermal, fresh water sea water) fluids.

We will discuss how these methods are applied in a range of Earth Science fields, from cosmochemistry, through mantle and crustal geochemistry, volcanology and igneous petrology, to chemical oceanography.

A special emphasis will be put on dealing with geochemical problems through modeling. Where relevant, software packages will be introduced and applied to real geochemical data.

Lecture notes
Slides of lectures will be available.

Prerequisites / notice
Pre-requisite: Geochemistry (651-3400-00L), Isotope Geochemistry and Geochronology (651-3501-00L).

651-4057-00L Climate History and Palaeoclimatology
W 3 credits 2G S. Bernasconi, B. Ausin Gonzalez, A. Fernandez Bremer, A. Gilli

Abstract
The course "Climate history and palaeoclimatology gives an overview on climate through geological time and it provides insight into methods and tools used in palaeoclimatic research.

Objective
The student will have an understanding of evolution of climate and its major forcing factors -orbital, atmosphere chemistry, tectonics- through geological time. He or she will understand interaction between life and climate and he or she will be familiar with the use of most common geochemical climate "proxies", he or she will be able to evaluate quality of marine and terrestrial sedimentary paleoclimate archives. The student will be able to estimate rates of changes in climate history and to recognize feedbacks between the biosphere and climate.

Content
Climate system and earth history - climate forcing factors and feedback mechanisms of the geosphere, biosphere, and hydrosphere.
Geological time, stratigraphy, geological archives, climate archives, paleoclimate proxies
Climate through geological time: "lessons from the past"
Cretaceous greenhouse climate
The Late Paleocene Thermal Maximum (PETM)
Cenozoic Cooling
Onset and Intensification of Southern Hemisphere Glaciation
Onset and Intensification of Northern Hemisphere Glaciation
Pliocene warmth
Glacial and Interglacial
Millennial-scale climate variability during glaciations
The last deglaciation(s)
The Younger Dryas
Holocene climate - climate and societies

651-4043-00L Sedimentology II: Biological and Chemical Processes in Lacustrine and Marine Systems
Prerequisite: Successful completion of the MSc-course "Sedimentology I" (651-4041-00L).
W 3 credits 2G V. Picotti, A. Gilli

Abstract
The course will focus on biological and chemical aspects of sedimentation in marine environments. Marine sedimentation will be traced from coast to deep-sea. The use of stable isotopes palaeoceanography will be discussed. Neritic, hemipelagic and pelagic sediments will be used as proxies for environmental change during times of major perturbations of climate and oceanography.

Objective
-You will understand chemistry and biology of the marine carbonate system
-You will be able to relate carbonate mineralogy with facies and environmental conditions
-You will be familiar with cool-water and warm-water carbonates
-You will see carbonate and organic-carbon rich sediments as part of the global carbon cycle
-You will be able to recognize links between climate and marine carbonate systems (e.g. acidification of oceans and reef growth)
-You will be able to use geological archives as source of information on global change
-You will have an overview of marine sedimentation through time

Content
-carbonates, chemistry, mineralogy, biology
-carbonate sedimentation from the shell to the deep sea
-carbonate facies
-cool-water and warm-water carbonates
-organic-carbon and black shales
-C-cycle, carbonates, Corg : CO2 sources and sink
-Carbonates: their geochemical proxies for environmental change: stable isotopes, Mg/Ca, Sr
-marine sediments through geological time
-carbonates and evaporites
-lacustrine carbonates
-economic aspects of limestone

Lecture notes
no script. scientific articles will be distributed during the course

Literature
We will read and critically discuss scientific articles relevant for "biological and chemical processes in marine and lacustrine systems"

Prerequisites / notice
The grading of students is based on in-class exercises and end-semester examination.

Autumn Semester 2016

701-1251-00L Land-Climate Dynamics
W 3 credits 2G S. Seneviratne, E. L. Davin

Abstract
The purpose of this course is to provide fundamental background on the role of land surface processes (vegetation, soil moisture dynamics, land energy and water balances) for the climate system. The course consists of 2 contact hours per week, including 2 computer exercises.

Data: 06.10.2017 12:53
**Objective**

The students can understand the role of land processes and associated feedbacks for the climate system.

**Lecture notes**

Powerpoint slides will be made available.

**Prerequisites / notice**

Prerequisites: Introductory lectures in atmospheric and climate science

---

**102-0237-00L Hydrology II**

**W 3 credits 2G**

P. Burlando, S. Fatchi

**Abstract**

The course presents advanced hydrological analyses of rainfall-runoff processes. The course is given in English.

**Objective**

Tools for hydrological modelling are discussed at the event and continuous scale. The focus is on the description of physical processes and their modelisation with practical examples.

**Content**

**Lecture notes**

Parts of the script for "Hydrology I" are used. Also available are the overhead transparencies used in the lectures. The semester project consists of a two part instruction manual.

**Literature**

Additional literature is presented during the course.

---

**701-1253-00L Analysis of Climate and Weather Data**

**W 3 credits 2G**

C. Frei

**Abstract**

Observation networks and numerical climate and forecasting models deliver large primary datasets. The use of this data in practice and in research requires specific techniques of statistical data analysis. This lecture introduces a range of frequently used techniques, and enables students to apply them and to properly interpret their results.

**Objective**

Observation networks and numerical climate and forecasting models deliver large primary datasets. The use of this data in practice and in research requires specific techniques of statistical data analysis. This lecture introduces a range of frequently used techniques, and enables students to apply them and to properly interpret their results.

**Content**

Introduction into the theoretical background and the practical application of methods of data analysis in meteorology and climatology.

Topics: exploratory methods, hypothesis tests, analysis of climate trends, measuring the skill of climate and forecasting models, analysis of extreme events, principal component analysis and maximum covariance analysis.

**Lecture notes**

Documentation and supporting material include:
- documented view graphs used during the lecture
- exercise sets and solutions
- R-packages with software and example datasets for exercise sessions

**Literature**

Suggested literature:

**Prerequisites / notice**

Prerequisites: Atmosphäre, Mathematik IV: Statistik, Anwendungsnahes Programmieren.

---

**651-4053-05L Boundary Layer Meteorology**

**W 4 credits 3G**

M. Rotach, P. Calanca

**Abstract**

The Planetary Boundary Layer (PBL) constitutes the interface between the atmosphere and the Earth's surface. Theory on transport processes in the PBL and their dynamics is provided. This course treats theoretical background and idealized concepts. These are contrasted to real world applications and current research issues.

**Objective**

Overall goals of this course are given below. Focus is on the theoretical background and idealised concepts.

Students have basic knowledge on atmospheric turbulence and theoretical as well as practical approaches to treat Planetary Boundary Layer flows. They are familiar with the relevant processes (turbulent transport, forcing) within, and typical states of the Planetary Boundary Layer. Idealized concepts are known as well as their adaptations under real surface conditions (as for example over complex topography).

**Content**

- Introduction
- Turbulence
- Statistical treatment of turbulence, turbulent transport
- Conservation equations in a turbulent flow
- Closure problem and closure assumptions
- Scaling and similarity theory
- Spectral characteristics
- Concepts for non-ideal boundary layer conditions

**Lecture notes**

available (i.e. in English)

**Literature**

**Prerequisites / notice**

Umwelt-Fluidynamik (701-0479-00L) (environment fluid dynamics) or equivalent and basic knowledge in atmospheric science

---

**Electives**

*The students are free to choose individually from the entire course offer of ETH Zürich and the universities of Zürich and Bern.*

#### Weather Systems and Atmospheric Dynamics

**Courses are only offered in FS.**

#### Climate Processes and Feedbacks

*Two additional courses are offered in HS by University of Berne.*

---

**701-1221-00L Dynamics of Large-Scale Atmospheric Flow**

**W 4 credits 2V+1U**

H. Wernli, S. Pfahl

**Abstract**

Dynamic, synoptic Meteorology

**Objective**

Understanding the dynamics of large-scale atmospheric flow
Content
Dynamical Meteorology is concerned with the dynamical processes of the earth's atmosphere. The fundamental equations of motion in the atmosphere will be discussed along with the dynamics and interactions of synoptic system - i.e. the low and high pressure systems that determine our weather. The motion of such systems can be understood in terms of quasi-geostrophic theory. The lecture course provides a derivation of the mathematical basis along with some interpretations and applications of the concept.

Abstract
Clouds are a fascinating atmospheric phenomenon central to the hydrological cycle and the Earth’s climate. Interactions between cloud particles can result in precipitation, glaciation or evaporation of the cloud depending on its microstructure and microphysical processes.

Objective
The learning objective of this course is that students understand the formation of clouds and precipitation and can apply learned principles to interpret atmospheric observations of clouds and precipitation.

Content
see: http://www.iac.ethz.ch/edu/courses/master/modules/cloud-microphysics.html

Lecture notes
This course will be designed as a reading course in 1-2 small groups of 8 students maximum. It will be based on the textbook below. The students are expected to read chapters of this textbook prior to the class so that open issues, fascinating and/or difficult aspects can be discussed in depth.

Students are able to:
- characterize quantitative knowledge needed to measure and parameterize structural, flow and transport properties of partially-saturated porous media,
- quantify driving forces and resulting fluxes of water, solute, and heat in soils,
- apply modern measurement methods and analytical tools for hydrological data collection
- conduct and interpret a limited number of experimental studies
- explain links between physical processes in the vadose-zone and major societal and environmental challenges

Soil Water Content and its Measurement - Definitions; measurement methods - gravimetric, neutron scattering, gamma attenuation; and time domain reflectometry; soil water storage and water balance.

Weeks 4 to 5: Soil Water Retention and Potential (Hydrostatics) - The energy state of soil water; total water potential and its components; properties of water (molecular, surface tension, and capillary rise); modern aspects of capillarity in porous media; units and calculations and measurement of equilibrium soil water potential components; soil water characteristic curves definitions and measurements; parametric models; hysteresis. Modern aspects of capillarity

Demo-Lab: Laboratory methods for determination of soil water characteristic curve (SWC), sensor pairing

Weeks 6 to 9: Water Flow in Soil - Hydrodynamics:
Part 1 - Laminar flow in tubes (Poiseille's Law); Darcy's Law, conditions and states of flow; saturated flow; hydraulic conductivity and its measurement.

Lab #1: Measurement of saturated hydraulic conductivity in uniform and layered soil columns using the constant head method.

Part 2 - Unsaturated steady state flow; unsaturated hydraulic conductivity models and applications; non-steady flow and Richards Eq.; approximate solutions to infiltration (Green-Ampt, Philip); field methods for estimating soil hydraulic properties.

Midterm exam

Lab #2: Measurement of vertical infiltration into dry soil column - Green-Ampt, and Philip's approximations; infiltration rates and wetting front propagation.

Part 3 - Use of Hydrus model for simulation of unsaturated flow

Week 10 to 11: Energy Balance and Land Atmosphere Interactions - Radiation and energy balance; evapotranspiration definitions and estimation; transpiration, plant development and transpiration coefficients small and large scale influences on hydrological cycle; surface evaporation.

Week 12 to 13: Solute Transport in Soils Transport mechanisms of solutes in porous media; breakthrough curves; convection-dispersion eq.; solutions for pulse and step solute application; parameter estimation; salt balance.

Lab #3: Miscible displacement and breakthrough curves for a conservative tracer through a column; data analysis and transport parameter estimation.

Additional topics:
Temperature and Heat Flow in Porous Media - Soil thermal properties; steady state heat flow; nonsteady heat flow; estimation of thermal properties; engineering applications.

Biological Processes in the Vadose Zone An overview of below-ground biological activity (plant roots, microbial, etc.); interplay between physical and biological processes. Focus on soil-atmosphere gaseous exchange; and challenges for bio- and phytoremediation.

Classnotes on website: Vadose Zone Hydrology, by Or D., J.M. Wraith, and M. Tuller (available at the beginning of the semester)
http://www.step.ethz.ch/education/active-courses/vadose-zone-hydrology

Prerequisites

The definition of prerequisites is part of the admission procedure for the master studies. You are informed by the admission office as to which courses of the section «prerequisites» you have to catch up with. You are accredited for these courses in the electives block of the master studies.

Objective

The lecture provides an introduction to atmospheric chemistry at bachelor level. It introduces the kinetics of gas phase and heterogeneous reactions on aerosols and in clouds and explains the chemical and physical mechanisms responsible for global (e.g. stratospheric ozone depletion) as well as regional (e.g. urban air pollution) environmental problems.

The students will understand the basics of gas phase and heterogeneous reactions and will know the most relevant atmospheric chemical processes taking place in the gas phase as well as between different phases including aerosols and clouds. The students will also acquire a good understanding of atmospheric environmental problems including air pollution, stratospheric ozone destruction and changes in the oxidative capacity of the global atmosphere.

Autumn Semester 2016
The students are able to

- explain up-to-date meteorological observation techniques and the basic methods of theoretical atmospheric dynamics
- to discuss the mathematical basis of atmospheric dynamics, based on selected atmospheric flow phenomena
- to explain how mountains influence the atmospheric flow on different scales

Abstract

We will explain the fundamentals of physics of glaciers which are necessary for treating applied problems. We will go into climate-glacier interactions, flow of glaciers, lake ice and hydrology of glaciers.

Objective

To understand the fundamental physical processes in glaciology.

To learn some basic numerical modelling techniques for glacier flow.

To identify glaciological hazards and to learn some assessment and mitigation possibilities.

Content

Basics in physical glaciology
Dynamics of glaciers: deformation of glacier ice, role of water in glacier motion, reaction of glaciers to climate changes, glacier calving, surges
Ice falls, ice avalanches
Glacier floods
Lake ice and bearing capacity

Lecture notes

Handouts are available

Literature

Relevante Literatur wird während der Vorlesung angegeben.

Prerequisites / notice

Für aktuelle Fallbeispiele werden risikobasierte Massnahmen bei glaziologischen Naturgefahren diskutiert.

Voraussetzungen: Es werden Grundkenntnisse in Mechanik und Physik vorausgesetzt.

651-1313-00L

Number

Isotopic and Organic Tracers in Biogeochemistry

W

3 credits

2G

R. Kipfer, S. Ladd

Abstract

The course introduces the scientific concepts and typical applications of tracers in biogeochemistry. The course covers stable and radioactive isotopes, geochemical tracers and biomarkers and their application in biogeochemical processes as well as regional and global cycles. The course provides essential theoretical background for the lab course "Isotopic and Organic Tracers Laboratory".

Objective

The course aims at understanding the fractionation of stable isotopes in biogeochemical processes. Students learn to know the origin and decay modes of relevant radiogenic isotopes. They discover the spectrum of possible geochemical tracers and biomarkers, their potential and limitations and get familiar with important applications

Content

Geogenic and cosmogenic radionuclides (sources, decay chains); stable isotopes in biogeochemistry (natural abundance, fractionation); geochemical tracers for processes such as erosion, productivity, redox fronts; biomarkers for specific microbial processes.

Lecture notes

Handouts will be provided for every chapter

Literature

A list of relevant books and papers will be provided

Prerequisites / notice

Students should have a basic knowledge of biogeochemical processes (BSc course on Biogeochemical processes in aquatic systems or equivalent)

701-1315-00L

Number

Biogeochemistry of Trace Elements

W

3 credits

2G

A. Voegelin, M. Etique, L. Winkel

Abstract

The course addresses the biogeochemical classification and behavior of trace elements, including key processes driving the cycling of important trace elements in aquatic and terrestrial environments and the coupling of abiotic and biotic transformation processes of trace elements. Examples of the role of trace elements in natural or engineered systems will be presented and discussed in the course.
Objective: The students are familiar with the chemical characteristics, the environmental behavior and fate, and the biogeochemical reactivity of different groups of trace elements. They are able to apply their knowledge on the interaction of trace elements with geosphere components and on abiotic and biotic transformation processes of trace elements to discuss and evaluate the behavior and impact of trace elements in aquatic and terrestrial systems.

Content: (i) Definition, importance and biogeochemical classification of trace elements. (ii) Key biogeochemical processes controlling the cycling of different trace elements (base metals, redox-sensitive and chalcophile elements, volatile trace elements) in natural and engineered environments. (iii) Abiotic and biotic processes that determine the environmental fate and impact of selected trace elements.

Lecture notes: Selected handouts (lecture notes, literature, exercises) will be distributed during the course.

Prerequisites: Students are expected to be familiar with the basic concepts of aquatic and soil chemistry covered in the respective classes at the bachelor level (soil mineralogy, soil organic matter, acid-base and redox reactions, complexation and sorption reactions, precipitation/dissolution reactions, thermodynamics, kinetics, carbonate buffer system).

This lecture is a prerequisite for attending the laboratory course "Trace elements laboratory".

701-1341-00L Water Resources and Drinking Water W 3 credits 2G S. Hug, M. Berg, F. Hammes, U. von Gunten

Abstract: The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. Natural processes, anthropogenic pollution, legislation of groundwater and surface water and of drinking water as well as water treatment will be discussed for industrialized and developing countries.

Objective: The goal of this lecture is to give an overview over the whole path of drinking water from the source to the tap and understand the involved physical, chemical and biological processes which determine the drinking water quality.

Content: The course covers qualitative (chemistry and microbiology) and quantitative aspects of drinking water from the resource to the tap. The various water resources, particularly groundwater and surface water, are discussed as part of the natural water cycle influenced by anthropogenic activities such as agriculture, industry, urban water systems. Furthermore, legislation related to water resources and drinking water will be discussed. The lecture is focused on industrialized countries, but also addresses global water issues and problems in the developing world. Finally, unit processes for drinking water treatment (filtration, adsorption, oxidation, disinfection etc.) will be presented and discussed.

Lecture notes: Handouts will be distributed

Literature: Will be mentioned in handouts

701-1346-00L Carbon Mitigation W 3 credits 2G N. Gruber

Abstract: Future climate change can only be kept within reasonable bounds when CO2 emissions are drastically reduced. In this course, we will discuss a portfolio of options involving the alteration of natural carbon sinks and carbon sequestration. The course includes introductory lectures, presentations from guest speakers from industry and the public sector, and final presentations by the students.

Objective: The goal of this course is to investigate, as a group, a particular set of carbon mitigation/sequestration options and to evaluate their potential, their cost, and their consequences.

Content: From the large number of carbon sequestration/mitigation options, a few options will be selected and then investigated in detail by the students. The results of this research will then be presented to the other students, the involved faculty, and discussed in detail by the whole group.

Lecture notes: None

Literature: Will be identified based on the chosen topic.

Prerequisites / notice: Exam: No final exam. Pass/No-Pass is assigned based on the quality of the presentation and ensuing discussion.

Minor in Global Change and Sustainability

<td>Seminar on Transdisciplinary Research for Sustainable Development</td>
<td>W</td>
<td>2 credits</td>
<td>2S</td>
<td>C. E. Pohl, M. Stauffacher</td>
</tr>
</tbody>
</table>

Abstract: The seminar is designed for students and researchers (MA, PhD, PostDoc) who use inter- and transdisciplinary elements in their projects. It addresses the challenges of this research: How to integrate disciplines? How (and in what role) to include societal actors? How to bring results to fruition? We discuss these questions based on case studies and theories and on the participant's projects.

Objective: The participants understand the specific challenges of inter- and transdisciplinary research in general and in the context of sustainable development in particular. They know methods and concepts to address these challenges and apply them to their research projects.

Content: The seminar covers the following topics:
(1) Theories and concepts of inter- and transdisciplinary research
(2) The specific challenges of inter- and transdisciplinary research
(3) Involving stakeholders
(4) Collaborating disciplines
(5) Exploration of tools and methods
(6) Analysing participants' projects to improve inter- and transdisciplinary elements

Literature: Literature will be made available to the participants

Prerequisites / notice: The seminar is specifically suitable for PhD or PostDoc researchers. It is open to master students (minor "global change and sustainability") and further interested people, who preferably are preparing, or working on, a project/thesis.

701-1551-00L Sustainability Assessment W 3 credits 2G P. Krüttli, C. E. Pohl

Abstract: The course deals with the concepts and methodologies for the analysis and assessment of sustainable development. A special focus is given to the social dimension and to social justice as a guiding principle of sustainability as well as to trade-offs between the three dimensions of sustainability.

Objective: At the end of the course, students should know:
- core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.
The course is structured as follows:
- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;
- Trade-offs in selected examples.

Abstract

In this seminar, the process of writing a scientific proposal will be introduced. The essential elements of a proposal, including the peer review process, will be outlined and class exercises will train scientific writing skills. Knowledge exchange between class participants is promoted through the preparation of a master thesis proposal and evaluation of each other's work.

Objective

Training scientific writing skills.

Content

In this seminar, the process of writing a scientific proposal will be introduced. The essential elements of a proposal, including the peer review process, will be outlined and class exercises will train scientific writing skills. Knowledge exchange between class participants is promoted through the preparation of a master thesis proposal and evaluation of each other's work.

Prerequisites / notice

Attendance is mandatory.

Literature

Fundamentals of chemistry, physics and thermodynamics are a prerequisite for this course.

Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.
In this seminar scientific project management is introduced and applied to your master project. The course concludes with a presentation of your project including an overview of the science and a discussion of project management techniques applied to your thesis project.

**701-1213-00L Introduction Course to Master Studies Atmosphere and Climate**

**Abstract**
New master students are introduced to the atmospheric and climate research field through keynotes given by the programme's professors. In several self-assessment and networking workshops they get to know each other and find their position in the science.

**Objective**
The aims of this course are i) to welcome all students to the master program and to ETH, ii) to acquaint students with the faculty teaching in the field of atmospheric and climate science at ETH and at the University of Bern, iii) that the students get to know each other and iv) to assess needs and discuss options for training and education of soft-skills during the Master program and to give an overview of the study options in general.

**Laboratory and Field Courses**
The course in the category «lab and field work» are only offered in spring semester.

**Master's Thesis**

Only students who fulfill the following criteria are allowed to begin with their master thesis:
- a. successful completion of the bachelor programme;
- b. fulfilling of any additional requirements necessary to gain admission to the master programme.

The master thesis is under the supervision of a professor teaching in the module courses of the master programme. Please refer to the web page linked here for instructions and guidelines how to register for the master thesis (http://www.iac.ethz.ch/education/master/curriculum/master/thesis/)

**Course Units for Additional Admission Requirements**

**Abstract**
This is a self-study course targeted at Master students who did not follow the bachelor course "atmospheric chemistry" or similar. The course provides a general introduction into atmospheric chemistry.

**Objective**
The learning target of this lecture is a general overview on the most important processes of atmospheric chemistry and the various problems of the anthropogenic change in the structure of Earth's atmosphere.

**Content**
- Origin and properties of the atmosphere: structure, large scale dynamics, UV radiation
- Thermodynamics and kinetics of gas phase reactions: enthalpy and free energy of reactions, rate laws, mechanisms of bimolecular and termolecular reactions.
- Tropospheric photochemistry: Photolysis reactions, photochemical C3 formation, role and budget of HOx, dry and wet deposition
- Aerosols and clouds: chemical properties, primary and secondary aerosol sources
- Multiphase chemistry: heterogeneous kinetics, solubility and hygroscopicity, N2O5 chemistry, SO2 oxidation, secondary organic aerosols
- Air quality: role of planetary boundary layer, summer- versus winter-smog, environment, particulate problems, legislation, long-term trends
- Stratospheric chemistry: Chapman cycle, Brewer-Dobson circulation, catalytic ozone destruction cycles, polar ozone hole, Montreal protocol
- Global aspects: global budgets of ozone, methane, CO and NOx, air quality - climate interactions

**Prerequisites / notice**
Basic courses in chemistry and physics are expected

Abstract
The fundamental background of cloud and precipitation formation (including thermodynamics and aerosol physics) and their relevance for climate are discussed.

Objective
The students can appreciate the processes leading to cloud and precipitation formation and their importance for climate.

Content
Moist processes/thermodynamics; aerosol physics; cloud formation; precipitation processes, storms; importance of aerosols and clouds for climate; measurements of clouds (radar and satellites)

Lecture notes
Powerpoint slides and script will be made available

Literature
Rogers and Yau, A Short Course in Cloud Physics, Pergamon Press, 1989; Wallace and Hobbs, Atmospheric Science: An Introductory Survey, Elsevier, 2006

701-0473-AAL Weather Systems E- 3 credits 6R M. A. Sprenger, C. Grams

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situtations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer

Objective
Introduction to basic aspects of atmospheric dynamics. Focus is given to the global-scale atmospheric circulation, synoptic-scale processes (in particular low-pressure systems), and the influence of mountains on the atmospheric flow.

Content
Satellite observations; analysis of vertical soundings; geostrophic and thermal wind; cyclones at mid-latitude; global circulation; north-atlantic oscillation; atmospheric blocking situtations; Eulerian and Lagrangian perspective; potential vorticity; Alpine dynamics (storms, orographic wind); planetary boundary layer

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

Objective
This lecture imparts the mathematical basis necessary for the development and application of numerical models in the field of Environmental Science. The lecture material includes an introduction into numerical techniques for solving ordinary and partial differential equations, as well as exercises aimed at the realization of simple models.

Content
Classification of numerical problems, introduction to finite-difference methods, time integration schemes, non-linearity, conservative numerical techniques, an overview of spectral and finite-element methods. Examples and exercises from a diverse cross-section of Environmental Science.

Lecture notes
Lecture notes and slides

Literature
Is provided (CHF 10.- per copy).

Three obligatory exercises, each two hours in length, are integrated into the lecture. The implementation language is Matlab (previous experience not necessary: a Matlab introduction is given). Example programs and graphics tools are supplied.

701-1901-AAL Systems Analysis E- 4 credits 6R N. Gruber

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
Self study course in Systems Analysis to fulfill requirements for enrollment into the master program. Topics covered include linear box models with one and several variables; non-linear box models with one or several variables; discrete-time models; and continuous models in space and time.

Objective
The aim of this course is to develop an understanding of the dynamical behavior of environmental systems and how this behavior can be captured and understood using mathematical concepts.

Lecture notes

701-0106-AAL Mathematics V: Applied Deepening of Mathematics I - III E- 3 credits 6R M. A. Sprenger

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Abstract
Selected mathematical topics are presented for later use in more specialised lectures. Part of the topics were already discussed in the lectures Mathematics I-III. Here, they should be shortly recapitulated and most importantly applied to practical problems. If necessary, new mathematical concepts and methods will be introduced in order to solve challenging and inspiring problems from practice.

Objective
The aim of this lecture is to prepare the students for the more specialised lectures. They should become more familiar with the mathematical background, the mathematical concepts and most of all with their application and interpretation.

Content
Practical examples from the following areas will be discussed: ordinary differential equations; eigenvvalue problems from linear algebra; systems of linear and nonlinear differential equations; partial differential equations (diffusion, transport, waves).

|              | Number of participants limited to 30. This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)". |      |      |       |                      |
|              | Abstract                                                              |      |      |       |                      |
|              | The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed. |      |      |       |                      |
Anyone wishing to be a successful teacher must first of all understand the learning process. Against this background, theories and findings from the learning sciences are critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and meetings with those will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

Objectives
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

851-0242-08L Research Methods in Educational Science
- 1 credit
- 1S
- P. Edelsbrunner, B. Rütsche, E. Stern, E. Ziegler

Abstract
Literature from the learning sciences is critically discussed with a focus on research methods. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

No enrollment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: 200a968

Mind the enrollment deadlines at UZH:
http://www.uzh.ch/studies/application/mobilitaet_en.html

Objectives
- At the end of the seminar, participants will be in a position to:
  - describe the scientific fundamentals of test theory and test structure.
  - evaluate examples of scientifically-developed tests in their application context.
  - if necessary, critically question the performance assessment that they employ in practice and professionalise it still further.

Content
Die konkreten Inhalte des Seminars ergeben sich aufgrund der Präferenzen der Teilnehmenden und der daraus abgeleiteten Themenübersicht für Vorträge und Seminararbeiten. Im Rahmen der Startveranstaltung wird eine Liste mit möglichen Themen abgegeben und erläutert. Schwerpunkte der Themenvorschläge sind:
- Testentwicklung
- Gütekriterien von Tests
- Aufgabenkonstruktion
- Datenauswertung
- Rasch-Modell
- Internationale Vergleichstests
- Zulassungsassessments

Lecture notes
Im Verlaufe des Semesters werden einzelne Unterlagen in den Veranstaltungen abgegeben. Dazu gehören auch die Handouts der verschiedenen, studentischen Vorträge.

Literature
Als Grundlagenliteratur werden folgende Werke empfohlen:
- Weitere Literatur wird in der Lehrveranstaltung genannt.

Prerequisites / notice
Die Leistungsanforderungen richten sich im Umgang nach der Zahl zu erwerbender ECTS-Punkte, wobei 1 ECTS-Punkt einem Zeitaufwand von ca. 30 Arbeitsstunden entspricht. ETHZ-Studierende können im Rahmen dieser Veranstaltung 3 ECTS-Punkte erwerben. Dazu sind folgende Leistungen zu erbringen:
- Präsenz und aktive mündliche Mitarbeit in der Lehrveranstaltung (MA)
- Referat (RE)
- Schreiben einer schriftlichen Arbeit

Weitere Angaben zu den Leistungsanforderungen werden im Rahmen der Startveranstaltung abgegeben und erläutert.

Educational Science Teaching Diploma

851-0240-03L Introduction to Test Theory and Test Construction in Educational Contexts (University of Zürich)
- 4 credits
- 2S
- University lecturers

Abstract
In this seminar, students establish the scientific fundamentals of performance measurement and educational diagnostics and study them on the basis of different current issues.

Objectives
At the end of the seminar, participants will be in a position to:
- understand research methods used in the empirical human sciences
- understand pedagogically relevant findings from the empirical educational sciences

Content
This course unit can only be enrolled after successful completion of the course "Introduction to Test Theory and Test Construction in Educational Contexts (University of Zürich)". It is about learning in childhood and adolescence.

Lecture notes
Folien werden zur Verfügung gestellt.
This is a mandatory course for students of the teacher's diploma for secondary schools, who have not completed the course 851-0238-01L "Outdoor Education: Concepts and Practice" (851-0242-02L) and for students who intend to enrol in the "Teaching Diploma". Enrolment only possible with matriculation in Teaching Diploma (except for students of Sport Teaching Diploma, who complete the sport-specific course unit EW4) and for students who intend to enrol in the "Teaching Diploma".

Prerequisites: successful participation in 851-0240-00L "Human Learning (EW1)".

The theoretical foundations will be taught in workshops which contain different means of activation and interaction such as group work, panel discussions, and individual work. Subsequently, this knowledge will be transferred and applied in different school-relevant situations by means of role plays, discussing of cases and video sequences, as well as reflections of practical experiences.

Forms of learning

Theoretical foundations will be taught in workshops which contain different means of activation and interaction such as group work, panel discussions, and individual work. Subsequently, this knowledge will be transferred and applied in different school-relevant situations by means of role plays, discussing of cases and video sequences, as well as reflections of practical experiences.

Lecture notes

Slides of the lecturer's presentations, supplementary materials, and materials for further reading are made available on Moodle.

Literature

Verschiedenen Grundlagen- und Anwendungstexte werden den Studierenden zur Verfügung gestellt.

Prerequisites / notice

Für eine reibungslose Semesterplanung wird um persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

This is a mandatory course for students of the teacher's diploma for secondary schools, who have not completed the course 851-0238-01L "Unterstützung und Diagnose von Wissenserwerbsprozessen" (EW 3) until the end of spring semester 2014 (except for students of Sport Teaching Diploma, who have completed the sport-specific course units EW2-4). The successful completion of ALL modules relevant for the teacher's diploma is required for participation in this course.

Prerequisites / notice

The students have to read the book "Lernwirksam unterrichten" from Felten/Stern and they have to answer the questions addressed on http://www.ifvll.ethz.ch/studium/lehre/ew-5.html. In individual or small-group sessions, Elisabeth Stern and the students will discuss how insights from learning research can inform classroom practice.
The focus of all classes on educational psychology is on scientific insights which help to reflect on instructional learning. In order to become professionals, teachers have to better understand students' behavior and achievement and thereby become aware of their scope of classroom practice. Students get a final opportunity to ask questions about psychological learning research.

Buch "Lernwirksam unterrichten" (Fetzen/Stern)

Detailed information: http://www.ifvll.ethz.ch/studium/lehre/ew-5.html

851-0242-07L Human Intelligence
Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).
Number of participants limited to 30.
This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)"

Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

Abstract
The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

851-0242-09L Student Research Projects: Practical Research on Learning and Instruction
Number of participants limited to 20.
The successful completion of both course no. 851-0240-00L "Menschliches Lernen (EW 1)" and course no. 851-0239-01L "Unterstützung und Diagnose von Wissenserwerbsprozessen (EW 3)" is a necessary prerequisite for this course.

Objective
- Getting to know cognitively activating instructions in MINT subjects
- Understanding findings from the empirical educational sciences
- Getting to know intelligence tests
- Understanding research methods used in the empirical human sciences

Prerequisites / notice
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

851-0242-06L Cognitively Activating Instructions in MINT Subjects
Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).

Objective
- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

Prerequisites / notice
Für eine reibungslose Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

851-0242-08L Research Methods in Educational Science
Enrolment only possible with matriculation in Teaching Diploma or Teaching Certificate (excluding Teaching Diploma Sport).
Number of participants limited to 30.

Objective
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

851-0250-05L Introduction to "Nature of Science" and "Scientific Inquiry"
Enrolment only possible with matriculation in Teaching Diploma (excluding Teaching Diploma Sport).
Number of participants limited to 20.

Objective
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: 090LLB1
Simultaneous enrolment in course “Lehr- und Lernort Berufsfachschule II: Förderung und Unterstützung von Lernenden” (UZH Module Code: 090LLB2) is compulsory.
Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract

The Vocational Schools as Sites of Teaching and Learning - Teaching Structure sets out and discusses how to implement the specifications in the framework curriculum. This module is aimed at teachers in high schools awarding vocational school-leaving certificates (Berufsmatura) and all types of vocational schools. It also covers the link established with the company as a learning location.

Objective

- Formulating learning objectives at different levels, and implementing and monitoring these.
- Steering tuition in terms of content and method to fit in with the objectives.
- Formulating examination questions and assignments on the basis of the learning objectives set out in the curriculum and the teaching given.
- Selectively deploying different examination types and procedures/structuring selected learning contents logically in terms of the subject matter and learning process (from the concrete to the abstract, from the simple to the complex) and implementing these with different didactic visual aids.

Content

In der Veranstaltung werden die Rahmen- und Schullehrpläne der Berufsmaturität (alle Richtungen) analysiert und deren Fachinhalt in Übungen und Hospitalitäten didaktisch umgesetzt. Der Unterricht an der Berufsmaturität wird im Hinblick auf die Herausforderung "Viel Stoff-wenig Zeit" erarbeitet.

Lecture notes

Von den Dozierenden.

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: 090LLB2
Simultaneous enrolment in course “Lehr- und Lernort Berufsfachschule I: Unterrichtsgestaltung” (UZH Module Code: 090LLB1) is compulsory.
Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract

The module "vocational schools as sites of teaching and learning: providing encouragement and support for apprentices" aims to provide teachers at VET and professional baccalaureate institutions with ways of dealing with learners problems, particularly in connection with their being fed up with school, with job-seeking, school-to-work transition, or continuing education.

Objective

- Die spezielle Situation der Berufsfremden in ihrer Doppelbelastung Beruf und Schule wahrnehmen und pädagogisch berücksichtigen können.
- Die Übertrittsthematik in Bezug auf die Leistungsmotivation kennen Mit Konflikten, Störungen und allgemein schwierigen Situationen im BM-Unterricht lösungsorientiert umgehen können.
- Krisenentwicklungen diagnostizieren und fördernde Massnahmen ergreifen.
- Wesentliche Aspekte eines förder- und Unterstützungsorientierten Unterrichtsmagements kennen.
- Rollensicherheit als Lehrperson finden und deren Grenzen definieren.
- Einblicke in die konkrete Ausbildungssituation der Berufsfremden gewinnen.

Content

- Positionierung des Berufsfachschulunterrichts innerhalb des dualen (trialen) Systems.
- Berufsmaturität: Entwicklung von Kernkompetenzen für die Wirtschaft?
- "Verakademisierung" der Berufsbildung?
- "Sozialisations- und Lernprozesse im beruflichen Umfeld / Führungsverständnis im Umgang mit Jugendlichen an Berufsfachschulen."
- Konfliktmanagement I: Wahrnehmungsinstrumente und Interventionssstrategien, Konfliktprävention und niederschwelliges Konfliktmanagement.
- Konfliktmanagement II: Der ressourcenorientierte Ansatz im Umgang mit Störungen.
- Das lösungsorientierte Konfliktgespräch in schulischen Kontext / Beratung und Coaching: Beratungssituationen im Kontext des Unterrichtsalltags.
- Rollenverständnis und Rollengrenzen.
- Berufsfremdenorientiertes Unterrichtsmangement.
- Mobbing in der Schule.
- Konzepte und Praxis der betrieblichen Betreuung und Förderung.
- Jugendkriminalität und Jugendgewalt.
- Jugendkrisen und Krisenintervention.

### Introduction to Test Theory and Test Construction in Educational Contexts (University of Zürich)

Enrolment only possible with Teaching Diploma or DC matriculation.

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

UZH Module Code: 200a968

Mind the enrolment deadlines at UZH: http://www.uzh.ch/studies/application/mobilitaet_en.html

#### Abstract

In this seminar, students establish the scientific fundamentals of performance measurement and educational diagnostics and study them on the basis of different current issues.

#### Objective

- describe the scientific fundamentals of test theory and test structure.
- evaluate examples of scientifically-developed tests in their application context.
- if necessary, critically question the performance assessment that they employ in practice and professionalise it still further.

#### Content

The concrete contents of the seminar arise from the preferences of the participants and those derived therefrom. At the end of the seminar, participants will be in a position to

- get information about recent literature on learning and instruction
- get to know cognitively activating instructions in MINT subjects
- get to know and critically question the performance assessment that they employ in practice and professionalise it still further
- evaluate examples of scientifically-developed tests in their application context
- describe the scientific fundamentals of test theory and test structure
- if necessary, critically question the performance assessment that they employ in practice and professionalise it still further

#### Literature

- Weitere Literatur wird in der Lehrveranstaltung genannt.

#### Prerequisites / notice

The seminar is recommended for students who have already attended MINT subjects at university level, for students who have participated in, or during enrollment in the course "Human Intelligence (EW 1)". This course can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

#### Prerequisites / notice

- Zulassungstests
- Internationale Vergleichstests
- Rasch-Modell
- Datenauswertung
- Aufgabenkonstruktion
- Gütekriterien von Tests

#### Prerequisites / notice

Die konkreten Inhalte des Seminars ergeben sich aufgrund der Präferenzen der Teilnehmenden und der daraus abgeleiteten Themenübersicht für Vorträge und Seminararbeiten. Im Rahmen der Startveranstaltung wird eine Liste mit möglichen Themen abgegeben und erläutert. Schwerpunkte der Themenvorschläge sind:

- Testentwicklung
- Referat (RE)
- Pflichtlektüre entsprechend der Angaben in der Lehrveranstaltung
- Referat (RE)
- Schreiben einer schriftlichen Arbeit
- Präsentationen aus der Praxis

Weitere Angaben zu den Leistungsanforderungen werden im Rahmen der Startveranstaltung abgegeben.

Im Rahmen der Startveranstaltung wird eine Liste mit möglichen Themen abgegeben und erläutert. Schwerpunkte der Themenvorschläge sind:

- Testentwicklung
- Gütekriterien von Tests
- Aufgabenkonstruktion
- Datenauswertung
- Rasch-Modell
- Internationale Vergleichstests
- Zulassungstests

- Evaluation of scientifically-developed tests in their application context
- Description of the scientific fundamentals of test theory and test structure
- If necessary, critical examination of the performance assessment that they employ in practice and professionalisation thereof

#### Literature

For a smooth semester planning, early registration and personal attendance at the first lecture meeting.

#### Prerequisites / notice

The seminar is recommended for students who have already attended MINT subjects at university level, for students who have participated in, or during enrollment in the course "Human Intelligence (EW 1)". This course can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

#### Prerequisites / notice

- Zulassungstests
- Internationale Vergleichstests
- Rasch-Modell
- Datenauswertung
- Aufgabenkonstruktion
- Gütekriterien von Tests

#### Literature

In the colloquium, we discuss scientific projects concerning the teaching in mathematics, computer science, natural sciences and technology (STEM). The colloquium is conducted by the professorships participating in the Competence Center EducETH (ETH) and in the Institute for Educational Sciences (UZH).

#### Prerequisites / notice

The seminar is recommended for students who have already attended MINT subjects at university level, for students who have participated in, or during enrollment in the course "Human Intelligence (EW 1)". This course can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

#### Prerequisites / notice

For a smooth semester planning, early registration and personal attendance at the first lecture meeting.
The focus will be on the book "Intelligenz: Grosse Unterschiede und ihre Folgen" by Stern and Neubauer. Participation at the first meeting is obligatory. It is required that all participants read the complete book. Furthermore, in two meetings of 90 minutes, concept papers developed in small groups (5 - 10 students) will be discussed.

Objective
- Understanding of research methods used in the empirical human sciences
- Getting to know intelligence tests
- Understanding findings relevant for education

Abstract
Literature from the learning sciences is critically discussed with a focus on research methods. At the first meeting, working groups will be assembled and meetings with those will be set up. In the small groups students will write critical essays about the read literature. At the third meeting, we will discuss the essays and develop research questions in group work.

Objective
- Understand research methods used in the empirical educational sciences
- Understand and critically examine information from scientific journals and media
- Understand pedagogically relevant findings from the empirical educational sciences

The successful completion of both course no. 851-0240-00L "Menschliches Lernen (EW 1)" and course no. 851-0238-01L "Unterstützung und Diagnose von Wissenserwerbsprozessen (EW 3)" is a necessary prerequisite for this course.

Abstract
In teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturer in this course. Basic conceptual and methodological issues are the topic of a series of plenary meetings; however, the major part of the work is done in small-group meetings with the advising researcher, and in self-directed research projects.

Objective
The course is targeted at advanced students who have taken an interest in gathering practical research experience in the field of Learning & Instruction. In teams of two, students conduct their own research projects (planning, conducting, analyzing, interpreting, and presenting research); thus, the course requires a high amount of self-directed working. Students are personally advised, and supported in their research project, by one of the researchers serving as lecturers in this course. During the first half the semester, relevant methodological knowledge and skills are practiced during plenary meetings and in students’ independent reading (e.g. generating and testing research questions, designing experiments, and analyzing data in the field of Learning and Instruction)

Learning goals include:
- Participants can illustrate and explain basic methods and concepts for research in the fields of Learning and Instruction, e.g. with the help of practical examples.
- Participants can generate testable research questions for a topic relevant in the fields of Learning and Instruction.
- Participants can design and conduct a study that is relevant for answering their research question.
- Participants can summarize and evaluate the main results from a study in the field of learning and Instruction, with regard to the research question being asked.

Student teachers will develop an understanding of the concepts of nature of science and scientific inquiry. They will design a variety of instructional materials for teaching students about these concepts.

The course is open to all ETH students. Participation does not require previous coursework in the social sciences.

After passing an end-of-semester test (requirement: grade 4.0 or higher) students will receive 3 ECTS credit points. The workload is around 90 hours (meetings, reading assignments, preparation of test).

Visiting students (e.g., from the University of Zurich) are subject to the same conditions. Registration of visiting students in the web-based enrolment system for this course is obligatory.

Lecture notes
Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link ‘Registered students, please click here for course materials’ at top of that page). Log in with your netzh name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike.Hudecheck@studnet.ethz.ch). All assigned papers must be read ahead of the respective meeting. Following the course on the basis of on-line slides and papers alone is not sufficient. Physical presence in the classroom is essential. Many books and journals covering international environmental policy issues can be found at the D-GESS library at the IFW building, Haldeneggistrasse 4, B-floor, or in the library of D-USYS.

Literature
Assigned reading materials and slides will be available at http://www.ib.ethz.ch/teaching.html (select link ‘Registered students, please click here for course materials’ at top of that page). Log in with your netzh name and password. Questions concerning access to course materials can be addressed to Mike Hudecheck (Mike.Hudecheck@studnet.ethz.ch).
Environmental History - Introduction and Overview

Number of participants limited to 100.

Introduction into environmental history; survey of long-term development of human-nature-interrelations; discussion of selected problems.

Lecture notes
Course material is provided on OLAT.

Prerequisites / notice
Students are asked to write an exam during the second last session (11.12.2015).

Philosophy of Science

The students will explore various strands in philosophy of science in a critical way, focusing on the notion of rationality in science, especially with regards to environmental research. It addresses the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

Objective
Students learn to engage with problems in the philosophy of science and to relate them to natural and environmental sciences, thus developing their skills in critical thinking about science and its use. They know the most important positions in philosophy of science and the objections they face. They can identify, structure and discuss issues raised by the use of science in society.

Content
1. Core differences between classical Greek and modern conceptions of science.
2. Classic positions in the philosophy of science in the 20th century: logical empiricism and critical rationalism (Popper); the analysis of scientific concepts and explanations.
3. Objections to logical empiricism and critical rationalism, and further developments: What is the difference between the natural sciences, the social sciences and the arts and humanities? What is progress in science (Kuhn, Fleck, Feyerabend)? Is scientific knowledge relativistic? What is the role of experiments and computer simulations?
4. Issues raised by the use of science in society: The relation between basic and applied research; inter- and transdisciplinarity; ethics and accountability of science.

Instructional Methods
A reader will be available for students.

Lecture notes
A list of introductory literature and handbooks will be distributed to the students.

Prerequisites / notice
Oral examination during the session examination.

Further optional exercises accompany the lecture and offer the opportunity for an in-depth discussion of selected texts from the reader. Students receive an additional credit point. They have to sign up separately for the exercises for the course 701-0701-01 U.

Philosophy of Science

The lecture covers the following main topics: Social perception and interpersonal judgement; attitudes; group dynamics and group performance; leadership behavior and leadership styles.

Objective
The aim of the lecture is to impart a well-founded scientific understanding of social influence processes in individuals, groups, organizations, and social settings.

Content
The participants should develop competencies in the structuring of communication, interaction, and management processes.

Environmental History - Introduction and Overview

Number of participants limited to 100.

Introduction into environmental history; survey of long-term development of human-nature-interrelations; discussion of selected problems.

Lecture notes
Course material is provided on OLAT.

Prerequisites / notice
Students are asked to write an exam during the second last session (11.12.2015).

Philosophy of Science: Exercises

The exercises in philosophy of science serve to develop skills in critical thinking by discussing seminal texts about the rationality of science. Topics discussed include the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

Objective
Students can engage with problems in the philosophy of science and to relate them to natural and environmental sciences. They learn to analyze and summarize philosophical texts. In this way, they develop their skills in critical thinking with a focus on the rationality of science.

Content
The optional exercises accompany the lecture and serve to develop skills in critical thinking with a focus on the rationality of science, based on discussing seminal texts. The texts cover important positions in the philosophy of science and their critics. Topics discussed include the significance and limits of empirical, mathematical and logical methods, as well as problems and ethical issues raised by the use of science in society.

Instructional Methods
A reader will be available for students.

Lecture notes
A list of literature will be distributed to the students together with the reader.

Prerequisites / notice
Students that want to subscribe for this course also have to subscribe for the lecture 701-0701-01 V "Wissenschaftsphilosophie". Credit points are given for preparing a structure and a summary of one of the texts.

Didactics of Mathematics at the College Level I (University of Zurich)

No enrolment to this course at ETH Zurich. Book the
Abstract
Students are familiarised with the subjects taught at high-school level I (the first three years of the full-length high school, or the first year of the reduced-length high school). The central contents of geometry, arithmetic and algebra, and also written mathematical problems are explained.

Objective
In the teaching given at high-school level I (the first three years of the full-length high school or the first year of the reduced-length high school), central concepts and approaches adopted in mathematics are introduced and observed in greater depth. These include variables, function, proof. This calls for a careful didactic analysis on the part of the teacher, requiring them to study and reflect on the prerequisites for the pupils and the requirements in terms of mathematics and cognitive psychology.

Content
Beispiele von Schülerarbeiten geben in diesem Seminar einen Einblick in die mathematische Denkwelt der Schülerinnen und Schüler. Vielfältige Aufgaben zum Einsatz im Unterricht werden vorgestellt, selber gelöst und diskutiert.

- Arithmetik und Algebra: Zahlbereiche, Form und Inhalt in der Algebra.
- Geometrie: Konstruieren-Berechnen-Beweisen, dynamische Geometrie (Geogebra).
- Sachrechnen: Funktionsbegriff, mathematische Modellierung.
- Aktuelle mathematikdidaktische Aspekte wie Lernprozesse, Grundvorstellungen, Kompetenzen, offene Aufgaben.

Lecture notes
Zahlreiche begleitende Unterlagen werden abgegeben.

**Abstract**

Professors from national and international universities, technical experts from the industry as well as research associates of the institute of structural engineering (IBK) are invited to present recent research results and specific projects from the practice. This colloquium is addressed to members of universities, practicing engineers and interested persons in general.

**Objective**

Learn about recent research results in structural engineering.

**Abstract**

The Institute for Geotechnical Engineering invites distinguished speakers from research and practice, nationally and internationally. The colloquia are directed towards staff and students from Universities as well as engineers and scientists working in industry. Details can be obtained from [www.igt.ethz.ch](http://www.igt.ethz.ch) by following Events & Public Events. Some colloquia are available via webcast.

**Objective**

Learn about recent research results in geotechnics.

Autumn Semester 2016
Page 154 of 1570
Abstract
This course gives an overview of the basic concepts of geology and petrography and shows some links to the application of these concepts. The course consists of lectures and exercises in groups. The lectures cover all aspects of the dynamic earth, from the history of the earth, to the formation of rocks, mountains, and oceans, and the degradation processes shaping the uppermost earth's crust.

Objective
This course gives an overview of the basic concepts of geology and petrography and shows some links to the application of these concepts.

Content

Lecture notes
The course is based on the book Dynamic Earth from Press & Siever

Literature
Press, F.; Siever, R.; Allgemeine Geologie, Spektrum Akademischer Verlag, Heidelberg

Abstract
This class introduces students to basic features of the legal system. Questions of constitutional and administrative law, contract law, tort law, corporate law, as well as litigation are covered.

Objective
Introduction to fundamental questions of public and private law which serves as a foundation for more advanced law classes.

Content
1. Public Law Constitutional law: sources of law, organization of the state, fundamental rights. Administrative law: administrative decisions, organization of the administration, enforcement of administrative decisions, procedural law, basics of police, environmental and zoning law.

Lecture notes
There are 'Lecture Notes' (in German) for this course.

Literature
Further information is available at http://www.hertig.ethz.ch/education/grundzuege-des-rechts-fuer-baug-und-arch.html

Abstract
The course Private Law focuses on the Swiss Code of Obligations (contracts, torts) and on Property Law (ownership, mortgage and easements). In addition, the course will provide a short overview of Civil Procedure and Enforcement.

Objective

Content
Le cours de droit civil porte notamment sur le droit des obligations (droit des contrats et responsabilité civile) et sur les droits réels (propriété, gages et servitudes). De plus, il est donné un bref aperçu du droit de la procédure et de l'exécution forcée.

Literature
Editions officielles récentes des lois fédérales, en langue française (Code civil et Code des obligations) ou italienne (Codice civile e Codice delle obbligazioni), disponibles auprès de la plupart des librairies.

Prerequisites / notice
- le Code civil et le Code des obligations;
- Sont conséquents:
  - Nef, Urs Ch.: Le droit des obligations à l'usage des ingénieurs et des architectes, trad. Bovay, J., éd. Payot, Lausanne
  - Boillod, J.-P.: Manuel de droit, éd Slatkine, Genève

Remarques
- Le cours de droit civil et le cours de droit public (2e sem.) sont l'équivalent des cours "Recht I" et "Recht II" en langue allemande et des exercices y relatifs.
- Les examens peuvent se faire en français ou en italien.
- Examen au 1er propédeutique; convient pour travail de semestre.

We will model and solve scientific problems with partial differential equations. Differential equations which are important in applications will be classified and solved. Elliptic, parabolic and hyperbolic differential equations will be treated. The following mathematical tools will be introduced: Laplace and Fourier transforms, Fourier series, separation of variables, methods of characteristics.

Learning to model scientific problems using partial differential equations and developing a good command of the mathematical methods that can be applied to them. Knowing the formulation of important problems in science and engineering with a view toward civil engineering (when possible). Understanding the properties of the different types of partial differential equations arising in science and in engineering.

Classification of partial differential equations

Study of the Heat equation general diffusion/parabolic problems using the following tools:
* Separation of variables
* Fourier series
* Fourier transform
* Laplace transform

Study of the wave equation and general hyperbolic problems using similar tools and the method of characteristics.

We will loosely follow the following books:

- Stanley J. Farlow - Partial Differential Equations for Scientists and Engineers (a Dover reprint and can be bought for less than 20 CHF)
- Chapters 11 and 12 of E. Kreyszig, Advanced Engineering Mathematics.

Two good sources in German are:

- Norbert Hungerbühler, "Einführung in die partiellen Differentialgleichungen"
- G. Felder: Partielle Differentialgleichungen.

Analysis I and II, in particular, knowing how to solve ordinary differential equations is an important prerequisite.

**Abstract**

Introduction, statically determinate beams and frames, stresses and deformations, application of the principle of virtual work, statically indeterminate beams and frames (force method).

**Objective**

Understanding the response of elastic beam and frame structures

- Ability to correctly apply the equilibrium conditions
- Ability to determine elastic deformations
- Ability to apply the force (flexibility) method for statically indeterminate structures

**Content**

Introduction

- Reactions, internal forces and moments
- Arches and cables
- Trusses
- Influence lines
- Stresses and deformations
- Principle of virtual work
- Flexure and axial force, shear, torsion
- Deflections, work equation
- Statically indeterminate systems

**Abstract**

The course explores the fundamental principles of Geomechanics and Geotechnical Engineering, with the following objectives:

- Recognition of the basic consequences of the ground construction;
- Understanding of the important fundamental concepts of Soil mechanics and Geotechnical Engineering;
- Independent analysis of the basic geotechnical problems.

**Objective**

The course explores the fundamental principles of Geomechanics and Geotechnical Engineering, with the following objectives:

- Recognition of the basic consequences of the ground construction;
- Understanding of the important fundamental concepts of Soil mechanics and Geotechnical Engineering;
- Independent analysis of the basic geotechnical problems.

**Content**

Overview of stability problems; Bearing capacity of shallow and deep foundations; Soil-foundation interaction; Analysis and design of shallow and deep foundations; Earth pressure on retaining structures; Analysis and design of retaining walls; Excavations: dewatering, analysis and design; Soil improvement; Safety considerations.

**Abstract**

Theoretical basic knowledge and detailing of plate girders, trusses and composite beams and columns. Local load introduction, design structural analysis stability and detailing of buildings. A global approach including aspects of structural safety, architecture, use and durability is given. The course includes practical examples and exercises done by the students to enhance their knowledge.

**Objective**

Students know the theoretical basics and the detailing of struttural steel elements. They understand how to cope with local load introduction and redirection. They know the basics of design, detailing and dimensioning of steel structures for buildings, respecting aspects of safety, architecture, use, durability and flexibility etc.

**Content**

- Basics of dimensioning of plate girders, trusses and composite beams and columns (structural modeling, detailing and selection of material).
- Load introduction and redirection, detailed. Design, detailing and dimensioning of steel and steel concrete composite structures including roof and façades. Interaction of different building elements including bracing and global stability of steel structures)

**Lecture notes**

Autography on plate girders, trusses, load introduction and redirection, steel concrete composite elements. Copies of presentations.

**Literature**

- Stahlbaukalender, Ernst & Sohn, Berlin

**Prerequisites / notice**

The content of steel structures I is a prerequisite

**Abstract**

Fundamentals of railroad technology and interactions between track and vehicles, network development and infrastructure planning, planning of rail infrastructure, planning and design of railway stations, construction and dimensioning of tracks, approval and beginning service on complex infrastructure facilities, special issues of maintenance.

**Objective**

Teaches the basic principles of public transport network and topology design, geometrical design, dimensioning and construction as well as the maintenance of rail infrastructures. Teaches students to recognize the interactions between the infrastructure design and the production processes. Provides the background for Masters degree study.

**Content**

(1) Fundamentals: Infrastructures of public transport systems; interaction between track and vehicles; passengers and goods as infrastructure users; management and financing of networks; railway standards and norms. (2) Infrastructure planning: Planning processes and decision levels in network development and infrastructure planning, planning of railway tracks and rail topologies; planning of the passenger parts of stations. (3) Infrastructure design: Fundamentals of the layout of a line; track geometry; switches and crossings; design of station platforms. (4) Construction of railway infrastructures: Assembly and evolution of the railway track; elements of the railway track; dimensioning of the track; track stability. (5) Approval and beginning service on complex infrastructure facilities: Definitions and limitations; fundamentals of the legal situation; test and approval processes; processes of putting railway systems into operation. (6) Maintenance of railway infrastructures: Fundamentals of infrastructure maintenance; kinds of deprecations; supervision methods; steps of infrastructure maintenance; estimation of maintenance need; methods to minimize maintenance costs.

**Lecture notes**

Course notes will be provided in German. Slides are made available some days before each lecture.

**Literature**

References to technical literature will be included in the course script. An additional list of literature will be given during the course.
101-0031-01L Systems Engineering  
**Abstract**
An introduction to system development, analysis and optimization, and decision making, with focus on linear programming, networks, formal decision methods and economic analysis.

**Objective**
- to gain competency in methods used to plan and analyse systems
- to gain the ability to formulate, analyse and solve complex problems
- to gain competency in the methods used for the evaluation of multiple solutions

**Content**
- Introduction
- System development
- System analysis
- Networks
- Decision theory
- Economic analysis
- Cost-benefit analysis

**Lecture notes**
Script and transparencies as well as additional material via Moodle. The transparencies will be provided via Moodle two days before the respective class.

102-0293-00L Hydrology  
**Abstract**
The course introduces the students to engineering hydrology. It covers first physical hydrology, that is the description and the measurement of hydrological processes (precipitation, interception, evapotranspiration, runoff, erosion, snow), and it introduces then the basic mathematical models of the single processes and of the rainfall-runoff transformation, thereby including flood analysis.

**Objective**
Know the main features of engineering hydrology. Apply methods to estimate hydrological variables for dimensioning hydraulic structures and managing water resources.

**Content**
Der hydrologische Kreislauf: globale Wasserressourcen, Wasserbilanz, räumliche und zeitliche Dimension der hydrologischen Prozesse.

Niederschlag: Niederschlagsmechanismen, Regenmessung, räumliche/zeitliche Verteilung des Regens, Niederschlagsregime, Punkt niederschlag/Gebiets niederschlag, Isohyeten, Thiessenpolygon, Extremniederschlag, Dimensionierungs niederschlag.

Interzeption: Messung und Schätzung.

Evaporation und Evapotranspiration: Prozesse, Messung und Schätzung, potentielle und effektive Evapotranspiration, Energiebilanzmethode, empirische Methode.

Infiltration: Messung, Horton-Gleichung, empirische und konzeptionelle Methoden, F-index und Prozentuale Methode, SCS-CN Methode.

Schnee und Eis: Schneeeigenschaften und -messungen Schätzung des Schneeschmelzprozesses durch die Energiebilanzmethode, Abfluss aus Schneeschmelze, Temperatur-Index- und Grad-Tag-Verfahren.

**Lecture notes**
Die Kopie der Folien zur Vorlesung können auf den Webseiten der Professur für Hydrologie und Wasserwirtschaft herunterladen werden.

**Literature**

**Prerequisites / notice**
Vorbereitende zu Hydrologie I sind die Vorlesungen in Statistik. Der Inhalt, der um ein Teil der Übungen zu behandeln und um ein Teil der Vorlesungen zu verstehen notwendig ist, kann zusammengefasst werden, wie hintereinander es beschrieben wird:

- Elementare Datenverarbeitung: Hydrologische Messungen und Daten, Datenreduzierung (grafische Darstellungen und numerische Kenngrössen).

**Exam Block 4**

**Number**
101-0125-00L Structural Concrete I  
**Abstract**
Contents: Introduction, historical development of structural concrete, materials and material behaviour (cement, concrete, reinforcing steel, prestressing steel), linear members (axial force, flexure and axial force, compression members and columns, shear, bending and shear, torsion and combined actions), strut-and-tie models and simple stress fields, detailing, basic aspects of membrane elements.

**Objective**
- Understanding the response of typical structural members; Knowing elementary models and ability to apply them to practical problems; Ability to correctly dimension and detail simple structures.

**Content**
Introduction, historical development of structural concrete, materials and material behaviour (cement, concrete, reinforcing steel, prestressing steel), linear members (axial force, flexure and axial force, compression members and columns, shear, bending and shear, torsion and combined actions), strut-and-tie models and simple stress fields, detailing.

**Lecture notes**
A structure to be designed serves as a mean to practice the holistic approach of conceptual design by working in parallel and iteratively on different levels of detailing. Both, requirements and scope of action, are identified by the students and serve as basis for a solution. The task group organizes itself to solve complex tasks.

The project work conceptual design conveys a first insight into the holistic approach to cope with typical tasks of civil engineering and introduces professional techniques of civil engineering to students. A further aim is to consolidate the knowledge gained so far in bachelor courses, to link different domains and to fill gaps with respect to work techniques. The students analyse the inventory, formulate design requirements and boundary conditions, elaborate approaches and proposals for solutions, dimension some exemplary structural elements, practise detailing and document their work by different media. Methodology:

Excursion with mission, lectures, autonomous work, poster session, role playing, workshop, exemplary plenary review.

Deliverables:
- Poster, sketches, service criteria agreement and basis of design, static calculations, plans, models, technical report.

Lecture notes:
- Lecture notes, partially as download

Literature:
- Codes SIA 260, 261, 400

Abstract

A structure to be designed serves as a mean to practice the holistic approach of conceptual design by working in parallel and iteratively on different levels of detailing. Both, requirements and scope of action, are identified by the students and serve as basis for a solution. The task group organizes itself to solve complex tasks.

Objective

The project work conceptual design conveys a first insight into the holistic approach to cope with typical tasks of civil engineering and introduces professional techniques of civil engineering to students. A further aim is to consolidate the knowledge gained so far in bachelor courses, to link different domains and to fill gaps with respect to work techniques. The students analyse the inventory, formulate design requirements and boundary conditions, elaborate approaches and proposals for solutions, dimension some exemplary structural elements, practise detailing and document their work by different media.

Content

Introduction into the basic and practical knowledge of important building materials and testing methods.

- Introduction to fundamentals of Finite Element Methods and their application in examples.
- Introduction into the basics of scanning electron microscopy: practical exercises with the Environmental Scanning Electron Microscope (ESEM).
- Introduction to fundamentals of Finite Element Methods and their application in examples.
- Introduction to durability of building materials and building structures: assessment of potentials for detecting and locating corrosion of steel reinforcement in concrete.

Abstract

Introduction into the basic and practical knowledge of important building materials and testing methods.

Objective

Introduction into the basic and practical knowledge of important building materials and testing methods.

Content

- Introduction of material testing equipment, with various examples of experiments on metals (tensile behaviour, hardness, bending and impact loading).
- Theoretical background and practical aspects of concrete technology: mixture design, casting and setting; determination of mechanical properties.
- Properties of bricks and mortar: individual materials and the composite brickwork. Parameters like strength, Youngs modulus, water absorption and thermal conductivity are determined.
- Understanding the characteristic properties of wood: anisotropy, hygroscopic behaviour, shrinkage and swelling, and effect of size on strength. Introduction to test-methods for wood and wood-products.
- Introduction into the basics of scanning electron microscopy: practical exercises with the Environmental Scanning Electron Microscope (ESEM).
- Introduction to fundamentals of Finite Element Methods and their application in examples.
- Introduction to durability of building materials and building structures: assessment of potentials for detecting and locating corrosion of steel reinforcement in concrete.

Lecture notes

For each topic a script will be provided, that can be downloaded under www.ifb.ethz.ch/education
The Bachelor Programme concludes with the Bachelor Thesis. This project is supervised by a professor. Writing up the Bachelor Thesis encourages students to show independence and to produce structured work.

**Objective**

Encourages students to show independence, to produce scientifically structured work and to apply engineering working methods.

**Content**

The contents base upon the fundamentals of the Bachelor Programme. Students can choose from different subjects and tasks. The thesis consists of both a written report and an oral presentation.

---

### Electives

The entire course programs of ETH Zurich and the University of Zurich are open to the students to individual selection.

Abstract
Procurement of consistent procedures to solve typical problems of civil engineering. Consolidation of the knowledge of the bachelor courses; integration of bachelors of other universities.
Practice of the holistic approach of conceptual design, parallel and iterative operations on varying levels of detailing. Integration of different fields of knowledge and experiences.

Objective
Procurement of consistent procedures to solve typical problems of civil engineering. Consolidation of the knowledge of the bachelor courses; integration of bachelors of other universities.
Practice of the holistic approach of conceptual design, parallel and iterative operations on varying levels of detailing. Integration of different fields of knowledge and experiences.

Content
Basic tools:
- Literature research, quotations
- Technical report and presentations
- Basics of graphical representation

Elements of the design process:
- Service criteria and respective agreement
- Design requirements and design boundary conditions
- Design alternatives
- Preliminary dimensioning
- Cost-effectiveness
- Optimization
- Detailing

Exemplary consolidations:
- Geotechnical basics of retaining walls
- Conceptual design and shaping of retaining walls
- Drainage of structures
- Case study conceptual bridge design

Implementation with a planning tutorial:
- Presentation of the objects
- Survey and inventory
- Design options
- Intermediate review
- Final presentation

Abstract
This course provides an introduction to the tools that can be used to evaluate infrastructure. In particular tools:
- to measure the level of service being obtained from infrastructure,
- to predict slow changes in infrastructure over time, and
- to predict fast changes in infrastructure over time, fits of monitoring.

Objective
to equip students with tools to be used to evaluate infrastructure and the level of service being provided from infrastructure

Content
Introduction
- Levels of service
- Reliability of infrastructure
- Availability and maintainability of infrastructure
- Mechanistic-empirical models
- Regression analysis
- Event trees
- Fault trees
- Markov chains
- Neural networks
- Bayesian networks

Conclusion

Lecture notes
All necessary materials (e.g. transparencies and hand-outs) will be distributed before class.

Literature
Appropriate reading material will be assigned when necessary.
Building Physics: Theory and Applications

**Abstract**
Principles of heat and mass transport, hygro-thermal performance, durability of the building envelope and interaction with indoor and outdoor climates, applications.

**Objective**
The students will acquire in the following fields:
- Indoor and outdoor climate and driving forces.
- Hygro-thermal properties of building materials.
- Building envelope solutions and their construction.
- Hygrothermal performance and durability.

**Content**
Principles of heat and mass transport, hygro-thermal performance, durability of the building envelope and interaction with indoor and outdoor climates, applications.

Renewable Energy Technologies I

**Abstract**
Scenarios for world energy demand and CO2 emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry). Wind and ocean energy, heat pumps, geothermal energy, energy from waste. CO2 sequestration.

**Objective**
Scenarios for the development of world primary energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO2 emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

**Content**

**Lecture notes**
Lecture notes will be distributed electronically during the course.

**Literature**

**Prerequisites / notice**
Fundamentals of chemistry, physics and thermodynamics are a prerequisite for this course.

Design and Building Process MBS

**Abstract**
"Design and Building Process MBS" is a brief manual for prospective architects and engineers covering the competencies and the responsibilities of all involved parties through the design and building process. Lectures on twelve compact aspects gaining importance in an increasingly specialised, complex and international surrounding.

**Objective**
Participants will come to understand how they can best navigate the design and building process, especially in relation to understanding their profession, gaining a thorough knowledge of rules and regulations, as well as understanding how involved parties' minds work. They will also have the opportunity to investigate ways in which they can relate to, understand, and best respond to their clients' wants and needs. Finally, course participants will come to appreciate the various tools and instruments, which are available to them when implementing their projects. The course will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship.

**Content**
"Design and Building Process MBS" is a brief manual for prospective architects and engineers covering the competencies and the responsibilities of involved parties through the design and building process. Twelve compact aspects regarding the estabilise building culture are gaining importance in an increasingly specialised, complex and international surrounding. Lectures on the topics of profession, service model, organisation, project, design quality, coordination, costing, tendering and construction management, contracts and agreements, life cycle, real estate market, and getting started will guide the participants, bringing the individual pieces of knowledge into a superordinate relationship. The course introduces the key figures, depicts the criteria of the project and highlights the proved services of the consultants. In addition to discussing the basics, the terminologies and the tendencies, the lecture units will refer to the studios as well as the practice: Teaching-based case studies will compliment and deepen the understanding of the twelve selected aspects. The course is presented as a moderated seminar to allow students the opportunity for individual input: active collaboration between the students and their tutor therefore required.

System and Network Planning

**Abstract**
Public transports in the context of the transport systems; customer needs in the transport market; service planning processes for regular public transport services; long distance, regional and urban public transport service strategies; access to public transport and the last mile

**Objective**
Students will develop a basic knowledge of all stages of the public transport planning process from market demand to service planning; they will understand the most relevant planning methods and will be able to use them

**Content**
(1) Fundamentals of system and network planning: Mobility and transport systems; public transport systems; customer needs versus supply characteristics of regular services. (2) System and network planning in public passenger services: Goals of the system and network planning; generic planning process; demarcation, analysis of the situation, setting of targets; design of public transport services; evaluation and optimization; system planning. (3) Public transport services: long distance service offers; suburban and urban service offers; regional and local service offers; access to public transport and the last mile

**Lecture notes**
A script in German will be provided for the course. The slides are made available.

**Literature**
References to technical literature will be included in the course script. An additional list of literature will be given during the course.

Project Management: Project Execution to Closeout

**Abstract**
The course will give Engineering students a comprehensive overview and enduring understanding of the techniques, processes, tools and terminology to manage the Project Triangle (time, cost Quality) and to organize, analyze, control and report a complex project from start of Project Execution to Project Completion. Responsibilities will be detailed in each phase of the execution.

**Objective**
A student after completing the course will have the understanding of the Project Management duties, responsibilities, actions and decisions to be done during the Execution phase of a complex project.

Data: 06.10.2017 12:53  Autumn Semester 2016  Page 162 of 1570
### Content

- **Execution Phase of the Project**
- **Engineering Management - Scope, EV Measurement, Reporting and Organization**
- **Procurement and Transportation - Scope, EV Measurement, Reporting and Organization**
- **Civil Construction and Erection - Scope, EV Measurement, Reporting and Organization**
- **Financial Reporting and forecasting**
- **Risk & Opportunity Identification Assessment and Quantification during Execution**
- **Team Organization and Leadership**
- **Risk and opportunity identification and quantification**
- **Contract Claims and Delays**
- **Execution Quality**
- **Environmental Health and safety during execution**

### Literature

Required and suggested reading will be uploaded on weekly basis.

### Prerequisites / notice

Prerequisite for this course is course Project Management: Pre-Tender to Contract Execution number 101-0517-01 G, unless otherwise approved by the lecturer.

Data: 06.10.2017 12:53  Autumn Semester 2016  Page 164 of 1570
Objective
In this course selected famous geotechnical failures are investigated with the following purpose: (a) to deepen understanding of the geotechnical risks and possible solutions; (b) to practice design and analysis methods; (c) to learn the techniques for investigation of failures; (d) to learn the techniques for mitigation of the failure damage.

Content
Failure due to the loading history
Failure due to the creeping landslides
Failure due to excessive settlements
Failure due to the leaning instability
Failure due to tunnelling
Bearing capacity failure
Excavation failure

Lecture notes
Lecture notes

Literature

Prerequisites / notice
The course is given in the first MSc semester.
Prerequisite: Basic knowledge in Geotechnical Engineering (Course content of "Bodenmechanik und Grundbau" or similar lecture).

101-0117-00L Structural Analysis III
Abstract
Enhanced understanding of the load-deformation response of beam and frame structures. Systematic treatment of elementary and combined load carrying mechanisms of elastic beams, cables, arches and rings.

Objective
Enhanced understanding of the load-deformation response of beam and frame structures. Systematic treatment of elementary and combined load carrying mechanisms of elastic beams, cables, arches and rings.

Content
Axially loaded members, shear deformation of girders, torsion, beams, cables, arches and rings, shear walls and frames, combined cable and flexural action.

Lecture notes
Lecture notes

101-0127-00L Structural Concrete III
Abstract
This course supplements the courses Structural Concrete I and II regarding the analysis and dimensioning of reinforced and prestressed concrete structures. It focuses on lower bound and upper bound limit analysis methods for girders, discs and shells, particularly regarding their applicability to the safety assessment of existing structures.

Objective
Enhancement of the understanding of the load-deformation response of reinforced and prestressed concrete; refined knowledge of models and ability to apply them to general problems, particularly regarding the structural safety assessment of existing structures; awareness of the limits of applicability of limit analysis methods and ability to check their applicability.

Content
Fundamentals (structural analysis, theorems of limit analysis, applicability of limit analysis methods); shear walls and girders (stress fields and truss models, failure mechanisms, deformation capacity, membrane elements with yield conditions and load-deformation behaviour); slabs (equilibrium solutions, yield conditions, failure mechanisms, shear in slabs); prestressed concrete for plate and shell structures; long term effects; complements (fire, watertight concrete structures).

Lecture notes

Literature

101-0127-00L Structural Steel Structures III
Abstract
Enhance theoretical considerations and detailing of structural steel design including aspects of economy and erection. E. g. Cranes, composite construction (compression and bending, continuous girders, partial connection, serviceability), fire design, stability of frames and buckling of plates with stiffeners, cold rolled sections, corrosion protection, price calculation and quality control

Objective
Enhance theoretical considerations and detailing of structural steel design including aspects of economy and erection.

Content
Constructive design of cranes, composite construction (compression and bending, continuous girders, partial connection, serviceability), fire design, stability of frames and buckling of plates with stiffeners, cold rolled sections, corrosion protection, price calculation and quality control

101-0187-00L Structural Reliability and Risk Analysis
Abstract
Structural reliability aims at quantifying the probability of failure of systems due to uncertainties in their design, manufacturing and environmental conditions. Risk analysis combines this information with the consequences of failure in view of optimal decision making. The course presents the underlying probabilistic modelling and computational methods for reliability and risk assessment.

Objective
The goal of this course is to provide the students with a thorough understanding of the key concepts behind structural reliability and risk analysis. After this course the students will have refreshed their knowledge of probability theory and statistics to model uncertainties in view of engineering applications. They will be able to analyze the reliability of a structure and to use risk assessment methods for decision making under uncertain conditions. They will be aware of the state-of-the-art computational methods and software in this field.

Data: 06.10.2017 12:53 Autumn Semester 2016 Page 165 of 1570
Engineers are confronted every day to decision making under limited amount of information and uncertain conditions. When designing new structures and systems, the design codes such as SIA or Euro codes usually provide a framework that guarantees safety and reliability. However, the level of safety is not quantified explicitly, which does not allow the analyst to properly choose between design variants and evaluate a total cost in case of failure. In contrast, the framework of risk analysis allows one to incorporate the uncertainty in decision making.

The first part of the course is a reminder on probability theory that is used as a main tool for reliability and risk analysis. Classical concepts such as random variables and vectors, dependence and correlation are recalled. Basic statistical inference methods used for building a probabilistic model from the available data, e.g. the maximum likelihood method, are presented.

The second part is related to structural reliability analysis, i.e. methods that allow one to compute probabilities of failure of a given system with respect to prescribed criteria. The framework of reliability analysis is first set up. Reliability indices are introduced together with the first order-second moment method (FORM) and the first order reliability method (FORM). Methods based on Monte Carlo simulation are then reviewed and illustrated through various examples. By-products of reliability analysis such as sensitivity measures and partial safety coefficients are derived and their links to structural design codes is shown. The reliability of structural systems is also introduced as well as the methods used to reassess existing structures based on new information.

The third part of the course addresses risk assessment methods. Techniques for the identification of hazard scenarios and their representation by fault trees and event trees are described. Risk is defined with respect to the concept of expected utility in the framework of decision making. Elements of Bayesian decision making, i.e. pre-, post and pre-post risk assessment methods are presented.

The course also includes a tutorial using the UQLab software dedicated to real world structural reliability analysis.

This course will be taught as a combination of lectures, exercises, and computer lab classes. The first part of the course is largely theoretical with a focus on building the necessary mathematical and probabilistic tools. The second part will be more computational with an emphasis on computer simulations. The third part is more focused on applications of structural reliability analysis and Bayesian decision making.

Lectures will be held on Wednesdays from 10:15 to 11:45 in room B 154. The schedule is available online and will be updated as necessary. The course is worth 4 credits. Attendance is mandatory. Working knowledge of matrix algebra and ordinary differential equations is required. Familiarity with Matlab and with structural analysis computer software is desirable.
Fibre Reinforced Polymer (FRP) composites are increasingly being used in civil infrastructure applications, such as reinforcing rods, tendon and FRP profiles as well as wraps for seismic upgrading of columns and repair of deteriorated structures. The objective of this course is on one hand to provide new generation of engineering students with an overall awareness of the application and design of FRP reinforcing materials for internal and external strengthening (repair) of reinforced concrete structures. The FRP strengthening of other structures such as metallic, timber and masonry will also be shortly discussed. On the other hand the course will provide guidance to students seeking additional information on the topic. Many practical cases will be presented analysed and discussed. An ongoing structural health monitoring of these new materials is necessary to ensure that the structures are performing as planned, and that the safety and integrity of structures is not compromised. The course outlines some of the primary considerations to keep in mind when designing and utilizing structural health monitoring technologies. During the course, the students will have the opportunity to design FRP strengthened concrete beams, apply the FRP by themselves, and finally test their samples up to failure.

Objective
At the end of the course, you shall be able to:
- Design advanced FRP composites for your structures,
- To consult owners and clients with necessray testing and SHM techniques for FRP structures,
- To continue your education as a phd student in this field.

Data: 06.10.2017 12:53  Autumn Semester 2016  Page 168 of 1570
Tasks of Spatial Planning and development
Issues of local and supra-local interest
Recurring spatial changes, impacts and key figures
Formal and informal instruments and procedures in spatial planning
Spatial Design - Ideas about the future
Reasoning and assessing the situation in spatial planning
Spatial planning as a sequence of decisions and interventions
Process and procedures management
Focus issues - Inner development before external development
Focus issues - Cross-border tasks
Focus Issues - Integrated spatial and infrastructure development

101-0499-00L Basics in Air Transport

Abstract
The course explains main principles of air transport in general and elaborates on simple interdisciplinary topics. Since working on broad topics like aerodynamics, manufacturers, airport operation, business aviation, business models etc. the students gets a good overview in Air Transportation.

Objective
Understand and explain basics, principles and contexts in the broader air transport industry.
Lay the foundation of working in or with the air transport industry.
Ideal foundation for Aviation II - Management of Air Transport

Content
Weekly: 1h independent preparation; 2h lectures and 1 h training with an expert in the respective field
Concept: This course will be taught as Aviation I. A subsequent course is under evaluation.

Content: Transport as part of the overall transportation scheme; Aerodynamics; Aircraft (A/C) Designs & Structures; A/C Operations; Law Enforcement; Maintenance & Manufacturers; Airport Operations & Planning; Customs & Security; ATC & Airspace; Air Freight; General Aviation; Business Jet Operations; Business models within Airline Industry; Military Operations.

Technical visit: This course includes a guided tour at Zurich Airport (baggage sorting system, apron, ATC Tower).

Slides are provided prior to each class

Examination: written, 60 min, open books (Examination in German; Answers may be given in English)

Further information and the documents for the lecture can be found on the homepage of the Chair of Spatial Development.

101-0499-00L Agent Based Modeling in Transportation (Additional JAVA Exercises)

Abstract
This course provides the basic concepts of high level programming languages to students without previous programming training. The language used is Java. Since this course is preparatory for the course Agent Based model in Transportation, the same simulation software, MATSim, will be used for several exercises.

Objective
The objective of this course is to make the students familiar with some basic concepts of object oriented programming and to give a short introduction to the Multi-agent transport simulation (MATSim) which will be used in the lecture (Agent Based Modeling in Transportation) following this one. The programming language used in the course is Java. This course, therefore, has the main goal of providing the students without previous programming training the skills necessary for the successful completion of the Agent Based Modeling in Transportation course.

Content
The main Java concepts explained in the course are:
1) Types, Variables, Operators
2) Methods, Conditionals, Loops, Arrays
3) Objects and Classes
4) Access control, Class scope, Packages, Java API
5) Design, Debugging, Interfaces
6) Inheritance, Exceptions, File I/O
MATSim will be introduced on a basic level and its basic functionalities will be explained.
Weekly exercises will be focused on building Java knowledge through various examples using the MATSim environment.

101-0491-00L Hydraulic structures II

Information: Enrollment of Hydraulic Engineering II is not recommended without having attended Hydraulic Engineering (101-0206-00L) previously since Hydraulic Engineering II is strongly based on Hydraulic Engineering (101-0206-00L).

Abstract
Hydraulic structures and their function within a hydraulic scheme are explained. The basic concepts of their layout and design with regard to economy and safety are provided.

Objective
Knowledge of hydraulic structures and their function within a hydraulic scheme. Skills for the layout and design of hydraulic structures with regard to economy and safety.

Content
Weirs: Weir stability, gates, inflatable dams, appurtenant structures.
Conduits: Design of headraces, pressure shafts, and penstocks, constructive details and construction.
Power plants: Power house and turbine types, design, structure, construction.
Dams: Dam types, appurtenant structures (diversion, spillways, bottom outlet), dam type selection criteria, layout and design of gravity dams, buttress dams, arch dams, rockfill dams with central core or concrete face, measures in the foundation, mass concrete, RCC dams, reservoir siltation and sediment management, dam surveillance.
Artificial reservoirs: Purpose, layout, sealing, appurtenant structures, environmental aspects.

Lecture notes manuscript and further documentation

Literature
is specified in the lecture and in the manuscript
Information: Enrolment of Hydraulic Engineering II is not recommended without having attended Hydraulic Engineering (101-0206-00L) previously since Hydraulic Engineering II is strongly based on Hydraulic Engineering (101-0206-00L).

**Prerequisites / notice**

### 101-0267-01L Numerical Hydraulics

**O** 3 credits 2G M. Holzner

**Abstract**
In the course Numerical Hydraulics the basics of numerical modelling of flows are presented.

**Objective**
The goal of the course is to develop the understanding of the students for numerical simulation of flows to an extent that they can later use commercial software in a responsible and critical way.

**Content**
The basic equations are derived from first principles. Possible simplifications relevant for practical problems are shown and their applicability is discussed. Using the example of non-steady state pipe flow numerical methods such as the method of characteristics and finite difference methods are introduced. The finite volume method as well as the method of characteristics are used for the solution of the shallow water equations. Special aspects such as wave propagation and turbulence modelling are also treated.

All methods discussed are applied practically in exercises. This is done using programs in MATLAB which partially are programmed by the students themselves. Further, some generally available softwares such as Hydraulic Systems and HEC RAS for non-steady flows are used.

**Lecture notes**
Lecture notes, powerpoints shown in the lecture and programs used can be downloaded. They are also available in German.

**Literature**
Given in lecture

### 102-0237-00L Hydrology II

**W** 3 credits 2G P. Burlando, S. Fattchi

**Abstract**
The course presents advanced hydrological analyses of rainfall-runoff processes. The course is given in English.

**Objective**
Tools for hydrological modelling are discussed at the event and continuous scale. The focus is on the description of physical processes and their modelisation with practical examples.

**Content**

**Lecture notes**
Parts of the script for "Hydrology I" are used. Also available are the overhead transparencies used in the lectures. The semester project consists of a two part instruction manual.

**Literature**
Additional literature is presented during the course.

### 102-0455-01L Groundwater I

**W** 3 credits 2G M. Willmann

**Abstract**
The course provides an introduction into quantitavie analysis of groundwater flow and transport. It is focussed on formulating flow and transport problems in groundwater, which are to be solved analytically or numerically.

**Objective**

a) Students understand the basic concepts of flow and contaminant transport processes and boundary conditions in groundwater.

b) Students are able to formulate simple practical flow and transport problems.

c) Students are able to understand and apply simple analytical solutions to simple flow and transport problems.

d) Students are able to use simple numerical codes to adequately solve simple flow (and transport) problems.

**Content**

Introduction, aquifers, groundwater use, sustainability, porosity.

Properties of porous media.

Exercises: Groundwater use, porosity, grain size analysis.

Flow properties, Darcy's law, filter.

Flow equations, stream function.

Exercises: Darcy's law.

Analytical solutions, confined aquifers, steady-state flow.

Exercises: Head isolines.

Use of superposition principles, transient flow, freee surface flow.

Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems I.

Exercises: Analytical solutions to flow problems.

Finite difference solutions to flow problems II.

Exercises: Finite difference formulations to flow problems.

Transport processes.

Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems I.

Exercises: Computer workshop using PMWIN.

Analytical solutions to transport problems II.

Exercises: Analytical solutions to transport problems.

Path lines, groundwater protection.

Exercises: Analytical solutions to transport problems.

Groundwater remediation, groundwater management.

Exercises: Groundwater remediation.

Lecture notes "River Engineering" (in German, 470 pages, including list of references)

Materials IV

Introduction to Computational Physics (for Civil Engineers)

The first part of the lecture treats the fundamentals required to deal with river engineering problems. Sampling methods for the river bed
material and methods to calculate the discharge in alluvial rivers are presented. The process of river bed armoring and the principles of
incipient motion, initiation of erosion as well as sediment transport (bed load, suspended load) are treated.

In the second part of the lecture, the procedures to quantify the sediment budget and the morphological changes (erosion, aggradation) in
river systems are explained. Furthermore, the process of natural channel formation and the different plan forms of rivers (straight,
meandering, braided) are discussed. Own chapters are dedicated to the topics of channel stability, bed forms, river morphology and scour.

The last part of the lecture concentrates on the design and dimensioning of river engineering works. The topics focussed on are the
stabilization of banks and of the longitudinal profile of rivers.

Lecture notes
Lecture notes "River Engineering" (in German, 470 pages, including list of references)

Strongly recommended lectures:
Hydrology (102-0293-AAL), Hydraulics I (101-0203-01L) and Hydraulic Engineering (101-0206-00L)

A practical exercise (voluntary, unmarked) is offered to deepen the learned subjects. This exercise bases on field data, which are partly
collected by the students on a river in nature. Besides the collection of fundamentals and field data, the exercise comprehends the
calculation of the stage-discharge relationship, of the critical discharges for initiation of bed load transport and bed erosion and of the annual
sediment load in a given river reach.

Abstract
This lecture is focused on current issues of materials research from various fields. It provides an overview on various directions of research
on civil engineering materials and is intended to simplify the further choice of courses.

Objective
Based on the bachelor courses Materials I-III, current, fundamental, and important issues of specific building materials are addressed. Next
to aspects of material production, usage and properties, their interaction with the environment e.g. by durability and environmental impact
are addressed. This course is intended to simplify the further selection of courses.

Content
The lecture is segmented into 13 important problems, namely:
1. Materials, Structures, and Sustainability
2. Granular matter: (DEM)
3. Fracture mechanics and size effects in concrete
4. Cyclic failure of asphalt (Fatigue)
5. Mechanics and failure of fiber reinforces materials
6. Wood: from the tree to the beam (multi scale approaches)
7. Transport and degradation in porous building materials
8. Rheology
9. Plasticity
10. Foam (e.g. polymers)
11. Gluing and coating (surfaces)
12. Asbestos, nano particles and hazardous substances
13. Biomimetics in Constructions

Abstract
This course offers an introduction to computer simulation methods for physics problems and their implementation on PCs and super
computers: classical equations of motion, partial differential equations (wave equation, diffusion equation, Maxwell’s equation), Monte Carlo
simulations, percolation, phase transitions.

Content
Einführung in die rechnergestützte Simulation physikalischer Probleme. Anhand einfacher Modelle aus der klassischen Mechanik,
Elektrodynamik und statistischen Mechanik sowie interdisziplinären Anwendungen werden die wichtigsten objektorientierten
Programmiermethoden für numerische Simulationen (überwiegend in C++) erläutert. Daneben wird eine Einführung in die Programmierung
von Vektorsupercomputern und parallelen Rechnern, sowie ein Überblick über vorhandene Softwarebibliotheken für numerische
Simulationen geboten.

Abstract
Opportunities and limitations of concrete technology. Commodities and leading edge specialties.

Objective
Advanced education in concrete technology for civil engineers who are designing, specifying and executing concrete structures.
Based on the lecture 'Werkstoffe I' students receive deep concrete technology training. A comprehensive knowledge of the most important properties of conventional concrete and the current areas of research in concrete technology will be presented. The course covers various topics.

The content of the course is:
- concrete components
- concrete properties
- concrete mix design
- production, transport, casting
- demoulding, curing and additional protective measures
- durability
- standards
- high performance concretes
  1. high strength and ultra high strength concrete
  2. fiber reinforced concrete
  3. self compacting concrete
  4. shotcrete
  5. light weight concrete
  6. low shrinkage concrete
  7. low heat concrete for mass structures
  8. frost and wear resistant concrete
  9. concrete for low and high ambient temperatures

101-0577-00L An Introduction to Sustainable Development in the Built Environment

Abstract

This year the UN Conference in Paris will shape future world objectives to tackle climate change.

Objective

Objective

At the end of the semester, the students have an understanding of the term of sustainable development, its history, the current political and scientific discourses and its relevance for our built environment.

In order to address current challenges of climate change mitigation and resource depletion, students will learn a holistic approach of sustainable development. Ecological, economical and social constraints will be presented and students will learn about methods for argumentation and tools for assessment (i.e. life cycle assessment).

For this purpose an overview of sustainable development is presented with an introduction to the history of sustainability and its today definition as well as the role of cities, urbanisation and material resources (i.e. energy, construction material) in social economic and environmental aspects.

The course aims to promote an integrative view and understanding of sustainability and describing different spheres (social/cultural, ecological, economical, and institutional) that influence our built environment.

Students will acquire critical knowledge and understand the role of involved stakeholders, their motivations and constraints, learn how to evaluate challenges, identify deficits and define strategies to promote a more sustainable construction.

After the course students should be able to define the relevance of specific local, regional or territorial aspects to achieve coherent and applicable solutions toward sustainable development.

The course offers an environmental, socio-economic and socio-technical perspective focussing on buildings, cities and their transition to resilience with sustainable development. Students will learn on theory and application of current scientific pathways towards sustainable development.

Content

The following topics give an overview of the themes that are to be worked on during the lecture.

- Overview on the history and emergence of sustainable development
- Overview on the current understanding and definition of sustainable development
- Case Study 1: Sustainable construction, the role of construction industry (national/international)
- Case Study 2: Cities, forms of settlements
- Case Study 3: Material resources, scenarios, energy, construction materials, urban metabolism
- Case Study 4: Buildings, heating/cooling, consumers, prosumers and other stakeholder, cooperations
- Method 1: Life cycle assessment (planning, construction, operation/use, deconstruction)
- Method 2: Economics for sustainable construction
- Method 3: Construction, flexibility, modularity
- Synthesis 1: Climate Change mitigation and adaptation in cities
- Synthesis 2: Transition to sustainable development

Lecture notes

All relevant information will be online available before the lectures. For each lecture slides of the lecture will be provided.

Literature

A list of the basic literature will be offered on a specific online platform, that could be used by all students attending the lectures.

101-0587-00L Workshop on Sustainable Building Certification

Abstract

Building labels are used to certify buildings and neighbourhoods in term of sustainability. Many different labels have been developed and can be used in Switzerland (LEED, DGNB, SNBS, Minergie). In this course the differences between the certification labels and its application on 3 emblematic case study buildings will be discussed.

Objective

After this course, the students are able to understand and use the different certification labels. They have a clear view of what the labels take into consideration and what they don't.

Content

Three buildings case study will be presented.

Different certification schemes, including LEED (American standard), DGNB (German Standard with Swiss adaptation), SNBS, MINERGIE-ECO and 2000-Watt-Society (Swiss standards) will be presented and explained by experts.

After this overall general presentation and in order to have a closer look to specific aspects of sustainability, students will work in groups and assess during one or two weeks this specific criteria on one of the case studies presented before. This practical hands on the label will end with a presentation and a discussion where we will highlight differences between the labels.

This alternance of working session on one specific criteria for one specific building followed by a group presentation and discussion to compare labels is repeated for the different focus point (operation energy, mobility, daylight, indoor air quality).

The slides from the presentations will be made available.

101-0439-00L Introduction to Economic Analysis - A Case Study Approach with Cost Benefit Analysis in Transport

Abstract

Evaluation of the cost performance and social benefits of transport systems and services.

Literature

All documents for certification labels as well as detail plans of the buildings will be available for the students.
Autumn Semester 2016

101-0419-00L  Railway Construction and Maintenance  W  4 credits  4G  U. A. Weidmann, P. Güldenapfel, M. Kohler, M. J. Manhart, further speakers

Abstract
Track geometry including calculation and measuring as well as related data systems; interaction between track and vehicles, vehicle dynamics, stress; track construction including special features of railway bridges and tunnels; track diagnostics and forecast; track maintenance and related methods

Objective
The lecture gives a deeper insight into track geometry, the interaction between track and vehicles as well as in construction and dimensioning of the track. Methods for the diagnosis of the state of the track and its forecast are shown. State-of-the-art maintenance strategies and technologies are presented.

Content
Track geometry including calculation and measuring as well as related data systems; interaction between track and vehicles, vehicle dynamics, stress; track construction including special features of railway bridges and tunnels; track diagnostics and forecast; track maintenance and related methods

Lecture notes
The slides will be made available.

Literature
A list with related technical literature will be handed out.

Prerequisites / notice
The lecture Railway Infrastructures (Transportation II) is recommended.

Content
Principles of physical modelling:
Centrifuge (physics, scaling laws, errors)
Experimental methods:
Geotechnical (sand/clay model making, site investigation), mechanical (packages, actuators), electronic (data acquisition)
Application of physical modelling for typical geotechnical problems, validated or calibrated by finite element analysis (learnt and applied in an earlier course).
Review of mechanisms observed, comparison between modelling, numerical and/or classical plasticity methods, implications for design.

From:- Foundations (shallow and deep), bridge abutments, reinforced soils, soil nailing & anchorages, tunnels & deep excavations, earthquake effects, dynamic problems, environmental geomechanics, transport processes, dams, embankments & slopes, cold regions engineering.

Lecture notes
Handout notes, Example worksheets
http://geotp.igf.ethz.ch

Literature

Prerequisites / notice
A simple soil structure interaction boundary value problem will be selected (e.g., foundation, embankment, slope) as the exercise topic, which will modelled, in various forms, throughout the course. A predictive (class A) numerical analysis will be carried out by the students, followed by a centrifuge test on the same geometry to validate the numerical calculations. Subsequently a Class C2 numerical analysis will be conducted, calibrated by the physical modelling event.

101-0367-00L
Geotechnical Engineering in Transportation

Abstract
Road design criteria, Technology of road construction materials, geotechnical testing methods in Laboratory and in situ, Planning, monitoring and interpretation of soil field tests, Soil classification for traffic construction, Compaction of road structures and dams, Frost characteristics of soil materials, soil stabilization

Objective
Aim of the course is to teach students the most important aspects of the road structure, its building and design methods. An essential part of the course is devoted to understand the influence of the insitu conditions: soil, underground, climate, water, as well as of the characteristics of building materials and of road surface on the durability of the pavement.

Content
Road design criteria, Technology of road construction materials, geotechnical testing methods in Laboratory and in situ, Planning, monitoring and interpretation of soil field tests, Soil classification for traffic construction, Compaction of road structures and dams, Frost characteristics of soil materials, soil stabilization

Lecture notes
Autographie, Uebungsbliitter, Handouts

Literature
In den Vorlesungen und Ubungen werden verschiedene Demonstrationsmaterialien verwendet.

Voraussetzungen: Grundlagenkenntnisse in "Bodenmechanik/Grundbau" sowie in "Projektierung von Verkehrsanlagen"

Literature

101-0159-00L Method of Finite Elements II W 3 credits 2G E. Chatzi

Abstract

- Basic theoretical and procedural concepts of the method of finite elements (FE) for the analysis of nonlinear & dynamic systems are introduced. Kinematic and material nonlinear effects and the dynamic analysis of structures in terms of modal and time domain analysis are described.
- The course is complemented by Homework Sessions using computing tools and FE software such as MATLAB, ABAQUS & ANSYS.

Objective

Useful Reading:

101-0169-00L Timber Structures II W 3 credits 2G A. Frangi, R. Jockwer, R. Steiger

Prerequisite: Timber Structures I (101-0168-00L)

Abstract

- Basic knowledge of structural timber design including material behaviour especially anisotropy, moisture and long duration effects and their consideration in structural analysis and detailing. Design, detailing and structural analysis of timber roof structures, buildings and bridges.

Objective

- Comprehension and application of basic knowledge of structural timber design including material behaviour especially anisotropy, moisture and long duration effects and their consideration in structural analysis and detailing. Design, detailing and structural analysis of timber roof structures, buildings and bridges.

Content

- Field of application of timber structures; Timber as building material (wood structure, physical and mechanical properties of wood and wood-based products); Durability; Principles of design and dimensioning; Connections (dowels, nails, screws, glued connections); Timber components and assemblies (mechanically jointed beams, trusses); Design and detailing of timber roof structures, buildings and bridges.

Prerequisites / notice

- Copies of lecture slides

Lecture notes

- Autography Timber Structures
- Timber design tables HB 1, Lignum (2012)
- Swiss Standard SIA 265 (2012)
- Swiss Standard SIA 265/1 (2009)

Literature

101-0189-00L Seismic Design of Structures II W 3 credits 2G B. Stojadinovic

Abstract

- The following advanced topics are covered: 1) behavior and non-linear response of structural systems under earthquake excitation; 2) seismic behavior and design of moment frame, braced frame, shear wall and masonry structures; 3) fundamentals of seismic isolation; and 4) assessment and retrofit of existing buildings. These topics are discussed in terms of performance-based seismic design.

Objective

- After successfully completing this course the students will be able to:
  1. Use the knowledge of nonlinear dynamic response of structures to interpret the design code provisions and apply them in seismic design structural systems.
  2. Explain the seismic behavior of moment frame, braced frame and shear wall structural systems and successfully design such systems to achieve the performance objectives stipulated by the design codes.
  3. Determine the performance of structures under earthquake loading using modern performance assessment methods and analysis tools.

Content

- This course completes the series of two courses on seismic design of structures at ETHZ. Building on the material covered in Seismic Design of Structures I, the following advanced topics will be covered in this course: 1) behavior and non-linear response of structural systems under earthquake excitation; 2) seismic behavior and design of moment frame, braced frame and shear wall structures; 3) fundamentals of seismic isolation; and 4) assessment and retrofit of existing buildings. These topics will be discussed from the standpoint of performance-based design.

Lecture notes

- The electronic copies of the learning material will be uploaded to ILIAS and available through myStudies. The learning material includes the lecture presentations, additional reading, and exercise problems and solutions.

Literature

- Earthquake Engineering: From Engineering Seismology to Performance-Based Engineering, Yousef Borzorgnia and Vitelmo Bertero, Eds., CRC Press, 2004

Prerequisites / notice

- ETH Seismic Design of Structures I course, or equivalent. Students are expected to understand the seismological nature of earthquakes, to characterize the ground motion excitation, to analyze the response of elastic single- and multiple-degree-of-freedom systems to earthquake excitation, to use the concept of response and design spectrum, to compute the equivalent seismic loads on simple structures, and to perform code-based seismic design of simple structures. Familiarity with structural analysis software, such as SAP2000, and general-purpose numerical analysis software, such as Matlab, is expected.
101-0179-00L Probabilistic Seismic Risk Analysis and Management

Objective
After successfully completing this course the students will be able to:

1. Gather the necessary data and conduct a probabilistic seismic hazard analysis for a site.
2. Gather the necessary data and conduct a probabilistic vulnerability analysis of a building or an element of a civil infrastructure system at a site.
3. Design structural and/or financial engineering solutions to mitigate the seismic risk at a site.

Content
This course extends the series of two courses on seismic design of structures at ETHZ and introduces the topic of probabilistic seismic risk analysis and seismic risk management for the build environment and civil infrastructure systems. The following advanced topics will be covered in this course: 1) probabilistic seismic hazard analysis; 2) probabilistic seismic risk analysis; 3) seismic risk management using structural and financial engineering means; and, time permitting, 4) advanced topics in systemic probabilistic risk evaluation.

Literature
Reading material:
- Jack R Benjamin, C. Allin Cornell (2014) Probability, Statistics, and Decision for Civil Engineers

Prerequisites / notice
ETH Seismic Design of Structures I course (101-0188-00), or equivalent. Students are expected to understand the seismological nature of earthquakes, to characterize the ground motion excitation, to analyze the response of elastic single- and multiple-degree-of-freedom structures to earthquake excitation, to use the concept of response and design spectrum, to compute the equivalent seismic loads on simple structures, and to perform code-based seismic design of simple structures.

101-0637-01L Wood and Wood Composites

Objective
Knowledge of characteristic properties of wood as a anisotropic and porous material and their consideration in structural timber design.
Solid timber, glued laminated timber and wood composites.
Fire behaviour and fire design.

Content
Characteristics of wood as a anisotropic and porous material and their consideration in structural timber design. History, ecology, structure of timber, drying, material properties, influence of moisture and creep. Durability and grading.
Design of timber in fire.

Literature

Prerequisites / notice
Power Point slides. Further literature.

Voraussetzungen: Grundkenntnisse der Baustoffkunde

101-0190-06L Topics on Signal Processing and Identification

Objective
The students will be able to analyse digital signals and systems in time-, z-, and frequency domains, and create, implement, and identify digital systems. The examples and sample data are measured from civil structures.

101-0439-00L Introduction to Economic Analysis - A Case Study Approach with Cost Benefit Analysis in Transport

Abstract
The course presents cost benefit analysis and related evaluation methods in transport and introduces the survey methods used to derive the monetary values of non-market goods.

Objective
Familiarity with the essential methods of project appraisal

Content
Cost-Benefit-Analysis; multi-criteria analysis; European guidelines; stated response methods; travel cost approach and others; Valuation of travel time savings; valuation of traffic safety

Data: 06.10.2017 12:53 Autumn Semester 2016 Page 177 of 1570
The collection and the methods of statistical and geographical analysis of road accidents are important fundamentals of this course. Safety aspects in design of urban roads are discussed and measures for improving the safety situation are presented. Procedures of infrastructure safety management for administrations and police are another topic.

Objective
Imparting knowledge base about road safety and the event of accident, presenting possibilities to increase road safety

Content
Accident origin, collection of road accidents, statistical (descriptive and multivariate, accident prediction models) and geographical analysis of road accidents, risk analysis and rehabilitation measures, road safety instruments for infrastructure with focus on road safety audit, Swiss and international transport policy

Literature
Further literature: will be presented during the course

Objective
The students comprehend the main principles of safety, reliability and optimization for railway systems and understand the basic concepts of command and control technologies for railways.

Content
- Railway safety strategies
  - Safety in public transport
  - Safety relevant characteristic of railway transport
  - Safety requirements for railway transport
  - Safety concepts
- Command and control technologies for railway systems
  - Protective functions
  - Ensure the sequence/spacing of trains
  - Ensure route protection
  - Ensure level crossing protection
  - Technical realization for protective functions
  - European Train Control System
- Operational command/control systems
  - Dispatching
  - Operational control systems
  - Concepts of optimization
- RAMS for railway systems
  - Accident investigation methods
  - RAMS standards for railways
  - Risk analysis and hazard control
  - RAMS methods
  - Design principles for availability and safety
  - Maintenance strategies
  - Life Cycle Costs (LCC)
  - Human Factor
  - Safety in long railway tunnels
- RAMS for railway systems
- Accident investigation methods
- RAMS standards for railways
- Risk analysis and hazard control
- RAMS methods
- Design principles for availability and safety
- Maintenance strategies
- Life Cycle Costs (LCC)
- Human Factor
- Safety in long railway tunnels
- Tutorials in Railway Operation Laboratory
  - Field trip to Siemens Wallisellen (command and control technologies)

Lecture notes
The slides will be provided in German.

Prerequisites / notice
Some of the tutorials will be held at the IVTs Railway Operation Laboratory. The lecture Systems Dimensioning and Capacity is recommended.

Objective
Comprehension of the transport and administrative policy as well as of the regulation of public transport companies. To develop a full understanding of the three important public transport system operations management processes: (1) Business management; (2) Marketing; (3) Quality control. The course will teach essential working techniques in each of these processes.

#### Content
- (1) Transport and administrative policy: Goals of the state related to public transports, governmental activities in public transport, regulation.
- (2) Business management in public transport enterprises: goals of public transport companies, goals of the business management; management of public transport on the different management levels, business organization.
- (3) Marketing, advertising and pricing: Fundamentals and goals; marketing strategies and concepts in public transports; marketing tools; putting marketing into action.
- (4) Quality control: Quality in transport systems; goals of quality management; structuring quality control measures; collecting quality data in an operating service; use of quality control systems for service optimization.

#### Literature
- References to technical literature will be included in the course script. An additional list of literature will be given during the course.

#### Prerequisites / notice
- Lectures System and Network Planning as well as Systems Dimensioning and Capacity recommended.

---

### Infrastructure Maintenance Processes

**Abstract**
This course provides an introduction to the tools that can be used to evaluate infrastructure. In particular tools:
- to measure the level of service being obtained from infrastructure,
- to predict slow changes in infrastructure over time, and
- to predict fast changes in infrastructure over time, fits of monitoring.

**Objective**
To equip students with tools to be used to evaluate infrastructure and the level of service being provided from infrastructure

**Content**
Introduction
- Levels of service
- Reliability of infrastructure
- Availability and maintainability of infrastructure
- Mechanistic-empirical models
- Regression analysis
- Event trees
- Fault trees
- Markov chains
- Neural networks
- Bayesian networks
- Conclusion

**Lecture notes**
All necessary materials (e.g. transparencies and hand-outs) will be distributed before class.

**Literature**
Appropriate reading material will be assigned when necessary.

---

### Infrastructure Management 1: Process

**Abstract**
The course provides an introduction to the steps included in the infrastructure management process. The lectures are given by a mixture of external people in German and internal people in English.

**Objective**
Upon completion of the course, students will
- understand the steps required to manage infrastructure effectively,
- understand the complexity of these steps, and
- have an overview of the tools that they can use in each of the steps.

**Content**
- The infrastructure management process and guidelines
- Knowing the infrastructure - Dealing with data
- Establishing goals and constraints
- Establishing organization structure and processes
- Making predictions
- Selecting strategies
- Developing programs
- Planning interventions
- Conducting impact analysis
- Reviewing the process

**Lecture notes**
Appropriate reading / and study material will be handed out during the course.

**Literature**
Transparencies will be handed out at the beginning of each class.

**Prerequisites / notice**
The courses will be given half in English and half in German. Students should have a minimum of level B2 in both to register for the course.

---

### Theory and Methodology of Spatial Planning

**Abstract**
In order to solve problems in spatial planning it is necessary to explore actions and to judge them: finally, one has to argue why a certain option should be preferred to others. Assessments of the situation are the basis for the problems to treat. Specific knowledge, represented in an adequate manner, is required.

**Objective**
The participants know the interdependencies between the assessment of a situation, decision making, knowledge and language. They are familiar with difficulties and pitfalls within these contexts and know what can be done against it.

**Content**
Assessment of the situation, deciding, language and knowledge are the main parts.

---

### Agent Based Modeling in Transportation

**Abstract**
The main topics of the lecture are:
1. Introduction to the agent-based paradigm and overview on existing agent-based models in transportation, including MATSim
2. Learn how to setup MATSim for policy analysis
3. Learn about the interfaces available to enhances the software (includes Java programming)
4. Create, run and analyse a policy study

**Objective**
The objective of this course is to make the students familiar with agent-based models and in particular with the software MATSim. They will learn the pros and cons of this type of approach versus traditional transport models and will learn to use the simulation. They will design a policy study and run simulations to evaluate the impacts of the proposed policies.
In this course the students will first learn some microscopic simulation concepts and then complete a traffic engineering project with microscopic traffic simulation and conduct a realistic traffic engineering project.

The objective of this course is to introduce basic concepts in microscopic traffic simulation, including model development, calibration, validation, data analysis, identification of strategies for improving traffic performance, and evaluation of such strategies. The modelling software used is VISSIM.

Microscopic simulation concepts will include:
1) Car following models
2) Lane change models

Specific tasks for the project will include:
1) Building a model with the simulator VISSIM in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/extend the model to improve the traffic performance.

In this course the students will first learn some microscopic simulation concepts and then complete a traffic engineering project with microscopic traffic simulator VISSIM.

Additional relevant readings, mostly scientific articles, will be recommended throughout the course.

There are no strict preconditions in terms of which lectures the students should have previously attended. However, it is expected that the students have some experience with some high level programming language (i.e. C, C++, Fortran or Java). If this is not the case, attending the additional java exercises (101-0491-00U) is strongly encouraged.

101-0492-00L Simulation of Traffic Operations

**Abstract**
The course introduces basics of microscopic traffic simulation, including model development, calibration, validation, data analysis, identification of strategies for improving traffic performance, and evaluation of such strategies. The modelling software used is VISSIM.

**Objective**
The objective of this course is to introduce basic concepts in microscopic traffic simulation and conduct a realistic traffic engineering project from beginning to end. The students will first familiarize themselves with microscopic traffic simulation models. They will then use a simulation for modeling and analyzing the traffic operations. The emphasis is not only on building the simulation model, but also understanding of the models behind and logically evaluating results. The final goal is to make valid and concrete engineering proposals based on the simulation model.

**Content**
In this course the students will first learn some microscopic simulation concepts and then complete a traffic engineering project with microscopic traffic simulator VISSIM.

Microscopic simulation concepts will include:
1) Car following models
2) Lane change models

Specific tasks for the project will include:
1) Building a model with the simulator VISSIM in order to replicate and analyze the traffic conditions measured/observed.
2) Calibrating and validating the simulation model.
3) Redesigning/extend the model to improve the traffic performance.

Lecture notes
The lecture notes and additional handouts will be provided before the lectures.

Literature
Additional literature recommendations will be provided at the lectures.

Prerequisites / notice
There are no strict preconditions in terms of which lectures the students should have previously attended. However, it is expected that the students have some experience with some high level programming language (i.e. C, C++, Fortran or Java). If this is not the case, attending the additional java exercises (101-0491-00U) is strongly encouraged.

**101-0249-00L Applied Glaciology**

**Abstract**
We will explain the fundamentals of physics of glaciers which are necessary for treating applied problems. We will go into climate-glacier interactions, flow of glaciers, lake ice and hydrology of glaciers.

**Objective**
To understand the fundamental physical processes in glaciology.
To learn some basic numerical modelling techniques for glacier flow.
To identify glaciological hazards and to learn some assessment and mitigation possibilities.

**Content**
Basics in physical glaciology
- Dynamics of glaciers: deformation of glacier ice, role of water in glacier motion, reaction of glaciers to climate changes, glacier calving, surges
- Ice falls, ice avalanches
- Glacier floods
- Lake ice and bearing capacity

Lecture notes
Handouts are available

Literature
Relevante Literatur wird während der Vorlesung angegeben.

Prerequisites / notice
Für aktuelle Fallbeispiele werden risikobasierte Massnahmen bei glaziologischen Naturgefahren diskutiert.

Voraussetzungen: Es werden Grundkenntnisse in Mechanik und Physik vorausgesetzt.

### Abstract
Hydraulic fundamentals are applied to hydraulic structures for wastewater, flood protection and hydropower. Typical case studies from engineering practice are further described.

### Objective
Understanding and quantification of fundamental hydraulic processes with particular focus on hydraulic structures for wastewater, flood protection and hydropower

### Content
1. Introduction & Basic equations
2. Losses in flow & Maximum discharge
3. Uniform flow & Critical flow
4. Hydraulic jump & Stilling basins
5. Backwater curves
6. Weirs/End overfalls & Venturi
7. Mobile discharge measurements & Culverts/restrictors/inverted siphons
8. Fall manholes & Vortex drop
9. Conjunctions & Shock waves at abrupt wall deflections
10. Air/water flows and bottom outlets
11. Driftwood retention racks
12. Vegetated flows - Introduction
13. Vegetated flows - Application
14. Summary & questions/preparations for examination

|            | Material models comprise our knowledge on the physical behavior of materials. Based on a short introduction to solid mechanics, 3D material laws for elastic, visco-elastic behavior, plasticity and damage mechanics are discussed. We focus on material laws for concrete, metals, wood and other composites, how to obtain parameters from mechanical tests and their application in FEM calculations. Upon completion of the course you should be able to:
- classify different material behavior (e.g. linear/non-linear elastic, elasto-plastic, creep) with respect to types of constitutive material models (total /incremental strain models, damage / plasticity models, linear visco-elasticity),
- review how incremental strain models (e.g. elasto-plastic) are algorithmically implemented in Finite Element software (UMat of Abaqus),
- formulate the main approach and assumptions to the most import models for building materials and discuss their limitations,
- propose experimental campaigns for obtaining relevant material parameters for non-linear material models.
| Content    | Introduction to constitutive models for materials
- Fundamentals of mechanics of materials
- Cauchy-, hyper- and hypoelastic material descriptions
- Constitutive Models for Concrete (non-linear elastic)
- Introduction to metal and concrete plasticity
- Introduction to ABAQUS UMAT Programming
- Damage continuum mechanics
- Linear visco-elastic materials
| Lecture notes | Will be provided during the lecture. |

| 101-0639-01L | Science and Engineering of Glass and Natural Stone in Construction | W    | 3    | 2G    | F. Wittel, T. Wangler |
|             | The course offers an overview of relevant practical issues and present technological challenges for glass and natural stones in constructions. Students gain a good knowledge of the basics of glasses and natural stones, their potential as engineering materials and learn to apply them in the design of civil engineering constructions and to evaluate concepts. |
Glass is increasingly used in constructions to ease the construction process, as functional insulation barrier, even for structural applications of impressive size. While everyone has experienced the innovation potential of glass in the last decade, products from natural stone suffer from an unjustified traditional image that often originates from a lack of understanding of the material and its combination with other materials. Culturally important structures often are made from natural stone and their conservation demands an understanding of their deterioration mechanisms, the concepts of which can be applied to other civil engineering materials. Designers and engineers need the knowledge to reconcile materials and system behavior with the entire processing, handling, integration and life time in mind.

In this module students are provided with a broad fundamental as well as practice-oriented education on glass and natural stone in civil engineering applications. Present and future construction and building concepts demand for such materials with optimized properties. Based on the fundamentals from the Bachelor course in materials by the end of this module, you should be able to:

- recognize and choose specific applications from the broad overview you were provided with,
- relate processing technologies to typical products and building applications and recognize (and explain typical damage related to wrong material choice or application,
- explain the nature of glassy and crystalline materials and interpret their physical behavior against this background,
- explain the major deterioration mechanisms in natural stone and how this relates to durability,
- analyze material combinations and appraise their application in future products as well as integration in existing constructions,
- summarize with appropriate guidance publications on a related topic in an oral presentation and short report.

Content

Lecture 1: An introduction to science and engineering of glass and natural stone in construction (FW/TW)

Lecture 2: Glass chemistry including historical development of glass composition, use of raw materials, melts, chemical stability and corrosion. (FW)

Lecture 3: Geology and mineralogy of stones used in construction. Formation processes, chemistry, crystal structure. (TW)

Lecture 4: Microscopic models for glassy materials. Physics of glass transition. From microscopic physical models to thermodynamics, rheology and mechanics of glassy materials. (FW)

Lecture 5: Stone properties and behavior: microstructure, density, porosity, mechanical properties (TW)

Lecture 6: Glass physics: Optical properties (transmission, reflection, emission, refraction, polarization and birefringence, testing methods); Mechanical properties (density, thermal, mechanical, electric properties, glass testing) (FW)

Lecture 7: Stone properties and durability: transport, moisture and thermal cycling (TW)

Lecture 8: Forming and processing of glass: (plate and molded glass, drawing, slumping, profiling etc.; Processing: Cutting, mechanical processing, tempering, gluing, bending, laminating of glass Surface treatments: coating, sputtering, enameling, printing, etching, chemical pre-stressing.) (FW)

Lecture 9: Durability: Salt crystallization, freezing, biodeterioration (TW)

Lecture 10: Glass products for civil engineering applications: (Molded glasses, fiber glass, foam glass, plate glass); construction glass (insulation glass, structural glass, protective glass, intelligent glass, codes); (FW)

Lecture 11: Conservation: Consolidation, cleaning, and other treatments (TW). Practical aspects (guest lecturer)

Lecture 12: Glass in constructions. (modelling, application and regulation, typical damage in glass) (FW)

Lecture 13: Student presentations; exam questions (FW/TW)

Lecture notes

Will be handed out in the lectures

Literature

Werkstoffe II script (download via the IFB homepage). Rest will be handed out in the lectures

Prerequisites / notice

Werkstoffe I/II of the bachelor studies or equivalent introductory materials lecture.
Reinforced concrete combines the good compressive strength of concrete with the high tensile strength of steel and has proven to be successful in terms of structural performance and durability. However, there are instances of premature failure of reinforced concrete and prestressed concrete components due to corrosion of the reinforcing steel with very high economic implications of such damage. This course focuses on the chloride and carbonation induced corrosion of steel in concrete, presenting transport mechanisms and electrochemical concepts. The main emphasis lies on design and execution aspects related to durability of new and existing structures. New methods and materials for preventative measures, condition assessment and repair techniques are discussed. The course is a point of reference for engineers and materials scientists involved in research and practice of corrosion protection, rehabilitation and maintenance of reinforced concrete structures and components.

Content of the course in detail:

Lecture 1
Administrative issues, literature, what do students expect to learn? Introduction (economic relevance of durability, transition from building to maintenance). Fundamentals of corrosion and durability / Passivity and pitting corrosion

Lecture 2
Reinforced concrete / Corrosion protection / Degradation mechanism corrosion (chlorides/carbonation) / electrochemical mechanism / controlling parameters / cracks and spalling on surface, danger of localized corrosion

Lecture 3
Other degradation mechanisms: sulphate attack, ASR, frost attack
Various examples, frequency of occurrence of individual deterioration mechanisms

Lecture 4
Service life: initiation stage & propagation stage. Durability design: prescriptive approach, constructive detailing, importance of moisture for almost all degradation mechanisms. Performance based approach, simple diffusion approach for chloride ingress, Critical chloride content (influencing parameters)

Lecture 5
Stainless steel as reinforcing steel for concrete / different types of stainless steels / mechanical properties / corrosion resistance, passivity / coupling with black reinforcing steel / examples of application / life-cycle-costs

Lecture 6
Inspection and condition assessment I: visual inspection / destructive testing (chloride profiles, carbonation depth, thin section analysis, etc.)

Lecture 7
Inspection and condition assessment II: non-destructive testing (potential mapping, cover depth measurement, resistivity measurement). Potential mapping: measurement principle / effect of carbonated cover zone / effect of moisture / examples

Lecture 8
Post-tensioned structures / problem with existing structures: no NDT method / approach for protection (multiple barrier) / new systems with polymer ducts / electrically isolated tendons / fib guidelines / Swiss guideline / Monitoring techniques / Applications

Lecture 9
Repair methods I: conventional repair / coatings / inhibitors / limitations

Lecture 10
Repair methods II: electrochemical repair methods (ECR, ER, CP) / principles / electrochemical chloride removal (theory and examples) / electrochemical realkalization (theory and examples) / when can these methods be applied ? / cost aspects

Lecture 11
Repair methods III: cathodic protection (theory, technical solutions, anode systems, etc and examples). Monitoring of CP.

Lecture 12
New cements, issue of CO2 reduction. Effects of fly ash, slag, limestone on workability, diffusion coefficient, resistivity, pH (including a discussion of the pozzolanic reaction and it's consequences with respect to pH buffering Portlandite reserve). Discuss products on the Swiss market.

Lecture 13
Summary of most important points of this course given by the students. Open discussion about durability design, use of new cements, new materials and repair methods. Expected consequences for practice ? Course evaluation and time for asking questions.

Lecture notes
The course is based on the book

Slides of the lectures will be distributed in advance
Special hand outs and reprints for particular topics will be distributed

Literature

Prerequisites / notice
Students are encouraged to actively participate during the lectures. Students are expected to work on all the exercises (four). For one exercise a detailed written solution of the exercise has to be delivered (after the discussion).

Students should have passed the exams on Werkstoffe I and II.

For each lecture, lecture notes will be provided. In addition, one or two research papers for each lecture will be indicated as supportive information.

Concrete is generally viewed as a durable construction material. However, the long-term performance of a concrete structure can be greatly compromised by early-age cracking. This course will explain how shrinkage of concrete leads to cracking and how control of shrinkage allows increasing the expected durability of a concrete structure.

This course will begin with a brief introduction about hydration and microstructure development in cement paste and concrete. The students will learn the main causes of cracking at early ages, namely plastic, drying, thermal and autogenous shrinkage, with special emphasis on the driving mechanisms. The importance of concrete curing, especially in the first few days after casting, will be explained. Building on the knowledge of the driving forces of shrinkage, the way of action of shrinkage-reducing admixtures will be clarified and different applications illustrated. As an extension of external curing, the students will become familiar with internal water curing by means of saturated lightweight aggregate and superabsorbent polymer.

Most concrete members are restrained by adjacent structures. When shrinkage is restrained, cracks may develop. The students will learn how to apply different criteria for assessing concrete cracking and how to retrieve the mechanical properties of the concrete, especially stiffness and creep, relevant for the calculations.

In addition to macroscopic cracks, microcracking may occur in the cement paste due to internal restraint offered by the aggregates. Both macroscopic cracks and diffuse microcracking within a concrete may facilitate the ingress of harmful substances (e.g., chloride and sulfate ions) into the concrete; these may react with the concrete or with the reinforcement and create further deterioration. The students will acquire an understanding of the mechanisms of transport through cracked concrete, with special focus on experimental evidence and on techniques able to visualize the transport process and follow it in time. As a final outcome of the course, the students will be able to estimate the impact of cracking on the expected durability of concrete structures and to implement different types of measures to reduce the extent of cracking.

Content

Concrete is generally viewed as a long-lasting construction material. However, the durability of a concrete structure can be jeopardized by shrinkage-induced cracking. In addition to being unsightly, cracks have the potential to act as weak planes for further distress or as conduits for accelerated ingress of aggressive agents that may reduce durability.

Advances in concrete technology over the past decades have led to the practical use of concrete with a low water to binder ratio and with different types of mineral and organic admixtures. Another recent development is self-compacting concrete, which avoids concrete vibration and reduces labor during placing. Unfortunately, these concretes are especially prone to cracking at an early age, unless special precautions are taken. Proper curing becomes in this case the key to achieve better performance in various environmental and load conditions.

Specific topics covered by the course:
- Hydration and microstructure development
- Plastic shrinkage
- Development of mechanical properties
- Thermal deformation
- Autogenous deformation
- Drying shrinkage
- Curing
- Shrinkage-reducing admixtures
- Internal curing: saturated lightweight aggregate and superabsorbent polymer
- Fracture and microcracking
- Transport in cracked concrete
- Impact of cracking on concrete durability

Lecture notes

For each lecture, lecture notes will be provided. In addition, one or two research papers for each lecture will be indicated as supportive information.

The students will be also provided with a DVD containing the teaching material of a previous course on the same topic, including 16 hours of filmed lectures.

Literature

Copies of one to two research papers relevant to the topic of each lecture will be provided to the students as supportive information.

A basic knowledge of concrete technology is preferable.

151-0353-00L Mechanics of Composite Materials

Abstract

The course Mechanics of Composite Materials is dedicated to modeling problems following from the complex mechanical behavior of these anisotropic material structures. and modeling of continuous fibre reinforced composites. Participants will be able to design parts for the mechanical, automotive and aerospace industry.

Objective

Understanding of the mechanical properties of fiber reinforced composites with regard to analysis and design of lightweight structures for mechanical, transportation and aerospace applications.

Content

1. Introduction and Elastic Anisotropy
2. Laminate Theory
3. Thick-Walled Laminates and Interlaminar Stresses
4. Edge Effects at Multidirectional Laminates
5. Micromechanics
6. Failure Hypotheses and Damage Prediction
7. Fatigue Response
8. Joining and Bonding Techniques
9. Sandwich Designs

151-0833-00L Principles of Nonlinear Finite-Element-Methods

Abstract

Most problems in engineering are of nonlinear nature. The nonlinearities are caused basically due to the nonlinear material behavior, contact conditions and instability of structures. The principles of the nonlinear Finite-Element-Method (FEM) will be introduced in the scope of this lecture for treating such problems.

Lecture notes

Script, handed out during lecture

The lecture comprises two written exercises and one literature exercise with short presentation that are requested to be done.
The goal of the lecture is to provide the students with the fundamentals of the non linear Finite Element Method (FEM). The lecture focuses on the principles of the nonlinear Finite-Element-Method based on explicit and implicit formulations. Typical applications of the nonlinear Finite-Element-Methods are simulations of:

- Crash
- Collapse of structures
- Materials in Biomechanics (soft materials)
- General forming processes

Special attention will be paid to the modeling of the nonlinear material behavior, thermo-mechanical processes and processes with large plastic deformations. The ability to independently create a virtual model which describes the complex non linear systems will be acquired through accompanying exercises. These will include the Matlab programming of important model components such as constitutive equations.

**Content**
- Fundamentals of continuum mechanics to characterize large plastic deformations
- Elasto-plastic material models
- Updated-Lagrange (UL), Euler and combined Euler-Lagrange (ALE) approaches
- FEM implementation of constitutive equations
- Element formulations
- Implicit and explicit FEM methods
- FEM formulations of coupled thermo-mechanical problems
- Modeling of tool contact and the influence of friction
- Solvers and convergence
- Modeling of crack propagation
- Introduction of advanced FE-Methods

**Abstract**
The lecture Wood structure and function conveys basic knowledge on the microstructure of softwoods and hardwoods as well as general and species-specific relationships between growth processes, wood properties and wood function in the living tree.

**Objective**
Learning target is a basic understanding of the anatomy of wood and the related impact of endogenous and exogenous factors. The students can learn how to distinguish common central European wood species at the macroscopic and microscopic level. A deeper insight will be given by wood identification exercises for softwood species. Further the students will gain insight into the relationships between tree growth and wood properties with a specific focus on the wood function in the living tree.

**Content**
In an introduction to wood anatomy, the general structural features of softwoods and hardwoods will be explained and factors of diversity and variability will be discussed. A specific focus is laid on common central European tree species with relevance in the wood sector, which will be studied in macro-and microstructural investigations. For softwoods, exercises for the identification of species will be conducted. In the following, relationships between wood structure, properties and function in the living tree will be the focus of the lecture. Topics covered are mechanical stability and water transport, branches, reaction wood formation (compression wood, tension wood), spiral growth, growth stresses as well as adaptive growth of trees.

**101-0637-10L** Structures of Wood and Function

**Number of participants limited to 15.**

**Remark:** Replaces 701-1801-00L. Thus, students having already assigned to 701-1801-00 are not allowed to assign to 101-0637-10.

Topics covered are mechanical stability and water transport, branches, reaction wood formation (compression wood, tension wood), spiral growth, growth stresses as well as adaptive growth of trees.
Objective
The objective of the course is to provide an overview of the wide range of non-linear mechanical behaviors displayed by soft materials and tissues together with a basic understanding of their physical origin, to familiarize students with appropriate mathematical concepts for their modelling, and to illustrate the application of these concepts in different fields in mechanics.

Content
Soft solids: rubber-like materials, gels, soft biological tissues
Non-linear continuum mechanics: kinematics, stress, balance laws
Mechanical characterization: experiments and their interpretation
Constitutive modeling: basic principles
Large strain elasticity: hyperelastic materials
Rubber-elasticity: statistical vs. phenomenological models
Biomechanics of soft tissues: composites, anisotropy, heterogeneity
Dissipative behavior: examples and the concept of internal variables.

Lecture notes
Accompanying learning materials will be provided or made available for download during the course.

Literature
Recommended text:
L.R.G. Treloar, The physics of rubber elasticity, 3rd ed., 2005

Prerequisites / notice
A good knowledge base in continuum mechanics, ideally a completed course in non-linear continuum mechanics, is recommended.

Design Thinking: Human-Centred Solutions to Real World Challenges

Due to didactic reasons, the number of participants is limited to 30.

All interested students are invited to apply for this course by sending a one-page motivation letter until 14.9.16 to Florian Rittiner (frittiner@ethz.ch).

Additionally please enroll via mystudies. Places will be assigned after the first lecture on the basis of your motivation letter and commitment for the class.

Abstract
The goal of this course is to engage students in a multidisciplinary collaboration to tackle real world problems. Following a design thinking approach, students will work in teams to solve a set of design challenges that are organized as a one-week, a three-week, and a final six-week project in collaboration with an external project partner.

Design Thinking is a deeply human process that taps into the creative abilities we all have, but that get often overlooked by more conventional problem solving practices. It relies on our ability to be intuitive, to recognize patterns, to construct ideas that are emotionally meaningful as well as functional, and to express ourselves through means beyond words or symbols. Design Thinking provides an integrated way by incorporating tools, processes and techniques from design, engineering, the humanities and social sciences to identify, define and address diverse challenges. This integration leads to a highly productive collaboration between different disciplines.

Design Thinking involves generating deep insights, engaging in collaborative ideation, rapid prototyping and iterative testing. It means to find our own strategies and approaches to design and to be aware of them. And so, according to the advice of Pier Luigi Nervi: "...At every stage of his training, the future architect should be constantly and methodically guided to search for essential elements in each problem, be it large or small. The study of the architectural works of the past should consist in the critical examination of their functional and structural solutions and of the relation between these and form, in order to show that form is a consequence and not a determinant of functional and structural needs." [P.L. Nervi: Costruire correttamente, Milano 1955; English version titled "Structures", 1956, p.28].

Purpose of this course is to equip students with methods and tools to tackle a broad range of problems. Following a Design Thinking approach, the students will learn how to observe and interact with key stakeholders in order to develop an in-depth understanding of what is truly important and emotionally meaningful to the people at the center of a problem. Based on these insights, the students ideate on possible solutions and immediately validated them through quick iterations of prototyping and testing using different tools and materials. The students will work in multidisciplinary teams on a set of challenges that are organized as a one-week, a three-week, and a final six-week project with an external project partner. In this course, the students will learn about the different Design Thinking methods and tools that are needed to generate deep insights, to engage in collaborative ideation, rapid prototyping and iterative testing.

Economics of Urban Transportation

The first part of the course will present some basic principles of transportation economics, applied to the main issues in urban transport policy (e.g. road pricing, public transport tariffs, investment in infrastructure etc.). The second part of the course will consider some case studies where we will apply the tools acquired in the first part to actual policy issues.

The main objective of this course is to provide students with some basic tools to analyze transport policy decisions from an economic perspective. Can economics help us reduce road congestion problems? Should drivers be asked to pay for using urban roads? Should public transport tariffs depend on how roads are priced? How should the investment in transport infrastructure be financed? These are some of the questions that students should be able to tackle after completing the course.
COURSE OUTLINE (preliminary):

1. Introduction
2. Travel demand:
   a. travel cost and value of time
   b. mode choice
3. Road congestion and first-best pricing
   a. Static congestion model
   b. Dynamic congestion models
   c. Examples: London Congestion Charge, Stockholm Congestion Charge
4. Second-best pricing
   a. Pricing roads with unpriced alternatives. Examples: tolled and toll-free highways
   b. Public transport: pricing with road congestion and with (or without) road tolls
5. Investment in infrastructure: public transport and roads
   a. Roads: Investment with and without pricing
   b. induced demand
   c. Economies of scale/density in public transport
6. Topics:
   a. Political economy of road pricing: why do we see road pricing in so few cities (London, Stockholm...) and not in many other cities (NYC, Manchester, Paris...)?
   b. What are the alternatives to road pricing to reduce congestion? Parking tariffs, traffic regulation (speed bumps, low emission zones), road space reduction. Examples: Zurich, San Francisco (SFPark), Paris.
   c. Transport and land use: value of housing and transport services. Road congestion, transport subsidies and urban sprawl.

Lecture notes

Course slides will be made available to students prior to each class.

Literature

SYLLABUS (preliminary):

Additional material:

Part 1 to 5: textbook: Small and Verhoef (The economics of urban transportation, 2007).

Part 6: Topics to be covered on research papers/case studies.

GESS Science in Perspective

Recommended GESS Science in Perspective (Type B) for D-BAUG.

Master’s Thesis

Number Title Type ECTS Hours Lecturers
101-0010-00L Master’s Thesis O 24 credits 47D Supervisors

Abstract

The Master Programme concludes with the Master Thesis, which has to be done in one of the chosen Majors and has to be completed within 16 weeks. The Master Thesis is supervised by a professor and shall attest the students ability to work independently and to produce scientifically structured work.

Objective

To work independently and to produce a scientifically structured work.

Content

The topics of the Master Thesis are published by the professors. The Topic can be set also in consultation between the student and the professor.

Civil Engineering Master - Key for Type

O Compulsory E- Recommended, not eligible for credits
W+ Eligible for credits and recommended Z Courses outside the curriculum
W Eligible for credits Dr Suitable for doctorate

Abstract: Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

Objective: To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

Content:
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

Lecture notes: Lecture notes and handouts

Abstract: Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Objective: Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

Abstract: Good work design is crucial for individual and company effectiveness and a core element to be considered in organizational change. Meaning of work, organization-technology interaction, and uncertainty management are discussed with respect to work design and sustainable organizational change. As course project, students learn and apply a method for analyzing and designing work in business settings.

Objective: - Know effects of work design on competence, motivation, and well-being
- Understand links between design of individual jobs and work processes
- Know basic processes involved in systematic organizational change
- Understand the interaction between organization and technology and its impact on organizational change
- Understand relevance of work design for company performance and strategy
- Know and apply methods for analyzing and designing work
Core texts for this course are:

- Work design: From Adam Smith to job crafting
- Effects of work design on performance and well-being
- Approaches to analyzing and designing work
- Modes of organizational change and change methods
- Balancing stability and flexibility in organizations as design criterion
- The organization-technology interaction and its impact on work design and organizational change
- Example Flexible working arrangements
- Strategic choices for work design

A list of required readings will be provided at the beginning of the course.

The course includes the completion of a course project to be conducted in groups of four students. The project entails applying a particular method for analyzing and designing work processes and is carried out by means of interviews and observations in companies chosen by the students.

See course website: http://www.entrepreneurship.ethz.ch/sresources/courses/tech-entrepreneurship.html

This course will prepare students for experimental work as it is typically done during the master thesis. The goal is to gain hands-on experience with measurement and analysis methods relevant for Humans Systems Neuroscience and Motor control (nerve/brain stimulation, EMG, EEG, psycho-physical paradigms etc). Students read scientific material, set up experiments, perform measurements in the lab, analyse data, apply statistics and write short reports or essays.

This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

See course website: http://www.entrepreneurship.ethz.ch/sresources/courses/tech-entrepreneurship.html

Students will have to solve scientific problems, requiring them to independently study scientific material, apply statistics and report their results in the form of written reports and essays. Assessments will be made on the basis of the completed theoretical and practical work that will be performed either in small groups or individually.

From the BSc-course the following book is recommended: ‘Essentials of strength training and conditioning’ T. Baechle, R. Earle (3rd edition). Selective journal articles from relevant journals such as Journal of Physical Activity and Health and Journal of Aging and Physical Activity will be used as supplementary material.

Physical activity and chronic disease; Coronary heart disease, diabetes, bone health, cancer and obesity

Physical activity and all cause morbidity and mortality

Physical activity epidemiology; concepts principles and approaches

Physical activity and all cause morbidity and mortality

Physical activity and chronic disease; Coronary heart disease, diabetes, bone health, cancer and obesity

Physical activity and brain health

Physical activity and sedentary behavior recommendations

Population prevalence of physical activity and sedentary behavior

Physical activity policies

Physical activity assessment

A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

From the BSc-course the following book is recommended: ‘Essentials of strength training and conditioning’ T. Baechle, R. Earle (3rd Edition)

Selecte
Inhaltliche Schwerpunkte der Vorlesung sind:
- Einführung in die Sportpädagogik und die pädagogische Psychologie des Sportunterrichts
- Bedeutung des Sports im Jugendalter
- Zeitgemäßer Sportunterricht
- Sport und Leistung
- Heterogenität im Sportunterricht
- Sport und Gesundheit
- Geschlechterfragen im Sport
- Soziale und moralische Entwicklung im Sportunterricht

Lecture notes
Unterrichtsmaterialien zu den einzelnen Veranstaltungen werden den Studierenden zur Verfügung gestellt.

376-1117-00L  
Sport Psychology  
W 2 credits 2V  H. Gubelmann

Abstract
This lecture is intended as an introduction to sport psychology and imparts knowledge on selected areas of the subject.

Objective
Students are given insight into different work areas of sport psychology. In order to understand what «sport psychology» is, it is necessary to explain the essence and tasks of sport psychology and what it relates to, and to work out an underlying basis for key topics, such as cognition and emotions. Students’ expertise is furthered by presenting and providing more in-depth treatment of additional topics of sport psychology. Selected intervention forms are intended to provide insight into applied sport psychology and ensure that mental processes and their impact in sport can be recognised. Case studies and practical exercises (e.g. objective training) are intended to prompt students to reflect to a greater extent on the forms in which sport psychology can be applied in their practice of sports and to integrate these in their teaching.

Content
Main Topics
- Introduction to sport psychology
- Cognitions in sports: mental rehearsal and mental training
- Emotions and stress
- Motivation: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

Lecture notes
Unterrichtsmaterialien zu den einzelnen Veranstaltungen werden den Studierenden zur Verfügung gestellt.

Literature

376-1127-00L  
Sociology of Sport  
W 2 credits 2V  M. Lamprecht

Abstract
These lectures deal with the current changes in society and sport and provide an overview of the many different problems and perspectives of sport sociology.

Objective
The lectures set out to:
- present the different dimensions, functions and interrelationships of present-day sport
- provide an introduction to the central theories and models of (sport) sociology
- show how far sport reflects society and how it changes and becomes more differentiated in the process
- take current examples from newspapers, magazines and television to highlight the sociological view of sport.

Content
- Sport and social change: developments and trends
- The economy and the media: dependencies, consequences, scandals
- Social inequalities and distinctions: gender differences and group behavior
- Conflicts and politics: sports organizations, doping, violence

Lecture notes
Selected materials for the lecture are available under www.LSSFB.ch --> Lehre

Literature

A detailed program with additional references will be delivered at the beginning of the lecture.

376-1155-00L  
The Musculoskeletal System and Work  
W 3 credits 2V  T. Läubli

Abstract
Consolidated findings of movement sciences concerning deterioration, overload and regeneration of the musculoskeletal system are an important basis for an ergonomic working environment. The following topics are covered: Muscle fatigue during the 8-hour-day, use of the computer mouse, backaches, Tendinitis, nerve compression, epidemiology, prevention, rehabilitation, laws, measuring procedures.

Objective
Goal of the course is the activation of physiological and patho-physiological insights for the understanding of loads of the musculoskeletal system during work. Prevention and rehabilitation of work related musculoskeletal disease will be discussed with the help of a bio-psycho-social model. Furthermore, evidence based methods for a healthy work design will be presented.

Content
- Insights of human movement sciences concerning wear, overstraining and regeneration of the musculoskeletal system form an important base for an ergonomic work design. The following topics will be covered: Muscle fatigue during an 8-hours-day, mouse appliance, back pain, insertional tendinitis, nerve compression, epidemiology, prevention, rehabilitation, laws, and measurement methods.

Lecture notes
Skript und Folien auf NETZ als PDF-Datei zur Verfügung

Prerequisites / notice

376-1305-00L  
Development of the Nervous System  
W 3 credits 2V  E. Stoeckli

Abstract
The course covers the development of the nervous system (NS) with a focus on neurogenesis and migration, axon growth, synapse formation, mol. & cell. mechanisms, and diseases of the developing NS.

Objective
The aim is to give a deepened insight on the normal development, of the nervous system based on molecular, cellular and biochemical approaches.

Content
- The main focus is on the development of the NS: Early development of the NS, cellular processes, nerve fiber growth, building of synapses and neuronal networks.

Lecture notes
Must be downloaded from OLAT: https://www.olat.uzh.ch/olat/dmz/ as BIO344

Literature
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

Prerequisites / notice
Auxiliary tools: None. Bring something to write and your student ID

376-1305-01L  
Structure, Plasticity and Repair of the Nervous System  
W 3 credits 2V  M. E. Schwab, L. Filli, K. A. Martin, further lecturers

Abstract
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

Prerequisites / notice
Auxiliary tools: None. Bring something to write and your student ID
Abstract
The course covers the structure, plasticity and regeneration of the adult nervous system (NS) with focus on: sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.

Objective
The aim is to give a deepened insight into the structure, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

Content
The main focus is on the structure, plasticity and regeneration of the NS: biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

Lecture notes
ETH students: Lecture notes will be provided on Moodle https://moodle-app2.let.ethz.ch/course/view.php?id=694
Password will be provided at the beginning of the lecture.

Literature
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on Moodle / OLAT.

376-1665-00L Training and Coaching I W 3 credits 2G O. Buholzer
Abstract
The combining of training and coaching as in the example of sport analysis, which has an effect on youth training and athlete development

Objective
- To develop basics for a differentiates analyses of sports (model)
- To develop a profile of requirements for specific sports
- To develop competencies of training with youth and talents
- To develop the basics of talent training in theory and practice
- To observe athletes in case studies, make judgments and conclusion

Content
Das Modell der Sportartenanalyse
Die Relevanz der einzelnen Leistungsfaktoren
Das Modell der Wettkampfanalyse
Folgerungen für das Training und Coaching in der Sportart
Folgerungen für das Nachwuchstraining
Folgerungen für die Athletenauswahl, Athletenbeobachtung und -betreuung
Das Nachwuchs- und Talenttraining (Sichtung, Selektion, Förderung)
Projekte aus der Praxis (Talent- und Nachwuchstraining)
Praxisoutput zum Thema Koordination, motorische Grundbedürfnisse, Kraft und Gesundheit
Praxisbeispiele erarbeiten und planen
Konkrete Athletenbeobachtung

Lecture notes
Die Skript- (Lektionsunterlagen) werden im Rahmen des Semesters abgeben und auf Homepage veröffentlicht.

376-1717-00L Practical Basics in Sports and Exercise Therapy W 2 credits 2V B. Spörri Kälin, B. Keller
Abstract
Practical from the 5th semester on.

Requirement: "Introduction of Exercise Therapy" passed.

Objective
Import knowledge of practical basics of Sports and Exercise Therapy

Content
The members are able to transform the knowledge from the previous courses in practical situations of Sports and Exercise Therapy. They learn basic aspects to design therapy lessons.

Lecture notes
The courses "Introduction in Sports and Exercise Therapy" and has been completed successfully.

376-1720-00L Application of MATLAB in the Human Movement Sciences W 2 credits 2G R. van de Langenberg
Abstract
Students will learn to import, process and graphically present experimental data using the MATLAB computing environment. Both the data and the methods of analysis will be typical for experiments in Human Movement Science (i.e. kinematics, kinetics and electromyography).

Objective
Students will acquire the ability to independently load, plot, and process kinematic, kinetic and electromyographical data using the MATLAB computing environment.

Content
- To develop the ability to independently load, plot, and process kinematic, kinetic and electromyographical data using the MATLAB computing environment.
- To develop the ability to independently load, plot, and process kinematic, kinetic and electromyographical data using the MATLAB computing environment.

Literature
During the lecture, several electronically available MATLAB introductions are indicated. Course-specific scripts will be provided by the lecturer.

Prerequisites / notice
A Laptop with MATLAB installed (v2009 or higher) and wireless internet access is mandatory. Two students can share a laptop if necessary. A MATLAB student version can be obtained at Stud-IDES for free.

Data: 06.10.2017 12:53    Autumn Semester 2016    Page 192 of 1570
Intensive discussion concerning complications of a spinal cord injury and their consequences on trainability and exercise performance of persons sitting in a wheelchair. Overview on the clinical application of exercise testing as well as on the implementation of sport scientific findings to optimise performance of spinal cord injured subjects in rehabilitation and elite sports.

Knowledge of the pathophysiology and the concomitant complications of a spinal cord injury and the consequences for physical exercise and trainability during rehabilitation as well as in recreational and elite sport.

The following issues will be discussed: Epidemiology and etiology of spinal cord injury; complications and consequences of spinal cord injury; trainability/exercise physiology and spinal cord injury; history and organisation of wheelchair sports; elite sport and spinal cord injury

Voraussetzung: Vorlesung Anatomie/Physiologie besucht!

Every day humans interact with various systems. Strategies of interaction, individual needs, physical & mental abilities, and system properties are important factors in controlling the quality and performance in interaction processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction & overall performance.

The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

- Physiological, physical, and cognitive factors in sensation and perception
- Body spaces and functional anthropometry, Digital Human Models
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

Gavriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students.

Further textbooks are introduced in the lecture
- Brouchures, checklists, key articles etc. are uploaded in ILIAS

Cybernetics systems have been studied and applied in various research fields, such as applications in the ergonomics domain. Research interests include the man-machine interaction (MMI) topic which involving the performance in multi-model interactions, quantification in gestalt principles in product development; or the information processing matter.

To learn and practice cybernetics principles in interface designs and product development.

- Fitt's law applied in manipulation tasks
- Hick-Hyman law applied in design of the driver assistance systems - Vigilance applied in quality inspection
- Accommodation/vergence crosslink function
- Cross-link models in neurobiology- the ocular motor control system
- Human performance in optimization of production lines

Course notes

Possible from the 5th semester on.

Requirement:"Introduction of Exercise Therapy" passed.

Basics of Exercise Therapy:
A: diagnostic, anamnese, diagnostic of movement and function, assessments in exercise therapy, diagnostic of experience and behavior in relation to movement
B: biological-medical basics, pathophysiological Basics (internal, orthopedic and psychological deseases).
C: didactic knowledge, Reha-didactic

Students learn the assessments to plan an exercise-therapy-treatment. They are able to use them. They're able to integrate biological and medical basics.

They are able to prepare a therapy-session

Grundlagen der Diagnostik, Anamnese, Bewegungsdiagnostik, Funktionsdiagnostik
Sport- und Bewegungstherapeutische Testverfahren
Motorische Basisdiagnostik
Diagnostik bewegungsbezogenen Erlebens und Verhaltens
Biologisch-medizinische Grundlagen
Biomechanik (v.a. Gelenke), Pathophysiologische Grundlagen, Modelle der Methodik und Didaktik, Lektionsplanung

Voraussetzung: Vorlesung Anatomie/Physiologie besucht!

To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic diseases.

This course introduces basic concepts of micro- and macronutrient nutrition. Macronutrients include proteins, fat and carbohydrates. Special attention is given to nutrient digestion, bioavailability, metabolism and excretion with some focus on energy metabolism.

To introduce the students to the both macro- and micronutrients in relation to food and metabolism.

This course introduces basic concepts of micro- and macronutrient nutrition. Macronutrients include proteins, fat and carbohydrates. Special attention is given to nutrient digestion, bioavailability, metabolism and excretion with some focus on energy metabolism.

To introduce to the students the basic principles of injury mechanics and rehabilitation focussing on sports injuries.

Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

The module Epidemiology and prevention describes the process of scientific discovery from the detection of a disease and its causes, to the development and evaluation of preventive and treatment interventions and to improved population health. Students will also become aware on how epidemiological facts are used in prevention, practice and politics. The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples form nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

Further possibilities to prevent injuries are discussed. Thereby the lecture focuses on sports injuries.

The lecture will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples form nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.
Leadership I
The student shall apply his basic knowledge in a practical scientific study. He/she will be confronted with the requirements of scientific

The lectures "Leadership I" (WS) and "Leadership II" (SS) have been designed as a two-semester lecture series, but may also be followed,

Practical Training II
The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy

G. Haller

Master's Thesis
W

Information on further reading will be announced during the lecture. There will be some mandatory as well as voluntary readings.

Prerequisites / notice
General knowledge about nutrition, human biology, physiology and biochemistry is a prerequisite for this course. The course builds on

Language: English
It is strongly recommended to attend the lectures. The lecture (including the handouts) is not designed for distance education.

853-0033-00L Leadership I

Abstract
The lectures "Leadership I" (WS) and "Leadership II" (SS) have been designed as a two-semester lecture series, but may also be followed independently of one another or in reverse order. "Leadership I" covers the following fields: leadership basics, leadership theories and leadership styles, the concept of leadership responsibility and the role of communication in practical leadership.

Objective
The aim of this lecture is to give students an introductory overview of relevant topics regarding leadership research and practice, thus enabling them to gain a deeper understanding of the leadership phenomenon. Students should understand different concepts of leadership in the complex interaction between individuals, groups, organisation, context and situation. They should be informed about the evolution of the understanding of mankind in relation to working processes and its impact on organizations and the understanding of leadership theory in the past 100 years. They should grasp the concept of leadership responsibility (leadership ethics) and be able to derive consequences for leadership in practical situations. They should recognize the fundamental importance of communication in leadership situations and receive input which enables them to communicate adequately in specific situations.

Prerequisites / notice
The 1-hour written exam will take place during the last lecture in the semester.

Practical Training

Number Title Type ECTS Hours Lecturers
557-1012-00L Practical Training II O 15 credits 15P E. de Bruin

Abstract
3-months practical work with topics from the major exercise in movement and training doctrines.

Objective
The students should obtain practical experience of 3 month length in possible job environments. The selected places (internal or external) should be as close as possible by the major exercise in movement and training doctrines.

557-1011-00L Practical Training I O 15 credits 15P E. de Bruin

Abstract
3-months practical work with topics from the major exercise in movement and training doctrines.

Objective
The students should obtain practical experience of 3 month length in possible job environments. The selected places (internal or external) should be as close as possible by the major exercise in movement and training doctrines.

Master's Thesis

Number Title Type ECTS Hours Lecturers
557-1100-00L Master's Thesis O 30 credits 30D E. de Bruin

Abstract
6-months research study with topics from the major exercise in movement and training doctrines.

Objective
The student shall apply his basic knowledge in a practical scientific study. He/she will be confronted with the requirements of scientific working. He/she must master this requirements.

Prerequisites / notice
The master thesis can only be started after the Bachelor Degree was obtained and the Vertiefungsleiter has approved the study.

Major in Biomechanics

Compulsory Subjects

Number Title Type ECTS Hours Lecturers
376-1651-00L Clinical and Movement Biomechanics O 4 credits 3G S. Lorenzetti, R. List, N. Singh

Abstract
Measurement and modeling of the human movement during daily activities and in a clinical environment.

Objective
The students are able to analyse the human movement from a technical point of view, to process the data and perform modeling with a focus towards clinical application.

Electives

Number Title Type ECTS Hours Lecturers
151-0503-00L Dynamics W 6 credits 4V+2U G. Haller, P. Tiso

Abstract
Kinematics, dynamics and oscillations: Motion of a single particle - Motion of systems of particles - 2D and 3D motion of rigid bodies Vibrations
Objective
This course provides Bachelor students of mechanical engineering with fundamental knowledge of kinematics and dynamics of mechanical systems. By studying motion of a single particle, systems of particles and rigid bodies, we introduce essential concepts such as work and energy, equations of motion, and forces and torques. Further topics include stability of equilibria and vibrations. Examples presented in the lectures and weekly exercise lessons help students learn basic techniques that are necessary for advanced courses and work on engineering applications.

Content
1. Motion of a single particle || Kinematics: trajectory, velocity, acceleration, inertial frame, moving frames - Forces and torques. Active- and reaction forces. - Linear momentum principle, angular momentum principle, work-energy principle - Equations of motion;
2. Motion of systems of particles || Internal and external forces - Linear momentum principle, angular momentum principle, work-energy principle - Rigid body systems of particles; conservative systems
3. 3D motion of rigid bodies || Kinematics: angular velocity, velocity transport formula, instantaneous center of rotation - Linear momentum principle, angular momentum principle, work-energy principle - Parallel axis theorem. Angular momentum transport formula

Lecture notes
Hand-written slides will be downloadable after each lecture.

Literature
Typed course notes from the previous year

Prerequisites / notice
Please log in to moodle (https://moodle-app2.let.ethz.ch/auth/shibboleth/login.php), search for "Dynamics", and join the course there. All exercises sheets, lecture materials etc. will be uploaded there.

227-0385-10L Biomedical Imaging

Abstract
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

Objective
To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.

Content
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging

227-0386-00L Biomedical Engineering

Abstract
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on understanding the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Objective
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

227-0447-00L Image Analysis and Computer Vision

Abstract

Objective
Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content
The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Lecture notes
Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice
Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C. The course language is English.

363-0790-00L Technology Entrepreneurship  
W  
2 credits  
2V  
U. Claesson, B. Clarysse

Abstract
Technology ventures are significantly changing the global economic picture. Technological skills increasingly need to be complemented by entrepreneurial understanding. This course offers the fundamentals in theory and practice of entrepreneurship in new technology ventures. Main topics covered are success factors in the creation of new firms, including founding, financing and growing a venture.

Objective
This course provides theory-grounded knowledge and practice-driven skills for founding, financing, and growing new technology ventures. A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

376-1219-00L Rehabilitation Engineering II: Rehabilitation of Sensory and Vegetative Functions  
W  
3 credits  
2V  
R. Riener, R. Gassert, L. Marchal Crespo

Abstract
Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Content
Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces
Literature

Introductory Books:

Prerequisites / notice

Target Group:
- Students of higher semesters and PhD students of
  - D-MAVT, D-ITET, D-INFK, D-HEST
  - Biomedical Engineering, Robotics, Systems and Control
  - Medical Faculty, University of Zurich
Students of other departments, faculties, courses are also welcome

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

376-1714-00L  Biocompatible Materials  W  4 credits  3G  K. Maniura, J. Möller, M. Zenobi-Wong

Abstract

Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Objective

The class consists of three parts:

1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

Content

Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

Lecture notes

Handouts can be accessed online.
Handouts provided during the classes and references therein.

376-1974-00L

Colloquium in Biomechanics

W 2 credits 2K

Abstract

Trauma biomechanics in an interdisciplinary research field investigating the biomechanics of injuries and related subjects such as prevention. The lecture provides an introduction to the basic principles of trauma biomechanics.

Objective

This lecture serves as an introduction to the field of trauma biomechanics. Emphasis is placed on the interdisciplinary nature of impact biomechanics, which uses the combination of fundamental engineering principles and advanced medical technologies to develop injury prevention measures. Topics include: accident statistics and accident reconstruction, biomechanical response of the human to impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations using multi-body and finite element modelling techniques, aspects of passive safety of vehicles (focusing on restraint systems and vehicle compatibility). Real world examples mainly from automobile safety are used to augment lecture material.

Lecture notes

Handouts will be made available.

376-1985-00L

Trauma Biomechanics

W 4 credits 2V+1U

Abstract

Introduction to the basic principles of trauma biomechanics.

Objective

This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented. Furthermore possibilities to prevent injuries are discussed. Thereby the lecture focuses on sports injuries.

Content

Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

Lecture notes

Handouts will be made available.

Literature

Prerequisites / notice

A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

401-0625-01L

Applied Analysis of Variance and Experimental Design

W 5 credits 2V+1U

Abstract

Objective

Participants will be able to plan and analyze efficient experiments in the fields of natural sciences. They will gain practical experience by using the software R.

Content

Literature

Prerequisites / notice

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software R, for which an introduction will be held.

551-1295-00L

Introduction to Bioinformatics: Concepts and Applications

W 6 credits 4G

Abstract

Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

Objective

Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although “Introduction to Bioinformatics I” will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course “Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms” that will be offered in the following semester.
Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

**363-0301-00L Work Design and Organizational Change**  
W 3 credits 2G  
G. Grote

**Abstract**

Good work design is crucial for individual and company effectiveness and a core element to be considered in organizational change. Meaning of work, organization-technology interaction, and uncertainty management are discussed with respect to work design and sustainable organizational change. As course project, students learn and apply a method for analyzing and designing work in business settings.

**Objective**

- Know effects of work design on competence, motivation, and well-being
- Understand links between design of individual jobs and work processes
- Know basic processes involved in systematic organizational change
- Understand the interaction between organization and technology and its impact on organizational change
- Understand relevance of work design for company performance and strategy
- Know and apply methods for analyzing and designing work

**Content**

- Work design: From Adam Smith to job crafting
- Effects of work design on performance and well-being
- Approaches to analyzing and designing work
- Modes of organizational change and change methods
- Balancing stability and flexibility in organizations as design criterion
- The organization-technology interaction and its impact on work design and organizational change
- Example Flexible working arrangements
- Strategic choices for work design

**Literature**

A list of required readings will be provided at the beginning of the course.

**Prerequisites**

A critical understanding of dos and don'ts is provided through highlighting and discussing real life examples and cases.

Autumn Semester 2016  
Page 201 of 1570
This course provides hands-on experience with measurement and analysis methods relevant for Humans Systems Neuroscience and Motor control (nerve/brain stimulation, EMG, EEG, psycho-physical paradigms etc). Students read scientific material, set up experiments, perform measurements in the lab, analyse data, apply statistics and write short reports or essays.

This course will prepare students for experimental work as it is typically done during the master thesis. The goal is to gain hands-on experience with measurement and analysis methods relevant for Humans Systems Neuroscience and Motor control (for example peripheral nerve stimulation, electrical and magnetic brain stimulation, EMG, EEG, psychophysics, motor learning etc). Students will learn how to perform small research projects in this area. Students will work individually or in small groups and solve scientific problems which require them to perform measurements in human participants, extract relevant data from the data, and interpret the results. They will also be required to write small essays and reports and they will get feedback on their writing throughout the course. Students are required to have successfully completed the course “Neural control of movement and motor learning” and to have basic knowledge of applied statistics. Self-study material about applied statistics will be available at the beginning of the course and statistical knowledge will be tested (central element) in the second course week. Passing this test is a requirement for continuing the course. Students will have to solve scientific problems, requiring them to independently study scientific material, apply statistics and report their results in the form of written reports and essays. Assessments will be made on the basis of the completed theoretical and practical work that will be performed either in small groups or individually.

376-0225-00L

**Abstract**

Physical Activities and Health

This course introduces/explora the complex relationship between physical activity, sedentary behavior and health. It will discuss the evolution of current physical activity recommendations. It will examine the current evidence base that has informed physical activity recommendations and that identified physical activity as a key modifiable lifestyle behavior contributing to disease and mortality.

**Objective**

On completion of this course students will be able to demonstrate:

1. knowledge of and critical awareness of the role of physical activity and sedentary behavior in the maintenance of health and the aetiology, prevention and treatment of disease.
2. thorough knowledge and critical awareness of current recommendations for physical activity, and current prevalence and trends of physical activity and associated diseases
3. awareness of current national and international physical activity policies and how these impact on global challenges

**Content**

Introduction to Physical Activity for Health, including sedentary behavior

Physical activity epidemiology; concepts principles and approaches

Physical activity and all cause morbidity and mortality

Physical activity and chronic disease; Coronary heart disease, diabetes, bone health, cancer and obesity

Physical activity and brain health

Physical activity and sedentary behavior recommendations

Population prevalence of physical activity and sedentary behavior

Physical activity policies

Physical activity assessment

**Literature**

Core texts for this course are:

**Prerequisites / notice**

Selective journal articles from relevant journals such as Journal of Physical Activity and Health and Journal of Aging and Physical Activity

From the BSc-course the following book is recommended: ‘Essentials of strength training and conditioning’ T. Baechle, R. Earle (3rd Edition)

**Abstract**

Sport Pedagogy

Central aspects of Sport related pedagogy will be handled in these lectures. These aspects cover, amongst others, the subject and tasks of Sport related pedagogy. Furthermore, the general and sports relevant foundations of Sport related pedagogy will be covered.

**Objective**

To gain basic knowledge of sport pedagogy and to recognize starting points for applied sports pedagogical intervention in schools.

**Content**

Inhaltliche Schwerpunkte der Vorlesung sind:

- Einführung in die Sportpädagogik und die pädagogische Psychologie des Sportunterrichts
- Bedeutung des Sports im Jugendalter
- Zeitgemäßer Sportunterricht
- Sport und Leistung
- Heterogenität im Sportunterricht
- Sport und Gesundheit
- Geschlechterfragen im Sport
- Soziale und moralische Entwicklung im Sportunterricht

**Literature**

Unterrichtsmaterialien zu den einzelnen Veranstaltungen werden den Studierenden zur Verfügung gestellt.

---

376-1117-00L

**Abstract**

Sport Psychology

This lecture is intended as an introduction to sport psychology and imparts knowledge on selected areas of the subject.

Students are given insight into different areas of sport psychology. In order to understand what «sport psychology» is, it is necessary to explain the essence and tasks of sport psychology and what it relates to, and to work out an underlying basis for key topics, such as cognition and emotions. Students' expertise is furthered by presenting and providing more in-depth treatment of additional topics of sport psychology. Selected intervention forms are intended to provide insight into applied sport psychology and ensure that mental processes and their impact in sport can be recognised. Case studies and practical exercises (e.g. objective training) are intended to prompt students to reflect on a greater extent on the forms in which sport psychology can be applied in their practice of sports and to integrate these in their teaching.
Content

Main Topics
- Introduction to sport psychology
- Cognitions in sports: mental rehearsal and mental training
- Emotions and stress
- Motivations: goal-setting in sports
- Career and career transition in elite sport
- Coach-Athlete-Interaction
- Psychological aspects of sport-injury rehabilitation
- Group dynamics in sport

Lecture notes
Unterrichtsmaterialien zu den einzelnen Veranstaltungen werden den Studierenden zur Verfügung gestellt.

Literature

376-1127-00L Sociology of Sport

Abstract
These lectures deal with the current changes in society and sport and provide an overview of the different many problems and perspectives of sport sociology.

Objective
The lectures set out to:
- present the different dimensions, functions and interrelationships of present-day sport
- provide an introduction to the central theories and models of (sport) sociology
- show how far sport reflects society and how it changes and becomes more differentiated in the process
- take current examples from newspapers, magazines and television to highlight the sociological view of sport.

Content
Sport and social change: developments and trends
- The economy and the media: dependencies, consequences, scandals
- Social inequalities and distinctions: gender differences and group behavior

Lecture notes
Selected materials for the lecture are available under www.LSSFB.ch --> Lehre

Literature

A detailed program with additional references will be delivered at the beginning of the lecture.

376-1155-00L The Musculoskeletal System and Work

Abstract
Consolidated findings of movement sciences concerning deterioration, overload and regeneration of the musculoskeletal system are an important basis for an ergonomic working environment. The following topics are covered: Muscle fatigue during the 8-hour day, use of the computer mouse, backaches, Tendinitis, nerve compression, epidemiology, prevention, rehabilitation, laws, measuring procedures.

Objective
Goal of the course is the activation of physiological and patho-physiological insights for the understanding of loads of the musculoskeletal system during work. Prevention and rehabilitation of work related musculoskeletal disease will be discussed with the help of a bio-psycho-social model. Furthermore, evidence based methods for a healthy work design will be presented.

Content
Insights of human movement sciences concerning wear, overstraining and regeneration of the musculoskeletal system form an important base for an ergonomic work design. The following topics will be covered: Muscle fatigue in an 8-hours-day, mouse appliance, back pain, insert tendonitis, nerve compression, epidemiology, prevention, rehabilitation, laws, and measurement methods.

Lecture notes
Skript und Folien auf NETZ als PDF-Datei zur Verfügung

Literature

Selected materials for the lecture are available under www.LSSFB.ch --> Lehre

Prerequisites / notice

376-1177-00L Human Factors I

Abstract
Every day humans interact with various systems. Strategies of interaction, individual needs, physical & mental abilities, and system properties are important factors in controlling the quality and performance of processes. In the lecture, factors are investigated by basic scientific approaches. Discussed topics are important for optimizing people's satisfaction & overall performance.

Objective
The goal of the lecture is to empower students in better understanding the applied theories, principles, and methods in various applications. Students are expected to learn about how to enable an efficient and qualitatively high standing interaction between human and the environment, considering costs, benefits, health, and safety as well. Thus, an ergonomic design and evaluation process of products, tasks, and environments may be promoted in different disciplines. The goal is achieved in addressing a broad variety of topics and embedding the discussion in macroscopic factors such as the behavior of consumers and objectives of economy.

Content
- Physiological, physical, and cognitive factors in sensation and perception
- Body spaces and functional anthropometry, Digital Human Models
- Experimental techniques in assessing human performance and well-being
- Human factors and ergonomics in system designs, product development and innovation
- Human information processing and biological cybernetics
- Interaction among consumers, environments, behavior, and tasks

Literature
- Gabriel Salvendy, Handbook of Human Factors and Ergonomics, 4th edition (2012), is available on NEBIS as electronic version and for free to ETH students
- Further textbooks are introduced in the lecture
- Brochures, checklists, key articles etc. are uploaded in ILIAS

376-1179-00L Applications of Cybernetics in Ergonomics

Abstract
Cybernetics systems have been studied and applied in various research fields, such as applications in the ergonomics domain. Research interests include the man-machine interaction (MMI) topic which involving the performance in multi-model interactions, quantification in gestalt principles in product development; or the information processing matter.

Objective
To learn and practice cybernetics principles in interface designs and product development.

Content
- Fitt's law applied in manipulation tasks
- Hick-Hyman law applied in design of the driver assistance systems - Vigilance applied in quality inspection
- Accommodation/vergence crosslink function
- Cross-link models in neurobiology- the ocular motor control system
- Human performance in optimization of production lines

376-1305-00L Development of the Nervous System

Abstract
...
### 376-1305-01L Structure, Plasticity and Repair of the Nervous System

**W 3 credits 2V**

**M. E. Schwab, L. Filli, K. A. Martin, further lecturers**

**Abstract**
The course covers the structure, plasticity and regeneration of the adult nervous system (NS) with a focus on: sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, and diseases of the NS.

**Objective**
The main focus is to develop an in-depth insight into the structure, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

**Content**
The main focus is on the structure, plasticity and regeneration of the NS: biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

**Lecture notes**
ETH students: Lecture notes will be provided on Moodle https://moodle-app2.let.ethz.ch/course/view.php?id=694
Password will be provided at the beginning of the lecture.

**Literature**
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures and are mentioned on OLAT.

**Prerequisites / notice**
None. Bring something to write and your student ID

### 376-1665-00L Training and Coaching I

**W 3 credits 2G**

**O. Buholzer**

**Abstract**
The combining of training and coaching as in the example of sport analysis, which has an effect on youth training and athlete development

**Objective**
- To develop basics for a different analyses of sports (model)
- To develop a profile of requirements for specific sports
- To develop competencies of training with youth and talents
- To develop the basics of talent training in theory and practice
- To observe athletes in case studies, make judgments and conclusion

**Content**
Das Modell der Sportartenanalyse
Die Relevanz der einzelnen Leistungsfaktoren
Das Modell der Wettkampfanalyse
Folgerungen für das Training und Coaching in der Sportart
Folgerungen für das Nachwuchstraining
Folgerungen für die Athletenauswahl, Athletenbeobachtung und -betreuung
Das Nachwuchs- und Talenttraining (Sichtung, Selektion, Förderung)
Projekte aus der Praxis (Talent- und Nachwuchstraining)
Praxisinput zum Thema Koordination, motorische Grundbedürfnisse, Kraft und Gesundheit
Praxisbeispiele erarbeiten und planen
Konkrete Athletenbeobachtung

**Lecture notes**
The Skript- (Lektionsunterlagen) werden im Rahmen des Semesters abgeben und auf Homepage veröffentlicht.

**Literature**
Struktur sportlicher Leistung (Modellansatz von Gundlach; (Trainingswissenschaften S. 45 - 49; Stiehler(Konzag/Döbler)

**Prerequisites / notice**
Für die Kreditvergabe sind die vorgeschriebenen Semesterarbeiten und die Präsenz zwingend. Die Benotung erfolgt durch eine schriftliche Arbeit.

### 376-1716-00L Basics of Exercise Therapy

**W 2 credits 2V**

**K. Marschall**

**Abstract**
Possible from the 5th semester on.
Requirement "Introduction of Exercise Therapy" passed.

**Objective**
- Basics of Exercise Therapy:
  A: diagnostic, anamnesis, diagnostic of movement and function, assessments in exercise therapy, diagnostic of experience and behavior in relation to movement
  B: biological-medical basics, pathophysiological Basics (internal, orthopedic and psychological deseases.
  C: didactic knowledge, Reha-didactic

- Students learn the assessments to plan an exercise-therapy-treatment.
- They are able to use them. They're able to integrate biological and medical basics.
- They are able to prepare a therapy-session
Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess those mechanisms and to develop measures to prevent such injury. Furthermore you should be able to perform the data analysis to optimise performance of spinal cord injured subjects in rehabilitation and elite sports. Persons sitting in a wheelchair. Overview on the clinical application of exercise testing as well as on the implementation of sport scientific findings to optimise performance of spinal cord injured subjects in rehabilitation and elite sports. Students will acquire the ability to independently load, plot, and process kinematic, kinetic and electromyographical data using the MATLAB computing environment. Both the data and the methods of analysis will be typical for experiments in Human Movement Science (i.e. kinematics, kinetics and electromyography). The following issues will be discussed: Epidemiology and etiology of spinal cord injury; complications and consequences of spinal cord injury; trainability/exercise physiology and spinal cord injury; history and organisation of wheelchair sports; elite sport and spinal cord injury.

Prerequisites / notice

A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

Data: 06.10.2017 12:53 Autumn Semester 2016 Page 205 of 1570
To introduce the students to the both macro- and micronutrients in relation to food and metabolism. The course is divided into two parts. The lectures on micronutrients are given by Prof. Zimmermann and the lectures on macronutrients are given by Prof. Wolfram. Prof. Zimmermann discusses the micronutrients, including fat-soluble vitamins, water-soluble vitamins, minerals and trace elements. Prof. Wolfram introduces basic nutritional aspects of proteins, fats, carbohydrates and energy metabolism. The nutrients are described in relation to digestion, absorption and metabolism. Special aspects of homeostasis and homeostasis are emphasized.

There is no script. Powerpoint presentations will be made available.

Elmadfa I & Leitzmann C: Ernährung des Menschen
UTB Ulmer, Stuttgart, 4. überarb. Ausgabe 2004

Garrow JS and James WPT: Human Nutrition and Dietetics
Churchill Livingstone, Edinburgh, 11th rev. ed. 2005

To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

At the end of this module students are able:
- to understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.
- to critically assess scientific literature.
- to plan public health interventions and health promotion projects concepts of descriptive and analytical epidemiology, study designs, measures of effect, confounding and bias, screening, surveillance, definition of health and health promotion, health dimensions and health determinants, prevention strategies, public health interventions, public health action cycle, epidemiology and prevention of infectious and chronic diseases (HIV, Tuberculosis, Obesity, Public health nutrition).

Language of the course is English

Information on further reading will be announced during the lecture. There will be some mandatory as well as voluntary readings.
The students should obtain practical experience of 3 month length in possible job environments. The selected places (internal or external) should be as close as possible by the major exercise physiology.

The content of the practica is determined by the supervisor together with the student. The practica can be combined with the master thesis. In such a case, it can only be started after the Bachelor Degree was obtained and the Vertiefungsleiter has approved the study.

This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

Introduction and discussion of advanced methods for recording and analysis of NMR data with biological macromolecules.

Z Dr.

Seminar series on technical aspects of high resolution nuclear magnetic resonance (NMR) spectroscopy with biological macromolecules.

The course consists of a series of research seminars on Structural Biology, Biochemistry and Biophysics, given by both scientists of the Z Dr.

Applied Statistical Regression

Objective

The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Content

The class covers separation techniques that are central in the purification and downstream processing of chemicals and biopharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Liquid-liquid extraction; 2) Adsorption and chromatography; 3) Membrane processes; 4) Crystallization and precipitation.

Lecture notes

Handouts during the class

Literature

Recommendations for text books will be covered in the class

Prerequisites / notice

Requirements: Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

Applied Statistical Regression

Objective

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

Literature

Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

Prerequisites / notice

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

NMR Methods for Studies of Biological Macromolecules

Objective

Seminar series on technical aspects of high resolution nuclear magnetic resonance (NMR) spectroscopy with biological macromolecules.

Content

Seminar series on technical aspects of high-resolution nuclear magnetic resonance (NMR) spectroscopy with biological macromolecules.

Prerequisites / notice

Requirements: Basic knowledge in biological NMR spectroscopy.

Structural Biology

Objective

The goal of this course is to provide doctoral and postdoctoral students with a broad overview on the most recent developments in biochemical, structural biology and biophysics.

Content

The course consists of a series of research seminars on Structural Biology, Biochemistry and Biophysics, given by both scientists of the National Center of Competence in Research (NCCR) in Structural Biology and external speakers. Information on the individual seminars is provided on the following websites:

http://www.structuralbiology.uzh.ch/educ002.asp
http://www.biol.ethz.ch/dbiol-cal/index

Prerequisites / notice

Particularly suitable for students of D-BIOL, D-CHAB, D-HEST

Research Ethics

Objective

This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

Content

The main goal of this course is to enhance the student's ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.
I. Ethics & the Process of Ethical Inquiry

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

Integrity in Research & Research Misconduct
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 R's (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

Cancer: Fundamentals, Origin and Therapy
Z 2 credits 2G H. Nägeli

Abstract
### Objective
Students are able to describe selected chemicals, biological and molecular processes that occur in cells spontaneously or after physical or chemical exposure and resulting in a tumor. They are able to list important cancer-inducing agents and explain the respective mechanism of action. They have knowledge of significant risk factors for cancer diseases. They are acquainted with the basics of toxicology and they can explain the principle of the most common therapeutic strategies.

### Content
The lecture deals with problems of tumor epidemiology (causes, mortality, incidence). Cancer is delineated as a multi-step process. Classes of chemical compounds that induce cancer are discussed as well as the reactive metabolites that may be built from. Covalent binding to DNA is discussed and different types of mutations resulting thereof. A selection of proto-oncogenes and tumor suppressor genes is presented. Their function will be discussed as well as the changes which are found in these genes in tumor cells, starting from single nucleotide exchanges up to large deletions. The reason for genetic predisposition to cancer will be discussed as well as cancer relevant aspects of cell cycle regulation. Phenomenons like angiogenesis and metastasis are presented as well as the mechanisms that protect the genome from mutagenic damage. Further subjects address old and new strategies of cancer treatment. Personalised cancer treatment.

### Lecture notes
Handouts with reproductions of all presented transparencies will be distributed.

### Literature

### Prerequisites / notice
The lecture requires an active participation of the students. All students will participate in individual or group work focussing on specific subject of the lecture. Students will have ample time for preparation during lecture time.

</table>

**Prerequisites / notice**
This is no lecture. There is no exam and no credit points will be awarded. The current program can be found on the web: http://stat.ethz.ch/events/zukost

**Course language**
English or German and may depend on the speaker.

#### 401-0512-00L
**Current Topics in Molecular and Cellular Neurobiology**

**Z Dr** 2 credits 1S

<table>
<thead>
<tr>
<th>Objective</th>
<th>Abstract</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of participants limited to 8.</td>
<td>The course is a literature seminar or “journolab”. Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.</td>
</tr>
</tbody>
</table>

**Content**
The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

**Lecture notes**
Presentations will be made available after the seminars.

**Prerequisites / notice**
You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

Data: 06.10.2017 12:53  Autumn Semester 2016  Page 212 of 1570
Abstract
This monthly meeting is a platform for Zurich-based immunology research groups to present and discuss their ongoing research projects. At each meeting three PhD students or Postdocs from the participating research groups present an ongoing research project in a 30 min seminar followed by a plenary discussion.

Objective
The aim of this monthly meeting is to provide further education for master and doctoral students as well as Postdocs in diverse topics of immunology and to give an insight in the related research. Furthermore, this platform fosters the establishment of science- and technology-based interactions between the participating research groups.

Content
Presentation and discussion of current research projects carried out by various immunology-oriented research groups in Zurich.

Lecture notes
none

551-1405-00L Electron Cryomicroscopy Seminar
Abstract
Intergroup seminar for scientists and students interested in electron cryomicroscopy
Objective
The goal of the seminar is to provide an exchange forum for anyone interested in electron cryomicroscopy (tomography and single particle).
The first ~10 minutes are used for exchange on instrument status and technical issues, followed by a ~30 min presentation and discussion of a specific project.
The seminar can also be used to discuss current literature and report from conferences.
Prerequisites / notice
Presented project data are confidential. Sign-up for seminar announcements by emailing pilhofer@biol.ethz.ch.

551-1106-00L Progress Reports in Microbiology and Immunology
Abstract
Presentation and discussion of current research results in the field of Microbiology and Infection Immunology
Objective
Precise and transparent presentation of research findings in relation to the current literature, critical discussion of experimental data and their interpretation, development and presentation of future research aims

551-0209-00L Sustainable Plant Systems (Seminar)
Abstract
Participants will be able to discuss and understand sustainability in the context of plant science research
Objective
Key objectives for the seminar are that (1) participants will be able to discuss issues of sustainability in the context of plant science research topics, e.g. how a specific research topic is important for understanding and advancing sustainability of plant systems and that (2) participants will be able to phrase their own visions for sustainability in plant sciences, their group work topic and their own MSc or PhD project. Plant science research topics will be on conservation agriculture, agro-ecology, plant breeding for orphan crops and methane emissions from wetland ecosystems.

551-1121-00L Progress Reports in Microbial Glycobiology and Fungal Defense Mechanisms
Abstract
Presentation and discussion of current research results in the field of Microbial Glycobiology and Fungal Defense Mechanisms
Objective
Precise and transparent presentation of research findings in relation to the current literature, critical discussion of experimental data and their interpretation, development and presentation of future research aims
## Compulsory Subjects First Year Examinations

### Mathematics I

- **Number**: 401-0291-00L
- **Title**: Mathematics I
- **ECTS**: 6 credits
- **Hours**: 4V+2U
- **Lecturers**: E. W. Farkas

**Abstract**
Mathematics I/II is an introduction to one- and multidimensional calculus and linear algebra emphasizing on applications.

**Objective**
Students understand mathematics as a language for modeling and as a tool for solving practical problems in natural sciences.

Students can analyze models, describe solutions qualitatively or calculate them explicitly if need be. They can solve examples as well as their practical applications manually and using computer algebra systems.

**Content**
Einführung in die Differential- und Integralerechnung von Funktionen einer Variablen und Anwendungen:

**Literature**
L. Papula, Mathematik für Ingenieure und Naturwissenschaftler, 11. Auflage, Vieweg und Teubner

Th. Wihler, Mathematik für Naturwissenschaften, 2 Bände: Einführung in die Analysis, Einführung in die Lineare Algebra; Haupt-Verlag Bern, UTB

Ch. Blatter, Lineare Algebra; VDF

H. H. Storrer: Einführung in die mathematische Behandlung der Naturwissenschaften I; Birkhäuser.

**Prerequisites / notice**

Der Zugang zu den Übungsseiten erfolgt online. Vorlesungsverzeichnis > Lernmaterialien > Material zur Vorlesung

### Foundations of Computer Science

- **Number**: 252-0852-00L
- **Title**: Foundations of Computer Science
- **ECTS**: 4 credits
- **Hours**: 2V+2U
- **Lecturers**: L. E. Fässler, H. J. Böckenhauer, M. Dahinden, D. Komm, H. Lehner

**Abstract**
Students learn to apply selected concepts and tools from computer science for working on interdisciplinary projects.

The following topics are covered: modeling and simulations, introduction to programming, visualizing multi-dimensional data, introduction matrices, managing data with lists and tables and with relational databases, universal methods for algorithm design.

**Objective**

- understand the role of computer science in science,
- to control computer and automate processes of problem solving by programming,
- choose and apply appropriate tools from computer science,
- process and analyze real-world data from their subject of study,
- handle the complexity of real-world data,
- know universal methods for algorithm design.

**Content**
1. The role of computer science in science
2. Introduction to Programming with Python
3. Modeling and simulations
4. Introduction to Matrices with Matlab
5. Visualizing multidimensional data
6. Data management with lists and tables
7. Data management with a relational database
8. Universal methods for algorithm design

**Prerequisites / notice**
This course is based on application-oriented learning. The students spend most of their time working through projects with data from natural science and discussing their results with teaching assistants. To learn the computer science basics there are electronic tutorials available.

### Fundamentals of Biology IA

- **Number**: 551-0105-00L
- **Title**: Fundamentals of Biology IA
- **ECTS**: 5 credits
- **Hours**: 5G
- **Lecturers**: M. Aebi, E. Hafen

**Abstract**
The course provides an introduction to the basics of molecular- and cell biology and genetics.

**Objective**
Introduction to modern biology and to principal biological concepts.

**Content**
The course is divided into several chapters:
1. Basic principles of Evolution.
2. Chemistry of Life: Water; Carbon and molecular diversity; biomolecules
3. The cell: structure; membrane structure and function, cell cycle
4. Metabolism: Respiration; Photosynthesis; Fermentation
5. Inheritance: meiosis and sexual reproduction; Mendelian genetics, chromosomal basis of inheritance, molecular basis of inheritance, from gene to protein, regulation of gene expression; genomes and their evolution

**Prerequisites / notice**
Certain sections of the text-book must be studied by self-instruction.

### General Chemistry (for Biology/Pharmacy/HST)

- **Number**: 529-1001-01L
- **Title**: General Chemistry (for Biology/Pharmacy/HST)
- **ECTS**: 4 credits
- **Hours**: 4V
- **Lecturers**: W. Uhlig

**Abstract**
The lecture deals with a number of basic chemistry concepts. These include (amongst others) chemical reactions, energy transfer during chemical reactions, properties of ionic and covalent bonds, Lewis structures, properties of solutions, kinetics, thermodynamics, acid-base equilibria, electrochemistry and properties of metal complexes.

**Objective**
The course is designed to provide an understanding of the basic principles and concepts of general and inorganic chemistry.
Content
The lecture deals with a number of basic chemistry concepts. These include (amongst others) chemical reactions, energy transfer during chemical reactions, properties of ionic and covalent bonds, Lewis structures, properties of solutions, kinetics, thermodynamics, acid-base equilibria, electrochemistry and properties of metal complexes.

529-1011-00L Organic Chemistry I (for students of Biology, Pharmaceutical Sci., and Health Sci. & Tech.) O 4 credits 4G C. Thilgen
Abstract Fundamentals of Organic Chemistry: molecular structure, Bonding and functional groups; nomenclature; resonance and aromaticity; stereochemistry; conformation; bond strength; organic acids and bases; basic reaction thermodynamics and kinetics; reactive intermediates: carbanions, carbenium ions and radicals.
Objective Understanding the basic concepts and definitions of organic chemistry. Knowledge of the functional groups and classes of compounds that are important in biological systems. Foundations for the understanding of the relationship between structure and reactivity.
Lecture notes Printed lecture notes are available. Exercises, answer keys and other handouts can be downloaded from the Moodle course “Organic Chemistry I” of the current semester (https://moodle-app2.let.ethz.ch).
Literature
Lecture notes are available.

Abstract
Introduction to the practical work in a chemistry laboratory. The most important manipulations and techniques are treated, as well as the the most fundamental chemical reaction types.

Objective
- Knowledge of the basic chemical laboratory methods.
- Basic knowledge of the scientific approach in experimenting.
- Observation and interpretation of real-world chemical processes.
- Keeping of a reliable laboratory journal.

Content
- Simple chemical methods and calculations.
- Separation techniques.
- Physical measurements: mass, volume, pH, optical spectra.
- Ionic solids (salts).
- Acid/base chemistry, buffers.
- Redox reactions.
- Metal complexes.
- Titration methods and quantitative spectrometry.
- Introduction to qualitative analysis.

Lecture notes
Course manual in German (is handed out to the students at the begin of the lessons). Language: German, English upon request.

PDF files available at http://acac1.ethz.ch/praktikum/docs.html

Literature

Wiley

is a suitable textbook.

Prerequisites / notice
This practical course causes costs for materials and chemicals. The costs are charged to the students at the end of semester.

551-0103-00L Fundamentals of Biology II: Cell Biology O 5 credits 5V E. Hafen, U. Kutay, J. Matos, G. Schertler, U. Suter, S. Werner
The goal of this course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

The lectures are presented in the Powerpoint format. These are available on the WEB for ETH students over the nethz (Moodle). Some lectures are available on the ETH WEB site in a live format (Livestream) at the above WEB site.

The focus is animal cells and the development of multicellular organisms with a clear emphasis on the molecular basis of cellular structures and phenomena. The topics include biological membranes, the cytoskeleton, protein sorting, energy metabolism, cell cycle and division, viruses, extracellular matrix, cell signaling, embryonic development and cancer research.

Some of the lectures are given in the English language. Certain sections of the text-book must be studied by self-instruction.

Vertiefung von Statistikmethoden. Nach dem detaillierten Fundament aus Statistik I liegt nun der Fokus auf konzeptueller Breite und konkreter Problemlösungsfähigkeit mit der Statistiksoftware R.

Data: 06.10.2017 12:53  Autumn Semester 2016  Page 216 of 1570
The lecture focuses on the following topics within Mycology:

1. The fungal lifestyle
2. Differentiation processes of the Mycelium
3. Reproductive cycles and systematic grouping of fungi
4. Ecology of the fungi
5. Use of fungi

Knowledge of the fungal lifestyle across all domains of life and how evolutionary science investigates these questions. These topics are important for the understanding of a number of evolutionary problems in the basic and applied sciences.

Abstract
This course introduces important questions about the evolutionary processes involved in the generation and maintenance of biological diversity across all domains of life and how evolutionary science investigates these questions.

Objective
This course introduces important questions about the evolutionary processes involved in the generation and maintenance of biological diversity across all domains of life and how evolutionary science investigates these questions. The topics covered range from different forms of selection, phylogenetic analysis, population genetics, life history theory, the evolution of sex, social evolution to human evolution.

Content
Topics likely to be covered in this course include research methods in evolutionary biology, adaptation, evolution of sex, evolutionary transitions, human evolution, infectious disease evolution, life history evolution, macroevolution, mechanisms of evolution, phylogenetic analysis, population dynamics, population genetics, social evolution, speciation and types of selection.

Literature
Textbook:
Evolutionary Analysis
Scott Freeman and Jon Herron

Prerequisites / notice
The exam is based on lecture and textbook.

551-0435-00L
Systematic Biology: Zoology

Abstract
Lecture: The lecture provides an overview of animal diversity. Using key selected groups, phylogenetic, morphological and ecological aspects are addressed. Two priority topics are the arthropods and the vertebrates (including vertebrate fauna of Switzerland).

Objective
Lecture: The systematic classification of animals and the characteristics of the most important animal groups, basic animal body plans.

Content
Lecture: Body plans, characteristics, diversity and phylogenetic position of the main groups of Protozoa, Invertebrates, and Vertebrates, with a special focus on Arthropods and Vertebrates (including vertebrate fauna of Switzerland).

Practical: Macroscopic and microscopic study of selected Protozoa, Invertebrates (especially insects) and Vertebrates: morphology and anatomy; behaviour, mainly locomotion, feeding, and reproduction.

Lecture notes
A script for the course will be sold in the lecture, and additional material will be handed out (particularly in the practical). Further literature required, the script contains suggestions for further reading.

Literature
No further literature required, the script contains suggestions for further reading.

551-0227-00L
Mycology

Abstract
The lecture gives an introduction into the field of Mycology. It provides an overview of the fungal lifestyle (hyphal growth/mycelium; reproductive cycles; ecology of the fungi; use of fungi)

Objective
Understanding the fungal life form.
Knowledge of the specific properties of the fungal cell
Knowledge of the different reproductive cycles in all fungal phyla
Knowledge of the different nutritional modes of the fungi; correlation with habitat and ecology
Knowledge of the application of fungi in food production and biotechnology

Content
The lecture focuses on the following topics within Mycology:
1. The fungal lifestyle
2. Differentiation processes of the Mycelium
3. Reproductive cycles and systematic grouping of fungi
4. Ecology of the fungi
5. Use of fungi

Lecture notes
none; hand-outs will be prepared before the lectures

Literature
none

Prerequisites / notice

529-0229-00L
Practical Course Organic Chemistry (for Students of Biology and Pharmaceutical Sciences)

Abstract
Analytical part: basic operations for the separation of mixtures of organic compounds (recrystallization, distillation, extraction, chromatography)
Synthetic part (main part): at least 8 synthetic steps (one- or two-step syntheses).

Latest online enrolment is 10 days before the beginning of the semester.

Data: 06.10.2017 12:53 Autumn Semester 2016 Page 217 of 1570
Lecturers

The origin of quantum theory. The hydrogen atom. Polyelectronic atoms and the periodic table. Orbitals and small molecules. Symmetry

K. Locher, Orbitals and chemical bonding in main-group elements and transition metals. 3 credits

Analytical part: basic operations for the separation of mixtures of organic compounds (recrystallization, distillation, extraction, chromatography).

Type

A. Mezzetti

Prerequisites / notice

The basic reactions of Organic Chemistry and their mechanisms should be known (cf. course 529-1012-00L Organic Chemistry II for Students of Biology, Pharmaceutical Sciences, and Health Sci. and Tech.).

As a prerequisite, all participants need to pass the "Safety Test HCI Chemie V2 English" (see https://moodle-app2.let.ethz.ch). A printout of the certificate generated by the system needs to be presented to the teaching assistants prior to starting lab work.

Abstract

Analytical part: basic operations for the separation of mixtures of organic compounds (recrystallization, distillation, extraction, chromatography).

Synthetic part (main part): at least 8 synthetic steps (one- or two-step syntheses).

Introduction to database searches (Reaxys, SciFinder).

Objective

Learn the basic techniques for the preparation and purification of organic compounds.

Learn to take accurate notes of the experiments.

Deepen the understanding of reaction mechanisms.

Content

Analytical part: basic operations for the separation of mixtures of organic compounds (recrystallization, distillation, extraction, chromatography).

Synthetic part (main part): at least 8 synthetic steps (one- or two-step syntheses).

Introduction to database searches (Reaxys, SciFinder).

Abstract

Orbitals and chemical bonding in main-group elements and transition metals.

Introduction to the orbital concept and to the binding theory in complexes of the transition metals.

Objective

Literature

Prerequisites / notice

Learn to take accurate notes of the experiments.

Deepen the understanding of reaction mechanisms.

Laboratory Practical Work in Organic Chemistry

Prerequisites

Prerequisites:

- A knowledge of basic organic chemistry.
- Completion of the theoretical courses "Chemistry I" and "Chemistry II".
- Completion of the laboratory courses "Chemistry I" and "Chemistry II".

Literature

- P. Wörfel, M. Bitzer, U. Claus, H. Felber, M. Hübel, B. Vollenweider, Laborpraxis (Bd. 1: Einführung, allgemeine Methoden; Bd. 2: Messmethoden; Bd. 3: Trennungsmethoden; Bd. 4: Analytische Methoden), Birkhäuser Verlag.

Prerequisites / notice

There will be 5 optional extra sessions for the population genetics part (following lectures 2-6) for computer simulations, designed to help understand the course material.

Abstract

The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

Objective

The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

Content

Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding, natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.

Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossingbreeding, effects on fitness; Fisher's fundamental theorem.

Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation.

Literature

- Handouts

Prerequisites / notice

There will be 5 optional extra sessions for the population genetics part (following lectures 2-6) for computer simulations, designed to help understand the course material.

<td>Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division &amp; growth, and cell migration.</td>
<td>U. Kutay, R. I. Enchev, B. Kommann, M. Peter, I. Zemp, further lecturers</td>
<td></td>
</tr>
<tr>
<td>The full-year course (551-0319-00 &amp; 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterization of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Introduction into structural and functional aspects of the immune system.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

Introduction to Bioinformatics: Concepts and Applications

<table>
<thead>
<tr>
<th>W</th>
<th>6 credits</th>
<th>4G</th>
</tr>
</thead>
</table>

Abstract
Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

Objective
Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

Content
Bioinformatics I will cover the following topics:
- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

376-1305-10L
Neurobiology

<table>
<thead>
<tr>
<th>W</th>
<th>6 credits</th>
<th>4V</th>
</tr>
</thead>

Abstract
Development of the nervous system (NS): the adult NS, plasticity and regeneration, sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, diseases of the NS.
Objective
Overview of normal development, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical
approaches.

Content
Development: Early development of the nervous system, cellular level, nerve fiber growth, building of neuronal networks; biology of the
adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration,
pathological loss of cells.

Lecture notes
Structure, Plasticity and Repair of the Nervous System (376-1305-01L); Lecture notes will be provided on Moodle https://moodle-
app2.let.ethz.ch/course/view.php?id=694
Password will be provided at the beginning of the lecture.

Development of the Nervous System (376-1305-00L); Lecture notes will be provided on OLAT https://www.olat.uzh.ch/olat/dmz/

Literature
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual
lectures.

Objective
Number of participants limited to 8.

Abstract
Introduction to the biology, systematics and ecology of the important fungal groups. The participants will study primarily fungal materials
that they collect during field excursions or that they isolate in the laboratory.

Objective
Knowledge of characteristics, life style and ecological significance of major fungal and fungal-like groups. Become acquainted with
methods for collecting, microscopic examination and identification of fungi.

Content
Die Studierenden lernen die Merkmale und Besonderheiten der Pilze und pilzartigen Organismen kennen und erhalten einen Überblick
über die Systematik der Ascomycota und Basidiomycota, und eventuell weiterer ausgewählter Gruppen. Die Ökologie der Pilze wird
anhand von ausgewählten Pilzgemeinschaften (z.B. Holz- und Streuabbaue, Begleitpilze, Endophyten) vorgestellt. Im Rahmen eines
kleinen Projekts befassen sich die Teilnehmer/innen mit pflanzenparasitären Pilzen (vor allem Rost- und Mehltaupilzen) und lernen, wie
man diese Pilze findet, mikroskopiert und bestimmt.

Lecture notes
Übersichten und Skriptunterlagen zum Kursstoff werden abgegeben.

Literature

Objective
Number of participants limited to 6.

Abstract
The course covers multidisciplinary aspects of plant molecular biology and green biotechnology. The participants will acquire theoretical
and practical introduction on diverse topics, including, generation and molecular characterization of transgenic plants; allele mining from
genetic resources and on strategies to improve plants against biotic & abiotic stresses and for their nutritional value

Objective
In this block course, students will gain conceptual and practical introduction to crop biotechnology research. In addition to the theoretical
overview of current trends in plant biotechnology, students will envision the practical application of the knowledge gained through hands-on
training on the plant molecular biology laboratory techniques. The course will introduce the potential of plant molecular biology and genetic
transformation as a tool for gene identification, gene function, crop improvement and commercial application. The course will also allow the
students to understand and critically evaluate the literature in this research field.

Content
- Lectures will particularly focus on the contribution of biotechnology towards crop improvement, with examples from our own work on crops
including rice and wheat.
Following topics will be covered:
- Green biotechnology: status and prospects
- Plant genetic transformation (methods)
- Molecular characterization of transformed plants
- Introduction to selection marker systems (examples, antibiotic and herbicide resistance, phosphomannose-isomerase, marker-free
systems, visible markers)
- Introduction to promoter types (example tissue specific promoters)
- Plant tissue culture techniques
- Crop improvement through biotechnology (examples from our work on rice, and cassava)
- Gene mining from plant genetic resource collections
- A visit to the ETH greenhouse facilities at Eschikon will provide an opportunity to visualize and discuss different rice, wheat and cassava
projects performed at the ETH Plant Biotechnology Lab.

Lecture notes
For the practical part, protocols will be distributed within the course and Lecture material will be made available.

Literature
Relevant literature information will be provided within the course.

Objective
Students will use lists of genes obtained in real experiments and learn how to obtain gene-centered information from literature and
databases. They will use tools for gene function prediction and visualization of protein-protein interaction networks. The work will lead to a
more meaningful annotation of co-detected genes and generate a hypothesis about their functional relationship.

Ability to use modern databases, mining- and modelling tools for functional annotation of genes and gene networks. Gene centered view of
plant processes.
Content
Many new biological analysis methods result in lists of genes or proteins related to biological structures, functions, or processes. The information available about the genes or proteins is often scattered in multiple databases and publications, making it difficult to extract and uncover common features or relationships among the biological molecules. In the course students will use lists of genes or proteins from ongoing experiments in the laboratory and learn how to find and assemble gene-centered information in the literature, different databases and with analysis tools. The training and research will lead to a better and more meaningful annotation of co-detected genes members and generate a hypothesis about their functional relationship. The work will be done exclusively using a computer. Students will work independently but with close supervision by experienced scientists. Daily discussions of the work will ensure progress. The computer work will be accompanied by lectures on theoretical and practical aspects of databases, gene networks and the project context of the gene lists that will be analyzed. Students will present their results and hypotheses at the end of the block course.

551-0347-00L Molecular Mechanisms of Cell Growth and Polarity

<table>
<thead>
<tr>

| 551-0421-00L | Biology and Ecology of Fungi in Forests | W | 6 credits | 7G | I. L. Brunner, S. H. Egli, D. H. Rigling |
| Number of participants limited to 10. |
| Abstract: Introduction of the biological and ecological basics of fungi in forests. Focusing on mycorrhizal, saprobic, and pathogenic fungi and their functional relevance in the forest ecosystems. To get to know current methodological research approaches on the basis of selected examples with practical works in forest and lab as well as excursions and lectures. |
| Objective: Knowledge of the fungi of forest and its ecological significance. Knowing of current methodological research approaches. Self-reliant and deepened activities of selected topics of fungi from forests. |
In this block course, students actively participate in ongoing research projects on plant metabolism and are tutored individually by doctoral students. In a lecture series, students will present their projects as well as discuss topical recent publications.

Content
- Participation in the following research projects will be possible: Photosynthetic metabolism; how is photo-assimilated carbon allocated to sustain plant growth? Chloroplast biology: how is chloroplast function integrated with that to the whole cell? Starch biosynthesis and degradation; how are complex, semi-crystalline starch granules made from simple sugars, and once made, how are they degraded again to release the stored carbohydrate? Regulation of metabolism through protein-protein interaction; how and why do proteins involved in starch metabolism interact with each other to form multi-subunit enzymes and multi-enzyme complexes? Sugar sensing; How does a plant know how much sugar it has, and how does this influence development.

Abstract
- Fundamentals (theoretical and practical) in phytopathology, eg. interaction between plants and plant-pathogenic microorganisms, morphology and lifecycles of plant-pathogenic fungi, evolution of plant-pathogenic fungi, biological control of plant diseases

Objective
- Insight into ongoing research projects
Content

Practical courses:
Experiments within ongoing phytopathological research projects
Macro- and microscopic diagnosis of plant diseases

Theoretical courses:
Fundamentals of phytopathology, eg. interaction between plants and plant-pathogenic microorganisms, morphology and lifecycles of plant-pathogenic fungi, evolution of plant-pathogenic fungi, biological control of plant diseases

will be distributed at the beginning of the course

Lecture notes

529-0739-00L Biological Chemistry: New Enzymes from Directed Evolution Experiments W 6 credits 7G P. A. Kast

Abstract
During the block course in the fall semester, we will carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. By working in parallel, teams of 2 participants each will generate a variety of different variants of a chassismate mutant. Individual enzyme catalysts will be purified and subsequently characterized using various different spectroscopic methods. The detailed chemical-physical analyses include determination of the enzymes’ kinetic parameters, their molecular mass, and the integrity of the protein structure. The results obtained from the individual evolution experiments will be compared and discussed at the end of the class in a final seminar. We expect that during this lab course we will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalyst.

Objective
All technologies used for the experiments will be explained to the students in theory and in practice with the goal that they will be able to independently apply them for the course project and in future research endeavors. After the course, an individual report about the results obtained has to be prepared.

Content
The class deals with a specifically designed and genuine research project. We intend to carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. By working in parallel, teams of 2 participants each will generate a variety of different variants of a chassismate mutant. Individual enzyme catalysts will be purified and subsequently characterized using various different spectroscopic methods. The detailed chemical-physical analyses include determination of the enzymes’ kinetic parameters, their molecular mass, and the integrity of the protein structure. The results obtained from the individual evolution experiments will be compared and discussed at the end of the class in a final seminar. We expect that during this lab course we will not only generate novel enzymes, but also gain new mechanistic insights into the investigated catalyst.

Prerequisites / notice
This laboratory course will involve experiments that require a tight schedule and (sometimes) long (!) working days. The maximum number of participants for the laboratory class is limited, but surplus applicants may contact P. Kast directly to have their names added to a waiting list. A valid registration is considered a commitment for attendance of the entire course, as involved material orders and experimental preparations are necessary and, once the class has started, the flow of the experiments must not be interrupted by individual absences. In case of an emergency, please immediately notify P. Kast. For more information, see also http://www.protein.ethz.ch/kast/praktikum.html

Further literature will be indicated in the distributed script.

551-0336-00L Methods in Cellular Biochemistry W 6 credits 7G P. Picotti, U. Kutay, J. Matos, M. Peter, K. Weis

Abstract
Students will learn about biochemical approaches to analyze cellular functions. The course consists of practical projects in small groups, lectures and literature discussions. The course concludes with the presentation of results at a poster session.

Objective
Students will learn to design, carry out and assess experiments using current biochemical and cell biological strategies to analyze cellular functions in a wide range of model systems. In particular they will learn novel imaging techniques along with biochemical approaches to understand fundamental cellular pathways. Furthermore, they will learn to assess strengths and limitations of the different approaches and be able to discuss their validity for the analysis of cellular functions.

Literature
Documentation and recommended literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
This course will be taught in English.

551-1515-00L Insulin Signaling W 6 credits 7G M. Stoffel

Abstract
Introduction to the physiological and biochemical action of insulin signaling and its role in the fasted/feeding response and in obesity and diabetes.

Objective
The students will obtain an overview about the current topics of research in insulin signaling and how it impacts on growth, metabolism and cell differentiation. They will learn to design experiments and use techniques necessary to analyze different aspects of insulin signaling, including physiological actions in whole animals as well as in tissue culture. Through lectures and literature seminars, they will learn about the open questions of insulin signaling research and discuss approaches to address these questions experimentally.

In practical lab projects the students will perform physiological in vivo studies as well as biochemical experiments. Finally, they will learn how to present and discuss their data. Student assessment is a graded semester performance based on individual performance in the laboratory, a written exam and the lab data presentation.

572-4020-00L Experimental Food Microbiology for Biologists W 6 credits 7G M. Schuppler, M. Loessner, M. Schmelcher

Prerequisites: It is recommended to attend the course Lebensmittel-Mikrobiologie (572-4005-00L) as a preparation.

Abstract
Teaching of basic experimental knowledge for detection and identification of microorganisms in food. Practical experiments were accompanied by theoretical introductions. Students become acquainted with classical and state-of-the-art molecular techniques for the rapid detection of food borne pathogens and experiments in dependence on current research topics of the Laboratory of Food Microbiology.

Objective
Introduction of methods and techniques of food microbiology

Content
Teaching of basic experimental knowledge for detection and identification of foodborne pathogens by applying state-of-the-art techniques as well as modern molecular techniques for the rapid identification of relevant foodborne pathogens.

Lecture notes
Handouts were provided at the start of the course

- Krämer: "Lebensmittel-Mikrobiologie" (Ulmer; UTB)
- Süßmuth et al.: “Mikrobiologisch-Biochemisches Praktikum” (Thieme)
Documentation and recommended literature will be provided at the beginning and during the course. The recommended literature, including reviews and primary research articles, will be provided during the course.

Biology of Bryophytes and Ferns

In vitro & in vivo experiments will introduce current research on the biosynthesis, structure & function of protein-bound glycans in different pro- and eukaryotic microorganisms.

Participants are familiar with the biosynthesis, structure and function of N-glycans in microorganisms and with the methods for their analysis.

Topics: biosynthesis of asparagine-linked glycans in pro- and eukaryotes; structure of glycans in different organisms; methods to analyse the structure of glycans; function of glycans in protein quality control

Introductory lectures

* Seminar with presentation and discussion of recent publications

* Experiments that exemplify the current research done in the group

Plant Volatiles in Plant Insect Interactions

The course will cover six main topics that will be connected throughout the experimental phase:

1) Plant volatile biosynthesis and classification
2) Insect olfactory physiology
3) Volatile-mediated plant-herbivore interactions
4) Volatile-mediated multitrophic interactions
5) Manipulation of plant volatile emission by vector- borne disease agents
6) Methods for volatile collection and analysis

The lab practical will be performed in a system consisting of the cabbage butterfly Pieris brassicae, its host plant Brassica oleracea (Brussels sprouts), and the parasitoid wasp Cotesia glomerata (natural enemy of P. brassicae).

Students will collect volatiles from herbivore-damaged and undamaged plants and learn how to identify and quantify these compounds through gas chromatography coupled with mass spectrometry and flame ionization detection (GC-MS-FID). Afterwards, they will be able to compare volatile emissions from herbivore-damaged and undamaged plants and identify important volatile compounds associated with herbivory. Finally, students will evaluate the effect of herbivore-induced volatile compounds on the behavior of the herbivore (P. brassicae) and its natural enemy (C. glomerata), using different behavioral assays, including Y-tube olfactometers and wind tunnels.

The course will be taught in English.

Assessment is a graded semester performance based on individual performance in the laboratory, the written exam and the poster presentation. Students have to present a poster on a special theme.

Students have to present a poster on a special theme.

Grade according to poster presentation and contributions during the course.

Number of participants limited to 16.

Read the recommended literature, including reviews and primary research articles, will be provided during the course.

Block Courses in 4th Quarter of the Semester

From 1.12.2016 08:00 hr to 23.12.2016 17:00 hr

Biology of Bryophytes and Ferns

Bryophytes: Basic knowledge on the morphology, ecology, biogeography and endangerment of bryophytes; knowledge of common species; skills in the determination of bryophytes; field trip.

Ferns: basic knowledge on the life cycle, evolution and ecology of ferns; identification of Swiss ferns; field trips.

Biology of Bryophytes and Ferns

Bryophytes: Basic knowledge on the morphology, ecology, biogeography and endangerment of bryophytes; knowledge of common species; skills in the determination of bryophytes.

Ferns: basic knowledge on the life cycle, evolution and ecology of ferns; identification of Swiss ferns.

Biology of Bryophytes and Ferns

Bryophytes: Systematics and morphology of hornworts, liverworts and mosses and special themes such as ecology, biogeography, diversity and endangerment of bryophytes; one full-day field trip.

Ferns: Life cycle; evolutionary groups of ferns and fern allies; breeding systems, micro- and macroevolution; ecology; full-day and half-day field trips.

DNA extraction, PCR, sequencing, bioinformatic analysis.

Hand-outs are available.

Students have to present a poster on a special theme.

Grade according to poster presentation and contributions during the course.

Number of participants limited to minimum 2 and maximum 8.

Number of participants limited to 20.

Number of participants limited to 20.

Number of participants limited to 20.

Number of participants limited to 20.
To learn the cellular and molecular principles underlying tissue repair processes, in particular in the skin and in the liver, and the parallels and differences to cancer. To learn modern technologies in Molecular and Cellular Biology as well as Histology and to use these technologies to study questions related to mechanisms underlying tissue repair and cancer.

This course aims at the understanding of the cellular and molecular mechanisms underlying tissue repair processes in response to different insults. The focus will be on repair of the skin and the liver. In addition, we will highlight the parallels and differences between tissue repair and cancer. Experimental approaches include biochemical studies, molecular and cellular studies using cultured cell lines and primary cells, as well as analysis of murine and human tissues. The course combines practical work with lectures, discussions, project preparations and presentations.

The aims of the block course are that participants

(i) understand the function and evolution of insulin/TOR signaling
(ii) learn how genetic approaches in different organisms contribute to the understanding of human diseases such as cancer
(iii) will get familiarized with reading and discussing research articles
(iv) get a first exposure to current research.

The block course consists of

(i) experiments:

Teams of two students each will join research labs to work on current projects focusing on growth regulation in both single-cell eukaryotes (yeast) and multicellular animals (Drosophila). The students will present their projects and results to their colleagues.

(ii) lectures on growth regulation in yeast and Drosophila.

(iii) journal clubs to discuss recent literature.

This course combines Limnology (the study of inland waters in its broad sense) with ecological and evolutionary concepts. It deals with rivers, groundwater and lakes.

This course contains a lecture part, an experimental part, two determination courses (aquatic invertebrates and algae) as well as excursions.

During this course you will get an overview of the world's typical continental aquatic ecosystems. After this course you will be able to understand how aquatic organisms have adapted to their habitat, and how the interactions (e.g. food web) between organisms work.

During the experimental part of this course you will learn the principles of doing research to observe interrelations in aquatic ecosystems. You will measure and interpret biological and physical data (e.g. during experiments, field work) and present the collected knowledge.

After this course you will know the most important aquatic species groups (macroinvertebrates, microinvertebrates and cryptogames) in Switzerland and the most important identification traits.

The course contains a lecture part, an experimental part, two determination courses (aquatic invertebrates and algae) and field excursions.

Lecture:
The lecture part covers ecology and evolution of aquatic organisms in lentic and lotic waters. Topics include: Adaptations, distribution patterns, biotic interactions, and conceptual paradigms in freshwater ecosystems. Important aspects regarding ecosystem metabolism and habitat properties of freshwaters. Applied case studies and experiments testing ecological and evolutionary processes in freshwaters.

Practical part:
The practical part includes excursions to Greifensee, to the river Sense (natural river system) and to the river Töss (groundwater). Additionally, you will perform in small groups an independent experiment in a research group at Eawag.

The taxonomic part will cover macroinvertebrates (e.g. Crustacean, aquatic insects), microinvertebrates and algae. The goal is to get to know the most common aquatic taxa in Switzerland, to identify them with commonly used identification literature, and to get an idea how these organisms are used in research and practice. (language: German, translation of the most important things during the course possible)

Course notes and power point presentations provided during the course.

The maximal participating number of biology students is 14.
### Analysis of Human T and B Cell Responses to Infectious Agents

**Number**: 551-1143-00L  
**Title**: Analysis of Human T and B Cell Responses to Infectious Agents  
**Type**: W  
**ECTS**: 6 credits  
**Hours**: 7G  
**Lecturers**: A. Lanzavecchia  

**Abstract**: Students actively participate in ongoing research projects on the analysis of human T and B cell response to pathogens and vaccines. They will be tutored in small groups by doctoral students and postdocs. In a lecture series, the theoretical background for the projects will be provided and the students will have the opportunity to present their projects and discuss recent publications.

**Objective**: To learn current methodologies in human immunology through experimental work in the lab. To learn current concepts through lectures and discussion of original papers. Requirement for obtaining the credit points: oral presentation of the research project in a ppt format.

**Content**: The students will be tutored in their experimental work by doctoral or postdoctoral students from the Glockshuber or Weber-Ban group. Additional, the course includes specific lectures that provide the theoretical background for the experimental work, as well as exercises on the numeric evaluation of biophysical data, and literature work.

### Protein Folding, Assembly and Degradation

**Number**: 551-0438-00L  
**Title**: Protein Folding, Assembly and Degradation  
**Type**: W  
**ECTS**: 6 credits  
**Hours**: 7G  
**Lecturers**: R. Glockshuber, E. Weber-Ban

**Abstract**: Students will carry out defined research projects related to the current research topics of the groups of Prof. Glockshuber and Prof. Weber-Ban. The topics include mechanistic studies on the assembly of adhesive pili from pathogenic bacteria, disulfide bond formation in the bacterial periplasm, ATP-dependent chaperone-protease complexes and formation of amyloid deposits in Alzheimer's disease.

**Objective**: The course should enable the students to understand and apply biophysical methods, in particular kinetic and spectroscopic methods, to unravel the mechanism of complex reactions of biological macromolecules and assemblies in a quantitative manner.

**Content**: The students will be tutored in their experimental work by doctoral and postdoctoral students from the Glockshuber or Weber-Ban group. Additional, the course includes specific lectures that provide the theoretical background for the experimental work, as well as exercises on the numeric evaluation of biophysical data, and literature work.

### Genomic and Genetic Methods in Cell and Developmental Biology

**Number**: 551-1709-00L  
**Title**: Genomic and Genetic Methods in Cell and Developmental Biology  
**Type**: W  
**ECTS**: 6 credits  
**Hours**: 7G  
**Lecturers**: A. Wutz, C. Ciaudo, M. Kopf, T. Schroeder, G. Schwank

**Abstract**: This course aims to provide students with a comprehensive overview of mammalian developmental biology and stem cell systems both on the theoretical as well as the experimental level. Centering the course on genetic and genomic methods engages the students in contemporary research and prepares for future studies in the course of semester and master projects.

**Objective**: - Understanding mammalian development  
- Introduction to stem cells systems  
- Working with cultured cells  
- Translational aspects of mammalian cell biology

**Content**: The course will consist of a series of lectures, essay assignments, project development and discussion workshops, and 2 and a half weeks of lab work with different mammalian cell systems embedded in real life research projects. At the end of the course students will take an exam consisting of questions on the topic of the lectures and workshops. It is expected that students will be able to apply the knowledge to concrete problems.

European Credit Transfer and Accumulation System

- Special students and auditors need special permission from the lecturers.
In teams of two, participants in this seminar conduct their own research project. Each team is advised by one of the researchers serving as lecturers in this course. During the first half the semester, relevant methodological knowledge and skills are practiced during plenary meetings and in students’ independent reading (e.g. generating and testing research questions, designing experiments, and analyzing data in the field of Learning and Instruction). The successful completion of both course no. 851-0240-00L “Menschliches Lernen (EW 1)” and course no. 851-0238-01L “Unterstützung und Diagnose von Wissenserwerbsprozessen (EW 3)” is a necessary prerequisite for this course.

The course is targeted at advanced students who have taken an interest in gathering practical research experience in the field of Learning & Instruction. In teams of two, students conduct their own research projects (planning, conducting, analyzing, interpreting, and presenting research); thus, the course requires a high amount of self-directed working. Students are personally advised, and supported in their research project, by one of the researchers serving as lecturers in this course. During the first half the semester, relevant methodological knowledge and skills are practiced during plenary meetings and in students’ independent reading (e.g. generating and testing research questions, designing experiments, and analyzing data in the field of Learning and Instruction). Learning goals include:

- Participants can illustrate and explain basic methods and concepts for research in the fields of Learning and Instruction, e.g. with the help of practical examples.
- Participants can generate testable research questions for a topic relevant in the fields of Learning and Instruction.
- Participants can design and conduct a study that is relevant for answering their research question.
- Participants can summarize and evaluate the main results from a study in the field of learning and instruction, with regard to the research question being asked.

**Thematische Schwerpunkte**

### Mentored Work Subject Didactics Biology A

**Mentored Work Subject Didactics Biology in Teaching Diploma, Teaching Diploma Biology as Minor Subject.**

The Subject Didactics as well as possible branch-specific requirements must be fulfilled prior to commencing the mentored paper.

**Abstract**

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

**Objective**

The objective is for the students:

- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

**Content**

Themenwahl nach Vereinbarung. Reflektion über Themen aus allen biologiespezifischen Bereichen des Unterrichts.

**Lecture notes**

Eine kurze Anleitung zur mentorierten Arbeit in Fachdidaktik wird zur Verfügung gestellt.

**Prerequisites / notice**

Die Arbeit sollte vor Beginn des Unterrichtspraktikums abgeschlossen werden.

Allfallige fachwissenschaftliche Auflagen müssen alle erfüllt sein, bevor mit der Mentorierten Arbeit begonnen werden kann.

### Mentored Work Subject Didactics Biology B

**Mentored Work Subject Didactics Biology in Teaching Diploma, Teaching Diploma Biology as Minor Subject and for students upgrading TC to Teaching Diploma.**

The Subject Didactics as well as possible branch-specific requirements must be fulfilled prior to commencing the mentored paper.

**Abstract**

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

**Objective**

The objective is for the students:

- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

**Content**

Thematische Schwerpunkte

Die Gegenstände der mentorierten Arbeit in Fachdidaktik stammen in der Regel aus dem gymnasialen Unterricht.

**Lecture notes**

Eine kurze Anleitung zur mentorierten Arbeit in Fachdidaktik wird zur Verfügung gestellt.

**Prerequisites / notice**

Die Arbeit sollte vor Beginn des Unterrichtspraktikums abgeschlossen werden.

Allfallige fachwissenschaftliche Auflagen müssen alle erfüllt sein, bevor mit der Mentorierten Arbeit begonnen werden kann.

### Subject Didactics Biology I

**Simultaneous enrolment in Introductory Internship Biology**

- course 551-0968-00L - is compulsory.

**Abstract**

- Basic conditions for tuition (MAR - recognition of Matura certificates - curricula, standards), selection of topics and reduction of the complexity of topics.
- Application of teaching methods and techniques from educational science in biology classes.
- Planning and preparation of lessons.

**Objective**

- Students can discuss and put into practice in their teaching work the conditions and objectives set out in the regulations governing the school-leaving examination (Matura), the framework curriculum and the conditionals and objectives specified by their school.
- They are in a position to select learning objectives and formulate these on the basis of the target level model. They can plan and prepare lessons and can also develop appropriate learning assignments.
- Students can reconstruct specialist contents in didactic terms and develop teaching modules suitable for the different levels from these on the basis of the subject structure and learner requirements.
- They can reduce the complexity of subject-based specialist contents and present them in such a way that they are comprehensible and meaningful for learners.
- They can select appropriate media for their work (e.g. school books) and use these. They can employ appropriate experiments.
- The students can use different forms of examination for monitoring performance.
- Students are in a position to implement and discuss the concepts of biology teaching and learning on the basis of specific topics covered in school biology.

**Content**

**Lecture notes**

Wird laufend in der Vorlesung abgegeben.
During the introductory teaching practice, the students sit in on five lessons given by the teacher responsible for their teaching practice, and teach five lessons themselves. The students are given observation and reflection assignments by the teacher responsible for their teaching practice.

Objective

Right at the start of their training, students acquire initial experience with the observation of teaching, the establishment of concepts for teaching and the implementation of teaching. This early confrontation with the complexity of everything that teaching involves helps students decide whether they wish to and, indeed, ought to, continue with the training. It forms a basis for the subsequent pedagogical and subject-didactics training.

**Prerequisites / notice**

Studierende müssen LE zusammen mit dem Einführungspraktikum - LE 551-0968-00L - belegen.

**Professional Training (First Subject)**

**Important:** You can only enrol in the courses of this category if you have not more than 12 CP left for possible additional requirements.
Simultaneous enrolment in “Examination Lesson I Biology” (551-0969-01L) is compulsory.

Abstract
In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

Objective
On the basis of a specified topic, the candidate shows that they are in a position
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Content

Die gehaltene Lektion wird kriteriernbasiert beurteilt. Die Beurteilung umfasst auch die schriftliche Vorbereitung und eine mündliche Reflexion des Kandidaten/ der Kandidatin über die gehaltene Lektion im Rahmen eines kurzen Kolloquiums.

Lecture notes
Dokument: Schriftliche Vorbereitung für Prüfungslektionen.

Prerequisites / notice
Nach Abschluss der übrigen Ausbildung.

551-0913-00L
Professional Exercises in Biology

Abstract
Students conduct a series of “classical” biological school experiments and therefore gain practice and experience in this area.

Objective
Implementation of Subject Didactics I and II with the focus on conducting biological experiments in schools. This includes finding, testing and further developing suitable protocols for different subject areas of school biology. Working out how to didactically embed the experiments in lessons.

Content
1. Suchen geeigneter Protokolle für 1-2 Schulversuche aus versch. Themenbereichen (vorgegebene Liste), Selbstständiges Austesten.
   Anleiten der Mitstudierenden.
2. Die Studierenden führen alle ausgearbeiteten Experimente selber durch.

Lecture notes
Hand out of course material.

Prerequisites / notice
Der Teil biologische Experimente findet im Rahmen von 7 Halbtagen statt.

551-0963-00L
Specialized Biology Course with an Educational Focus: Teaching Diploma

Abstract
Specialist aspects of biology are covered from the angle of imparting these to pupils, their historical development, and their significance for the subject, the individual and society.

Objective
After successfully completing the module, students should be in a position:
- to call up more in-depth specialist knowledge of biology, covering a wide range of topics, and to impart this to others.
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyse controversial topics and to give factual explanations for these.
- to conduct more in-depth work on a research topic and to compile a tuition unit based on this topic
- to prepare tuition units involving complex learning matter at a high specialist level which are suitably tailored to the recipients, and to teach these in a manner conducive to learning.

Content
Demanding biological topics are dealt with under consideration of the special needs of persons involved in teaching. The module comprises the parts:

1) Lecture (Tues. 08.00-09.45 hrs)
2) Colloquium (every second Tues. 10.15-12.00 hrs., begins on first lecture day)
3) Seminar with presentation (every second Tues. 10.15-12.00 hrs., begins in second lecture week)
4) Semester thesis in a research group (7 weeks)

Lecture notes
Unterlagen für den Unterricht werden online mit Hilfe der e-learning Platform OLAT abgegeben.

Literature
Literator und Literaturhinweise werden mit der e-learning Platform OLAT abgegeben.

Prerequisites / notice
This Course lasts for two semesters. It can be started in autumn or in spring. Booking is only required once.

Performance Assessment:
Performance is assessed during the course of the entire modul, with a final test. Active participation in the colloquia and group seminars is required. The thesis report and an oral presentation have to be completed.

The Specialized Biology Course with an Educational Focus (12 CP) can be acknowledged, in agreement with the advisor of the respective elective major, as one of the two obligatory research projects (each 15 CP). In such a case, additional 3 CP must be obtained in another course.

In case of overbooking of the course, students enrolled in the Teaching Diploma in Biology will have priority for registration.

The course is organized jointly with the University of Zurich (Fachbereich Biologie) and is held at the Life Science Zurich Learning Center of the ETH Zurich and the University of Zurich.
Demanding biological topics are dealt with under consideration of the special needs of persons involved in teaching. The module:

1) Lecture (Tues. 08.00-09.45 hrs)
2) Colloquium (every second Tues. 10.15-12.00 hrs., begins on first lecture day)
3) Seminar with presentation (every second Tues. 10.15-12.00 hrs., begins in second lecture week)
4) Semester thesis in a research group (3.5 weeks)

Lecture notes
None.

Literature
Specific references will be made available for the individual projects.

Prerequisites / notice
The program of this course represents one half (6 CP) of that of the Specialized Biology Course with an Educational Focus (551-0963-00, 12 CP).

Compulsory Elective Courses

Further course offerings from the category Educational Science are listed under "Programme: Educational Science for Teaching Diploma and TC".

- Particularly suitable for students of D-BIOL, D-CHAB, D-HEST

Abstract
This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

Objective
The main goal of this course is to enhance the student's ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.
I. Ethics & the Process of Ethical Inquiry

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

Integrity in Research & Research Misconduct
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 Rs (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks;
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

701-0015-00L Seminar on Transdisciplinary Research for Sustainable Development W 2 credits 2S C. E. Pohl, M. Stauffacher

Abstract
The seminar is designed for students and researchers (MA, PhD, PostDoc) who use inter- and transdisciplinary elements in their projects. It addresses the challenges of this research: How to integrate disciplines? How (and in what role) to include societal actors? How to bring results to fruition? We discuss these questions based on case studies and theories and on the participant's projects.

Objective
The participants understand the specific challenges of inter- and transdisciplinary research in general and in the context of sustainable development in particular. They know methods and concepts to address these challenges and apply them to their research projects.
The course addresses environmental policies, focusing on new steering approaches, which are generally summarized as environmental governance. The course also provides students with tools to analyze environmental policy processes and assesses the key features of environmental governance by examining various practical environmental policy examples.

Objectives
- To understand how an environmental problem may (not) become a policy and explain political processes, using basic concepts and techniques from political science.
- To analyze the evolution as well as the key elements of environmental governance.
- To be able to identify the main challenges and opportunities for environmental governance and to critically discuss them with reference to various practical policy examples.

Content
Improvements in environmental quality and sustainable management of natural resources cannot be achieved through technical solutions alone. The quality of the environment and the achievement of sustainable development strongly depend on human behavior and specifically the human uses of nature. To influence human behavior, we rely on public policies and other societal rules, which aim to steer the way humans use natural resources and their effects on the environment. Such steering can take place through government intervention alone. However, this often also involves governance, which includes the interplay between governmental and non-governmental actors, the use of diverse tools such as emission standards or financial incentives to steer actors' behavior and can occur at the local, regional, national or international level.

In this course, we will address both the practical aspects of as well as the scientific debate on environmental governance. The course gives future environmental experts a strong basis to position themselves in the governance debate, which does not preclude government but rather involves a spectrum from government to governance.

Key questions that this course seeks to answer: What are the core characteristics of environmental challenges from a policy perspective? What are key elements of ‘environmental governance’ and how legitimate and effective are these approaches in addressing persistent environmental challenges?

Lecture notes
Lecture slides and additional course material will be provided throughout the semester.

Literature
We will mostly work with readings from the following books:

Prerequisites / notice
A detailed course schedule will be made available at the beginning of the semester.

We recommend that students have (a) three-years BSc education of a (technical) university; (b) successfully completed Bachelor introductory course to environmental policy (Entwicklungen nationaler Umweltpolitik (or equivalent)) and (c) familiarity with key issues in environmental policy and some fundamental knowledge of one social science or humanities discipline (political science, economics, sociology, history, psychology, philosophy).

701-1651-00L Environmental Governance W 3 credits 2G E. Lieberherr, G. de Buren, R. Schweizer

Abstract

701-1551-00L Sustainability Assessment W 3 credits 2G P. Krütli, C. E. Pohl

Abstract
The course deals with the concepts and methodologies for the analysis and assessment of sustainable development. A special focus is given to the social dimension and to social justice as a guiding principle of sustainability as well as to trade-offs between the three dimensions of sustainability.

Objective
At the end of the course students should know:
- core concepts of sustainable development, and;
- the concept of social justice - normatively and empirically - as a core element of social sustainability;
- important empirical methods for the analysis and assessment of local / regional sustainability issues.

Understand and reflect on:
- the challenges of trade-offs between the different goals of sustainable development;
- and the respective impacts on individual and societal decision-making.

Content
The course is structured as follows:
- Overview of rationale, objectives, concepts and origins of sustainable development;
- Importance and application of sustainability in science, politics, society, and economy;
- Sustainable (local / regional) development in different national / international contexts;
- Analysis and evaluation methods of sustainable development with a focus on social justice;
- Trade-offs in selected examples.

551-0916-00L Learning and Teaching Biology W 6 credits 7G E. Hafen

Abstract
This course represents an introduction to recent research into student learning on the conceptual foundations of modern biology, together with pedagogical methods associated with effective instruction and its valuation. Students will be involved in active research into conceptual and practical issues involved in biology education and methods to discover student preconceptions.

Objective
Provides an overview on student's learning and shows ways to make the classroom experience more engaging and effective for students.

Students will learn to produce a research-based paper on a project they work on during the course.

Abstract

- Basic conditions for tuition (MAR - recognition of Matura certificates - curricula, standards), selection of topics and reduction of the complexity of topics.
- Application of teaching methods and techniques from educational science in biology classes.
- Planning and preparation of lessons.

Objective

- Students can discuss and put into practice in their teaching work the conditions and objectives set out in the regulations governing the school-leaving examination (Matura), the framework curriculum and the conditions and objectives specified by their school.
- They are in a position to select learning objectives and formulate these on the basis of the target level model. They can plan and prepare lessons and can also develop appropriate learning assignments.
- Students can reconstruct specialist contents in didactic terms and develop teaching modules suitable for the different levels from these on the basis of the subject structure and learner requirements.
- They can reduce the complexity of subject-based specialist contents and present them in such a way that they are comprehensible and meaningful for learners.
- They can select appropriate media for their work (e.g. school books) and use these. They can employ appropriate experiments.
- The students can use different forms of examination for monitoring performance.
- Students are in a position to implement and discuss the concepts of biology teaching and learning on the basis of specific topics covered in school biology.

Abstract

In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

Objective

The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

#### Abstract
Students apply the insights, abilities and skills they have acquired within the context of an educational institution. They observe 10 lessons and teach 20 lessons independently. Two of them are assessed as Examination Lessons.

#### Content
- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- They are able to assess the significance of tuition topics for their subject from different angles (including interdisciplinary angles) and impart these to their pupils.
- They learn the skills of the teaching trade.
- They practise finding the balance between instruction and openness so that pupils can and, indeed, must make their own cognitive contribution.
- They learn to assess pupils' work.
- Together with the teacher in charge of their teacher training, the students constantly evaluate their own performance.

#### Abstract
Genetics, fossil remains, comparative anatomy and behavioral research prove the affiliation of humans to primates. This mammalian order represents variations of a single theme. The main adaptations and the critical steps of phylogeny are presented.

#### Objective
- Interpret the main features of primates and especially of fossil hominids in the evolutionary and functional context;
- Explain the genetic, phenetic and cultural diversity of modern human populations as the result of evolutionary processes;
- Recognize similarities and differences in the behavior and the cognitive lines from humans and animals, in particular monkeys;
- Explain why cultural evolution occurs only in humans;
- Discuss the question "What are human beings?" from an evolutionary biological perspective.

**Abstract**

The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

**Objective**

The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods, and explanatory power of evolutionary genetics.

**Content**

Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics; neutral theory of molecular evolution and basics of coalescent theory.

Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher's fundamental theorem.

Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation.

**Lecture notes**

Handouts

**Literature**

**Prerequisites / notice**

There will be 5 optional extra sessions for the population genetics part (following lectures 2-6) for computer simulations, designed to help understand the course material.

**Abstract**

This class focuses on ecological processes involved with plant life, mechanisms of plant adaptation, plant-animal and plant-soil interactions, plant strategies and implications for the structure and function of plant communities. The discussion of original research examples familiarises students with research questions and methods; they learn to evaluate results and interpretations.

**Objective**

Students will be able to:

- propose methods to study ecological processes involved with plant life, and how these processes depend on internal and external factors;
- analyse benefits and costs of plant adaptations;
- explain plant strategies with relevant traits and trade-offs;
- explain and predict the assembly of plant communities;
- explain implications of plant strategies for animals, microbes and ecosystem functions;
- evaluate studies in plant ecology regarding research questions, assumptions, methods, as well as the reliability and relevance of results.

**Content**

Plants represent the matrix of natural communities. The structure and dynamics of plant populations drives the function of ecosystems.

This course presents essential processes and plant traits involved with plant life. We focus on research questions that have been of special interest to plant ecologists as well as current topical questions. We use original research examples to discuss how ecological questions are studied and how results are interpreted.

- Growth: what determines the production of a plant?
- Nutrients: consumption or recycling; opposite strategies and feedbacks on soils;
- Clonality: collaboration and division of labour in plants;
- Plasticity: benefits and costs of plant intelligence;
- Flowering and pollination: how expensive is sex?
- Seed types, dispersal, seed banks and germination: strategies and trade-offs in the persistence of plant populations;
- Development and structure of plant populations;
- Stress, disturbance and competition as drivers of different plant strategies;
- Herbivory: plant-animal feedbacks and functioning of grazing ecosystems
- Fire: impacts on plants, vegetation and ecosystems.
- Plant functional types and roles in the assembly of plant communities.

**Lecture notes**

Handouts and further reading will be available electronically at the beginning of the semester.

**Prerequisites / notice**

Prerequisites:

- General knowledge of plant biology
- Basic knowledge of plant systematics
- General ecological concepts

**Abstract**

The focus is on the potential to assess strategies and tactics of pest management, taking into account the demands from the economy, the environment and the society. Significant agricultural approaches will be explained using practical examples, including prevention using natural resources, surveillance and forecasting, resistance management, as well as product registration, incl. ecotoxicology.

**Objective**

The students gain a good understanding of fundamental aspects of pest management in agroecosystems. They will have the ability to assess options for action in view of requirements from the economy, the ecology and the society. Further, they will learn to perform searches on relevant issues in pest management, and to critically evaluate case studies.

Abstract

The focus will be on agro-ecology and ecology of urban habitats. Both experience frequent disturbances, specific chemical influences, and extreme climatic conditions. Additionally, in urban habitats edaphic conditions are difficult as well. Turnover of species diversity and composition are higher, both locally and temporary, compared to natural conditions at comparable sites.

Objective

Knowledge of agro-ecosystems and urban ecosystems; their origin, ecosystem services, mechanisms and importance for the maintenance of biodiversity.

701-1441-00L

Alpine Ecology and Environments

Abstract

The online course ALPECOLe provides a global overview of the complex ecosystems of mountain regions, and of their great diversity of habitats and organisms. The course is interdisciplinary and the various approaches are designed to help understand the past, present and future of mountain ecosystems.

Objective

Knowledge of alpine environments worldwide and their ecology

Content

The online course is subdivided into
- 5 lessons on abiotic factors: geology, soils and their forming processes, climate, and disturbance factors
- 12 lessons on plants: diversity, patterns and processes, treelines, water & nutrients, carbon cycle, atmospheric influences, sexual and clonal reproduction, and one specific lesson on aquatic environments
- 5 lessons on animals: habitats and adaptations, origin of species, food ecology and impact of domestic livestock
- 3 lessons on landscape evolution: quaternary paleoenvironments, methods like radiocarbon dating, pollen records, dendrochronology, stable isopopes, and historical data
- 1 lesson on global change

Prerequisites / notice

Students can also follow a virtual walk through alpine areas where context-based information on alpine environments can be accessed. Moreover, all major alpine areas of the world can be selected on a map and then informative pictures of those landscapes and faunistic and floricultral inhabitants will be shown.

Online exercises and tests allow to test the learned matter.

Literature

Selected required readings (peer reviewed literature, selected book chapters). Optional recommended readings with additional information.

5 credits

401-0649-00L

Applied Statistical Regression

Abstract

This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning "good practice" that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

Objective

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Lecture notes

Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

Prerequisites / notice

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L *Applied Statistical Regression* and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

Data: 06.10.2017 12:53

Autumn Semester 2016

Page 240 of 1570
At the end of the course...

...you know how to structure your inquiry and how to proceed the analysis when faced with a complex environmental issue. You can formulate the relevant questions, find answers (supported by discussions, input from the lecturers and the literature), and you are able to present your conclusions clearly and cautiously.

...you understand the complexity of interactions and structures in ecosystems. You know how ecosystem processes, functions and services interact and feed back across multiple spatio-temporal scales (in general, plus in depth case examples).

...you understand that biodiversity and the interaction between organisms are an integral part of ecosystems. You are aware that the link between biodiversity and process/function/service is rarely fully understood. You know how to honestly deal with this lack of understanding and can nevertheless find, critically analyse and communicate solutions.

...you understand the importance of ecosystem services for society.

...you have an overview of the methods of ecosystem research and have a deeper insight into some of them, e.g. ecosystem observation, manipulation and modelling.

...you have reflected on ecology as a young discipline at the heart of significant applied questions.

This course provides the ecological systems' knowledge needed to question applied sustainability solutions. We will critically assess the complexity of current environmental issues, illustrating basic ecological concepts and principles. Our central aim is to balance participants' respect for complexity with a sense of possibility by providing examples from the vast solution space offered by ecological systems, such as e.g. green infrastructure to manage water.

The course is structured around four larger topical areas: (1) Integrated Water Management -- Green infrastructure (land management options) as an alternative to engineered solutions (e.g. large reservoirs) in flood and drought management; (2) Fire dynamics, the water cycle and biodiversity -- The surprising dynamics of species life cycles and populations in arid landscapes; (3) Rewilding, e.g. re-introducing apex predators (e.g. wolves), or large ungulates (e.g. bisons) in protected areas -- A nature conservation trend with counterintuitive effects; (4) Coupling of aquatic and terrestrial systems: carbon, nitrogen and phosphorus transfers of global importance on landscape scale.

The students will be able to use the software R efficiently for data analysis.

Note: This part builds on "Using R... (Part I)", but can be taken independently if the basics of R are already known.

1 credit

Schulze et al. (2005) Plant Ecology; Springer.

Choosing the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

The course combines elements of a classic lecture, group discussions and problem based learning. It is helpful, but not essential to be familiar with the "seven stages" method (see e.g. course 701-0352-00L "Analysis and Assessment of Environmental Sustainability" by Christian Pohl et al.).

The course resources will be provided via the Moodle web learning platform please login (with your ETH (or other University) username+password) at https://moodle-app2.let.ethz.ch/enrol/users.php?id=1145

Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

Note: Part II of the course builds on part I and covers the following additional topics:
- Elements of the R language: control structures (if, else, loops), lists, overview of R objects, attributes of R objects;
- More on R functions;
- Applying functions to elements of vectors, matrices and lists;
- Object oriented programming with R: classes and methods;
- Tayloring R: options;
- Extending basic R: packages

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

Note: Part I of UsingR is complemented and extended by Part II, which is offered during the second part of the semester and which can be taken independently from Part I.

The course resources will be provided via the Moodle web learning platform please login (with your ETH (or other University) username+password) at https://moodle-app2.let.ethz.ch/enrol/users.php?id=1145

A. J. Papritz

A. Drewek, A. J. Papritz
Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Objective

Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Content

Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1 No Lecture: First day of autumn semester

Week 2 The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nemate attack strategies and types of damage.

Week 5 Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6 Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7 Pisatin and pisatin demethylase. Local and systemic acquired resistance, signal molecules.

Week 8 Pathogen effects on food quality and safety.

Week 9 Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 10 Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11 Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELISA, PCR, rDNA and rep-PCR.

Week 12 Strategies for minimizing disease risks: principles of disease control and management.

Week 13 Disease control strategies: economic thresholds, physical control methods.

Week 14 Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

Lecture notes

Slides of the lecture will be available online.

https://www.bsse.ethz.ch/cevo/education/cb-materials.html
Suggested books for additional reading (available electronically)

- A. Hall, S. Wielgoss, *V+1P*

Identify common macroparasites in aquatic organisms.

Lectures:

G. Velicer

This class provides students with an overview of techniques for data analysis used in modern ecological research, as well as practical experience in running these analyses with R and interpreting the results. Topics include linear models, generalized linear models, mixed models, model selection and randomization methods.

Objective

Students will be able to:
- describe the aims and principles of important techniques for the analysis of ecological data
- choose appropriate techniques for given problems and types of data
- evaluate assumptions and limitations
- implement the analyses in R
- represent the relevant results in graphs, tables and text
- interpret and evaluate the results in ecological terms

Content

- Linear models for experimental and observational studies
- Model selection
- Introduction to likelihood inference and Bayesian statistics
- Analysis of counts and proportions (generalised linear models)
- Models for non-linear relationships
- Grouping and correlation structures (mixed models)
- Randomisation methods

Lecture notes

Lecture notes and additional reading will be available electronically a few days before the course

Literature

Suggested books for additional reading (available electronically)

Prerequisites / notice

Time schedule

The course takes place over a period of nine days from Thursday 12.01 to Friday 20.01, with classes on 12, 13, 16, 17 and 18.01, and an exam in the morning of 20.01.

Prerequisites

- Basic statistical training (e.g. Mathematik IV in D-USYS): Data distributions, descriptive statistics, hypothesis testing, linear regression, analysis of variance
- Basic experience in data handling and data analysis in R

Individual preparation

Students without the required knowledge are asked to contact the lecturer before Christmas for support with individual preparation.

Number of participants limited to 20.

Enrollment is limited to Master students of the study programme *Environmental Sciences majoring Ecology and Evolution* and to Master students of the study programme *Biology majoring Ecology and Evolution (Elective Compulsory Master Courses)*. Time of enrolment is decisive. It is possible to enrol until September 12. The registration will only be effective once confirmed.

Abstract

Course focuses on the ecology and evolution of macroparasites and their hosts. Through lectures and practical work, students learn about diversity and natural history of parasites, adaptations of parasites, ecology of host-parasite interactions, applied parasitology, and human macroparasites in the modern world.

Objective

1. Identify common macroparasites in aquatic organisms.
2. Understand ecological and evolutionary processes in host-parasite interactions.
3. Conduct parasitological research.

Content

Lectures:

1. Diversity and natural history of parasites (i.e. systematic groups and life-cycles).
2. Adaptations of parasites (e.g. evolution of life-cycles, host manipulation).
3. Ecology of host-parasite interactions (e.g. parasite communities, effects of environmental changes).
4. Applied parasitology (e.g. aquaculture and fisheries).
5. Human macroparasites (schistosomiasis, malaria).

Practical exercises:

1. Examination of parasites in fish (identification of species and description of parasite communities).
2. Examination of parasites in molluscs (identification and examination of host exploitation strategies).
3. Examination of parasites in amphipods (identification and examination of effects on hosts).

Prerequisites / notice

Students will analyze experimental evolution literature covering a wide range of questions, species and types of analysis and will lead discussions of this literature. Students will develop a written project proposal for a novel evolution experiment (or a novel analysis of a published experiment) to address an unanswered question and will also deliver an oral presentation of the project proposal.

Objective

Course objectives:

i) become familiar with a diverse sample of experimental evolution literature,

ii) gain understanding of the strengths and limitations of experimental evolution for addressing evolutionary questions relative to other forms of evolutionary analysis, and

iii) gain the ability to effectively design and analyze evolution experiments that address fundamental or applied questions in evolutionary biology.
Concepts in Modern Genetics and Genomics: This course focuses on the concepts of classical and modern genetics and genomics. Students will analyze experimental evolution literature covering a diverse range of topics, species and types of analysis and will lead discussions of this literature. Students will develop a written project proposal for a novel evolution experiment (or a novel analysis of a published experiment) to address an unanswered question and will also deliver an oral presentation of the project proposal. Evaluation will be based on a combination of participation in and leadership of literature discussions, in-class exams, and oral and written presentations of the project proposal.

Microbiology (Part I): Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis. Students will develop a written project proposal for a novel evolution experiment (or a novel analysis of a published experiment) to address an unanswered question and will also deliver an oral presentation of the project proposal. Evaluation will be based on a combination of participation in and leadership of literature discussions, in-class exams, and oral and written presentations of the project proposal.

Concepts in Modern Genetics: This course focuses on the concepts of classical and modern genetics and genomics. Students will analyze experimental evolution literature covering a diverse range of topics, species and types of analysis and will lead discussions of this literature. Students will develop a written project proposal for a novel evolution experiment (or a novel analysis of a published experiment) to address an unanswered question and will also deliver an oral presentation of the project proposal. Evaluation will be based on a combination of participation in and leadership of literature discussions, in-class exams, and oral and written presentations of the project proposal.

Introduction to Bioinformatics: Concepts and Applications: The current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis. Students will develop a written project proposal for a novel evolution experiment (or a novel analysis of a published experiment) to address an unanswered question and will also deliver an oral presentation of the project proposal. Evaluation will be based on a combination of participation in and leadership of literature discussions, in-class exams, and oral and written presentations of the project proposal.

Bioinformatics I: Introduction to Bioinformatics: Concepts and Applications: The current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis. Students will develop a written project proposal for a novel evolution experiment (or a novel analysis of a published experiment) to address an unanswered question and will also deliver an oral presentation of the project proposal. Evaluation will be based on a combination of participation in and leadership of literature discussions, in-class exams, and oral and written presentations of the project proposal.

Abstract: Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

Content: Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

551-0313-00L Microbiology (Part I)

Abstract: Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Objective: The course is intended to provide a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content: Advanced class covering the state of the research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Lecture notes: Updated handouts will be provided during the class.

Literature: Current literature references will be provided during the lectures.

Prerequisites / notice: English

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

551-0309-00L Concepts in Modern Genetics

Abstract: Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective: This course focuses on the concepts of classical and modern genetics and genomics.

Content: The course covers modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes: Scripts and additional material will be provided during the semester.

Prerequisites / notice: This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UZH Irchel.

Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

**Objective**

Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocultures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enchantments and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.

**Content**

This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

**227-1043-00L Neuroinformatics - Colloquia (University of Zurich)**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

**UZH Module Code:** INI410

**Abstract**

The colloquium in Neuroinformatics is a series of lectures given by invited experts. The lecture topics reflect the current themes in neurobiology and neuromorphic engineering that are relevant for our Institute.

**Objective**

The goal of these talks is to provide insight into recent research results. The talks are not meant for the general public, but really aimed at specialists in the field.

**Content**

The topics depend heavily on the invited speakers, and thus change from week to week. All topics concern neural computation and their implementation in biological or artificial systems.

**227-1047-00L Consciousness: From Philosophy to Neuroscience (University of Zurich)**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

**UZH Module Code:** INI410

**Objective**

This seminar reviews the philosophical and phenomenological as well as the neurobiological aspects of consciousness. The subjective experiences of consciousness are explored, and modern research into its neural substrates, particularly in the visual domain, is explained. Emphasis is placed on students developing their own thinking through a discussion-centered course structure.

**Content**

The course's goal is to give an overview of the contemporary state of consciousness research, with emphasis on the contributions brought by modern cognitive neuroscience. We aim to clarify concepts, explain their philosophical and scientific backgrounds, and to present experimental protocols that shed light on a variety of consciousness related issues.

**Lecture notes**

None

**Literature**

We display articles pertaining to the issues we cover in the class on the course's webpage.

**Prerequisites / notice**

Since we are all experts on consciousness, we expect active participation and discussions!

**227-1051-00L Systems Neuroscience (University of Zurich)**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

**UZH Module Code:** INI415

**Objective**

This course focuses on basic aspects of central nervous system physiology, including perception, motor control and cognitive functions.

**Content**

Main emphasis sensory systems, with complements on motor and cognitive functions.

**Lecture notes**

None

**Literature**

"Principles of Neural Science", Kandel, Schwartz, and Jessel

**Prerequisites / notice**

None

**376-1414-00L Current Topics in Brain Research (HS)**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

**UZH Module Code:** INI431

**Abstract**

Different national and international scientific guests are invited to present and discuss their actual scientific results. To exchange scientific knowledge and data and to promote communication and collaborations among researchers.

**Objective**

For students: Critical discussion of current research. Students aiming at getting a credit point for this colloquium choose one topic and write a critical essay on the presented research topic.

**Content**

Different scientific guests working in the field of molecular cognition, neurochemistry, neuromorphology and neurophysiology present their latest scientific results.

**Lecture notes**

No handout

**Literature**

None

**227-1045-00L Readings in Neuroinformatics (University of Zurich)**

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH.

**Content**

The course's goal is to give an overview of the contemporary state of consciousness research, with emphasis on the contributions brought by modern cognitive neuroscience. We aim to clarify concepts, explain their philosophical and scientific backgrounds, and to present experimental protocols that shed light on a variety of consciousness related issues.

**Lecture notes**

None

**Literature**

We display articles pertaining to the issues we cover in the class on the course's webpage.

**Prerequisites / notice**

Since we are all experts on consciousness, we expect active participation and discussions!

Data: 06.10.2017 12:53  Autumn Semester 2016  Page 246 of 1570
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze this alignment (such as BLAST algorithm, GWAS approaches). Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, Influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Lecture notes

Slides of the lecture will be available online. 
https://www.bsse.ethz.ch/cevo/education/cb-materials.html

1. Roy and Sherrington showed that there was a neural activity-dependent regulation of blood flow in the brain. One hundred years later, Ogawa discovered that they could use Nuclear Magnetic Resonance (NMR) to measure a blood oxygen-level dependent (BOLD) signal, which they showed was neural activity-dependent. This discovery led to the development of human functional Magnetic Resonance Imaging (fMRI), which has revolutionized neuropsychology and neuropsychiatry. We will read both these original papers and explore the conceptual links between them and discuss the sociology of science, which in this case, the pursuit of basic science questions over a century of research, led to an explosion in applications. We will also explore the personalities of the scientists and the context in which they made their seminal discoveries. Each week the course members will be given original papers to read for homework, they will have to write a short abstract for each paper. We will then meet weekly with the course leader (KACM) and an assistant for an hour-or-so long interactive seminar. An intimate knowledge of the papers will be assumed so that the discussion does not center simply on an explication of the contents of the papers. Assessment will in the form of a written exam in which the students will be given a paper and asked to write a short abstract of the contents.

3. It is a commonplace that scientists rarely cite literature that is older than 10 years and when they do, they usually cite one paper that serves as the representative for a larger body of work that has long since been incorporated anonymously in textbooks. Worse than that, many authors have not even read the papers they cite in their own publications. This course, Foundations of Neuroscience is one antidote.

Thirteen major areas of research have been selected, which cover the key concepts that have led to our current ideas of how the nervous system is built and functions. Unusually, we will explore these areas of research by reading research by reading the original publications, instead of reading someone else's digested summary from a textbook or review. By doing this, we will learn how the discoveries were made, what instrumentation was used, how the scientists interpreted their own findings, and how their work, often over many decades and linked together with related findings from many different scientists, generate the current views of mechanism and structure of the nervous system. To give one concrete example, in 1890 Roy and Sherrington showed that there was a neural activity-dependent regulation of blood flow in the brain. One hundred years later, Ogawa discovered that they could use Nuclear Magnetic Resonance (NMR) to measure a blood oxygen-level dependent (BOLD) signal, which they showed was neural activity-dependent. This discovery led to the development of human functional Magnetic Resonance Imaging (fMRI), which has revolutionized neuropsychology and neuropsychiatry. We will read both these original papers and explore the conceptual links between them and discuss the sociology of science, which in this case, the pursuit of basic science questions over a century of research, led to an explosion in applications. We will also explore the personalities of the scientists and the context in which they made their seminal discoveries. Each week the course members will be given original papers to read for homework, they will have to write a short abstract for each paper. We will then meet weekly with the course leader (KACM) and an assistant for an hour-or-so long interactive seminar. An intimate knowledge of the papers will be assumed so that the discussion does not center simply on an explication of the contents of the papers. Assessment will in the form of a written exam in which the students will be given a paper and asked to write a short abstract of the contents.

4. It is a commonplace that scientists rarely cite literature that is older than 10 years and when they do, they usually cite one paper that serves as the representative for a larger body of work that has long since been incorporated anonymously in textbooks. Worse than that, many authors have not even read the papers they cite in their own publications. This course, Foundations of Neuroscience is one antidote.

Thirteen major areas of research have been selected, which cover the key concepts that have led to our current ideas of how the nervous system is built and functions. Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

Literature

Prerequisites / notice
Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung".

Objective
Basic knowledge of the mechanisms and the regulation of an immune response.

Content
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histoincompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Scripts and additional material will be provided during the semester.

Prerequisites / notice
This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hönggerberg, and on Tuesday morning at UZH Irchel.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.
Elective Compulsory Master Courses

**Abstract**
This course provides a detailed understanding of
- development of T and B cells
- the dynamics of an immune response during acute and chronic infection
- mechanisms of immunopathology
- modern vaccination strategies

**Objective**
Obtain a detailed understanding of
- the development, activation, and differentiation of different types of T cells and their effector mechanisms during immune responses,
- Recognition of pathogenic microorganisms by the host cells and molecular events thereafter,
- events and signals for maturation of naive B cells to antibody producing plasma cells and memory B cells.
- Optimization of B cell responses by intelligent design of new vaccines

**Content**
- Development and selection of CD4 and CD8 T cells, natural killer T cells (NKT), and regulatory T cells (Treg)
- NK T cells and responses to lipid antigens
- Differentiation, characterization, and function of CD4 T cell subsets such as Th1, Th2, and Th17
- Overview of cytokines and their effector function
- Co-stimulation (signals 1-3)
- Dendritic cells
- Evolution of the "Danger" concept
- Cells expressing Pattern Recognition Receptors and their downstream signals
- T cell function and dysfunction in acute and chronic viral infections

**Abstract**
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

**Objective**
The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

**Content**
You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

**Lecture notes**
Presentations will be made available after the seminars.

**Prerequisites / notice**
You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).
**Abstract**

The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Emphasis is on processes that are specific to bacteria and archaea and that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest.

**Objective**

The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms.

**Content**

Important biochemical processes specific to bacteria and archaea will be presented that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest. Emphasis is on concepts of energy generation and assimilation.

**List of topics:**

- Eating sugars and letting them in
- Complex: (Ligno-)Cellulose and in demand for bioenergy
- Living on a diet and the anaerobic provocation
- Of climate relevance: The microbial C1 cycle
- What are AMO and Anammox?
- 20 amino acids: the making of
- Extending the genetic code
- The 21st and 22nd amino acid
- Some exotic biochemistry: nucleotides, cofactors
- Ancient biochemistry? Iron-sulfur clusters, polymers
- Secondary metabolites: playground of evolution

**Lecture notes**

A script will be provided during the course.

**551-1105-00L** Glycobiology

**Abstract**

Structural principles, nomenclature and different classes of glycosylation. The different pathways of N- and O-linked protein glycosylation and glycolipid biosynthesis in prokaryotes and eukaryotes are discussed. Specific glycan binding proteins and their role in deciphering the glycan code are presented. The role of glycans in infectious diseases, antigen mimicry and autoimmunity are discussed.

**Objective**

Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glycobiology, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

**Content**

Structure and linkages; analytical approaches; N-linked protein glycosylation (ER, Golgi); glycan-assisted protein folding and quality control; O-linked protein glycosylation; glucosaminoglycans; glycolipids; prokaryotic glycosylation pathways; lectins; glycans and infectious disease

**Lecture notes**

Handouts

**Literature**

**Prerequisites / notice**

The course will be in English. It will include the preparation of short essays (marked) about defined topics in Glycobiology.

**551-1117-00L** Cutting Edge Topics: Immunology and Infection Biology

**Abstract**

Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.

**Objective**

Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.

The aim of this course is to confront students with current research topics and with scientific presentation. The course offers the opportunity to gain in depth knowledge about diverse topics which are often only briefly touched in the concept courses and to engage in discussion with experts in the field.

**Content**

Immunology and infection biology.

The specific topics are variable and depend each semester on the list of invited experts.

**551-1153-00L** Systems Biology of Metabolism

**Number of participants limited to 15.**

**Abstract**

Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

**Objective**

Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

**Content**

The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

**Lecture notes**

Script and original publications will be supplied during the course.

**Prerequisites / notice**

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

**551-1171-00L** Immunology: from Milestones to Current Topics

**Abstract**

Milestones in Immunology: on old concepts and modern experiments

The course will cover six grand topics in immunology (B cells, innate immunity, antigen presentation, tumor immunity, thymus and T cells, cytotoxic T cells and NK cells) and for each grand topic four hours will be allocated. During the first double hour, historical milestone papers will be presented by the supervisor providing an overview on the development of the conceptional framework and critical technological advances. The students will also prepare themselves for this double lecture by reading the historical milestone papers and contributing to the discussion. In the following lecture up to four students will present each a recent high impact research paper which emerged from the landmark achievements of the previously discussed milestone concepts.

**Objective**

Milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells and NK cells, and tumor immunity.

**Content**

Milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells and NK cells, and tumor immunity.

**Literature**

Original and review articles will be distributed by the lecturer.

Literaturunterlagen werden vor Beginn des Kurses auf folgender website zugänglich sein: Moodle Course https://moodle-app2.let.ethz.ch/course/view.php?id=1002

**551-1303-00L** Cellular Biochemistry of Health and Disease

**Number of participants limited to 15.**

Students should be able to select for a given biotechnological product a suitable set of purification operations and judge on process economy.

During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies.

The course offers detailed information on selected foodborne pathogens and toxin producing organisms; the focus lies on relevant molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.

Selected topics will be used to illustrate the rapid development but also limits of basic knowledge for applications of functional microorganisms to produce food with high quality, safety and potential health benefits for consumers.

This integration course will discuss new applications of microorganisms with functional properties in food and functional food products. Selected topics will be used to illustrate the rapid development but also limits of basic knowledge for applications of functional microorganisms to produce food with high quality, safety and potential health benefits for consumers.

Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to introduce, present, evaluate, critically discuss and write about recent scientific articles in the research area of cellular biochemistry.

Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems as a basis for implementing disease management strategies in agroecosystems.

The literature will be provided during the course

The course will be taught in English.
Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1  No Lecture: First day of autumn semester

Week 2  The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nematode attack strategies and types of damage.

Week 5  Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6  Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7  Pisatin and pisatin demethylase. Local and systemic acquired resistance, signal molecules.

Week 8  Pathogen effects on food quality and safety.

Week 9  Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 10  Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11  Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELISA, PCR, rDNA and rep-PCR.

Week 12  Strategies for minimizing disease risks: principles of disease control and management.

Week 13  Disease control strategies: economic thresholds, physical control methods.

Week 14  Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

Lecture notes
Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.
Lecture notes

Slides of the lecture will be available online.
https://www.bsse.ethz.ch/cevo/education/cb-materials.html

Literature

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:
- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST

Prerequisites / notice

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Some programming experience will be useful for the exercises, but is not required. Programming skills will not be tested in the examination.

751-4805-00L Recent Advances in Biocommunication

Number of participants limited to 25

Abstract

Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods.

Objective

Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods. Students will engage in discussion and critical analyses of relevant papers and present their evaluations in a seminar setting.

Abstract

This lecture is the first part of a one-year course. It offers insights into the fundamentals and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts and molds present in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

Objective

The lecture offers insights into the basics, practical consequences and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts, molds and protozoa in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms. The focus of this first part of the lecture will be on the organisms, but also on the factors which determine spoilage and foodborne disease.

Content

1. History of Food Microbiology
   1.1. Short synopsis of foodborne microorganisms
   1.2. Spoilage of Foods
   1.3. Foodborne Disease
   1.4. Food Preservation
   1.5. VIP's of Food Microbiology
2. Overview of Microorganisms in Foods
   2.1 Origin of foodborne Microorganisms
   2.2. Bacteria
   2.3. Yeasts
   2.4. Molds
3. Microbial Spoilage of Foods
   3.1. Intrinsic and Extrinsic Parameters
   3.2. Meats, Seafoods, Eggs
   3.3. Milk and Milk Products
   3.4. Vegetable and Fruit Products
   3.5. Miscellaneous (baked goods, nuts, spices, ready-to-eat products)
   3.6. Drinks and Canned Foods
4. Foodborne Disease
   4.1. Significance and Transmission of Foodborne pathogens
   4.2. Staphylococcus aureus
   4.3. Gram-positive Sporeformers (Bacillus & Clostridium)
   4.4. Listeria monocytogenes
   4.5. Salmonella, Shigella, Escherichia coli
   4.6. Vibrio, Yersinia, Campylobacter
   4.7. Brucella, Mycobacterium
   4.8. Parasites
   4.9. Viruses and Bacteriophages
   4.10. Mycotoxins
   4.11. Bioactive Amines
   4.12. Miscellaneous (Antibiotic-resistant Bacteria, Biofilms)

Literature

Electronic copies of the presentation slides (PDF) and additional material will be made available for download.

551-1295-00L Introduction to Bioinformatics: Concepts and Applications

Abstract

Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.
**Objective**

Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

**Content**

Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

**701-2413-00L Evolutionary Genetics**

</tr>
</thead>
<tbody>
<tr>
<td><strong>Abstract</strong></td>
<td>The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Objective</strong></td>
<td>The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| **Content** | Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics; neutral theory of molecular evolution and basics of coalescent theory. 
Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding, effects on fitness; Fisher's fundamental theorem. 
Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation |
| **Lecture notes** | Handouts |
| **Prerequisites / notice** | There will be 5 optional extra sessions for the population genetics part (following lectures 2-6) for computer simulations, designed to help understand the course material. |

<td><strong>Abstract</strong></td>
<td>The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates physiology and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| **Objective** | The new course "Molecular Life of Plants" reflects the rapid advances that are occurring in the field of experimental plant biology as well as the changing interests of students being trained in this discipline. Contemporary plant biology courses emphasize a traditional approach to experimental plant biology by discussing discrete topics that are removed from the context of the plant life cycle. The course will take an integrative approach that focuses on developmental concepts. Whereas traditional plant physiology courses were based on research carried out on intact plants or plant organs and were often based on phenomenological observations, current research in plant biology emphasizes work at the cellular, subcellular and molecular levels. 
The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms. |
| **Content** | The course "Molecular Life of Plants" will cover the following topics in a developmental context: 
- Plant genome organization 
- Seed anatomy 
- Food reserves and mobilization 
- Seedling emergence 
- Heterotrophic to autotrophic growth 
- Chlorophyll biosynthesis, photoceptors 
- Integration of metabolism 
- Hormones 
- Cell cycle 
- Cell differentiation and expansion 
- Environmental interactions 
- Environmental interactions 
- Environmental interactions 
- Environmental interactions biotic 
- Flower development and fertilization 
- Embryo and seed development 
- Fruit development 
- Senescence |

Data: 06.10.2017 12:53  Autumn Semester 2016  Page 254 of 1570
Abstract  
Strongly recommended for students interested in Biochemistry, Molecular Biology, or Biotechnology.

Objective  
To introduce the basic concepts of molecular biology and genetics, including principles of classical genetics, molecular biology, and bioinformatics.

Lecture notes  
Lecture notes and additional material will be provided during the semester. Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

Literature  
Specific texts will be selected from recent scientific literature and will be distributed during the course.

### 551-0319-00L Cellular Biochemistry (Part I)

| W | 3 credits | 2V | U. Kutay, R. I. Enchev, B. Kornmann, M. Peter, I. Zemp, further lecturers |

**Abstract**  
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

**Objective**  
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

**Content**  
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

**Lecture notes**  
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

**Literature**  
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

---

### 529-0731-00L Nucleic Acids and Carbohydrates

| W | 6 credits | 3G | D. Hilvert, P. A. Kast, S. J. Sturla, H. Wennenemers |

**Abstract**  
Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.

**Objective**  
Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines.

**Content**  
Structure, function and chemistry of nucleic acids and carbohydrates, DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNAi; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccine.

**Lecture notes**  
no script

**Literature**  
Mainly based on recent original literature, a detailed list will be distributed during the first lecture.

**Abstract**  
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry. The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UZH Irchel.

551-0309-00L Concepts in Modern Genetics

Objective
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Content
Introduction into structural and functional aspects of the immune system.
- Basic knowledge of the mechanisms and the regulation of an immune response.
- Introduction into structural and functional aspects of the immune system.
- Basic knowledge of the mechanisms and the regulation of an immune response.

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

551-0317-00L Immunology I

Objective
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Content
Introduction into structural and functional aspects of the immune system.
- Basic knowledge of the mechanisms and the regulation of an immune response.
- Introduction into structural and functional aspects of the immune system.
- Basic knowledge of the mechanisms and the regulation of an immune response.

Abstract
Introduction into structural and functional aspects of the immune system.
Basic knowledge of the mechanisms and the regulation of an immune response.

Prerequisites / notice
Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung".

551-1295-00L Introduction to Bioinformatics: Concepts and Applications

Objective
Introduction to Bioinformatics: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physical experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.
Content  
Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

Neurobiology  
W  
6 credits  
4V  
M. E. Schwab, E. Stoeckli, L. Filli, K. A. Martin, further lecturers

Abstract  
Development of the nervous system (NS); the adult NS, plasticity and regeneration, sensory systems, cognitive functions, learning and memory, molecular and cellular mechanisms, animal models, diseases of the NS.

Objective  
Overview of normal development, plasticity and regeneration of the nervous system based on molecular, cellular and biochemical approaches.

Content  
Development: Early development of the nervous system, cellular level, nerve fiber growth, building of neuronal networks; biology of the adult nervous system; structural plasticity of the adult nervous system, regeneration and repair: networks and nerve fibers, regeneration, pathological loss of cells.

Lecture notes  
Structure, Plasticity and Repair of the Nervous System (376-1305-01L): Lecture notes will be provided on Moodle https://moodle-app2.let.ethz.ch/course/view.php?id=694

Password will be provided at the beginning of the lecture.

Literature  
The lecture requires reading of book chapters, handouts and original scientific papers. Further information will be given in the individual lectures.

Abstract  
The course is a literature seminar or "journal club". Each Friday a student, or a member of the Suter Lab in the Institute of Molecular Health Sciences, will present a paper from the recent literature.

Objective  
The course introduces you to recent developments in the fields of cellular and molecular neurobiology. It also supports you to develop your skills in critically reading the scientific literature. You should be able to grasp what the authors wanted to learn i.e. their goals, why the authors chose the experimental approach they used, the strengths and weaknesses of the experiments and the data presented, and how the work fits into the wider literature in the field. You will present one paper yourself, which provides you with practice in public speaking.

Content  
You will present one paper yourself. Give an introduction to the field of the paper, then show and comment on the main results (all the papers we present are available online, so you can show original figures with a beamer). Finish with a summary of the main points and a discussion of their significance.

You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Presentations will be made available after the seminars.

Prerequisites / notice  
You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

Mind the enrolment deadlines at UZH:  
http://www.uzh.ch/studies/application/mobilitaet_en.html

Abstract  
The evolution of the various body-plans is investigated by means of comparison of developmentally essential control genes of molecularly analysed model organisms.

Objective  
By the end of this module, each student should be able to
- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.

Key skills:
- By the end of this module, each student should be able to
  - present and discuss a relevant evolutionary topic in an oral presentation
  - select and integrate key concepts in animal evolution from primary literature
  - participate in discussions on topics presented by others

551-1103-00L  
Microbial Biochemistry  
W  
4 credits  
2V  
J. Vorholt-Zambelli, J. Piel

Abstract  
The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Emphasis is on processes that are specific to bacteria and archaea and that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest.
Important biochemical processes specific to bacteria and archaea will be presented that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest. Emphasis is on concepts of energy generation and assimilation.

List of topics:
- Eating sugars and letting them in
- Challenging: Aromatics, xenobiotics, and oil
- Complex: (Ligno-)Cellulose and in demand for bioenergy
- Living on a diet and the anaerobic requirement
- Of climate relevance: The microbial C1 cycle
- What are AMO and Anamox?
- 20 amino acids: the making of
- Extending the genetic code
- The 21st and 22nd amino acid
- Some exotic biochemistry: nucleotides, cofactors
- Ancient biochemistry? Iron-sulfur clusters, polymers

Secondary metabolites: playground of evolution

A script will be provided during the course.

**Prerequisites / notice**

The course will be in English. It will include the preparation of short essays (marked) about defined topics in Glycobiology.

---

**Course Details**

**Course Code:** 551-1105-00L

**Title:** Glycobiology

**Credits:** 4 credits

**Language:** English

**Objective:**

- Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glycobiology, in particular in the biosynthesis of glycoproteins and glycolipids.
- 2) the cellular machinery required for these pathways.
- 3) The principles of carbohydrate/protein interaction.
- 4) The function of lectins.
- 5) The role of glycans in infectious disease.

**Content:**

- Structure and linkages; analytical approaches; N-linked protein glycosylation (ER, Golgi);
- Glycan-assisted protein folding and quality control:
- O-linked protein glycosylation; glucosaminoglycans; glycolipids; prokaryotic glycosylation pathways;
- Lectins; glycans and infectious disease

**Literature:**

---

**Course Details**

**Course Code:** 551-1117-00L

**Title:** Cutting Edge Topics: ImmunoInfection Biology

**Credits:** 2 credits

**Language:** English

**Objective:**

- Weekly seminar about cutting edge topics in immunology and infection biology. Internationally renowned experts present their current research followed by an open discussion.

**Content:**

- Immunology and infection biology:

The specific topics are variable and depend each semester on the list of invited experts.

**Prerequisites / notice**

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

**Course Details**

**Course Code:** 551-1153-00L

**Title:** Systems Biology of Metabolism

**Credits:** 4 credits

**Language:** English

**Objective:**

- Developing a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

**Content:**

- The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics.

For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

**Prerequisites / notice**

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

**Course Details**

**Course Code:** 551-1171-00L

**Title:** Immunology: from Milestones to Current Topics

**Credits:** 4 credits

**Language:** English

**Objective:**

- The course will cover six grand topics in immunology (B cells, innate immunity, antigen presentation, tumor immunity, thymus and T cells, cytotoxic T cells and NK cells) and for each grand topic four hours will be allocated. During the first double hour, historical milestone papers will be presented by the supervisor providing an overview on the development of the conceptual framework and critical technological advances. The students will also prepare themselves for this double lecture by reading the historical milestone papers and contributing to the discussion. In the following lecture up to four students will present each a recent high impact research paper which emerged from the landmark achievements of the previously discussed milestone concepts.

**Content:**

- Milestones and current topics of innate immunity, antigen presentation, B cells, thymus and T cells, cytotoxic T cells and NK cells, and tumor immunology.

**Prerequisites / notice**

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

**Course Details**

**Course Code:** 551-1303-00L

**Title:** Cellular Biochemistry of Health and Disease

**Credits:** 4 credits

**Language:** English

**Objective:**

- During this Masters level seminar style course, students will explore current research topics in cellular biochemistry focused on the structure, function and regulation of selected cell components, and the consequences of dysregulation for pathologies.
### Research Seminar: Ecological Genetics

**Number:** 701-1409-00L  
**Title:** Research Seminar: Ecological Genetics  
**Type:** W  
**ECTS:** 2  
**Hours:** 1S  
**Lecturers:** A. Widmer, S. Fior

**Objective:** 
The students should obtain an understanding of these processes, which are at work during gene expression.

**Abstract:** 
In this research seminar we will critically discuss current topics in Ecological Genetics using publications from the leading scientific journals in this field.

**Prerequisites / notice:** 
The course will be taught in English. Active participation in the discussions is a prerequisite for this course.

### RNA Biology Lecture Series I: Transcription & Processing & Translation

**Number:** 551-1407-00L  
**Title:** RNA Biology Lecture Series I: Transcription & Processing & Translation  
**Type:** W  
**ECTS:** 4  
**Hours:** 2V  
**Lecturers:** F. Allain, N. Ban, U. Kutay, further lecturers

**Objective:** 
This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

**Abstract:** 
The students should obtain an understanding of these processes, which are at work during gene expression.

**Prerequisites / notice:** 
Basic knowledge of cell and molecular biology.

### Cellular Biochemistry of Health and Disease

**Number:** 551-1303-00L  
**Title:** Cellular Biochemistry of Health and Disease  
**Type:** W  
**ECTS:** 4  
**Hours:** 2S  
**Lecturers:** P. Picotti, Y. Barral, V. Korkhov, B. Kornmann, R. Kroschewski, J. Matos, M. Peter, A. E. Smith, K. Weis

**Objective:** 
Students will work with experts toward a critical analysis of cutting-edge research in the domain of cellular biochemistry, with emphasis on normal cellular processes and the consequences of their dysregulation. At the end of the course, students will be able to introduce, present, evaluate, critically discuss and write about recent scientific articles in the research area of cellular biochemistry.
Guided by an expert in the field, students will engage in classical round-table style discussions of current literature with occasional frontal presentations. Students will alternate as discussion leaders throughout the semester, with the student leader responsible to briefly summarize key general knowledge and context of the assigned primary research paper. Together with the faculty expert, all students will participate in discussion of the primary paper, including the foundation of the biological question, specific questions addressed, key methods, key results, remaining gaps and research implications.

The course will be taught in English.

Lecture notes

Handouts

The literature will be provided during the course.

Prerequisites / notice

You must attend at least 80% of the journal clubs, and give a presentation of your own. At the end of the semester there will be a 30 minute oral exam on the material presented during the semester. The grade will be based on the exam (45%), your presentation (45%), and a contribution based on your active participation in discussion of other presentations (10%).

Number of participants limited to 8.

You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Presentations will be made available after the seminars.

Original and review articles will be distributed by the lecturer. Presentations will be made available after the seminars.

You are expected to take part in the discussion and to ask questions. To prepare for this you should read all the papers beforehand (they will be announced a week in advance of the presentation).

Systems Biology of Metabolism

Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Number of participants limited to 15.

The course will be in English. It will include the preparation of short essays (marked) about defined topics in Glycobiology.

Structural principles, nomenclature and different classes of glycosylation. The different pathways of N- and O-linked protein glycosylation and glycolipid biosynthesis in prokaryotes and eukaryotes are discussed. Specific glycan binding proteins and their role in deciphering the glycan code are presented. The role of glycans in infectious diseases, antigen mimicry and autoimmunity are discussed.

Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glyobiology, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

Glycobiology

Number of participants limited to 20.

Structural knowledge of glycans and their role in diseases.

Number of participants limited to 8.

The overall goal of the course is to introduce students to epidemiological thinking and methods, which are critical pillars for medical and public health research. Students will also become aware on how epidemiological facts are used in prevention, practice and politics.

The module Epidemiology and prevention follows an overall framework that describes the course of scientific discovery from the detection of a disease to the development of prevention and treatment interventions and their evaluation in clinical trials and real world settings. We will discuss study designs in the context of existing knowledge and the type of evidence needed to advance knowledge. Examples form nutrition, chronic and infectious diseases will be used in order to show the underlying concepts and methods.

**Content**

- Biological Engineering and Biotechnology: Will cover the latest technological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy.  This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.
- Molecular Biology of Foodborne Pathogens: Focuses on the molecular biological aspects of pathogenicity and virulence, as well as on the occurrence and survival of these organisms in foods.
- Synthetic Biology II: Students are supposed to acquire a deep understanding of the process of biological design including model representation of a biological system, its thorough analysis, and the subsequent experimental implementation of the system and the related problems.
- Translational Science for Health and Medicine: Explores principles of translational science (including project planning, ethics application, basics of resource management and interdisciplinary communication).
What is translational science and what is it not?

- Disease concepts and consequences for research
- Basics about incidence, prevalence etc., and orphan indications

How to identify need?

- Ethical considerations including ethics application
- Pros and cons of different types of research
- Coordination of complex approaches incl. timing and resources
- How to measure success?
- Outcome variables
- Improving the translational process

Challenges of communication?

- How independent is translational science?
- Academic boundary conditions vs. industrial influences

Positive and negative examples will be illustrated by distinguished guest speakers.

551-0319-00L Cellular Biochemistry (Part I) 3 credits 2V U. Kutay, R. I. Enchev, B. Kornmann, M. Peter, I. Zemp, further lecturers

Abstract

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterization of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

Literature

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

551-1407-00L RNA Biology Lecture Series I: Transcription & Processing & Translation 4 credits 2V F. Allain, N. Ban, U. Kutay, further lecturers

Abstract

This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Objective

The students should obtain an understanding of these processes, which are at work during gene expression.

Content

Transcription & 3’end formation ; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA.

Prerequisites / notice

Basic knowledge of cell and molecular biology.
The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Emphasis is on developmental processes; epigenetics and RNA interference.

The course will be taught in English. A script will not be handed out.

- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UZH Irchel.

---

Content

Important biochemical processes specific to bacteria and archaea will be presented that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest. Emphasis is on concepts of energy generation and assimilation.

List of topics:
- Eating sugars and letting them in
- Challenging: Aromatics, xenobiotics, and oil
- Complex: (Ligno-)Cellulose and in demand for bioenergy
- Living on a diet and the anaerobic provocation
- Of climate relevance: The microbial C1 cycle
- What are AMO and Anamox?
- 20 amino acids: the making of
- Extending the genetic code
- The 21st and 22nd amino acid
- Some exotic biochemistry: nucleotides, cofactors
- Ancient biochemistry? Iron-sulfur clusters, polymers
- Secondary metabolites: playground of evolution

Abstract

Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective

Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content

The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics.

For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Prerequisites / notice

The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

Literature

U. Sauer, N. Zamboni, M. Zampieri

https://www.ethz.ch/content/specialinterest/bsse/computational-systems-biology/en/education/lectures/csb/LectureMaterial.html

Applied Statistical Regression

This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning “good practice” that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

Objective

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

Content

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearity problems and model interpretation, as well as general modeling strategies.

The last third of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

Lecture notes
A script will be available.

7. Functional Food. Enjoy your Meal!

Lecture notes: Handsout during the course.

529-0041-00L Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics

Abstract: Modern mass spectrometry, hyphenated analytical methods, speciation, methods of surface analysis, chemometrics.

Objective: Comprehensive knowledge about the analytical methods introduced in this course, and their applications.

Content: Coupling of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: Time of flight and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods.

Methods of surface analysis (ESCA, Auger, SIMS, raster microscopy methods).

Employment of computer science for processing data in chemical analysis (chemometrics).

Lecture notes: Lecture notes will be available in the lecture at production cost.

Literature: Information about relevant literature will be available in the lecture and in the lecture notes.

Prerequisites / notice: Exercises are an integral part of the lecture. Prerequisites: 529-0051-00 "Analytische Chemie I (3. Semester)" and 529-0058-00 "Analytische Chemie II (4. Semester)" or equivalent.

551-1407-00L RNA Biology Lecture Series I: Transcription & Processing & Translation

Abstract: This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Objective: Transcription & 3'end formation; splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export; mRNA surveillance & mRNA turnover; signal transduction & RNA.

Content: Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytcs.

Lecture notes: Lectures will be based on procedures from the freely available, open-source statistical software package R, for the exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-1407-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

Course 3V: This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biology & nuclear export, mRNA surveillance & mRNA turnover; signal transduction & RNA. 

Lecture notes: Handsout during the course.

551-0039-00L Concepts in Modern Genetics

Abstract: Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective: This course focuses on the concepts of classical and modern genetics and genomics.

Content: The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes: Scripts and additional material will be provided during the semester.

| **Abstract** | Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and practice. |
| **Objective** | Introduction to Bioinformatics: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large datasets. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.  

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.  

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.  

| **Content** | Bioinformatics I will cover the following topics:  
- From genes to databases and information  
- BLAST searches  
- Prediction of gene function and regulation  
- RNA structure prediction  
- Gene expression analysis using microarrays  
- Protein sequence and structure databases  
- WWW for bioinformatics  
- Protein sequence comparisons  
- Proteomics and de novo protein sequencing  
- Protein structure prediction  
- Cellular and protein interaction networks  
- Molecular dynamics simulation

| **Lecture notes** | no script |
| **Literature** | Mainly based on recent original literature, a detailed list will be distributed during the first lecture. |
The advanced course introduces students to plants through a concept-based discussion of developmental processes that integrates physiology and biochemistry with genetics, molecular biology, and cell biology. The course follows the life of the plant, starting with the seed, progressing through germination to the seedling and mature plant, and ending with reproduction and senescence.

The goal of "Molecular Life of Plants" is to train students in integrative approaches to understand the function of plants in a developmental context. While the course focuses on plants, the training integrative approaches will also be useful for other organisms.

The course "Molecular Life of Plants" will cover the following topics in a developmental context:

- Plant genome organization
- Seed anatomy
- Food reserves and mobilization
- Seedling emergence
- Heterotrophic to autotrophic growth
- Chlorophyll biosynthesis, photoreceptors
- Integration of metabolism
- Hormones
- Cell cycle
- Cell differentiation and expansion
- Environmental interactions
- Environmental interactions
- Flower development and fertilization
- Embryo and seed development
- Fruit development
- Senescence

**Abstract**

Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.

**Objective**

Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysical and physical methods as well as modern methods for protein purification and microanlytics.

**Literature**

Basics:
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

**Abstract**

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective**

The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Prerequisites / notice**

This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UZH Irchel.

Abstract
Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective
The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content
Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.

Lecture notes
Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biok.ethz.ch)

Literature
Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

Prerequisites / notice
To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

551-1295-00L Introduction to Bioinformatics: Concepts and Applications

Abstract
Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

Objective
Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

Content
Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

701-2413-00L Evolutionary Genetics

Abstract
The concept course 'Evolutionary Genetics' consists of two lectures that jointly provide an introduction to the fields of population and quantitative genetics (emphasis on basic concepts) and ecological genetics (more emphasis on evolutionary and ecological processes of adaptation and speciation).

Objective
The aim of the course is to provide students with a solid introduction to the fields of population genetics, quantitative genetics, and ecological genetics. The concepts and research methods developed in these fields have undergone profound transformations; they are of fundamental importance in our understanding of evolutionary processes, both past and present. Students should gain an appreciation for the concepts, methods and explanatory power of evolutionary genetics.

Content
Population genetics - Types and sources of genetic variation; randomly mating populations and the Hardy-Weinberg equilibrium; effects of inbreeding; natural selection; random genetic drift and effective population size; gene flow and hierarchical population structure; molecular population genetics: neutral theory of molecular evolution and basics of coalescent theory.

Quantitative genetics - Continuous variation; measurement of quant. characters; genes, environments and their interactions; measuring their influence; response to selection; inbreeding and crossbreeding; effects on fitness; Fisher's fundamental theorem.

Ecological Genetics - Concepts and methods for the study of genetic variation and its role in adaptation, reproductive isolation, hybridization and speciation

Lecture notes
Handouts

Literature

Prerequisites / notice
There will be 5 optional extra sessions for the population genetics part (following lectures 2-6) for computer simulations, designed to help understand the course material.

The focus is on the potential to assess strategies and tactics of pest management, taking into account the demands from the economy, the environment and the society. Significant agricultural approaches will be explained using practical examples, including prevention using natural resources, surveillance and forecasting, resistance management, as well as product registration, incl. ecotoxicology.

Objective
The students gain a good understanding of fundamental aspects of pest management in agroecosystems. They will have the ability to assess options for action in view of requirements from the economy, the ecology and the society. Further, they will learn to perform searches on relevant issues in pest management, and to critically evaluate case studies.

551-1105-00L Glycobiology

Abstract
Structural principles, nomenclature and different classes of glycosylation. The different pathways of N- and O-linked protein glycosylation and glycolipid biosynthesis in prokaryotes and eukaryotes are discussed. Specific glycan binding proteins and their role in deciphering the glycan code are presented. The role of glycans in infectious diseases, antigen mimicry and autoimmunity are discussed.

Objective
Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glycobiology, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

Content
Structure and linkages; analytical approaches; N-linked protein glycosylation (ER, Golgi); glycan-assisted protein folding and quality control; O-linked protein glycosylation; glucosaminoglycans; glycolipids; prokaryotic glycosylation pathways; lectins; glycans and infectious disease

Lecture notes
handouts

Literature
Introduction to Glycobiology; M.E.Taylor, K.Drickamer, Oxford University Press, 2003

Prerequisites / notice
The course will be in English. It will include the preparation of short essays (marked) about defined topics in Glycobiology.

551-1103-00L Microbial Biochemistry

Abstract
The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Emphasis is on processes that are specific to bacteria and archaea and that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest.

Objective
The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms.

Content
Important biochemical processes specific to bacteria and archaea will be presented that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest. Emphasis is on concepts of energy generation and assimilation.

List of topics:
Eating sugars and letting them in
Challenging: Aromatics, xenobiotics, and oil
Complex: (Ligno-)Cellulose and in demand for bioenergy
Living on a diet and the anaerobic provocation
Of climate relevance: The microbial C1 cycle
What are AMO and Anammox?
20 amino acids: the making of
Extending the genetic code
The 21st and 22nd amino acid
Some exotic biochemistry: nucleotides, cofactors
Ancient biochemistry? Iron-sulfur clusters, polymers
Secondary metabolites: playground of evolution

Lecture notes
A script will be provided during the course.

529-0733-00L Enzymes

Abstract
Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Objective
Overview of enzymes, enzyme-catalyzed reactions and metabolic processes.

Content
Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Lecture notes
A script will not be handed out.

Literature
General:

In addition, citations from the original literature relevant to the individual lectures will be assigned weekly.

751-5121-00L Insect Ecology

Abstract
This is an introductory course in insect ecology. Students will learn about the ways in which insects interact with and adapt to their abiotic and biotic environments and their roles in diverse ecosystems. The course will entail lectures, outside readings, and critical analysis of contemporary literature.

Objective
Students completing this course should become familiar with the application of ecological principles to the study of insects, as well as major areas of inquiry in this field. Highlighted topics will include insect behavior, chemical and sensory ecology, physiological responses to biotic and abiotic stressors, plant-insect interactions, community and food-web dynamics, and disease ecology. The course will emphasize insect evolution and adaptation in the context of specific interactions with other organisms and the abiotic environment. Examples from the literature incorporated into lectures will highlight the methods used to study insect ecology.

Lecture notes
Provided to students through ILIAS

Literature
Selected required readings (peer reviewed literature, selected book chapters). Optional recommended readings with additional information.

551-1153-00L Systems Biology of Metabolism

Abstract
Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach modern methods and concepts.

Objective
Develop a deeper understanding of how relevant biological problems can be solved, thereby providing advanced insights to key experimental and computational methods in systems biology.

Content
The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics. For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Lecture notes
Script and original publications will be supplied during the course.
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

751-4504-00L

Plant Pathology I

W 2 credits 2G B. McDonald

Abstract

Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems.

Objective

Students will understand: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Content

Course description: Plant Pathology I will focus on pathogen-plant interactions, epidemiology, disease assessment, and disease development in agroecosystems. Themes will include: 1) how pathogens attack plants and; 2) how plants defend themselves against pathogens; 3) factors driving the development of epidemics in agroecosystems. Topics under the first theme will include pathogen life cycles, disease cycles, and an overview of plant pathogenic nematodes, viruses, bacteria, and fungi. Topics under the second theme will include plant defense strategies, host range, passive and active defenses, and chemical and structural defenses. Topics under the third theme will include the disease triangle and cultural control strategies.

Lecture Topics and Tentative Schedule

Week 1 No Lecture: First day of autumn semester

Week 2 The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nemate attack strategies and types of damage.

Week 5 Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6 Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7 Pistons and pistin demethylase. Local and systemic acquired resistance, signal molecules.

Week 8 Pathogen effects on food quality and safety.

Week 9 Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 10 Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11 Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELISA, PCR, rDNA and rep-PCR.

Week 12 Strategies for minimizing disease risks: principles of disease control and management.

Week 13 Disease control strategies: economic thresholds, physical control methods.

Week 14 Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

Lecture notes

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

751-4805-00L

Recent Advances in Biomacommunication

Number of participants limited to 25

W 2 credits 2S C. De Moraes

Abstract

Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods.

Objective

Students will gain insight into the role of sensory cues and signals in mediating interactions within and between species. There will be a primary, but not exclusive, focus on chemical signaling in interactions among plants, insects and microbes. The course will focus on the discussion of current literature addressing key conceptual questions and state-of-the-art research techniques and methods.

Content

Topics in protein biophysics and structural biology.

(Next semester) as a two-semester course

D-BIOL BSc students are obliged to take part I and part II

Week 1 No Lecture: First day of autumn semester

Week 2 The nature of plant diseases, symbiosis, parasites, mutualism, biotrophs and necrotrophs, disease cycles and pathogen life cycles. Nemate attack strategies and types of damage.

Week 5 Symptoms and signs of fungal infection. Example fungal diseases: potato late blight, wheat stem rust, grape powdery mildew, wheat Septoria leaf blotch.

Week 6 Plant defense mechanisms, host range and non-host resistance. Passive structural and chemical defenses, preformed chemical defenses. Active structural defense, papillae, active chemical defense, hypersensitive response, pathogenesis-related (PR) proteins, phytoalexins and disease resistance.

Week 7 Pistons and pistin demethylase. Local and systemic acquired resistance, signal molecules.

Week 8 Pathogen effects on food quality and safety.

Week 9 Epidemiology: historical epidemics, disease pyramid, environmental effects on epidemic development. Plant effects on development of epidemics, including resistance, physiology, density, uniformity.

Week 10 Disease assessment: incidence and severity measures, keys, diagrams, scales, measurement errors. Correlations between incidence and severity.

Week 11 Molecular detection and diagnosis of pathogens. Host indexing, serology, monoclonal and polyclonal antibodies. ELISA, PCR, rDNA and rep-PCR.

Week 12 Strategies for minimizing disease risks: principles of disease control and management.

Week 13 Disease control strategies: economic thresholds, physical control methods.

Week 14 Cultural control methods: avoidance, tillage practices, crop sanitation, fertilizers, crop rotation.

Lecture notes

Detailed lecture notes (~160 pages) will be available for purchase at the cost of reproduction at the start of the semester.

551-1407-00L

RNA Biology Lecture Series I: Transcription & Processing & Translation

W 4 credits 2V F. Allain, N. Ban, U. Kutay, further lecturers

Abstract

This course covers aspects of RNA biology related to gene expression at the posttranscriptional level. These include RNA transcription, processing, alternative splicing, editing, export and translation.

Objective

The students should obtain an understanding of these processes, which are at work during gene expression.

Content

Transcription & 3' end formation: splicing, alternative splicing, RNA editing; the ribosome & translation, translation regulation, RNP biogenesis & nuclear export, mRNA surveillance & mRNA turnover, signal transduction & RNA.

Prerequisites / notice

Basic knowledge of cell and molecular biology.

Elective Concept Courses

Number Title Type ECTS Hours Lecturers

551-0307-00L Molecular and Structural Biology I: Protein Structure and Function W 3 credits 2V R. Glockshuber, K. Locher, E. Weber-Ban

D-BIOL BSc students are obliged to take part I and part II (next semester) as a two-semester course

Abstract

Biophysics of protein folding, membrane proteins and biophysics of membranes, enzymatic catalysis, catalytic RNA and RNAi, current topics in protein biophysics and structural biology.
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalyticals.

**Lecture notes**

Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

**Literature**

Basics:
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

---

**551-0309-00L Concepts in Modern Genetics**

| W | 6 credits | 4V | Y. Barral, D. Bopp, A. Hajnal, M. Stoffel, O. Vo grownet |

**Abstract**

Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Objective**

This course focuses on the concepts of classical and modern genetics and genomics.

**Content**

The topics include principles of classical and modern genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

**Lecture notes**

Scripts and additional material will be provided during the semester.

**Prerequisites / notice**

This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggberg, and on Tuesday morning at UZH Irchel.

---

**551-0313-00L Microbiology (Part I)**

| W | 3 credits | 2V | W.D. Hardt, L. Eberl, H.M. Fischer, J. Piel, M. Pilhofer |

**Abstract**

Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Objective**

This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Content**

Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

**Lecture notes**

Updated handouts will be provided during the class.

**Literature**

Current literature references will be provided during the lectures.

**Prerequisites / notice**

English

The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture.

---

**551-0319-00L Cellular Biochemistry (Part I)**

| W | 3 credits | 2V | U. Kutay, R. I. Enchev, B. Kornmann, M. Peter, I. Zemp, further lecturers |

**Abstract**

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

**Objective**

This students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

**Content**

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

**Lecture notes**

Scripts and additional material will be provided during the semester. Please contact Dr. Alicia Smith for assistance with the learning materials. (alicia.smith@bc.biol.ethz.ch)

**Literature**

Recommended supplementary literature (review articles and selected primary literature) will be provided during the course.

**Prerequisites / notice**

To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

---

**551-1295-00L Introduction to Bioinformatics: Concepts and Applications**

| W | 6 credits | 4G | W. Gruissem, K. Bärenfaller, A. Callisch, G. Capitani, J. Fütterer, M. Robinson, A. Wagner |

**Abstract**

Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.

**Objective**

Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

| Prerequisites / notice | This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UZH Irchel. |

| 551-0313-00L | Microbiology (Part I)                    | W    | 3    | 2V    | W.D. Hardt, L. Eberl, H.M. Fischer, J. Piel, M. Pilhofer |
| Abstract     | Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis. |
| Objective    | This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis. |
| Content      | Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis. |
| Lecture notes | Updated handouts will be provided during the class. |
| Literature   | Current literature references will be provided during the lectures. |
| Prerequisites / notice | English |
| The lecture "Grundlagen der Biologie II: Mikrobiologie" is the basis for this advanced lecture. |

| Abstract     | Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis. |
Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

<td>Objective</td>
<td>The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Content</td>
<td>Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label &quot;Systems Biology&quot;, focuses on how networks, which are more than the mere sum of their parts' properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks. We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.</td>

By the end of this module, each student should be able to

- recognize the universal principles underlying the development of different animal body plans.
- explain how the genes encoding the molecular toolkit have evolved to create animal diversity.
- relate changes in gene structure or function to evolutionary changes in animal development.

Key skills:
- By the end of this module, each student should be able to
  - present and discuss a relevant evolutionary topic in an oral presentation
  - select and integrate key concepts in animal evolution from primary literature
  - participate in discussions on topics presented by others

Abstract

Evolutionary dynamics is concerned with the mathematical principles according to which life has evolved. This course offers an introduction to mathematical modeling of evolution, including deterministic and stochastic models.

Objective

The goal of this course is to understand and to appreciate mathematical models and computational methods that provide insight into the evolutionary process.

Content

Evolution is the one theory that encompasses all of biology. It provides a single, unifying concept to understand the living systems that we observe today. We will introduce several types of mathematical models of evolution to describe gene frequency changes over time in the context of different biological systems, focusing on asexual populations. Viruses and cancer cells provide the most prominent examples of such systems and they are at the same time of great biomedical interest. The course will cover some classical mathematical population genetics and population dynamics, and also introduce several new approaches. This is reflected in a diverse set of mathematical concepts which make their appearance throughout the course, all of which are introduced from scratch. Topics covered include the quasispecies equation, evolution of HIV, evolutionary game theory, birth-death processes, evolutionary stability, evolutionary graph theory, somatic evolution of cancer, stochastic tunneling, cell differentiation, hematopoietic tumor stem cells, genetic progression of cancer and the speed of adaptation, diffusion theory, fitness landscapes, neutral networks, branching processes, evolutionary escape, and epistasis.

Lecture notes

No.

Abstract

Concepts and molecular mechanisms underlying the biochemistry of the cell, providing advanced insights into structure, function and regulation of individual cell components. Particular emphasis will be put on the spatial and temporal integration of different molecules and signaling pathways into global cellular processes such as intracellular transport, cell division & growth, and cell migration.

Objective

The full-year course (551-0319-00 & 551-0320-00) focuses on the molecular mechanisms and concepts underlying the biochemistry of cellular physiology, investigating how these processes are integrated to carry out highly coordinated cellular functions. The molecular characterisation of complex cellular functions requires a combination of approaches such as biochemistry, but also cell biology and genetics. This course is therefore the occasion to discuss these techniques and their integration in modern cellular biochemistry.

The students will be able to describe the structural and functional details of individual cell components, and the spatial and temporal regulation of their interactions. In particular, they will learn to explain the integration of different molecules and signaling pathways into complex and highly dynamic cellular processes such as intracellular transport, cytoskeletal rearrangements, cell motility, cell division and cell growth. In addition, they will be able to illustrate the relevance of particular signaling pathways for cellular pathologies such as cancer.

Content

Structural and functional details of individual cell components, regulation of their interactions, and various aspects of the regulation and compartmentalisation of biochemical processes.

Topics include: biophysical and electrical properties of membranes; viral membranes; structural and functional insights into intracellular transport and targeting; vesicular trafficking and phagocytosis; post-transcriptional regulation of gene expression.
Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background.

This course focuses on the concepts of classical and modern genetics and genomics.

**Prerequisites / notice:** To attend this course the students must have a solid basic knowledge in chemistry, biochemistry and general biology. The course will be taught in English.

**529-0731-00L Nucleic Acids and Carbohydrates**

- **ECTS:** 6
- **Hours:** 3G
- **Lecturer:** D. Hilvert, P. A. Kast, S. J. Sturfa, H. Wennemers
- **Objective:** Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNA; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines
- **Content:** Structure, function and chemistry of nucleic acids and carbohydrates. DNA/RNA structure and synthesis; recombinant DNA technology and PCR; DNA arrays and genomics; antisense approach and RNA; polymerases and transcription factors; catalytic RNA; DNA damage and repair; carbohydrate structure and synthesis; carbohydrate arrays; cell surface engineering; carbohydrate vaccines
- **Prerequisites / notice:** no script
- **Literature:** Mainly based on recent original literature, a detailed list will be distributed during the first lecture

**551-0313-00L Microbiology (Part I)**

- **ECTS:** 3
- **Hours:** 2V
- **Lecturer:** W.D. Hardt, L. Eberl, H.M. Fischer, J. Piel, M. Pilhofer
- **Abstract:** Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.
- **Objective:** This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.
- **Content:** Updated handouts will be provided during the class.
- **Prerequisites / notice:** English

**551-1295-00L Introduction to Bioinformatics: Concepts and Applications**

- **ECTS:** 6
- **Hours:** 4G
- **Lecturer:** W. Gruissem, K. Bärenfänger, A. Cafflosch, G. Capitani, J. Fütterer, M. Robinson, A. Wagner
- **Abstract:** Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.
- **Objective:** Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.
- **Content:** Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation
- Tools and software used: BLAST, Geneious, JBrowse, Jmol, JBrowse, SAMtools, UCSC Genome Browser, VEP, etc.
- **Prerequisites / notice:** The lecture “Grundlagen der Biologie II: Mikrobiologie” is the basis for this advanced lecture.
- **Literature:** Current literature references will be provided during the lectures.
- **Number:** 551-1295-00L
- **Title:** Introduction to Bioinformatics: Concepts and Applications
- **Type:** W
- **ECTS:** 6
- **Hours:** 4G
- **Lecturer:** W. Gruissem, K. Bärenfänger, A. Cafflosch, G. Capitani, J. Fütterer, M. Robinson, A. Wagner

**551-0309-00L Concepts in Modern Genetics**

- **ECTS:** 6
- **Hours:** 4V
- **Lecturer:** Y. Barral, D. Bopp, A. Hajnal, M. Stoffel, O. Vöönnet
- **Abstract:** Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.
- **Objective:** This course focuses on the concepts of classical and modern genetics and genomics.
- **Content:** This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UZH Irchel.
- **Prerequisites / notice:** This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UZH Irchel.

---
Microbial Biochemistry

Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Overview of enzymes, enzyme-catalyzed reactions and metabolic processes.

Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

A script will not be handed out.

In addition, citations from the original literature relevant to the individual lectures will be assigned weekly.

Glycobiology

Structural principles, nomenclature and different classes of glycosylation. The different pathways of N- and O-linked protein glycosylation and glycolipid biosynthesis in prokaryotes and eukaryotes are discussed. Specific glycan binding proteins and their role in deciphering the glycan code are presented. The role of glycans in infectious diseases, antigen mimicry and autoimmunity are discussed.

Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glycobiology, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

Structure and linkages; analytical approaches; N-linked protein glycosylation (ER, Golgi); glycan-assisted protein folding and quality control; O-linked protein glycosylation; glucosaminylglycans; glycolipids; prokaryotic glycosylation pathways; lectins; glycans and infectious disease

The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics.

Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glycobiology, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

Introduction to Glycobiology; M.E. Taylor, K. Drickamer, Oxford University Press, 2003

The course will be in English. It will include the preparation of short essays (marked) about defined topics in Glycobiology.

Microbial Biochemistry

The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Emphasis is on processes that are specific to bacteria and archaea and that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest.

The lecture course aims at providing an advanced understanding of the physiology and metabolism of microorganisms. Important biochemical processes specific to bacteria and archaea will be pointed out that contribute to the widespread occurrence of prokaryotes. Applied aspects of microbial biochemistry will be pointed out as well as research fields of current scientific interest. Emphasis is on concepts of energy generation and assimilation.

Eating sugars and letting them in Challenging: Aromatics, xenobiotics, and oil Complex: (Ligno-)Cellulose and in demand for bioenergy Living on a diet and the anaerobic provocation Of climate relevance: The microbial C1 cycle What are AMO and Anammox? 20 amino acids: the making of Extending the genetic code The 21st and 22nd amino acid Some exotic biochemistry: nucleotides, cofactors Ancient biochemistry? iron-sulfur clusters, polymers Secondary metabolites: playground of evolution A script will be provided during the course.

Advanced Protein Engineering (University of Zurich)

No enrolment to this course at ETH Zurich. Book the corresponding module directly at UZH. UZH Module Code: BCH420

Restricted to max. 10 students from ETH

Introduction to current research strategies in protein science.

Proteins have become an object of intense study in modern science, ranging from their use as therapeutics to elucidating their structure and function in the cell. Moreover, it is now possible to engineer and evolve tailor-made proteins, opening up many new areas of science. This course will attempt to cover the frontiers and remaining challenges, emphasizing the biochemical foundations of the various approaches.

Introduction to current research strategies in protein science.

To understand current research strategies in protein science.

Proteins have become an object of intense study in modern science, ranging from their use as therapeutics to elucidating their structure and function in the cell. Moreover, it is now possible to engineer and evolve tailor-made proteins, opening up many new areas of science. This course will attempt to cover the frontiers and remaining challenges, emphasizing the biochemical foundations of the various approaches.

Slides and references will be available on OLAT server. https://www.olat.uzh.ch/olat/auth/repo/go?rid=600670219

PDFs will be available on OLAT server. https://www.olat.uzh.ch/olat/auth/repo/go?rid=600670219

Solid knowledge in biochemistry strongly recommended

Starting from contemporary biological problems related to metabolism, the course focuses on systems biological approaches to address them. In a problem-oriented, this-is-how-it-is-done manner, we thereby teach methods and concepts.

The course will be given as a mixture of lectures, studies of original research and guided discussions that focus on current research topics.

For each particular problem studied, we will work out how the various methods work and what their capabilities/limits are. The problem areas range from microbial metabolism to cancer cell metabolism and from metabolic networks to regulation networks in populations and single cells. Key methods to be covered are various modeling approaches, metabolic flux analyses, metabolomics and other omics.

Script and original publications will be supplied during the course.

List of topics:
Eating sugars and letting them in Challenging: Aromatics, xenobiotics, and oil Complex: (Ligno-)Cellulose and in demand for bioenergy Living on a diet and the anaerobic provocation Of climate relevance: The microbial C1 cycle What are AMO and Anammox? 20 amino acids: the making of Extending the genetic code The 21st and 22nd amino acid Some exotic biochemistry: nucleotides, cofactors Ancient biochemistry? iron-sulfur clusters, polymers Secondary metabolites: playground of evolution A script will be provided during the course.
The course extends many of the generally introduced concepts and methods of the Concept Course in Systems Biology. It requires a good knowledge of biochemistry and basics of mathematics and chemistry.

**529-0004-00L** Computer Simulation in Chemistry, Biology and Physics

**W** 7 credits 4G P. H. Hünenberger

**Abstract**

Molecular models, Force fields, Boundary conditions, Electrostatic interactions, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.

For more information: www.csms.ethz.ch/education/CSCBP

**Objective**

Introduction to computer simulation of (bio)molecular systems, development of skills to carry out and interpret computer simulations of biomolecular systems.

**Content**

Molecular models, Force fields, Spatial boundary conditions, Calculation of Coulomb forces, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.

**Lecture notes**

Available (copies of powerpoint slides distributed before each lecture)

**Literature**

See: www.csms.ethz.ch/education/CSCBP

**Prerequisites / notice**

Since the exercises on the computer do convey and test essentially different skills as those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam.

For more information about the lecture: www.csms.ethz.ch/education/CSCBP

**401-0649-00L** Applied Statistical Regression

**W** 5 credits 2V+1U M. Dettling

**Abstract**

This course offers a practically oriented introduction into regression modeling methods. The basic concepts and some mathematical background are included, with the emphasis lying in learning “good practice” that can be applied in every student's own projects and daily work life. A special focus will be laid in the use of the statistical software package R for regression analysis.

**Objective**

The students acquire advanced practical skills in linear regression analysis and are also familiar with its extensions to generalized linear modeling.

**Content**

The course starts with the basics of linear modeling, and then proceeds to parameter estimation, tests, confidence intervals, residual analysis, model choice, and prediction. More rarely touched but practically relevant topics that will be covered include variable transformations, multicollinearly problems and model interpretation, as well as general modeling strategies.

Third part of the course is dedicated to an introduction to generalized linear models: this includes the generalized additive model, logistic regression for binary response variables, binomial regression for grouped data and poisson regression for count data.

**Lecture notes**

A script will be available.

**Literature**

Faraway (2005): Linear Models with R
Faraway (2006): Extending the Linear Model with R
Draper & Smith (1998): Applied Regression Analysis
Fox (2008): Applied Regression Analysis and GLMs
Montgomery et al. (2006): Introduction to Linear Regression Analysis

**Prerequisites / notice**

The exercises, but also the classes will be based on procedures from the freely available, open-source statistical software package R, for which an introduction will be held.

In the Mathematics Bachelor and Master programmes, the two course units 401-0649-00L "Applied Statistical Regression" and 401-3622-00L "Regression" are mutually exclusive. Registration for the examination of one of these two course units is only allowed if you have not registered for the examination of the other course unit.

**401-6215-00L** Using R for Data Analysis and Graphics (Part I)

**W** 1 credit 1G A. Drewek, A. J. Papritz

**Abstract**

The course provides the first part an introduction to the statistical software R for scientists. Topics covered are data generation and selection, graphical and basic statistical functions, creating simple functions, basic types of objects.

**Objective**

The students will be able to use the software R for simple data analysis.

**Content**

The course provides the first part of an introduction to the statistical software R for scientists. R is free software that contains a huge collection of functions with focus on statistics and graphics. If one wants to use R one has to learn the programming language R - on very rudimentary level. The course aims to facilitate this by providing a basic introduction to R.

Part I of the course covers the following topics:
- What is R?
- R Basics: reading and writing data from/to files, creating vectors & matrices, selecting elements of dataframes, vectors and matrices, arithmetics;
- Types of data: numeric, character, logical and categorical data, missing values;
- Simple (statistical) functions: summary, mean, var, etc., simple statistical tests;
- Writing simple functions;
- Introduction to graphics: scatter-, boxplots and other high-level plotting functions, embellishing plots by title, axis labels, etc., adding elements (lines, points) to existing plots.

The course focuses on practical work at the computer. We will make use of the graphical user interface RStudio: www.rstudio.org

**Lecture notes**

An Introduction to R. http://stat.ethz.ch/CLEAN/doc/contrib/Lam-IntroductionToR_LHL.pdf

**Prerequisites / notice**

The course resources will be provided via the Moodle web learning platform Please login (with your ETH (or other University) username-password) at https://moodle-app2.let.ethz.ch/enrol/users.php?id=1145

Choose the course "Using R for Data Analysis and Graphics" and follow the instructions for registration.

**529-0041-00L** Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics

**W** 6 credits 3G R. Zenobi, M. Badertscher, B. Hattendorf, P. Martinez-Lozano Sinues

**Abstract**

Modern mass spectrometry, hyphenated analytical methods, speciation, methods of surface analysis, chemometrics.

Comprehensive knowledge about the analytical methods introduced in this course, and their applications.

Coulping of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation.

Modern mass spectrometry: Time of flight and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods.

Methods of surface analysis (ESCA, Auger, SIMS, rater microscopy methods).

Employment of computer science for processing data in chemical analysis (chemometrics).
Elective Major: Biological Chemistry

### Abstract
This course has its focus on the responsible conduct of research (RCR) and the ethical dimensions of the biological and biomedical sciences.

### Objective
The main goal of this course is to enhance the student’s ability to:
- recognize and identify ethical issues and conflicts,
- analyze and develop well-reasoned responses to the kinds of ethical problems a scientist is likely to encounter.

Additionally, students will become familiar with regulations and ethical guidelines relevant for their research field on the international, governmental, institutional and professional level.

To achieve these objectives, teaching methods will include lectures, discussions, case study work (alone and in groups), moral games, paper work and exercises.
I. Ethics & the Process of Ethical Inquiry

Introduction in Ethics and Research Ethics
- What is ethics? What ethics is not...;
- Awareness: what constitutes an ethical question? Distinguishing ethical questions from other kinds of questions; Science & ethics: a comparison;
- The ethics movement in the biological and health sciences;
- What is research ethics and why is it important?
- Values (personal, cultural & ethical) in science & principles for ethical conduct in research;
- Professional codes of conduct: functions and limitations

Ethical approaches in the conduct of research (Normative Ethics)
- Overview over important theories for research ethics: virtue theories, duty-based theories (rights theory, categorical imperative, prima facie duties), consequentialist theories, other theories);
- The plurality of ethical theories and its consequences;
- The concept of dignity

Moral reasoning I: Arguments
- Why arguments? What is a good argument? The structure of (moral) arguments;
- Deductive and inductive arguments; Validity and soundness;
- Assessing moral arguments

Moral reasoning II: Decision-making
- How (not) to approach ethical issues...; Is there a correct method for answering moral questions?
- Models of method in Applied Ethics: a) Top-down approaches; b) the reflective equilibrium; c) a bottom-up approach: casuistry (or reasoning-by-analogy);
- Is there a right answer?

II. Research Ethics / Responsible Conduct of Research (RCR)

Integrity in Research & Research Misconduct
- What is "integrity" in scientific research? What is research misconduct (falsification, fabrication, plagiarism - FFP) and questionable research practices (QRP)?
- Factors leading to misconduct; Procedure for responding to allegations of research misconduct;
- The confidant of ETH Zurich

Data Management
- Data collection and recordkeeping; Analysis and selection of data;
- Ownership of data; retention and sharing of data;
- Falsification and fabrication of data

Research involving animals
- The moral status of animals; Ethical approaches to animal experimentation: Animal welfare (Peter Singer) and Animal rights (Tom Regan);
- The 3 R's (replacement, reduction, refinement);
- Ethical assessment of conflicting issues in animal experimentation;
- The dignity of animals in the Swiss constitution;

Research involving human subjects
- History & guidelines (Nuremberg Code; Declaration of Helsinki; Belmont Report; International Ethical Guidelines for Biomedical Research Involving Human Subjects (CIOMS Guidelines); Convention on Human Rights and Biomedicine (Oviedo Convention);
- Informed consent; confidentiality and anonymity; research risks and benefits; vulnerable subjects;
- Clinical trials;
- Biobanks
- Ethics Committees / Institutional Review Boards (IRB)

Authorship & Peer review
- Criteria for authorship;
- Plagiarism;
- Challenges to openness and freedom in scientific publication;
- Open access;
- Peer review

Social responsibility
- What is social responsibility? Social responsibility: whose obligation?
- Public advocacy by researchers

Lecture notes
Course material (handouts, case studies, exercises, surveys and papers) will be available during the lectures and on the course homepage.

Literature
Recommended literature:
- "Introduction to the Responsible Conduct of Research" (http://ori.dhhs.gov/education/products/RCRintro/)

Detailed literature lists for the different topics of the course will be provided in the script/handout or on the course work space.

The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

The lecture will be taught in English.

Topics are treated in 2 blocks:
(I) From Quantum to Continuum
From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale
Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.

Self-assembly and directed assembly of 2D and 3D structures.

Handouts (available online)

| 227-0393-10L | Bioelectronics and Biosensors    | W    | 6       | 2V+2U  | J. Vörös, M. F. Yanik, T. Zambelli  
New course. Not to be confounded with 227-0393-00L last offered in the Spring Semester 2015. |
| **Abstract** | The course introduces the concepts of bioelectricity and biosensing. The sources and use of electrical fields and currents in the context of biological systems and problems are discussed. The fundamental challenges of measuring biological signals are introduced. The most important biosensing techniques and their physical concepts are introduced in a quantitative fashion. |
| **Objective** | During this course the students will:  
- learn the basic concepts in biosensing and bioelectronics  
- be able to solve typical problems in biosensing and bioelectronics  
- learn about the remaining challenges in this field |

Data: 06.10.2017 12:53  Autumn Semester 2016  Page 285 of 1570
Part I - Linear Signal Representation and Approximation: Hilbert spaces, least squares and LMMSE estimation, projection and estimation

Part II - Learning Linear and Nonlinear Functions and Filters: Kernel methods, neural networks.

L1. Bioelectronics history, its applications and overview of the field
- Volta and Galvani dispute
- BMI, pacemaker, cochlear implant, retinal implant, limb replacement devices
- Fundamentals of biosensing
- Glucometer and ELISA

L2. Fundamentals of quantum and classical noise in measuring biological signals

L3. Biomeasurement techniques with photons

L4. Acoustics sensors
- Differential equation for quartz crystal resonance
- Acoustic sensors and their applications

L5. Engineering principles of optical probes for measuring and manipulating molecular and cellular processes

L6. Optical biosensors
- Differential equation for optical waveguides
- Optical sensors and their applications
- Plasmonic sensing

L7. Basic notions of molecular adsorption and electron transfer
- Quantum mechanics: Schrödinger equation energy levels from H atom to crystals, energy bands
- Electron transfer: Marcus theory, Gerischer theory

L8. Potentiometric sensors
- Fundamentals of the electrochemical cell at equilibrium (Nernst equation)
- Principles of operation of ion-selective electrodes

L9. Amperometric sensors and bioelectric potentials
- Fundamentals of the electrochemical cell with an applied overpotential to generate a faraday current
- Principles of operation of amperometric sensors
- Ion flow through a membrane (Pfick equation, Nernst equation, Donnan equilibrium, Goldman equation)

L10. Channels, amplification, signal gating, and patch clamp Y4

L11. Action potentials and impulse propagation

L12. Functional electric stimulation and recording
- MEA and CMOS based recording
- Applying potential in liquid - simulation of fields and relevance to electric stimulation

L13. Neural networks memory and learning

Literature
Plonsey and Barr, Bioelectricity: A Quantitative Approach (Third edition)

Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monocoltures of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enforcements and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.
Handouts can be accessed online.

**Content**

Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Diffuse applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

**Lecture notes**

Handouts provided during the classes and references therein.

**Literature**

- Scanprobe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

- As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

- The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is controlled by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

- High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

- Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body.

- Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

- 3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

### Recommended Elective Courses

These courses are particularly recommended for the Bioelectronics track. Please consult your track advisor if you wish to select other subjects.

Abstract

Objective

Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content

The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention. The methods for object tracking will be presented. Several techniques are discussed to extract third-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Lecture notes

Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice

Prerequisites: Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C. The course language is English.

227-0468-00L Analog Signal Processing and Filtering

Suitable for Master Students as well as Doctoral Students.

W 6 credits 2V+2U H. Schmid

Abstract

This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers.

Objective

This lecture provides a wide overview over analog filters (continuous-time and discrete-time), signal-processing systems, and sigma-delta conversion, and gives examples with sensor interfaces and class-D audio drivers. All systems and circuits are treated using a signal-flow view. The lecture is suitable for both analog and digital designers. The way the exam is done allows for the different interests of the two groups.

Content

The learning goal is that the students can apply signal-flow graphs and can understand the signal flow in such circuits and systems (including non-ideal effects) well enough to gain an understanding of further circuits and systems by themselves.

Lecture notes

The base for these lectures are lecture notes and two or three published scientific papers. From these papers we will together develop the technical content.

Prerequisites / notice

Prerequisites: Recommended (but not required): Stochastic models and signal processing, Communication Electronics, Analog Integrated Circuits, Transmission Lines and Filters.

Knowledge of the Laplace transform and z transform and their interpretation (transfer functions, poles and zeros, bode diagrams, stability criteria ...) and of the main properties of linear systems is necessary.

227-0981-00L Cross-Disciplinary Research and Development in Medicine and Engineering

A maximum of 12 medical degree students and 12 biomedical engineering degree students can be admitted, their number should be equal.

W 4 credits 2V+2A V. Kucurcuoglu, D. de Julien de Zelicourt, M. Mebodi, M. Schmid Daners, O. Ulrich

Abstract

Cross-disciplinary collaboration between engineers and medical doctors is indispensable for innovation in health care. This course will bring together engineering students from ETH Zurich and medical students from the University of Zurich to experience the rewards and challenges of such interdisciplinary work in a project based learning environment.

Objective

The main goal of this course is to demonstrate the differences in communication between the fields of medicine and engineering. Since such differences become the most evident during actual collaborative work, the course is based on a current project in physiology research that combines medicine and engineering. For the engineering students, the specific aims of the course are to:

- Acquire a working understanding of the anatomy and physiology of the investigated system;
- Identify the engineering challenges in the project and communicate them to the medical students;
- Develop and implement, together with the medical students, solution strategies for the identified challenges;
- Present the found solutions to a cross-disciplinary audience.

Content

After a general introduction to interdisciplinary communication and detailed background on the collaborative project, the engineering students will receive tailored lectures on the anatomy and physiology of the relevant system. They will then team up with medical students who have received a basic introduction to engineering methodology to collaborate on said project. In the process, they will be coached both by lecturers from ETH Zurich and the University of Zurich, receiving lectures customized to the project. The course will end with each team presenting their solution to a cross-disciplinary audience.

Lecture notes

Handouts and relevant literature will be provided.

227-1033-00L Neurocomputing I

Registration in this class requires the permission of the instructors. Class size will be limited to available lab spots. Preference is given to students that require this class as part of their major.

W 6 credits 2V+3U T. Delbruck, G. Indiveri, S.C. Liu

Abstract

This course covers analog circuits with emphasis on neurocomputing: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Objective

Understanding of the characteristics of neurocomputing circuit elements.
Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulation of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Particular: The course is highly recommended for those who intend to take the spring semester course ‘Neuromorphic Engineering II’, that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

227-2037-00L Physical Modelling and Simulation W 5 credits 4G C. Hafner, J. Leuthold, S. Majic

Abstract
This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

Objective
Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability (a) to develop own simple field simulation programs, (b) to select an appropriate field solver for a given problem, (c) to perform field simulations, (d) to evaluate the obtained results, and (e) to interactively improve the models until sufficiently accurate results are obtained.

Content
The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. After the introduction follows a detailed overview of the available numerical methods for solving electromagnetic, thermal and mechanical boundary value problems. This part of the course contains a general introduction into numerical methods, differential and integral forms, linear equation systems, Finite Difference Method (FDM), Boundary Element Method (BEM), Method of Moments (MoM), Multiple Multipole Program (MMP) and Finite Element Method (FEM). The theoretical part of the course finishes with a presentation of multiphysics simulations through several practical examples of HF-engineering such as coupled electromagnetic-mechanical and electromagnetothermal analysis of MEMS.

In the second part of the course the students will work in small groups on practical simulation problems. For solving practical problems the students can develop and use own simulation programs or chose an appropriate commercial field solver for their specific problem. This practical simulation work of the students is supervised by the lecturers.

151-0255-00L Energy Conversion and Transport in Biosystems W 4 credits 2V+1U D. Poulikakos, A. Ferrari

Abstract
Theory and application of thermodynamics and energy conversion in biological systems with focus on the cellular level.

Objective
Theory and application of energy conversion at the cellular level. Understanding of the basic features governing solutes transport in the principal systems of the human cell. Connection of characteristics and patterns from other fields of engineering to biofluidics. Heat and mass transport processes in the cell, generation of forces, work and relation to biomedical technologies.

Content
Mass transfer models for the transport of chemical species in the human organism. Organization and function of the cell membrane and of the cell cytoskeleton. The role of molecular motors in cellular force generation and their function in cell migration. Description of the functionality of these systems and of analytical experimental and computational techniques for understanding of their operation. Introduction to cell metabolism, cellular energy transport and cellular thermodynamics.

Lecture notes
Material in the form of hand-outs will be distributed.

Literature
Lecture notes and references therein.

151-0509-00L Microscale Acoustofluidics W 4 credits 3G J. Dual

Abstract
In this lecture the basics as well as practical aspects (from modelling to design and fabrication ) are described from a solid and fluid mechanics perspective with applications to microsystems and lab on a chip devices.

Objective
Understanding acoustophoresis, the design of devices and potential applications

Content
Linear and nonlinear acoustics, foundations of fluid and solid mechanics and piezoelectricity. Gorkov potential, numerical modelling, acoustofluidics streaming, applications from ultrasonic microfluidics to surface acoustic wave devices

Lecture notes

Literature

Prerequisites / notice
Solid and fluid continuum mechanics. Notice: The exercise part is a mixture of presentation, lab session and hand in homework.

376-1103-00L Frontiers in Nanotechnology W 4 credits 4V V. Vogel, further lecturers

Abstract
Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.

Objective
Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within mammade and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

Content
The goal of the course is to give Master and Graduate students from all interested departments an overview of what nanotechnology is all about, from analytical techniques to nanosystems, from physics to biology. Students will start to appreciate the extent to which scientific communities are meeting at the nanoscale. They will learn about the specific challenges and what is currently sizzling in the respective fields, and learn the vocabulary that is necessary to communicate effectively across departmental boundaries.

Each lecturer will first give an overview of the state-of-the art in his/her field, and then describe the research highlights in his/her own research group. While preparing their Final Projects and discussing them in front of the class, the students will deepen their understanding of how to apply a range of new technologies to solve specific scientific problems and technical challenges. Exposure to the different frontiers will also improve their ability to conduct effective nanoscale research, recognize the broader significance of their work and to start collaborations.

Content
Starting with the fabrication and analysis of nanoparticles and nanostructured materials that enable a variety of scientific and technical applications, we will transition to discussing biological nanosystems, how they work and what bioinspired engineering principles can be derived, to finally discussing biomedical applications and potential health issues. The emerging technologies will be covered that start impacting so many aspects of our lives. This includes new phenomena in physics, advanced materials, novel technologies and new methods to address major medical challenges.

Lecture notes
All the enrolled students will get access to a password protected website where they can find pdf files of the lecture notes, and typically 1-2 journal articles per lecture that cover selected topics.

376-1219-00L Rehabilitation Engineering II: Rehabilitation of W 3 credits 2V R. Riener, R. Gassert,
Sensory and Vegetative Functions

Abstract
Rehabilitation Engng is the application of science and technology to ameliorate the handicaps of individuals with disabilities to reintegrate them into society. The goal is to present classical and new rehabilitation engineering principles applied to compensate or enhance motor, sensory, and cognitive deficits. Focus is on the restoration and treatment of the human sensory and vegetative system.

Objective
Provide knowledge on the anatomy and physiology of the human sensory system, related dysfunctions and pathologies, and how rehabilitation engineering can provide sensory restoration and substitution.

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

Content

Introduction, problem definition, overview
Rehabilitation of visual function
- Anatomy and physiology of the visual sense
- Technical aids (glasses, sensor substitution)
- Retina and cortex implants
Rehabilitation of hearing function
- Anatomy and physiology of the auditory sense
- Hearing aids
- Cochlea Implants
Rehabilitation and use of kinesthetic and tactile function
- Anatomy and physiology of the kinesthetic and tactile sense
- Tactile/haptic displays for motion therapy (incl. electrical stimulation)
- Role of displays in motor learning
Rehabilitation of vestibular function
- Anatomy and physiology of the vestibular sense
- Rehabilitation strategies and devices (e.g. BrainPort)
Rehabilitation of vegetative Functions
- Cardiac Pacemaker
- Phrenic stimulation, artificial breathing aids
- Bladder stimulation, artificial sphincter
Brain stimulation and recording
- Deep brain stimulation for patients with Parkinson, epilepsy, depression
- Brain-Computer Interfaces

Literature

Introductory Books:

Selected Journal Articles and Web Links:

VideoTact, ForeThought Development, LLC. http://my.execpc.com/?dwysocki/videotac.html
This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard-disk technology for biosensing and scanning microfluidics for analyzing tissue sections are just a few examples of the covered topics.

The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having a background in the life sciences. The course should familiarize the students with the techniques used in micro/nanotechnology and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and medical applications. The second objective is to have life sciences students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

Mostly formal lectures (2 x 45 min), with a 2 hour visit and introduction to cleanroom and micro/nanotechnology instruments, last 3 sessions would be dedicated to the presentation and evaluation of projects by students (3 students per team).
Lecturers S. Kozerke, L. Van Gool, J. Vörös

**Cell and Molecular Biology for Engineers I**
Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques

**Image Analysis and Computer Vision**
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

---

**Biomedical Methods for Engineers (Basic Lab)**

**Abstract**
The course covers the basics of medical imaging technology including X-ray procedures, computed tomography, magnetic resonance imaging, and ultrasound imaging techniques.

**Objective**
To understand the principles of medical imaging and the physical and technical aspects of common medical instruments.

**Content**
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

---

**Biomedical Engineering**

**Abstract**
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

**Objective**
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

**Content**
- Neuro- and electrophysiology
- Functional analysis of peripheral nerves, muscles, sensory organs, and the central nervous system
- Electrogams, evoked potentials, audiometry, optometry
- Functional electrostimulation: Cardiac pacemakers
- Function of the heart and the circulatory system, transport and exchange of substances in the human body, pharmacokinetics, endoscopy, medical television technology
- Lithotripsy, electrical safety, orthopaedic biomechanics, lung function, bioinformatics and bioelectronics, biomaterials

**Track Core Courses**
During the Master program, a minimum of 12 CP must be obtained from track core courses.
This course will provide a solid foundation for understanding physical principles of THz applications. We will discuss various building blocks.

Abstract

Objective

Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content

The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information from multiple images, with motion and depth as two important examples. The estimation of image velocities (optical flow) will get due attention and methods for object tracking will be presented. Several techniques are discussed to extract three-dimensional information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Lecture notes

Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites

Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C.

The course language is English.

227-0965-00L Micro and Nano-Tomography of Biological Tissues

Abstract

The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective

Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

Content

Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

<td>Abstract</td>
<td>This course will provide a solid foundation for understanding physical principles of THz applications. We will discuss various building blocks of THz technology - components dealing with generation, manipulation, and detection of THz electromagnetic radiation. We will introduce THz applications in the domain of imaging, communications, and energy harvesting. This is an introductory course on Terahertz (THz) technology and applications. Devices operating in THz frequency range (0.1 to 10 THz) have been increasingly studied in the recent years. Progress in nonlinear optical materials, ultrafast optical and electronic techniques has strengthened research in THz application developments. Due to unique interaction of THz waves with materials, applications with new capabilities can be developed. In theory, they can penetrate somewhat like X-rays, but are not considered harmful radiation, because THz energy level is low. They should be able to provide resolution as good or better than magnetic resonance imaging (MRI), possibly with simpler equipment. Imaging, very-high bandwidth communication, and energy harvesting are the most widely explored THz application areas. We will study the basics of THz generation, manipulation, and detection. Our emphasis will be on the physical principles and applications of THz in the domain of imaging, communication and energy harvesting.</td>

## Content

### INTRODUCTION
- Chapter 1: Introduction to THz Physics
- Chapter 2: Components of THz Technology

### THz TECHNOLOGY MODULES
- Chapter 3: THz Generation
- Chapter 4: THz Detection
- Chapter 5: THz Manipulation

### APPLICATIONS
- Chapter 6: THz Imaging
- Chapter 7: THz Communication
- Chapter 8: THz Energy Harvesting

### Literature
- Yun-Shik Lee, Principles of Terahertz Science and Technology, Springer 2009

### Prerequisites / notice

Whenever we deviate from the main material discussed in these books, softcopy of lectures notes will be provided.

### Prerequisites / notice

Good foundation in electromagnetics & knowledge of microwave or optical communication is helpful.

**Abstract**

This seminar teaches problem solving skills for computational neuroimaging, based on joint analyses of neuroimaging and behavioural data. It deals with a wide variety of real-life problems that are brought to this seminar from the neuroimaging community at Zurich, e.g. mass-univariate and multivariate analyses of fMRI/EEG data, or generative models of fMRI, EEG, or behavioural data.

**Objective**

1. Consolidation of theoretical knowledge (obtained in the following courses: 'Methods & models for fMRI data analysis', 'Translational Neuromodelling', 'Computational Psychiatry') in a practical setting.
2. Acquisition of practical problem solving strategies for computational modeling of neuroimaging data.

**Content**

This seminar teaches problem solving skills for computational neuroimaging, based on joint analyses of neuroimaging and behavioural data. **Abstract**

This five-day course teaches state-of-the-art methods in computational psychiatry. It covers various computational models of cognition (e.g., learning and decision-making) and brain physiology (e.g., effective connectivity) of relevance for psychiatric disorders. The course not only provides theoretical background, but also demonstrates open source software in application to concrete examples.

**Objective**

This course aims at bridging the gap between mathematical modelers and clinical neuroscientists by teaching computational techniques in the context of clinical applications. The hope is that the acquisition of a joint language and tool-kit will enable more effective communication and joint translational research between fields that are usually worlds apart.

<td>A detailed overview of numerical methods for field simulations, and practical examples solved in form of small projects.</td>
</tr>
</tbody>
</table>

**Abstract**

This module consists of (a) an introduction to fundamental equations of electromagnetics, mechanics and heat transfer, (b) a detailed overview of numerical methods for field simulations, and (c) practical examples solved in form of small projects.

**Objective**

Basic knowledge of the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. Knowledge of the main concepts of numerical methods for physical modelling and simulation. Ability (a) to develop own simple field simulation programs, (b) to select an appropriate field solver for a given problem, (c) to perform field simulations, (d) to evaluate the obtained results, and (e) to interactively improve the models until sufficiently accurate results are obtained.

**Content**

The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. After the introduction follows a detailed overview of the available numerical methods for solving electromagnetic, thermal and mechanical boundary value problems. This part of the course contains a general introduction into numerical methods, differential and integral forms, linear equation systems, Finite Difference Method (FDM), Boundary Element Method (BEM), Method of Moments (MoM), Multiple Multipole Program (MMP) and Finite Element Method (FEM). The theoretical part of the course finishes with a presentation of multiphysics simulations through several practical examples of HF-engineering such as coupled electromagnetic-mechanical and electromagnetic-thermal analysis of MEMS.

In the second part of the course the students will work in small groups on practical simulation problems. For solving practical problems the students can develop and use own simulation programs or chose an appropriate commercial field solver for their specific problem. This practical simulation work of the students is supervised by the lecturers.

</table>

**Abstract**

The course provides an introduction to digital image analysis in modern flow diagnostics. Different techniques which are discussed include image velocimetry, laser induced fluorescence, liquid crystal thermography and interferometry. The physical foundations and measurement configurations are explained. Image analysis algorithms are presented in detail and programmed during the exercises.

**Objective**

Introduction to modern imaging techniques and post processing algorithms with special emphasis on flow analysis and visualization. Understanding of hardware and software requirements and solutions. Development of basic programming skills for (generic) imaging applications.
Content
Familiarize students with basic science and engineering principles governing the nano domain.

Frequently used mage processing techniques (filtering, correlation processing, FFTs, color space transforms).
Image Velocimetry (tracking, pattern matching, Doppler imaging).
Surface pressure and temperature measurements (fluorescent paints, liquid crystal imaging, infrared thermography).
Laser induced fluorescence.
(Digital) Schlieren techniques, phase contrast imaging, interferometry, phase unwrapping.
Wall shear and heat transfer measurements.
Pattern recognition and feature extraction, proper orthogonal decomposition.

Lecture notes available

Prerequisites / notice
Prerequisites: Fluiddynamics I, Numerical Mathematics, programming skills.
Language: German on request.

Virtual Reality in Medicine

376-1279-00L

W 3 credits R. Riener

Abstract
Virtual Reality has the potential to support medical training and therapy. This lecture will derive the technical principles of multi-modal (audiovisual, haptic, tactile etc.) input devices, displays and rendering techniques. Examples are presented in the fields of surgical training, intra-operative augmentation, and rehabilitation. The lecture is accompanied by practical courses and excursions.

Objective
Provide theoretical and practical knowledge of new principles and applications of multi-modal simulation and interface technologies in medical education, therapy, and rehabilitation.

Content
Virtual Reality has the potential to provide descriptive and practical information for medical training and therapy while relieving the patient and/or the physician. Multi-modal interactions between the user and the virtual environment facilitate the generation of high-fidelity sensory impressions, by using not only visual and auditory modalities, but also kinesthetic, tactile, and even olfactory feedback. On the basis of the existing physiological constraints, this lecture will derive the technical requirements and principles of multi-modal input devices, displays, and rendering techniques. Several examples are presented that are currently being developed or already applied for surgical training, intra-operative augmentation, and rehabilitation. The lecture will be accompanied by several practical courses on graphical and haptic display devices as well as excursions to facilities equipped with large-scale VR equipment.

Target Group:
Students of higher semesters and PhD students of
- D-HEST, D-MAVT, D-ITET, D-INFK, D-PHYS
- Robotics, Systems and Control Master
- Biomedical Engineering/Movement Science and Sport
- Medical Faculty, University of Zurich

Language: German on request.
Prerequisites
Basic experience in Information Technology and Computer Science will be of advantage.

Nanosystems

151-0605-00L

W 4 credits R. Stemmer, J. N. Tisserant

Abstract
From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.
Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.
Self-assembly and directed assembly of 2D and 3D structures.

Objective
Familiarize students with basic science and engineering principles governing the nano domain.

Content
The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics that are traditionally taught separately.

Special emphasis is placed on the emerging field of molecular electronic devices, their working principles, applications, and how they may be assembled.

Topics are treated in 2 blocks:

(I) From Quantum to Continuum
From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale
Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.
Self-assembly and directed assembly of 2D and 3D structures.

Literature

Prerequisites
Course format:
Lectures and Mini-Review presentations: Thursday 10-13, ML F 36

Homework: Mini-Reviews
Students select a paper (list distributed in class) and expand the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper.
This course covers fundamental concepts of modern computer graphics. Students will learn about 3D object representations and the details of how to generate photorealistic images from digital representations of 3D scenes. Starting with an introduction to 3D shape modeling and representation, texture mapping and ray-tracing, we will move on to acceleration structures, the physics of light transport, appearance modeling and global illumination principles and algorithms. We will end with an overview of modern image-based image synthesis techniques, covering topics such as lightfields and depth-image based rendering.

402-0674-00L  
**Physics in Medical Research: From Atoms to Cells**  
W 6 credits  
2V+1U  
T. B. K. Müller

**Abstract**

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

**Objective**

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitations mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

227-1033-00L  
**Neuromorphic Engineering I**  
W 6 credits  
2V+3U  
T. Delbrück, G. Indiveri, S.C. Liu

**Abstract**

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells. The programming assignments will be in C++. This will not be taught in the class.

**Content**

- Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementations of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions.

**Literature**

S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

**Prerequisites / notice**

- Particular: The course is highly recommended for those who intend to take the spring semester course ‘Neuromorphic Engineering II’, that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

227-1037-00L  
**Introduction to Neuroinformatics**  
W 6 credits  
2V+1U  
K. A. Martin, M. Cook, V. Mante, M. Pfeiffer

**Abstract**

The course provides an introduction to the functional properties of neurons. Particularly the description of membrane electrical properties (action potentials, channels), neuronal anatomy, synaptic structures, and neuronal networks. Simple models of computation, learning, and behavior will be explained. Some artificial systems (robot, chip) are presented.

**Objective**

Understanding computation by neurons and neuronal circuits is one of the great challenges of science. Many different disciplines can contribute their tools and concepts to solving mysteries of neural computation. The goal of this introductory course is to introduce the monoculars of physics, maths, computer science, engineering, biology, psychology, and even philosophy and history, to discover the enigmas and challenges that we all face in taking on this major 21st century problem and how each discipline can contribute to discovering solutions.
The course covers the structure and function of biological neural networks at different levels. It focuses on the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed to handle syntrophic logics, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with bioinformatics methods through guided exercises. The course provides students from different backgrounds with training in bioinformatics approaches that have impact on biological, chemical and physical experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

Content
- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

Biological Methods for Engineers (Basic Lab) ■

Abstract
The course during 4 afternoons (13h to 18h) covers basic laboratory skills and safety, cell culture, protein analysis, RNA/DNA isolation and RT-PCR. Each topic will be introduced, followed by practical work at the bench. Presence during the course is mandatory.

Objective
The goal of this laboratory course is to give students practical exposure to basic techniques of cell and molecular biology.

Content
Enrollment is limited and students from the Master's programme in Biomedical Engineering (BME) have priority.
The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective
Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

Content
Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

Lecture notes
Will be indicated during the lecture.

Clinical and Movement Biomechanics
W
4 credits
3G
S. Lorenzetti, R. List, N. Singh

Abstract
Measurement and modeling of the human movement during daily activities and in a clinical environment.

Objective
The students are able to analyse the human movement from a technical point of view, to process the data and perform modeling with a focus towards clinical application.

Content
This course includes study design, measurement techniques, clinical testing, accessing movement data and anisys as well as modeling with regards to human movement.

376-1985-00L
Trauma Biomechanics
W
4 credits
2V+1U
K.U. Schmitt, M. H. Muser

Abstract
Trauma biomechanics in an interdisciplinary research field investigating the biomechanics of injuries and related subjects such as prevention. The lecture provides an introduction to the basic principles of trauma biomechanics.

Objective
Introduction to the basic principles of trauma biomechanics.

Content
This lecture serves as an introduction to the field of trauma biomechanics. Emphasis is placed on the interdisciplinary nature of impact biomechanics, which uses the combination of fundamental engineering principles and advanced medical technologies to develop injury prevention measures. Topics include: accident statistics and accident reconstruction, biomechanical response of the human to impact loading, injury mechanisms and injury criteria, test methods (including crash tests), computer simulations using multi-body and finite element modelling techniques, aspects of passive safety of vehicles (focusing on restraint systems and vehicle compatibility). Real world examples mainly from automobile safety are used to augment lecture material.

Lecture notes
Handouts will be made available.

Energy Conversion and Transport in Biosystems
W
4 credits
2V+1U
D. Poulikakos, A. Ferrari

Abstract
Theory and application of thermodynamics and energy conversion in biological systems with focus on the cellular level.

Objective
Theory and application of energy conversion at the cellular level. Understanding of the basic features governing solutes transport in the principal systems of the human cell. Connection of characteristics and patterns from other fields of engineering to biofluidics. Heat and mass transport processes in the cell, generation of forces, work and relation to biomedical technologies.

Content
Mass transfer models for the transport of chemical species in the human cell. Organization and function of the cell membrane and of the cell cytoskeleton. The role of molecular motors in cellular force generation and their function in cell migration. Description of the functionality of these systems and of analytical experimental and computational techniques for understanding of their operation.

Introduction to cell metabolism, cellular energy transport and cellular thermodynamics.

Continuum Mechanics I
W
4 credits
2V+1U
E. Mazza

Abstract
The lecture deals with constitutive models that are relevant for design and calculation of structures. These include anisotropic linear elasticity, linear viscoelasticity, plasticity, viscoplasticity. Homogenization theories and laminate theory are presented. Theoretical models are complemented by examples of engineering applications and experiments.

Objective
Basic theories for solving continuum mechanics problems of engineering applications, with particular attention to material models.

Content

Lecture notes
yes

151-0604-00L
Microrobotics
W
4 credits
3G
B. Nelson

Abstract
Microrobotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to the fundamentals of this emerging field. Throughout the course students are expected to submit assignments. The course concludes with an end-of-semester examination.

Objective
The objective of this course is to expose students to the fundamental aspects of the emerging field of microrobotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content
Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical microrobots

Lecture notes
The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

Prerequisites
The lecture will be taught in English.
From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.

Self-assembly and directed assembly of 2D and 3D structures.

Special emphasis is placed on the emerging field of molecular electronic devices.

Familiarize students with basic science and engineering principles governing the nano domain.

The course addresses basic science and engineering principles ruling the nano domain. We particularly work out the links between topics that are traditionally taught separately.

Topics are treated in 2 blocks:

(I) From Quantum to Continuum
From atoms to molecules to condensed matter: characteristic properties of simple nanosystems and how they evolve when moving towards complex ensembles.

(II) Interaction Forces on the Micro and Nano Scale
Intermolecular forces, their macroscopic manifestations, and ways to control such interactions.

Self-assembly and directed assembly of 2D and 3D structures.

The module begins with an introduction to the fundamental equations and effects of electromagnetics, mechanics, and heat transfer. After the introduction follows a detailed overview of the available numerical methods for solving electromagnetic, thermal and mechanical boundary value problems. This part of the course contains a general introduction into numerical methods, differential and integral forms, linear equation systems, Finite Difference Method (FDM), Boundary Element Method (BEM), Method of Moments (MoM), Multiple Multipole Program (MMP) and Finite Element Method (FEM). The theoretical part of the course finishes with a presentation of multiphysics simulations through several practical examples of HF-engineering such as coupled electromagnetic-mechanical and electromagnetic-thermal analysis of MEMS.

In the second part of the course the students will work in small groups on practical simulation problems. For solving practical problems the students can develop and use own simulation programs or chose an appropriate commercial field solver for their specific problem. This practical simulation work of the students is supervised by the lecturers.

Homework: Mini-Reviews
Students select a paper (list distributed in class) and expand the topic into a Mini-Review that illuminates the particular field beyond the immediate results reported in the paper.
I. THE FINITE ELEMENT METHOD

(1) Introduction, model problems.
(2) 1D problems. Piecewise polynomials in 1D.
(3) 2D problems. Triangulations. Piecewise polynomials in 2D.
(4) Variational formulations. Galerkin finite element method.
(5) Implementation aspects.

II. DIRECT SOLUTION METHODS

(6) LU and Cholesky decomposition.
(7) Sparse matrices.
(8) Fill-reducing orderings.

III. ITERATIVE SOLUTION METHODS

(9) Stationary iterative methods, preconditioning.
(10) Preconditioned conjugate gradient method (PCG).
(11) Incomplete factorization preconditioning.
(12) Multigrid preconditioning.
(13) Nonsymmetric problems (GMRES, BiCGstab).
(14) Indefinite problems (SYMMLQ, MINRES).

This lecture is independent from Rehabilitation Engineering I. Thus, both lectures can be visited in arbitrary order.

376-1279-00L Virtual Reality in Medicine W 3 credits 2V R. Riener

Data: 06.10.2017 12:53 Autumn Semester 2016 Page 302 of 1570
Abstract
Virtual Reality has the potential to support medical training and therapy. This lecture will derive the technical principles of multi-modal (audiovisual, haptic, tactile etc.) input devices, displays and rendering techniques. Examples are presented in the fields of surgical training, intra-operative augmentation, and rehabilitation. The lecture is accompanied by practical courses and excursions.

Objective
Provide theoretical and practical knowledge of new principles and applications of multi-modal simulation and interface technologies in medical education, therapy, and rehabilitation.

Content
Virtual Reality has the potential to provide descriptive and practical information for medical training and therapy while relieving the patient and/or the physician. Multi-modal interactions between the user and the virtual environment facilitate the generation of high-fidelity sensory impressions, by using not only visual and auditory modalities, but also kinesthetic, tactile, and even olfactory feedback. On the basis of the existing physiological constraints, this lecture will derive the technical requirements and principles of multi-modal input devices, displays, and rendering techniques. Several examples are presented that are currently being equipped or already applied for surgical training, intra-operative augmentation, and rehabilitation. The lecture will be accompanied by several practical courses on graphical and haptic display devices as well as excursions to facilities equipped with large-scale VR equipment.

Literature
- K. Maniura, W., J. Möller, M. Zenobi-Wong

Prerequisites / notice
The course language is English. Basic experience in Information Technology and Computer Science will be of advantage. More details will be announced in the lecture.

376-1714-00L
Biomaterials Science

Objective
The class consists of three parts:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

Content
Introduction into molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Literature
- Biocompatible Materials
- Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

376-1351-00L
Micro/Nanotechnology and Microfluidics for Biomedical Applications

Objective
This course is an introduction to techniques in micro/nanotechnology and to microfluidics. It reviews how many familiar devices are built and can be used for research and biomedical applications. Transistors for DNA sequencing, beamers for patterning proteins, hard-disk technology for biosensing and scanning microfluidics for analyzing tissue sections are just a few examples of the covered topics.

Content
The main objective of the course is to introduce micro/nanotechnology and microfluidics to students having a background in the life sciences. The course should familiarize the students with the techniques used in micro/nanotechnology and show them how micro/nanotechnology pervades throughout life sciences. Microfluidics will be emphasized due to their increasing importance in research and medical applications. The second objective is to have life science students less intimidated by micro/nanotechnology and make them able to link instruments and techniques to specific problems that they might have in their projects/studies. This will also help students getting access to the ETHZ/IBM Nanotech Center infrastructure if needed.

Literature
- Handouts provided during the classes and references therein.
- Handouts can be accessed online.
- Handouts can be accessed online.

376-1720-00L
Application of MATLAB in the Human Movement

Objective
Students will learn to import, process and graphically present experimental data using the MATLAB computing environment. Both the data and the methods of analysis will be typical for experiments in Human Movement Science (i.e. kinematics, kinetics and electromyography).

Content
Students will acquire the ability to independently load, plot, and process kinematic, kinetic and electromyographical data using the MATLAB computing environment.

Literature
- Drawbacks of Excel; Possibilities in MATLAB: Import of several data formats; Plot of one and more signals; Removing of an offset and the methods of analysis will be typical for experiments in Human Movement Science (i.e. kinematics, kinetics and electromyography).
- During the lecture, several electronically available MATLAB introductions are indicated. Course-specific scripts will be provided by the lecturer.

Prerequisites / notice
A Laptop with MATLAB installed (v2009 or higher) and wireless internet access is mandatory. Two students can share a laptop if necessary. A MATLAB student version can be obtained at Stud-IDES for free.

376-1974-00L
Colloquium in Biomechanics

Objective
Current topics in biomechanics presented by speakers from academia and industry.

Literature
- A Laptop with MATLAB installed (v2009 or higher) and wireless internet access is mandatory. Two students can share a laptop if necessary. A MATLAB student version can be obtained at Stud-IDES for free.
Within the scope of this lecture you will learn the basic principles of trauma biomechanics. Based on examples from sports, you will get to know different mechanisms that can possibly result in injury. Investigating the background and cause of injury should allow you to assess the injury risk for sports activities. Furthermore you should be able to develop measures to prevent such injury.

This lecture deals with the basic principles of injury mechanics and rehabilitation. Mechanisms that can result in injury are presented. Furthermore possibilities to prevent injuries are discussed. Thereby the lecture focusses on sports injuries.

Medical Physics I

The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

Prerequisites / notice

A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

Lecture notes

A script will be provided.

402-0341-00L

Medical Physics I

Introduction to the fundamentals of medical radiation physics. Functional chain due to radiation exposure from the primary physical effect to the radiobiologically and medically manifest secondary effects. Dosimetric concepts of radiation protection in medicine. Mode of action of radiation sources used in medicine and its illustration by means of Monte Carlo simulations.

Objective

Understanding the functional chain from primary physical effects of ionizing radiation to clinical radiation effects. Dealing with dose as a quantitative measure of the energy transferred to tissue. Getting familiar with the terminology of radiation in medicine and learn how they are applied for medical purposes. Eventually, the lecture aims to show the students that medical physics is a fascinating and evolving discipline where physics can directly be used for the benefits of patients and the society.

Content

The lecture is covering the basic principles of ionizing radiation and its physical and biological effects. The physical interactions of photons as well as of charged particles will be reviewed and their consequences for medical applications will be discussed. The concept of Monte Carlo simulation will be introduced in the exercises and will help the student to understand the characteristics of ionizing radiation in simple and complex situations. Fundamentals in dosimetry will be provided in order to understand the physical and biological effects of ionizing radiation. Deterministic as well as stochastic effects will be discussed and fundamental knowledge about radiation protection will be provided. In the second part of the lecture series, we will cover the generation of ionizing radiation. By this means, the x-ray tube, the clinical linear accelerator, and different radioactive sources in radiology, radiotherapy and nuclear medicine will be addressed. Applications in radiology, nuclear medicine and radiotherapy will be described with a special focus on the physics underlying these applications.

Physics in Medical Research: From Atoms to Cells

Scanning probe and diffraction techniques allow studying activated atomic processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

Objective

The lecture series is motivated by an overview covering the skin of the crystals, roughness analysis, contact angle measurements, protein absorption/activity and monocyte behaviour.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced.

The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the evolution of the crystal structure of the nuclei and of the other activated processes. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue's anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

Prerequisites / notice

A course work is required. The mark of this course work contributes to the final credits for this lecture. Details will be given during the first lecture.

Lecture notes

A script will be provided.

465-0953-00L

Biostatistics

The course deals with simple quantitative and graphical as well as more complex methods of biostatistics. Contents: Descriptive statistics, probability theory and design of experiments, testing hypotheses, confidence intervals, correlation, simple and multiple linear regression, classification and prediction, diagnostic tests, measurement of agreement.

Objective

Getting insight into actual areas and problems of biomechanics.
The course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on understanding the structure and function of the human body, and how these are interlinked with one another. This course introduces the visualization of anatomy supported by 3D-animation, Computed Tomography and Magnetic Resonance imaging.

Abstract: To understand basic principles and structure of the human body in consideration of the clinical relevance and the medical terminology used in medical work and research.

Content:
- The Human Body: nomenclature, orientations, tissues
- Musculoskeletal system, Muscle contraction
- Blood vessels, Heart, Circulation
- Blood, Immune system
- Respiratory system
- Acid-Base-Homeostasis

Lecture notes and handouts

Literature:
Silbernagl, S., Despopoulos A. Color Atlas of Physiology; Thieme 2008
Faller A., Schuenke M. The Human Body; Thieme 2004
Netter F. Atlas of human anatomy; Elsevier 2014

Objective: By the end of the course, students should be able to:

1. Describe the basic organization of eukaryotic cells
2. Explain molecular mechanisms and cellular functions
3. Combine textbook knowledge with recent research and technological innovations.
4. Understand basic techniques of cell and molecular biology.

After completing the course, students will gain practical exposure to basic techniques of cell and molecular biology.

The course is part I of a two-semester course.

Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. The course will be developed in a way that DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

Bioinformatics I will cover the following topics:

- From genomes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

Abstract

Objective

Overview of the most important concepts of image formation, perception and analysis, and Computer Vision. Gaining own experience through practical computer and programming exercises.

Content

The first part of the course starts off from an overview of existing and emerging applications that need computer vision. It shows that the realm of image processing is no longer restricted to the factory floor, but is entering several fields of our daily life. First it is investigated how the parameters of the electromagnetic waves are related to our perception. Also the interaction of light with matter is considered. The most important hardware components of technical vision systems, such as cameras, optical devices and illumination sources are discussed. The course then turns to the steps that are necessary to arrive at the discrete images that serve as input to algorithms. The next part describes necessary preprocessing steps of image analysis, that enhance image quality and/or detect specific features. Linear and non-linear filters are introduced for that purpose. The course will continue by analyzing procedures allowing to extract additional types of basic information about objects and scenes. Finally, approaches for the recognition of specific objects as well as object classes will be discussed and analyzed.

Lecture notes: Course material Script, computer demonstrations, exercises and problem solutions

Prerequisites / notice

Prerequisites: Basic concepts of mathematical analysis and linear algebra. The computer exercises are based on Linux and C. The course language is English.

Abstract

The lecture introduces the physical and technical know-how of X-ray tomographic microscopy. Several X-ray imaging techniques (absorption-, phase- and darkfield contrast) will be discussed and their use in daily research, in particular biology, is presented. The course discusses the aspects of quantitative evaluation of tomographic data sets like segmentation, morphometry and statistics.

Objective

Introduction to the basic concepts of X-ray tomographic imaging, image analysis and data quantification at the micro and nano scale with particular emphasis on biological applications.

Content

Synchrotron-based X-ray micro- and nano-tomography is today a powerful technique for non-destructive, high-resolution investigations of a broad range of materials. The high-brilliance and high-coherence of third generation synchrotron radiation facilities allow quantitative, three-dimensional imaging at the micro and nanometer scale and extend the traditional absorption imaging technique to edge-enhanced and phase-sensitive measurements, which are particularly suited for investigating biological samples.

The lecture includes a general introduction to the principles of tomographic imaging from image formation to image reconstruction. It provides the physical and engineering basics to understand how imaging beamlines at synchrotron facilities work, looks into the recently developed phase contrast methods, and explores the first applications of X-ray nano-tomographic experiments.

The course finally provides the necessary background to understand the quantitative evaluation of tomographic data, from basic image analysis to complex morphometrical computations and 3D visualization, keeping the focus on biomedical applications.

Lecture notes: Available online

Abstract
Many disciplines are meeting at the nanoscale, from physics, chemistry to engineering, from the life sciences to medicine. The course will prepare students to communicate more effectively across disciplinary boundaries, and will provide them with deep insights into the various frontiers.

Objective
Building upon advanced technologies to create, visualize, analyze and manipulate nano-structures, as well as to probe their nano-chemistry, nano-mechanics and other properties within mammal and living systems, many exciting discoveries are currently made. They change the way we do science and result in so many new technologies.

| 376-1714-00L | Biocompatible Materials | W    | 4    | 3G    | K. Maniura, J. Möller, M. Zenobi-Wong |

Abstract
Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

Objective
The class consists of three parts:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

Content
Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an implant material are elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

Lecture notes
Handouts can be accessed online.

As the first step, real structures on clean surfaces including surface reconstructions and surface relaxations, defects in crystals are presented, before the preparation of clean metallic, semiconducting, oxidic and organic surfaces are introduced. The atomic processes on surfaces are activated by the increase of the substrate temperature. They can be studied using scanning tunneling microscopy (STM) and atomic force microscopy (AFM). The combination with molecular beam epitaxy (MBE) allows determining the sizes of the critical nuclei and the other activated processes in a hierarchical fashion. The evolution of the surface morphology is characterized by the density and size distribution of the nanostructures that could be quantified by means of the rate equation analysis, the mean-field nucleation theory, as well as the scaling theory. The surface morphology is further characterized by defects and nanostructure's shapes, which are based on the strain relieving mechanisms and kinetic growth processes.

High-resolution electron diffraction is complementary to scanning probe techniques and provides exact mean values. Some phenomena are quantitatively described by the kinematic theory and perfectly understood by means of the Ewald construction. Other phenomena need to be described by the more complex dynamical theory. Electron diffraction is not only associated with elastic scattering but also inelastic excitation mechanisms that reflect the electronic structure of the surfaces studied. Low-energy electrons lead to phonon and high-energy electrons to plasmon excitations. Both effects are perfectly described by dipole and impact scattering.

Thin-films of rather complex organic materials are often quantitatively characterized by photons with a broad range of wavelengths from ultra-violet to infra-red light. Asymmetries and preferential orientations of the (anisotropic) molecules are verified using the optical dichroism and second harmonic generation measurements. These characterization techniques are vital for optimizing the preparation of medical implants and the determination of tissue’s anisotropies within the human body.

Cell-surface interactions are related to the cell adhesion and the contractile cellular forces. Physical means have been developed to quantify these interactions. Other physical techniques are introduced in cell biology, namely to count and sort cells, to study cell proliferation and metabolism and to determine the relation between cell morphology and function.

3D scaffolds are important for tissue augmentation and engineering. Design, preparation methods, and characterization of these highly porous 3D microstructures are also presented.

Visiting clinical research in a leading university hospital will show the usefulness of the lecture series.

**Literature**

(available online via ETH library)

Handouts provided during the classes and references therein.

---

**402-0674-00L**

**Physics in Medical Research: From Atoms to Cells**

- **Abstract**: Scanning probe and diffraction techniques allow studying activated processes during early stages of epitaxial growth. For quantitative description, rate equation analysis, mean-field nucleation and scaling theories are applied on systems ranging from simple metallic to complex organic materials. The knowledge is expanded to optical and electronic properties as well as to proteins and cells.

- **Objective**: The course deals with simple quantitative and graphical as well as more complex methods of biostatistics. Contents: Descriptive statistics, probability theory and design of experiments, testing hypotheses, confidence intervals, correlation, simple and multiple linear regression, classification and prediction, diagnostic tests, measurement of agreement.

- **Literature**: Freely accessible software tools and databases will be explained and explored in the lectures. Additional reading materials will be provided in the lectures and references therin.

- **Prerequisites / Notice**: Some of the lectures are given in the English language. Certain sections of the textbook must be studied by self-instruction.

**Introduction to Bioinformatics: Concepts and Applications**

- **Abstract**: Storage, handling and analysis of large datasets have become essential in biological research. The course will introduce students to a number of applications of bioinformatics in biology. Freely accessible software tools and databases will be explained and explored in theory and praxis.
Objective

Introduction to Bioinformatics I: Concepts and Applications (formerly Bioinformatics I) will provide students with the theoretical background of approaches to store and retrieve information from large databases. Concepts will be developed how DNA sequence information can be used to understand phylogenetic relationships, how RNA sequence relates to structure, and how protein sequence information can be used for genome annotation and to predict protein folding and structure. Students will be introduced to quantitative methods for measuring gene expression and how this information can be used to model gene networks. Methods will be discussed to construct protein interaction maps and how this information can be used to simulate dynamic molecular networks.

In addition to the theoretical background, the students will develop hands-on experiences with the bioinformatics methods through guided exercises. The course provides students from different backgrounds with basic training in bioinformatics approaches that have impact on biological, chemical and physics experimentation. Bioinformatics approaches draw significant expertise from mathematics, statistics and computational science.

Although "Introduction to Bioinformatics I" will focus on theory and praxis of bioinformatics approaches, the course provides an important foundation for the course "Introduction to Bioinformatics II: Fundamentals of computer science, modeling and algorithms" that will be offered in the following semester.

Content

Bioinformatics I will cover the following topics:

- From genes to databases and information
- BLAST searches
- Prediction of gene function and regulation
- RNA structure prediction
- Gene expression analysis using microarrays
- Protein sequence and structure databases
- WWW for bioinformatics
- Protein sequence comparisons
- Proteomics and de novo protein sequencing
- Protein structure prediction
- Cellular and protein interaction networks
- Molecular dynamics simulation

Abstract

Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

Objective

1. Insight Into The Mammalian Cell Cycle. Cycling, The Balance Between Proliferation and Cancer - Implications For Biopharmaceutical Manufacturing
2. The Licence To Kill. Apoptosis Regulatory Networks - Engineering of Survival Pathways To Increase Robustness of Production Cell Lines.
5. From Target To Market. An Antibody’s Journey From Cell Culture to The Clinics.
6. Biology and Malign Applications. Do Life Sciences Enjoy the Development of Biological Weapons?
7. Functional Food: Enjoy your Meal!

Abstract

Micro robotics is an interdisciplinary field that combines aspects of robotics, micro and nanotechnology, biomedical engineering, and materials science. The aim of this course is to expose students to fundamentals of this emerging field. Throughout the course students are expected to submit assignments. The course concludes with an end-of-semester examination.

Objective

The objective of this course is to expose students to the fundamental aspects of the emerging field of micro robotics. This includes a focus on physical laws that predominate at the microscale, technologies for fabricating small devices, bio-inspired design, and applications of the field.

Content

Main topics of the course include:
- Scaling laws at micro/nano scales
- Electrostatics
- Electromagnetism
- Low Reynolds number flows
- Observation tools
- Materials and fabrication methods
- Applications of biomedical micro robots

Lecture notes

The powerpoint slides presented in the lectures will be made available in hardcopy and as pdf files. Several readings will also be made available electronically.

Prerequisites / notice

The lecture will be taught in English.

Abstract

Introduction and analysis of medical imaging technology including X-ray procedures, computed tomography, nuclear imaging techniques using single photon and positron emission tomography, magnetic resonance imaging and ultrasound imaging techniques.

Objective

To understand the physical and technical principles underlying X-ray imaging, computed tomography, single photon and positron emission tomography, magnetic resonance imaging, ultrasound and Doppler imaging techniques. The mathematical framework is developed to describe image encoding/decoding, point-spread function/modular transfer function, signal-to-noise ratio, contrast behavior for each of the methods. Matlab exercises are used to implement and study basic concepts.
Content
- X-ray imaging
- Computed tomography
- Single photon emission tomography
- Positron emission tomography
- Magnetic resonance imaging
- Ultrasound/Doppler imaging

Literature
Webb A, Smith N.B. Introduction to Medical Imaging: Physics, Engineering and Clinical Applications; Cambridge University Press 2011

Prerequisites / notice
Analysis, Linear Algebra, Physics, Basics of Signal Theory, Basic skills in Matlab programming

Abstract
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The focus is on learning the concepts that govern common medical instruments and the most important organs from an engineering point of view. In addition, the most recent achievements and trends of the field of biomedical engineering are also outlined.

Objective
Introduction into selected topics of biomedical engineering as well as their relationship with physics and physiology. The course provides an overview of the various topics of the different tracks of the biomedical engineering master course and helps orienting the students in selecting their specialized classes and project locations.

Content

Practical and theoretical exercises in small groups in the laboratory.

Abstract
The course introduces the concepts of bioelectricity and biosensing. The sources and use of electrical fields and currents in the context of biological systems and problems are discussed. The fundamental challenges of measuring biological signals are introduced. The most important biosensing techniques and their physical concepts are introduced in a quantitative fashion.

Objective
During this course the students will:
- learn the basic concepts in biosensing and bioelectronics
- be able to solve typical problems in biosensing and bioelectronics
- learn about the remaining challenges in this field

Content
L1. Bioelectronics history, its applications and overview of the field
- Volta and Galvani dispute
- BMI, pacemaker, cochlear implant, retinal implant, limb replacement devices
- Fundamentals of biosensing
- Glucometer and ELISA

L2. Fundamentals of quantum and classical noise in measuring biological signals
L3. Biomeasurement techniques with photons
L4. Acoustics sensors
- Differential equation for quartz crystal resonance
- Acoustic sensors and their applications
L5. Engineering principles of optical probes for measuring and manipulating molecular and cellular processes
L6. Optical biosensors
- Differential equation for optical waveguides
- Optical sensors and their applications
- Plasmonic sensing
L7. Basic notions of molecular adsorption and electron transfer
- Quantum mechanics: Schrödinger equation energy levels from H atom to crystals, energy bands
- Electron transfer: Marcus theory, Gerischer theory
L8. Potentiometric sensors
- Fundamentals of the electrochemical cell at equilibrium (Nernst equation)
- Principles of operation of ion-selective electrodes
L9. Amperometric sensors and bioelectric potentials
- Fundamentals of the electrochemical cell with an applied overpotential to generate a faraday current
- Principles of operation of amperometric sensors
- Ion flow through a membrane (Fick equation, Nernst equation, Donnan equilibrium, Goldman equation)
L10. Channels, amplification, signal gating, and patch clamp Y4
L11. Action potentials and impulse propagation
L12. Functional electric stimulation and recording
- MEA and CMOS based recording
- Applying potential in liquid - simulation of fields and relevance to electric stimulation
L13. Neural networks memory and learning

| 227-0981-00L| Cross-Disciplinary Research and Development in Medicine and Engineering ■ | Lecture | 4      | 2V+2A | V. Kurtcuoglu, D. de Julien de Zelicourt, M. Meboldt, M. Schmid Daners, O. Ulrich |
| Abstract   | Cross-disciplinary collaboration between engineers and medical doctors is indispensable for innovation in health care. This course will bring together engineering students from ETH Zurich and medical students from the University of Zurich to experience the rewards and challenges of such interdisciplinary work in a project based learning environment. |
| Objective  | The main goal of this course is to demonstrate the differences in communication between the fields of medicine and engineering. Since such differences become the most evident during actual collaborative work, the course is based on a current project in physiology research that combines medicine and engineering. For the engineering students, the specific aims of the course are to: |
| Content    | - Acquire a working understanding of the anatomy and physiology of the investigated system; |
|            | - Identify the engineering challenges in the project and communicate them to the medical students; |
|            | - Develop and implement, together with the medical students, solution strategies for the identified challenges; |
|            | - Present the found solutions to a cross-disciplinary audience. |
| Lecture notes | Handouts and relevant literature will be provided. |

| 327-0505-00L| Surfaces, Interfaces and their Applications I                              | Lecture | 3      | 2V+1U | N. Spencer, M. P. Heuberger, L. Isaksson |
| Abstract   | After being introduced to the physical/chemical principles and importance of surfaces and interfaces, the student is introduced to the most important techniques that can be used to characterize surfaces. Later, liquid interfaces are treated, followed by an introduction to the fields of tribology (friction, lubrication, and wear) and corrosion. |
| Objective  | To gain an understanding of the physical and chemical principles, as well as the tools and applications of surface science, and to be able to choose appropriate surface-analytical approaches for solving problems. |
| Content    | Introduction to Surface Science |
|            | Physical Structure of Surfaces |
|            | Surface Forces (static and dynamic) |
|            | Adsorbates on Surfaces |
|            | Surface Thermodynamics and Kinetics |
|            | The Solid-Liquid Interface |
|            | Electron Spectroscopy |
|            | Vibrational Spectroscopy on Surfaces |
|            | Scanning Probe Microscopy |
|            | Introduction to Tribology |
|            | Introduction to Corrosion Science |

| 327-1101-00L| Biomineralization                                                          | Lecture | 2      | 2G    | K.H. Ernst |
| Abstract   | The course addresses undergraduate and graduate students interested in getting introduced into the basic concepts of biomineralization. |
| Objective  | The course aims to introduce the basic concepts of biomineralization and the underlying principles, such as supersaturation, nucleation and growth of minerals, the interaction of biomolecules with mineral surfaces, and cell biology of inorganic materials creation. An important part of this class is the independent study and the presentation of original literature from the field. |

Data: 06.10.2017 12:53
Autumn Semester 2016
Page 312 of 1570
Biominalization is a multidisciplinary field. Topics dealing with biology, molecular and cell biology, solid state physics, mineralogy, crystallography, organic and physical chemistry, biochemistry, dentistry, oceanography, geology, etc. are addressed. The course covers definition and general concepts of biominalization (BM)/ types of biominalers and their function / crystal nucleation and growth / biological induction of BM / control of crystal morphology, habit, shape and orientation by organisms / strategies of compartmentalization / the interface between biomolecules (peptides, polysaccharides) and the mineral phase/ modern experimental methods for studying BM phenomena / inter-, infra, extra- and epipcellular BM/ organic templates and matrices for BM / structure of bone, teeth (vertebrates and invertebrates) and mollusk shells / calcification / siliification in diatoms, radiolarias and plants / calcium and iron storage / impact of BM on lithosphere and atmosphere/ evolution / taxonomy of organisms.

1. Introduction and overview
2. Biominalers and their functions
3. Chemical control of biominalization
4. Organization of morphology: Organic templates and additives
5. Modern methods of investigation of BM
6. BM in matrices: bone and nacre
7. Vertebrate teeth
8. Invertebrate teeth
9. BM within vessels: calciate of coccoliths
10. Silica
11. Iron storage and mineralization.

Lecture notes
Script with more than 600 pages with many illustrations will be distributed free of charge.

Literature

Cell and Molecular Biology for Engineers I

Abstract

This course gives an introduction into cellular and molecular biology, specifically for students with a background in engineering. The focus will be on the basic organization of eukaryotic cells, molecular mechanisms and cellular functions. Textbook knowledge will be combined with results from recent research and technological innovations in biology.

Objective

After completing this course, engineering students will be able to apply their previous training in the quantitative and physical sciences to modern biology. Students will also learn the principles how biological models are established, and how these models can be tested.

Content

Lectures will include the following topics: DNA, chromosomes, RNA, protein, genetics, gene expression, membrane structure and function, vesicular traffic, cellular communication, energy conversion, cytokkeleton, cell cycle, cellular growth, apoptosis, autophagy, cancer, development and stem cells.

In addition, three journal clubs will be held, where one/two publications will be discussed (part I: 1 Journal club, part II: 2 Journal Clubs). For each journal club, students (alone or in groups of up to three students) have to write a summary and discussion of the publication. These written documents will be graded and count as 25% for the final grade.

Lecture notes

Scripts of all lectures will be available.

4P

Autumn Semester 2016
The 4 hour lecture covers the basics of writing & presenting a scientific text. The focus will be on the structure and elements of a scientific text and not on the language. Citation rules, good practice of scientific writing and an overview on software tools will be part of the training.

The lecture will be thought on two afternoons. Some exercises will be built into the lecture.

Knowledge on structure and content of a scientific text. The course further is arranged to stimulate a discussion on how to properly write a legible scientific text versus writing an interesting novel. We will further discuss the practice of properly citing and critically reflect on recent plagiarism allegations.

* Topic 2: Power Point Presentations.

* Topic 3: Citation Rules and Citation Software.

* Topic 4: Guidelines for Research Integrity.

ETH "Citation Etiquette", see www.plagiate.ethz.ch.

Students should already have a Bachelor degree and plan to do either a semester project or a master thesis in the immediate future.

The masters program culminates in a six months research project which adresses a scientific research questions on one's chosen area of specialization. The masters thesis is supervised by a program-affiliated faculty member and the topic must be approved by the track advisor.

Recommended GESS Science in Perspective (Type B) for

Students should already have a Bachelor degree and plan to do either a semester project or a master thesis in the immediate future.

Admission only if all of the following apply:

a. bachelor program successfully completed;

b. successful completion of the track core courses, the biology laboratory and the semester project;

c. acquired (if applicable) all credits from additional requirements for master program.

The masters program culminates in a six months research project which adresses a scientific research questions on one's chosen area of specialization. The masters thesis is supervised by a program-affiliated faculty member and the topic must be approved by the track advisor.

| 636-0005-00L | Systems Biology                                                     | W+   | 6    | 3G    | R. Paro, N. Beerenwinkel |
|              | **Abstract**                                                         |      |      |       |           |
|              | This lecture course is an introduction to systems biology. It explores how complex biological networks are experimentally studied and how the resulting data is mathematically evaluated in order to derive predictive models. The biology of selected cellular processes, ranging from protein interaction networks to gene controlling systems and signaling cascades will be discussed in detail. |
|              | **Objective**                                                       |      |      |       |           |
|              | The goal of this course is to learn how a detailed quantitative description of complex biological processes can be employed for a better understanding of molecular interactions, the power and efficiency of regulatory networks, and the evolution of biological complexity. Students will learn how to identify techniques producing quantitative data and how to develop mathematical models and efficient statistical inference algorithms to recognize patterns, molecular interrelationships and systems behavior. |
|              | **Content**                                                         |      |      |       |           |
|              | Sessions will alternate between a thorough introduction into the basic biology of defined cellular processes and a corresponding mathematical and statistical analysis of the experimental data. Selected complex biological systems and the respective experimental tools for a quantitative analysis will be presented. Examples include the identification of protein interaction networks required for specific physiological processes in yeast based on graph theoretic methods, including the identification of network motifs and the global statistical analysis of graph properties (power laws); the comparative analysis of gene expressions data from cancer and normal cells involving data normalization techniques, multiple testing procedures, clustering algorithms, Bayesian networks, and linear dynamical systems; the definition of hierarchies of kinase signaling cascades employing Bayesian networks and their causal interpretation and nested effects models for the analysis of perturbed systems; analysis of deep sequencing data derived from studies of chromatin control and gene expression. |
|              | **Topics:**                                                         |      |      |       |           |
|              | Control of Gene Expression: DNA binding proteins, gene activation in chromatin, posttranscriptional control  
- Genetic Switches: combinatorial gene control, transcriptional circuits, transcriptional noise/robustness  
- Analysis of Gene Expression Data: normalization, differential gene expression, multiple testing, PCA, clustering  
- Large-scale Genomic Profiling: mapping genomes/epigenomes, high throughput sequencing technologies  
- Analysis of Deep Sequencing Data: quality control, genome assembly, read mapping, RNA-seq, ChIP-seq  
- Biological Networks: signaling networks and protein-protein interaction networks  
- Network Biology: basic graph theory, motifs, dense subgraphs, power laws  
- Boolean Network Dynamics: Boolean algebra, Boolean networks, random Boolean networks, yeast cell cycle  
- Cellular Communication: signal transduction cascades, regulatory mechanisms.  
- Probabilistic Graphical Models: probabilities, statistical inference, Bayesian networks, nested effects models  
- Evolutionary Mechanisms: RNA world, origin of life, ribosome selection, genome evolution, SNP mapping, evolution & development  
- Genome-wide association studies |
|              | **Lecture notes**                                                   |      |      |       |           |

Abstract

Biological computers are man-made biological networks that interrogate and control biological hosts—cells and organisms—in which they operate. Their key features, inspired by computer science, are programmability, modularity and versatility. The course will show how to rationally design, implement and test biological computers using molecular engineering, DNA nanotechnology and synthetic biology.

Objective

The course has the following objectives:

* Familiarize students with parallels between theories in computer science and engineering and information-processing in live cells and organisms
* Introduce basic theories of computation
* Introduce approaches to creating novel biological computing systems in non-living environment and in living cells including bacteria, yeast and mammalian/human cells.

The covered approaches will include
- Nucleic acids engineering
- DNA and RNA nanotechnology
- Synthetic biology and gene circuit engineering
- High-throughput genome engineering and gene circuit assembly

* Equip the students with computer-aided design (CAD) tools for biocomputing circuit engineering. A number of tutorials will introduce MATLAB SimBiology toolbox for circuit design and simulations

* Foster creativity, research and communication skills through semester-long "Design challenge" assignment in the broad field of biological computing and biological circuit engineering.
Lecture 1. Introduction: what is molecular computation (part I)?

* What is computing in general?
* What is computing in the biological context (examples from development, chemotaxis and gene regulation)
* The difference between natural computing and engineered biocomputing systems

Lecture 2: What is molecular computation (part II) + State machines

1st hour

* Detailed definition of an engineered biocomputing system
* Basics of characterization
* Design challenge presentation

2nd hour

* Theories of computation: state machines (finite automata and Turing machines)

Lecture 3: Additional models of computation

* Logic circuits
* Analog circuits
* RAM machines

Basic approaches to computer science notions relevant to molecular computation. (i) State machines; (ii) Boolean networks; (iii) analog computing; (iv) distributed computing. Design Challenge presentation.

Lecture 4. Classical DNA computing

* Adleman experiment
* Maximal clique problem
* SAT problem

Lecture 5: Molecular State machines through self-assembly

* Tiling implementation of state machine
* DNA-based tiling system
* DNA/RNA origami as a spin-off of self-assembling state machines

Lecture 6: Molecular State machines that use DNA-encoded tapes

* Early theoretical work
* Tape extension system
* DNA and enzyme-based finite automata for diagnostic applications

Lecture 7: Introduction to cell-based logic and analog circuits

* Computing with (bio)chemical reaction networks
* Turing computation with ultrasensitivity and cooperativity
* Specific examples

Lecture 8: Transcriptional circuits I

* Introducing transcription-based circuits
* General features and considerations
* Guidelines for large circuit construction

Lecture 9: Transcriptional circuits II

* Large-scale distributed logic circuits in bacteria
* Toward large-scale circuits in mammalian cells

Lecture 10: RNA circuits I

* General principles of RNA-centered circuit design
* Riboswitches and sRNA regulation in bacteria
* Riboswitches in yeast and mammalian cells
* General approach to RNAi-based computing

Lecture 11: RNA circuits II

* RNAi logic circuits
* RNAi-based cell type classifiers
* Hybrid transcriptional/posttranscriptional approaches

Lecture 12: In vitro DNA-based logic circuits

* DNAzyme circuits playing tic-tac-toe against human opponents
* DNA brain

Lecture 13: Advanced topics

* Engineered cellular memory
* Counting and sequential logic
* The role of evolution
* Fail-safe design principles
Lecture notes will be available online.

As a way of general introduction, the following two review papers could be useful:

Benenson, Y. Biolcomputers: from test tubes to live cells. Molecular Biosystems 2009, 5:675:685

Prerequisites / notice

Compulsory attendance of (at least) 12 of 14 lectures. In addition, it is recommended that students take 636-0002-00 Synthetic Biology I prior to attending this course. Basic knowledge of molecular biology is assumed.

636-0013-00L Stem Cells: Biology and Therapeutic Manipulation W+ 6 credits 3G A. Teniente Schroeder

Abstract
Stem cells are central in tissue regeneration and repair, and hold great potential for therapy. We will discuss the role of stem cells in health and disease, and possibilities to manipulate their behavior for therapeutic application. Basic molecular and cell biology, engineering and novel technologies relevant for stem cell research and therapy will be discussed.

Objective
Understanding of current knowledge, and lack thereof, in stem cell biology, regenerative medicine and required technologies. Theoretical preparation for practical laboratory experimentation with stem cells.

Content
We will use different diseases to discuss how to potentially model, diagnose or heal them by stem cell based therapies. This will be used as a guiding framework to discuss relevant concepts and technologies in cell and molecular biology, engineering, imaging, bioinformatics, tissue engineering, that are required to manipulate stem cells for therapeutic application.

Topics will include:
- Embryonic and adult stem cells and their niches
- Induced stem cells by directed reprogramming
- Relevant basic cell biology and developmental biology
- Relevant molecular biology
- Cell culture systems
- Cell fates and their molecular control by transcription factors and signalling pathways
- Cell reprogramming
- Disease modelling
- Tissue engineering
- Bioimaging, Bioinformatics
- Single cell technologies

636-0018-00L Data Mining I W 6 credits 3G K. M. Borgwardt

Abstract
Data Mining, the search for statistical dependencies in large databases, is of utmost importance in modern society, in particular in biological and medical research. This course provides an introduction to the key problems, concepts, and algorithms in data mining, and the applications of data mining in computational biology.

Objective
The goal of this course is that the participants gain an understanding of data mining problems and algorithms to solve these problems, in particular in biological and medical applications.

Content
The goal of the field of data mining is to find patterns and statistical dependencies in large databases, to gain an understanding of the underlying system from which the data were obtained. In computational biology, data mining contributes to the analysis of vast experimental data generated by high-throughput technologies, and thereby enables the generation of new hypotheses.

In this course, we will present the algorithmic foundations of data mining and its applications in computational biology. The course will feature an introduction to popular data mining problems and algorithms, reaching from classification via clustering to feature selection. This course is intended for both students who are interested in applying data mining algorithms and students who would like to gain an understanding of the key algorithmic concepts in data mining.

Tentative list of topics:
1. Distance functions
2. Classification
3. Clustering
4. Feature Selection

Lecture notes
Course material will be provided in form of slides.

Prerequisites / notice
Basic understanding of mathematics, as taught in basic mathematics courses at the Bachelor's level.

636-0020-00L Microtechnology and Microelectronics W+ 6 credits 3G A. Hierlemann

Prerequisites: Physics I and Physics II highly recommended

Abstract
Students are introduced to the basics of semiconductors, microelectronics, microtechnology, and silicon process technology. They will get to know the fabrication of silicon-based microdevices and -systems by a sequence of defined batch processing steps as well as dedicated microfabrication processes.

Objective
Students are introduced to the basics of semiconductors, microelectronics, microtechnology, and silicon process technology. They will get to know the different fabrication methods for various microdevices and systems.

Content
Introduction to semiconductors, microelectronics, microtechnology, and micro electro mechanical systems (MEMS)

- Fundamentals of semiconductors
- Basics of microelectronics: transistor and diode.
- Silicon processing and fabrication steps
- Silicon crystal structure and manufacturing
- Thermal oxidation
- Doping via diffusion and ion implantation
- Photolithography
- Thin film deposition: dielectrics and metals
- Wet etching & bulk micromachining
- Dry etching & surface micromachining
- Microelectronics processing and fabrication sequence
- Packaging

Lecture notes
Handouts in English
### Electives

**The MSc Electives will be held in Zürich or Basel**

</table>
In this course students will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis. A design workshop will allow students to develop new microscale flow processes by appreciating the dominant physics at the microscale. The application of these basic ideas will primarily focus on biological problems and will include a treatment of diagnostic devices for use at the point-of-care, advanced functional material synthesis, DNA analysis, proteomics and cell-based assays. Lectures, assignments and the design workshop will acquaint students with the state-of-the-art in applied microfluidics.

### Content

Specific topics in the course include, but not limited to:

1. Theoretical Concepts
   - Features of mass and thermal transport on the microscale
   - Key scaling laws
2. Microfluidic Device Manufacture
   - Conventional lithographic processing of rigid materials
   - Soft lithographic processing of plastics and polymers
   - Mass fabrication of polymeric devices
3. Unit operations and functional components
   - Analytical separations (electrophoresis and chromatography)
   - Chemical and biological synthesis
   - Sample pre-treatment (filtration, SPE, pre-concentration)
   - Molecular detection
4. Design Workshop
   - Design of microfluidic architectures for PCR, distillation & mixing
   - Contemporary Applications in Biological Analysis
   - Microarrays
   - Cellular analyses (single cells, enzymatic assays, cell sorting)
   - Proteomics
   - System integration
   - Applications in radiochemistry, diagnostics and high-throughput experimentation

### Lecture notes

Lecture handouts, background literature, problem sheets and notes will be provided electronically.

### Literature

- **C. Halin Winter**, ***Therapeutic Proteins***
- **A. de Mello**, *Biomicrofluidic Engineering*
- **W** 3G
- **3G**
- **A. de Mello**

### Objective

In the course students will investigate the theoretical concepts behind microfluidic device operation, the methods of microfluidic device manufacture and the application of microfluidic architectures to important problems faced in modern day chemical and biological analysis.
The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments. Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic genetic biology, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data. Detailed knowledge in 1) the different areas of prokaryotic and eukaryotic glycobiology, in particular in the biosynthesis of glycoproteins and glycolipids, 2) the cellular machinery required for these pathways, 3) the principles of carbohydrate/protein interaction, 4) the function of lectins, 5) the role of glycans in infectious disease.

T. Stadler, T. Hennet

While no specific textbook will be followed, much of the material and homework problems will be taken from the following books:

* Computational Biology
  * M. Aebi, T. Hennet
  * Introduction to Glycobiology; M.E. Taylor, K. Drickamer, Oxford University Press, 2003

The course will be in English. It will include the preparation of short essays (marked) about defined topics in Glycobiology.

**Literature**

**Prerequisites / notice**

The course will involve a healthy balance between mathematical rigor (theorem proving) and biological applications. Students are expected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.

**636-0015-00L**

**Abstract**

The course will involve a healthy balance between mathematical rigor (theorem proving) and biological applications. Students are expected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.

**Objective**

The aim of the course is to introduce certain topics in Probability Theory and Stochastic Processes that have been specifically selected with an eye on biological applications. This course will teach students the tools and techniques for modeling and analyzing random phenomena. Throughout the course, several biological applications will be discussed and students will be encouraged to do additional reading based on their research interests.

**Content**

The first half of the course will cover the basics of Probability Theory while the second half will delve into the theory of Stochastic Processes. Below is the list of topics that will be covered in the course.

1. The mathematical representation of random phenomena: The probability space, properties of the probability measure, Independence of events, Conditional probability and Bayes formula, applications to parameter inference.
3. Convergence of Random Variables: Modes of convergence, Laws of large numbers, the central limit theorem, the law of the iterated logarithm. Applications to the analysis of cell population data.

**Literature**

While no specific textbook will be followed, much of the material and homework problems will be taken from the following books:

**636-0017-00L**

**Abstract**

The course will involve a healthy balance between mathematical rigor (theorem proving) and biological applications. Students are expected to have a good grasp of Linear Algebra and Multivariable Calculus. Basic knowledge of set theory will also be needed. Students should be prepared for abstract reasoning.

**Objective**

Attendees will learn which information is contained in genetic sequencing data and how to extract information from them using computational tools. The main concepts introduced are:

* stochastic models in molecular evolution
* phylogenetic & phylodynamic inference
* maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

* epidemiology
* pathogen evolution
* macroevolution of species

**Content**

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze this output (such as BLAST algorithm, GWAS approaches). Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylogeography. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

**Literature**

Further references will be provided in the course.
The students are supposed to acquire a deep understanding of the process of biological design including model representation of a biological system, its thorough analysis, and the subsequent experimental implementation of the system and the related problems. The students are expected to learn how to choose from a wide range of modelling techniques and how to apply these to further our understanding of biological processes. Mathematical techniques will be presented as part of the course, including concepts from non-linear dynamics (ODE and PDE models), stochastic techniques (SDE, Master equations, Monte Carlo simulations), and thermodynamic descriptions.

**Abstract**

The course offers insights into the basics, practical consequences and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts, molds and protozoa in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms. The focus of this first part of the lecture will be on the organisms, but also on the factors which determine spoilage and foodborne disease. The course builds on introductory courses in Computational Biology. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

**Lecture notes**

All lecture material will be made available online.

**Prerequisites / notice**

The course builds on introductory courses in Computational Biology. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

**572-4005-00L Food Microbiology I**

* For students of the study programme Biology BSc the course can only be selected as 4th course.

**Abstract**

This lecture offers insights into the basics, practical consequences and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts, molds and protozoa in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

**Objective**

The course builds on introductory courses in Computational Biology. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.

**752-4005-00L Food Microbiology I**

* For students of the study programme Biology BSc the course can only be selected as 4th course.

**Abstract**

This lecture offers insights into the basics, practical consequences and applications of Food Microbiology. Contents include basic microbiology of the different bacteria, yeasts, molds and protozoa in foods, as well as the occurrence and control of foodborne pathogens and spoilage organisms.

**Objective**

The course builds on introductory courses in Computational Biology. The course assumes no background in biology but a good foundation regarding mathematical and computational techniques.
Content

1. History of Food Microbiology
   1.1. Short synopsis of foodborne microorganisms
   1.2. Spoilage of Foods
   1.3. Foodborne Disease
   1.4. Food Preservation
   1.5. VIP's of Food Microbiology
2. Overview of Microorganisms in Foods
   2.1. Origin of foodborne Microorganisms
   2.2. Bacteria
   2.3. Yeasts
   2.4. Molds
3. Microbial Spoilage of Foods
   3.1. Intrinsic and Extrinsic Parameters
   3.2. Meats, Seafoods, Eggs
   3.3. Milk and Milk Products
   3.4. Vegetable and Fruit Products
   3.5. Miscellaneous (baked goods, nuts, spices, ready-to-eat products)
   3.6. Drinks and Canned Foods
4. Foodborne Disease
   4.1. Significance and Transmission of Foodborne pathogens
   4.2. Staphylococcus aureus
   4.3. Gram-positive Sporeformers (Bacillus & Clostridium)
   4.4. Listeria monocytogenes
   4.5. Salmonella, Shigella, Escherichia coli
   4.6. Vibrio, Yersinia, Campylobacter
   4.7. Brucella, Mycobacterium
   4.8. Parasites
   4.9. Viruses and Bacteriophages
   4.10. Mycotoxins
   4.11. Bioactive Amines
   4.12. Miscellaneous (Antibiotic-resistant Bacteria, Biofilms)

Lecture notes
Electronic copies of the presentation slides (PDF) and additional material will be made available for download.

Literature
Recommendations will be given in the first lecture

636-0021-00L Mathematical Modelling in Systems Biology
W+ 5 credits 3G D. Iber

Abstract
Basic concepts and mathematical tools to explore biochemical reaction kinetics and biological network dynamics.

Objective
The aim of the course is to provide an introductory overview of mathematical and computational methods to analyse biological network dynamics.

Content
1. Introduction to Mathematical Modeling
2. Introduction to Biochemical Reaction Modeling
3. Model Analysis: Phase Plane
4. Model Analysis: Linear Stability Analysis
5. Model Analysis: Bifurcation Analysis
6. Regulatory Feedback: Switches
7. Regulatory Feedback: Adaptation
8. Regulatory Feedback: Oscillations and Delay Equations
9. Receptor Signaling and Signaling Cascades
10. Network Properties: Sensitivity and Robustness
11. Introduction to Parameter Estimation

Lecture notes

Literature
- Keener and Sneyd, Mathematical Physiology, Springer
- Klipp et al, Systems Biology in Practice, Wiley
- Kreyszig, Engineering Mathematics, Wiley

Prerequisites / notice
Introductory courses in Mathematics (Linear Algebra, Differential Equations, Numerics) and basic concepts of programming.

Research Project

Number Title Type ECTS Hours Lecturers
636-0801-00L Research Project O 20 credits 46A Professors

Abstract
In a research project students extend their knowledge in a particular field, get acquainted with the scientific way of working, and learn to work on an actual research topic. Research projects are carried out in a core or optional subject area as chosen by the student.

Objective
Students get acquainted with scientific working methods and deepen their knowledge in a particular research area.

Master's Thesis

Number Title Type ECTS Hours Lecturers
636-0900-00L Master's Thesis O 40 credits 91D Professors

Only students who fulfill the following criteria are allowed to begin with their master thesis:
- successful completion of the bachelor programme
- successful completion of any additional requirements necessary to gain admission to the master programme.

Abstract
In the Master thesis students prove their ability to independent, structured and scientific working. The Master thesis is carried out under the supervision of a professor in a research group of the D-BSSE, usually at the D-BSSE. Students are free to choose the area.

Objective
In the Master Thesis students prove their ability to independent, structured and scientific working.

GESS Science in Perspective

Recommended GESS Science in Perspective (Type B) for D-BSSE.

Abstract
This seminar will feature invited lectures about recent advances and developments in systems biology, including topics from biology, bioengineering, and computational biology.

Objective
To provide an overview of current systems biology research.

Content
The final list of topics will be available at http://www.bsse.ethz.ch/education/.

Course Units for Additional Admission Requirements
The courses below are only available for MSc students with additional admission requirements.

<table>

</tr>
</tbody>
</table>

Abstract
Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Objective
The course aims at introducing the fundamental concepts and methods of bioinformatics. Emphasis is given to a deep understanding of the methods' foundations and limitations to enable critical evaluations and applications of bioinformatics tools in areas such as biotechnology and systems biology.

Content
From "Understanding Bioinformatics":
Chapter 4: Producing and Analyzing Sequence Alignments
Chapter 5: Pairwise Sequence Alignment and Database Searching
Chapter 6: Patterns, Profiles, and Multiple Alignments
Chapter 7: Recovering Evolutionary History
Chapter 8: Building Phylogenetic Trees
Chapter 9: Revealing Genome Features
Chapter 10: Gene Detection and Genome Annotation
Chapter 11: Obtaining Secondary Structure from Sequence
Chapter 12: Predicting Secondary Structures
Chapter 13: Modeling Protein Structure
Chapter 14: Analyzing Structure-Function Relationships

From "Biological Sequence Analysis":
Sections 3.1, 3.2, 3.3, 4.1, 4.2, 4.4, 5.2, 5.3, 5.4, 6.5 (Markov Chains and Hidden Markov Models)

From "A First Course in Systems Biology":
Chapter 1: Biological Systems

Lecture notes
Course material will be made available at: http://www.csb.ethz.ch

Literature

Prerequisites / notice
There will be two opportunities for tutorials during the semester

626-0003-AAL Molecular Biology E- 4 credits 9R R. Paro

Abstract
This lecture course gives an in-depth view into molecular mechanisms controlling basic biological processes, ranging from genetic regulatory networks, the internal functional organization of a cell to the signaling events controlling cells in their social context. An additional focus is on methods and techniques used in molecular biology to solve problems in biotechnology and medicine.

Objective
The goal is to achieve a high level knowledge of basic biological processes, to learn the methodology to tackle questions in molecular biology and to interpret experimental molecular data. Emphasis is given to cellular processes amenable to studies in systems and synthetic biology.
### Content

- **Chapter 4 DNA, Chromosomes, and Genomes**
  - p. 173-216
- **Chapter 5 DNA Replication, Repair, and Recombination**
  - p. 237-286
- **Chapter 6 How Cells Read the Genome: From DNA to Protein**
  - p. 299-362
- **Chapter 7 Control of Gene Expression**
  - p. 369-438
- **Chapter 8 Analyzing Cells, Molecules, and Systems**
  - p. 439-508
- **Chapter 9 Visualizing Cells**
  - p. 529-562
- **Chapter 10 Membrane Structure**
  - p. 565-594
- **Chapter 11 Membrane Transport of Small Molecules and the Electrical Properties of Membranes**
  - p. 597-638
- **Chapter 12 Intracellular Compartments and Protein Sorting**
  - p. 641-691
- **Chapter 13 Intracellular Membrane Traffic**
  - p. 695-750
- **Chapter 15 Cell Signaling**
  - p. 813-880
- **Chapter 17 The Cell Cycle**
  - p. 963-1018
- **Chapter 18 Cell Death**
  - p. 1021-1054
- **Chapter 20 Cancer**
  - p. 1091-1141
- **Chapter 22 Stem Cells and Tissue Renewal**
  - p. 1217-1260

### Lecture notes

Use the respective end-of-chapter problems section ("Which statements are true?") to test your knowledge and prepare for exam.

### Literature

http://www.garlandscience.com/product/isbn/9780815344322

**Book Summary**

As the amount of information in biology expands dramatically, it becomes increasingly important for textbooks to distill the vast amount of scientific knowledge into concise principles and enduring concepts. As with previous editions, Molecular Biology of the Cell, Sixth Edition accomplishes this goal with clear writing and beautiful illustrations. The Sixth Edition has been extensively revised and updated with the latest research in the field of cell biology, and it provides an exceptional framework for teaching and learning.

The entire illustration program has been greatly enhanced. Protein structures better illustrate structure-function relationships, icons are simpler and more consistent within and between chapters, and micrographs have been refreshed and updated with newer, clearer, or better images. As a new feature, each chapter now contains intriguing open-ended questions highlighting "What We Don’t Know" introducing students to challenging areas of future research. Updated end-of-chapter problems reflect new research discussed in the text, and these problems have been expanded to all chapters by adding questions on developmental biology, tissues and stem cells, pathogens, and the immune system.

### Prerequisites / notice

During the semester two half days will be offered to discuss the content and allow questions to the lecturer.

- **Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.**

- Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

Introduction into the field of microbial biotechnology, covering possible products of enzyme and fermentation technology.

**Objective**

The student should be able to identify opportunities for microbial bioprocesses and to go through basic and advanced design procedures for microbial bioprocesses.

**Content**

- Bioprocess development - An interdisciplinary challenge
- Introduction to engineering calculations
- Presentation and analysis of data
- Material balances
- Energy balances
- Unsteady-state material and energy balances
- Fluid flow
- Mixing
- Mass transfer
- Homogeneous reactions
- Heterogeneous reactions
- Reactor engineering

<td>The main goal of this course is to convey a deep understanding of the key concepts of sequential object-oriented programming and their support in different programming languages. This is achieved by studying how important challenges are addressed through language features and programming idioms. In particular, the course discusses alternative language designs by contrasting solutions in languages such as C++, C#, Eiffel, Java, Python, and Scala. The course also introduces novel ideas from research languages that may influence the design of future mainstream languages.</td>

Data: 06.10.2017 12:53  Autumn Semester 2016  Page 329 of 1570
Introduction to information retrieval with a focus on text documents and images. Main topics comprise extraction of characteristic features from documents, index structures, retrieval models, search algorithms, benchmarking, and feedback mechanisms. Searching the web, images and XML collections demonstrate recent applications of information retrieval and their implementation.

In depth understanding of managing, indexing, and retrieving documents with text, image and XML content. Knowledge about basic search algorithms on the web, benchmarking of search algorithms, and relevance feedback methods.

Objective

Students will be introduced to a variety of novel information services and architectures developed for mobile environments in order to gain insight into the requirements and processes involved in designing and developing such systems and learning to think beyond traditional information systems.

Content

In mobile devices and communication technologies have led to a rapid increase in demands for various forms of mobile information systems where the users, the applications and the databases themselves may be mobile. Based on both lectures and breakout sessions, this course examines the impact of the different forms of mobility and collaboration that systems require nowadays and how these influence the design of systems at the database, the application and the user interface level. For example, traditional data management techniques have to be adapted to meet the requirements of such systems and cope with new connection, access and synchronisation issues. As mobile devices have increasingly become integrated into the users’ lives and are expected to support a range of activities in different environments, applications should be context-aware, adapting functionality, information delivery and the user interfaces to the current environment and task. Various forms of software and hardware sensors may be used to determine the current context, raising interesting issues for discussion. Finally, user mobility, and the varying and intermittent connectivity that it implies, gives rise to new forms of dynamic collaboration that require lightweight, but flexible, mechanisms for information synchronisation and consistency maintenance. Here, the interplay of mobile, personal and social context will receive special attention.

Objective

The course examines how traditional information system architectures and technologies have been adapted to support various forms of mobile and personal information systems. Topics to be covered include: databases of mobile objects; context-aware services; opportunistic information sharing; ambient information; pervasive display systems.

Content

Randomized Algorithms and Probabilistic Methods

Randomized Algorithms are algorithms that "flip coins" to take certain decisions. This concept extends the classical model of deterministic algorithms and has become very popular and useful within the last twenty years. In many cases, randomized algorithms are faster, simpler or just more elegant than deterministic ones. In the course, we will discuss basic principles and techniques and derive from them a number of randomized methods for problems in different areas.

Lecture notes

Yes.

Literature

Objective

Advanced engineering techniques for developing secure systems. We examine concepts, methods, and tools, applied within the different activities of the SW development process to improve security of the system. Topics: security requirements & risk analysis, system modeling & model-based development methods, implementation-level security, and evaluation criteria for secure systems.

Objective

Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software.

Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include

- security requirements & risk analysis,
- system modeling and model-based development methods,
- implementation-level security, and
- evaluation criteria for the development of secure systems
Security engineering is an evolving discipline that unifies two important areas: software engineering and security. Software Engineering addresses the development and application of methods for systematically developing, operating, and maintaining, complex, high-quality software.

Security, on the other hand, is concerned with assuring and verifying properties of a system that relate to confidentiality, integrity, and availability of data.

The goal of this class is to survey engineering techniques for developing secure systems. We will examine concepts, methods, and tools that can be applied within the different activities of the software development process, in order to improve the security of the resulting systems.

Topics covered include:

- security requirements & risk analysis,
- system modeling and model-based development methods,
- implementation-level security, and
- evaluation criteria for the development of secure systems

Modules taught:

1. Introduction
   - Introduction of Infsec group and speakers
   - Security meets SW engineering: an introduction
   - The activities of SW engineering, and where security fits in
   - Overview of this class

2. Requirements Engineering: Security Requirements and some Analysis
   - overview: functional and non-functional requirements
   - use cases, misuse cases, sequence diagrams
   - safety and security
   - FMEA, FTA, attack trees

3. Modeling in the design activities
   - structure, behavior, and data flow
   - class diagrams, statecharts

4. Model-driven security for access control (design)
   - SecureUML as a language for access control
   - Combining Design Modeling Languages with SecureUML
   - Semantics, i.e., what does it all mean,
   - Generation
   - Examples and experience

5. Model-driven security (Part II)
   - Continuation of above topics

6. Security patterns (design and implementation)

7. Implementation-level security
   - Buffer overflows
   - Input checking
   - Injection attacks

8. Testing
   - overview
   - model-based testing
   - testing security properties

9. Risk analysis and management 1 (project management)
   - "risk": assets, threats, vulnerabilities, risk
   - risk assessment: quantitative and qualitative
   - safeguards
   - generic risk analysis procedure
   - The OCTAVE approach

10. Risk analysis: IT baseline protection
    - Overview
    - Example

11. Evaluation criteria
    - CMM
    - systems security engineering CMM
    - common criteria

12. Guest lecture
    - TBA

Literature

- Further relevant books and journal/conference articles will be announced in the lecture.

Abstract

Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective

Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensable to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:
- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non-parametric density estimation: Parzen windows, nearest neighbor
- Dimension reduction: principal component analysis (PCA) and beyond

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments.

No lecture notes, but slides will be made available on the course webpage.

Fundamentals of calculus and linear algebra, basic concepts of algorithms and data structures, programming skills in C++. Visual Computing course recommended. The programming assignments will be in C++. This will not be taught in the class.

Abstract
This course covers some of the fundamental concepts of computer graphics, namely 3D object representations and generation of photorealistic images from digital representations of 3D scenes.
Objective
At the end of the course the students will be able to build a rendering system. The students will study the basic principles of rendering and image synthesis. In addition, the course is intended to stimulate the students' curiosity to explore the field of computer graphics in subsequent courses or on their own.

252-0546-00L Physically-Based Simulation in Computer Graphics W 4 credits 2V+1U B. Solenthaler, B. Thomaszewski
Abstract
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.
Objective
This lecture provides an introduction to physically-based animation in computer graphics and gives an overview of fundamental methods and algorithms. The practical exercises include three assignments which are to be solved in small groups. In an additional course project, topics from the lecture will be implemented into a 3D game or a comparable application.

252-1407-00L Algorithmic Game Theory W 7 credits 3V+2U+1A P. Widmayer, P. Penna
Abstract
Game theory provides a formal model to study the behavior and interaction of self-interested users and programs in large-scale distributed computer systems without central control. The course discusses algorithmic aspects of game theory.
Objective
Learning the basic concepts of game theory and mechanism design, acquiring the computational paradigm of self-interested agents, and using these concepts in the computational and algorithmic setting.

Content
The Internet is a typical example of a large-scale distributed computer system without central control, with users that are typically only interested in their own good. For instance, they are interested in getting high bandwidth for themselves, but don't care about others, and the same is true for computational load or download rates. Game theory provides a particularly well-suited model for the behavior and interaction of such selfish users and programs. Classic game theory dates back to the 1930s and typically does not consider algorithmic aspects at all. Only a few years back, algorithms and game theory have been considered together, in an attempt to reconcile selfish behavior of independent agents with the common good.

This course discusses algorithmic aspects of game-theoretic models, with a focus on recent algorithmic and mathematical developments. Rather than giving an overview of such developments, the course aims to study selected important topics in depth.

Outline:
- Introduction to classic game-theoretic concepts.
- Existence of stable solutions (equilibria), algorithms for computing equilibria, computational complexity.
- Speed of convergence of natural game playing dynamics such as best-response dynamics or regret minimization.
- Techniques for bounding the quality-loss due to selfish behavior versus optimal outcomes under central control (a.k.a. the 'Price of Anarchy').
- Design and analysis of mechanisms that induce truthful behavior or near-optimal outcomes at equilibrium.
- Selected current research topics, such as Google's Sponsored Search Auction, the U.S. FCC Spectrum Auction, Kidney Exchange.

Lecture notes
No lecture notes.
The first part of the lecture covers individual system aspects starting with tamperproof or tamper-resistant hardware in general over operating system related security mechanisms to application software systems, such as host based intrusion detection systems. In the second part, the focus is on system design and methodologies for building secure systems.

In this lecture, students learn about the security requirements and capabilities that are expected from modern hardware, operating systems, and other software environments. An overview of available technologies, algorithms and standards is given, with which these requirements can be met.

The first part of the lecture covers individual system aspects starting with tamperproof or tamper-resistant hardware in general over operating system related security mechanisms to application software systems such as host based intrusion detection systems. The main topics covered are: tamper resistant hardware, CPU support for security, protection mechanisms in the kernel, file system security (permissions / ACLs / network filesystem issues), IP Security, mechanisms in more modern OS, such as Capabilities and Zones, Libraries and Software tools for security assurance, etc.

In the second part, the focus is on system design and methodologies for building secure systems. Topics include: patch management, common software faults (buffer overflows, etc.), writing secure software (design, architecture, QA, testing), compiler-supported security, language-supported security, logging and auditing (BSM audit, dtrace, ...), cryptographic support, and trustworthy computing (TCG, SGX).

Along the lectures, model cases will be elaborated and evaluated in the exercises.

**Literature**

- "Game Theory and Strategy", Philip D. Straffin, The Mathematical Association of America, 5th printing, 2004

**Prerequisites / notice**

Several copies of both books are available in the Computer Science library.

Audience: Although this is a Computer Science course, we encourage the participation from all students who are interested in this topic.

Requirements: You should enjoy precise mathematical reasoning. You need to have passed a course on algorithms and complexity. No knowledge of game theory is required.

This course gives an overview of database technologies and of the most important database design principles that lay the foundations of the Big Data universe. The material is organized along three axes: data in the large, data in the small, data in the very small. A broad range of aspects is covered with a focus on how they fit together in the big picture of the Big Data ecosystem.

- physical storage (HDFS, S3)
- logical storage (key-value stores, document stores, column stores, key-value stores, data warehouses)
- data formats and syntaxes (XML, JSON, CSV, XBRML)
- data shapes and models (tables, trees, graphs, cubes)
- an overview of programming languages with a focus on their type systems (SQL, XQuery, MDX)
- the most important query paradigms (selection, projection, joining, grouping, ordering, windowing)
- paradigms for parallel processing (MapReduce) and technologies (Hadoop, Spark)
- optimization techniques (functional and declarative paradigms, query plans, rewrites, indexing)
- applications.

We will also host two guest lectures to get insights from the industry: UBS and Google.

Large scale analytics and machine learning are outside of the scope of this course.

<table>

<th>Literature</th>
<th>Papers from scientific conferences and journals. References will be given as part of the course material during the semester.</th>
</tr>
</thead>
</table>

## Objective
This combination of requirements, together with the technologies that have emerged in order to address them, is typically referred to as "Big Data." This revolution has led to a completely new way to do business, e.g., develop new products and business models, but also to do science -- which is sometimes referred to as data-driven science or the "fourth paradigm".

Unfortunately, the quantity of data produced and available -- now in the Zettabyte range (that's 21 zeros) per year -- keeps growing faster than our ability to process it. Hence, new architectures and approaches for processing it were and are still needed. Harnessing them must involve a deep understanding of data not only in the large, but also in the small.

## Content
The field of databases evolves at a fast pace. In order to be prepared, to the extent possible, to the (re)volutions that will take place in the next few decades, the emphasis of the lecture will be on the paradigms and core design ideas, while today's technologies will serve as supporting illustrations thereof.

After visiting this lecture, you should have gained an overview and understanding of the Big Data landscape, which is the basis on which one can make informed decisions, i.e., pick and orchestrate the relevant technologies together for addressing each business use case efficiently and consistently.

## Literature
Papers from scientific conferences and journals. References will be given as part of the course material during the semester.

</table>
Objective

Students are aware of current threats that Internet services and networked devices face and can explain appropriate countermeasures. Students can identify and assess known vulnerabilities in a software system that is connected to the Internet. Students know fundamental network security concepts. Students have an in-depth understanding of important security technologies. Students know how to configure a real firewall and know some penetration testing tools from their own experience.

Content

Risk management and the vulnerability lifecycle of software and networked services are discussed. Threats like denial of service, spam, worms, and viruses are studied in-depth. Fundamental security related concepts like identity, availability, authentication and secure channels are introduced. State of the art technologies like secure shell, network and transport layer security, intrusion detection and prevention systems, cross-site scripting, secure implementation techniques and more for securing the Internet and web applications are presented. Several case studies illustrate the dark side of the Internet and explain how to protect against current threats. A hands-on computer lab that accompanies the lecture gives a deep dive on firewalls, penetration testing and intrusion detection. This lecture is intended for students with an interest in securing Internet services and networked devices. Students are assumed to have knowledge in networking as taught in the Communication Networks lecture.

Prerequisites / notice

Due to recent changes in the Swiss law, ETH requires each student of this course to sign a written declaration that he/she will not use the information given in this for illegal purposes. This declaration will have to be signed and submitted no later than at the beginning of the second lesson.

263-4650-00L Specification and Proof of Probabilistic Programs with W 4 credits 2V+1U A. McIver, C. C. Morgan

Objective

The course will introduce participants to semantic models for probabilistic programs. The semantics will provide the fundamental model for deriving generic properties of probabilistic systems, and as a context for proving soundness and completeness of proof techniques.

Content

Students in this course will learn new ways to specify and reason about quantitative properties of probabilistic programs. Both probabilistic programs' functional behaviour and their information-flow properties are important aspects of modern systems building, complementing existing methods of abstraction, nondeterminism and refinement. This course's objective is to give the students the necessary intellectual skills for rigorous reasoning about building such systems.

Literature

The course will follow the book "Abstraction, Refinement and Proof for Probabilistic Systems". Other material will consist of research papers which will be available in the secured area.

Prerequisites / notice

The course is intended for MSc and PhD students.

263-4655-00L Lattice Cryptography W 4 credits 2V+1U V. Lyubashevsky

Objective

The course will introduce lattice-based cryptography, which is one of the main candidates for quantum-resistant cryptography.

Content

In this course, we will study lattice-based cryptography. We will cover the basic algorithms associated with integer lattices such as Gram-Schmidt orthogonalization, algorithms for finding short and near lattice vectors, as well as the critical algorithm for sampling lattice points according to a discrete Gaussian distribution. We will then proceed to build up a toolbox of lattice-based cryptographic primitives beginning from collision-resistant hash functions, then moving on to digital signatures, encryption, identity-based encryption, and fully-homomorphic encryption. Particular emphasis will be placed on concrete parameters and practical instantiations. For this purpose, we will also study cryptographic constructions based on the hardness of ideal lattices, which are ideals of polynomial rings.

Prerequisites / notice

There are no formal mathematical pre-requisites, but students should have "mathematical maturity", which entails dealing with abstract concepts and being comfortable with doing mathematical proofs. Some previous exposure to linear algebra, abstract algebra, and cryptography would be useful.

263-5001-00L Introduction to Finite Elements and Sparse Linear System Solving W 4 credits 2V+1U P. Arbenz

Objective

Students will know the most important direct and iterative solvers for sparse linear systems. They will be able to determine which solver to choose in particular situations.
I. THE FINITE ELEMENT METHOD
   (1) Introduction, model problems.
   (2) 1D problems. Piecewise polynomials in 1D.
   (3) 2D problems. Triangulations. Piecewise polynomials in 2D.
   (4) Variational formulations. Galerkin finite element method.
   (5) Implementation aspects.

II. DIRECT SOLUTION METHODS
   (6) LU and Cholesky decomposition.
   (7) Sparse matrices.
   (8) Fill-reducing orderings.

III. ITERATIVE SOLUTION METHODS
   (9) Stationary iterative methods, preconditioning.
   (10) Preconditioned conjugate gradient method (PCG).
   (11) Incomplete factorization preconditioning.
   (12) Multigrid preconditioning.
   (13) Nonsymmetric problems (GMRES, BiCGstab).
   (14) Indefinite problems (SYMMLQ, MINRES).

Literature

Prerequisites / notice
Prerequisites: Linear Algebra, Analysis, Computational Science.
The exercises are made with Matlab.

---

Abstract
Many scientific and commercial applications require insights from massive, high-dimensional data sets. This course introduces principled, state-of-the-art techniques from statistics, algorithms and discrete and convex optimization for learning from such large data sets. The course both covers theoretical foundations and practical applications.

Objective
The course will cover theoretical foundations and practical applications.

Content
Topics covered:
- Dealing with large data (Data centers; Map-Reduce/Hadoop; Amazon Mechanical Turk)
- Fast nearest neighbor methods (Shingling, locality sensitive hashing)
- Online learning (Online optimization and regret minimization, online convex programming, applications to large-scale Support Vector Machines)
- Multi-armed bandits (exploration-exploitation tradeoffs, applications to online advertising and relevance feedback)
- Active learning (uncertainty sampling, pool-based methods, label complexity)
- Dimension reduction (random projections, nonlinear methods)
- Data streams (Sketches, coresets, applications to online clustering)
- Recommender systems

Prerequisites / notice
Prerequisites: Solid basic knowledge in statistics, algorithms and programming. Background in machine learning is helpful but not required.

---

Abstract
This course introduces core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as sensor networks, robotics, and the Internet.

Objective
How can we build systems that perform well in uncertain environments and unforeseen situations? How can we study core modeling techniques and algorithms from statistics, optimization, planning, and control and study applications in areas such as sensor networks, robotics, and the Internet. The course is designed for upper-level undergraduate and graduate students.

Content
Topics covered:
- Search (BFS, DFS, A*), constraint satisfaction and optimization
- Tutorial in logic (propositional, first-order)
- Probability
- Bayesian Networks (models, exact and approximative inference, learning) - Temporal models (Hidden Markov Models, Dynamic Bayesian Networks)
- Probabilistic palnning (MDPs, POMDPs)
- Reinforcement learning
- Combining logic and probability

Prerequisites / notice
Solid basic knowledge in statistics, algorithms and programming

---

Abstract

- Probabilistic palnning (MDPs, POMDPs)
- Reinforcement learning
- Combining logic and probability

Prerequisites / notice
Solid basic knowledge in statistics, algorithms and programming
The goal of this course is to provide students with a good understanding of computer vision and image analysis techniques. The main concepts and techniques will be studied in depth and practical algorithms and approaches will be discussed and explored through the exercises.

Objective

The objectives of this course are:
1. To introduce the fundamental problems of computer vision.
2. To introduce the main concepts and techniques used to solve these.
3. To enable participants to implement solutions for reasonably complex problems.
4. To enable participants to make sense of the computer vision literature.

Content

Camera models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition.

Prerequisites / notice

It is recommended that students have taken the Visual Computing lecture or a similar course introducing basic image processing concepts before taking this course.

Abstract

The course provides advanced knowledge in the design of complex computer systems, in particular embedded systems. Models and methods are discussed that are fundamental for systems that consist of software and hardware components. Effective computational treatments of regularity to capture real world regular or near-regular patterns in spite of uncertainty.

Objective

The course provides advanced knowledge in the design of complex computer systems, in particular embedded systems. Models and methods are discussed that are fundamental for systems that consist of software and hardware components.

Content

The course covers the following subjects: (a) Models for describing hardware and software components (specification), (b) Hardware-Software Interfaces (instruction set, hardware and software components, reconfigurable computing, heterogeneous computer architectures, System-on-Chip), (c) Application specific instruction sets, code generation and retransportable compilation, (d) Performance analysis and estimation techniques, (e) System design (hardware-software partitioning and design space exploration).

Prerequisites / notice

Prerequisites for the course is a basic knowledge in the following areas: computer architecture, digital design, software design, embedded systems.

Abstract

The course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics and more.

Objective

The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

Content

Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...),
- Basic combinatorial optimization problems (spanning trees, network flows, knapsack problem, ...),
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

Literature

Information about relevant literature will be given in the lecture.

Prerequisites / notice

This course may be attended by students who have not yet taken this course.

Abstract

The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks. We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation, (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

Literature

https://www.ethz.ch/content/specialinterest/bsse/computational-systems-biology/en/education/lectures/csb/LectureMaterial.html

Abstract

The aim of the course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data.

Computational algorithms extracting biological information from genetic sequence data are discussed, and statistical tools to understand this information in detail are introduced.

Objective

The aim of this course is to provide up-to-date knowledge on how we can study biological processes using genetic sequencing data.

Content

Computational models and calibration, invariant features, Multiple-view geometry, Model fitting, Stereo Matching, Segmentation, 2D Shape matching, Shape from Silhouettes, Optical flow, Structure from motion, Tracking, Object recognition, Object category recognition.
Attendees will learn which information is contained in genetic sequencing data and how to extract information from them using computational tools. The main concepts introduced are:

- stochastic models in molecular evolution
- phylogenetic & phylodynamic inference
- maximum likelihood and Bayesian statistics

Attendees will apply these concepts to a number of applications yielding biological insight into:

- epidemiology
- pathogen evolution
- macroevolution of species

The course consists of four parts. We first introduce modern genetic sequencing technology, and algorithms to obtain sequence alignments from the output of the sequencers. We then present methods to directly analyze this alignment (such as BLAST algorithm, GWAS approaches). Second, we introduce mechanisms and concepts of molecular evolution, i.e. we discuss how genetic sequences change over time. Third, we employ evolutionary concepts to infer ancestral relationships between organisms based on their genetic sequences, i.e. we discuss methods to infer genealogies and phylogenies. We finally introduce the field of phylodynamics. The aim of that field is to understand and quantify the population dynamic processes (such as transmission in epidemiology or speciation & extinction in macroevolution) based on a phylogeny. Throughout the class, the models and methods are illustrated on different datasets giving insight into the epidemiology and evolution of a range of infectious diseases (e.g. HIV, HCV, influenza, Ebola). Applications of the methods to the field of macroevolution provide insight into the evolution and ecology of different species clades. Students will be trained in the algorithms and their application both on paper and in silico as part of the exercises.

Slides of the lecture will be available online.

https://www.bsse.ethz.ch/cevo/education/cb-materials.html

The course is not based on any of the textbooks below, but they are excellent choices as accompanying material:

- Drummond, A. & Bouckaert, R. 2015. Bayesian evolutionary analysis with BEAST

Basic knowledge in linear algebra, analysis, and statistics will be helpful. Some programming experience will be useful for the exercises, but is not required. Programing skills will not be tested in the examination.

**263-2100-00L**  
*Research Topics in Software Engineering*  
**W** 2 credits 2S  
**P. Müller, M. Püschel**  

**Abstract**  
This seminar covers advanced topics in computer science, including both seminal research papers as well as the latest research results. Each time the course is offered, a collection of research papers are selected covering topics such as modeling, rendering, animation, real-time graphics, physical simulation, and computational photography. Each student presents one paper to the class and leads a discussion about the paper and related topics. All students read the papers and participate in the discussion.

**Objective**  
Individual research papers are selected each term. See http://graphics.ethz.ch/ for the current list.

**Content**  
The courses "Computer Graphics I and II" (GDV I & II) are recommended, but not mandatory.

**Literature**  
The publications to be presented will be announced on the seminar home page at least one week before the first session.

**Prerequisites / notice**  
- The seminar will cover a variety of machine learning models and algorithms (including deep neural networks) and will discuss their applications in a diverse set of domains. Furthermore, the seminar will discuss how domain knowledge is integrated into vanilla ML models.
- Seminars often suffer from poor attention retention and low student engagement. This is often due to the format of the seminar where only one student reads papers in-depth and then prepares a long presentation about one or sometimes several papers. There is little reason for the other students to really pay attention or engage in the discussion.
- To improve this the seminar will use a case-study format where all students read the same paper each week but fulfill different roles and hence prepare with different viewpoints in mind.
- The seminar is organized with each student taking one of the following roles on a rotating basis:
  1. Conference Reviewer (e.g., reviewer of UIST/ICML/PLDI): Complete a full critical review of the paper. Use the original review and come to a recommendation whether the paper should be accepted or not.
  2. Historian: Find out how this paper sits in the context of the related work. Use bibliography tools to find the most influential papers cited by this work and at least one paper influenced by the work (and summarize the two papers).
  3. PhD student: Propose a follow-up project for your own research based on this paper - importantly the project should be directly inspired by the paper or even use/extend the method proposed.
  4. Hacker: Implement a (simplified) version of the core aspect of the paper. Prepare a demo for the seminar. In case the complexity is too high perform an in-depth analysis of reproducibility of the paper.
  5. Detective: Find out background information about the authors. Where did they work when the paper was published; what was their role; who else have they published with; which prior work of the authors may have inspired the current paper? Students may contact the authors (but need to adhere to politeness and courteous manners and stay on topic in their conversations).
  6. All students (every week): Come up with alternative title; find a missing result that the paper should have included.

**Prerequisites / notice**  
- Participation will be limited subject to available topics.

**263-2920-00L**  
*Machine Learning for Interactive Systems and Advanced Programming Tools*  
**W** 2 credits 2S  
**O. Hilliges, M. Vechev**  

**Objective**  
The seminar covers advanced topics in computer graphics, including both seminal research papers as well as the latest research results. Each time the course is offered, a collection of research papers are selected covering topics such as modeling, rendering, animation, real-time graphics, physical simulation, and computational photography. Each student presents one paper to the class and leads a discussion about the paper and related topics. All students read the papers and participate in the discussion.

**Content**  
The objective of this seminar is to introduce students to recent research results in the area of programming languages and software engineering. To accomplish that, students will study and present research papers in the area as well as participate in paper discussions. The papers will span topics in both theory and practice, including papers on program verification, program analysis, testing, programming language design, and development tools. A particular focus will be on domain-specific languages.

**Literature**  
The publications to be presented will be announced on the seminar home page at least one week before the first session.

**Prerequisites / notice**  
- Participation will be limited subject to available topics.

**263-3504-00L**  
*Communication Networks Seminar*  
**W** 2 credits 2S  
**T. Roscoe, A. Singla**  

**Abstract**  
We will study recent advances in computer networking by reading and presenting research papers from recent iterations of the top conferences in the area, including NSDI, SIGCOMM, and CoNEXT.

**Objective**  
The objectives are (a) to understand the state-of-the-art in the field; (b) to learn to read, present and critique papers; and (c) to identify opportunities for new research.

**Prerequisites / notice**  
- Students are expected to attend the entire seminar, choose a topic for presentation from a given list, and make a presentation on that topic.
- Students are evaluated on the knowledge gained, the presentation made, and the report they present at the end of the semester.

**263-3900-00L**  
*Software Engineering Seminar*  
**W** 2 credits 2S  
**M. Püschel**  

**Abstract**  
This seminar covers advanced topics in computer science, including both seminal research papers as well as the latest research results. Each time the course is offered, a collection of research papers are selected covering topics such as modeling, rendering, animation, real-time graphics, physical simulation, and computational photography. Each student presents one paper to the class and leads a discussion about the paper and related topics. All students read the papers and participate in the discussion.

**Objective**  
Individual research papers are selected each term. See http://graphics.ethz.ch/ for the current list.

Abstract
Develop an understanding of selected topics in the area of molecular algorithms, and the practice of scient

Objective
Study and understanding of selected topics of interest in molecular algorithms such as: Computational Power of Molecular Algorithms, Molecular Algorithms for Solving Fundamental Tasks (Majority, Leader Election, Counting), Complexity Lower Bounds, Implementations of Algorithms in DNA.

Content
This seminar will familiarize the students with current research on molecular algorithms, with a focus on algorithms executable in DNA. We will have an introductory lecture covering the basics of molecular computational models, and the underlying bio-chemical phenomena. Subsequently, we will read and present selected research papers, focusing on their algorithmic content. No prior knowledge of biology or chemistry will be required.

Literature
Selected research articles.

Prerequisites / notice
The course will require a good understanding of Randomized Algorithms. Hence, you must have passed our “Randomized Algorithms” class (or have acquired equivalent knowledge, in exceptional cases). No prior knowledge of biology or chemistry will be assumed. The basics will be presented in an introductory lecture.

227-0559-00L Seminar in Distributed Computing
W 2 credits 2S R. Wattenhofer

Abstract
In this seminar participating students present and discuss recent research papers in the area of distributed computing. The seminar consists of algorithmic as well as systems papers in distributed computing theory, peer-to-peer computing, ad hoc and sensor networking, or multi-core computing.

Objective
In the last two decades, we have experienced an unprecedented growth in the area of distributed systems and networks; distributed computing now encompasses many of the activities occurring in today’s computer and communications world. This course introduces the basics of distributed computing, highlighting common themes and techniques. We study the fundamental issues underlying the design of distributed systems: communication, coordination, synchronization, uncertainty. We explore essential algorithmic ideas and lower bound techniques.

In this seminar, students present the latest work in this domain.

Seminar language: English

Content
Different each year. For details see: www.disco.ethz.ch/courses.html

Lecture notes
Slides of presentations will be made available.

Literature
Papers.
The actual paper selection can be found on www.disco.ethz.ch/courses.html.

# Dietary Etiologies of Chronic Disease

**Number** 752-6101-00L  
**Type** W  
**ECTS** 3 credits  
**Hours** 2V  
**Lecturers** M. B. Zimmermann

**Abstract**  
To have the student gain understanding of the links between the diet and the etiology and progression of chronic diseases, including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

**Objective**  
To examine and understand the protective effect of foods and food ingredients in the maintenance of health and the prevention of chronic disease, as well as the progression of complications of the chronic diseases.

**Content**  
The course evaluates food and food ingredients in relation to primary and secondary prevention of chronic diseases including diabetes, gastrointestinal diseases, kidney disease, cardiovascular disease, arthritis and food allergies.

**Lecture notes**  
There is no script. Powerpoint presentations will be made available on-line to students.

**Prerequisites / notice**  
No compulsory prerequisites, but prior completion of Human Nutrition I + II (Humanernährung I+II) is strongly advised.

---

# Nutrition and Performance

**Number** 752-6403-00L  
**Type** W  
**ECTS** 2 credits  
**Hours** 2V  
**Lecturers** S. Mettler, M. B. Zimmermann

**Abstract**  
The course introduces basic concepts of the interaction between nutrition and exercise and cognitive performance.

**Objective**  
To understand the potential effects of nutrition on exercise performance, with a focus on concepts and principles of nutrition before, during and after exercise.

**Content**  
The course will cover elementary aspects of sports nutrition physiology, including carbohydrate, glycogen, fat, protein and energy metabolism. A main focus will be to understand nutritional aspects before exercise to be prepared for intensive exercise bouts, how exercise performance can be supported by nutrition during exercise and how recovery can be assisted by nutrition after exercise. Although this is a scientific course, it is a goal of the course to translate basic sports nutrition science into practical sports nutrition examples.

**Lecture notes**  
Lecture slides and required handouts will be available on the ETH website.

**Literature**  
Information on further reading will be announced during the lecture. There will be some mandatory as well as voluntary readings.

**Prerequisites / notice**  
General knowledge about nutrition, human biology, physiology and biochemistry is a prerequisite for this course. The course builds on basic nutrition and biochemistry knowledge to address exercise and performance related aspects of nutrition.

The course is designed for 3rd year Bachelor students, Master students and postgraduate students (MAS/CAS).

**Language:** English

It is strongly recommended to attend the lectures. The lecture (including the handouts) is not designed for distance education.

---

# Selected Topics in Physiology Related to Nutrition

**Number** 752-6301-00L  
**Type** W  
**ECTS** 3 credits  
**Hours** 2V  
**Lecturers** W. Langhans

**Abstract**  
Gives the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand.

**Objective**  
Some basic knowledge in physiology is recommended for this course, which revisits important physiological topics, emphasizing their relation to nutrition. The aim is to give the students background knowledge necessary for a basic understanding of the complex relationships between food composition and nutrition on one hand and the functioning, as well as the malfunctioning, of major organ systems on the other hand. For students with a background in medicine, pharmacy or biology, the course is useful as a review of previously acquired knowledge. Major topics are basic neuroanatomy and neurophysiology; general endocrinology; the physiology of taste and smell; nutrient digestion and absorption; intermediary metabolism and energy homeostasis; and some aspects of cardiovascular physiology and water balance.

**Lecture notes**  
Handouts for each lecture will be made available every week: http://www.fpb.ethz.ch/teaching/handouts.html

|               | Institute-Seminar covering current research Topics in Physical Chemistry |      |       |       |               |

| 529-1100-00L  | Fragrance Chemistry                           | E-   | 1 credit | 1V    | P. Kraft |
|               | **Abstract**                                  |      |       |       |               |
|               | The lecture provides a journey into the molecular world of scents from the chemical secrets behind Chanel N°5 to structure-odor relationships, industrial processes, and total synthesis of terpenoids. Each subunit is centered on one odorant family and highlights a certain class of chemical reactions, illustrated by prominent perfumery examples. |      |       |       |               |
|               | **Objective**                                 |      |       |       |               |
|               | After completion of this lecture module the students know all the major perfumery materials of the important odor families with their academic and industrial syntheses, their olfactory properties, their usage, their historic perspective, and today's economic importance. The students can explain the significance of important building blocks and industrial transformations, and can estimate how attractive chemical processes are on large scale. They can retrosynthetically plan academic and industrial syntheses of fragrant compounds and terpenoids, and the acquired knowledge on structure-odor relationships enables them to predict and design new odorants. The students can approximate the conformational space of odorants and especially macrocycles on the basis of simple rules, and know how olfactophore models are used. The students understand and can explain the molecular mechanism of smell, the biosynthesis of terpenes, and the basics of perfumery composition. The latter enables them to further their education in perfumery at specialized Universities such as the ISIPCA in Versailles; yet, the student also knows about the links of Fragrance Chemistry with Pharmaceutical Chemistry and the Specialty Chemicals business in general. |      |       |       |               |
|               | **Literature**                                |      |       |       |               |

| 529-0688-00L  | Safety Lecture for Assistants                 | Z    | 0 credits |       | T. Mäder |

Introduction to Computer Science

Introduction to UNIX, data representation, introduction to C++ programming, errors, algorithms, computer architecture, sorting and searching, databases, numerical algorithms, types of algorithms, simulation, data communication & networks, chemical structures, operating systems, programming languages, software engineering.

For more information: www.csms.ethz.ch/education/infol

Discuss fundamentals of computer architecture, languages, algorithms and programming with an eye to their application in the area of chemistry, biology and material science.

Minimal introduction to UNIX, Data representation and processing, algorithms and programming in C++, Errors, programming guidelines, efficiency, computer architecture, algorithms for sorting and searching, databases, numerical algorithms, types of algorithms, simulation, data communication & networks, chemical structures, operating systems, programming languages, style, software engineering.

Available (in English), distributed at first lecture
See: www.csms.ethz.ch/education/infol

Since the exercises on the computer do convey test essentially different skills as those being conveyed during the lectures and tested at the written exam, the results of the exercises are taken into account when evaluating the results of the exam.

For more information about the lecture: www.csms.ethz.ch/education/infol

Laboratory Courses

Practical Course General Chemistry

Qualitative analysis (determination of cations and anions), acid-base-equilibria (pH-values, titrations, buffer), precipitation equilibria (gravimetry, potentiometry, conductivity), redox reactions (syntheses, redox-titrations, galvanic elements), metal complexes (syntheses, complexometric titration)

Analysis of measured values, states of aggregation (vapour pressure, conductivity, calorimetry)

Qualitative analysis (simple cation and anion separation process, determination of cations and anions), acid-base-equilibria (strengths of acids and bases, pH- and pKa-values, titrations, buffer systems, Kjeldahl determination), precipitation equilibria (gravimetry, potentiometry, conductivity), oxidation state and redox behaviour (syntheses), redox-titrations, galvanic elements), metal complexes (syntheses of complexes, ligand exchange reactions, complexometric titration)

Analysis of measured values (measuring error, average value, error analysis), states of aggregation (vapour pressure), characteristics of electrolytes (conductivity measurements), thermodynamics (calorimetry)

The general aim for the students of the practical course in general chemistry is an introduction in the scientific work and to get familiar with simple experimental procedures in a chemical laboratory. In general, first experiences with the principal reaction behaviour of a variety of different substances will be made. The chemical characteristics of these will be elucidated by a series of quantitative experiments alongside with the corresponding qualitative analyses. In order to get an overview of classes of substances as well as some general phenomena in chemistry suitable experiments have been chosen. In the second part of the practical course, i.e. physical chemistry, the behaviour of substances in their states of aggregation as well as changes of selected physical values will be recorded and discussed.

http://www.gruetzmacher.ethz.ch/education/labcourses

Compulsory: online enrolment latest one week prior start of the semester

Compulsory Subjects Examination Block I

Inorganic Chemistry I

Complexes of the transition metals: structure, bonding, spectroscopic properties, and synthesis. General synthetic strategies.

The chemical bond (overview). Symmetry and group theory. The chemical bond of coordination compounds (Valence Bond Theory, Crystal Field Theory, Molecular Orbital Theory (sigma- and pi-bonding), pi-Accepting ligands (CO, NO, olefins, dioxygen, dihydrogen, phosphines and phosphites). Electronic spectra of coordination compounds (Tanabe-Sugano diagrams). Coordination numbers and isomers in complexes. Dynamic phenomena (stereochemical nonrigidity). Complexes and kinetics.

Can be bought at the HCI-shop

Organic Chemistry I

Chemical reactivity and classes of compounds. Eliminations, fragmentations, chemistry of aldehydes and ketones (hydrates, acetals, imines, enamines, nucleophilic addition of organometallic compounds, reactions with phosphorus and sulfur ylides; reactions of enolates as nucleophiles) and of carboxylic acid derivatives. Aldol reactions.

Acquisition of a basic repertoire of synthetic methods including important reactions of aldehydes, ketones, carboxylic acids and carboxylic acid derivatives, as well as eliminations and fragmentations. Particular emphasis is placed on the understanding of reaction mechanisms and the correlation between structure and reactivity. A deeper understanding of the concepts presented during the lecture is reached by solving the problems handed out each time and discussed one week later in the exercise class.

Chemical reactivity and classes of compounds. Eliminations, fragmentations, chemistry of aldehydes and ketones (hydrates, acetals, imines, enamines, nucleophilic addition of organometallic compounds, reactions with phosphorus and sulfur ylides; reactions of enolates as nucleophiles) and of carboxylic acid derivatives. Aldol reactions.

A pdf file of the printed lecture notes is provided online. Supplementary material may be provided online.

No set textbooks. Optional literature will be proposed at the beginning of the class and in the lecture notes.

Physical Chemistry II: Introduction to Chemical

A fundamentals of physical chemistry suitable experiments have been chosen. In the second part of the practical course, i.e. physical chemistry, the behaviour of substances in their states of aggregation as well as changes of selected physical values will be recorded and discussed.

Introduction to the binding theory in complexes of the transition metals. Interpretation of structure, bonding, and spectroscopic properties.

Reaction Kinetics

Abstract

Objective
Introduction to Chemical Reaction Kinetics

Content
Fundamental concepts: rate laws, elementary reactions and composite reactions, molecularity, reaction order. Experimental methods in reaction kinetics up to new developments in femtosecond kinetics. Simple chemical reaction rate theories: temperature dependence of the rate constant and Arrhenius equation, collision theory, reaction cross-section, transition state theory. Reaction mechanisms and complex kinetic systems, approximation techniques, chain reactions, explosions and detonations. Homogeneous catalysis and enzyme kinetics.

Lecture notes

Literature

Prerequisites / notice
- Mathematik I und II
- Allgemeine Chemie I und II
- Physikalische Chemie I

402-0043-00L (Physics I) O 4 credits 3V+1U T. Esslinger

Abstract
Introduction to the concepts and tools in physics with the help of demonstration experiments: mechanics of point-like and ridged bodies, periodic motion and mechanical waves.

Objective
The concepts and tools in physics, as well as the methods of an experimental science are taught. The student should learn to identify, communicate and solve physical problems in his/her own field of science.

Content
Mechanics (motion, Newton's laws, work and energy, conservation of momentum, rotation, gravitation, fluids)
Periodic Motion and Waves (periodic motion, mechanical waves, acoustics)

Lecture notes
The lecture follows the book "Physics" by Paul A. Tipler.

Literature
Paul A. Tipler and Gene P. Mosca, Physics (for Scientists and Engineers), W. H. Freeman and Company

Prerequisites / notice
- Mathematics I & II

529-0051-00L (Analytical Chemistry I) O 3 credits 3G D. Günther, M.O. Ebert, R. Zenobi

Abstract
Introduction into the most important spectroscopical methods and their applications to gain structural information.

Objective
Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications

Content
Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:
- Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.

Lecture notes
Script will be for the production price

Literature
- M. Hesse, H. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5. überarbeitete Auflage, Thieme, Stuttgart, 1995

Prerequisites / notice
Excercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounts" (4th semester) is recommended.

401-0373-00L (Mathematics III: Partial Differential Equations) O 4 credits 2V+1U F. Da Lio

Abstract

Objective
The main objective is that the students get a basic knowledge of the classical tools to solve explicitly linear partial differential equations.
## Examples of partial differential equations
- Classification of PDEs
- Superposition principle

## One-dimensional wave equation
- D'Alembert's formula
- Duhamel's principle

## Fourier series
- Representation of piecewise continuous functions via Fourier series
- Examples and applications

## Separation of variables
- Resolution of wave and heat equation
- Homogeneous and inhomogeneous boundary conditions, Dirichlet and Neumann boundary conditions

## Fourier transform
- Derivation and Definition
- Inverse Fourier transformation and inversion formula
- Interpretation and properties of the Fourier transform
- Resolution of the heat equation

## Laplace transform
- Definition, motivation and properties
- Inverse Laplace transform of rational functions
- Application to ordinary differential equations

Lecture notes
There are available some Lecture Notes in English and also in German of the Professor. These can be found following the links provided under the tab 'Lernmaterialien'.

Literature
2) Y. Pinchover and J. Rubinstein, An Introduction to Partial Differential Equations, Cambridge University Press
3) E. Kreyszig, Advanced Engineering Mathematics, John Wiley & Sons (only Chapters 1,2,6,11)

Prerequisites / notice
It is required a minimal background of: 1) multivariables functions (Riemann integrals in two or three variables, change of variables in the integrals through the Jacobian, partial derivatives, differentiability, Jacobian) 2) numerical and functional sequences and series, basic knowledge of ordinary differential equations.

</tr>
</tbody>
</table>

**Abstract**
The course gives an introduction to magnetic resonance spectroscopy (NMR and EPR) in liquid, liquid crystalline and solid phase. It starts from a classical description in the framework of the Bloch equations. The implications of chemical exchange are studied and two-dimensional exchange spectroscopy is introduced. An introduction to Fourier spectroscopy in one and two dimensions is given and simple 'pulse trickery' is described. A quantum-mechanical description of magnetic resonance experiments is introduced and the spin Hamiltonian is derived. The chemical shift term as well as the scalar, dipolar and quadrupolar terms are discussed. The product-operator formalism is introduced and various experiments are described, e.g. polarization transfer. Applications in chemistry, biology, physics and medicine, e.g. determination of 3D molecular structure of dissolved molecules, determination of the structure of paramagnetic compounds and imaging (MRI) are presented.

**Lecture notes**
Detailed documentation to each experiment will be handed out in the lecture (in English)

**Literature**

**Prerequisites / notice**
Praktikum Physikalische und Analytische Chemie (529-0054-00) or Praktikum Physikalisiche Chemie (529-0054-01).

**Abstract**
Laboratory experiments to acquire a profound knowledge of spectroscopical methods and techniques in chemistry. Evaluation and visualization of measurement data. Writing lab reports.

**Objective**
Laboratory experiments to acquire a profound knowledge of spectroscopical methods and techniques in chemistry. Evaluation and visualization of measurement data. Writing lab reports.

**Content**
Laboratory experiments: UV/VIS spectroscopy, luminescence spectroscopy, FT infrared spectroscopy, dye laser, light diffraction and refraction, laser ablation inductively coupled plasma mass spectrometry (LA-ICP-MS), FT nuclear magnetic resonance spectroscopy (NMR), electron paramagnetic resonance spectroscopy (EPR), atomic force microscopy (AFM), Fourier transform methods.

**Lecture notes**
Detailed documentation to each experiment will be handed out.

**Literature**
see http://www.ssnmr.ethz.ch/education/PC_IV_Lecture

### Analytical Chemistry

#### 529-0041-00L

**Modern Mass Spectrometry, Hyphenated Methods, and Chemometrics**

</tbody>
</table>

**Abstract**
Modern mass spectrometry, hyphenated analytical methods, speciation, methods of surface analysis, chemometrics.

**Objective**
Comprehensive knowledge about the analytical methods introduced in this course, and their applications.

**Content**
Coupling of separation with identification methods such as GC-MS, LC-MS, GC-IR, LC-IR, LC-NMR etc.; importance of speciation. Modern mass spectrometry: Time of flight and ion cyclotron resonance mass spectrometry, ICP-MS. Soft ionization methods, desorption methods, spray methods. Methods of surface analysis (ESCA, Auger, SIMS, raster microscopy methods). Employment of computer science for processing data in chemical analysis (chemometrics).

**Lecture notes**
Lecture notes will be available in the lecture at production cost.

**Literature**
Information about relevant literature will be available in the lecture & in the lecture notes.
### Biological Chemistry

</tbody>
</table>

**Abstract**
An introduction to the principles of X-ray diffraction and crystal structure determination as it relates to Chemistry

**Objective**
To gain an understanding of the principles of crystal structure determination by X-ray diffraction.

**Content**
Basic crystallographic concepts: Unit cells, Bravais lattices, Laue symmetry, crystal classes (point groups), space groups, crystal growth, instrumentation, diffraction of X-rays by crystals; physical and geometric basics, powder and single crystal methods, structure solution and modelling, interpretation of crystal structure data; internal coordinates for structure description: atom spacing, co-ordination polyhedra, bond angles, torsion angles; intermolecular interactions, absolute configuration determination. Overview of inorganic, organic and macromolecular databases.

**Literature**
The script and exercises will be distributed weekly in loose form

Content

Part I: Fate of Chemicals in the Environment:
Relevant environmental compartments and how chemicals reach the environment.
Overview on partitioning and transformation processes of chemicals in the environment.
Partitioning in the environment:
  - Meaning of vapor pressure, water solubility and air-water partition coefficient for environmental behavior
  - Octanol-water partition coefficient as surrogate for partitioning into biological systems
  - Influence of temperature and pH on partitioning
  - Global distribution of semi-volatile chemicals
  - Molecular interactions that govern partitioning
  - Sorption to natural surfaces, partitioning into natural organic matter
Chemical and photochemical transformation reactions
  - Microbial transformation processes in the environment

Part II: Effects of chemicals in the environment
Biological test systems for assessing ecotoxicological effects
Endpoints of toxicity assessment:
  - Acute and chronic toxicity, effects on reproduction
  - Dose-response modeling
Bioavailability and bioaccumulation:
  - Biomagnification, food chain accumulation
  - Active and passive uptake mechanisms
Toxicokinetics and toxicodynamics:
  - Metabolism and transformation reactions of pollutants in organisms, phase I and II transformations
  - Detoxification, active excretion
Molecular mechanisms of toxicity in cells:
  - Baseline toxicity
  - Specific toxicity (Examples: Inhibition of photosynthesis, neurotoxicity, including AchEsterase, ion channels etc.)
  - Oxidative stress
  - Genotoxicity

Part III: Specific aspects of trace analysis in the environment (soil, water, air)
Planning of analytical strategy and sampling
Enrichment procedures
Separation and detection
Quantification, screening for unknowns

Lecture notes
Copies of the slides and some articles are distributed

Literature

701-1233-00L  Stratospheric Chemistry  W  4 credits  2V+1U  T. Peter, A. Stenke
Abstract

Objective
The lecture gives an overview on the manifold reactions which occur in the gas phase, in stratospheric aerosol droplets and in polar cloud particles. The focus is on the chemistry of stratospheric ozone and its influence through natural and anthropogenic effects. Especially the intercontinental air traffic and the ozone depletion caused by FCKW CFC in the mid-latitudes and the polar regions as well as coupling with the greenhouse effect.

Content
Short presentation of thermodynamical and kinetic basics of chemical reactions: bi- and terthermo molecular reactions, photo-dissociation. Introduction to the chemical family concept: active species, their source gases and reservoir gases. Detailed treatment of the pure oxygen family (odd oxygen) according to the Chapman chemistry. Radical reactions of the oxygen species with nitric oxide, active halogens (chlorine and bromine) and odd hydrogen. Ozone depletion cycles. Methane depletion and ozone production in the lower stratosphere (photo-smog reactions). Heterogeneous chemistry on the background aerosol and its significance for heavy air traffic. Chemistry and dynamics of the ozone hole: Formation of polar stratospheric clouds and chloride activation.

Lecture notes
Documents are provided in the contact hours.

Literature

Prerequisites / notice
Prerequisites: Basics in physical chemistry are required and an overview equivalent to the bachelor course in atmospheric chemistry (lecture 701-0471-01) is expected.

**Abstract**

This course unit can only be enrolled after successful participation in, or during enrollment in the course "Human Learning (EW 1)".

**Objective**

- Get to know cognitively activating instructions in MINT subjects
- Get information about recent literature on learning and instruction

**Prerequisites / notice**

Für eine reibungsfreie Semesterplanung wird um frühe Anmeldung und persönliches Erscheinen zum ersten Lehrveranstaltungstermin ersucht.

**Abstract**

This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

**Objective**

- Understanding findings relevant for education
- Getting to know intelligence tests
- Understanding findings relevant for education
- Understanding research methods used in the empirical human sciences

**Abstract**

This seminar focuses on teaching units in chemistry, physics and mathematics that have been developed at the MINT Learning Center of the ETH Zurich. In the first meeting, the mission of the MINT Learning Center will be communicated. Furthermore, in groups of two, the students will intensively work on, refine and optimize a teaching unit following a goal set in advance.

**Objective**

- Understanding research methods used in the empirical educational sciences
- Understanding and critically examine information from scientific journals and media
- Understanding pedagogically relevant findings from the empirical educational sciences
Abstract
In their mentored work on subject didactics, students put into practice the contents of the subject-didactics lectures and go into these in greater depth. Under supervision, they compile tuition materials that are conducive to learning and/or analyse and reflect on certain topics from a subject-based and pedagogical angle.

Objective
The objective is for the students:
- to be able to familiarise themselves with a tuition topic by consulting different sources, acquiring materials and reflecting on the relevance of the topic and the access they have selected to this topic from a specialist, subject-didactics and pedagogical angle and potentially from a social angle too.
- to show that they can independently compile a tuition sequence that is conducive to learning and develop this to the point where it is ready for use.

Content
Thematic Schwerpunkte
Die Gegenstände der mentorierten Arbeit in Fachdidaktik stammen in der Regel aus dem gymnasialen Unterricht.

Lernformen

Lecture notes
Eine kurze Anleitung zur mentorierten Arbeit in Fachdidaktik wird zur Verfügung gestellt.

Literature
Die Literatur ist themenspezifisch. Die Studierenden beschaffen sie sich in der Regel selber (siehe Lernziele). In besonderen Fällen wird sie vom Betreuer zur Verfügung gestellt.

Prerequisites / notice
Die Arbeit sollte vor Beginn des Praktikums abgeschlossen werden.

Subject Didactics Chemistry I
Simultaneous enrolment in Introductory Internship Chemistry - course 529-0966-00L - is compulsory.

Implementation of findings from research into teaching and learning for chemistry lessons and coverage of subject-specific teaching and learning specialities.

Among other things, students are put in a position where they can
- divide up the subject matter into contents that can be learned by heart or accessed intellectually, and communicate these contents.
- break down technically complex contents to the right level for a class and still present these in a stringent, error-free manner in their simplified form.
- establish which subject matter can be presented with which teaching techniques and methods that have been recognised as efficient in teaching terms, and adapt these tools to the learning content in question.
- plan school experiments, incorporate them in lessons, perform them in accordance with all the rules of the art, and also evaluate them in a beneficial manner.
- assess pupils' prior knowledge, clarify it in greater detail and take it into account for planning lessons.
- design a sequential curriculum suitable for the levels in question and put it into practice.
- reliably identify stumbling blocks in the contents and get round these.

Schwerpunkte im ersten Studiensemester bilden die folgenden Themen:

- Auswahl gymnasiumsrelevanter Lerninhalte
- Modellbegriff in den Naturwissenschaften, insbesondere der Chemie
- Sprache und Fachsprache im Chemieunterricht
- Wechselwirkungen zwischen Beobachtungen in der realen Welt und Deutungsversuchen auf der Modell-Ebene
- Interdisziplinarität mit Biologie, Mathematik und Physik
- Leistungserhebung und -beurteilung im Theorie- und Laborunterricht
- Atommodelle und chemische Bindung
- Mathematische Beschreibung chemischer Systeme (z.B. Stöchiometrie und Gleichgewichtssysteme)
- Auswahl, Konzeption, Einbettung, Vorbereitung, Durchführung, Nachbereitung und Auswertung von Demonstrations- und Schüler-Experimenten

O Wird von der Praktikumslehrperson bestimmt. Schwerpunkte im ersten Studiensemester bilden die folgenden Themen:

- Students use their specialist-subject, educational-science and subject-didactics training to draw up concepts for teaching.
- Hours
- ECTS
- Right at the start of their training, students acquire initial experience with the observation of teaching, the establishment of concepts for teaching and the implementation of teaching. This early confrontation with the complexity of everything that teaching involves helps students decide whether they wish to and, indeed, ought to, continue with the training. It forms a basis for the subsequent pedagogical and subject-didactics training.
- Objective
- The teaching practice takes in 50 lessons: 30 are taught by the students, and the students sit in on 20 lessons. The teaching practice lasts 4-6 weeks. It gives students the opportunity to implement the contents of their specialist-subject, educational science and subject-didactics training in the classroom. Students also conduct work assignments in parallel to their teaching practice.
- Content
- The Didierenden sammeln Erfahrungen in der Unterrichtsführung, der Auseinandersetzung mit Lernenden, der Klassenbetreuung und der schulischen Alltag erhält und die vielfältigen Verpflichtungen einer Lehrperson kennen lernt.
- Literature
- Wird von der Praktikumslehrperson bestimmt.

Vor- und Nachbesprechungen durch.

Anleitungen abgegeben.

- Einhaltung aller einschlägigen Sicherheitsbestimmungen.
- Befähigung zu eindrücklichem Experimentieren.
- Aufbau einer persönlichen Experimente-Bibliothek.
- Sensibilisierung für die Wichtigkeit des Experiments im Chemie-Unterricht.
- Leistungserhebung und -beurteilung im Experimentalunterricht.
- Evaluate experiments together with the pupils
- accompany pupils' experiments from the content, pedagogical and safety angles
- perform demonstration experiments in a technically correct and safe manner
- develop experiments of their own
- adapt experiments described in the literature to their own teaching situation
- develop experiments of their own
- plan and implement the incorporation of experiments in their tuition
- apprecitate whether experiments would make sense, or are even indispensable

- Prerequisites / notice
- This course unit introduces students to the technique of conducting experiments in chemistry lessons. It covers didactic, technical, safety-related and presentation aspects.
- Objective
- Amongst other things, students are put in a position to
- Theorettische Einführung.
- Merkpunkte für das sichere Experimentieren.
- Erstellen und Überarbeiten von Experimentiervorschriften.
- Vorführungen von Experimenten.
- Experimentierkurs mit praktischen Übungen für die Studierenden.
- Leistungserhebung und -beurteilung im Experimentalunterricht.
- Sensibilisierung für die Wichtigkeit des Experiments im Chemie-Unterricht.
- Aufbau einer persönlichen Experimente-Bibliothek.
- Befähigung zu eindrücklichem Experimentieren.
- Einhaltung aller einschlägigen Sicherheitsbestimmungen.

- Notice
- Findet in der Regel am Schluss der Ausbildung, vor Ablegung der Prüfungslektionen statt.
529-0968-01L Examination Lesson I Chemistry ■ O 1 credit 2P A. Baertsch
Will mark the conclusion of the teacher training program in Chemistry.

Abstract
In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

Objective
- to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
- to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Content

529-0968-02L Examination Lesson II Chemistry ■ O 1 credit 2P A. Baertsch
Will mark the conclusion of the teacher training program in Chemistry.

Abstract
In the context of an examination lesson conducted and graded at a high school, the candidates provide evidence of the subject-matter-based and didactic skills they have acquired in the course of their training.

Objective
- On the basis of a specified topic, the candidate shows that they are in a position
  - to develop and conduct teaching that is conducive to learning at high school level, substantiating it in terms of the subject-matter and from the didactic angle
  - to analyze the tuition they have given with regard to its strengths and weaknesses, and outline improvements.

Abstract
Selected topics in general chemistry:
1) The language of chemistry
2) Chirality and stereochemistry
3) Oxidation of water
4) Chemistry of the atmosphere

Objective
In this course, participants acquire extended and more in-depth knowledge of selected chemistry topics. The selection is based to a large extent on the partial aspects of chemistry that are typically taught at high school. By gaining a broader understanding, teachers are put in a position where they can comprehend the topics that are to be taught in a wider and, to some extent, unconventional context and critically process these in respect of their teachability and learnability. At the same time, interrelationships between the classical sub-disciplines of chemistry are highlighted, along with the unique features of chemistry as one of the central natural sciences.

Content
Content of the four modules:
1) The language of chemistry: Concepts, formulas, aesthetics, and philosophical aspects
2) Chirality and stereochemistry: Selected aspects, origin of biomolecular chirality, inorganic chemistry
3) Cosmochemistry
4) Chemistry of the atmosphere

Lecture notes
Foliend und ausgewählte Literatur werden zur Verfügung gestellt.

Literature
Ausgewählte Artikel aus der Primärliteratur werden vorgestellt, kommentiert und zur Lektüre empfohlen.

Prerequisites / notice
- FV A (gelesen im Frühjahrsemester) und FV B (gelesen im Herbstsemester) bauen nicht aufeinander. Die Reihenfolge der Belegung ist somit indifferent.
Subject with an Educational Focus Chemistry B

Abstract
In the mentored work on their subject specialisation, students link high-school and university aspects of the subject, thus strengthening their teaching competence with regard to curriculum decisions and the future development of the tuition. They compile texts under supervision that are directly comprehensible to the targeted readers - generally specialist-subject teachers at high-school level.

Objective
- The aim is for the students
- to familiarise themselves with a new topic by obtaining material and studying the sources, so that they can selectively extend their specialist competence in this way.
- to independently develop a text on the topic, with special focus on its mathematical comprehensibility in respect of the level of knowledge of the targeted readership.
- To try out different options for specialist further training in their profession.

Abstract
1. Introduction: What are Inorganic Polymers
2. Polyphosphazenes
3. Polyoxides
4. Organometallic Polymers
5. Dendritic Molecules
6. Introduction to Inorganic Materials

Objective
Understanding of the current literature in the field of inorganic polymers and materials.

Lecture notes
A manuscript will be distributed to the participants of the course.

Literature
Script and recent original literature indicated in the course.

Prerequisites / notice
Basis for the understanding of this lecture are the courses Allgemeine Chemie I & II, Anorganische Chemie I: Übergangsmetallchemie (Dozent Mezzetti).

Abstract
Advanced Modern Methods and Strategies in Synthesis

Objective
Knowledge of modern methods in asymmetric stereocontrol, enantioselective catalysis, and organic reaction mechanisms.

Content
Current trends in methods for and approaches to synthesis of complex natural products, pharmaceuticals, and biological molecules; fragment coupling and protecting group strategies; chemical ligation and biomolecules synthesis; enantioselective catalysis including ligand design and optimization; crossed coupling reactions from preactivated precursors; C-H activation and oxidation chemistry; building block synthesis with chiral auxiliaries and reagents; new concepts in asymmetric catalysis. Analysis of key primary literature including identification of trends, key precedents, and emerging topics will be emphasized.

Lecture notes
will be provided in class and online

Abstract
The course is for advanced students and covers selected topics from magnetic resonance spectroscopy. This year, the lecture will introduce and discuss relaxation theory and its applications in magnetic resonance.

Objective
The aim of the course is to familiarize the students with the basic concepts of magnetic resonance relaxation theory in liquids and solids. Starting from the mathematical description of spin dynamics, the effect of stochastic motional processes on the density operator will be analyzed. In the end students should understand the Redfield formulation of relaxation and be able to understand the effect of dynamics on magnetic resonance experiments.

Content
The aim of the course is to familiarize the students with the basic concepts of magnetic resonance relaxation theory in liquids and solids. Starting from the mathematical description of spin dynamics, the effect of stochastic motional processes on the density operator will be analyzed. In the end students should understand the Redfield formulation of relaxation and be able to understand the effect of dynamics on magnetic resonance experiments.

Lecture notes
A script which covers the topics will be distributed in the lecture and will be accessible through the web page http://www.ssnmr.ethz.ch/education/
This course provides an introduction to the interaction of light with nano- and microparticles followed by an overview of applications of current interest. Examples range from nanoparticles for medical applications and sensing to the role of the interaction of solar radiation with aerosol particles and cloud droplets for the climate.

The students will be introduced to the basic concepts of the interaction of light with nano- and microparticles. The combination of basic concepts with different applications will enable students to apply their knowledge to new problems in various fields where nanoscale objects play a role.

Light interacts surprisingly differently with small particles than with bulk or with gas phase materials. The first part of the course provides a basic but rigorous introduction into the interaction of light with nano- and microparticles. The emphasis is on the classical treatment of absorption and scattering of light by small particles. The strengths and limits of this conventional approach will be discussed. The second part of the course is devoted to a broad range of applications. Here topics include: Plasmon resonances in metallic systems, metal- dielectric nanoparticles for medical applications, the use of lasers for optical trapping and characterization of single particles, vibrational excitons in dielectric nanoparticles, interaction of light with aerosol particles and cloud droplets for remote sensing applications and climate predictions, characterization of ultrafine aerosol particles by photomission using velocity mapping imaging.

Applications: References will be provided during the course.

**Abstract**

Advanced organic physical chemistry. Methods for the elucidation of reaction mechanisms. Reactive intermediates. Thermochemistry; isotope labeling; cross-over experiments; kinetic isotope effects; thermodynamics-kinetics correlations; solvation and ion pairs; radical reactions; electron transfer; spectroscopic methods.

**Objective**

Methods for the elucidation of organic reaction mechanisms.

**Content**

**Lecture notes**

A printed script are handed out in the course. This material is also available for download from the web page of the course (as pdf files).

**Literature**

Required reading and original publications are cited in the lectures.

**Prerequisites / notice**

Required level: Courses in organic and physical chemistry of the first and second year. Each participant is expected to contribute to a 30 min. seminar (prepared by groups of 2-4 students), presented in the last weeks of the semester.

Advanced Optics and Spectroscopy

This course provides an introduction to the interaction of light with nano- and microparticles followed by an overview of applications of current interest. Examples range from nanoparticles for medical applications and sensing to the role of the interaction of solar radiation with aerosol particles and cloud droplets for the climate.

Content
Light interacts surprisingly differently with small particles than with bulk or with gas phase materials. The first part of the course provides a basic but rigorous introduction into the interaction of light with nano- and microparticles. The combination of basic concepts with different applications will enable students to apply their knowledge to new problems in various fields where nanoscale objects play a role.

Lecture notes
Copies of problem sets and solutions will be distributed free of charge

Analytical Strategy

Problem-oriented development of analytical strategies and solutions.

Objective
Ability to create solutions for particular analytical problems.

Content
Individual development of strategies for the optimal application of chemical, biochemical, and physico-chemical methods in analytical chemistry solving predefined problems. Experts from industry and administration present particular problems in their field of activity.

Principles of sampling.
Design and application of microanalytical systems.

Lecture notes
Copies of problem sets and solutions will be distributed free of charge

Analytical Methods for Characterization of Nanoparticles and Nanomaterials

Introduction to modern analytical methods used to fully characterize and identify nano-engineered materials and systems.

Objective
Understanding of analytical concepts used in nanotechnology, In-depth knowledge of most important methods used in industry and research. Introduction to selected industrial applications, Basic knowledge of production mechanisms of nano-engineered materials.

Content
Nanotechnology is the basis of many main technological innovations of the 21st century. After more than twenty years of research, nanotechnologies are now increasingly employed for commercial use: they are used in hundreds of everyday consumer products, such as cosmetics, food, automotive, electronics and medical products. Nanoparticles can contribute to stronger, lighter, cleaner, smarter, better, etc. products.

Besides these positive effects, relatively little is still known about potential health and environmental effects and risks of such small nano-sized particles. Therefore, a lot of different industry customers are forced nowadays to monitor and regulate the size and concentration of nanoparticles in their nano-enabled products.

Above and beyond these regulatory requirements, most industries employing nanoparticles need to be able to online measure nanoparticles to meet their requirements towards quality control and production efficiency. All these requirements demand new precise, accurate, fast and innovative analysis methods to fully characterize nanoparticles in real-time and during the manufacturing process.

Lecture notes
Lecture notes will be provided

Enzymes

Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Objective
Overview of enzymes, enzyme-catalyzed reactions and metabolic processes.

Content
Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Lecture notes
A script will not be handed out.
To gain a deeper understanding of crystal structure determination principles and practice by X-ray diffraction and the evaluation of results. Handouts, selected original literature, problem sets, and other materials will be provided electronically.

Lecturers

Handouts, selected original literature, problem sets, and other materials will be provided electronically.

### Chemical Aspects of Energy

Abstract
Scenarios for world energy demand and CO2 emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry). Wind and ocean energy, heat pumps, geothermal energy, energy from waste. CO2 sequestration.

Objective
Scenarios for the development of world primary energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO2 emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

Content

Lecture notes
Lecture notes will be distributed electronically during the course.

Literature

Prerequisites / notice
Fundamentals of chemistry, physics and thermodynamics are a prerequisite for this course.

Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.

Abstract
Advanced X-ray crystal structure analysis

Objective
To gain a deeper understanding of crystal structure determination principles and practice by X-ray diffraction and the evaluation of results.

Content
Review of principles of diffraction and instrumentation, unit cells, lattices, and symmetry. Inorganic structural chemistry: sphere packings, ionic crystals, covalent networks, intermetallic compounds. Overview of powder diffraction and application of crystal chemistry for structure analysis of polycrystalline phases. Working safely with X-rays, crystal growth, selection and mounting, data collection strategies, data reduction, corrections for absorption, extinction and Lp, advanced structure solution theory and techniques: Patterson function, heavy atom technique, Fourier methods, direct methods. Structure modeling and refinement, disorder, twinning, false symmetry, interpretation of anisotropic shift parameters. Determination of absolute configuration, interpretation of results and scope of chemically useful information, validation and publication of results, critical evaluation of published crystal structures.

Lecture notes
Information and exercise sheets will be distributed in loose form.
1) Introductory lecture: basics of quantum mechanics and quantum chemistry

W

Additional literature

(2) J.D. Dunitz, "X-ray Analysis and the Structure of Organic Molecules", 1995, Verlag HCA.

Prerequisites / notice

Students will conduct the computational exercises and examples of structure solution and refinement on personal computers.

Prerequisite: Principles of Crystal Structure Determination (529-0039-00L).

**Abstract**

Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

**Objective**

1. Insight Into The Mammalian Cell Cycle. Cycling, The Balance Between Proliferation and Cancer - Implications For Biopharmaceutical Manufacturing.
2. The Licence To Kill. Apoptosis Regulatory Networks - Engineering of Survival Pathways To Increase Robustness of Production Cell Lines.
5. From Target To Market. An Antibody's Journey From Cell Culture to The Clinics.
6. Biology and Malign Applications. Do Life Sciences Enable the Development of Biological Weapons?
7. Functional Food. Enjoy your Meal!

**Lecture notes**

Handout during the course.

<table>

<tr>
<td>529-0003-00L</td>
</tr>
</tbody>
</table>

**Abstract**

Advanced, but fundamental topics central to the understanding of theory in chemistry and for solving actual chemical problems with a computer.

Examples are:

* Operators derived from principles of relativistic quantum mechanics
* Relativistic effects + methods of relativistic quantum chemistry
* Open-shell molecules + spin-density functional theory
* New electron-correlation theories

**Objective**

The aim of the course is to provide an in-depth knowledge of theory and method development in theoretical chemistry. It will be shown that this is necessary in order to be able to solve actual chemical problems on a computer with quantum chemical methods.

The relativistic re-derivation of all concepts known from (nonrelativistic) quantum mechanics and quantum-chemistry lectures will finally explain the form of all operators in the molecular Hamiltonian - usually postulated rather than deduced. From this, we derive operators needed for molecular spectroscopy (like those required by magnetic resonance spectroscopy). Implications of other assumptions in standard non-relativistic quantum chemistry shall be analyzed and understood, too. Examples are the Born-Oppenheimer approximation and the expansion of the electronic wave function in a set of pre-defined many-electron basis functions (Slater determinants). Overcoming these concepts, which are so natural to the theory of chemistry, will provide deeper insights into many-particle quantum mechanics. Also revisiting the workhorse of quantum chemistry, namely density functional theory, with an emphasis on open-shell electronic structures (radicals, transition-metal complexes) will contribute to this endeavor. It will be shown how these insights allow us to make more accurate predictions in chemistry in practice - at the frontier of research in theoretical chemistry.

**Content**

1) Introductory lecture: basics of quantum mechanics and quantum chemistry
2) Einstein's special theory of relativity and the (classical) electromagnetic interaction of two charged particles
3) Klein-Gordon and Dirac equation; the Dirac hydrogen atom
4) Numerical methods based on the Dirac-Fock-Coulomb Hamiltonian, two-component and scalar relativistic Hamiltonians
5) Response theory and molecular properties, derivation of property operators, Breit-Pauli-Hamiltonian
6) Relativistic effects in chemistry and the emergence of spin
7) Spin in density functional theory
8) New electron-correlation theories: Tensor network and matrix product states, the density matrix renormalization group
9) Quantum chemistry without the Born-Oppenheimer approximation

**Lecture notes**

A set of detailed lecture notes will be provided, which will cover the whole course.

This class conducts and supports experiments for a specifically designed genuine research project. We will carry out biological-chemical enzyme evolution experiments using molecular genetic mutation technologies and in vivo selection in recombinant bacterial strains. The necessary documents and protocols will be distributed to the participants during the course. The projects of this course are tightly linked to the ones of the Biology BSc course "Biological Chemistry B: New Enzymes from Directed Evolution Experiments", which takes place as a block course during the month of November. There will be joint lectures for the participants of both courses during that time. The teaching language is English.

Further literature will be indicated in the distributed script.

- This laboratory course will involve experiments that require a tight schedule and (sometimes) long (!) working days.
- The projects of this course are tightly linked to the ones of the Biology BSc course "Biological Chemistry B: New Enzymes from Directed Evolution Experiments", which takes place as a block course during the month of November. There will be joint lectures for the participants of both courses during that time. The teaching language is English.
- The number of participants for the laboratory class is limited. It is mandatory to sign up for the course directly with P. Kast at the latest 2 weeks prior to the start of the fall semester. The teaching language is English.
- The necessary documents and protocols will be distributed to the participants during the course.

Further literature

- For more information, see also http://www.protein.ethz.ch/kast/praktikum.html or contact P. Kast directly (HCl F 333, Tel. 044 632 29 08, kast@org.chem.ethz.ch).

Only students who fulfill the following criteria are allowed to begin with their master thesis:

- a. successful completion of the bachelor programme;
- b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Duration of the Master's Thesis 16 weeks.

In the Master thesis students prove their ability to independent, structured and scientific working. The Master thesis is usually carried out in a core or optional subject area as chosen by the student.

In the Master Thesis students prove their ability to independent, structured and scientific working.

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Introduction into the most important spectroscopical methods and their applications to gain structural information.

Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications

Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:
- Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, arrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.
- UV/VIS spectroscopy: Basics, interpretation of electron spectra. Circular dichroism (CD) and optical rotation dispersion (ORD).

Script will be for the production price

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

The lecture is based on Inorganic Chemistry I and addresses an enhanced understanding of the symmetry aspects of chemical bonding of molecules and translation polymers, i.e. crystal structures.

The lecture is based on Inorganic Chemistry I and addresses an enhanced understanding of the symmetry aspects of chemical bonding of molecules and translation polymers.

Symmetry aspects of chemical bonding, point groups and representations for the deduction of molecular orbitals, energy assessment for molecules and solids, Sanderson formalism, derivation and understanding of band structures, densities of states, overlap populations, crystal symmetry, basic crystal structures and corresponding properties, visual representations of crystal structures.

Additional information is available on the internet at: http://www.ac.ethz.ch/ user: aach password: jsenpw

Abstract
Fundamental aspects of the organometallic chemistry of the transition elements. Mechanistic homogeneous catalysis including oxidative additions, reductive eliminations and insertion reactions. Catalytic hydrogenation, carbynylation, C-C bond-forming and related reactions.

Objective
Towards an understanding of the fundamental coordination-chemical and mechanistic aspects of transition-metal chemistry relevant to homogeneous catalysis.

Content
Fundamental aspects of the organometallic chemistry of the transition elements. Mechanistic homogeneous catalysis including oxidative additions, reductive eliminations and insertion reactions. Catalytic hydrogenation, carbynylation, C-C bond-forming and related reactions.

Literature
A relatively concise but excellent introduction to organometallic chemistry. Strong textbook character, available as E-book

A more comprehensive standard work on organometallic chemistry. Several chapters written by various authors, partly specialized review-article style.

ECTS

European Credit Transfer and Accumulation System

Special students and auditors need special permission from the lecturers.
The aim of the course is to provide the tools needed for the understanding of the fundamental processes and the design of the industrial processes. This course starts with analyzing existing chemical needs and unmet technical challenges. We then develop the skills to critically analyze a project and design a new polymerization reactor for the production of polymers with molecular characteristics suitably tuned for specific applications. Post treatment of polymer colloids. Kinetics and design of aggregation processes.

Specific topics in the course include, but not limited to:

1. Theoretical Concepts
   Features of mass and thermal transport on the microscale
   Key scaling laws
2. Microfluidic Device Manufacture
   Conventional lithographic processing of rigid materials
   Soft lithographic processing of plastics and polymers
   Mass fabrication of polymeric devices
3. Unit operations and functional components
   Analytical separations (electrophoresis and chromatography)
   Chemical and biological synthesis
   Sample pre-treatment (filtration, SPE, pre-concentration)
   Molecular detection
4. Design Workshop
   Design of microfluidic architectures for PCR, distillation & mixing
5. Contemporary Applications in Biological Analysis
   Microarrays
   Cellular analyses (single cells, enzymatic assays, cell sorting)
   Proteomics
6. System integration
   Applications in radiochemistry, diagnostics and high-throughput experimentation

Lecture notes: Lecture handouts, background literature, problem sheets and notes will be provided electronically.

### Polymers

Objective: Introduce the students to the design of polymerization reactors for the production of polymers with molecular characteristics suitably tuned for specific applications. This includes the post-treatment of polymer latexes and the analysis of their colloidal behavior.

Content: The aim of the course is to provide the tools needed for the understanding of the fundamental processes and the design of the industrial units involved in the production of polymeric materials and in the post-treatment of polymer colloids. In particular, the following topics are discussed: Physico-chemical characterization of polymers and description of the polymerization processes. Kinetics of free-radical polymerization and use of population balance models. Production of homo- and co-polymerizations with controlled characteristics in terms of molecular weight distribution and chain composition distribution. Living polymerizations. Design of polymerization reactors and the thermal runaway problem. Kinetics and control of emulsion polymerization. The radical segregation problem. Surfactants and colloidal stability. Aggregation kinetics and aggregate structure in conditions of diffusion and reaction limited aggregation. The role of shear conditions on aggregation and breakage kinetics and on the aggregate structure. Modeling and design of colloid aggregation processes.

### Chemical Product Design

Abstract: The 'Chemical Product Design' course teaches students quantitative concepts to analyze, select and transform theoretical concepts from chemistry and engineering into valuable real-world products. Basic chemistry and chemical engineering knowledge is required (Diffusion, Thermodynamics, Kinetics,...).

Objective: This course starts with analyzing existing chemical needs and unmet technical challenges. We then develop the skills to critically analyze a specific chemical idea for a product, to rapidly test feasibility or chance for success and to eventually realize its manufacturing. The chemical engineering basics are then used to assess performance of products or devices with non-traditional functions based on dynamic properties (e.g. responsive building materials; personal medical diagnostics on paper strips). The course teaches the interface between laboratory and market with a specific focus on evaluating the chemical value of a given process or compound, and the necessary steps to pursue the resulting project within an entrepreneurial environment. We therefore extend the questions of process design ('how do we make something?') to the question of 'what should we make?'
Content

Part A: The 'Chemical Product Design' course starts with discussing questions along, 'What is a chemical product, and why do people pay for it? How does a given compound in a specific setting provide a service? They then learn how to translate new, often ill-defined wishes or ideas into quantifiable specifications.

Part B: Thermodynamic and kinetic data allow sharp selection criteria for successful products. We learn how to deal with insufficient data and development of robust case models to evaluate their technical and financial constraints. How can parameters of a running process in one industry be scaled into another industry? Can dimensionless engineering numbers be applied beyond traditional chemical processes?

Part C: Manufacturing of commodity products, devices and molecular products: Chemical reactors, separation and detection or isolation units as part of a toolbox. Planning of manufacturing and decisions based on hard data. Providing quantitative answers on potential value generated.

Students are expected to actively develop chemical products along the course. Contributions will be made individually, or in small groups, where a larger topic is studied.

Abstract

This course encompasses the theoretical principles of chemical process simulation, as well as its practical application in process analysis and optimization. The techniques for simulating stationary and dynamic processes are presented, and illustrated with case studies. Commercial software packages are presented as a key engineering tool for solving process flowsheeting and simulation problems.

Objective

This course aims to develop the competency of chemical engineers in process flowsheeting and simulation. Specifically, students will:

- Understand the theoretical principles of chemical process simulation, as well as its practical application in process analysis and optimization.
- Learn how to use commercial software packages as a key engineering tool for solving process flowsheeting and simulation problems.
- Develop the following skills:
  - Deep understanding of chemical engineering fundamentals: the acquisition of new concepts and the application of previous knowledge in the area of chemical process systems and their mechanisms are crucial to intelligently simulate and evaluate processes.
  - Model general chemical processes and systems: students have to be able to identify the boundaries of the system to be studied and develop the set of relevant mathematical relations, which describe the process behavior.
  - Mathematical reasoning and computational skills: the familiarization with mathematical algorithms and computational tools is essential to be capable of achieving rapid and reliable solutions to simulation and optimization problems. Hence, students will learn the mathematical principles necessary for process simulation and optimization, as well as the structure and application of process simulation software. Thus, they will be able to develop criteria to correctly use commercial software packages and critically evaluate their results.

Content

Overview of process simulation and flowsheeting
- Definition and fundamentals
- Classification: stationary (steady-state) versus dynamic (transient state) systems
- Fields of application
- Case studies

Process modeling
- Modeling strategies of process systems
- Mass conservation
- Species balance
- Energy conservation
- Momentum balance
- Multiphase-systems: equilibrium & non-equilibrium models
- Process system model

Process simulation
- Process specification
- Introduction to process specification
- Classification of mathematical models: AMS, DOE, DAE, PDE
- Model validation
- Software tools
- Solution methods for process flowsheeting
- Simultaneous methods
- Sequential methods
- Dynamic simulation
- Numerical solution: explicit and implicit methods
- Continuous-discrete simulation: handling of discontinuities

Process optimization and analysis
- Classification of optimization problems
- Linear programming
- Non-linear programming
- Dynamic programming
- Optimization methods in process flowsheeting
- Sequential methods
- Simultaneous methods

Commercial software for simulation: Aspen Plus
- Thermodynamic property methods
- Reaction and reactors
- Separation / columns
- Convergence & debugging

Literature

An exemplary literature list is provided below:

Prerequisites / notice

A basic understanding of material and energy balances, thermodynamic property methods and typical unit operations (e.g., reactors, flash separations, distillation/absorption columns etc.) is required.
529-0643-00L  Process Design and Development  W+  7 credits  3G  G. Storti

Abstract
The course is focused on the design of Chemical Processes, with emphasis on the preliminary stage of the design approach, where process creation and quick selection among many alternatives are important. The main concepts behind more detailed process design and process simulation are also examined in the last part of the course.

Abstract
Basic elements of surface science important for materials and catalysis research. Physical and chemical methods important for research in surface science, material science and catalysis are considered and their application is demonstrated on practical examples.

Objective
Basic aspects of surface science. Understanding of principles of most important experimental methods used in research concerned with surface science, material science and catalysis.

Content
Methods which are covered embrace: Gas adsorption and surface area analysis, IR-Spectroscopy, X-ray diffraction, X-ray photoelectron spectroscopy, X-ray absorption, solid state NMR, Electron Microscopy and others.

529-0617-00L  Catalysis Engineering  W+  7 credits  3G  J. Pérez-Ramírez

Abstract
The purpose of the "Catalysis Engineering" course is to provide students with tools that enable the optimal design of catalytic materials and reactor engineering concepts favoring more sustainable manufacturing processes within the chemical industry.

Objective
The course aims at illustrating, from conception to implementation, the design of sustainable catalytic processes by integration of the microlevel (catalyst), mesolevel (reactor), and macrolevel (process). The word "sustainable" implies intensified processes with an improved exploitation of raw materials, wider use of renewable feedstocks, reduction of energy consumption, and minimized environmental impact. By the use of modern case studies of industrial relevance, aspects of catalyst preparation and characterization, kinetics, mass and heat transport, and deactivation are discussed. Emphasis is put on understanding the interaction among these basic elements in order to select the optimal catalytic process. Since no textbooks covering this area are available at this time and the intention of this course is unique, the lectures will be based on own texts and journal articles. During the course, there will be specific topics addressed by industrial contributors.

Content
The following general aspects:
- Catalyst preparation and characterization
- Kinetics
- Mass and heat transport
- Selectivity
- Deactivation

will be demonstrated for modern catalytic materials and processes of industrial relevance such as:
- Chlorine recycling
- NOx abatement
- Chemoselective hydrogenations
- Hierarchical zeolite catalysts
- Syngas conversion
- Biomass to chemicals and fuels

Lecture notes
The course material is based on own script, journal articles, and slides.

Prerequisites / notice
It is assumed that students selecting this course are familiar with general concepts of catalysis, reactor design, and transport phenomena.

Abstract
Applied Fluid Dynamics
The methods of fluid dynamics play an important role in the description of a chain of events, involving the release, spreading and dilution of dangerous fluids in the environment. Tunnel ventilation systems and strategies are studied, which must meet severe requirements during normal operation and in emergency situations (tunnel fires etc.).

Objective
Generally applicable methods in fluid dynamics and gas dynamics are illustrated and practiced using selected current examples.

Content
Often experts fall back on the methodology of fluid dynamics when involved in the construction of environmentally friendly processing and incineration facilities, as well as when choosing safe transport and storage options for dangerous materials. As a result of accidents, but also in normal operations, dangerous gases and liquids may escape and be transported further by wind or flowing water. There are many possible forms that the resulting damage may take, including fire and explosion when flammable substances are mixed. The topics covered include: Emissions, liquids and gases from containers and pipelines, evaporation from pools and vaporization of gases kept under pressure, the spread and dilution of waste gas plumes in the wind, deflagration and detonation of inflammable gases, fireballs in gases held under pressure, pollution and exhaust gases in tunnels (tunnel fires etc.)

Lecture notes
Requirements: successful attendance at lectures "Fluidynamik I und II", "Thermodynamik I und II"
151-0109-00L Turbulent Flows

Abstract

- Laminar and turbulent flows, instability and origin of turbulence - Statistical description: averaging, turbulent energy, dissipation, closure problem - Scalings. Homogeneous isotropic turbulence, correlations, Fourier representation, energy spectrum - Free turbulence: wake, jet, mixing layer - Wall turbulence: Channel and boundary layer - Computation and modelling of turbulent flows

Objective

- Basic physical phenomena of turbulent flows, quantitative and statistical description, basic and averaged equations, principles of turbulent flow computation and elements of turbulence modelling

Content

- Properties of laminar, transitional and turbulent flows.
- Origin and control of turbulence. Instability and transition.
- Statistical description, averaging, equations for mean and fluctuating quantities, closure problem.
- Scalings, homogeneous isotropic turbulence, energy spectrum.
- Turbulent free shear flows. Jet, wake, mixing layer.
- Wall-bounded turbulent flows.
- Turbulent flow computation and modelling.

Lecture notes

Lecture notes are available

Literature

151-0951-00L Process Design and Safety

Abstract

Process design and safety deals with the fundamentals of process apparatus, plant design and safety.

Objective

The objective of the course is to expound the design and characteristics of systems for process engineering applications.

Content

Fundamentals of plant and apparatus design; materials in the process industries, mechanical design and design rules of main components; pumps and fans; piping and armatures, safety in process industry

Lecture notes

Script is available, English slides will be distributed

Literature

151-0927-00L Rate-Controlled Separations in Fine Chemistry

Abstract

The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Objective

The students are supposed to obtain detailed insight into the fundamentals of separation processes that are frequently applied in modern life science processes in particular, fine chemistry and biotechnology.

Content

The class covers separation techniques that are central in the purification and downstream processing of chemicals and biopharmaceuticals. Examples from both areas illustrate the utility of the methods: 1) Liquid-liquid extraction; 2) Adsorption and chromatography; 3) Membrane processes; 4) Crystallization and precipitation.

Lecture notes

Handouts during the class

Literature

Recommendations for text books will be covered in the class

Prerequisites / notice

Requirements: Thermal separation Processes I (151-0926-00) and Modelling and mathematical methods in process and chemical engineering (151-0940-00)

529-0611-00L Characterization of Catalysts and Surfaces

Abstract

<td>The course aims at illustrating, from conception to implementation, the design of sustainable catalytic processes by integration of the macrolevel (catalyst), mesolevel (reactor), and microlevel (process). The word “sustainable” implies intensified processes with an improved exploitation of raw materials, wider use of renewable feedstocks, reduction of energy consumption, and minimized environmental impact. By the use of modern case studies of industrial relevance, aspects of catalyst preparation and characterization, kinetics, mass and heat transport, and deactivation are discussed. Emphasis is put on understanding the interaction among these basic elements in order to select the optimal catalytic process. Since no textbooks covering this area are available at this time and the intention of this course is unique, the lectures will be based on own texts and journal articles. During the course, there will be specific topics addressed by industrial contributors.</td>

will be demonstrated for modern catalytic materials and processes of industrial relevance such as:

- Chlorine recycling
- N2O abatement
- Chemoselective hydrogenations
- Hierarchical zeolite catalysts
- Syngas conversion
- Biomass to chemicals and fuels

It is assumed that students selecting this course are familiar with general concepts of catalysis, reactor design, and transport phenomena.

Projects on chemical assessment with the focus on the analysis and assessment of basic substance data for selected chemical classes; analysis and modelling of technical processes; characterisation of environmental and health risks. Risk assessment on the basis of quality and protection goals. Estimation of model and parameter uncertainty. Precaution and safety measures.

Projects on chemical assessment with the focus on the following aspects:
* Analysis and assessment of basic substance data for selected chemical classes: physical chemical properties, environmental behaviour (distribution, persistence), human and eco-toxicity (biochemical metabolism, effect mechanisms), safety.
* Analysis and modelling of technical processes determining chemical release into the environment, e.g., chemicals applications.
* Characterisation of environmental and health risks on the basis of exposure and effect models, QSARs from environmental chemistry, toxicology and methods of risk analysis.
* Risk assessment on the basis of quality and safety goals. Estimation of the model and data uncertainty.
* Demonstration of possibilities and limits of precaution and safety measures (technical, organisational, concerning personnel) including effectiveness and efficiency.

Project teaching; time frame totals ca. 80 hours.

Lecture notes
See recommended literature.

Literature

Prerequisites / notice
Voraussetzung: 529-0580-00L - Risikoanalyse chemischer Prozesse und Produkte oder: 701-0998-00L - Environmental and Human Health Risk Assessment of Chemicals

Beschränkt auf 6 Projektarbeiten pro Semester

529-0745-00L General and Environmental Toxicology W 7 credits 3V M. Arand, K. Hungerbühler, H. Nägeli, B. B. Stieger, I. Werner

Abstract
Toxicokinetic and toxicodynamic aspects of xenobiotic interactions with cellular structures and mechanisms. Toxic responses at the level of organs (immune-, neuro-, reproductive and genotoxicity) and organisms. Introduction into developmental toxicology and ecotoxicology.

Objective
Understanding of the impact of chemicals on biological systems; evaluation of the effects from different biomedical perspectives.

Content
Explanation of important interactions between xenobiotic chemicals and cellular structures such as membranes, enzymes, and nucleic acids. Relevance of intake, distribution, excretion, and biochemical transformations. Relevance of mixtures. Explanation of important modes of toxic action such as immune toxicity, neurotoxicity, reproduction toxicity, genotoxicity based on examples of certain xenobiotics and their effects on important organs.

Lecture notes
Course material will be handed out as the lectures progress.

Literature
Textbooks of pharmacology and toxicology (cf. list in course material)

Prerequisites / notice
Educational basis: basic chemistry, biology and biochemistry

529-0659-00L Electrochemistry W 6 credits 3G P. Novák

Abstract

Objective
Towards the end of the course the students will understand the basics of electrochemistry and will be able to describe and calculate electrochemistry-related matters in industrial processes and products.

Content

529-0193-00L Renewable Energy Technologies I W 4 credits 3G A. Wokaun, A. Steinfield

Abstract
The lectures Renewable Energy Technologies I (529-0193-00L) and Renewable Energy Technologies II (529-0191-01L) can be taken independently from one another.

Objective
Scenarios for world energy demand and CO2 emissions, implications for climate. Methods for the assessment of energy chains. Potential and technology of renewable energies: Biomass (heat, electricity, biofuels), solar energy (low temp. heat, solar thermal and photovoltaic electricity, solar chemistry). Wind and ocean energy, heat pumps, geothermal energy, energy from waste, CO2 sequestration.

Content
Scenarios for the development of world primary energy consumption are introduced. Students know the potential and limitations of renewable energies for reducing CO2 emissions, and their contribution towards a future sustainable energy system that respects climate protection goals.

Lecture notes
Lecture notes will be distributed electronically during the course.

Literature
Biocompatible Materials

**Abstract**
Introduction to molecules used for biomaterials, molecular interactions between different materials and biological systems (molecules, cells, tissues). The concept of biocompatibility is discussed and important techniques from biomaterials research and development are introduced.

**Objective**
The class consists of three parts:
1. Introduction into molecular characteristics of molecules involved in the materials-to-biology interface. Molecular design of biomaterials.
2. The concept of biocompatibility.
3. Introduction into methodology used in biomaterials research and application.

**Content**
Introduction into native and polymeric biomaterials used for medical applications. The concepts of biocompatibility, biodegradation and the consequences of degradation products are discussed on the molecular level. Different classes of materials with respect to potential applications in tissue engineering and drug delivery are introduced. Strong focus lies on the molecular interactions between materials having very different bulk and/or surface chemistry with living cells, tissues and organs. In particular the interface between the materials surfaces and the eukaryotic cell surface and possible reactions of the cells with an invasive material is elucidated. Techniques to design, produce and characterize materials in vitro as well as in vivo analysis of implanted and explanted materials are discussed.

In addition, a link between academic research and industrial entrepreneurship is established by external guest speakers.

**Lecture notes**
Handouts can be accessed online.

**Literature**

(available online via ETH library)

Handouts provided during the classes and references therein.

**Computational Systems Biology**

**Abstract**
Study of fundamental concepts, models and computational methods for the analysis of complex biological networks. Topics: Systems approaches in biology, biology and reaction network fundamentals, modeling and simulation approaches (topological, probabilistic, stoichiometric, qualitative, linear / nonlinear ODEs, stochastic), and systems analysis (complexity reduction, stability, identification).

**Objective**
The aim of this course is to provide an introductory overview of mathematical and computational methods for the modeling, simulation and analysis of biological networks.

**Content**
Biological systems have witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label “Systems Biology”, focuses on how the mere sum of the parts’ properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

**Lecture notes**

**Literature**

**Biological Engineering and Biotechnology**

**Abstract**
Biological Engineering and Biotechnology will cover the latest biotechnological advances as well as their industrial implementation to engineer mammalian cells for use in human therapy. This lecture will provide forefront insights into key scientific aspects and the main points in industrial decision-making to bring a therapeutic from target to market.

**Objective**
1. Insight Into The Mammalian Cell Cycle. Cycling, The Balance Between Proliferation and Cancer - Implications For Biopharmaceutical Manufacturing.
2. The Licence To Kill. Apoptosis Regulatory Networks - Engineering of Survival Pathways To Increase Robustness of Production Cell Lines.
5. From Target To Market. An Antibody's Journey From Cell Culture to The Clinics.
6. Development of Biological Weapons?

**Lecture notes**
Handouts during the course.

**Uncertainty Quantification for Engineering & Life Sciences**

**Abstract**
Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

**Objective**
The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

**Content**
Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

**Lecture notes**
The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

**Prerequisites / notice**
Fundamentals of chemistry, physics and thermodynamics are a prerequisite for this course.

Topics are available to carry out a Project Work (Semesterarbeit) on the contents of this course.
Nano-Optics is the study of optical phenomena and techniques on the nanometer scale. It is an emerging field of study motivated by the rapid advance of nanoscience and technology. It embraces topics such as plasmonics, optical antennas, optical trapping and manipulation, and high-resolution imaging and spectroscopy. Further topics are: optical interactions between nanoparticles, atomic decay rates in inhomogeneous environments, single molecule spectroscopy, light forces and optical trapping, photonic bandgap materials, and theoretical methods in nano-optics.

Abstract: Nano-Optics is the study of optical phenomena and techniques on the nanometer scale. It is an emerging field of study motivated by the rapid advance of nanoscience and technology. It embraces topics such as plasmonics, optical antennas, optical trapping and manipulation, and high-resolution imaging and spectroscopy.

Objective: Understanding concepts of light localization and light-matter interactions on the nanoscale.

Content: Starting with an angular spectrum representation of optical fields the role of inhomogeneous evanescent fields is discussed. Among the topics are: theory of strongly focused light, point spread functions, resolution criteria, confocal microscopy, and near-field optical microscopy.

Prerequisites / notice: - Electrodynamics (or equivalent)
- Physics I-II

Abstract: In a research project students extend their knowledge in a particular field, get acquainted with the scientific way of working, and learn to work on an actual research topic. Research projects are carried out in a core or optional subject area as chosen by the student.

Objective: First contact with experimental techniques of chemical engineering in a research group. Critical evaluation and presentation of the results in a scientific report.

Content: This laboratory project is organised during the spring vacation before the sixth semester. The participant can choose his topic from the list of projects suggested. Main emphasis during this research work is to get experience in using different engineering tools and evaluation and the interpretation of the results. Those are presented as a scientific report.

Abstract: The learning objective is to design, simulate and optimise a real (bio-)chemical process from a process systems perspective. Specifically, a commercial process simulation software will be used for the process simulation and optimisation. Students have to integrate knowledge and develop engineering thinking and skills acquired in the other courses of the curriculum.

Objective: Simulate and optimise a chemical production process using a commercial process simulation software.

Content: The learning objectives (LO) of this course are:

**LO 1: Create a model describing the production process**
- Students will apply a commercial process simulator systematically for process creation and analysis.
- Students will create a simulation flowsheet for steady-state simulation.
- Students will discriminate the models for the different process units.
- Students will evaluate the sequencing in which process units associated with recycle loops are solved to obtain converged material and energy balances.

**LO 2: Evaluate the performance of the production process**
- Students will analyse and understand the degrees of freedom in modelling process units and flowsheets.
- Students will make design specifications and follow the iterations implemented to satisfy them.
- Students will judge the role of process simulators in equipment sizing and costing and profitability analysis.
- Students will assess the economic performance of the process, including investment and operation costs.
- Students will assess the environmental impact of the production process.

**LO 3: Optimise the design and operating conditions of the production process**
- Students will solve sensitivity analyses and optimisations are conducted considering technical and economic criteria.
- Students will generate process integration alternatives to improve the initial production process.
- Students will optimise the production process considering economic and environmental criteria.
Before the case study week, students do exercises in the course of Process Simulation and Flowsheeting in order to get familiar with Aspen Plus simulation software (compulsory). They also receive guidelines for environmental impact assessment and skills on oral presentations.

The problem statement and detailed instructions are provided at the beginning of the case study week.

During the case study week:
- Students work in teams of 3-5 people.
- Students have to pose and solve the different questions presented in the problem statement.
- Students have to coordinate the activities, the preparation of the written report and the oral presentation.
- Students will be assessed in specific questions they may find along the case study development.
- An industry expert, namely a chemical engineer from ETHZ, exchanges with the groups.

One week after the case study week, the groups deliver the written report.

One week later, the students receive the comments on the work done, and implement required corrections.

All the groups prepare a single presentation comparing the results and showing their achievements.

Finally, the students visit the real industrial process at the site. They also present their work to the industrial experts on the day of the industry visit.

Only students who fulfill the following criteria are allowed to begin with their master thesis:

a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Duration of the Master's Thesis 16 weeks.

Abstract
In the Master thesis students prove their ability to independent, structured and scientific working. The Master thesis is carried out in a research group of the Department of Chemistry and Applied Biosciences, usually in the Institute of Chemical and Bioengineering, as chosen by the student.

Objective
In the Master Thesis students prove their ability to independent, structured and scientific working.

Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

Abstract
The goal of this course is to provide students with a wide general understanding in cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Objective
The goal of this course is to provide students with a wide general understanding cell biology. With this material as a foundation, students have enough of a cell biological basis to begin their specialization not only in cell biology but also in related fields such as biochemistry, microbiology, pharmacological sciences, molecular biology, and others.

Content
The focus is animal cells and the development of multicellular organisms with a clear emphasis on the molecular basis of cellular structures and phenomena. The topics include biological membranes, the cytoskeleton, protein sorting, energy metabolism, cell cycle and division, viruses, extracellular matrix, cell signaling, embryonic development and cancer research.

### Biology II

**Enrolment**

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement. Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

The lecture course Biology II is a basic introductory course into biology for students who need to pass this course for admission to their MSc curriculum.

**Objective**

The objective of the lecture course Biology II is the understanding of form, function, and development of animals and of the basic underlying mechanisms.

**Content**

The following numbers of chapters refer to the text-book "Biology" (Campbell & Reece, 7th edition, 2005) on which the course is based. Chapters 1-4 are a basic prerequisite. The sections "Structure of the Cell" (Chapters 5-10, 12, 17) and "General Genetics" (Chapters 13-16, 18, 46) are covered by the lecture Biology I.

1. Genomes, DNA Technology, Genetic Basis of Development
   - Chapter 19: Eukaryotic Genomes: Organization, Regulation, and Evolution
   - Chapter 20: DNA Technology and Genomics
   - Chapter 21: The Genetic Basis of Development

2. Form, Function, and Development of Animals I
   - Chapter 40: Basic Principles of Animal Form and Function
   - Chapter 41: Animal Nutrition
   - Chapter 44: Osmoregulation and Excretion
   - Chapter 47: Animal Development

3. Form, Function, and Development of Animals II
   - Chapter 42: Circulation and Gas Exchange
   - Chapter 43: The Immune System
   - Chapter 45: Hormones and the Endocrine System
   - Chapter 48: Nervous Systems
   - Chapter 49: Sensory and Motor Mechanisms

**Literature**

The following text-book is the basis for the courses Biology I and II:

**Prerequisites / notice**

Prerequisite: Lecture course Biology I of winter semester

---

### Analytical Chemistry I

**Enrolment**

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement. Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

Introduction into the most important spectroscopical methods and their applications to gain structural information.

**Objective**

Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications

**Content**

Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:

- Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.
- UV/VIS spectroscopy: Basics, interpretation of electron spectra, Circular dichroism (CD) and optical rotation dispersion (ORD).

**Lecture notes**

Script will be for the production price

**Literature**

**Prerequisites / notice**

Exercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounds" (4th semester) is recommended.

---

### Biochemistry

**Enrolment**

Enrolment ONLY for MSc students with a decree declaring this course unit as an additional admission requirement. Any other students (e.g. incoming exchange students, doctoral students) CANNOT enrol for this course unit.

**Abstract**

The lecture is a basic introductory course on the molecular principles of biology for students who need to pass this course for admission to their MSc curriculum.

**Objective**

The goal of this course is to give the students a basic understanding of the molecules that build a cell and make it function, and the basic principles of metabolism and molecular genetics
Content

The course content is based on the following chapters of the textbook Biochemistry (Berg, Tymoczko, Stryer, 7th edition, 2012, Freeman & Co, New York)

Chapter 1: The molecular design of life
Chapter 2: Protein composition and structure
Chapter 3: Exploring proteins and proteomes
Chapter 4: DNA, RNA and the flow of information
Chapter 5: Exploring Genes and Genomes
Chapter 7: Hemoglobin
Chapter 8: Enzymes and the basic concepts of catalysis
Chapter 11: Carbohydrates
Chapter 12: Lipids and cell membranes
Chapter 15: Metabolism: Basic concepts and design

Abstract

Introduction to UNIX, data representation, introduction to C++ programming, errors, algorithms, computer architecture, sorting and searching, databases, numerical algorithms, types of algorithms, simulation, data communication & networks, chemical structures, operating systems, programming languages, software engineering.

Objective

Discuss fundamentals of computer architecture, languages, algorithms and programming with an eye to their application in the area of chemistry, biology and material science.

Content

Minimal introduction to UNIX, Data representation and processing, algorithms and programming in C++, Errors, programming guidelines, efficiency, computer architecture, algorithms for sorting and searching, databases, numerical algorithms, types of algorithms, simulation, data communication & networks, chemical structures, operating systems, programming languages, style, software engineering.

Lecture notes

Available (in English), distributed at first lecture

Literature

See: www.csm.ethz.ch/education/infol

Prerequisites / notice

Since the exercises on the computer do convey and test essentially different skills as those being conveyed during the lectures and tested at the written exam, the results of the exercises are taken into account when evaluating the results of the exam.

For more information about the lecture: www.csm.ethz.ch/education/infol

Objective

Qualitative analysis (determination of cations and anions), acid-base-equilibria (pH-values, titrations, buffer), precipitation equilibria (gravimetry, potentiometry, conductivity), redox reactions (syntheses, redox-titrations, galvanic elements), metal complexes (syntheses, complexometric titration) analysis of measured values, states of aggregation (vapour pressure, conductivity, calorimetry)

Content

The general aim for the students of the practical course in general chemistry is an introduction in the scientific work and to get familiar with simple experimental procedures in a chemical laboratory. In general, first experiences with the principal reaction behaviour of a variety of different substances will be made. The chemical characteristics of these will be elucidated by a series of quantitative experiments alongside with the corresponding qualitative analyses. In order to get an overview of classes of substances as well as some general phenomena in chemistry suitable experiments have been chosen. In the second part of the practical course, i.e. physical chemistry, the behaviour of substances in their states of aggregation as well as changes of selected physical values will be recorded and discussed.

Abstract

Chemical reactivity and classes of compounds. Eliminations, fragmentations, chemistry of aldehydes and ketones (hydrates, acetals, imines, enamines, nucleophilic addition of organometallic compounds, reactions with phosphorus and sulfur ylides; reactions of enolates as nucleophiles) and of carboxylic acid derivatives. Aldol reaction.

Objective

Acquisition of a basic repertoire of synthetic methods including important reactions of aldehydes, ketones, carboxylic acids and carboxylic acid derivatives, as well as eliminations and fragmentations. Particular emphasis is placed on the understanding of reaction mechanisms and the correlation between structure and reactivity. A deeper understanding of the concepts presented during the lecture is reached by solving the problems handed out each time and discussed one week later in the exercise class.

Content

Chemical reactivity and classes of compounds. Eliminations, fragmentations, chemistry of aldehydes and ketones (hydrates, acetals, imines, enamines, nucleophilic addition of organometallic compounds, reactions with phosphorus and sulfur ylides; reactions of enolates as nucleophiles) and of carboxylic acid derivatives. Aldol reactions.

Lecture notes

A pdf file of the printed lecture notes is provided online. Supplementary material may be provided online.

Literature

No set textbooks. Optional literature will be proposed at the beginning of the class and in the lecture notes.

## Reaction Kinetics

**Abstract**

**Objective**

Introduction to Chemical Reaction Kinetics

**Content**

**Lecture notes**

**Literature**

**Prerequisites / notice**

- Mathematik I und II
- Allgemeine Chemie I und II
- Physikalische Chemie I

### Lecture notes 402-0043-00L Physics I

**Abstract**

Introduction to the concepts and tools in physics with the help of demonstration experiments: mechanics of point-like and ridged bodies, periodic motion and mechanical waves.

**Objective**

The concepts and tools in physics, as well as the methods of an experimental science are taught. The student should learn to identify, communicate and solve physical problems in his/her own field of science.

**Content**

Mechanics (motion, Newton's laws, work and energy, conservation of momentum, rotation, gravitation, fluids)

Periodic Motion and Waves (periodic motion, mechanical waves, acoustics).

**Lecture notes**

The lecture follows the book "Physics" by Paul A. Tipler.

**Literature**

- Paul A. Tipler and Gene P. Mosca, Physics (for Scientists and Engineers), W. H. Freeman and Company

**Prerequisites / notice**

- Mathematics I & II

### Lecture notes 529-0051-00L Analytical Chemistry I

**Abstract**

Introduction into the most important spectroscopical methods and their applications to gain structural information.

**Objective**

Knowledge about the necessary theoretical background of spectroscopical methods and their practical applications

**Content**

Application oriented basics of organic and inorganic instrumental analysis and of the empirical employment of structure elucidation methods:

- Mass spectrometry: Ionization methods, mass separation, isotope signals, rules of fragmentation, rearrangements.
- NMR spectroscopy: Experimental basics, chemical shift, spin-spin coupling.
- IR spectroscopy: Revisiting topics like harmonic oscillator, normal vibrations, coupled oscillating systems (in accordance to the basics of the related lecture in physical chemistry); sample preparation, acquisition techniques, law of Lambert and Beer, interpretation of IR spectra; Raman spectroscopy.

**Lecture notes**

Script will be for the production price

**Literature**

- M. Hesse, H. Meier, B. Zeeh, Spektroskopische Methoden in der organischen Chemie, 5. überarbeitete Auflage, Thieme, Stuttgart, 1995

**Prerequisites / notice**

Excercises are integrated in the lectures. In addition, attendance in the lecture 529-0289-00 "Instrumental analysis of organic compounds" (4th semester) is recommended.

### Lecture notes 401-0373-00L Mathematics III: Partial Differential Equations

**Abstract**

**Objective**

The main objective is that the students get a basic knowledge of the classical tools to solve explicitly linear partial differential equations.

Data: 06.10.2017 12:53  Autumn Semester 2016  Page 381 of 1570
## Examples of partial differential equations
- Classification of PDEs
- Superposition principle
- Fourier series
- Representation of piecewise continuous functions via Fourier series
- Examples and applications
- Resolution of wave and heat equation
- Homogeneous and inhomogeneous boundary conditions, Dirichlet and Neumann boundary conditions
- Resolution of the Laplace equation
- Poisson formula
- Mean value theorem and maximum principle
- Fourier transform
- Derivation and definition
- Inverse Fourier transformation and inversion formula
- Interpretation and properties of the Fourier transform
- Resolution of the heat equation
- Laplace transform
- Definition, motivation and properties
- Inverse Laplace transform of rational functions
- Application to ordinary differential equations

### Lecture notes
There are available some Lecture Notes in English and also in German of the Professor. These can be found following the links provided under the tab 'Lernmaterialien'.

### Literature
2) Y. Pinchover and J. Rubinstein, An Introduction to Partial Differential Equations, Cambridge University Press
3) E. Kreyszig, Advanced Engineering Mathematics, John Wiley & Sons (only Chapters 1,2,6,11)

### Prerequisites / notice
Prerequisites:
- Practical Course General Chemistry (1. Semester, 529-0011-04)
- Practical Course Inorg. and Org. Chemistry I (2. Sem., 529-0230)
- Attendance of Course Inorg. Chemistry I (3. Sem., 529-0121)

If necessary, access priority will be settled according to the results of the first-year examinations.

### 5. Semester

#### Compulsory Subjects

Latest online enrolment is one week before the beginning of the semester.

Introduction to the experimental methods of Inorganic Chemistry

The teaching laboratory offers an insight into different aspects of Inorganic Chemistry, including solid state chemistry, organometallic chemistry, kinetics, etc. The synthesis, characterization and analysis of inorganic compounds are a main topic. Emphasis is given to scientific writing (experiment reports).

Inorganic chemistry part: Synthesis and analysis of elemento-organic compounds, metal complexes, and organometallic compounds. Introduction to Schlenk techniques, solid state synthesis, and kinetics. Introduction in the chemistry library: literature data banks and collections of spectra.

Organic synthesis with organometallic compounds and catalysts: Experiments in the framework of a selected specialised project. Possible projects: Rh catalysed asymmetric hydrogenation of enamides, Mn-catalysed epoxidation of olefins, Cu catalysed Diels-Alder reactions, synthesis of organo-boron compounds and Pd catalysed coupling with halides, Ru catalysed transfer hydrogenation.

A manual is distributed in the teaching laboratory.

Prerequisites:
- Practical Course General Chemistry (1. Semester, 529-0011-04)
- Practical Course Inorg. and Org. Chemistry I (2. Sem., 529-0230)
- Attendance of Course Inorg. Chemistry I (3. Sem., 529-0121)

If necessary, access priority will be settled according to the results of the first-year examinations.

### Autumn Semester 2016
The first part of the course is focusing on pure fluids (ideal and real). First, some fundamentals of thermodynamics are reviewed, including thermodynamic quantities and balances (of mass, energy and entropy). Then, equations of state and their use to estimate the volumetric properties of pure fluids are introduced. Finally, it is discussed how to use previous results for the estimation of the main thermodynamic properties (internal energy, enthalpy, entropy, free Gibbs energy, fugacity, etc.).

The second part of the course is focusing on mixtures, starting from binary mixture to mixtures of N components. Again, real mixtures are discussed, with emphasis on when such mixtures can be approximated as ideal ones and on the corrections which are needed to switch from ideal to real mixtures. As for pure fluids, first the use of the equations of state is discussed to estimate volumetric properties, then the estimation of the thermodynamic properties of mixtures is introduced. In this part, a particular focus is given to phase equilibria in the absence of chemical reactions. The most common equilibria (liquid-vapor, solid-liquid, liquid-liquid, etc) are discussed.

In the last part of the course, the chemical equilibria are discussed, with particular focus on the calculation of mass and energy balances for multicomponent systems (mixtures), also in the presence of physical equilibria.

During the lectures, theoretical aspects will be discussed and will be linked to application by the discussion of a comprehensive study case, including the methods for its solution. Detailed exercises will be given (and discussed later) to the students, to let them familiarize with the main methods discussed during the lecture.

Books on this subject can be mostly found under the title: 'Chemical Engineering Thermodynamics', 'Thermodynamics for Chemical Engineers', or 'Chemical Process Principles'. A selection:

Acquisition of material properties and data:

5. "TRC Thermodynamic Tables", Thermodynamic Research Center, College Station USA

Prerequisites / notice

Knowledge in chemical thermodynamics required

Statistical and Numerical Methods for Chemical Engineers
O 3 credits 2V+2U
R. Käppeli, P. Müller, M. Sokolov

Abstract
This course covers common numerical algorithms and statistical methods used by chemical engineers to solve typical problems arising in industrial and research practice.

Objective
This course covers common numerical algorithms and statistical methods used by chemical engineers to solve typical problems arising in industrial and research practice. The focus is on application of these algorithms to real world problems, while the underlying mathematical principles are also explained. The MATLAB environment is adopted to integrate computation, visualization and programming.

Content
Topics covered:

Part I: Numerical Methods:
- Interpolation & Numerical Calculus
- Non-linear Equations
- Ordinary Differential Equations
- Partial Differential Equations
- Linear and Non-linear Least Squares

Part II: Statistical Methods:
- Data analysis and regression methods
- Statistical experimental design
- Multivariate analysis of spectra

Lecture notes

Discovering Management
O 3 credits 3G
B. Clarysse, M. Ambühl, S. Brusoni, E. Fleisch, G. Grote, V. Hoffmann, P. Schönleben, G. von Krogh, F. von Wangenheim

Abstract
Discovering Management offers an introduction to the field of business management and entrepreneurship for engineers and natural scientists. The module provides an overview of the principles of management, teaches knowledge about management that is highly complementary to the students’ technical knowledge, and provides a basis for advancing the knowledge of the various subjects offered at D-MTEC.

Objective
Discovering Management combines in an innovative format a set of lectures and an advanced business game. The learning model for Discovering Management involves ‘learning by doing’. The objective is to introduce the students to the relevant topics of the management literature and give them a good introduction in entrepreneurship topics too. The course is a series of lectures on the topics of strategy, innovation, corporate finance, leadership, design thinking and corporate social responsibility. While the 14 different lectures provide the theoretical and conceptual foundations, the experiential learning outcomes result from the interactive business game. The purpose of the business game is to analyse the innovative needs of a large multinational company and develop a business case for the company to grow. This business case is as relevant to someone exploring innovation within an organisation as it is if you are planning to start your own business. By discovering the key aspects of entrepreneurial management, the purpose of the course is to advance students’ understanding of factors driving innovation, entrepreneurship, and company success.

Content
Discovering Management aims to broaden the students’ understanding of the principles of business management, emphasizing the interdependence of various topics in the development and management of a firm. The lectures introduce students not only to topics relevant for managing large corporations, but also touch upon the different aspects of starting up your own venture. The lectures will be presented by the respective area specialists at D-MTEC.

The course broadens the view and understanding of technology by linking it with its commercial applications and with society. The lectures are designed to introduce students to topics related to strategy, corporate innovation, leadership, corporate and entrepreneurial finance, value chain analysis, corporate social responsibility, and business model innovation. Practical examples from industry experts will stimulate the students to critically assess these issues. Creative skills will be trained by the business game exercise, a participant-centered learning activity, which provides students with the opportunity to place themselves in the role of Chief Innovation Officer of a large multinational company. As they learn more about the specific case and identify the challenge they are faced with, the students will have to develop an innovative business case for this multinational corporation. Doing so, this exercise will provide an insight into the context of managerial problem-solving and corporate innovation, and enhance the students’ appreciation for the complex tasks companies and managers deal with. The business game presents a realistic model of a company and provides a valuable learning platform to integrate the increasingly important development of the skills and competences required to identify entrepreneurial opportunities, analyse the future business environment and successfully respond to it by taking systematic decisions, e.g. critical assessment of technological possibilities.
Prerequisites / notice

Discovering Management is designed to suit the needs and expectations of Bachelor students at all levels as well as Master and PhD students not belonging to D-MTEC. By providing an overview of Business Management, this course is an ideal enrichment of the standard curriculum at ETH Zurich.

No prior knowledge of business or economics is required to successfully complete this course.

Abstract

The focus of part I of the case study course lies on the literature-based comparison of chemical process alternatives. Based on this compilation and selected quantitative as well as qualitative measures a process assessment and comparison is conducted and the most promising process alternative is chosen for further evaluation, and a basic flowsheet and mass and energy balances are generated.

Objective

- to obtain knowledge about different databases and sources of information
- application of the knowledge obtained in lectures
- problem-oriented problem solving (application of different methods to the same subject)
- team work
- report writing and presentation techniques

Content

The focus of part I of the case study course lies on the literature-based comparison of chemical process alternatives. For this purpose relevant substance data (i.e. physico-chemical, toxicological, safety, and environmental data) as well as information about synthesis routes and technical implementations (i.e. on reaction kinetics; possible separation operations; economic, safety, and environmental aspects) are collected from the literature. Based on this compilation and selected quantitative as well as qualitative measures a process assessment and comparison is conducted and the most promising process alternative is chosen for further evaluation. For this alternative a basic flowsheet and mass and energy balances are generated.

</table>

Abstract
The seminar covers basic issues of research design, small-n research, and data collection. It deals with issues of causality, conceptualization, case study design and QCA. Data collection includes interviews, surveys, and text analysis.

Objective
This MACIS core seminar covers basic issues of research design, small-n research, and data collection. It familiarizes students with general research design problems such as defining research questions, analyzing causality, and designing single and comparative case studies. It then introduces them to basic issues in small-n research. Students acquire an understanding of the specific challenges and design problems in qualitative analysis. Finally, students are introduced to exemplary methods of data collection. By the end of the course, students should be able to use the principal methods of data collection used by political scientists, have a critical understanding of the advantages and disadvantages of the methods, and should be able to reflect on and discuss the methods in light of research questions of their interest.

Abstract
The seminar focuses on seminal books and articles as well as brand new analyses on topical issues of democratic theory and practice. After reviewing theoretical models and different types of democracy, the seminar deals with core problems of democratic governance and with challenges to democracy stemming from globalization and international institutions.

Objective
At the end of the seminar, students are familiar with the relevant theoretical and empirical literature on democracy and democratization in national and international contexts. They are able to reflect on contemporary challenges to democracy in particular, those stemming from the internationalization of politics.

Abstract
This research seminar at the intersection between Security Studies and Science and Technology Studies focuses on how sociotechnical innovations (cyberspace, chemical and biological agents and robots) impact security politics and military strategy, and will look at the possibilities and limitations for international governance and arms control, with specific attention on the challenge of 'dual-use'.

Objective
The aim of this course is to introduce students to fundamental concepts from Science and Technology Studies and Security Studies that are useful in understanding current issues in national security. In specific, they will learn to understand how technological innovation impacts security politics and military strategy, with a particular focus on the issue of 'dual-use'. Students will learn about national technoscientific projects such as the creation of artificial intelligence, the creation of cyberspace, the weaponization of chemical and biological agents, and the recent move towards 'Lethal Autonomous Weapons Systems'. Furthermore, students will learn about problems and solutions for the international governance of technologies and arms control. By the conclusion of the course, students should be able to frame problems related to technology and security in an analytical framework that makes clear their complexity as well as the points at which policy might intervene successfully.

Abstract
This research seminar complements the MACIS core seminar in Political Economy. It covers topics such as international trade, environmental policy, international finance and foreign direct investment, and welfare state policy. Students will, based on reading assignments and discussions in class, develop a research question, present a research design, and write a paper.

Objective
Students will acquire an advanced understanding of some of the key issues and arguments in comparative and international political economy.

Content
They will also prepare the ground for a high-quality MA thesis in political economy.

Prerequisites / notice
This seminar is restricted to students enrolled in the MACIS program.

Abstract
Because the number of students will be very small, the Political Economy core course runs in parallel, and research interests will be heterogeneous, the general approach will be informal and decentralized. Before the seminar starts we will identify what research topics - within the broader field of Comparative and International Political Economy - the participating students are most interested in. In the first two weeks of the semester, we will meet twice for two hours each as a group to discuss how to write a good research seminar paper, and to identify more closely what each student will be working on. Each student will then receive a reading list, so that she/he can get familiar with the state-of-the-art in her/his field of interests and develop a research design in close cooperation with Profs. Bernauer and Koubi as well as postdocs from Prof. Bernauer's group. The group as a whole meets again ca. in week 7 of the semester to discuss the provisional research designs. Research then continues in a decentralized fashion - again in consultation with Profs. Bernauer and Koubi as well as postdocs from Prof. Bernauer's group. The group as a whole meets again in the second to last week of the semester. Each student reports on progress in her/his research during that meeting. The research seminar paper must be finalized and submitted by the end of July 2015.

Prerequisites / notice
This seminar is restricted to students enrolled in the MACIS program.

**Abstract**

This advanced research seminar deals with current issues and research in comparative politics and EU integration and politics. This seminar is designed for advanced students with an interest in comparative European politics and EU integration and politics. It introduces students to state-of-the-art theorizing, data, methods, and empirical findings and provides them with opportunities to work with data on their own. After taking this seminar, students should have a good overview of current research and be prepared to write their Master's thesis in this area. Topics include: European integration, EU decision-making, parliaments in the EU and its member states, party groups and parliamentarians. Students may also propose research topics of their interest.
Public policies result from decision-making processes that take place within formal institutions of the state (parliament, government, public administration, courts). That is, policies are shaped by the characteristics of decision-making processes and the characteristics of public institutions and related actors (e.g., interest groups). In this course, students acquire the contextual knowledge for analyzing public policies. They learn why and how public policies and laws are developed, designed, and implemented at national and international levels, and what challenges arise in this regard. The course is organized in three modules. The first module (Stefan Bechtold) examines basic concepts and the role of law, law-making, and law enforcement in modern societies. The second module (Thomas Bernauer) deals with the functioning of legislatures, governments, and interest groups. The third module (Frank Schimmelfennig) focuses on the European Union and international organisations.

Reading materials will be distributed electronically to the students when the semester starts.

Objective

- To gain an overview of the history of the transition of large technical systems
- To demonstrate knowledge on the role of policy and politics in energy transitions
- To recognize current challenges in the energy system to understand the theoretical frameworks and concepts for studying transitions
- To demonstrate knowledge on the role of policy and politics in energy transitions

Content

Schedule (for up-to-date information, see the syllabus that will be distributed to participants electronically):

**W1:** Bechtold: Bernauer: Introduction
- How are laws created and interpreted? How are they enforced?
- Why do we need laws and why do people and firms usually obey the law? What are possible goals of legal systems? What is the relationship between laws, social norms, and moral values?
- What role does scientific evidence play in the creation and enforcement of the law? How does the law deal with non-quantifiable factors or incommensurable values?
- Bernauer: How are parliaments (legislatures) elected, how do they work, and how do their characteristics and processes affect policy-making?
- Schimmelfennig: Governance beyond the state: why and how states create international institutions.
- Schimmelfennig: International organizations and regimes: case studies of global governance.
- Schimmelfennig: Institutions and policy-making in the European Union.

**W2:** Bernauer: Institutions and policy-making in the European Union.

An add-on module to this course (3 ECTS) involves an essay. This part of the course is accessible only to ISTP MSc students and requires enrollment in the main course (3 ECTS). ISTP MSc students must enrol in both parts. Other students can only enrol in the main course.

3rd week of January: deadline for review essay

Lecture notes

Reading materials will be distributed electronically to the students when the semester starts.

This is a Master level course. The course is capped at 25 students, with ISTP Master students having priority.
Content
Climate change, access to energy and other societal challenges are directly linked to the way we use and create energy. Both the recent United Nations Paris climate change agreement and the UN Sustainable Development Goals make a fast and extensive transition of the energy system necessary.

This course introduces the social and environmental challenges involved in the energy sector and discusses the implications of these challenges for the rate and direction of technical change in the energy sector. It compares the current situation with historical socio-technical transitions and derives the consequences for policy-making. It then introduces theoretical frameworks and concepts for studying innovation and transitions. It then focuses on the role of policy and policy change in governing the energy transition, considering the role of political actors, institutions and policy feedback.

The course has a highly interactive (seminar-like) character. Students are expected to actively engage in the weekly discussions and to give a presentation (15-20 minutes) on one of the weekly topics during that particular session. The presentation (30%) and participation in the discussions (20%) will form one part of the final grade, the remaining 50% of the final grade will be formed by a final exam.

Prerequisites / notice
This course is particularly suited for students of the following programmes: MA Comparative International Studies; MSc Energy Science & Technology; MSc Environmental Sciences; MSc Management, Technology & Economics; MSc Science, Technology & Policy; ETH & UZH PhD programmes.

857-0075-00L
Contemporary European Politics
4 credits

Objective
How have the EU's powers developed until now and what are the problems facing the Union today? In this course, we will discuss the development of European integration. Furthermore, the course will address key issues such as the EU's democratic deficit, the consequences from enlargement to Central and Eastern Europe, the prospects for future entrants, the Euro-crisis, and the refugee crisis.

Abstract
Since its start in the fifties, the European Union has evolved into an even more important multilevel system of integration in terms of decision-making competences and scope of policy. The course 'Contemporary European Politics' discusses the development of the EU's powers and the problems that the Union faces today. At the end of this course, the participants will be familiar with the major theories and debates in the EU studies. Based on this knowledge, the participants should be able to identify the strengths and weaknesses of existing studies as well as to formulate and to defend their own arguments.

The course is divided into two parts. The first part discusses the development of European integration in terms of the functioning of the EU institutions and the policy-making process (i.e. agenda-setting, decision-making and implementation). In the second part of the course, we analyze the problems confronting Europe during the process of European integration, as well as current issues associated with the EU's expansion of powers and membership. For example, key questions include: Is there a "democratic deficit" in the EU in terms of responsiveness to public opinion? To what extent does the existing EU institutional structure allow for representation? How can we explain patterns of "differentiated integration" across policy areas and countries? What are the consequences from the EU's enlargement on the "new" Central and Eastern European member states and the prospects for future entrants? We will conclude with a discussion about the Euro-crisis and the European refugee crisis.

865-0067-00L
Foundations of Sustainable Development Practice
1 credit

Objective
The students are able to:
- define the main underlying concepts of the SDGs like "sustainability" and "development";
- explain the background of the Agenda 2030, its intention, the process of its development and the guiding principles for its implementation;
- discuss practical difficulties in pursuing and achieving sustainable development through development & cooperation interventions;
- describe the relevant actors and their roles and responsibilities;
- discuss the merits and the limitations of such an ambitious, multi-disciplinary, universally agreed upon framework;
- examine what the SDGs could mean for "developed nations" like Switzerland.

Content
- Setting the stage: What is sustainable? What is development? Why Sustainable Development Goals (SDGs)?
- The Agenda 2030: 17 goals and 169 targets
- Actors: Who are the actors in the SDG debate? How do these actors influence decisions? What are the roles of civil society, of the private sector, and of governments in implementing the SDGs?
- Switzerland: What does the Agenda 2030 mean for Switzerland’s national and international agendas? Which SDGs does Switzerland focus on at home and abroad?
- Focus on a selection of SDGs and their related targets (not dealt with in other courses).

865-0010-02L
Food Security and Agriculture
2 credits

Objective
The student will be able to:
- describe the most important milestones in the history of food and agriculture
- understand the concept of food security and discuss causes and impact of food insecurity
- compare different approaches to promote and increase crop- and livestock production in a sustainable manner
- reflect on some of the main economic challenges of the world food system and understand some of the tradeoffs between smallholders' decisions of labor, income, consumption, and production of food
- give insights in how international organizations work with farmers and governments in developing countries to ensure availability and equal access to food

860-0006-00L
Applied Statistics and Policy Evaluation
3 credits

Abstract
This course introduces students to key statistical methods for analyzing social science data with a special emphasis on causal inference and policy evaluation. Students learn to choose appropriate analysis strategies for particular research questions and to perform statistical analyses with the statistical Software Stata.
Objective

- have a sound understanding of linear and logit regression
- know strategies to test causal hypotheses using regression analysis and/or experimental methods
- are able to formulate and implement a regression model for a particular policy question and a particular type of data
- are able to critically interpret results of applied statistics, in particular, regarding causal inference
- are able to critically read and assess published studies on policy evaluation
- are able to use the statistical software STATA for data Analysis

Content

The topics covered in the first part of the course are a revision of basic statistics and linear and logit regression analysis. The second part of the course focuses on causal inference and introduces methods such as panel data analysis, difference-in-difference methods, instrumental variable estimation, and randomized controlled trials mostly used for policy evaluation. The course shows how the various methods differ in terms of the required identifying assumptions to infer causality as well as the data needs.

Students will apply the methods from the lectures by solving weekly assignments using statistical software and data sets provided by the instructors. These data sets will cover topics at the interface of policy, technology and society. Solving the assignments contributes to the final grade with a weight of 30%. Students are assisted in solving the assignments during the exercises session.

Permission to begin master thesis is required to take part in Colloquium.

Abstract

In this colloquium, students enrolled in the MACIS program first present and discuss research design and methods issues concerning their prospective MA theses. Towards the end of the semester they present preliminary findings from their MA thesis work.

Objective

It is the goal of the colloquium to help students with the initial steps of writing their master theses. During the colloquium, they will develop a relevant research question and hypotheses and select appropriate methods and data.

Only students who fulfill the following criteria are allowed to begin with their master thesis:
a. successful completion of the bachelor programme;
b. fulfilling of any additional requirements necessary to gain admission to the master programme.

Abstract

The Master Thesis is an independent piece of research on an issue in comparative and international politics. It combines theory, methods, and empirical work.

Objective

The Thesis should demonstrate the students’ ability to conduct independent research on the basis of the theoretical and methodological knowledge acquired during the MA program.

Content

Biology has witnessed an unprecedented increase in experimental data and, correspondingly, an increased need for computational methods to analyze this data. The explosion of sequenced genomes, and subsequently, of bioinformatics methods for the storage, analysis and comparison of genetic sequences provides a prominent example. Recently, however, an additional area of research, captured by the label “Systems Biology”, focuses on how networks, which are more than the mere sum of their parts’ properties, establish biological functions. This is essentially a task of reverse engineering. The aim of this course is to provide an introductory overview of corresponding computational methods for the modeling, simulation and analysis of biological networks.

We will start with an introduction into the basic units, functions and design principles that are relevant for biology at the level of individual cells. Making extensive use of example systems, the course will then focus on methods and algorithms that allow for the investigation of biological networks with increasing detail. These include (i) graph theoretical approaches for revealing large-scale network organization, (ii) probabilistic (Bayesian) network representations, (iii) structural network analysis based on reaction stoichiometries, (iv) qualitative methods for dynamic modeling and simulation (Boolean and piece-wise linear approaches), (v) mechanistic modeling using ordinary differential equations (ODEs) and finally (vi) stochastic simulation methods.

Lecture notes

Content

1. Introduction to Modelling in Biology
2. Discrete Mathematics

Abstract

This course covers analog circuits with emphasis on neuromorphic engineering: MOS transistors in CMOS technology, static circuits, dynamic circuits, systems (silicon neuron, silicon retina, silicon cochlea) with an introduction to multi-chip systems. The lectures are accompanied by weekly laboratory sessions.

Objective

Understanding the characteristics of neuromorphic circuit elements.

Content

Neuromorphic circuits are inspired by the organizing principles of biological neural circuits. Their computational primitives are based on physics of semiconductor devices. Neuromorphic architectures often rely on collective computation in parallel networks. Adaptation, learning and memory are implemented locally within the individual computational elements. Transistors are often operated in weak inversion (below threshold), where they exhibit exponential I-V characteristics and low currents. These properties lead to the feasibility of high-density, low-power implementation of functions that are computationally intensive in other paradigms. Application domains of neuromorphic circuits include silicon retinas and cochleas for machine vision and audition, real-time emulations of networks of biological neurons, and the development of autonomous robotic systems. This course covers devices in CMOS technology (MOS transistor below and above threshold, floating-gate MOS transistor, phototransducers), static circuits (differential pair, current mirror, transconductance amplifiers, etc.), dynamic circuits (linear and nonlinear filters, adaptive circuits), systems (silicon neuron, silicon retina and cochlea) and an introduction to multi-chip systems that communicate events analogous to spikes. The lectures are accompanied by weekly laboratory sessions on the characterization of neuromorphic circuits, from elementary devices to systems.

Literature
S.-C. Liu et al.: Analog VLSI Circuits and Principles; various publications.

Prerequisites / notice

Particular: The course is highly recommended for those who intend to take the spring semester course ‘Neuromorphic Engineering II’, that teaches the conception, simulation, and physical layout of such circuits with chip design tools.

Prerequisites: Background in basics of semiconductor physics helpful, but not required.

Data: 06.10.2017 12:53    Autumn Semester 2016    Page 393 of 1570
This course considers the structure and function of biological neural networks at different levels. The function of neural networks lies fundamentally in their wiring and in the electro-chemical properties of nerve cell membranes. Thus, the biological structure of the nerve cell needs to be understood if biologically-realistic models are to be constructed. These simpler models are used to estimate the electrical current flow through dendritic cables and explore how a more complex geometry of neurons influences this current flow. The active properties of nerves are studied to understand both sensory transduction and the generation and transmission of nerve impulses along axons. The concept of local neuronal circuits arises in the context of the rules governing the formation of nerve connections and topographic projections within the nervous system. Communication between neurons in the network can be thought of as information flow across synapses, which can be modified by experience. We need an understanding of the action of inhibitory and excitatory neurotransmitters and neuromodulators, so that the dynamics and logic of synapses can be interpreted. Finally, the neural architectures of feedforward and recurrent networks will be discussed in the context of co-ordination, control, and integration of sensory and motor information in neural networks.

529-0004-00L Computer Simulation in Chemistry, Biology and Physics

Abstract
Molecular models, Force fields, Boundary conditions, Electrostatic interactions, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.

For more information: www.csms.ethz.ch/education/CSCBP

Objective
Introduction to computer simulation of (bio)molecular systems, development of skills to carry out and interpret computer simulations of biomolecular systems.

Content
Molecular models, Force fields, Spatial boundary conditions, Calculation of Coulomb forces, Molecular dynamics, Analysis of trajectories, Quantum-mechanical simulation, Structure refinement, Application to real systems. Exercises: Analysis of papers on computer simulation, Molecular simulation in practice, Validation of molecular dynamics simulation.

Lecture notes
Available (copies of powerpoint slides distributed before each lecture)

Literature
See: www.csms.ethz.ch/education/CSCBP

Prerequisites / notice
Since the exercises on the computer do convey and test essentially different skills as those being conveyed during the lectures and tested at the oral exam, the results of the exercises are taken into account when evaluating the results of the exam.

For more information about the lecture: www.csms.ethz.ch/education/CSCBP

529-0733-00L Enzymes

Abstract
Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Objective
Overview of enzymes, enzyme-catalyzed reactions and metabolic processes.

Content
Principles of enzymatic catalysis, enzyme kinetics, mechanisms of enzyme-catalyzed reactions (group transfer reactions, carbon-carbon bond formation, eliminations, isomerisations and rearrangements), cofactor chemistry, enzymes in organic synthesis and the biosynthesis of natural products, catalytic antibodies.

Lecture notes
A script will not be handed out.

Literature
General:

In addition, citations from the original literature relevant to the individual lectures will be assigned weekly.

535-0810-00L Gene Technology

Abstract
The course will provide a solid overview of the science and issues in gene technology and its pharmaceutical applications.

Objective
The aim of the lecture course is to provide a solid overview of gene technology, with a special focus on drug development. Topics: Antibody phage technology, DNA-encoded chemistry, protein modification technology, genome sequencing, transcriptomics, proteomics, functional genomics, principle of drug discovery. The course is suited for advanced undergraduate and early graduate students in pharmaceutical sciences or related fields.

Content
1. Antibody phage technology
   The antibody molecule
   V genes, CDRs, basics of antibody engineering
   Principles of phage display
   Phagemid and phage vectors
   Antibody libraries
   Phage display selection methodologies
   Other phage libraries (peptides, globular proteins, enzymes)
   Alternative screening/selection methodologies
   DNA-encoded chemical libraries
   2. Proteins: chemical modification and detection of biomolecular interactions
   Homo- and hetero-dimerization of proteins
   Chemical modifications of proteins
   Antibody-drug conjugates
   Radioactive labeling of proteins
   Kinetic association and dissociation constants
   Affinity constant: definition and its experimental measurement
   3. Genomics: Applications to Human Biology
   Protein cloning and expression
   DNA sequencing
   Some foundations of genetic analysis
   Knock-out technologies
   Transcriptomics
   Proteomics
   Recombinant vaccines
   4. Pharmaceuticals: Focus on Discovery
   Ligand Discovery
   Half-life extension
   Cancer therapy
   Gene therapy

Lecture notes
Skript "Gene Technology" by Prof. Dario Neri and slides of the lecture

551-0307-00L Molecular and Structural Biology I: Protein Structure

Objective
Overview of enzymes, enzyme-catalyzed reactions and metabolic processes.

Content
1. Antibody phage technology
   The antibody molecule
   V genes, CDRs, basics of antibody engineering
   Principles of phage display
   Phagemid and phage vectors
   Antibody libraries
   Phage display selection methodologies
   Other phage libraries (peptides, globular proteins, enzymes)
   Alternative screening/selection methodologies
   DNA-encoded chemical libraries
   2. Proteins: chemical modification and detection of biomolecular interactions
   Homo- and hetero-dimerization of proteins
   Chemical modifications of proteins
   Antibody-drug conjugates
   Radioactive labeling of proteins
   Kinetic association and dissociation constants
   Affinity constant: definition and its experimental measurement
   3. Genomics: Applications to Human Biology
   Protein cloning and expression
   DNA sequencing
   Some foundations of genetic analysis
   Knock-out technologies
   Transcriptomics
   Proteomics
   Recombinant vaccines
   4. Pharmaceuticals: Focus on Discovery
   Ligand Discovery
   Half-life extension
   Cancer therapy
   Gene therapy

Lecture notes
Skript "Gene Technology" by Prof. Dario Neri and slides of the lecture
Introduction into structural and functional aspects of the immune system.

Objective
Understanding of structure-function relationships in proteins and in protein folding, detailed understanding of biophysics and physical methods as well as modern methods for protein purification and microanalytics.

Lecture notes
Scripts on the individual topics can be found under http://www.mol.biol.ethz.ch/teaching.

Literature
Basics:
- Creighton, T.E., Proteins, Freeman, (1993)
- Fersht, A., Enzyme, Structure and Mechanism in Protein Science (1999), Freeman.

Current topics: References will be given during the lectures.

551-0309-00L Concepts in Modern Genetics

Abstract
Concepts of modern genetics and genomics, including principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Objective
This course focuses on the concepts of classical and modern genetics and genomics.

Content
The topics include principles of classical genetics; yeast genetics; gene mapping; forward and reverse genetics; structure and function of eukaryotic chromosomes; molecular mechanisms and regulation of transcription, replication, DNA-repair and recombination; analysis of developmental processes; epigenetics and RNA interference.

Lecture notes
Scripts and additional material will be provided during the semester.

Prerequisites / notice
This course is a co-production of the University of Zurich and ETH Zurich, and will be taught in English. The course takes place on Monday afternoon at ETH Hoenggerberg, and on Tuesday morning at UZH Irchel.

551-0313-00L Microbiology (Part I)

Abstract
Advanced lecture class providing a broad overview on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Objective
This concept class will be based on common concepts and introduce to the enormous diversity among bacteria and archaea. It will cover the current research on bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Content
Advanced class covering the state of the research in bacterial cell structure, genetics, metabolism, symbiosis and pathogenesis.

Lecture notes
Updated handouts will be provided during the class.

Literature
Current literature references will be provided during the lectures.

551-0317-00L Immunology I

Abstract
Introduction into structural and functional aspects of the immune system.

Objective
Basic knowledge of the mechanisms and the regulation of an immune response.

Content
Introduction into structural and functional aspects of the immune system.
- Introduction and historical background
- Innate and adaptive immunity, Cells and organs of the immune system
- B cells and antibodies
- Generation of diversity
- Antigen presentation and Major Histocompatibility (MHC) antigens
- Thymus and T cell selection
- Autoimmunity
- Cytotoxic T cells and NK cells
- Th1 and Th2 cells, regulatory T cells
- Allergies
- Hypersensitivities
- Vaccines, immune-therapeutic interventions

Lecture notes
Electronic access to the documentation will be provided. The link can be found at "Lernmaterialien"

Literature

Prerequisites / notice
Immunology I (WS) and Immunology II (SS) will be examined as one learning entity in a "Sessionsprüfung".

401-0647-00L Introduction to Mathematical Optimization

Abstract
Introduction to basic techniques and problems in mathematical optimization, and their applications to problems in engineering.

Objective
The goal of the course is to obtain a good understanding of some of the most fundamental mathematical optimization techniques used to solve linear programs and basic combinatorial optimization problems. The students will also practice applying the learned models to problems in engineering.

Content
Topics covered in this course include:
- Linear programming (simplex method, duality theory, shadow prices, ...).
- Basic combinatorial optimization problems (spanning trees, network flows, knapsack problem, ...).
- Modelling with mathematical optimization: applications of mathematical programming in engineering.

Literature
Information about relevant literature will be given in the lecture.

Prerequisites / notice
This course is meant for students who did not already attend the course "Mathematical Optimization", which is a more advance lecture covering similar topics and more.

Abstract
Concepts to cope with: a) what can be accomplished in a fully automated fashion (algorithmically solvable) b) How to measure the inherent difficulty of tasks (problems) c) What is randomness and how can it be useful? d) What is nondeterminism and what role does it play in CS? e) How to represent infinite objects by finite automata and grammars?

Objective
Learning the basic concepts of computer science along their historical development.
This lecture gives an introduction to theoretical computer science, presenting the basic concepts and methods of computer science in its historical context. We present computer science as an interdisciplinary science which, on the one hand, investigates the border between the possible and the impossible and the quantitative laws of information processing, and, on the other hand, designs, analyzes, verifies, and implements computer systems.

The main topics of the lecture are:
- alphabets, words, languages, measuring the information content of words, representation of algorithmic tasks
- finite automata, regular and context-free grammars
- Turing machines and computability
- complexity theory and NP-completeness
- design of algorithms for hard problems

The lecture is covered in detail by the textbook "Theoretical Computer Science".

Further reading:

More exercises and examples in:
6. A. Asteroth, Ch. Baier: Theoretische Informatik

During the semester, two non-obligatory test exams will be offered.

Abstract
Machine learning algorithms provide analytical methods to search data sets for characteristic patterns. Typical tasks include the classification of data, function fitting and clustering, with applications in image and speech analysis, bioinformatics and exploratory data analysis. This course is accompanied by practical machine learning projects.

Objective
Students will be familiarized with the most important concepts and algorithms for supervised and unsupervised learning; reinforce the statistics knowledge which is indispensible to solve modeling problems under uncertainty. Key concepts are the generalization ability of algorithms and systematic approaches to modeling and regularization. A machine learning project will provide an opportunity to test the machine learning algorithms on real world data.

Content
The theory of fundamental machine learning concepts is presented in the lecture, and illustrated with relevant applications. Students can deepen their understanding by solving both pen-and-paper and programming exercises, where they implement and apply famous algorithms to real-world data.

Topics covered in the lecture include:
- Bayesian theory of optimal decisions
- Maximum likelihood and Bayesian parameter inference
- Classification with discriminant functions: Perceptrons, Fisher's LDA and support vector machines (SVM)
- Ensemble methods: Bagging and Boosting
- Regression: least squares, ridge and LASSO penalization, non-linear regression and the bias-variance trade-off
- Non parametric density estimation: Parzen windows, nearest neighbour
- Dimension reduction: principal component analysis (PCA) and beyond

Lecture notes
No lecture notes, but slides will be made available on the course webpage.

Literature

Prerequisites / notice
During the semester, two non-obligatory test exams will be offered.

Abstract
The course gives an introduction into fundamental techniques and algorithms of numerical mathematics which play a central role in numerical simulations in science and technology. The course focuses on fundamental ideas and algorithmic aspects of numerical methods. The exercises involve actual implementation of numerical methods in C++.

Objective
* Knowledge of the fundamental algorithms in numerical mathematics
* Knowledge of the essential terms in numerical mathematics and the techniques used for the analysis of numerical algorithms
* Ability to choose the appropriate numerical method for concrete problems
* Ability to interpret numerical results
* Ability to implement numerical algorithms efficiently

The course requires solid basic knowledge in analysis, statistics and numerical methods for CSE as well as practical programming experience for solving assignments. Students should at least have followed one previous course offered by the Machine Learning Institute (e.g., CIL or LIS) or an equivalent course offered by another institution.
1. Direct Methods for linear systems of equations
2. Least Squares Techniques
3. Data Interpolation and Fitting
4. Filtering Algorithms
8. Approximation of Functions
9. Numerical Quadrature
10. Iterative Methods for non-linear systems of equations
11. Single Step Methods for ODEs
12. Stiff Integrators

Lecture notes
Lecture materials (PDF documents and codes) will be made available to participants:
- Lecture Git repository: https://gitlab.math.ethz.ch/NumCSE/NumCSE
- Tablet classroom notes: http://www.sam.math.ethz.ch/~grsam/HS16/NumCSE/NCSE16_Notes/

Literature
W. Hackbusch "Grundlagen der Numerischen Mathematik und des wissenschaftlichen Rechnens", BG Teubner, 2002
P. Deuflhard and A. Hohmann, "Numerische Mathematik I", DeGruyter, 2002

Prerequisites / notice
The course will be accompanied by programming exercises in C++ relying on the template library EIGEN. Familiarity with C++, object oriented and generic programming is an advantage. Participants of the course are expected to learn C++ by themselves.

151-0104-00L Uncertainty Quantification for Engineering & Life Sciences
Number of participants limited to 60.

Abstract
Quantification of uncertainties in computational models pertaining to applications in engineering and life sciences. Exploitation of massively available data to develop computational models with quantifiable predictive capabilities. Applications of Uncertainty Quantification and Propagation to problems in mechanics, control, systems and cell biology.

Objective
The course will teach fundamental concept of Uncertainty Quantification and Propagation (UQ+P) for computational models of systems in Engineering and Life Sciences. Emphasis will be placed on practical and computational aspects of UQ+P including the implementation of relevant algorithms in multicore architectures.

Content
Topics that will be covered include: Uncertainty quantification under parametric and non-parametric modelling uncertainty, Bayesian inference with model class assessment, Markov Chain Monte Carlo simulation, prior and posterior reliability analysis.

Lecture notes
The class will be largely based on the book: Data Analysis: A Bayesian Tutorial by Devinderjit Sivia as well as on class notes and related literature that will be distributed in class.

Literature
1. Data Analysis: A Bayesian Tutorial by Devinderjit Sivia
2. Probability Theory: The Logic of Science by E. T. Jaynes
3. Class Notes

Prerequisites / notice
Fundamentals of Probability, Fundamentals of Computational Modeling

Applications (Research Projects)
